RA: Are these old maps like Sanskrit, Tibetan tantric texts? One could call those antique maps. Those antique maps are closer to what you're talking about, I guess.

TM: Well, maps grow more and more complete. Some of these older maps are badly torn and worn by time; some of them are not really maps but more almost like journals of explorers saying, "Today at noon we passed the mouth of a river, we know not from where it was flowing, but it was a mile wide where it entered the river we are navigating". Now we are going back and hoping for more complete maps of this area. I said to you this afternoon that if we had to find a formal transition point from your maps to my maps, it was Tom Banchoff's films of hyper-dimensional objects. You might say something about that.

RA: Well, I thought of that as a map, only it's not a map; it suggests an image as the videotape we saw suggests some images that we encounter, probably in hyperspace. But it doesn't represent the experience of life in hyperspace at all. Tom Banchoff's best film, "Hypercube", is an instructional pedagogic film on traveling in four-dimensional space. This is a good start if the metaphor of dimension is of any use here. When I saw Banchoff's film, which I knew from my knowledge of the mathematical sources was actually a representation in common space of hyperspace, that made the hyperspace idea as a metaphor, as a map context, real for me. In Banchoff's film you see a hypercube, that means a solid figure in four-dimensional space, the simplest and most symmetrical one, but outlined only by its edges and vertices. It is then projected down, using color as a code for the fourth dimension, into a three-dimensional reality where we can experience it as a solid object represented in the traditional wire frame technology of computer graphics. This looked exactly like DMT trips I've had--so exactly that it deprived me for a long time of the religious fascination that I had with my travels in hyperspace. Because I was afraid that they were simply a precognitive experience of this Thursday evening in Santa Cruz when I would be viewing Banchoff's film. So this is much less than a map, but it's like some context in which to seek metaphors out of which you can make a map.

TM: Yes, I called the book I wrote with my brother *The Invisible Landscape* because someone once said to me that psychedelic drugs were like magnesium flares dropped from aircraft; they would briefly illuminate a landscape and then darkness would reclaim everything. But you don't still think that that was a precognitive experience of seeing Banchoff's films, do you?

RA: No, I think that Banchoff's film was a precognitive expression of a DMT trip that he has yet to take. In fact, the time sequence is not important because the time sequence is only a necessity of a cognitive strategy that we have evolved to deal with three-dimensional space and our motion in it with a very limited mind. So the whole cause and effect idea comes out of a kind of Greek philosophy where very static concepts are really all there is. Freud and Jung and all their maps, tantricism--it is all much too limited to use in any way in mapping our experience in hyperspace.

TM: Yes, perhaps hyperspace is not really what we want to get at, but the idea that there are occult (in the classical sense of hidden), dimensions to reality that are now accessible through the use of these psychedelic compounds. Obvious occult dimensions in reality are the future, the after-death state, and then the idea that there are occult or hyperdimensional organs of the human body, specifically the human mind. The human mind is like a fourth-dimensional organ because it seems to come tangential to the body, perhaps only at one point, and yet we feel its imminence as the most overwhelming fact of being. In fact, it is the experience of the fact of being. Right?

RA: I guess it's reasonable to put our consciousness at the base of the rest of it and say that it's the seat.

TM: But I like to think of it not so much as a diffuse field but actually more along medieval lines like the soul, and to actually try to imagine that there is an organ attendant upon the living human body that is invisible under all normal conditions but is, in fact, the *raison d'être* that holds the whole fact of metabolism together. Then when the connection between that hyperobject and the body is broken, the body ceases to be a four-dimensional object; it ceases to have this life in time that we call metabolism, and it becomes merely a lump of matter whose organization is steadily falling away from it, then it's not active any more and it's not interesting.

RA: Well, the incarnation of the spirit in a body or the association that we have in our consciousness of our being in the body is a terrible limitation that comes from an over-addiction that spirit has had with incarnation over the centuries. It is perhaps a part of the fact that the earth is a dark planet, but in our travels we frequently have found that the body is left behind. Isn't it so? The experience of consciousness that we have during trips in hyperspace may not involve bodies or anything body-like in the sense of a kind of limitation in spatial or dimensional extension. There may be an increased clarity in a smaller location or something, but the experience of our consciousness in hyperspace is fairly diffuse. So it could be that the body is something like a computer terminal in its relationship to the host computer--that it's a probe for sensing data experience on planet Earth in common space in a lower dimensional reality, piping it back up to wherever. I have never been able to really buy the idea that consciousness is in the head or in the body or even necessarily nearby.

TM: Sheldrake, when we talked to him two weeks ago, mentioned Bergson's Matter and Memory. Since that conversation I read it and, though Bergson is very much an unpopular philosopher in the present context, his idea that memories are not located in the brain--that the brain merely is able to access a dimension that is everywhere--is very modern. It touches ideas like Pribam's and all the things that are being said now about Bell's Theorem and the non-locality of information. But what puzzles me concerning those who are big on the non-locality of information...doesn't it devolve upon them to show why experience, even psychedelic experience, is always particularized? You always do have a particularized experience. Why isn't the psychedelic experience a plenum if all information is everywhere? Then what is the tuning device that brings out the various aspects of it?

RA: Well, since my first distant trip I have totally rejected the idea of explaining or showing why, as you would challenge them to show why. Because those theories, Bell's Theorem, quantum mechanics, mathematics, that is all the efforts to make very low-dimensional, almost common-space dimensional conceptual models for an experience which is much richer than these models. So I couldn't take that seriously. I think that people should take their experience more seriously and try to evolve from this experience models, maps, simple metaphors, or whatever, so that we could make an atlas out of local charts. In this room are people who have travelled extensively and analyzed their experiences using all kinds of knowledge of all the cultures on the planet. It's very difficult for any two of us, for example you and me, to compare our experience of hyperspace in order to see whether or not there is some kind of overlap where we could agree that this part of experience was the same, so that your map and my map could then be overlapped a little bit. Then I could have confidence that your experience expands this piece of my mind, or my experience expands that piece of yours. With the rest of us working together, if we had any sort of common ground between any two of us, we could build an atlas for the group experience of hyperspace. But even after ten years or more of doing this, I find it very difficult to use any metaphors of ordinary reality to overlap our experience, much of which is obviously identical, but as far as representation in common ground metaphors, no. So, Bell's Theorem may show the way, but from that experience we have to evolve new consciousness which should grow so as to be able to deal with experience verbally, visually, space-time multimedia musically, to share.

It's very difficult. I'd like to try this out and see if anybody finds that in traveling you experience hyperspace, or whatever you want to call it--you experience life there. It is not that this is the structure of the room; the walls are there in ordinary reality. We have a very low-dimensional thing here, even though in, say, computer technology, you need enormous memory to record a single instant in very low resolution.

In our own perception of life in this room the walls and many things stay fixed, everybody is sitting while one person moves, so this is a very low dimension of reality, and life on this planet is interactive. When you travel in hyperspace, everything is interactive. The whole universe is as a person and we are relating or dancing with everything. The child says "Mom, I danced with a rock". The reply is "Rock's don't dance." We know that everything dances. You poke it; it pokes back. So we don't have the metaphors for this experience. When we move, we have practiced our conceptual, our cognitive reality with this. Most everything is fixed and one thing moves. We fasten on the thing moving and record that in the log book. In hyperspace travel these metaphors are no good. Where we project down to too low a dimensional representation, we lose things.

All maps are vibrations, are projections. In the map of Paris, for example, many different people occupy the same spot--what I call a spot--on the map of Paris. Much information is lost through mapping reality to a map. So the dynamics of life in hyperspace exceeds what we can deal with cognitively. This is, I think, the reason why we have a great deal of trouble describing it to each other. Is it anything like that for you?

TM: Yes, it's like that. I think that while we experience it fully we are repressed by the content of the experience. The reason it is so hard to communicate it is because language is a creation of habit, and our habits are all of this lower-dimensional space. So everything is referred downward. Everything in the psychedelic dimension is like this, like that, and yet there is this tremendous sense of inadequacy. Even as you say it is like this or like that, you know that you're betraying it. And I don't think that is necessary; it isn't that there is something magical that makes these realities state-bounded so that they can never be brought back to experience. It's simply that we have a problem with developing a language that is suitable to the subject and the only way to overcome that is to make the psychedelic dimension more and more a part of our reality, however multidimensional it is. This is essentially what poetry is attempting to do, but doing it very inadequately or very badly, even when it's doing it at its best. A William Blake or a John Milton says "Well, yes, you like what I wrote, but if you could only have seen what I saw, you wouldn't even bother with it". So it's a task of building new dictionaries and new languages and bootstrapping ourselves by transforming our language so that, finally, it maps onto the thing beheld in the psychedelic state. And this is a task of a lifetime or many generations, perhaps. Certainly it's happening now among many people, but it is incomplete and it's frustrating in its incompleteness. Our language for reality, for what you call the low grade reality, is by no means complete.

Many lyric poets have exhausted themselves without ever reaching for the heights, so the difficulty of mapping these higher order states is very great. Maybe that's why, though we can't exactly articulate it, I gravitate to you as a mathematician, hoping to hear something that will illuminate the problem, because mathematics is a language too and a very different language from the language of ordinary experience. Perhaps both mathematics and ordinary human languages are inadequate to the psychedelic dimension. But this is then where we are in the cultural task. We need to create a meta-linguistic metamathematical, metaphorical language in order to behold these things. I think it must be possible because people who are loaded together with a very few words do understand these things.

RA: It may not be hopeless to think that we will find verbal, mathematical, scientific, musical, artistic metaphors and language strategies for recording and exchanging our experiences to help further our evolution. One cannot stand forever a situation where we cannot compare our experience. Even to tell a joke about life in hyperspace is very bad. So we want this evolution. At the same time we have already experienced it, as you said, only not with these kinds of metaphors but through telepathic experience or whatever one wants to call it. Which is a part of our experience of traveling together, which is a certain

proportion of every person's experience of traveling. It varies. Some people are very solitary in their travels; some people always go in twos; sometimes there's millions...

TM: Fill the skies....

RA: Flying in group formation on the astral plane. So I think that the expansion of our language, mathematics and what not, has to be an expansion where what is considered to be mystical, the impossible, in search of the miraculous, telepathic and so on, is allowed to become part of everybody's experience. This is one of the most important things, in my view. I don't know what is necessary to preserve the possibility of the species' future evolution. It's not hopeless. I think somewhere evolution is possible. We have the glimpse here through our personal experience; our group experiences are extremely frustrating, even this kind of talking and sharing.

Q: Do you think there's some behavioral imperative to deny those kinds of experiences as a society?

RA: Well, filtration of experience is an ingredient in every social structure...filtration of experience. "Johnny, rocks do not dance." You are told that you did not dream, that you did not experience what you actually did experience as a child. And that is part of the problem, but even if by some miracle or another you were able to re-program yourself from prenatal on out, as many people are trying to do by re-processing their previous incarnations and everything else, if you could totally clarify your soul so that you had no cultural conditioning at all, then I think there is still a lot of structure missing that we need to have to function as fully expanded beings in hyperspace and to achieve the evolutionary promise of our group consciousness.

TM: Because the fact of the matter is, though we've talked of hyperspace and used this geometric model which signifies clean breaks between levels, actually this hyperspace that we're talking about is present all the time in the here and now as an aspect of the here and now that is simply not perceived by us. Think about the reality that we do perceive through the mediation of language and the way it differs from, say, the next highest primate. Obviously our tremendous awareness of our history, our appetite for our future, our baggage of all these abstractions--scientific, cultural or mathematical, this is itself an aspect of being in this linguistically created space that is different from the space of the experience of an animal. If you want to think of history as pointed toward a moment in time when it will enter hyperspace, then realize that the fact that history exists at all means that this process of entering into hyperspace is well advanced. History is the shock-wave that precedes the entry of a species into hyperspace. A lemur or any creature, even a social insect, cannot enter into hyperspace without entering into history first, perhaps for ten or fifteen thousand years. That is the aura that precedes the entry into hyperspace and it's a domain of accumulating language and metaphor and experience.

RA: So perhaps there is an accumulation from the bottom up. To physics we add Bell's Theorem; to mathematics we add chaotic attractors; to language we add a new poetic metaphor, and thus we create new maps of hyperspace. This is bottom-up accretion. Maybe there is a top-down one where the capability to communicate telepathically between two people is dramatically increased by the accretion of metaphorical skills in telepathic communication or something. Or maybe there are telepathic plants that you find in the Amazon. Suddenly this communication is very clear. I'm biased for the top-down one as I think that from the bottom-up is so feeble, there is so little help, that this is Jack's beanstalk which has got to go to the sky. But you are optimistic, being a word freak, that language can be expanded to the point where one could

succeed in describing the experience.

TM: But I do think there is some kind of, for want of a better word again, hyper-dimensional object at the end of history which is casting an enormous shadow over the historical landscape and causing it to be what it is. It's as though history were the shock wave of eschatology. There is an event at the end of history such that when it is finally reached, all time which preceded it will be seen to be adumbrations and reflections of the approach to this thing. It's as though consciousness is attempting to become more and more self-reflective. And since language is the way, the strategy that is being used, we are getting a fantastic accumulation of languages and cybernetic technology -- technologies of storage and delayed replay -- so that consciousness is bootstrapping itself toward this omega-point. But the creode, the cleft in the epigenetic landscape that is directing it toward this end point already exists in some sense. This is like a Platonic model of hyperspace. Plato said, "Time is the moving image of eternity". What he simply meant was that we have a low-dimensional slice of reality in the form of what we call the present, with its perspective on the past, but that actually it is part of a higher dimensional manifold which, beheld in its entirety, is eternity. Consciousness is reflecting itself and culture is the waste product of that process. So it seems to me that what the historical task consists of is humanity turning itself inside out and that this is the problem with dimensions that we sense so acutely. It is that the body, which is presently exteriorized, must be interiorized. And the soul-mind, which is presently felt -- only felt -- needs to be exteriorized. One can hark back to the metaphors of alchemy for an idea of what this is. It's the idea that the soul should be potentially condensable as a visible object, or a form of trans-dimensional or trans-linguistic matter which is then beheld. By being brought through this process of entry into normal space, the space we experience, the soul is placed beyond the crisis of death which is, somehow, the rending of this connection between the organic and the trans-organic, and with the advent of more and more advanced cybernetic systems, more and more advanced psychedelic substances and shamanic techniques, there is a vast family of these things to be synthesized and explored. The task of exteriorizing the soul and making it familiar will come to be. Apparently then, this end-point of history that we keep talking about is actually the place where biology is left behind because death is overcome by understanding. History is the process of being consciously caught in being without understanding death. Through languages and mathematics and science and all these various strategies, we are attempting to gain a hold on that problem so that we can turn it around. There's nothing that says this is impossible; it simply takes ten or fifteen thousand years to get our ducks in a row so that we can have a firm enough epistemological basis and a firm enough understanding of what the self, the brain, the body, the present at hand, actually mean. Then we can turn the switch and be at play in the fields of the Lord in the human imagination. Don't you think the human imagination is where history is carrying us all? That is Elysium.

RA: Well, that might be just a feeble projection of the much more grand... I wonder what you think is the role of the human anti-imagination? For example, what is going on with the repression and control of psychedelic drugs? Why are people persecuted? Is there a negative force in evolution? Is this archetypal creode at the end of history, the future which is determining the present as effect of the cause, does this have a major evil component?

TM: This is a real problem. I always feel nervous about sounding dualistic or Manichaeian, but I have the strong intuition that we are not monkeys but we are in monkeys. What we're asking is "Why is there so much monkey business?" It's because we are having a great deal of trouble. We love the monkey body; we connect it to the earth, we connect it to a long evolutionary history and we believe that we must treasure it. Yet it's very obvious, looking at the way global society is organized, that the monkey nature is utilizing the

discoveries of the angelic or Buddha nature of people -- ivory towerists, scientists, seers, and people simply trying to understand how things work. But this information is used by monkeys, generals, politicians, advertising executives and propagandists, and it is lethal. So we are bootstrapping ourselves, and we're not all moving. If this is a marathon race to the end of history, we cannot all be in the lead.

RA: It's very critical, I think, to sit here suggesting that consciousness, the unique inhabitant, the living occupant of hyperspace, in fact has got a serious personality defect. It's got an addictive personality and it likes to incarnate in monkey bodies. There's really a lot of oversoul; we're just about a millionth of one percent of it. So we are the laggards. We are addicted to the occupation of the monkey-body; otherwise we would have gone back where we belong. Some people think that we've been banished to an incarnation on the dark planet as a punishment, but for what? First of all you're suggesting that the oversoul has a personality problem and secondly, there is the dualism between the oversoul and the monkey. Are the monkeys a foreign species while the oversoul lives in Beta Orion and the monkeys live on solar earth? Are the monkeys an inferior species? Are they not part of the projection of the conscious soul? Are there different parts? There is not a single occupant in hyperspace, but there are actually different ones. There's oversoul; there's monkeys; then, I suppose, there's mosquitoes--one of the few living beings I still enjoy to kill. There are these different parts. It is not all one.

TM: I think that what is loose on this planet and has been for at least a billion and a half years, is a self-replicating information system. It first appears as replicating polymers which then grow sophisticated enough to be DNA and cellular matrices and enzymatic feedback systems and then, at a very late period in its history relative to us, it transcends mere genetic information and evolves epigenetic information such as culture, writing, this sort of thing. This phenomenon is localized in the monkeys. But the thing is that knowledge and understanding are inevitably two-edged, so that as we reach for angelhood to free ourselves, we inevitably gain the power to destroy ourselves. We cannot become some kind of star-roving, hyper-dimensional, cybernetic species radiating out through the galaxy unless we go through the very narrow gate that has to do with the fact that we discovered fusion processes while we were still bound to a single planet. We have fifty, a hundred, two hundred years before we are home free. We will carry that burden of the knowledge of how to destroy ourselves as a species until we get, as James Joyce said, "up ne Ent" And once we're up ne Ent we leave behind the planetary ecology, the possibility of toxifying the planet and destroying ourselves, but it's clear that angelhood is not easily won. One must banish interior demons. These are demons of knowledge, the wrathful dieties are the knowledge dieties, and the knowledge that they hold is the knowledge of how to blow the planet apart as though you had stuck a stick of dynamite into a rotten apple.

Q: How come we have so many dangerous people in power positions?

TM: Well, monkey tribes are about pecking orders and male dominance. These monkey hierarchies are the last to get the news. The militarists do not understand what Ralph understands, or what the people who build these hydrogen weapons understand. They only use these things because they have everybody under their thumb. Power is one game which they play very well. Understanding is another game which people like Ralph play very well...but the faith of people like Ralph and myself is that the power, the transcendent power of the knowledge in and of itself will be so great that it will overcome the wish of the monkeys to misuse it.

A perfect example of that would be the chip. When the chip was first developed, the alpha males were

about to put it in the wastebasket because it didn't work fast enough for the military applications for which the contract had been led to produce it. They couldn't see any reason why this would have any application at all. And then someone outside that research mentality realized that it meant everyone could have a computer; it meant that the computer technology which had been a privileged thing of the ruling military and industrial classes had escaped their control. I have a real faith that this will always be the case -- that all effort to take control of something in the technological area will find it mercurially slipping through one's fingers.

It's a moving front of knowledge. The real thing is not to think that it's research scientists pitted against the monkey generals. Orchestrating this whole scenario from hyperspace is the overmind of the species. It is releasing these ideas into consciousness. We cannot go to the stars without genetic engineering, nuclear fusion, all of these things. I think that the current situation on the planet with H bombs stacked like cordwood, etc., is a perfectly natural situation. This is exactly what it's like when a species prepares to depart for the stars. There is tremendous risk and the risk factor exponentially rises. Who knows how many species throughout the universe confront this situation and can't make it through. It is a very narrow neck. Naturally, only sophisticated life forms radiate through the galaxy and what sophisticated means we don't know, but we're going to find out because we're going to find out whether we are one or not. The next hundred years will tell the tale. We will either break free or we will fatally foul the cradle of our origins.

Q: Just assuming that humans are the vanguard of evolution and it's happening to this mutant monkey first and we leave biology behind, what continues to go on on the planet? There's a whole planet world going on still and there are dolphins evolving towards this kind of escape. What happens to the plants once we leave the planet?

RA: Well, I think the planet is like high-school: every year there's another graduating class. The school looks the same every year, but if you watch the individuals then you see it evolving. If you look at war games, the battle field is always there, but the individuals on it are always different. People grow through these stages of evolution. This planet is one step in a ladder of evolution and devolution. I think there are two strategies for the growth of the spirit. One is the bottom-up one; this one requires these efforts of the research scientist since the bottom-up one assumes, pessimistically, that the top-down can't work, that telepathy will not be developed fast enough to put individuals in the kind of tight interconnective contact they have to have in order to survive these delicate balances with destruction that Terence has described. The bottom-up strategy assumes that top-down can't work so therefore it has to improve the communication of people by constructing computer networks, by tapping energy from the sun and bringing it down, and so on. All of technology is an effort to reach angelhood through material means, while mysticism is an effort to achieve the same goal by expanding peoples' capabilities with psychedelics, by meditation, by teachings from foreign planets, and whatever...

TM: You can't live on a planet and have the kinds of powers and ideas which we have because a planet is such a delicate thing. What we dream of is so outlandish and so centered upon ourselves that the only way it can be realized without being Faustian, without destroying us and everything else, is to build it in space. The human imagination has to be lifted off the surface of the planet for our survival and the survival of the planet. It's like a mother come to term; this baby must now be born.

RA: It's an ecological imperative.

TM: We must leave the womb for the sake of the mother and for the sake of the child. This great separation, this cleavage, has to happen.

Q: I believe that the human mind is dependent upon a minimum quantity of atoms and that if you had the amount of atoms in a chicken's brain you couldn't make the human mind and that it requires spatial organization, whereas you both imply that the mind came before--that the mind isn't related to the brain. Can you explain this?

TM: Evidence that numbers of neurons are important is incomplete. The Penfield experiments are the crudest indicators that there is some relationship between neural activity and thought, but what this relationship is has never been shown. A materialist like John Eccles took the position that the mind was something which could initiate quantum-mechanically balanced electron cascades. The mind shunts these one way or another, and these events start avalanches of electron cascades which would then become what are measured as crude neural signals. But he actually had to posit an invisible force that could, at least at the level of one electron, push on the physical world. I'm not swayed by the idea that it's been shown what is going on with the relationship of neurons to thought.

Q: But neurons do seem to grow, as imprinting occurs in a chicken, and you do get an increase in mass with the neuron during the imprinting stage.

TM: The neuronal material has a relationship to thought, but we do not know of what the relationship consists. In other words, does the brain generate thought, or does it receive thought? Is it a generator, a receiver, or what is it?

Q: Why would the human mind need to exist if it weren't for the human body -- the genes? What would be the point of a human mind without a human body?

TM: Well, perhaps mind is a generalized term. There may not be human minds and chicken minds, there may simply be mind and one perceives as much of it as one's neural network is able to transduce.

RA: The brain is an organ of perception.

Q: Normally when we think of the millennium, the omega-point, the Resurrection, we think of fundamentalist religion. How does that fit into the conservatism of most religions.

TM: I said that the object, the trans-dimensional object at the end of time, cast a shadow over the three-dimensional landscape of history. Implied in that metaphor is the notion that the shadow is distorted. I think that all empires and forms of social organization are attempts to get it right. Nobody, not even Hitler and Nero went around saying "I'm just the worst person to ever come down the pike". People always believe they are acting from a clear vision of what is required. But the fact is that the very nature of being in this low-dimensional space makes it very very hard to get it right. That's why the idea of Zen koans, where you are somehow to break out of a system of logic and perceive beyond it, is indicative of that. I think the thing at the end of time will be a *coincidencia oppositorum*. It will be a union of opposites. It will not be rationally apprehendable. It will transcend rational apprehendability and, as you know, the British enzymologist, J. B. S. Haldane said, "The universe may not only be stranger than we suppose, it may be stranger than we can suppose". It's that thing which is stranger than we can suppose which is calling us

through time toward it, and which we anticipate in visionary, mystical and psychedelic states.

Q: I was wondering...ever since we've been working with psychedelics we've been receiving guidance as to diet and choice of various things in our life to create an energy coordinate system that changes the dramas and energies that we draw into life. If we choose a diet, or something that we haven't been channeled, it tends to imbalance the reality.

RA: This is the epitome of the top-down way, so that our experience, more or less, extends to all of us. It is a function of ego, I think, to reject guidance which clearly comes -- and people do do that; furthermore, they make conspiracies to do that. I heard of one today. There is a bill in the Assembly that would allow the postal service to open everybody's mail primarily to look for things like Prevention Magazine. People are sharing ideas that they've received about the right way to eat for achieving certain purposes. Even on this level the information is suppressed. I think the ego conspiracies are monkey-level strategies for defeating the insertion of information through intuition and connection. I think that it's very difficult to be what we are calling our monkey if we don't eat other monkeys. One of the strange things about this planet is glaciation -- these historical events that force animals to eat other animals where otherwise it wouldn't be necessary because there's an adequate supply of plants. The difficulty of the survival of the species through the various glaciations has, I think, produced some of the ecological problems that we feel on the social level as wars and torture, the pressure that makes it seem as though we have no chance of getting through the bottle neck to the omega point.

Q: If you think we're going to leave this body or move on from the planet, why are these beings so interested that we become pure enough to channel them, to become part of them? When you take the mushroom or LSD, it means you become part of their energies and that we're able to evolve in this way. I've been told that they're working toward physical immortality, working toward balancing and energizing all our energy coordinate systems so that they will harmonize. You're actually going to be an ongoing entity that constantly changes in this way, constantly renews itself, constantly goes through a birth/death process?

RA: I personally am very pessimistic about our chances for survival to a goal without receiving guidance. I don't think that the probability of our getting past the nuclear menace is zero. The computer could make a mistake and some chimpanzees actually believe that the planet can survive a limited nuclear war. Our chances of making it through are dim and so we're pessimistic, but actually our chances of making it through to here were zero without guidance. To me it's a mystery, but the nature of the guidance and the direction in which it's going seems absolutely certain to me, so I'm hungry to take it.

TM: I would differ with Ralph in that I'm very optimistic. I think that the most intelligent form of life on this planet is not the human individual and it is certainly not the social institutions that human individuals have pushed together. The things that make us so strange, that always make it a stumbling block to view ourselves as simply highly evolved monkeys, is the presence on the planet of something which you could call the human overmind. It has its hand on the tiller of history. No government, no scientific institution, no occult organization is running history. The overmind is running history and it can drop the differential calculus simultaneously on Descartes and Leibniz; it decides when it's steam engine time and when it's photon engine time. It will pull us through or it will pull something through; but history is a dash -- a ten thousand year dash -- from the point in time when you cognize that you could go to the stars to the point in time when you look back on the receding earth and breathe a sigh of relief and say, "We made it". It's very tricky, but I think if the overmind didn't exist it would be entirely impossible.

Q: What do you think it is that the overmind is saying?

TM: You probably know Phil K. Dick's book *Valis*, where he talks about the mad god. He isn't the first one to talk about the mad god, and all I can say about that is my deepest intuition is that there may be a mad god. But in the true tradition of Gnosticism, beyond the mad god, beyond the machineries of fate that the mad god has imprisoned us in is the true, higher, hidden God, who cannot signal us at all because we are fallen into the black hole of the mad god. But we have within ourselves a spark of divinity that, if we study it carefully enough, the message -- the way out of the labyrinth, is written there. And once we, entirely by our own efforts, make our way out of the labyrinth, and this means the overmind as well, then the higher and hidden God will be present. But, yes, this universe appears to be as the Gnostics said, the creation of a monstrosity. This universe is a prison of iron. At least that was their view.

Q: Well, is your idea of an overmind some version of Margulis and Lovelock's Gaia Hypothesis, and is that healthy?

TM: I don't believe they think of Gaia as minded and directed as I am saying. They see it as a global system for maintaining meta-stability on the planetary surface. But I actually see it as something which is controlling perturbations, directing developmental processes down certain chains to make things be the way they are. You see, I can believe the orthodox theory of evolution--the neo-Darwinian theory--except that it seems to me the time scale is preposterous. The theory works on a scale of twenty million years, but we are asked to believe that we came from the trees in half a million years. That's too fast. If that's true, then there must be a higher governing order because that's too many right choices in a row. It couldn't possibly have happened that fast without it being a non-stochastic process.

Q: You've talked about a ten or fifteen thousand year history on the one hand and, on the other, something is out there pulling us towards the future... I wonder whether you have considered that there's only one moment of time in which we're inventing both your ten and fifteen thousand year past and that thing that's pulling us towards the future. What we're doing here tonight is exploring ways of getting our heads together so that we project a reality that's a little more compassionate. I don't know any other words. Perhaps we could make that agreement and not be quite so frightened in that case.

TM: Well, the psychedelics carry you to the end of time. You discover the secret; you leave history and you experience the secret outside of time. It's what Mircea Eliade calls the dichotomy of the sacred and the profane. I think that's what is so exciting about the psychedelics; the government can't control the truth, the secret of the future cannot be hidden from people who do it. I don't know if this addresses your question, but it's the only source of optimism, of existential optimism, that I know. I think that Ralph would probably agree. It affirms that there is a way outside the labyrinth. It lifts you above so that you can contemplate the topology you were enmeshed in.

Q: We've taken some giant steps because this evening would not have been possible fifty years ago, or twenty years ago even. Something different has happened.

TM: Language...

Ralph: I want to reply also.... I'm sorry I've made myself so unclear as to be so completely misunderstood. I

am not pessimistic. What I tried to say and what I want to say is that I would be very pessimistic about our chances of making it on bottom-up evolution without any guidance from the top-down information. However, it is my experience that we have an abundance of this and that many of us here are running one hundred percent on intuition from above. One hundred percent...many of us. As a matter of fact, I am not pessimistic.

TM: Psilocybin induces this phenomenon -- at the lowest level the strong intuition of what you should do, and at the highest level, the direct verbal order.

Q: In your book you sketch out what you call a quantized modular hierarchy that tries to pinpoint the points in history where all this information floods in from outside the manifold. I'm wondering since you wrote the book if you have had any further insights into that? One question I want to ask you, why did you pick 2012. It is also the end of the Mayan calendar.

TM: Peter Broadwell, who is sitting in the front row, has labored mightily to make the time-wave theory accessible to people. My original reason for choosing the 2012 date was very idiosyncratic. It had to do with temporal distances from the date that the atomic weapons were used on Hiroshima. But once we had this program running well enough that I could see what was happening, I felt that the time-wave gave very good agreement with the historical data. The time-wave maps novelty, coming and going, from historical time. Configure it so that you'd have the zero point in November, 2012; in that case the deepest ingression of novelty before modern times was in that fifty year period in the fifth century B.C., when Lao Tzu, Mencius, Ezekiel and Zoroaster and Plato were all active. Such a moment! Nothing has been done since except adumbrations of that work. Then, of course, as you mentioned, the end of the Mayan calendar, which is a very, very strong coincidence. The Mayan calendar was right once before. They predicted that on a certain morning on a certain day in a certain year, men would come in white ships and should be treated like gods. And on that morning of that day of that year, the ships of Cortez dropped anchor off the coast of Mexico. We're talking about forces which wrecked a civilization. Are we to believe that the Aztec civilization was wrecked on the basis of a coincidence? It isn't like that. The prophecy was fulfilled. They had good agreement between prophecy and fact, but it set them up psychologically to be conquered in a way that would never have happened had they not had that prediction in their world view. I don't want to get into it in great detail, but I think the modern relationship of science to the flying saucer is approximately at the same level of sophistication as the Mayan astronomers sophistication was to his ability to predict future events. So prophecies do have a way of coming true when you look at civilizations on the scale of millennia, and it usually bodes great change for the society in which it happens.

Q: All the people you mentioned that lived during that time, I've been told that there was a planetary alignment--the same as the kind of planetary alignment that we're experiencing now until 1989 where certain planets are lining up.

TM: Well I don't know if what you're saying is true, but it should be true if my theory is correct, because you've got to have agreement in the sky and on the ground. The time-wave that I propagated is only thirty years away from the zero point; this is like approaching a black hole. We have sunk below the event horizon. The Millenarian event has now exerted such hold, the creode is so deep, that it's calling us toward this moment. The walls are so high that there is no way out now. Very definitely we are tidally locked to that future event. The Mayan calendar was a five thousand year cycle and it starts out with everything in a certain configuration and then it returns to that exact configuration on that date. The theory that I

developed was a hierarchical wave that can be derived from the I Ching and I derived my fit empirically or, in a sense empirically, by putting the wave against stretches of historical time and asking myself if the wave configuration fit my intuition of how that historical period should be graphed.

Q: I'm not trying to be too materialistic, but I'm really trying to understand your paradigm. If you don't believe the mind is intimately connected to the organization of the brain, why would we bother to ingest a chemical to effect the brain, to effect the mind?

TM: I didn't say it wasn't intimately connected. I just said perhaps it wasn't generated by it. For instance, think of a television. It does not generate the signal that it receives but, by making changes in the television, you can certainly change the quality or you can get new channels, or wipe out all channels. So I see the brain as a receiver and the chemicals as various resistors, tubes, transducers, this and that, which you drop in and then say "Well, what do we get if we turn to this channel...?"

Q: But you do believe that you have your religion, whatever your parents told you, inside that brain?

TM: Perhaps we can have the best of both worlds here; perhaps there is a small reservoir of personal experience and memory that is actually coded into the wetware of the brain, but one of the things that's always struck me about the psychedelic experience is that if you take the theory of evolution seriously, then you have to say, well, if evolution is an endless economizing of what is good for us in terms of maximizing our survivability, what in the world is all this information doing there that is released by the psychedelic? Why should I see the planets around Zeta Reticuli? Why should I see all this material that cannot be organized by my linguistic faculties? It seems as though the evolution of the organism did not sculpt and strip away the accessibility of that information. It remained accessible because it was actually independent of the organism, consequently the evolution of the organism did not modify or limit that information. Interestingly enough, the same problem can be posed of Tantra. Obviously, evolution economizes the propagation of the species; without that there is no evolution. So why in the world should there be a fantastically transcendent experience that is accessed through the control of ejaculation? In other words, all evolution pushes for that to happen; how can denying ejaculation possibly deliver an important and transcendent experience. Again I would argue that it's because there are fields of information that are not modified and filled or lost according to the evolutionary needs of the species of the individual. These fields, these psychedelic information fields, are there to be perceived in the same way that three-dimensional manifolds are accessible.

Q: Would you say something about exteriorizing the soul, riticulti??? the body and, perhaps something about the balance to strike between these two?

TM: I think alchemy, in the Western tradition, is the great way, the great metaphor for doing that. The alchemists in the late phase, fifteenth century forward, were talking about the stone -- the sophic hydrolith -- some kind of thing which was matter but beyond matter. It was exteriorized; it could do anything, and yet it was somehow simply material. Yet it had all the properties of thought. When we went to the Amazon in 1971 -- the incidents that are written about in *The Invisible Landscape* -- what led us down there were a series of reports about a plant preparation called ayahuasca which some of you may know about. It is a beta-carboline DMT combination. There were reports that on ayahuasca there were shamans who vomited a black fluid that was not visible to anyone except other people who had also taken the plants. We were told that they would vomit this fluid as part of their curing ceremony. They would spread it out on the

ground and look into it. It was described as a phosphorescent, obsidian black, translucent material. It was translinguistic matter. It was, as James Joyce says, "all space in a nutshell". There were stars in this stuff...it was impossible. It was not simply a body fluid in the normal sense; it was actually a product of some kind of metabolic process that you could think of as transdimensional in some sense. One could think of it as a psychedelic molecule that had its trip on the outside of itself so that to look upon it is to see the psychedelic phenomenology unfolding. But it was liquid and not fixed. Our idea was that if this had any objective reality to it at all, then alchemical metaphors could be brought to bear on it. Our goal was to fix this translinguistic material. It is essentially one's mind exteriorized; it has one's name written on it. If you need to take a shower, you just stretch it out over your head and water comes out of it; if you're hungry, you eat it; if you need to go somewhere, you sit on it and it takes you there; if you need to know something, you ask it and it tells you. It is something which we have a great deal of trouble conceiving of because it violates all our notions of category. But something like this will come. The fact that it can be experienced in the psychedelic state seems to indicate that it is only in the imagination. That means that all that is necessary to experience it in three-dimensional space is for one to be in the imagination. Then it will be found not only to exist but to be a microcosm which is mirroring a macrocosm, which is also in the imagination. It's a way to cosmicize the self and yet realize it as an object which you can wear as a bead around your neck or put in your pocket or carry in your mouth.

Q: I wonder if psilocybin ever told you where it came from? I know in the forward to your magic mushroom book there's a wonderful quote from the mushrooms.

RA: Which was a discussion we had the day we met....

TM: That's right. I don't believe everything the mushroom says. I don't think you can believe anything anybody says or all that anybody says. My brother was telling me just recently that psilocybin is, I believe he said, the only four hydroxylated indole which occurs in nature. Well, that's very interesting. That single fact right there seems to me to make good grist for an empirical argument that this gene was inserted into Earth's ecology from outside. How else could it be that the only four hydroxylated indole in nature could be associated with this organism? Psilocybin occurs in a number of mushroom species, but they are all fairly closely related. It seems to me the whole problem of extra-terrestrial intelligence has been ill conceived. The scientists have been allowed to make the rules of the game and their rules are very self-limiting. The current, rather primitive, state of molecular biology is already talking about taking control of the genetic code and genetic engineering and that sort of thing. Obviously, once that's done, once a species discovers how to do that, its form is no longer dictated by the evolutionary constraints of its planet of origin; its form is dictated by imagination. If a species wanted to radiate through the galaxy and was searching for contact with other minded species, a good approach would be to create a probe which is more biology than technology. After traveling a given distance, say one astronomical unit or something like that, this probe replicates itself into four and then, as these probes move out from each other at a certain astronomical distance, they replicate again. What you get is an expanding sphere of probes, but the number of probes is increasing as the sphere grows in size. When any one of these probes contacts a world where there is the potential for the evolution of minded beings, a gene is tailor-made or is already in existence in the programming of this bio-mechanical probe, and it inserts that gene into an organism or set of organisms that can be seen to have already occupied their ecological niche, so they are not going to undergo radical evolution. The fungi are in this category. If you want to write a message to someone, the pyramids are six thousand years old and they're wearing away; the only slate you can write on and hope to have your message last over tens of millions of years....

RA: A self-replicating one.

TM: Yes, a von Neumann machine. The DNA will carry a gene along for hundreds of millions of years, unmodified--the morphogenetic field. So then when this psychoactive molecule is taken by a primitive human group, shamanism emerges. Shamanism is about predicting game movement and weather on the functional level. In hunting and gathering groups, this is what the shamans' prognostications consist of, because these are the only future events that matter. Movement of game and weather; this information is being fed into the ecology from the probe--the part of the probe which remained somewhere else in the ecology. I don't know if psilocybin throws open the door to contact with a minded species like that, but it seems to me highly possible. At the level of fifteen milligrams, which is usually five dried grams or so of mushrooms, the phenomenon of an organized entelechy, a voice speaking with greater knowledge than you or your subconscious possess, is very marked. I began this evening by talking about how the Freudian and Jungian maps were inadequate. I was just edging up on this matter. For Freud and Jung a voice in the head was pure psychopathology. I am saying that beyond their model there is the voice in the head which is, simply, the contact with this sophisticated entity. It's non-technological, you know; this is another unsettling thing. It doesn't come in enormous ships at hyperlight speed. No, it radiated through the stars by the slow pressure of radiation. The spore itself is one of the hardest organic materials known and has an electron density close to that of metals. Imagine the mushroom shedding the spores which then, by Brownian motion, percolate to the top of the atmosphere of a planet. As they pass through the outer levels of the atmosphere of a planet, there is a lot of electrostatic charge present, and they pick up what are called global currents, which initiate electron flow over the spherical surface of the spore. These global currents become, perhaps, superconducting; at that point the imperviousness of the spore to radiation is such that it has no trouble surviving the drift between the stars, even if it has to lay dormant for millions of years. And millions of years is an unnecessary amount of time. The earth goes around the galaxy every 275,000 years. There is great percolation of material in the galaxy. I will anticipate a revolution in biology right here by making a prediction which will be obvious to everyone in this room, but which no biologist has ever said: Outer space is only a barrier to species drift, no more a barrier to species drift than oceans are. All of the processes of drift and establishment of new populations on desert islands that we're familiar with in earth-based ecology happen on a galactic scale. The galaxy is an organized bio-system; it's simply that the species which developed the strategies which allow them to drift across the galaxy are either minded and do it as we propose at our current level of civilization to do it, with ships and suspended animation and the whole gamut of science fiction techniques, or biology can carry a species to it another way by creating a spore-bearing organism. Or it may be that once the mushroom was a monkey, but it decided to repackage itself as a mushroom because that was a more viable evolutionary strategy when the galaxy is viewed as the biome that one wishes to populate rather than the surface of a planet. Let's call a halt. Thank you very much.

So everyone can hear, yes? I can hear anyway. Good. Well I want to thank Mandala books, Jan, I want to thank Jay Weidner for bringing me back to Seattle, the home of real grunge and real peculiarity. Before I plunge into this I should tell you, because Harper would like me to do that, The Invisible Landscape after years and years of being out of print is shipping right now. I don't know if it's in the bookstores but it's real. True Hallucinations is going into paper at the same time so if you couldn't afford the \$22, wait for the \$12 or the 2012.

What I wanted to talk about tonight simply because it's the thing that is moving me to the edge of my chair at the moment is: I called the talk Eros and the Eschaton. What I could have called it is Eros and the Eschaton, What Science Forgot. Somebody asked me recently is there any permission to hope? More specifically, is there any permission for smart people to hope? It's easy to hope if you're stupid. Is there any basis for intelligent people to hope? I wanted to deal with that because I think so. It was to me a shocking question because I live in an aura of hope because I live in a twilight world of my own self-generated, cannabinated fantasy. I forget that not everyone is so fortunate and that there's a lot of despair and uncertainty out there.

So I wanted to talk about this. I'll talk for a while and then we'll break and have an intermission. I'll sign books if anybody needs a book signed. Then we'll come back and do Q&A on this until we're sick of it basically. If there's a technician adjusting this, help me out a little bit.

Eros and the Eschaton – these are the two areas that I think compromise the old paradigm and give permission to hope. Strangely, neither of these words is

that well known, which gives you a measure of how completely the dominator position has squelched, subverted and downplayed any opposition to its worldview. Eros we know about in some kind of devalued, shticky kind of glitzy way because we get it in the eroticization of media and society. Really what Eros means in the Greek sense is a kind of unity of nature, a kind of all-pervasive order that bridges one ontological level to another. This is not permitted in the official worldview of our civilization, which is science. The world of inorganic chemistry is not thought to make any statement about the organic world and the organic world is not thought to be extrapolatable into the world of culture and thought. There are imagined to be clear breaks in these categories.

I had a biologist tell me once, "If genes aren't involved, it ain't evolution." So that means you can't talk about the evolution of the Earth as a physical body. You can't talk about the evolution of human social institutions. Evolution is somehow a word appropriate to biology and appropriate nowhere else. This brings me then to the first factor easily discerned by anybody who has their eyes open that compromises and erodes the hopeless, existential view of the world that we're getting from science. That is the idea that nature is in fact across all scales and all levels of phenomena, a unity. It's not a coincidence that electrons spinning around an atomic nucleus and planets going around a star and star clusters orbiting around the gravitational center of a galaxy; it's no coincidence that these systems exhibit the same kind of order on different scales. Yet, science would say that is a coincidence.

P.W. Bridgeman, who was a philosopher of science, defined a coincidence as what you have left over when you apply a bad theory. It means that you've overlooked something and what jumps out at you as a coincidence is actually a set of relationships whose casuistry and whose relationships to each other are simply hidden from you. What I've observed and I think it's fair to give credit to the psychedelic experience for this - what I've observed is that nature builds on previously established levels of complexity. This is a great general, natural law that your own senses will confirm for you but has never been allowed into the canon of science. What I mean by that nature builds on complexity is the following. When the universe was born in the dubious and controversial circumstance called the Big Bang, it was at first simply a pure plasma of electrons. It was the simplest that it could possibly be. There were no atoms. There were no molecules. There were no highly organized systems of any kind. There was simply a pure plasma of expanding energy.

As the universe cooled, simply cooled, new kinds of phenomena, we say

emerged out of the situation. As the universe cooled, atomic nuclei could form and electrons could settle in to stable orbits. As the universe further cooled, the chemical bond became a possibility. Still later the hydrogen bond...which is a weaker bond, which is the basis of biology. So as the universe aged, it complexified. This is so obvious that it's never really been challenged. But on the other hand, it's never been embraced as a general and dependable principle either. Follow it through with me. Out of atomic systems come chemical systems. Out of chemical systems comes the covalent hydrogen bond, the carbon bond; complex chemistry that is prebiotic, organic. Out of that chemistry come the macro-physical systems that we call membranes, jells, charge transfer complexes, this sort of thing. These systems are the chemical preconditions for life - simple life, the life of the prokaryotes, the life of naked unnucleated DNA that characterized primitive life on the planet.

Out of that life come eukaryotes, nucleated cells and then complex colonies of cells. Then cell specialization – leading to higher animals, to social animals, leading to complex social systems, leading to technologies, leading to globe girdling, electronically based, information transfer oriented cultures like ourselves. Someone once said, 'what's so progressive about media?' 'It's the spreading of darkness at the speed of light.' It can be, it can be. So this is very interesting that apparently the way the universe works is upon a platform of previously achieved complexity; chemical, electrical, social, biological, whatever. New forms of complexity can be built that cross these ontological boundaries. In other words, what I mean by that is that biology is based on complex chemistry but it is more than complex chemistry. Social systems are based on the organization that is animal life and yet it is more than animal life.

So this is a general law of the universe overlooked by science. Out of complexity emerges greater complexity. We could almost say that the universe, nature, is a novelty conserving or complexity conserving engine. It makes complexity and it preserves it and it uses it as the basis for further complexity. Now, there's more to this than simply that. I think we all observationally could agree what has been said so far. The added wrinkle, or an added wrinkle, is that each advancement into complexity, into novelty, precedes more quickly than the stage that preceded it. This is very profound because if accepted as a serious first principle, it ends the marginalization of our own species to the level of spectator status in a universe that knows nothing of us and cares nothing for us. This is the most advanced position that modern science will allow us –

spectators to a drama we didn't write, shouldn't expect to understand and cannot influence. But I say, if in fact novelty is the name of the game, if in fact the conservation and complexification of novelty is what the universe is striving for, then suddenly our own human enterprise, previously marginalized, takes on an immense new importance. We are apparently players in the cosmic drama and in this particular act of the cosmic drama; we hold a very central role.

We are at the pinnacle of the expression of complexification in the animal world and somehow this complexity which is concentrated in us has flowed over out of the domain of animal organization and into this mysterious domain which we call culture, language, consciousness, higher values – each stage of advancement into complexity occurs more quickly than the stage which preceded it. After the initial big bang there was a period of billions of years when the universe cooled, stars condensed, planetary systems formed and then the quickening process crossed an invisible Rubicon into the domain of animal and biological organization.

Well you see since the rise of western monotheism, the human experience has been marginalized. We have been told that we were unimportant in the cosmic drama. But we now know from the feedback that we're getting from the impact of human culture on the earth that we are a major factor shaping the temperatures of the oceans, the composition of the atmosphere, the general speed and complexity of speciation on the planet. A single species, ourselves, has broken from the ordinary constraints of animal nature and created a new world, an epigenetic world, meaning a world not based on gene transfer and chemical propagation and preservation of information but a world based on ideas, on symbols, on technologies, on tools, on ideas downloaded out of the human imagination and concretized into three dimensional space as choppers, aeropoints, particle accelerators, gene sequencers, space craft, what have you.

All of this complexification is occurring at a faster and faster rate. This brings me then to the second quality or phenomena that science has overlooked, which is the acceleration of complexification. The early history of the universe proceeded with excruciating slowness then life took hold in the oceans of this planet. A quickening of process and evolution but still things proceeded on a scale of tens of millions of years to clock major change. Then the conquest of the land, higher animals, higher exposure to radiation, faster change, species following species, one upon another. Then fifty thousand, a hundred thousand, a million years ago – anyway recently – the crossover into the domain of culture, tool making, myth

making, dance, poetry, song and story that set the stage for the fall into history; the incredibly unusual and self-consuming process that has been going on for the past fifteen or twenty thousand years. A biological snap of the finger. Yet in that time everything that we call human, everything that we associate with higher values has been adumbrated, elaborated, created, set in place by one species – ourselves.

This acceleration of time or complexity shows no sign of slowing down. In fact, within the fabric of our own lives, we can almost daily, hourly, by the minute feel it speeding up, taking hold. It's a cliché that time is moving faster and faster, a cliché of the mass media. But I want to suggest that this is not a perceptual illusion or a cultural mirage – that this is actually happening to the space-time matrix and that time is in fact speeding up. That history in which we are embedded because our life of fifty to eighty years is so ephemeral on a scale of ten to fifteen thousand years – but nevertheless history is a state of incredible destabilization.

It's a catastrophe in the process of happening. It begins with animals kept in balance by natural selection and it ends with a global Internet of electronic information transfer and a language using species hurling its instruments towards the stars. There is no reason for us to suppose that this process of acceleration is ever going to slow down or be deflected. It has been a law of nature from the very beginning of nature; this acceleration was built in. What poses a problem to us as thinking individuals is that the speed of involution toward concrescence is now so great that we can feel the tug of it within the confines of our own lives. There has been more change since 1960 than in the previous several thousand years. There has been more change since 1992 than in the previous thousand years. Change is accelerating. Invention, connection, adumbration of ideas, mathematics, algorithms, connectivity of people, social systems – this is all accelerating furiously and under the control of no one; not the Catholic church, the communist party, the IMF – no one is in charge of this process. This is what makes history so interesting. It's a runaway freight train on a dark and stormy night.

This is why I'm not particularly sympathetic to a conspiracy theory because I can't make the leap to faith that would cause you to believe that anyone could get hold of the beast enough to control it. Conspiracies, of course, we have conspiracies up the kazoo but none of them are succeeding. They're all being swept away, compromised, astonished by new information and endlessly

agonized.

So two factors relating to eros: the movement into complexity and the fact that that movement goes ever faster. The second quality, the acceleration of the movement into novelty, leads me to the third point, which is I suppose more controversial. I am frankly willing to admit that my sensitivity to this third point is based on my psychedelic experience. Science is the exploration of the experience of nature without psychedelics. I propose therefore to expand that enterprise and say we need a science beyond science. We need a science that plays with a full deck. The reason the psychedelic experience is so important here is not some namby-pamby notion that it expands consciousness or it makes you more perceptive or something like that.

That is all true but it isn't strongly enough put. A cultural point of view is like a crystal. You have an amorphous cultural medium, which at certain temperatures will form a crystal of cultural convention if you will. Within the geometry of that crystal certain things make sense and certain things are excluded from making sense. Science is a condensed cultural point of view that is a rigid crystal of interlocking assumptions; assumptions such as matter is primary, mind is tertiary, causality works from the past into the future, so forth and so on. What psychedelics do in terms of their impact on the physical brain and organism of human beings is they withdraw cultural programming. They dissolve cultural assumptions. They lift you out of that reassuring crystalline matrix of interlocking truths, which are lies.

Instead, they throw you into the presence of the great 'who knows.' The mystery! The mystery, which has been banished from western thought since the rise of Christianity and the suppression of the mystery religions. Now the model that attracts me to the psychedelic experience is not that it makes you smarter – a kind of simple-minded idea paradoxically. Or the idea that...[Audience Laughter].

You are paying attention, aren't you? Or the idea that it's some kind of magnifying glass into the personal unconscious – your trauma, your childhood memories, your satanic abuse your parents laid on you, so forth and so on. The model which I like is a geometric model and says simply that since the rise of the Greek alphabet, print, linear thinking and science, we have become imprisoned in a causal universe of material connectivity and that this is a cultural myth as much as believing that we are the sons and daughters of the

great father who got out of his canoe at the second waterfall to take a leak. These are just cultural myths.

What is revealed through the psychedelic experience I think is a higher dimensional perspective on reality. I use higher dimensional in the mathematical sense. Literally, you are lifted out of the plane of cultural assumptions and can look down with a kind of godlike understanding that one obtains when one flies in an airplane over a landscape previously only viewed from the ground. In other words, from the vantage point of the psychedelic experience, the cultural landscape is seen more nearly in its correct perspective – seen as historically bounded, spatially and intellectually bounded. Now it's no coincidence that if you analyze biology, what it is: it's a kind of conquest of dimensionality. The earliest forms of life were probably slimes of some sort, stabilized on a clay surface - immobile, unable to perceive light, with no sense of time – merely a fingernail or a toehold in existence. Then if you look at the entire fossil record, what you see is the evolution of senses. Sensory preceptors and organs of locomotion. The preceptors, the eye, the hand, bring into the cognitive field the sense of things at a distance. Then language provides models for these things at a distance. Similarly, fins, legs, so forth...means of locomotion carry us through space.

This is a journey of dimensionality and essentially what animals are that plants are not are life forms mobile in a very conscious way in the spatial dimension. This is why from the point of view of evolutionary biologists animals are somehow more advanced than plants. Well if conquest of dimensionality is the criteria then notice that we again occupy a special and privileged position in nature because we cannot only run with the best of them, see with the best of them but we can remember and anticipate like crazy. Other animals are not doing this. Other animals may imprint past situations of danger or opportunity but they do not analyze experience and extrapolate it towards the hidden domain of the future. Consciousness is the generalized word that we use for this coordination of complex perception to create a world that draws from the past and builds a model of the future and then suspends perceiving organism in this magical moment called the now where the past is coordinated for the purpose of navigating the future. McLuhan called it driving with the rearview mirror and the only thing that's good about it is it's better than driving with no mirror at all.

What this conquest of dimensionality comes to be in the presence of

psychedelics is an anticipation of the future. We can anticipate the future. We know to within microseconds when the sun will rise. We know within a few percentage points where the prime rate will be in six months. Some things we can predict fairly closely, some things with less precision. But the perception of the future is very important to us. When we marry the need to perceive the future with the psychedelic experience, I believe we come up with data that is very, very difficult for science to come to terms with. This is the third item or really the second item on the list – what science forgot. It's what I call the Eschaton. Now Eschaton is a rare word. Until very recently, unheard of outside schools of theology which I understand were a dying enterprise. Eschaton comes from the Greek word eskhatos, which just means the end. The eschaton is the last thing, the final thing.

It's very important to science to eliminate from its thinking any suspicion that this eschaton might exist because if it were to exist, it would impart to reality a purpose, you see. If the eschaton exists then it's like a goal or an attraction point or an energy sync toward which historical process is being moved. Science is incredibly hostile toward the idea of purpose. If you are not involved in the sciences, this may come as somewhat of a surprise to you. If you are a workbench scientist or a theoretician, you know that this is what's called the problem of teleology. It is because modern science defined itself in the 19th century when the reigning philosophy was Deism and Deism was the idea that the universe is a clock made by God. God wound this clock and has walked away from it. The clock will eventually run down. That theological construct was poisonous to evolutionary theory in the 19th century. So they said we must create a theory of reality that does not require a goal, does not require a purpose, everything must be pushed from the past. Nothing must be pulled toward the future.

The problem with this is that it does not fulfill out intuitions about reality. We can see that evolution, biological evolution, has built on chemical systems. We can see that social and historical systems build on biology. As people with open minds or as open as they can be inside this culture, we nevertheless have this intuition of purpose and it is dramatically underscored by the psychedelic experience, which takes the raw material of your life, your culture, your history and tells you this is not an existential mishmash to be lived out with dignity because there's nothing else to be done with it – some kind of Camusian 'why not' affirmation. It says no. It says your reality is a coherent cosmos and

embedded in your own sense of identity, embedded in your own sense of purpose is a microscopic reflection of the larger purpose that is built into the universe. Now this is not just blowing smoke in the sense of 'it's a nice idea' or its like a religious idea like saying Jesus loves you so feel alright about yourself. It isn't like that. It's a theory about reality that has teeth because reality is actually following the script that this particular version of reality dictates. Reality is accelerating towards an unimaginable omega point.

We are the inheritors of immense momentum in our social systems, our philosophical and scientific and technological approaches to the world. Because we're driving the historical vehicle with a rearview mirror, it appears to us that we're headed straight into a brick wall at a thousand miles an hour. It appears that we are destroying the Earth, polluting the atmosphere, wrecking the oceans, dehumanizing ourselves, robbing our children of a future – so forth and so on. I believe what is in fact going on is that we are burning our bridges; one by one we're burning our bridges to the past. We cannot go back to the mushroom dotted plains of Africa or the canopied rainforest of five million years ago. We can't even go back to the era of Cayuse and six-shooters of two hundred years ago. We have burned our bridges. We are preparing for a kind of cultural forward escape and this question – is there cause for optimism? The answer is, it depends on where you placed your bets.

If you placed your bets on male dominated institutions based on consumer fetishism, propaganda, classicism and materialism, then God help you. You should call your broker. If on the other hand, you've recognized that a life boat strategy is involved here, that what is really important is empowering personal experience, backing off from consumer object fetishism, freeing the mind, empowering the imagination – then in that case, I think you can feel pretty good about what is going on.

You know there is a lot of talk about cultural death and disenfranchisement and it's usually couched in terms of some happy naked people in the rainforest or in Tajikistan making their rugs or milking their camels or something - and isn't it too bad that their culture is being blown up and traded in for mall culture and shopping by remote? But in fact all cultural is being destroyed. All culture is being sold down the river by the sorts of people who want to turn the entire planet into an international airport arrival concourse. That's not the victory of somebody's culture over somebody else's culture. Nobody ever had a culture like that, the victory of schlockmeisterism and crapola over good taste and good

sense.

If I were dependent on the notion that human institutions are necessary to pull us out of the ditch, I would be very despairing. As I said, nobody is in charge. Not the IMF, the pope, the communist party, the Jews – no, no no! Nobody has their finger on what's going on. So then why hope? Isn't it just a runaway train out of control? I don't think so. I think the 'out of controlness' is the most hopeful thing about it. After all, whose control is it out of? You and I never controlled it in the first place. Why are we anxious about the fact that it's out of control? I think if it's out of control then our side is winning.

To me, the most confounding datum of the psychedelic experience is this thing, which I call the eschaton and I want to talk about it a little bit this evening because I think it is the hardest thing for people to grasp about my particular rap. Sometimes I've talked to many of you about psychedelic plants, shamanism, techniques, chemistry, approaches, so forth and so on – I'm approaching this evening as a graduate seminar. I figure everybody has their little mojo kit and their particular way of approaching these things and then the question is, what kind of conclusions can we draw? The conclusion that I draw is – and this is sort of pulling together what I said before – we are central to the human drama and to the drama of nature and process on this planet. The opposition, which is science... Well first let me say this. Every model of the universe has a hard swallow. What I mean by a hard swallow is a place where the argument cannot hide the fact that there's something slightly fishy about it.

The hard swallow built into science is this business about the Big Bang. Now let's give this a little attention here. This is the notion that the universe, for no reason, sprang from nothing in a single instant. Well, now before we dissect this, notice that this is the limit test for credulity. Whether you believe this or not, notice that it is not possible to conceive of something more unlikely or less likely to be believed. I defy anyone. It's just the limit case for unlikelihood that the universe would spring from nothing in a single instant for no reason. If you believe that, my family has a bridge across the Hudson River that we'll give you a lease option for five dollars. It makes no sense. It is in fact no different from saying 'and God said let there be light.' What these philosophers of science are saying is give us one free miracle and we will roll from that point forward from the birth of time to the crack of doom. Just one free miracle and then it will all unravel according to natural law and these bizarre equations that nobody can understand but which are so holy in this enterprise.

Well I say then, if science gets one free miracle then everybody gets one free miracle. I perceive that it is true when you build these large scale cosmogonic theories that you have to have kind of an umbilical cord to start from that is different from all other points in the system. So if we have to have a singularity in our modeling of what reality is, let's make it as modest and as non-unlikely a singularity as possible. The singularity that arises for no reason in absolutely empty space instantly is the least likely of all singularities. Doesn't it seem more likely if we have to have a singularity that it occurs in a domain with a rich history with many causal streams feeding into the situation that nurtures the complexity. In other words, to put it simply – if you have to have a singularity, doesn't it make more sense to put it at the end of a cosmogonic process than at the beginning?

I think this is the great breakthrough of psychedelics and shamanism is that science got it absolutely wrong. The universe didn't begin in a singularity. Who knows how the universe began or even presumes to judge – but the universe ends in a singularity. It has been growing more singular, more complex, more unique, more novel every passing moment since it burst into existence. If that's true then we represent a kind of concrescence of universal intent. We're not mere spectators or a cosmic accident or some sideshow or the Greek chorus to the main event. The human experience is the main event. The coordination of perception, of hope, of dream, of vision that occurs inside the human heart/mind/body interface is the most complex phenomenon in the universe. Now even the physicalists acknowledge that the human neo-cortex represents the most densely ramified matter known to exist in the biological world.

You don't have to be rocket scientist to see that human society, human history, human art, human literature, represent things for which there is no analog in the world of wasps, groundhogs, killer whales and so forth and so on. In our species, complexity has turned inward upon itself and in our species. Time has accelerated. Time has left the gentle ebb and flow of gene transfer and adaptation that characterizes biological evolution and instead historical time is generated. So I believe that science and its reluctance to deal with the psychedelic experience and the way in which science has used the law to suppress its rival in this case arises out of a profound discomfort on the part of science about this future state of complexification that is clearly the grail, the dwell point, the end point of the human historical process. Not one of us I think can imagine that history could go on for another thousand years. I mean what

would it look like? At the current rate of population growth, spread of epidemic disease, rate of invention, connectivity, depletion of resources, the atmosphere – it is impossible to conceive of another thousand years of human history.

History then is ending. History is a kind of gestation process. It's a kind of metamorphosis. It's an episode in the life of a species. If you think of the simple example of metamorphosis, that of caterpillar to butterfly, we all know that there is this intermediate resting stage where the caterpillar is for all practical purposes enzymatically dissolved and then reconstituted and an entirely different kind of organism with different physical structures, different eyes, different legs, a different way of breathing, with wings where no wings were before, with a different kind of feeding apparatus. This is what's happening to us. History is a process of metamorphosis. It's a pubescent stage. It begins with naked monkeys and it ends with a human/machine planet-girdling interface capable of releasing the energies that light the stars and it lasts about 15,000 or 20,000 years and during that period, the entire process hangs in the balance.

It's a period of high risk. It's like what a butterfly is doing in the cocoon or what is happening to a child in the womb. It's a gestation process where one form of life is being changed into another. Well, this would all happen naturally and with a great deal of anxiety I imagine as history builds to it's ever more climatic and horrifying crescendo and we would all be ignorant or very baffled about what's going on were it not for the institution of psychedelic shamanism. Remember I said that what is dissolved are the crystalline structures of cultural assumption. Well one of the strongest symmetries in our cultural crystal is the symmetry that gathers around the concept of past and future. The shaman actually rises into a domain where past and future are different areas on the same topological manifold. This is not a metaphor. It's what's really going on. If you think about shamanism in its classical guise for a moment – it is about predicting weather, predicting game movement and curing disease.

If you had a prescient or extraordinary understanding of the future, each one of us would be able to do these things. Predicting the weather, you just look into next week and there it is. Predicting the movement of game, same deal. Curing the sick actually involves very judicious choice of your patients with a pre-knowledge of who will get well and who will not get well. So it's as though the members of the culture are imprisoned in linear time and the shaman is not. And why not? Because the shaman has perturbed the brain states sanctioned by the culture, sanctioned by its educational processes, its habits, its attitudes

and into that vacuum created by the perturbation by these cultural values rushes the raw unanalyzed datum of reality. This is what Aldus Huxley called removing the reducing valve of consciousness. Suddenly culture is seen to be a relative phenomena; the stockbroker no different from the rainforest shaman, each somewhat similar to the Trobriand islander or the Eskimo.

Culture is simply clothing upon the human experience but the human organism outside the confines of culture in a direct relationship to nature transcends time and space. This was a fact, I believe, that was known in pre-history and in fact was the source of Paleolithic values which were not material, not linear, not surplus oriented, not class oriented, not power oriented but rather oriented towards a kind of egalitarian partnership in an environment of great material simplicity. Human beings lived like that for probably a half a million years with poetry, with dance, with mathematics, with magic, with story, with humor but not with the paralyzing and toxic artifacts of the late evolving, machine worshipping, monotheistic, linear, phonetic alphabet, tight ass straight culture that we are a part of.

So now at a kind of moment of great cultural challenge and dynamic for western civilization which has for a thousand years called all the shots and shoved itself down everybody's throat whether they liked it or not, in the last hundred years, through the science of anthropology, ethnography, ethnomedicine and botany, the news has arrived that these "primitive" people are in fact master technicians of journeying into a world of the neurological imagination. A world we didn't even know exists. A world that is as distant to us as the world at the heart of the atom is from the rainforest fisherman. Because our own cultural values seem a little shoddy at this moment, those on the fringes of western civilization have begun to seek alternatives, begun to look at alternative religions, yoga, Tantra, Buddhism, Zen, whatever. Alternative approaches to diet – vegetarianism, macrobiotic, so forth and so on, and alternative approaches to authentic experience – which means psychedelics.

In the early stage of psychedelic involvement, everyone was sort of flying under the banner of hands on Freudianism or hands on Jungianism. 'We're going to see those archetypes, we're going confront those sexual repressions, we're going to journey into those traumatic childhood memories.' Now it's understood I think that those metaphors were fairly inadequate and that actually we stand on the brink of an unexplored landscape of planetary size. The world of the high Paleolithic, which is a Gaian world – a world of feeling, not analytical,

intellectual constructs but a world of empowered feeling, empathy and intuitive understanding. An understanding that doesn't arrive in a context of Greek logic but in a context of animal knowing in the authentic mode of the body.

So just to bring it all around here. The great exhibit, which we must always keep in front of ourselves and our critics, is the mystery of the human mind and body. No one knows how it is that I can command my hand to make a fist and that it will do that. That's mind over matter. That's the violation of every scientific principle in the books and yet it is the most trivial experience that any of us have. We expect to command our body. We expect the mental will to order the monkey flesh into action and it will follow. The body is the nexus of the mystery of life and our culture takes us out of the body and sells our loyalty into political systems, into religions, into inanimate objects and machines, collections, so forth and so on.

The felt experience of the body is what the psychedelics are handing back to us. That's why it's called escape because it's escape from HBO, from walking the mall, from seeing what's on the tube, from consuming trash media. It's escape from all of that into the authenticity of the body. This is why sexuality is so edgy in this society. They'd make it illegal if they could but figure out how. It's the one drug that they can't tear from our grip, so they lay a guilt trip about it.

But sexuality and psychedelics, by carrying us back to an authentic sense of the body, carry us back to the domain of authentic values. More and more, the message that people are getting as they avail themselves of the psychedelic experience is that it is not a journey into the human unconsciousness or into the ghost bardos of our chaotic civilization. It's a journey into the presence of the Gaian mind. That the earth is a coherent whole. It is a thinking, feeling, intending being that in terms of our value structures, it would be foolish to image as anything other than female. When cultural values, created by male dominance, science and linearity and so forth and so on; when those values are dissolved, what is waiting there is this incredibly poignant experience of matrix – what James Joyce called the mama matrix most mysterious – nothing more than our bodies and the earth out of which our bodies came.

History as we have lived it in the west has been a turning of our back on that. Now history has failed. Western cultural institutions having become global cultural institutions now show themselves to be inadequate to inspire, lead or carry anyone into a future worth living in. At this moment then, this reconnecting

to the Gaian mind becomes a kind of moral imperative. So this whole drug issue is not an issue even about criminal syndicates or about untaxed billions or about the mental health of our youth or any of that malarkey. I mean my God, the most destructive known to the species are pedaled on every street corner without restriction.

The real issue is what kind of mental worlds shall people inhabit. What kinds of hope shall be permitted? What kind of value systems shall be allowed? The value systems that aggrandize the possessions of things, the tearing up of the Earth, competition, classism, racism, sexism, have led us to the brink of catastrophe. Now I think we have to abandon western cultural values and return to the deeper wisdom of the body in connection with the plants. That's the seamless web that leads us back into the heart of nature. If we can do this, then this very narrow neck of cultural crisis can be navigated.

Very little of the past can be saved. The architectonics, the machines, the systems of monetary exchange and propaganda, the silly religions, the asinine aesthetic canons, very little of that can be saved. What can be saved is the sense of love and caring and mutuality that we all put into and take from the human enterprise. You know there's a grateful dead song that says, 'you can't go back and you can't stand still, if the thunder don't get you, then the lightning will.' We now hold through the possession of these psychedelics, catalysts for the human imagination of sufficient power that if we use them, we can deconstruct the lethal vehicle that is carrying us toward the brink of apocalypse. We can deconstruct that vehicle and redesign it into a kind of starship that would carry us and our children out into the broad starry galaxy we know to be awaiting us. But it's a cultural test. Nature is pitiless. Intelligence is a grand experience upon which a great deal has been risked. But if it proves inadequate, nature will cover it over with the same kind of cool impunity that she covered over the dinosaurs, the trilobites and the crossopterygian fishes and all those other folks that came before.

So what we must do I think is see our future in the imagination, catalyze the imagination, form symbiotic relationships with the plants, affirm archaic values and spread the good news that what is out of control, what is in fact dying, is a world that had become too top heavy with its own hubris, too bent by its own false value systems and too dehumanized to care about what happened to its own children. So I say good riddance to it. Bring on the archaic revival and lets create a new world. And that's it!

Ethnobotany and Shamanism: Psychedelics Before and After History

Day Month 1988

California Institute of Integral Studies

Description

- [Video Link](#)
- [Transcription](#)
- [Other links](#)

The, uh, title of the, uh, weekend that I'll be giving here at CIIS is 'Ethnobotany and Shamanism: Psychedelics Before and After History'. This is the third year that I've lectured at CIIS. A course which, uh, the core content is a survey of the psychedelic plants of planet Earth and the cultures that have used them, and then discussion of their chemistry, uh, geographical distribution, uh history of usage, impact on the growth of ideas and historical institutions, and so forth. It's basically an effort to pack a psychobotany course into a weekend. And it is always preceded by this Friday night lecture in which I intend to give, uh, an overview and a sort of state-of-the-art report on psychobotany and why anyone should, uh, place any importance upon it. So I sort of think of this lecture as uh the philosophical implications of psychobotany: past, present, and future. So that is the theme that will guide the, uh, lecture this evening.

For me personally, it has been an experience of, uh, never being able to really anticipate the direction in which this line of thought would develop. It seems to have a life of its own, uh, a richness of its own, uh, that is not predictable by the conscious mind. A few--uh, about three years ago, I began trying to, uh, think about feminism and what role it had, if any, to psychedelics and the role they had played in shaping culture. And, uh-- It, it seemed at the time... to my critics, and to some degree, to me, that it was almost a kind of opportunism. S- It's such a safe issue to clothe yourself in, that, uh, no matter what you're doing, if you can make it part of the feminist agenda, you, you somehow have become inviolate. It now seems to me that, um, this thread in thinking about the sh- impact of shamanic, and specifically, visionary shamanism's impact on culture, it has grown in my own mind, uh, more and more important. The rise of the consciousness of Gaia, which is the notion of the planet as, at le-, at the very least, a self-regulating system, and, uh, possibly, at the other end of the scale, as actually a kind of conscious entelechy--a kind of super-being or oversoul that, by the control of planktonic, uh, uh... populations on the surface of the sea, can regulate rainfall and thus control the density of vegetation on the continents, and thereby regulate the composition of the atmosphere; and by a series of interlocking, interwoven feedback loops, actually create a kind of biological or organic homeostasis, which is the precondition for the evolution of, uh, advanced organisms. And this idea of Gaia, uh- or of perceiving the Earth as a living organism, has been, uh, I think the intellectual or philosophical centerpiece of what feminism, uh, has done with its agenda in the last, uh, 15 years or so. But this enthusiasm for the goddess, this enthusiasm for the seamless web of life, has not yet clarified itself as a philosophical intention sufficiently to draw certain obvious conclusions about the relationship that it should have to shamanism, number one, and most specifically to psychedelic

shamanism.

Now, why? What is the connection there? Well, a- what I would like to suggest is that the condition of cultural neurosis, in which we as moderns reside, might operationally be described as, uh, ego-inflation; and that specifically it is the masculine ego that is inflated. Now, the cause for this has been sought by various different commentators on culture, but none of them have suggested that the, uh, tumorous growth of the masculine ego as a cultural and individual institution [laughter], uh, is specifically due to the absence of, uh, the dissolving agency of psychoactive ecstasy induced by plants.

[laughter]

Do you - Do you see where I'm going with this?

[laughter]

So that, in fact, the modern enthusiasm for shamanism and, secondarily or in a connected mode, with psychedelics, is actually an intuitive feeling-back-toward this state of non-neurotic empathy that characterized archaic time. And that is what has specifically been lost by the descent into the historical process. And this notion: that there is... that something was lost which is tangible, then allows us to set a radical reconstructive agenda for society. Because, if what was lost was tangible rather than, say, the good will of God Almighty, which is not something tangible--and that's the culture myth, that we lost the good will of God Almighty--so we had to leave Eden and descend into toil. Uh. But notice that if we take the story of Eden more seriously, more literally, what we're dealing with is a, uh, struggle over use and abuse of available, uh, psychoactive compounds in the endemic environment. And that, in fact, the challenge to Yahweh was the challenge of the woman who sought to eat of the fruit of the Tree of Knowledge, to have the knowledge of good or evil, which would place the- the man and the woman on an equal footing with God. And this aspiration to gnosis, this desire to transcend the ordinary and penetrate into the realm of existential truth, was enough to get them canned out of Eden.

Now, I want to cast further back into time and sort of lay the groundwork for this case about the, uh, the male ego. But before I do that, I want to ask you to, uh, review in your mind for a moment certain curious facts about the religions of Western culture--the tradition of monotheism as its practiced in the West. First of all, this is the only--and any student of myth who wishes to correct me is welcome to do so--this is the only theogamy, the only god-system that I know of in which, uh, the head honcho has nothing, absolutely nothing to do with women--does not have a mother, [laughter] does not have a consort, does not have a daughter. It's a locker room religion from the get-go.

[laughter]

Now, it was ,uh, the, uh, insight of Carl Jung and his school, uh, to understand that myths are narcissistic reflections of our own aspirations as individuals and societies. And when you look at the monotheistic hypothetization of God, with omnipotence, omniscience, all power, all moral suasion--everything is held in the hands of the father god, who is characterized by wrath and an obsession with, uh, punishment and with the carrying out of, uh, what are essentially punishments related to taboos--in other words, sins which are not clearly sins for any reason other than that they are forbidden. And this model of God became the model for the personalities, the atomic personalities, that were creating the civilizations that worshiped in this fashion. In other words, that became a way to be: omniscient, omnipresent, brooking no opposition, swift to punish, stern in all demands; so forth and so on. And this shift--and it was a shift--because the pre-pottery neolithic level in the Middle East seems very clearly and generally to be a goddess culture, a religion based on, uh, on pastoralism and to ga- a large amount of gathering integrated into hunting. That goddess-oriented, wandering, pastoral religion gave way to the fixed-settlement, neolithic, male-dominated model that, in its many adumbrations, has persisted into the present moment.

Well, as I said, I believe the reasons for this lie further in the past, in the moments of human emergence that occurred 15-, 20,000 years before the appearance of the goddess cultures in the ancient Near East. It-- The, the critical moment, I believe, uh, occurred in Africa during the process of the desertification of the African continent. The previously arboreal pack-hunting p-, er, arboreal primates descended onto the grasslands, which was an environment of increased nutritional pressure. And there, bipedalism, binocular vision, the opposable thumb--which had probably existed earlier--all these things were channeled into creating a highly efficient, omnivorous, pack-hunting creature. And the the key word here is 'omnivorous'. One of the great and unexplained lacunas in modern evolutionary theory is that evolutionary primatologists have not made any attempt to discuss the impact on human evolution of changes in diet, which were, uh, uh, swift and unusual in this evolving grasslands situation.

Let me explain what I mean: uh, most animals have a very selective and restricted diet; so consequently, whatever the chemical composition of that diet, over millions of years of exposure, the animal forms, uh, a relationship of [it-] of adaptability to whatever its food source is. When a animal population becomes omnivorous under, uh, pressure on the availability of nutrition, suddenly the animal begins to test for possible food sources in the environment. Well, this testing for food sources in the environment introduces a vast number of mutagenic compounds into the body- into the bodies of these animals. Not only psychoactive compounds but, uh, depressants, stimulants, things which interfere with RNA transcription, things which, uh, enhance or suppress the immune system, things which retard or clarify vision, things which suppress appetite, things which, uh, interfere with the estrus cycle. Uh- remind yourself for a moment that Ortho-Novum and the birth control pills, are, uh, all derived--the, the compounds in those pills are derived from *Dioscorea* plants grown on hu-, in huge plantations in Mexico--uh, a kind of tropical yam. Well, yams in the tropics are now and always have been a major food source for foraging primates. And yet some varieties of yams contain so much of these, uh, uh, hormone-like substances that they send the reproductive cycle and ovulation and all these things just into a tizzy.

Well, you can imagine the impact, the evolutionary speed-up that this decision to go omnivorous would have on these, uh, evolving primates. And I maintain that, uh, the prolongation of infantile traits in human beings, some of which persist throughout our entire lives, such as our, uh,--that too. I was--

[laughter]

[laughing] -I was thinking of, uh, our our relative hairlessness and stuff like that, but--

[laughter]

-you're right. It's a puzzle. Every generation thinks that the generation which, uh, uh- f-, which it spawns is more infantile yet than it was. And somebody wrote me a letter recently suggesting that this was a good thing, and it would end with us simply skipping the 'life-in-3D' phase. And you would just go from fetus to chip and skip over, uh, this whole messy three-dimensional, cultural phase. Um. But I digress.

Note: The talk available on the Psychedelic Salon and in the TMK audio archive torrents was mislabeled and out of order – I have restored the transcript of the talk to its order as presented in November of 1988.

Because this is a small group and probably self-selected for high interest in these subjects, as much as possible you should direct me toward whatever your special concerns are so that for each person, whatever their slant, there is a reasonable payback in information. There may be areas where I am disappointing or unhelpful but usually then I can point you toward somebody else or some source.

The first thing this afternoon is that I'll bring in some books to show you, ten or fifteen source books that would help you in researching any aspect of this, whether you are interested in it academically, or for personal spiritual growth, or whatever. It's very important to be informed. This is an area where it's very hard to bluff it, because on one level it's a branch of medical science. What we're talking about is folk pharmacology, and you really should understand certain things about pharmacology, certain things about physiology, because your life may come to depend on it in some situations. It's not casual; you want to be able to assess risk and make intelligent choices.

I'll say just a little bit about my own interest in all this, or how I got into it. I don't know, I mean one creates a false history when you look back into time to try to explain how you got to where you are, or at least I do. Trying now to understand how I came to be involved in the psychedelic experience, it seems to me that what it really requires is a love of the peculiar, of the weird, the bizarre, the outré, the freaky and unimaginable. I don't give great credence to astrology, but I am a double Scorpio, so I'm told that this kind of thing predisposes one for 12th house activity.

Several times in my life I've gone through these kinds of revelations where everything seemed to change so profoundly that I could hardly recognize who I had been before. I noticed this happening the first time around the time I was 7 or 8. Nature and the imagination seemed to be the precursors to involvement in the psychedelic experience, so I was a rock hound, a butterfly collector, a rocket builder, a connoisseur of explosives and all of this sort of thing. While my peers were off playing little league baseball I was back in the hills digging out trilobites and tracking down moths and stuff like that. Then science fiction was a tremendous stimulus to my imagination, because it seemed to say that anything you can imagine is fair game, anything that you can conceive of can be treated as a reality. I was also raised in a Catholic household, so my whole thing was to build cynical resistance to the spirit. I was an atheist, a Marxist, an existentialist, a rational materialist — a pain in the neck, basically.

In all of that, somehow I began reading Aldous Huxley, the social novels: *Antic Hay*, *Chrome Yellow*, these comedies of manners of British academic society. I was 12 or something, but I always drove myself to read beyond my level. This led me to *The Doors of Perception*. I had read *Brave New World*, which is an anti-drug dystopia, a nightmarish world of plastic never-grow-old people who take tranquilizers every time there's a hint of any deep emotion or any kind of anxiety. The motto was, "A gram is better than a damn!" and you could just for a quarter, anywhere, get one of these pills that just put you right back into being happy and cooperative. And so Huxley, who was a very concerned person, very interested in the fate of 20th century society, went from this dystopic vision of drugs to *The Doors of Perception* and *Heaven and Hell* in which he describes experiments with mescaline that totally turned him around and convinced him that these medieval mystics that he was so fond of, Meister Eckhart, William Blake and San Juan de la Cruz and so forth, were actually describing the same reality that he was getting into.

So I wanted to pursue this, and this was 1962 or something, I was about 14 years old. Then a few months later there were stories in the newspaper that morning glories were being abused for their psychedelic effect. There was a bindweed that grew locally, so I went tearing out and gathered half a peanut butter jar of this wild morning glory and took it home and ground it up and took it. Of course, nothing happened, but in the hour before it failed to come on I sat quietly and fearfully and examined my mind from that point of view for the first time in my life. In other words, from the point of view of watching it to see if it was changing in some unpredictable way. Actually, though the morning glories were totally inactive, in that hour of watching I did observe some interesting false positives that would come and go for a few minutes.

Then a few months later I got my data a little more together and learned that it was a certain species of morning glory and that you had to buy the seeds from a seed company. Then I discovered what it was, though not the full-blown psychedelic experience. By this time I was in southern California going to school, and a friend of mine and I would go out into the Mojave desert and grind up low doses of these morning glory seeds, because we didn't know what a dose was, really, or what actually was supposed to happen, because if you read Huxley it's pretty high-flown language, it's all about radiance and significance and existential validity flooding into the rose. Well, once you're looking at a rose and posing the question, "Is existential validity flooding into it?" you don't have anything to measure it about. We would go out into the Mojave and take these morning glory seeds and observe shifts in the apparent significance of things. Everything would appear somehow more pregnant with potential meaning. Then, in fact, if you would close your eyes in that situation there would be the beginnings of hypnagogia: drifting lights and undulating colored patterns, grids and laceworks, all these things which are the preconditions for the psychedelic experience.

It wasn't long after that that I went to Berkeley in the fall of 1965, and LSD was available a few months later, DMT was available. I was just stunned and have never lost that sense of profound astonishment that such things could exist. I mean, DMT seems to argue — convincingly, I might add — that the world is made entirely of something that for want of a better word we would have to call "magic." Things are not what they appear, not *at all* what they appear. What we call reality is some kind of utterly provisional construct that if leaned upon too hard can just fly to pieces before your startled eyes. Then the question is, "What are the implications of this? What lies behind it?" So I, as most people do, looked to tradition for some kind of guidance about what this was, and read Jung and read Mircea Eliade and saw parallels, but not a clear congruency.

What I saw in the iconography of Tibetan Buddhism seemed to me to bear certain kinds of parallels to the hallucinations that I had by that time glimpsed in LSD states. So I studied the Tibetan language, went to Asia, and learned that the iconography of Tibetan Buddhism is a rip from the pre-Buddhist shamanism of Tibet, which has been there since the Stone Age. Buddhism only entered Tibet in the 7th century with Padmasambhava, and all the iconography was taken from the autochthonous indigenous shamanism that was there. I didn't find in these yogis and lamas what I was looking for, which was direct experience of these realities. Tibetan Mayahana seemed tremendously sophisticated in its analysis of states of mind, but operationally it was not coming anywhere close to what these psychedelics were able to deliver. Because I was fortunate enough to have wise and well read friends, I knew that this tradition was alive in the Amazon. I went from Nepal to India throughout Malaysia, Thailand and Indonesia, ostensibly making my living as a professional butterfly collector but also using that as an excuse to go to these extremely rural and tribal situations and observe what was going on. I concluded that it was far in the past, or far removed, that it was something that had retreated to the status of a myth in most cultures.

Then in late 1970 I went to the Amazon and very quickly, through using mushrooms and through using ayahuasca, learned that there it is accessed, the traditions are alive and the attitudes were simpatico with my own. There were no lineages, you didn't have to pledge eternal fealty to some character. They were exploratory in their approach, they were open-minded, everybody admitted that nobody knew what was going on with it. Yes, they could cure, yes, they could balance their societies and act as paradigms of behavior to other members of their tribe, but what these shamans really liked to do was get together and puzzle over what the hell it is, and how can it be? They were like scientists, they were like explorers, they didn't have a myth that encompassed it. They were technicians of myth which they presented back to their societies, and this is something that is very important to realize about shamanism as it is being packaged and sold in this society.

A shaman is primarily a theatrical entertainer. They are not putting on the show for themselves, but in this society people actually become actors on their own stage. I maintain from spending time with them that the shamans do not believe in the powers of magic words, crystals, healing darts, and so forth and so on. They manipulate these things the way a stage magician manipulates rabbits, hats, saws and boxes with women inside them. They understand what it's for and how it works, and these things are manipulated to create an effect on other people, but the shamans understand that the real magic is the magic of sign, symbol, and language, and that by manipulating cueing, by manipulating expectation you can lead people to a fundamental confrontation, not only with themselves but with the Other.

It is no easier for an Amazonian Indian to come to terms with these things than it is for a native of Manhattan. Ultimately, this coming to confront the Other is coming to confront the mystery of being. Not as a phrase, "mystery of being," I mean we all give lip service to that — the mystery of being is everywhere, it's in the trees, the stones, the elevators, the life of the city, the life of the country, everything is radiant with the mystery of being — this is some kind of gloss. What I'm talking about is the mystery of being as existential fact: that there is something that haunts this

world, that can take apart and reduce every single one of us to a mixture of terror and ecstasy, fear and trembling. It is not an idea, that's the primary thing to bear in mind, it is an experience.

As we went around this morning a surprising number of people spoke to it as an experience. This is what makes the great distinction between the shamanic, pragmatic approach and what I called last night the political ideologue approach: that we are not working here from theory, our theories are the weakest part of what we say. What we are working from is the fact of an experience which we need to make sense of. Now, most of these Other-oriented experiences, which are hard to keep track of or make sense of, cannot be commanded freely. They are more in the realm of: you are traveling in a foreign country and you contract a terrific fever and you fall into a vision and you have deep awareness and realization about the nature of life. This is not an experience that can ever be repeated; or you're alone in a wilderness and you confront a flying object in the sky which seems to trigger strange bursts of thought in yourself; this cannot be repeated and triggered on command. So only in the context of the psychedelic experience and the willed decision to act can you enter this arena of repeatedly going to meet the experience of the Other. It is a very, very bizarre enterprise. It is not that if we do it enough times, we will understand it, or become comfortable with it. It is not in its nature to be understood, and it is not in its nature to accommodate itself to us. Rather it's that we have discovered another dimension, almost

in the same way that Europeans discovered another world only 500 years ago.

In 1992 we will celebrate the 500th anniversary of Columbus' discovery of America. Now, notice that when Columbus set out from Spain there was a large body of intelligent opinion which believed that he was sailing over the edge of the world. Literally, that he was sailing out of mind. Instead, what lay at the end of that voyage was real estate, immense amounts of real estate, and we have come to terms with that and in fact now inhabit what 500 years ago was not even on the maps. It was in the unconscious; now it is the center of the global economy. In the same way that these European navigators began to have this intimation that the world was a wrap-around — that's what it means to say that the world is round. It means that you can get back to where you started from by going away continuously — in the same way, I think we are on the brink of discovering that you can start in three-dimensional space and time, move off in a linguistic vehicle, and find your way back to the place you left from. This means that what we call three-dimensional space and what we call the imagination actually have a contiguous and continuous transformation from one into the other, and this is big news. This is entirely goes against our Cartesian expectation of thoughts inside, world outside, objects outside, perceptions inside. This is actually nothing more, this inside-outside thing, than an artifact of European languages, and yet

we take it to be how God made the world, basically, because we are so embedded in our language that we literally cannot cognize reality without it.

We cannot cognize reality without our language, but in the psychedelic state somehow this happens. Somehow syntax is replaced by hypersyntax, linguistically-moderated and modulated perception is replaced by perception in the raw; not coded and sculpted and sifted for culturally validated meaning, but rather just the full hit. This is tremendously disorienting, but it is also tremendously liberating, because that's the full deck. That's when you have full command of the options available within the matrix. If you play the cultural game it's like playing only with clubs, or

playing only with the red marked cards. You have to play with a full deck, and that includes this prelinguistic surround in which we are embedded.

Why is it so emotionally charged for us? In other words, why can the shamans go into this dimension and heal or divine, see into the future, or, in a sense, see into the past by discovering who stole whose cow, or who is sleeping with who, all these things that shamans are concerned with? What is this ground of being that we discover by dissolving the cultural machinery of cognition? I think it is simply reality unpackaged for a historical epoch. In other words, reality uncompromised by the need to be culturally efficacious and useful. This is precisely what we need to throw light on our culture crisis, because the models that we have used to sanction information that is culturally useful have given us information which is toxic. We have actually created a toxic relationship between ourselves and nature. We have pursued avenues of questioning, the feedback

from which has given us an overpopulated, polluted, ideology-obsessed, unresponsive planet.

One of the things that's so striking about shamanism in the native context is the absence of mental illness, the absence of serious neurotic patterns of behavior. This is because this translinguistic reality is allowed to work its will through shamanism, is allowed to regulate the society. In other words, our model of how society works is that we are at war with nature and we must push it back, seize a beachhead, fortify our position, dig in — these kinds of metaphors, metaphors of capture and control — while the shamanic approach is that we must communicate with nature in order that nature can communicate with us, in order that we may know what should be done. Shamanism as classically practiced is hunting magic, weather magic, healing magic. In other words, ways of getting into the evolving of state-bound system-patterns within nature. Weather, we would presume, can to some degree be predicted by looking at past weather states. Hunting can to some degree be predicted by looking at the migration and movement of game in past situations. So shamanism then becomes a kind of mnemonic exercise, where by keeping track of what has happened you can build up a model of what will happen. Originally this was done through great mnemonic feats of memory, like the Yugoslavian folktales singers or the Homeric epics or the people who sang the Edda. These were works of hundreds of thousands of lines that were

passed down virtually without change over millennia.

There's a strange phenomenon, at least in the evolution of cultures and perhaps more generally, which is that every step into freedom contains within it the potential for greater bondage. Here's an example of what I mean by that: women in charge of the gathering phase in hunting-gathering cultures developed language, I believe, because they had great need of the ability to make fine distinctions. In other words, here you have 50 grasses, small herbs, shrubs, roots, fruits, berries, seeds, inflorescences. Some of these things are poisonous, some of these things are foods, some grow in the spring, some in the fall, some along the river courses, some on the hillsides, so forth and so on. A great many descriptive dimensions come to bear on this, so consequently I think that women are to be held responsible for the evolution of language, in order to discuss the extremely important matter of what is good to eat and what is not, where do you find it, how do you preserve it, what do you combine it with and so forth and so on. Men, on the other hand, who were in charge of the hunting — because of the different body type and bladder

capacity and so on — the premium there was placed on silence, stoicism, being able to stalk and for days make no noise, possibly, and to just sort of integrate into this silent kind of thing.

This same kind of freedom which binds occurred in the shamanic effort to steer culture by mnemonic means, because eventually even the greatest of the shamanic memory artists were overwhelmed by the amount of data, by the size of the epics, by the sheer length of these genealogies, so then symbolic notation is brought in. Shamanism turns into scribecraft, signifying magical forces turns into writing down their names, and there is a tremendous binding, a compression, a limitation of freedom because the strategy of freedom became too successful. This reaching beyond ourselves is a process that is continuous. We transcend a state, we then lock ourselves into the transcendent state, it becomes defined by its own set of limitations and we move beyond it. This kind of bootstrapping mechanism has been at work throughout the evolution of

language, throughout the evolution of shamanism.

Now we have come to a similar kind of bind having to do with the bankruptcy of analytical analysis and rationalism, which has led us to a pretty complete mastery of inert matter, but when pushed into the quantum realm, suddenly contradictions begin to multiply and impossible conclusions force themselves upon the investigator. What this means is that rationalism has simply reached its limit. There is no reason to think that it doesn't have a limit. It was just the inflated fantasy of the 17th century that thought that God's mind must work like the mind of a

watchmaker. In fact, what with chaos theory and catastrophe theory and numerous other non-equilibrium partial differential processes in nature, we now know that nature is extremely unpredictable, highly variable, not subject to analytical understanding except in very limited domains.

This understanding that quantum physics has brought the physicists and that the psychedelic state has brought the people who pursue that has not fed back into the mainstream of society. We're still living in a male-dominated, object-dominated, subject-other kind of world model, a world model inherited from the 18th century even more than from the 19th century. Well, is it going to kill us? Is it too late? What can we do about it? This is what I talked about last night, about the archaic revival as the notion of making a sharp left turn away from the momentum that the historical vehicle wants to follow, which is thanatotic, don't kid yourself. You cannot have three religions stacked up on top of each other, stretching back 4,000 years, pursuing this monotheistic vision which ends in an apocalypse without building a tremendous morphogenetic predilection

for the apocalypse.

Our demonic investigations into matter have led us to create the machinery to produce the apocalypse. It was interesting, somebody said of the Reagan administration — this was when James Watt was running around saying that we didn't have to save the trees because Jesus was coming anyway, so it didn't matter — someone said, "The jerks want to be in the Bible," and that's precisely the historical situation, the jerks want to be in the Bible. In other words, every petty potentate from Frederick Barbarossa to Ronald Reagan has secretly believed that they were living in the time of the Antichrist and would participate in the scenario of the Book of Revelations. I mean, this is psychosis if you meet it in a person; if you meet it in a culture it's called religious piety and conviction. It has been going on so long that it has actually created a very narrow neck in the historical process that cannot be avoided. We now have no choice in the matter of business as usual; there will not apparently be business as usual. There will either be an apocalyptic destruction of the planet, a kind of Ragnarök, a Götterdämmerung, a complete storm of fire brought on by the eruption of the psychic mythologies that have driven the matter-centered, monotheistic, male ego culture, or there will be a plucking of victory from the jaws of that defeat, and not an apocalypse but a kind of cultural millennium, a complete breaking out of the pattern

into something else.

Some of you may know Riane Eisler's work *The Chalice and the Blade*. If you haven't read this book I recommend it to you — for psychedelics people, for feminists, for people concerned with the state of society, this is certainly an important book. What she's saying is that it is not true that the story of the human race is the story of a pendulum swing between patriarchy and matriarchy, each with its own flaws. Rather it is that human beings have always lived in an equilibrium style partnership society, except that during the last 8,000 years this pattern has been disrupted by the rise of the male ego, the suppression of the Logos-like connection to nature and a certain evolutionary path taken in the epigenetic coding of information, in other words, the phonetic alphabet. The phonetic alphabet, which has no reference to the icon of the things expressed, is utterly cool, utterly unable then to give you any feeling of engagement with what is being described. This gives permission for analytical science and the detachment of rationalism and the sorts of philosophies that have created the tremendous split between head and heart that characterizes the

political systems of the last several hundred years.

This thing which the shamans are contacting, which we can call another dimension, hyperspace, the collective unconscious — whatever it is, it is the ground of our becoming. The only way to unhitch ourselves from the ego is to open pathways of communication to this invisible field of intentionality in which we are embedded. This is a very difficult task because the culture in which we live denies that this thing even exists. If you start saying that you feel the heartbeat of the planet, or that you are in resonance with the local ecosystem, or still worse, if you say that you hear the voices of elves and fairies, this is automatically psychosis. You have to be observed, sedated and cured because you are participating in a model of reality that is not consensually validated. Nevertheless, I think that what we're trying to do with meetings like this is empower this particular meme, empower this idea. I can't remember who developed the idea of memes, but it's basically the notion that ideas compete with each other the way animals and plants compete in an ecosystem, that ideas adapt and spread, occupy niches, defend territory and redefine

environments, and so my mention last night of the woman who said to me, "I thought I was crazy until I heard you speak," for me that is really the nugget of this work and the most satisfying kind of comment that anybody could make.

What has happened since the 1960s is that the straight people all went off together — and by this I don't refer to sexual preference, I use "straight" in the earlier sense — they all went off and became very weird together, with their golden Mercedes and their Picasso ceramics and all that. The freaks all went off and became strange alone, each apart in our own way, because community was shattered, affinity groups were suppressed, people went all kinds of directions. Now the people who went through the '60s, approaching or in their 40s, have had 20 years to see how they like that kind of alienated aloneness, and so this morning as we went around I heard many people saying that they had done these things in the '60s, but not for a long time, and now they were returning to it. I think this is because it finally dawns on you that this may be the only shot

you've got at it. Reincarnation is fine, past lives are fine, but we're all getting daily older and we don't know where we came from, what lies beyond the zygote, and we don't know where we're going, what lies beyond the pine box. Who can say?

Out of the incredible mystery of whatever the universe is, a microsecond of opportunity against impossible odds has sprung into being. We are embedded in that moment of opportunity, so what are you going to do with it? Are you going to sweep up around the ashram for 30 years and

Terence McKenna

then decide that that was a mistake, or are you going to just give yourself over to the arms of holy mother Church for a lifetime? I mean, people do this. You cannot escape making some kind of commitment to something. Nobody gets through life without being asked to sign up, either in their own club or somebody else's. The mushroom said to me once, in the way that it does when it delivers these aphorisms, it said, "You must have a plan. If you have no plan you will become part of somebody else's plan. You either have a plan, or you are part of somebody else's

plan."

I think people are waking up to the fact that we must use what works. When we went around the room someone talked about yoga and how the psychedelic gives the experience on demand, but are we ready, and how do you gain skills? This sort of thing. To my mind, the goal is not the psychedelic experience, the beginning of the path is the psychedelic experience. So if yoga promises that after 20 years it will deliver you to the beginning of the path, then there's something seriously wrong here. The psychedelic sets you at the beginning of the path and then people do all kinds of things with it. I am amazed; I feel there is more variation in how we deal with this than in almost any other phase of human activity, because some people seem to have almost no self-reflection. I've noticed that it also touches sexuality. I don't know how many of you have ever encountered the Penthouse Forum, but this is where people write into Penthouse and detail these astonishing, unpredictable sexual exploits — threesomes, foursomes and twelvesomes that just fell upon them — and whenever I have some occasion to read these things, what is amazing to me is that these appear to be descriptions of the behavior of an alien species. There is no self-reflection on, "What does this mean?" "What does this mean that I get stuck in an elevator and end up copulating with twelve stockbrokers?" It's just accepted as how it is. Well, you get this same thing with psychedelics, someone says, "Oh yeah, in the 60s I took psychedelics. Wow. It was really strange, all these colors and voices," and apparently there is no self-reflection, no realization that this is actually happening to you. This is happening to you; therefore the implications must be fairly central. Then other people immediately get it, they say, "My gosh, this plant, this pill shows me that reality is at least a thousand times larger than I thought it was. It showed me that I don't know who I am, where I am, what I am, or anything else." I don't know

what it takes to instill that in people, maybe intellectual self-reflection.

One of things that is so puzzling about shamans when you actually deal with them in the field is that they are not like the other people in the tribe. The other people in the tribe are very tribal people. In other words, they have all the curious cultural limitations of people in every culture. They think you smell funny, they think you look funny, everything you do is amusing, they stand around in small groups giggling and pointing. The shamans, on the other hand, are nothing like that. They accept you totally as a person. They make no cultural judgments — you don't look funny, smell funny, so forth and so on — because they are what I call extra-environmentals, they are deconditioned from the assumptions of their own culture. So they may be the Witoto shaman, but the Witoto shaman is less Witoto than any other Witoto, because the Witoto shaman operates in

the context of Witoteness embedded in the larger reality.

I think what we need to do when we try to revivify shamanism in our own lives is to recover the profound reality of what it's doing. Sometimes I have flashes when I'm giving these talks of how different it is to be stoned than to talk about being stoned. I mean, here we sit in our cotton underwear, with our schedules in front of us, the mundaneness of it is so all-pervasive. We could be discussing Gnosticism or a political action project, but we're discussing instead something really appalling. I think, We're calmly discussing the fact that there is another world overlapping our own and very few people will even admit the fact. I always think of a wonderful B-movie I saw when I was a kid where there's a dinosaur in the swamp, and it's set somewhere in Mexico, and the typical *campesino* is sent by the *patrón* of the ranch to gather firewood in the jungle, and he of course encounters this extremely large rubber reptile roaring around, and then comes back to the ranch and is pointing back in the woods, and is completely inarticulate trying to say, "A creature from the id, a beast from another dimension is rampaging around in the forest." They just

dismiss him as, "These peasants, they believe anything. You can't trust them for a moment." This is the sort of situation we're in.

The extraterrestrial invasion that so many people anticipate, or the extraterrestrial contact that so many people hope for and that sells so many cheap newspapers is well under way. It's simply that the words we have to describe it are utterly inadequate. So words like "extraterrestrial invasion," "contact with an intelligent species," "end of history," "migration into hyperspace," these are pathetic signifiers of what is actually happening to us. What is actually happening to us is pretty damn hard to wrap your mind around. We are caught in a vortex of concreteness and compression that was set in motion at least as early as the melting of the last glaciation. We are reaping the fruits of 10,000-50,000 years of sowing of the fields of mind. It is being dropped into our laps for us to create human-machine interfacing, control of genetic material, redefinition of social reality, reengineering of languages, re-visioning of the planetary ecology. All these things fall upon us, and for us to be worthy of it, for us to be anything other than victimized by the 20th century, we need to reach back into time and to anchor ourselves with

the transcendent mystery which is somehow tied up with our own being, somehow present on the planet, but mostly a large list of unanswered questions.

We don't know what is going on on this planet. We don't know why there is life here, whether it's an accident or somebody's plan. We don't know why intelligence is here: again, accident? Plan? If plan, whose plan? If plan, for what? If plan, where are we in the plan? We all tend, when

we abandon ourselves to cultural values, to focus in so tightly that we lose the big picture, and if psychedelics are anything, they are a zoom lens back to the broadest possible point of view.

Audience: I was curious about what you were talking about with extraterrestrials and not having the appropriate language to really discuss it, and your view of what's going on.

It changes for me all the time. I don't have a point of view, and my primary job is not public speaking or writing, but exploring. When I first started taking mushrooms, and throughout the '70s when we wrote the Mushroom Grower's Guide, I held several opinions, but my most strongly held opinion was that it actually is an extraterrestrial. Just no shit, flat out, it is an extraterrestrial. What's surprising to me is that a single mushroom trip of a certain sort could probably put me right back there again. Getting it worked down to Gaia, or the Overmind of the species, is a kind of process of coming down from the real unassimilable context of the experience. It's like an extraterrestrial. I would certainly say this: if extraterrestrials appeared over Washington and Moscow tomorrow it wouldn't make this any less mysterious or puzzling. In fact, the extraterrestrials might turn out to be mundane; this is not. It speaks: this is the most astonishing thing for me to get used to. I mean, the visual hallucinations, somehow I can work it around that these are floods of imagery set off from deep structures of the brain and dumping of memory banks, but that it can just

address you in real time and say, "Terence..." and then proceed to blow my mind.

Now, several things may be happening here. The only time when we have the experience of focusing on an incoming message, decoding it in real time, and responding to it immediately is when we have a conversation with someone. So if you find yourself responding to a message in real time, your brain automatically thinks you're having a conversation. "If it looks like a duck, it walks like a duck, it must be a duck. So here I am, listening and responding to someone speaking to me in English, therefore this must be a conversation." There are physical arguments for viewing the mushroom as extraterrestrial. First of all, what is psilocybin? Psilocybin is O-phosphoryl-4-hydroxy-N,N-dimethyltryptamine. Of all the indole compounds in nature, only psilocybin is hydroxylated at the 4-position. If you were to design a computer program to search the life forms of earth for evidence of extraterrestrial origin, one of the things that you would tell this program to do is look for unusual molecules that have no apparent cousins or relatives among other organisms. Well, here is psilocybin, hydroxylated in the 4-position. Nothing else on earth is; a material

argument for its origin outside of the terrestrial ecosystem.

A slightly different argument that would see the mushroom as extraterrestrial is to look at its style, for want of a better word. What is a mushroom? First of all, they reproduce by spores. Spores are the most economical biological unit imaginable. They can survive the radiation levels of interstellar space. They can survive for aeons under conditions very close to those encountered in deep space. The mushroom spore falls into an ecosystem and it immediately undergoes cell division; a fine, thread-like network full of neurotransmitters begins to spread itself through the soil. It's very closely analogous to the neural network of a higher animal, including a human being. We're accustomed to thinking that an extraterrestrial would bear the imprint of the evolutionary situation in which it came to be. In other words, if it evolved on a low-gravity planet it will be tall and thin, if it evolved in a methane atmosphere it will have an exotic bio chemistry and so forth, but that's because we ourselves have possessed the knowledge of how DNA works for only about 40 years. It's reasonable to assume, I think, that if an intelligent species gets 1,000 years of study of DNA that they can design themselves to be however they care to be. In fact, if you think of the mushroom from that point of view, I think that we might chose that kind of an adaptation if we could have any form we wanted, because it's very non-invasive, very humbly

insinuates itself into a situation and grows essentially on waste material in the soil, yet when it sporulates it can actually cross the boundary of outer space.

Great economy, great artistry, tremendous Zen-like aesthetics seem expressed in the mushroom if you view it as a designed piece of work rather than an object in the environment. Then finally, of course, the major argument for the extraterrestrial origin of the mushroom — but it's an insider argument — is the content of the experience. Number one, it says it's an extraterrestrial organism and it has the data to back up the claim. It can show you movies of desert worlds, jungle worlds, high-pressure, high-gravity, methane worlds, planets whose cores are helium-4, worlds where you don't know whether you're inside an organism or inside some kind of piece of machinery, whether you're under the surface of a planet, literally things where our minds just stop in the presence of. To me, that's really the interesting thing about the mushroom. It can be as friendly as it needs to be and can even reassure you with a Disneyesque burlesque of dancing flowers and pirouetting pink elephants, but once you are comfortable with it, and enter the dialogue, and begin to get to know it, getting to know it is an appalling experience. You can say to it,

"Show me a little more of who you are for yourself," and then a veil is lifted and your jaw just drops. Then you say, "Show me a little more of who you are," and, "That's enough of who you are for yourself!"

Then you wonder, while this thing is talking to me, how engaged is the mushroom by me? Is all of its attention focused upon me when I'm talking to it the way all of my attention is focused back on it, or is it like a multi-user computer system, is it able to simultaneously deal with huge numbers of organisms? What is the relationship of psilocybin to the inner life of the mushroom? Is it stoned all the time? Why is it so important that these indole compounds get lodged in the nervous systems of mammals? It's almost as though it's a symbiotic relationship, that the

mushroom does not truly live its life unless it is taken, unless its unique molecular component can find its way into the synapses of a self-reflecting higher animal. Then what are we for it? You can ask these questions.

One reason why I think people have had trouble confirming the animate and intelligent quality of the mushroom is that you must ask. You just don't take psilocybin and sit there because it won't do it, but if you take psilocybin and call it in some sense, whatever that means — invoke, call, try to visualize — then it will begin to come toward you and lift these veils, and this world of zany, pun-like, hyperdimensional intelligence that is revealed is as strange as an extraterrestrial would be. This is, I guess, the final content of evidence for the extraterrestrial origin, the fact that it just seems so different from anything one could conceive of or imagine. I mean, you cannot, in one of these volleys of hallucination, convince yourself, "This is only me, these are my memories, or these are distorted transforms of past experience." I was trained as an art historian to have an eye for stylistic difference and cohesion of a set of aesthetic canons, and it just blows my mind. There is more art locked up in these things to be viewed in a single hour than the human race has produced in 10,000 years, art of a compelling, weird, breathtaking, awesome quality that just

breathes in every pore of itself. "This is the Other, this is not you. Don't be deceived, my little primate friend."

Audience: This thing about popular culture digs into that, because if you look at the movies that came out between 1952-1962, how many of those sci-fi movies were about spores from outer space and plants coming down? These were from very straight people who hadn't taken

psychedelics at all; maybe they were tuning into what was about to come 10 or 15 years later.

Well, I think, and I am so far as I know pretty alone in this opinion, that a very small percentage of information is able to tunnel backward through time, that there is a very small counterflow to the forward movement of causal efficacy. One of the things that shamanism is about is going into that hyperdimensional place and picking up this thin signal from the future and tuning it in. This is why prophecy and seership and all of that has to do with states of ecstasy and intoxication. One way of viewing all religion and all spiritual metaphor-making is as an anticipation of the future. These Western religions have these apocalyptic transformations built into them almost as a self-fulfilling prophecy, in other words, they believe that the world is going to end because the world is going to end. Since the melting of the glaciers, people of sufficient sensitivity have heard

through a vast wall of stochastic noise coming from the future the thin, reedy broadcast station of the true vision of the future.

Terence McKenna

This seems to be one of the things that you can do with these psychedelics, tune this in. It's a cliché, and I'm sure you've heard it, that artists are society's antenna for change, that artists are supposed to be somehow more sensitive than the rest of us and they pick up the new design forms, the evolving aesthetic canons and then translate it into society for the rest of us. Well, that gains a little more bite if you substitute shaman for artist, and realize that this may not be a metaphor, it may not be simply because they pursue bohemian lifestyles and are willing to accept poverty for a life of free thinking and so forth. That isn't what's allowing an anticipation of the future, what's happening is that there truly is an anticipation of the future. Visionaries like William Blake or the author of Revelations are actually people who, by virtue of some fortuitous confluence of circumstance, space, time and genetic constitution, are able to draw these messages out. What is startling is that apparently this is fairly ordinary in psychedelic states, that in fact one way of thinking of psychedelics is that you begin to move through time when you put them into your life. I don't mean while the trip is happening, I mean ever after. If you're living with a 1960s style mind and you have a strong psychedelic experience, you will come down with a 1970's mind, or perhaps a 2040 style mind. Mind is a temporal style, it's like clothing. This is what

McLuhan understood, you see, that we dress ourselves out of the closet of ideology.

"Ladies and gentlemen, we are floating in space," that we're living in. We, as a culture, must conventionalize and believe that today is whatever it is, November 5th or 6th, 1988, but some of us are living in the 21st century and some of us are living in the 18th century. The goal is to try to move all this forward. It's funny, certain themes that have emerged in the Western mind are, in fact, very psychedelic. One of them is the notion of progressivism, which is a pretty Western idea and quite psychedelic. It's the idea that things are getting better, or that things can get better. Most societies look backward toward a paradigm of a past paradise and all effort is toward recovering this paradise. We are the only people who have this faith in progress, and it's quite strong in us, so strong that we barely question it. I remember the first time I was in Karachi, Pakistan, I was being hauled around the city in a rickshaw drawn by a guy with bare feet. It was a human-powered machine, and he spoke English and we were scoring hash and this and that and we got to know each other, and he said, "In Pakistan we understand what is wrong with the world," and

I said, "So what's wrong with the world?" He said, "Progress, that's what it is! We have to stop progress!" which for me was quite a revelatory idea.

This thing about time, though, is very interesting and operates on many different levels. Ultimately, I think what the psychedelic experience may be is a higher topological manifold of temporality; that the reason it is so puzzling and so familiar, so alien and so exalting is that it is, in fact, mundane. It is in fact just us, but us sectioned through some higher spatial dimension. If, for instance, you think about magic for a moment, let's think about the major identifiers of the magical act, such as psychic surgery, where your hand is plunged through the wall of the body cavity of a human being and a tumorous organ is taken out and no wound is visible. A typical form of folk magic, much discussed, I'm sure you're all familiar with it. Another form of magic, stage magic in this case: a word is written on an envelope, the envelope is locked in a box and the blindfolded magician is able to tell the audience what the word is in the envelope in the box. These things are miraculous and we cannot conceive of how they could be done, but if you allow the possibility of a higher spatial dimension, then these things become trivial because it means that the body is open. There is a way that, from the point of view of this higher spatial dimension, the inside and the outside of the body are on the same side, so no problem is posed by removing this organ. Likewise, from the point of view of a higher spatial dimension the locked box is open on one end,

the end that is intersecting that dimension, so the way you read the message is you just go over and look, it's completely trivial.

A way to make this cogent for people who are now thoroughly confused is to recall Edwin Abbott's fantasy Flatland, where he imagined a world of two dimensions where a house was what in our world is what's called a blueprint, and that was all you needed, and you could live in the blueprint, because you could walk in and once you had closed the door, no one in Flatland could come through that blue line and get at you. Of course, to do this in our three dimensions, we just lean over and look at the blueprint and put your thumb on the inside of the Flatlander's living room. From his point of view, from out of nowhere an enormous thumb has magically appeared in his living room. Well, this shows how perfectly mundane situations on one level appear to be absolute violations of natural law on another level. This is happening very much in the

psychedelic experience, because the mind is the cutting edge of the evolving event system.

Audience: Can you talk a little bit about the idea of the period that we're in with the apocalypse as some kind of transformational event, and how your experience in altered states has lead you to believe or feel that there is some hope for changing that?

I think it's clear that we're in a race between apocalypse and breakthrough. I suppose breakthrough is the dark horse. Everything seems to be set up to favor apocalypse, it has the inside track, although very few people would own up to saying that they personally would want to die. So why is it, if none of us really want to die, why is the overwhelming global cultural image one of inevitable catastrophe? I'm very optimistic. I really think rich history was for a purpose. I would not have had it. I think it was useful and that we must have learned something very important. What we learned that was so important, I'm not sure, but probably when we need it we'll have it. Maybe we need atomic weapons because a large object will be detected hurtling toward earth, and if nature had not split off the monkeys 100,000 years ago and evolved intercontinental missile thermonuclear weapon delivery systems that we could use to destroy that asteroid, then all life on earth would die. So what appears to us as madness, our own dedication to the release of larger and larger amounts of energy for no purpose other than to destroy ourselves, is suddenly

rescued from pathology and shown to be this tremendously foresightful thing: "Thank God we did this, because otherwise we'd all be dead and everything else would be dead." I don't seriously believe that, but I do think that we must have learned something very, very important.

Perhaps cybernetics come in here; perhaps this exoskeleton of mnemonic material that allows us, essentially, to freeze and record our entire culture. Everything is going into the databanks. One way of thinking about what's going on is compression of information, and history represents a compression of information magnitudes more accelerated than the evolution of life. Then 20th century history represents an even greater information compression, information finally compressed to such a degree that it's like the singularity inside a black hole. A black hole has at its center a place where the equations don't sum, in other words where it doesn't make any sense. The only conclusion you can reach is that at that point of so-called infinite compression or singularity, another universe bursts into being somewhere else in a greater and vaster cosmology, and then the energy equations balance. It's as though mind is undergoing this kind of gravitational collapse, and information is being compressed to such a degree that eventually it will not all fit in the present, and then the information begins to move off into the only dimensions available to it, which are the past and the future, exactly as you fill a glass with more water than it can hold. Once it has more water in it than it can hold, the water begins to flow down to the sides and out into the larger domain; and so I think that people who try to use history, which are usually male egos and male-dominated institutions, are actually tremendously frustrated. We don't see it that way because to us it looks like they win every battle because they win every election, but because they win every election, it is their job to manage this situation. It's a case of, "You want it? Here it is!"

and they have not a clue as to how to manage it. Their thing is all about the headaches of ownership; our political point of view is pretty much about the headaches of disenfranchisement.

I think that there is some kind of event ahead of us in time, on the order of 20-40 years, that is casting an enormous shadow back through the lower-dimensional slice of being which we call history, so that religions, mystical visions and the visions of revolutionary leaders are a response to flickering intimations of this transcendent object that is pulling intelligence out of the organic matrix of life on this planet in a process that is occupying 50,000-100,000 years. It's extremely unusual what's happening. A process that creates a series of self-transforming bootstrapped steps in a period of 100,000 years means it's a unique kind of phenomenon, there's never been anything like it on the planet. What it is leading toward is hard to say, but I know that its values are the values of life, connectedness, primacy of experience, and caring, and it is using the historical

process to wire us all together in some way. Control mechanisms are spreading through the society at an enormous rate.

One of the horror fantasies of the 1950s — when this conservative, straight, crowd point of view was really at its height — one of the fears of the future that people would just toss off off-handedly was that in the future machines would take over and run everything, and this notion of the control of the planet wrested from the sure hands of noble human beings and instead betrayed into the power of calculating automatons was a great science fiction theme of the '50s. It's interesting how impartial computers are. They are not ideologues, they are managers, and remember, I said that the struggle was between the shaman manager and the ideologue politician. So I think that the cybernetic matrix is a tremendous tool for feminizing and radicalizing and psychedelizing the social matrix. I see computers as entirely feminine. People have a reaction to this because they think that, because men spend a lot of time around them and seem obsessed with them, that somehow it isn't feminine; but men have always been obsessed with the feminine. I think it was D.H. Lawrence who said, "What life is really about is men keeping women from ever

suspecting how truly obsessed we are by them."

I think that this linking-together, feminizing, cybernetic thing is part of the anticipation of this object at the end of time. What seems to be happening is that we are all flowing together. We keep talking about unity, globalism, completion: well, you're going to get what you ordered. I think what it means is that probably the dear individual — which, don't be fooled, is a soft description of the male ego run rampant — the democratic individual, the citizen, this notion is in fair peril to be replaced by "the person," which is a much more rubbery kind of concept. The person is not an interchangeable part, the citizen is. The citizen is a model of society based on the industrial revolution of the 18th century, but the person is a harking back to a pre-print model. This is being set loose; it's what the hippies were, essentially. What they were trying to evoke was this "do your

own thing" idea, but there's a paradox here: the "do your own thing" idea is somehow leading to this vectoring toward a unified cultural state where everybody else is involved in everybody else. It's alright that it's paradoxical, because there's no reason that it should be reasonable.

Audience: I wonder if you could address the difference between the LSD experience and the mushroom experience, if there is a difference, and also your feelings about marijuana as an altered state.

I speak only from my own experience, of course, but to me the LSD experience seemed more psychoanalytical than psychedelic. I mean, I was in my early 20s when I encountered LSD, maybe I had more "stuff," as they say, to deal with, but it was not a reliable visionary drug for me. It caused me to have funny ideas; it seemed mostly to be a thought thing, but not a visual thing. Somehow in my education, somewhere along the way I had picked up this bias in favor of the visual channel, so I wasn't satisfied with LSD. I wanted those things that Havelock Ellis describes, "Jeweled ruins and phosphorescent maidens in diaphanous gowns, howling demon songs beneath a violet moon," not funny ideas. I worked pretty diligently at it with LSD and I found that my most satisfying LSD experiences were while smoking hash, and that then really did do something interesting with it, it sent it skittering off in these wonderful visionary directions. These things do have characters, and these things do have characters, and this is something probably worth talking about in this group. At low doses, everything seems like everything else. In other words a little mescaline, a tiny amount of LSD, a little bit of MDMA, a tiny tad of psilocybin, all of these things simply register as wired, aroused, eager to hear what's being said and follow the thread of the argument and absolutely fascinated by what's going on, no matter what's going on. As you raise the dose, the character of these

things begins to appear.

For instance, psilocybin is, to my mind, in many ways the most anomalous, because, number one, this thing about how it speaks; it does speak. None of the others do. The others, you may occasionally in years of fiddling get a sentence or two, but the mushroom is just voluble, it just comes on and raves, and people have said to me, "It really does rave!" It's not a calm, go-with-the-flow rap, it's a rap about planetary destiny and the next ten million years and the last ten million years. It's this trumpet blast. Cecil B. DeMille, hyperreal rap. Then something like ayahuasca, which is this thing that these shamans use in the Amazon basin that's based on DMT and monamine oxidase inhibitors, you take that and it's about the rivers and the jungle, and these people and their humility and dignity, and your humility and dignity, and the earth, and plants, and life, and water and sunlight. It's this totally earth-bound, terrestrial, life-affirming thing, and it does not speak. It's an eye, and its language is visual, and after an ayahuasca trip you just feel like your eyes are literally being out of your head. I mean, you've spent 6 hours looking, not really doing anything else but looking. Then something like datura has this watery, magical, forgetful, kind of witchy, occult quality. It's shadows, shadows, and a peculiar quality of erosion of your own attention. No matter who you are, you find yourself wandering through

empty colonnades under a sky pregnant with the possibility of rain. It's this strange de Chiricoesque kind of landscape. DMT has another quality, it seems to convey you into a world of utter outrage where all linguistic, sensory and analytical machinery is just brought to a screeching halt.

It's important to learn what you like and to learn what you can put up with. I said to someone at a recent weekend who takes mushrooms quite religiously and quite regularly, "Does it ever get easier?" He said, "No, it never gets easier. Each time what I pray as I go into it is, 'Please let

me be able to stand a little bit more!'" Finally, it is the real mystery, so the only way your relationship to it can end is by you averting your gaze, because no human being can gaze into it endlessly. It is what it says it is, it is the Other.

Audience: I just want to follow up on that question a little bit. Stan Grof describes LSD as a non-specific amplifier, and by that he means it amplifies that which already exists in the psyche. He uses this metaphor that LSD serves as a sort of a telescope or microscope, in that itself it does not produce the experience, but it enables you to have an experience that is already there *in potentia*, latent in your psyche. I was wondering if you could comment on that, since you just described the various psychoactives as having a character. So would you disagree with his framework,

or would you say that the various telescopes are tinted with a certain lens? How would you reconcile that?

Well, at the beginning of your question you characterized LSD. It's that it is a non-specific amplifier, but of the contents of the personal unconscious and the sensorium. What people notice about LSD is either what's right or wrong with themselves, or how freaky the world is. A bug, a drop of water, it can be anything, but you discover the strangest things on LSD and they're real things: relationships of reflections and windows... It basically seems to be a tremendous amplifier of attention and analysis of the input of attention when directed into the outer world, and when directed into the inner world it's an analytical tool for looking at the past history of the individual, which is what I call the personal unconscious. The thing that always puzzled me about enthusiasts of LSD was that they claimed that beyond this lay what they call "the white light," which they put great store by, and put all kinds of Buddhist associations to it. I don't know if I've ever had the white light experience. As I go deeper into strong psychedelics what happens is that multiplicity proliferates; there is not a simplifying, there is a further and further complexifying. I was talking to someone at Qjai Foundation about this and they said, "But surely, beyond all this there is some kind of simplification and unity," and I said I wasn't sure, that maybe it's just an infinite samsaric ocean in all directions and all dimensions forever. Ketamine comes closer to providing a no

observer, nothing observed kind of state, but you can't do much with that. You can have it, and there is, of course, with the dropping of all boundaries, a feeling of release.

What I am interested in is bringing back artifacts to share with the tribe, and I've accepted that they will come in the form of either things that can be painted or things that can be said. Since I'm better at the saying than the painting, I work like that. Stan is a good friend of mine, we've talked about this over the years. I just can't confirm his maps of the psyche, I don't see those states occurring along a continuum the way that he says they do. I think it's much more chaotic. If his categories work to facilitate psychotherapy then that's good, because that's what he's interested in. In other words, I see his maps as very, very provisional and useful for navigating but I doubt that when we get the final maps, if we ever do, that they will bear terrifically much resemblance to that. I think he would agree with that; we're not at loggerheads about this. Anybody

who works with psychedelics, their ultimate position is that, "Hell, we don't know."

This afternoon I thought we would do some operational homework and academic referencing. One of the most important things about all of this that we've been discussing is to get the information straight, to be as well informed as possible. It's as important to be well informed in this area if you're going to do it as it is to be well informed about procedures in skin diving if you're going to do that. What I thought I'd do at the beginning of this afternoon today, apropos of this idea that people should inform themselves about what's going on — though you can't find out everything, you can find out a lot more than most people know. It's amazing to me the number of people who would pay a couple of hundred bucks to come to a weekend with a person like myself to learn about psychedelics, when a couple of hundred bucks would get you quite far in a

bookstore, and the public library is a marvelous resource for this stuff.

I hauled some titles off my own bookshelf and I'll go through them, this is by no means all. I simply chose books that I thought were either important to the field or that I felt would be fairly easy for someone to obtain if they wanted to look into these matters. This one some of you may know, this is probably the easiest to obtain and the most compendious. It's *Plants of the Gods* by Richard Evans Schultes, who is professor emeritus of botany at Harvard. This is basically the distillation of his life's work. It's filled with pictures, it has all kinds of information arranged in this kind of table form where you can look up a plant, get a notion of what it looks like, what family it belongs to, what its chemical constituents are and so forth, and it has a very good bibliography and chemical appendix. So this is around and highly recommended. If you want to go slightly deeper than that book goes, this is the academic version of the same book, this is *The Botany and Chemistry of Hallucinogens*. This is the bible of this field. It lists virtually the state of the art circa 1980, and it has a compendious bibliography. This book, though it's from an expensive academic press, is highly recommended. If you had to have just one book on hallucinogens, this would probably be the one to go for. It's also by Richard Evans Schultes and Albert Hofmann, who some of you may know as the discoverer of LSD and the man who first characterized and

synthesized psilocybin.

From a slightly more countercultural point of view, this is the revised edition of the *Psychedelics Encyclopedia* by Peter Stafford, who some of you may know. Again, this is an effort to be compendious. No one of these books should be taken as gospel; you want to get it from several

different sources before you conclude any given fact as true. This book is published by Tarcher in L.A., I think this is a fairly easily obtained book. This is the 2nd edition and he's going to do a 3rd edition, and he's very good about keeping up on the literature. This is an interesting book.

Then for those of you who are more inclined to pharmacology and neurophysiology, this is a fairly hard book to obtain but in a way it's never been surpassed. It's called *The Hallucinogens* by Hoffer and Osmond, and there was never a revised edition after 1965. It discusses a lot about LSD and psychotherapy, and also has all kinds of strange information that was never again mentioned in the literature, that was just sort of dropped out. You can read here, for instance, about the hallucinogen dimethylacetamide, where you drink 8 fluid ounces a day for 5 successive days, and then the onset of hallucinations begin that are supposedly quite spectacular; it's just that the notion of drinking 8 fluid ounces of this bizarre chemical compound is not too appetizing. Then for sort of the state of the art in one book is Solomon H. Snyder's book *Drugs and the Brain*, and it doesn't simply address hallucinogens, it talks about all kinds of drugs. It explains the mechanism of drug activity, the notion of the lock-and-key activity of the drug molecule to the synaptic cleft. It gives you a short, basic course in neurology, and Sol Snyder is one of the giants of psychopharmacology, Albert Lasker Award winner, so forth and so on. Here's another book somewhat along the lines of Snyder's book, this is one of the most recent books written on hallucinogens. The editor is Barry Jacobs, *Hallucinogens: Neurochemical, Behavioral and Clinical*

Perspectives, and as my brother said, "All of the uninteresting perspectives are covered here, very thoroughly and in detail."

What these books are good for, besides whatever they say, is that they contain excellent bibliographies, so tracing a particular problem you go to these books and then they direct you to the journal articles that give you what you want to know. Most of the literature of psychopharmacology is in journals which you will never, as a layman, encounter unless you go to medical libraries and attempt to see these things, things like *Lloydia* and *Acta Neurologica* and the *Journal of Psychopharmacology*. Some of these journals cost as much as \$200-300 a year to subscribe to, so if

you don't want to do that, the bibliography directs you to the articles you need, and you just go to the med library and xerox them out.

This sort of bridges the gap between pharmacology, sociology and anthropology. This is Brian du Toit, *Drugs, Rituals and Altered States of Consciousness*. Let me see if I can make a quick identification here. I think this is actually *Banisteriopsis rusbyana*, which is a rare admixture plant

that contains DMT but has the lanceolate leaf end which distinguishes it from *Banisteriopsis caapi*. Probably could do 10 years for the book. The publisher on this one is a weird one, Balkema of Rotterdam, so it's a Dutch publisher.

Then sort of moving out of the realm of pharmacology and psychology and into the specifically anthropological stuff, this is one with a number of various contributors, *Alternate States of Consciousness: Multiple Perspectives on the Study of Consciousness*, edited by Norman Zinberg of Harvard. This deals not only with shamanic drug usage but the heroin subculture, and a number of different things. Urban drug cultures are discussed as well. It's mostly a sociological perspective here. Moving into the more specifically anthropological stuff, here's my favorite one. Before he got into drumming, Michael Harner edited this book, *Hallucinogens and Shamanism*, Oxford University Press, available in paper. A number of writers contributed to this, there are about four articles on ayahuasca that you just will not find anywhere else, articles on peyote, a wonderful

article by Henry Munn called *The Mushrooms of Language*, just a classic article on mushrooms. This is highly recommended.

A sort of similar book by a different author is *Flesh of the Gods: The Ritual Use of Hallucinogens* by Peter Furst. He's an anthropologist who made his reputation among the Huichol in Mexico. This has articles by Wasson, Furst, Doug Sharon, William Emboden, Fernandez, Reichel-Dolmatoff, the usual names in this ethnobotanical field. This is a specific guide, *Hallucinogenic Plants of North America* by Jonathan Ott. The interesting thing about this is that it's pretty compendious, meaning that there are things discussed here that you just won't find discussed anywhere else, probably because there are so few hallucinogenic plants in North America. This guy really had to scratch to produce a book about it, but this is useful for that. Similar but more broadly-based is this book *Narcotic Plants*, terrible title, by William Emboden. This book has a lot of visuals in it. Why I value this book is because he has a more liberal definition of psychoactivity than most people do, so consequently his species lists are longer than anybody else's. If somebody asks you about an obscure plant — is it psychedelic or not? — this is where I look first,

because he seems to list many things that nobody else has ever discussed. He teaches at Cal State; some of you may know him, I don't.

Here's another one of these anthologies of writing about psychedelics, also by the same author as *Flesh of the Gods*, *Hallucinogens and Culture* by Peter Furst. Again, this has articles on mushrooms, on the discovery of LSD, on ayahuasca, on cannabis and tobacco, the biochemistry of consciousness, shamanism as the ur-religion, so forth and so on. It seems like every one of these authors then goes on to edit a book of their own favorite essays. Here's another one, *Hallucinogens: Cross-Cultural Perspectives* by Marlene Dobkin de Rios, who is a woman who has done

a great deal of work on ayahuasca. She published a book called *The Visionary Vine* and another book called *Ayahuasca: Mestizo Curing in an Urban Setting*. Basically a sociologist, she's also at Cal State.

This is sort of the granddaddy of all of these anthologies, a very interesting book, hard to get but fascinating. It's called *The Ethnopharmacologic Search for Psychoactive Drugs*, and it was the name of a conference that was given in San Francisco in 1967. The plan at the time of the conference was to have it occur every year, but it never occurred again because of course everything was made illegal the next year and this faltered. To show you to what degree the government was of two minds about psychedelics, it says on the frontispiece of this book, "Sponsored by the Pharmacology Section, Psychopharmacology Research Branch, National Institute of Mental Health, United States Public Health Service, U.S. Department of Health, Education, and Welfare," and it was published at government expense. This is in fact a technical publication of the National Institute of Mental Health. Wonderful bibliography, extremely interesting discussion of DMT-containing snuffs, an article on the psychopharmacology of nutmeg that you just won't find anywhere else, articles on kava and an article on the history of research into psychedelic plants that goes clear back to the medieval herbalists. The last time we were in the Amazon we christened our expedition, in honor of this book, *The Ethnopharmacologic Search for Cold Beer*, because there ain't any, and it becomes an obsession. It's so strange what you miss. I don't even

drink beer, so what do I care? After ten days in the jungle, all anybody could talk about was the possibility of cold beer, and it was still four weeks away, so...

Then for somebody who really is serious, or technical, or plotting an expedition or a research project of some sort, this is really a pretty amazing book. It's dull as death, because it's essentially listings from the herbarium sheets at the Harvard Museum Botanical Library. It was put together by Siri von Reis Altschul, who was one of Schultes' graduate students, along with Ara DeMarderosian and Marlene Dobkin de Rios, some of the few women who have made significant contributions to this field when it was firmly in the hands of dominant male types. Anyway, this book is called *Drugs and Foods from Little-Known Plants*, and they're not whistling Dixie when they say "little-known plants." You look through this and some say "hallucinogen" or "reported hallucinogen," and this touches foods, one of the things that's not part of our concern here. One of the things that's so frustrating when you do ethnobotany is to realize that people can be starving in environments where there are many food plants, but they don't utilize the food plants because they've accepted the values of a capitalist economy. Because the foods cannot be trucked to market or have a short shelf life, they are called "pig food," and nobody will eat it. Time and time again in the tropics, I would come upon a plant that I knew to be edible and proteinaceous, say to my informant or guide "What's the story on this?" "Food for pigs, people don't eat it," but

you know they are buying canned tuna fish and spam from the priests at the mission. So this is a way in which people's folklore and folk heritage is distorted.

Then a book by a good friend of mine, and if any of you are interested in ayahuasca, or plan on going to South America where you may encounter ayahuasca, this book, *Vegetalismo: Shamanism Among the Mestizo Population of the Peruvian Amazon*, this is a lovely book. This is about the people that I spent most of my fieldwork time with. You just cannot read this book without coming away with a sense of the depth and complexity of the ayahuasca worldview: its healing classifications, the power allies, the admixture plants, the magical songs. It's by Luis Eduardo Luna, who I know has lectured and shown his films here at CIIS. He's an excellent person, a very good friend of mine, to my mind probably the person doing the best anthropological work on ayahuasca in the world right now. The publisher, in case you want to try to track this down, is

Almqvist and Wiksell International, Stockholm. If any of you are just dying to have this book, order it from Lux Natura, we have three copies left.

This is the last one that I was going to mention, because this could have been the title of our weekend. This is *Psychedelic Drugs Reconsidered* by Lester Grinspoon and James Bakalar. Lester Grinspoon managed to find his way into Herb Caen as a name freak when he published a monograph on the dangers of excessive cocaine use. Basically, this is a very reasoned presentation of why psychedelics should be reconsidered for therapy, the case for them, the case against them, the nature of the hysteria that placed them off limits. He has also written *Marijuana Reconsidered*, and is a very nice person and leading the fight to decriminalize drugs for research. So that's all the books that I brought in to show you; they are, as I say, by no means all. The only resource that I would mention for the serious student of these things that I didn't bring in is: nobody should try to deal with this subject without being aware of what's called the *Harvard Museum Botanical Leaflets*. These are a series of leaflets that have been published since the '30s by the Peabody Museum in Boston. So write to the Harvard Museum Botanical Garden and say

you want a list of the leaflets. They cost between \$1-4 a piece. They deal of all of Schultes' papers; all kinds of very hard to recover information is available there. There are about 180 of these reprints on all aspects of all psychedelics and some non-psychedelics as well.

It's important to have this information, to have it at your fingertips. The compartmentalization between areas of knowledge that impinge on this always amazes me. I mean, you get psychologists who don't know what an MAO inhibitor is, you get people combining things without knowing how drug synergies work. You get people just not informing themselves on the importance of set, setting, dosage, psychic predisposition, so forth and so on: all vital matters that can impinge on how an experience develops. If you can take the time to inform yourself you will feel much more sure of what you're doing, and that in itself can alleviate confusion and negative reactions.

So then I thought what I would do is sort of go around the world and talk about these things a little to give you an idea of what is available, what's on the menu.

Audience: Could you explain the difference between psychoactive, psychotropic and psychedelic?

Psychoactive means exactly what it implies, that you can detect this compound as a higher cortical experience, that's all. To my mind a higher cortical experience is a shift of mood, depression, elation, acute hearing, sensitivity to noises: all of these things could be classed as psychoactive reactions to a compound. Psychotropic is a word that I've never been very fond of and it sort of came in late. Psychedelic, which is a fairly maligned word, but was coined by the psychiatrist Humphry Osmond, means simply "mind-manifesting," and I like that because it is phenomenologically neutral. Some people have tried to push the word "entheogen" for these things, meaning literally "god-inducing," but to my mind this carries a huge amount of ideological freight that we may not wish to buy into. Maybe it's god-inducing, maybe it isn't, but psychedelic — meaning mind-manifesting — is pretty good, and then if all of these make you uncomfortable you can just fall back on a completely phenomenological description and call them "consciousness-expanding drugs." I certainly don't consider alcohol a psychedelic, but clearly a psychoactive.

Marijuana is one of these things that's so widely variant, both in how people react to it and how strong it can be. I would call MDMA a psychoactive drug, not a psychedelic drug.

I use the word "hallucinogen" a lot, and a lot of people don't like that, even people in the field. They say, "Hallucinogen seems to imply that it's an illusion," but not in my mind. I don't hear that. I'm fascinated by hallucinations. To me that is the sine qua non that you're getting somewhere. I guess that's just my philosophical biases, but a hallucination is such an extraordinary concept, isn't it? To see something which isn't there. I don't mean to misread a surface, so that you think it sticks into the room when in fact it sticks out of the room, or something like that, I mean seeing something that *is not there*. Then that divides into two classes: seeing an ordinary object which is not there — I think this is what most people think a hallucination is: "Here is a bicycle. Is it real or not? The drug-crazed victim cannot tell," — but most hallucinations are of things

which can only be hallucinations, because that's what they are. They have this aura of the unexpected and the Other, the intrusive alienness.

People have claimed to me that they have seen objects which are not there which are completely ordinary. That is more typical of accounts of datura users, people who take high molecular weight tropanes, such as occur in jimsonweed and those kinds of things. My brief experimentation with that is that it's what I call a deliriant, rather than a psychoactive. When you take datura you are so messed up that you literally lose all discrimination: you can't tell exactly where you are, you can't tell thinking about being somewhere from being there. Well, you're in no shape to undertake a spiritual quest if you're that discombobulated. What I like are the things which do not destroy what I call core functions. In other words, there is still an evidence-gathering, observing mind left intact, and the disruption of perceptual input, if you want to put it that way, is pretty

much confined to the visual cortex, and then to the metaphor-forming capacity that is relating to the visual cortex; but I don't like things which confuse you, which impair judgment.

Audience: What about *Salvia divinorum*?

That's an obscure one about which not much is known, although in the past year they've learned the absolute chemical characterization of the psychoactive compound, which is called salvinorin A. More work has to be done. Anthropologists who have taken it with Indians in Oaxaca describe a very intense experience. When we grew it in Hawaii and took it exactly the way these people said to do it, it was an experience, but it was not clear whether it was psychedelic or merely so physiologically active in such a complex way that you couldn't tell exactly what was going on. The impression which was not mine, but Kat's and a beloved dean, they both experienced flow. They described the experience as though you were lying in a dirty ditch with this cold fluid flowing from the top of your head to the bottom of your feet, and where this kind of cold, clammy fluid encountered energy obstructions in your body, it would wash them away. It was a kind of vertigo with nausea; it was a complex experience, but it was not largely mental, it was more a re-visioning of the body image. This is another one of these things where no research has been done. It isn't illegal, but you're not going to do your career any good to get tangled up with this, so consequently it's pretty much left alone. Salvinorin A is extremely unstable and breaks down within 12 hours, so that indicates that it's probably a polyhydric alcohol or an isooquinoline or

something like that, it's not an indole.

Audience: Wasson talked about "entheogen" versus "hallucinogen," and his theory was that a hallucination is something that isn't there completely. He thought that the experience on soma or the mushroom is something that you are actually experiencing, so it's not a hallucination, it's real.

Yes, that was what he said, but if you actually look at the etymology of the word "hallucination," what it has come to mean in English is a delusion, but what it really means in the original language is "to wander in the mind." That's the meaning of hallucination, to wander in the mind. Well, that's a pretty good operational description of what's happening, and then when you add in the visual component, it's hard for me to imagine how someone could undervalue hallucinations if they had had them. These guys were very frustrated with seeing this thing turned into a social

hysteria, and Wasson at the time expressed great unhappiness with Tim Leary's approach, and hated going to Mexico and seeing these mushroom villages invaded by graffiti-covered vans of filthy freaks from southern California who were disrupting the local ecology.

It was a kind of proprietary approach: this thing belongs to anthropologists, to specialists. Wasson was very reticent to assess his own work. Some of you may have seen Bob Forte's interview with him in that psychedelic issue of *Revision* where Forte asks him, "How do you assess the historical impact of your work?" and he said, "I'll leave that to others to decide." He didn't want to deal with the question of the potential impact on his own society. He really looked at it as this exotic, foreign kind of thing. These guys were cautious, this first generation — Hofmann,

Wasson, Schultes — these guys are not stoners by any means. Their approach is cautious, and their psychedelic experiences in a lifetime can be counted on the fingers of one hand. I'm not sure that they ever realized the size of the tiger whose tail they had seized.

Audience: The DMT and the toad, whatever it is, how is that extracted?

Well, I haven't had the good fortune to be present at the milking, so I really couldn't say. I gather that you put pressure on the back of the neck in two places and this exudate emerges, exactly where I'm not sure, and probably decency should scarcely inquire. Then it's dried on sheets of glass and scraped up and packaged and so forth.

Let me start through this and give you a notion of what is available. Whenever you talk about the distribution and cultural usage of hallucinogens the first thing that you come up against is a curious unsolved problem in botany. No one knows why this is, and we would be grateful if somebody could figure it out, but for unknown reasons there is a tremendous concentration of psychoactive plants on the South American continent. The South American continent has more known hallucinogens than the rest of the planet combined. Why is this? After all, the climaxed tropical rainforests of Eastern Indonesia are at least as species-rich as the Amazon basin, and yet not a single powerful hallucinogen is known with certainty from the Old World tropics. All kinds of suggestions have been made: that actually there are psychedelic plants common throughout the tropics of the Old World but the cultures have lost contact with them and forgotten them, and hence our anthropologists have not discovered them, or something in the soil of South America — very improbable theory. I was talking about this once in a workshop and somebody raised

their hand and said, "No problem. Obviously that's where the spaceships landed." Good! Well, we've solved that problem, now we can move on.

North America is extraordinarily poor in hallucinogens, perhaps the poorest of all continents, so that the psychedelic phobia that Europe created against paganism was completely reinforced, or at least not eroded, by the colonization of the New World or of North America, because there were no plants here to challenge that. The North American Indians tend to ordeal as a shamanic vehicle, the Sun Dance thing which some of you may be familiar with, or sonic driving, which is worldwide in shamanically-oriented cultures without drugs. You should know that not everyone agrees with me that psychedelics are the sine qua non of shamanism; that's what Wasson thought, that you don't have shamanism unless you have psychedelics. If you have people calling themselves shamans and not using psychedelics, then they are cut off from the older level of

tradition, and through ritual, drumming, ordeal, starvation and flagellation they are creating near-psychedelic, or pseudo-psychedelic states.

Now, a brilliant and respected commentator on comparative religion like Mircea Eliade, who I quote whenever it suits my purpose, totally disagreed with this and said no, what he called "narcotic shamanism" — which means psychedelic shamanism, the choice of the word tells you that the guy had a problem — "Narcotic shamanism is decadent shamanism," and the flagellation, the starvation, the ordeals, and the drumming is the real shamanism, and it's only when the tradition is abandoned and decadent that a culture will turn to drugs. I maintain that this is nothing more than his Western cultural bias operating. He was a Romanian who became an academic in Paris. Also, in his youth he was pretty infatuated with yoga, and they will insist to you that drugs are an inferior path. However, any of you who are scholars of yoga should know that all yoga is based on the Yoga Sutras of Patañjali, 2nd century Hindu, Vedic commentator, and Patañjali specifically says, "There are three paths to the goal of yoga, and they are control of the breath, control of posture and light-filled herbs." It says it right there, stanza six of the Yoga Sutras of Patañjali. It's never discussed again, basically. In the entire exegesis of the yogic literature, the third path is never mentioned. Is that because it's a secret tradition, or what? I don't know. When you go to India seeking these yogis practicing these higher yogas, what you find are a bunch

of guys smoking as much charas as they possibly can, and the notion that you could do it without that just gets a long laugh from everybody down around the burning ghats. They deal with it on a practical level.

Moving out of drug-impooverished North America, or psychedelic-impooverished North America, where there are more than 20 species of indigenous psilocybin-containing mushrooms but, and this is interesting, no evidence whatsoever for tribal or traditional usage. In other words, in this

Terence McKenna

Northwest Coast Indian complex — the Tsimshian, Tlingit, Nootka group — there's no reason to believe, other than our own predilection for romantic fantasy, that these people were using mushrooms in pre-contact times, and yet the mushrooms were there. The complex that we're most familiar with as a North American hallucinogen is in the Southwest of the United States: *Lophophora williamsii*, the peyote cactus. Now, the interesting thing here is that we cannot find archeological evidence of peyote use that is particularly ancient. Peyote use in the Southwest appears to be less than 500 years old. Before that, what we find in Indian graves of the Tarahumara and so forth are the seeds of *Sophora secundiflora*. *Sophora secundiflora* is a highly poisonous legume that contains cytisine. This is an example of what we call, not a psychedelic, but an ordeal

poison. In certain parts of the world this approach to spiritual growth has been taken, most notably on the island of Madagascar off the coast of eastern Africa.

What is an ordeal poison? This is a plant where you take it and you are so convinced that you are dying that you have an experience of self-abandonment, getting straight, surrender, and then you live and you're fine. You are absolutely convinced that you are dying, your heart pounds or fibrillates, or you convulse, or you fall into deep coma, or you have tetanus in the limbs and then you recover. Well, anybody can tell you that this is a kind of psychedelic experience, because you're so damn glad you lived that you see everything in a new light. You can be kind to your

children, love your wife and tolerate your relatives. People say, "It made a new man out of him!" Well, yes, because he came so close to dying that he shed neurotic behavior patterns, but this is not a true psychedelic.

What we're assuming is that about 500 or 1,000 years ago, sometime in that span, the *Sophora* cult was replaced by the peyote cult which came from a much smaller usage area. Then, also in southern California, there were what were called the *toloache* religions, religions of datura intoxication, initiation of young men by intoxicating them with datura and leaving them in the wilderness to fend for themselves. Again, this comes close to being an ordeal poison, although it also has psychoactive properties, but so confusing, such a deliriant that it bears no relationship to the true hallucinogens which, with the exception of mescaline, I believe all fall into the category of the indoles. Now, mescaline is not an indole, it's an amphetamine, closely related to MDA and MDMA, but it is a true hallucinogen at fairly high doses. The indoles, which are this structurally-

related small family, they seem to me to be the true visionary ecstasogens, and I will mention as I go through the list which ones are indoles and which ones are not.

A kind of parallel phenomenon to the peyote cult of the Southwest is in the deserts of northwestern Peru. There are very large columnar cacti in the genus *Trichocereus* that contain mescaline, and they have been used for a long time, a lot longer than peyote. We have Moche ceramics dated to before 1,000 B.C. which show a Peruvian design 1,500 years old. In central Mexico we come upon the first of these large centers of hallucinogenic use, in the cultural area in which the Olmec arose and were subsequently succeeded by the Maya, who were subsequently subjugated by the Toltecs. The plants that were in use in those situations fall into two pretty well defined categories, first of all, psilocybin-containing mushrooms of several species, and second of all, morning glories of at least two types. *Convolvulaceae* which contain LSD-like alkaloids active in the milligram range that are highly visionary. There is considerable evidence in the Codex Vindobonensis and in some of the Mayan ceramics that this was a culture that made a very important place for hallucinogens, and that it was the privilege of the priestly class, and that their obsession with calendrics and astronomy and this sort of thing was also somehow intimately connected to their interest in the psilocybin mushrooms. Again, one of these botanical puzzles: here is a cluster of 10 or 15 species of mushrooms in central Mexico, and a culture builds itself

around them. A similar cluster of species on the Northwest Coast, the culture seems to totally ignore and have no use for, and nowhere else on earth are there clusters of species of psilocybin mushrooms with a long history of use.

Naturally, the export of cattle throughout the warm tropics has allowed the coprophilic mushrooms, the mushrooms which grow on manure, to be spread throughout the warm tropics. Then in places like England and France you get the occurrence of the diminutive psilocybin mushrooms, *Semilanceata*, but again, only the most unconvincing evidence of traditional use. I mean, I am Irish Celtic. I would love to have somebody come up with a bunch of evidence that ancient Celtic and Druidic art and magic was somehow related to mushrooms, but to date the efforts have been unconvincing to any skeptic. It may still be there, perhaps in heraldic devices. Someone should go back and study the escutcheons of the families of medieval Europe; and you do find, for instance, the Morelli family, a noble Italian family with mushrooms on the family coat of arms, and

other families in France whose names escape me.

Let me say a little bit more about the morning glory complex, because it's very interesting. LSD, discovered by Albert Hofmann in 1938, comes from ergot, comes from an organism called *Claviceps purpurea* which is a smut which grows on ergot. A humbler organism you could hardly imagine. This is basically "Yuck!" That's how you would describe this organism if you were to come upon it. It looks like a mistake, because it's just an amorphous, slimy, black mess growing on certain cereal grains. One of the fascinating questions to these chemists once they discover a new compound is to try to figure out, "Does it occur anywhere else in nature?" Some plants, some fish, some something, and then you can form theories and judgments about evolutionary relationships. So Albert Hofmann, the discoverer of LSD, was amazed when carrying out analytical work for Gordon Wasson on magic morning glory seeds that had been sent to Wasson from Schultes, he discovered the same compounds or very closely related compounds as he had synthesized to make LSD. I'm going to slightly jump around here now and say that in India, there are 13 species of morning glories in a different family — not in the family *Ipomoea* or the family *Turbina*, which are the Mexican families, but in the family *Argyria* — of morning glories which contain these ergotamine-like compounds. This is the Hawaiian baby woodrose. Again, the interesting

thing is that there is no evidence that ancient India, with its obsession for altered states of consciousness, ever utilized any of these Asian morning glories, so this would be something that somebody would want to look at.

Audience: Probably you would not be able to get any hardcore data on the use of mushrooms in Arthurian times, but I was delighted to note in *The Mists of Avalon* that when Morgaine was supposedly banished, one of the faeries of Avalon left her some mushrooms to accompany her on

her journey.

Well, Marion Zimmer Bradley lives in the hills of Berkeley. We can assume she's fully installed and hooked into the myths of the counterculture, but it would be great. Someone told me that they went to the island of Iona, where the Book of Kells was supposedly composed, and they said that there were mushrooms everywhere, that to be there is to be inescapably confronted with mushrooms; and yet there is no tradition, no mention. This is where Saint Columba came and reintroduced Christianity into England in the 900s. Christianity had died out in England; it was only in

the advanced Celtic civilizations on the fringes of the British landmass that the Christian tradition was preserved.

Audience: The deterioration of the etymology of hallucinogen into a delusional, romantic meaning kind of catalyzed my mind going into how mythology has devolved into "a lie." If you look up the original meaning of mythology, it means "the mutterings of eternity," *mytho-Logos*, and this whole thing with Avalon being that place between the worlds that one went to, the mythical part, and Glastonbury was sort of the other place where all this Christianity existed. When I was in a mushroom experience one time in a circle, and I was a recovering Catholic trying to find out what my mind was all about, this one man, this shaman student from the Amazon, he said, "If you eat these mushrooms you're going to be excommunicated, because the Christians will tell you that once you eat the mushrooms you are doomed forever to hell, Satan, and the devil." Well, it's

bullshit, you've got to be kidding. Where would that come from? Maybe the Christian control looked at these people, their paganism and everything, and just wiped out their connection with the other world.

It's very interesting that when the Jesuits arrived in Mexico and talked to the Indians and found them eating these mushrooms, they said, "What do you call it?" and they said, "We call it *teonanacatl*," and when they got their lexicons out and got that pieced together, what *teonanacatl* means is "flesh of the gods." Well, the center of the Catholic mystery is the Eucharist, a sacrificial meal where a small wheat wafer is believed to be transubstantiated into the body and blood of the son of God. So then to place the psychic experience which follows upon a good Holy Communion next to the psychic experience which follows upon a good dose of mushrooms, clearly these guys said, "This is competition we don't need, we're going to wipe this out," and it is interesting. Think about this for a moment. We grow so inured to these religious forms; think about the notion of instituting at the center of your religion a rite where you eat your god, and that is what is happening in Christianity. It suggests that this sacrificial meal idea, which can be traced back even to pre-Exilic traditions in Judaism, is probably a memory of a relationship to some kind of psychedelic experience of some sort. I think institutions will inevitably substitute a rite or a ritual for the real McCoy, because then priests can control the pipeline to God and the parishioner can approach with offerings. If everybody can have a pipeline to deity then the whole priest

scam is put out of business.

Audience: Has Buddhism substituted a ritual for the experience and then empowered the priests? In other words, has the process that you are describing in Christianity happened in Buddhism?

Buddhism is a heresy on Hinduism. It was Hinduism that did the dirty work for Buddhism. By the time Buddha came along, priestcraft was an ancient tradition in India. I'm sure many of you know the Rigvedas, which are these tremendous outpourings of poetry which these Indo-Aryan people created as they came out of Central Asia and into India. The Rigvedas are entirely devoted to the praise of a mysterious plant, soma. The ninth Mandala of the Rigveda says, "Soma is greater than Indra, soma is greater than Vishnu." It just lists the entire pantheon and says, "Soma is greater than all of these things." By the time Buddhism is getting rolling, soma is a suppressed ancient tradition and the soma sacrifice, which is still being done, is being done with inert materials. If you want to read on this then read Wasson's book on soma and notice how it traces back to haoma, which is a yet older strata of religious ritual practice that was Zoroastrian and Iranian in origin. It's very clear that what we're talking about here is an intensely psychoactive plant and there's great argument about what it was. Buddhism, because of the long

historical record in the East, arises entirely within the historical context, so the suppression of the plant connection was in the earlier stratum of Hinduism.

OK, we discussed the central Mexican complex. It has minor components such as were mentioned here. *Salvia divinorum*, and there are others not chemically well understood but also not widely or regularly used, but then as you pass down across the Darién Gap and into South America proper there is just an explosion of available psychoactives. Not only the tropane complex of the dataras, which now reemerge in the subgenus *Brugmansia*, the arboreal dataras which we see around town as ornamentals with huge, pendulous, hanging white flowers. All of those tree dataras, with yellow, orange, red, white or purple flowers, originated in a very constrained area in the Andes and have been used for shamanic purposes for a long, long time. Also, coca is endemic to that part of South America — it occurs nowhere else in the world naturally — but more interesting from my point of view are the tremendous proliferation of DMT cults and options based around two pharmacological approaches: one, you orally ingest DMT at the same time as you orally ingest a MAO inhibitor. MAO is monoamine oxidase: this is the enzyme system that oxidizes monoamines, that makes them harmless. Monoamines are this whole family of drugs we're talking about, and many other things as well. If you don't have any monoamine oxidase in your body, then monoamines just stick around because the machinery to degrade them is inoperable. So, there are what are called MAO inhibitors. This means that you take this compound and it causes the monoamine oxidase in your body to be bound, it can no longer do its work. DMT ordinarily would be destroyed in the gut, in the upper gastrointestinal tract, but if you inhibit all the MAO in the upper gastrointestinal tract then the DMT is conveyed into the bloodstream, can cross the blood-brain barrier and initiate a psychedelic experience. This is the strategy of ayahuasca, also called yagé. North of the Caquetá it's called yagé, south of the Caquetá it's named

in the Quechua language *ayahuasca*.

This is a really fascinating thing for many reasons. First of all, this begins to look like the world's first truly designer drug. Notice what's happening here: all these other things I've been talking about — peyote, mushrooms, datura, cannabis, what have you — are single plants that require very little preparation. Basically, find it, eat it: that's the way you prepare it. Ayahuasca is very different: it's composed of two plants, neither of which is active except in combination with the other. So somebody figured this out. This may not sound like such an accomplishment until you stand in the Amazon basin and look around you, and realize that we're talking 50,000 species per square mile and 50,000,000 square miles, so how did anybody ever figure out that you take the leaves of the little bush and the bark of the woody vine, and combine them in these proportions, and boil them and concentrate it, and then you have this fantastic psychedelic drug? The only way that I can imagine is that somebody told them. My experience is that these plants talk. This does not make sense to the rational and discerning mind, but nevertheless it is

possible for one plant to lead you on to another.

A perfect example of this is actually in the chemical literature. Melvin Bristol was a student of Schultes in the late '60s and he specialized in the *Brugmansias*, the arboreal dataras, and he went to the valley of the Sibundoy, and there they actually add the datura to the ayahuasca. He took this ayahuasca, and while he was on it the ayahuasca entity showed him a man. He kept seeing this plant and he couldn't get out of his mind, and the next day after they came down from the trip he was collecting in the forest with Indians and he came upon the plant, the exact plant that he had seen in his vision. Well, he thought that was pretty strange, so he made extensive collections of this plant, took it back to Harvard, analyzed it and it was in fact psychoactive. It did contain psychoactive alkaloids. So we are tiptoeing over the surface of some kind of mystery. We maybe can bring ourselves to accept that a voice could speak on mushrooms telling you that you should be kinder to your children, or love your mother, or not be so hard on yourself, but it's a real leap for us to believe that a plant could tell you, "You know that plant over there? Analyze

that sucker!" In other words, real information, not information subject to personal interpretation.

Terence McKenna

The whole of the Amazonian narcotic complex, as it's called in the old literature, is based on activation of DMT by one strategy or another. Either by drinking this "ghastly beverage," as the literature calls it, this psychedelic beverage, ayahuasca, or as you go east into the lowlands, the ayahuasca complex is replaced by what's called the snuff complex, and it is based around a number of species of myristicaceous trees. The *Myristicaceae* are the same family as nutmeg occurs in, although nutmeg is an Old World member of the genus. Several members of the *Myristicaceae* contain DMT in the inner bark exudate, and these Indians go out before dawn — before the first rays of sunlight strike the tree, because when that happens this resin retracts — and put their hands on both sides of the tree to determine the coolest side, and strip the bark from that side of the tree. Then they take these long strips of bark back to the village, burn a fire and let it burn to coals, and then spread the coals out; lay these long strips of bark on the coals with the "wounded" side up, the clean inner side up, and this orange resin will be forced out the

bark and onto the surface. Then you can go along with a scraper of some sort, gather this stuff up, put it in a pot, cook it down, grind that in a mortar and pestle, and then you have a dandy paralytic arrow poison which can also be honked up as an outlandish hallucinogenic snuff.

There are many stories of these Y?nomam6 and Waika people going out on the hunt and honking up their supply of drug, just getting their poison arrows out and scraping off the points so the guys can get a buzz on and won't have to go back to the village. It's a very interesting complex, it hasn't been very much researched by Westerners and the reason is easy to figure out why. Here's how you take this stuff: you get with your buddy and you have a bamboo tube — maybe some of you remember this from The Emerald Forest — and you pack it with this ground bark exudate, then you hunker down in front of your friend, put the thing with the loaded end into your nostril, your friend takes a huge inhalation of air, blasts on the end of this thing and just drives this stuff up into your sinus cavities. Everything goes violet, you scream, you salivate outlandishly, you fall over backwards, and by the time you've gotten yourself together your friend has repacked the other side and is ready to give you that. Then you do that — it goes purple again, you scream, you salivate, you fall over — and then people usually say something like, "Good!" I'm sure you've seen the films about this. Napoleon Chagnon did a film, Juan Downey did a film; this is great filmic material. In these Waika villages, I wouldn't want to say it's a drug of abuse, but it's certainly a recreational drug. Not only the shamans are doing this, but people

are just doing it. You see people leaning against walls with a line of saliva coming out of their mouth and people just say, "Oh, he's doing the *ipina*." "Oh, OK." People are in various attitudes of consciousness and unconsciousness...

Coca, of course, there's not a whole lot to say about coca. It's an interesting example of a psychoactive non-psychedelic. The minute you hit the Amazon rainforest they are so concerned that you've been misinformed about coca. They say, "Not a drug! This is not a drug! This is a food, this is a good food, this food makes us healthy." There is some evidence that this is true, that cocaine bears very little resemblance to coca. Coca is not a spectacular experience. What I found was that the way coca works is that you've been sitting with these people for hours and they're talking in Witoto or some language that you have no hope of understanding, you're just about ready to excuse yourself and go to your hammock, and they drag out the coca. The way you do it — this is another thing where people miss the point in South America, because they have no idea how much you're supposed to do. Imagine taking a tablespoon and going into a jar or a sack of flour and getting as much flour as you possibly could on a tablespoon. I mean a high-walled tablespoon; so you get that much coca, you bring it to your mouth and you put it in. It's dry as dust, and the trick is to slime it over, get it into your cheek and hold it there, all without a break in your conversational flow. For a honky, the main effort is not to strangle and disgrace yourself in this scene, because it's usually no women, you're in the longhouse with the men, and these guys are the authentic bare-ass scarified folks, and you're trying to fit in and choking to death on this wad of coca. Well, it dribbles down your throat and suddenly these people don't seem so bad, this place doesn't seem so filthy and you don't seem so tired, and maybe you can make out what they're saying, and maybe you'll just try out a little of what you've picked up on. Before you know it you're the life of the party, and then about 20 minutes later you think, "Maybe now I'll knock off," and then like clockwork they reach for the tin can again and send it around, and

they will do this until it's all gone.

Let's see, which way shall we go? Let's jump across the water now to Africa. I talked a little about iboga; fascinating cult, very similar to ayahuasca in the social patterns that have arisen around it. The way ayahuasca is taken in the Amazon in the Mestizo populations that Luna is talking about is that people get together on Saturday nights in windowless sheds: about one third to have the trip, about one third because they have something physically or psychologically wrong with them that they want help from the shaman with, and about one third who are wannabes or just hanging in for the social occasion. In Zaire and Gabon where the iboga cult is operating, this same pattern exists. These things, ayahuasca and iboga in Africa, are the major forces resisting conversion to Christianity. They really are the native people's answer to the missionaries, and as

such they act as a tremendous force for social cohesion. Outside of the iboga complex, in Africa we really only have rumors.

You will meet shamans from this place and that place, and they even have come and spoken at this school. They claim knowledge of extremely powerful plant hallucinogens but they won't cough up the name, or the species, or a sample, and until that's done you have to be very skeptical that these things are real. One of the things that was so interesting to me, and I mentioned it this morning, is how the shamans are like scientists. We would take ayahuasca with these people and sing, and cure, and go through all these trips and hallucinations, and 6 or 7 hours later, as dawn was breaking and all but the most hardcore people had gone back to their huts, the assessing of the trip would begin. Inevitably people would say, "Well, this was pretty good, but I remember a time in Rio Yaguas when so-and-so made it, and it was like this and like this." In other words, amazing dope tales, amazing stories of other trips in other times and places and what had been achieved, so these shamans were consistently engaged in the search for the perfect high. They were not set in a cultural pattern, they were experimentalists, always on the lookout for

rumors of new plants, untried combinations, so forth and so on.

Returning then to the African situation, there is a complex of plants and suspect hallucinogens in southern Africa in use among the Hottentots, the aboriginal peoples of South Africa. In the family of the *Mesembryanthemaceae*, which includes the *Lithops*, the *Haworthias*, these little ground-growing things that look like stones, the so-called "rock plants," some of those contain mesembrine. Mesembrine is an alkaloid of some sort, with unresearched psychoactivity but a persistent enough rumor of its use that it should probably be checked on. Then when you turn to the Eurasian continent, the largest landmass on the planet, you discover what I referred to before: this surprising poverty of hallucinogenic plants. You get the belladonna complex, the tropanes, you get the opium complex. Opium poppies are native to Southeast Asia and have been used by people in Eurasia at least as far back as the ancient Scythians; we have accounts in Herodotus which make that clear. In fact, there's a considerable amount of Greek archeological material that shows opium diadems and opium poppies being used as ornaments by various goddesses, so

it was understood that it was psychoactive.

Audience: Robert Graves suggests in one of his books that the ambrosia of the Greek gods was actually psilocybin mushrooms. Have you ever come across another allusion to that?

Yes, well it's an interesting question, it has to do with Eleusis, and as you probably know, Eleusis was a major prophetic mystery site in classical and ancient Greece where every September a ceremony would be done, and the rule was that you could only do it once in your life, so you never got a second shot. Everybody in the Greek world would go at some point in their life — Plato, Aeschylus, Aristotle, the whole gang — everybody had this experience, and at the center of it something was drunk and something happened. There's been great argument about what it was and what happened. Wasson and Hofmann and Ruck, who's a classicist at Cornell, all wanted to argue that it was an ergotized beer. In other words, that on the Eleusinian Plain there was a kind of rye being grown which was infected with a strain of *Claviceps* that was mild enough that it was hallucinogenic without being convulsive or causing miscarriages or something like that. Because if you just go out and gather ergot smut, *Claviceps purpurea* — and you should be very careful with it, some of these ergot alkaloids can send you into convulsions and they're fairly toxic —

but it's conceivable that a strain grew on the Eleusinian Plain that was made into a kind of beer that was then this hallucinogenic intoxicant, but Robert Graves, who didn't have the kind of public relations machinery that Wasson had, had a different notion.

He claimed that the surviving recipes of the sacrament at Eleusis, and there were I think four examples of surviving recipes, all called for the same ingredients. Don't hold me to it, but I think the ingredients were barley, honey, water, and something else, *haisa*, maybe. He pointed out that a recipe for beer in Greece would never specify water because you understand that water is part of beer, so he said that these words were code words, and that in Greek the first initial of these four words could be arranged to spell the word ?????, *mykos*, which is mushroom, *mucus*. Part of the Indo-European language family believed that mushrooms are slimy. This is why the word *mucus* can be traced back to the word *mykos*, mushroom, *Mykonos*. Myconae, in fact, means "the land of the mushroom," and so the role of mushrooms in generating the religions of early

Greece is a completely unexplored area, it's never been fully thought through.

This is called an Ogham, by the way, where you take the first letters of the items of a list and the first letters spell out a secret meaning, and it was a favorite trick of Irish bardic poets, which Graves was very much into. Here's a great project for somebody: we need someone to prove that you can brew a hallucinogen out of *Claviceps* on rye. I mean, this ergotized beer rap is just a phrase until somebody puts the stein on the table in front of you. It would go a great distance toward trying to prove their case. Someone should go to the Eleusinian Plain and see if they can still find any cereal grains growing there, and if so, can they infect them with *Claviceps*, or is there *Claviceps* in the area? Now, there's a problem here: I understand there's an oil refinery where the Eleusinian Mysteries used to be practiced, but even in California one could at least take a step toward understanding this, because we have in California species of grasses called *Spartina*. There's quite a population of *Spartina* on the cliffs above the sea just north of Santa Cruz. Well, *Spartina* could support *Claviceps purpurea* as an organism, so why not grow *Spartina* and attempt to infect it with a mild strain of ergot which you could get from the American Type Culture Collection or something like that? See if an ergotized beer could be brewed. The absence of mushrooms in these places does not disprove the theory, because all of the Mediterranean has been

drying out throughout historical times, and there are Greek vases and friezes which do show mushrooms in situations that are ambiguous as to whether or not they are being venerated or exactly what is happening.

I mentioned the *Argyria* complex in India, that's the Hawaiian baby woodrose. That's an interesting one, and I'm always on the alert for these, because I'm interested in unclaimed indole complexes. In other words, why was *Argyria nervosa* never utilized by anybody? It's extremely powerful, you only have to take 8 or 9 seeds, and you don't have to prepare it at all, you just chew it up and swallow it. How come there's no cult, no impact on the history of ideas? Well, we don't know. Those 13 species of *Argyria* are spread from India down through Polynesia. It's called

Hawaiian baby woodrose, but it was introduced into Hawaii 100 years ago, it has nothing to do with Hawaii.

The only major complex that I didn't discuss is the cannabis complex. This is one that is not an indole, and there are many anomalous things about cannabis. First of all, it's what is called a polyhydric alcohol, the only psychedelic polyhydric alcohol known to science. It's an extremely old plant. I mentioned last night the relationship of the metaphors of storytelling and weaving and language, and of course hemp is a fiber plant. We find hemp mats that go back to as late as PPNB, Pre-Pottery Neolithic B. At Catalhöyük there are hemp mats. Well, it's very unlikely, what with tossing waste from weaving into fires and the oiliness of the seed and so forth, that the psychoactive properties of this thing were not discovered. Cannabis originates in Central Asia, the original species is *ruderalis*. Then very early in prehistory it divided into the resin race, *indica*, and the

fiber races, and then it was carried across the land bridge, presumably, into North America and that accounts for the *sativa* variant and so forth.

Herodotus describes, interestingly enough, that marijuana was used for thousands and thousands of years before it was smoked. One of the hardest things to wrap your mind around is the notion that until Columbus discovered the New World 500 years ago no one in Europe had ever conceived of smoking anything. It was a New World cultural practice, and if you read Columbus' diary of when he landed in the New World, he was amazed. He wrote, "The natives drink smoke." That was the only way he could imagine it: "What are you doing?" Then, of course, it was less than 100 years before it was a major vice of the sophisticated raconteurs of Europe. Within 100 years of the introduction of tobacco into Europe, tobacco was being buried in the graves of Lapland shamans above the Arctic Circle. So the shamanic nature of tobacco was immediately recognized, even in the European context. Herodotus describes marijuana ingestion as a process somewhat like being in a sweat lodge and then pouring hemp seeds and hemp waste onto the hot rocks and letting it mingle with the steam in this closed space and deep breathing, but nobody ever had the notion of a pipe or anything like this. It's very interesting for many different reasons, and one is that it's a new use for the human body, less than 500 years old in European culture. At Non Nok Tha in Northern Thailand, and in other Neolithic graves, they have found long bones, arm and leg bones with burned-out centers, and they don't know whether this was a marrow extraction procedure or if it was a chillum. A chillum is a ceramic tube, narrow at one end and wide at the other, and you pack it with hash and tobacco and then you hold it and inhale.

It may be that smoking was known in Asia in Neolithic times but somehow died out in the preclassical period and had to be reintroduced from the New World.

Audience: Terence, do you want to comment about *Amanita muscaria*?

Yes, I'm glad you reminded me. *Amanita muscaria* is perhaps the Old World hallucinogen *par excellence*, at least in the opinion of Gordon Wasson and a lot of other scholars. The problem with it is that it's extremely difficult to get a reliable positive experience from it. The reasons for this

are complex: first of all, it's geographically variant, it's seasonally variant, and it's genetically variant. So only if you have lived in an ecosystem virtually your entire life and have inherited the accumulated knowledge from the shamanic elders of your tribe are you going to know whether you've got a good one or not. Nevertheless, Gordon Wasson tried to argue that it was the ur-hallucinogen, the prototypic hallucinogen of prehistory used by these Vedic peoples who invaded India. In fact, he thought it was soma, and I had correspondence with him about it before he died. I

think the soma question isn't settled and it could well have been a coprophilic mushroom associated with the dung of cows. After all, the role of cattle in Indian religion is very central, and in fact the role of cattle in early religion generally is extremely central.

I mean, you do not get goddess religion in the ancient Near East without cattle worship. Cattle and goddesses seem to go very much together, and on the other hand, the Dionysian-Mithraic complex is a bull cult, and it too can be traced back into time until it's just lost in remote antiquity.

So, yes that's the Arctic mushroom used by Siberian shamans, and it's been made the prototypic hallucinogen, because Siberian shamanism was made the prototype of all other shamanism, only because some anthropologists somewhere decided that that would be a good idea.

Australia is again singularly poor in known hallucinogens. I always say in known hallucinogens, because somebody could go out into these places and come up with something brand new, something that we've overlooked. This is a great challenge for fieldworkers.

The other thing I want to say, and then I'll stop for today, is a bit about this issue of synthetics. Are all psychedelics the same? Are synthetics in any way inferior or superior to naturally occurring hallucinogens? If so, why or why not? This controversy began for me as an aesthetic issue. I just felt better about taking plants sanctioned by thousands of years of use, but I didn't particularly feel that it was a strong distinction. But the more time I've spent with it, and the more time I've spent with Rupert Sheldrake's theory of morphogenetic fields, the more I come to see that I really think there is a very large distinction between synthetic and naturally occurring drugs. It's not a distinction that you're going to get a chemist to agree to, or a materialist. As far as they are concerned DMT from a plant or DMT synthesized in a laboratory are exactly the same thing, and as far as they are concerned, a synthetic hallucinogen like, I don't know, ketamine, let's give it the benefit of the doubt for the moment. Ketamine and a natural hallucinogen such as psilocybin, the differences do not reside in the fact that one is organic and one is synthetic. I think that

these plants take people as much as people take the plants, so that when you have a mushroom trip, you not only are having a mushroom trip, you are contributing to the future mushroom trips of everybody in the future who will take this thing.

In other words, you make a small offering on the altar, and that henceforth becomes part of the setting of the thing. It's like the notion of the Tao of the ancestors: when you take one of these ancient hallucinogens you are locking into the morphogenetic fields of all the people who ever took it. How else are we to explain the fact that when you take morning glory seeds you are flooded with Mayan imagery of staircase cities and hieroglyphed balustrades, people dressed in gold and Quetzl finery and all this, or that when you take ayahuasca, even in this culture, there is a

very strong impression of the jungle, of jaguars, of rivers. These things are coded into these compounds somehow. It seems to me, without talking about issues of toxicity and pharmacological uncertainty, that the content of the naturally occurring hallucinogens are much richer.

One last I point that I want to make to sum up this geographical survey of what is available is to say that, again, another research frontier is China. There is very little evidence of any use of hallucinogens in China, and yet there are clues that mushrooms were understood, that other plants may have been used, the knowledge of which has been lost. The Cultural Revolution did a pretty thorough job on wiping out this kind of traditional Taoist shamanic data. A very simple way of focusing the problem is to say that there has never been reported from China a psilocybin-containing mushroom, and yet I'll bet that if a reasonably informed investigator were to go to southern China and spend no more than 2 or 3 months off the beaten path, talking to country people, I'll bet you could come up with half a dozen psychoactive mushrooms with a history of folk

usage, it's simply that the question has not been asked.

Well, we're not going to have a clear understanding of the historical development of Chinese thought and institutions unless we know what their relationship to the invisible world precisely was, and I think that the indigenous tradition of shamanism, which then became Taoism, which

became the real substratum of Chinese religion while it weathered various late-grafted variants and foreign imports like Buddhism, but that native stratum of Taoistic shamanism hints very strongly that there was psychedelic usage of these plants in ancient China.

A couple of people expressed interest in this week that I'm doing at Esalen, so I might describe it a little bit. It's quite different from this, it's an in-depth involvement in the mathematics of the I Ching and then a theory that I evolved out of my engagement with that that has to do with the structure of time and analysis of history as a predictable phenomenon. It has no connection with psychedelics, other than that the entire thing was dreamed up under the influence of psychedelics, but it's a stand-alone idea. If I am able to control the group, I will keep it quite far from psychedelics except in moments of rhetorical desperation. If you are interested in the I Ching, don't let the word "mathematics" put you off. I am not a mathematician, and the best mathematicians aren't either. It's just a way of talking about it and doing analysis that was very fruitful, so that's a five-day, from the 28th of this month to the 2nd of December at Esalen. A lot of people will be bringing their computers, there will be a lot of machine implementation people. It will go from Taoist scholars to assembly language programmers, and everybody will have more of a

contribution to make than they suspect at the time.

Well, hopefully you turned some of this over in your minds in the time that we were apart. I certainly did, in the sense of trying to figure out what I had missed and whose concerns had not been met. What I came up with was your interest in the specifics of time, place, and manner, which

should certainly be covered because it's operational information.

Talking about the various visionary plant complexes that we talked about yesterday, each one of these things has a style and a set of demands that it makes on its practitioners. If you look at the ethnographic literature you then see how the people who have used these things over millennia have come to terms with them, how they have accommodated themselves to these things. For instance, in the iboga cult of Gabon, what is aimed for is that early on in the involvement in the plant, a massive dose is taken, and they say, "It splits your head open," and you never have to take very much again, because somehow a creode or a predilection has been created and then you are initiated into this. When you read the ethnographic literature it's hard to believe how much they say they are taking. There's a saying in Gabon — Bwiti is what they call iboga — "Bwiti begins at 60," and that means 60 grams. Even allowing for the fact that they're using fresh root and you might get a collapse rate of 50-75%, that still means they're saying that Bwiti begins at 15-20 grams, which from my own experience with this stuff I can tell you is not even a

conceivable place to begin. That's not a strong hit, that's an impossible hit.

You have to know, pharmacologically speaking, the window of effective activity. Every drug, every compound has a profile which you can imagine as a linear spectrum. Below a certain amount it's undetectable, above that amount it becomes detectable, first as this CNS arousal that I mentioned yesterday and then as a full-blown psychedelic experience. At higher doses it begins to have toxic effects; all drugs are toxins. People often make the mistake of thinking that if you have a toxic substance and you take half of it, then it's not toxic because there is no register of its effects, but of course everything is incrementally toxic. Some things are very safe, have a great range of effectiveness well below the range where any toxicity begins to set in; other compounds are active as psychedelics at a level just slightly below the level where you're going to begin

to have toxic effects. So you want to know what the profile is of the particular substance that you are thinking of taking.

In pharmacology, one of the parameters that they establish is an LD50, which is a fairly unpleasant concept which you should nevertheless be informed of. LD50 means lethal dose 50. This means that we have 100 mice and we give them an unknown drug; at the point where half of them die, that is the LD50 dose of that compound. There's an LD100 and LD10 and so forth. What you want is for the LD50 to be tremendously high relative to the effective dose. Now, the perfect or model compound in that case is of course LSD. LSD is active at the 25 microgram range, 25 ? . A microgram is a millionth of a gram. It's well below a smidgen. The LD50 for lysergic acid has never been determined. It's never been found how much it takes to kill half of the test animals, so that makes it a tremendously safe drug if mortality is the only concern. Of course, what most psychedelic trippers eventually realize is that mortality is rarely at risk in psychedelic experiences. What's at risk is sanity. Being nuts is not as bad as being dead, but nevertheless it can spoil your entire day. It's very reassuring to have taken a compound like psilocybin, and having

become totally convinced that you are dying, to remind yourself that the LD50 is 200 times more than what you took, and therefore it's impossible, and you merely have to discipline the hindbrain and take control of your fear and then you will be alright.

We've talked so much about hallucination here, and always because of my particular bent which I have unconsciously transferred to you we're talking about visual hallucinations, but all psychedelic explorers should be aware of the concept of what is called a cognitive hallucination. This is a much more insidious phenomenon; this is quite simply an out-and-out delusion. The commonest form of cognitive hallucination goes like this: you take mushrooms, an hour and 20 minutes into it it's getting mighty strange — this is especially a problem with first timers — and you realize

with the force of revelation that you didn't take psilocybin, you took a poisonous mushroom, and now you are going to die. This is an out-and-out cognitive hallucination which is as real as a belief, but it is not a disturbance in the visual field, it is a disturbance in the cognitive machinery.

A friend of mine had never taken mushrooms and was very concerned about how to do it and got the instructions from me — silent darkness, quiet room, stay sitting — and took them in his room in silent darkness. At about the hour and a half point he realized with a demonic chuckle that I had been kidding, I had been putting him on, and actually had told him to stay in his room because we were preparing a surprise party for him at the bar two blocks down the street. Chuckling to himself with this realization, he showered, dressed, went down to the bar, pushed open the door and said, "I'm here!" and the guy behind the bar said, "Oh, really?" Well, the trip got wilder from there, because in the wake of disconfirmation in one of these cognitive hallucinations people tend to become confused, paranoid and upset. You have to continuously track your mental processes and it's really good to stick with whatever rules that you've laid down for yourself. I actually apply this technique in my own life. If I get to the place where I cannot understand what is happening, I try to think back to the last moment when I did understand what was happening,

and then do what I said I was going to do then, having given up on understanding it in the moment.

The practical fallout from this in terms of psychedelic research is what we call the "chained to a tree technique," which is where you just chain yourself to a tree, and providing you don't hang yourself with the chain, this cuts down the possibility of doing something peculiar. With psychedelics this doesn't tend to be a problem, but for instance with datura, the best intended and most together people lose it completely and then come back into it 12 or 24 hours later to just survey the swath of wreckage that they have cut through their own and other peoples lives. I had a friend years ago, a very diminutive, attractive woman who took datura with a couple of boyfriends, waited hours and hours, nothing happened. They finally decided to go to their homes. She walked them down the stairs, said goodbye to them at the top of the stairs — it actually happened in the Haight. That was the last thing she remembered until she came to on the 6th floor of the federal building in the San Francisco County Jail. The charge was assault on arresting officer, and the evidence was the officer's thumb, which had been bitten off. She was an

Antioch PhD in medieval literature, so it happens to be the best of us.

Audience: Can't you eliminate a lot of that cognitive uncertainty by having somebody with you when you do this?

Yes, you can. I'm only speaking from my own experience, and I may have an odd take on it, because God knows, I'm odd, but to my mind the ideal situation is to have the sitter two rooms away, and to have a doorbell or the equivalent, because if the sitter is with you, you start to analyze the sitter. As someone once said to me in India, "Face is index of mind," and the sitter can just become an existential galaxy of possibilities, because you can read their history, their intent, their most secret thoughts — your belief in what are their most secret thoughts. People are concrescences of ambiguity that you don't want to get too tangled up with in that state unless you really are ready for the trip to take that particular direction. I don't know if it was in this workshop or the other night that I mentioned that I recall a trip I took with this English guy; it took me

two weeks to get his voice out of my head. It just became like this accompaniment to consciousness, this stream of sort of understated, English upper class gibberish on all subjects, and finally it retracted.

That's called becoming a victim of the transference. All psychotherapists are aware of this. The transference is when you get dragged into the other person's system of values or delusions. There's even a name for this in clinical psychology: it's called allophrenia. Allophrenia is schizophrenic behavior on the part of normal people in the presence of schizophrenics. This is a real problem. Your friend is put in the place, you go to see your friend to cheer them up, and your friend is not violently insane, but saying strange things, behaving in strange ways, and you, in an effort to relate to them, begin saying strange things and behaving in strange ways, and before you know it, the resident has to break in and escort you to the elevator because you're causing a problem in the ward. The transference is this phenomenon happening among people who are more or less psychologically healthy, but still it can be very disrupting.

I think the sitter should be there only if there's a three-dimensional emergency. I like the word "sitter," because it's operational, it tells what you should do. "Guide" is not such a pleasing word: this implies control, prior knowledge, hierarchy, so forth and so on. The best guide-sitter I ever knew was a wonderful old guy, he's dead now but I'm not yet ready to say his name in public, his style was that he read these paperback trash novels. He would just sit down with somebody, give them the stuff, and every once in a while they would fight their way out of this ocean of

hallucination to deliver some insight and he would just put down his book and turn to them and say, "That's nice, now go back to the music." This guy could get 600 pages in a situation where he was nominally in charge of a dozen people who were tripping. Non-intervention, I think.

Then there's the question of doing it with another person, meaning that the other person is going to be stoned too, and this has its own pitfalls and ambiguities. If it's your lover, your sexual partner, then in my opinion that's probably the best way to spend your time. If it's not, then the sky's the limit. You're going to learn more about this person than perhaps you were prepared to. Sometimes it's easy, it's no problem, everybody stays who they appeared to be before you took off, but sometimes the masks just start being hurled across the room in all directions and you don't know where it's going to leave you.

My approach, I guess, is one of two extremes. I sort of belong to the sensory deprivation school that says, "Lie down, shut up, silent darkness, music very judiciously, if at all," and I always do it at night, which some people find strange, but night is quiet, the energy dies down. There is calm and still between midnight and 4 a.m. The other end of the spectrum is someone like Salvador Roquet, who gives you three drugs, plays heavy metal rock 'n' roll, then you get to see the Auschwitz film. I'm not kidding: it is an effort, so far as I can tell, to drive you absolutely starkers. I would not submit myself to that. This same polarity exists in therapeutic theories. Some schools of therapy want you to lose it, want you to weep, lament, rend your clothing, throw yourself on the floor, kick your feet in the air. This is called "getting out your stuff," or "working through your stuff." What I find about this kind of thing is that it resonates too long. It doesn't feel like you've gotten clear of it, it feels like you have simply objectified it, but life is an uncompleted puzzle; I could certainly change my mind.

I have never felt that the primary use of these things was to cure what is called in modern parlance "neurosis," what I call "unhappiness." It isn't for that. This may be the influence of Jung in my background. Jung felt that there was no such thing as normality, that the task of life was what he called individuation, and he felt that it doesn't really begin until you approach middle life. You must leave the 20s behind you, because they are so socially and hormonally turbulent that you're just basically trying to make sense of it on a day to day basis. Then you settle in and this unfolding takes place. I really assume that we are all beyond neurosis; not that we are not neurotic, but that we all have our own strategies and our own take on our own quirks and peculiarities. The psychedelic thing as tool is more to go beyond the legacy of the normal into the

transpersonal or the suprapersonal, and really view life as an open-ended domain to be explored.

I find myself talking to psychologists a lot — because this is where this has been seized upon, because it does perturb the dynamics of the psyche — but for instance, I don't think you should give people hospitalized for psychotic behavior psychedelics. They are having enough trouble. They are being overwhelmed by the contents of the unconscious 24 hours a day and have no tool to make sense of it. The rest of us can make sense of overwhelmed by the unconscious if it doesn't go on too long. I don't think there's any one of us who would wish to take mushrooms, arrive at the heights and just stay there. After 48 or 72 hours, some situation would arise which would cast us into an extreme state of disequilibrium. It's more like diving. A friend of mine said many years ago, "The yogi," and sub in "shaman," "psychedelic voyager," "The yogi and the schizophrenic dive in the same ocean, it's just that the yogi remembers to take his tanks along." That's what it is: there is this possibility of inundation and overwhelm. Well, let's return to the matter of dosage and set and setting.

Audience: You mentioned yesterday how you favored organic materials over synthetics. What about taking organic materials and then refining them and narrowing them down, getting rid of all the other ingredients in the plant? That's our Western tendency, to take something and refine it down and isolate the active ingredient and then take doses with that. Do you see that the natural ingredients in mushrooms, or ayahuasca, or whatever it is, have provided and sort of synergized the active ingredients and made the trip easier or smoother?

Yes, I think so. Rarely in a plant where you have a psychoactive compound will it occur all by itself. For instance, in the peyote cactus, there is mescaline, there is *N*-methylmescaline, there is anhalamine, anhalinine, there's a whole family, about a dozen of these things. Similarly, in the coca bush: cocaine, several other -caines and several other active compounds. When you take a plant, you're getting a broad spectrum of these active molecules that have a familial relationship to each other. No chemist has ever exactly explained to me what's happening, but I think all chemists and pharmacologists are aware of the fact that natural compounds, even extracted or purified, are smoother than their synthetic counterpart.

I recently had occasion to relearn this because there's been some amount of experimentation with 5-methoxy-*N,N*-DMT, which is not like DMT, but it is short acting and creates a profound oceanic emotion, but also in the pure substance there's a tremendous heart rush in the first 30 seconds. I mean, you just feel like you are in an up-elevator which knows no limit, and just about the time that you figure you're going to go into some kind of emergency situation, it tends to back off. So recently there has been this material in the underground called "toad foam," which is actually 5-methoxy-*N,N*-DMT extracted from the glands of a large southwestern toad. Well, when you smoke that, it too is 5-MeO-DMT, but there is no heart rush and it also doesn't last as long. It's much more benign and easygoing.

Even in cases where there isn't a detectably variant spectrum of compounds present — for instance, in *Stropharia cubensis* there are really only two active principles: psilocybin and psilocin, and psilocin is the dephosphorylated ester of psilocybin, so they are basically the same compound. Nevertheless, if you talk to somebody who has only taken Sandoz psilocybin, it's much less animated and interesting than organic psilocybin. The counterexample to this is that when Hofmann synthesized psilocybin for the first time, he gave some of it to Wasson, and Wasson took it back to Huautla in the Sierra Mazateca of Oaxaca and gave it to Maria Sabina, and Maria Sabina said, "The spirit of the mushroom is in the little pill." This story has been repeated over and over again. My assumption is simply that Maria Sabina was a wily old lady. It's not writ anywhere that

shamans have to always tell you the truth, and I very seriously doubt that the experience is the same, although I've never had the opportunity to take chemically pure psilocybin.

The difference between the morning glories and LSD is one of animation and color. The morning glories — I'm talking now about *Ipomoea* and *Turbina*, the Mexican species — when you take them there is a flood of Aztec, Toltec, Mayan imagery. It's just uncanny. You can't believe it while it's happening, that you would see this much carved obsidian, glyphs, Quetzl feathers and all of this stuff. Is it the morphogenetic field? Is it the broader vegetable spectrum of the alkaloid rather than the synthetic? Who knows; these things remain to be looked at.

In terms of the theory of morphogenetic resonance — some of you probably follow Rupert's ideas and Rupert himself — he problem is that the morphogenetic field is very difficult for instruments to detect. So far the only instrument I think that can detect it is the human mind. This probably means that it's perturbing a field that is very, very far removed from the fields associated with the four or five ordinary forces of nature. But for instance when you go to Tikhal in Guatemala, or Borobudur in Central Java, or Konark on the Puri Coast of India, and you take these psychedelics, the past is present. You see these places at their height, and you can say, "Well, it's just suggestion," but I don't know.

When I take ayahuasca, wherever I take it I encounter the motifs typical of Amazonian shamanism: the jaguar, the giant anaconda. To show you that sometimes the iconography of these compounds is not predictable: black people. Everyone in the Amazon says this, that you see black people. Well, there are no black people in the Amazon, not really. In the Lower Amazon there are a few, but in the Upper Amazon a black person is as rare as a Kurd, and yet everybody insists on this. I have had this experience on ayahuasca, and to call it "seeing black people" is a very mild gloss on what it is. It's like being at the Apollo Ballroom on a hot evening in 1960 and Aretha Franklin is onstage; I mean, it is a deep hit of blackness.

I don't know quite what to make of it. I don't know why, and Claudio Naranjo gave harmaline to urban people in Santiago, Chile — stockbrokers and advertising executives, people who have no connection to the jungle — and they reported jaguars, giant snakes, jungles and black people. This is a tremendously fertile area for Jungians to look into. Psychics have claimed since who knows how long that by holding an object in their hand they could penetrate its past states of being. Well, it's like all these other occult claims in my experience: mantra, yintra, yoga posturing, past life recovery. For me, none of these things are possible unless I'm stoned, and then they all become possible. It's like you just throw the switch and suddenly mantras work. I can chant mantras until hell freezes over in an unstoned state. The precondition for empowering occult idea systems seems to be a shift in brain chemistry.

It's to be noted that in these cultures where a lot of magic, a lot of violation of natural law is going on, there is a lot of psychedelic stuff going on. Among the Aguaruna-Jivaro for instance, a very no-nonsense tribe of headhunting people in the Amazon, the shamans live continuously in a state of altered consciousness. I mean, they are taking this stuff all the time, it is a food item. What would it be like to be the shaman of the Aguaruna in the jungle, all the time taking all this stuff? It's hard to imagine, because when you just do it once all plants have auras, all plants have songs which can be extracted out of them. They are living, literally, in some kind of other dimension.

Audience: I'd like to play devil's advocate, if I can for a minute, about this whole idea that certain plants or certain substances have certain attributes or certain places that they take people to. I've had the ideation that you're talking about — the visualization of the snakes, the cats, the jungle, the pyramids, the whole Mayan aspect, jungle and shamanic routine — on LSD, on mushrooms, on ibogaine and on yagé, and I've had clients that have had the same ideation doing breathwork.

Yes, this raises a real question. I don't understand exactly how this works. I will join your side for a moment because there's a phenomenon that I've noticed, and some of you have heard me talk about it. It's possible to do this on psilocybin; it's really easy to do it on ayahuasca.

Ayahuasca, in a way, is somehow more open to suggestion. These other things have their own agenda; ayahuasca will work with you. One of the bizarre things that you can do on ayahuasca is that you can suggest a period, let's say Italian Baroque. You just say it in your mind and paintings, altarpieces, architectural spaces, balustrades, vehicles, armaments, saddlery, clothing, serving utensils, bowls, pewter, candelabra, all of this stuff will begin drifting toward you, and it is high Baroque. In fact, it is more Baroque than the Baroque, it's obviously what they were

shooting for. Then you say, "Dynastic Egypt," and you get a hawk-headed guy. Then you say, "Art Deco," and thousands of cigarette lighters and coffee tables appear, more intensely realized than when you actually encounter these things in real life.

Well, what does that mean? I have no idea. First of all, the possibilities seem to be that what we call styles or motifs are actually categories in the unconscious, but the amazing thing about it, having looked at the Italian Baroque, Dynastic Egypt, and Art Deco, is that you can also say to it, "Surprise me," and suddenly it can surprise you, 100%. It can show you objects that you cannot place to any set of motifs, any historical period, past, present or future, and then you can say to it, "Surprise me again," and it gives you Surprise B, which is completely different from Surprise A and also not related to any known style. So then you say, "Are styles categories in the unconscious? How many of them are there? What does it mean then for a group of people in 1680 or 1930 to suddenly find one of these places and punch into it?" Then another question is, "Is there a necessary historical progression, or is it by chance?" In other words, "Could the political world of the 16th century have lived with the design motifs of Art Deco? Could we have had Columbus arriving in America in a ship consonant with the best canons of Bauhaus design?" Strange

questions, friends. "Is there necessary succession in style or are these things pure chance?" I don't know.

Returning to and responding to your demonic advocacy, it may be that going to Tikal preconditions you and that pushes the button, and then when you take the psychedelic you realize that the high Mayan, the classic Mayan button had been set, and then you find all of this stuff. It's a little more bewildering to have it happen in your living room.

Audience: My feeling about it is that those experiences are available to anybody in various states, with various ways to get there, and I don't feel that it is mutually exclusive to say that some substances do seem to have a certain predilection for certain kinds of experiences. I've had both feelings about it, that the bandwidth of experiences is available and some things are more likely to put me there than others.

Well, LSD is a relative of morning glories, so if you got Mexican imagery off of LSD that would be understandable. It may be that all the indoles resonate together, and Rupert is fond of saying, "The thing which is most impinging on the present is the immediate and most closely related past," but also impinging are the related past moments and the related contingencies. Perhaps all of the indoles can access each other. One thing that I've done on psilocybin — and you might try this, this is an interesting experiment — once you get it up and running smoothly, then you can say to it, "Be MDMA" and it will be it, and you can say to it, "Be LSD!" It loves to do imitations of other psychoactive drugs. I don't think you can say to MDMA, "Be DMT!" and it will move over into that space. You hope not, don't you? Obviously, it's some kind of freely commanded modality in the psyche with which we can have a relationship if we will but evolve a control language and a dialogue. It remains mysterious. A point that I made yesterday that I think is worth repeating is that the psychedelic experience is the beginning of the spiritual path. That's why it's

not important that yogis claim that they can deliver you the psychedelic experience, because it begins with the psychedelic experience and then you go from there.

I said something like this a few weeks ago at the John Ford Theater in L.A., and this guy got up and said, "So why don't you take more?" which I think is a very interesting question, very valid for me, personally. Our whole lives, we conceive of spiritual development as looking for the answer: is it Taoism? Is it diet? Is it tantra? We look for the answer, and I think we have become so accustomed to looking for the answer that it's never really entered our minds what it would be like to find it, to have it. Once you come face to face with these psychedelics, the trail ends. You have found the answer. Perhaps because you're smart, perhaps because you're lucky, perhaps because you deserved it, perhaps because you hang out with the right people, you have found the answer. Now the question is, "What the hell do you do with it?" because the answer is

going to make hash out of your life, because your life is based on living without the answer. Suddenly it's not, "I want to be an enlightened being, I want to be a shaman, I want to be a Taoist, I want to be a yogi." Be it, see how you like it!

So the answer to the question, "Why don't you take more?" is because I am attached, basically. It is entirely my own attachments that now impede my spiritual growth. Nobody is holding me back, nothing is holding me back except my sense of the awesomeness of what is now possible. This is true of everybody who reaches a certain point. Think of the Taoist sage on Cold Mountain who has been up there in the fog and the mist and the rock escarpments for 30, 40, 50 years, and the people in the village occasionally mention him to each other and say, "Is old Fuzhi still alive? Has anyone seen him recently?" and someone will say, "Oh yes, I saw him three years ago across a valley gathering wood, but when I approached he ran further up the mountain and disappeared." To be Fuzhi is entirely possible, to actually attain what we have previously thought of as unattainable spiritual accomplishment, but I don't think it can happen without leaving everything. Do you really want to be a Taoist hermit circulating the light for 200 years in a cave, high up above the timberline? You can; there's nothing stopping you once you understand that this

psychedelic vehicle is available. I am appalled at that. I mean, it's one thing to change your life to be nicer to your coworkers, it's quite another to change your life to be incomprehensible to 99.9% of all humanity.

Once you have the psychedelic tool in hand, then real choices have to be made. What is this to you? Is it simply something that you do once or twice a year to affirm to yourself that it's possible? Is it something that you can use in some way for your good and the world's? That's sort of where I have come to rest, and I hope it's not a delusion, but I think that there are ideas out there, and that they don't do any good out there, that they only have efficacy if brought into three dimensions. There are all kinds of ideas, in fact they are all ideas. So we're talking about a more efficient internal combustion engine, how people can learn to love each other, how to save the planet, the most efficient way of packing crackers in a box for long shelf life and low destruction of their structural integrity. It doesn't matter what the problem is, the answer can be found out there. It puts people who are into this psychedelic thing in an entirely different stance from all other spiritual seekers, because all other spiritual seekers are furiously seeking. Psychedelic people are holding it back with all their power because they are in the presence of the mystery, and

then the trick is to get a spigot on it so that it can be turned on and off, rather than just coming at you like a tidal wave a mile high and twenty miles wide.

It's a different problem, an embarrassment of riches, an embarrassment of access to past, present, future, alien dimensions, mantra-hoarding elves and promise-bearing demons. Strangely enough, it creates a certain kind of conservatism. I don't think that everybody realizes this. Many people take psychedelics in order to prove to themselves that they can, and then gain acceptance from their social group. It's a way of fitting in. You can always evade the mystery, not always, but if you're trying to from the get-go you can evade fully confronting the mystery, but if it's

what you want, you will quickly discover that you have hit the main vein, and that changes the rules of the game pretty entirely.

Audience: Some psychologists say that psychedelics will only take you so far, and then you have to do something else, but my experience with it is that that's not true and it will take you as far as you're willing to go.

That's what I think, I think people who quit doing it see something, detect. If you think of the self as a diamond, the psychedelic is pressure on the diamond. You can raise the pressure to 1,000 pounds per square inch and there are no structural flaws, but if you raise the pressure to 10,000 pounds per square inch microflaws begin to show and sheer lines appear, because everything will fly apart at a certain level. One cannot encompass this mystery. I think finally you have to avert your eyes and just — "adore" is a strange word, and "worship" is also a strange word — but

certainly give credit to. It is not a program that you finish, and people who say, "I learned all I could from it," probably learned mostly that they shouldn't do more of it.

Audience: I think it threatens to put people out of a job, especially psychotherapists.

Well, it threatens to put anybody out of a job, because eventually the contradictions of living in this low-level slice of reality will just become unbearable. This actually happened in the '60s, many people quit and dropped out for many reasons, but the seed of all that talk is that you just say, "This is absurd, I am going to sit." That's not absurd. But what about your stockbrokerage? What about your portfolio? What about your divorce in progress? I think that the depth of this cannot be taken. Eventually the male ego in every single one of us, regardless of our gender, will feel threatened, because it's hardly different from death, because you're not going to recognize yourself. That's the point that I wanted to make in talking about the guy up on Cold Mountain. Once he ran a gas station, once he followed the Dodgers, but then it all began to slide in a certain

direction and he is no longer recognizable to himself.

Carlos Castaneda has Don Juan say, "You must lose your personal history." I don't know whether Don Juan is a real person or whether he ever said that, but it's interesting, that notion. How many of us would be willing to become unrecognizable to ourselves? And yet obviously that's the path that one is on, and so then you just decide, "Is there an obligation to go to the end? Do I have to become a genie? Do I have to become a Taoist sage, an immortal?" and I think the answer is no, one doesn't have to do that. Buddhism creates the notion of the Bodhisattva, that is in a way this same thing. It's where you're just about to go over the hill into incomprehensibility, and then you say, "Wait a minute, what about the people in the prisons, the naked, the hungry, the oppressed?" and you pull back and say, "No, I forswear enlightenment until the last being attains enlightenment." Well, it's a noble gesture, but I'll bet these Bodhisattvas make this vow with a tremendous sigh of relief. Now they know what they're going to do with their lives: they're going to work in prisons, or council the dying, or get into political action. "Gee! For a minute I

thought I was going to go straight into the light, and become unrecognizable to myself and lose my definitions," and so forth and so on.

Audience: The two words that struck me were "adore" and "worship." On Friday night Matthew Fox quoted, "We have come to a point in history where we must either find some form of meaningful worship or commit suicide," and somehow that quote came back when you mentioned, "When one may reach that point of the penultimate truth, of the unspeakable, or the formless form, or the light," and the mushrooms are pointing the way. Breath therapy, all these things are only something that points you to the ultimate, and when you get there it moves into the adoration and the worship level. Interestingly enough, coming from a recovering Catholic, I could never find any kind of religious community and I didn't want to join a monastery for that purpose. What I see is this neurosis or unhappiness that exists in so many people in this country. They have no

contextual format for worship, because it doesn't have that power for them to do it.

You have to have the personal experience of something to worship: this is what has been lacking. What the churches are peddling is high abstraction, and you really have to work yourself up into a lather to be able to accept that as worthy of that kind of attention. The psychedelic subset of society is into an experience, it's accessible. In a way we're like Calvinists, not in our ethics or our restraint on behavior, but in our insistence on a direct personal relationship with the mystery. This is something very new. We have really accepted the idea that truth descends through hierarchies, basically from Newsweek and Time and the Washington Post down to us, as consumers of these various images of what is going on. The notion that you might know more about reality than the combined editorial board of Scientific American and the Journal of Foreign Affairs is startling stuff. We always give ourselves away, we don't realize that it only depends on you. To believe that at Cornell or down at SRI people understand the universe is not helpful. You must understand the universe, and if you don't know partial differential calculus then your model of

how the universe works must do it without partial differential calculus. In other words, it's not writ anywhere that only one model will work, and in fact I think that all abstract models should be highly suspect.

We have to view life as an opportunity. What are you doing with it? Are you afraid of it? Some people live their lives and apparently what they are doing is arranging their deathbed scene. They want it to take place in a large baronial house with clipped green lawns, acres in surround, they

want the room in which they die to be filled with fine art, they want their loving heirs to be dutifully assembled while they pass out the final wisdom, and they spend their entire life creating the dramatic scenario of their passage. Of course you have to work hard, because you've got to make the money to buy that house, you have to sire all these children, educate them into your values so they won't be stabbing you in the back and misbehaving in this situation. You have to create loyalty, possession, power, all of these things and then you won't die in a ditch, unknown and

abandoned; but on the other hand, what was the quality of that life?

Life is an opportunity: how much pressure should you put on it? How many places should you go? How many drugs should you take? How many sexual configurations should you experiment with? How many professions? It depends; the question, I think, is, "How seriously do you take it?" Do you just think that life is a lark and it's fine with you that you're going to go into a pine box and be forgotten for all eternity, or do you have some inner consolation that that won't happen and you're going to go off and be with Lao Tzu and Mao and everybody else who ever died? Just

what is it? I think of it as a telephone booth being filled with water. You can see that when the water reaches the top of the telephone booth you're going to be dead as a doornail, so you have 30 years to figure it out.

We are alive, there's no contest about that. It's extremely improbable that we should be alive, that we should be here thinking, feeling, sharing. The fact that we're alive throws open the whole game, means anything is probably possible, but I doubt that it's easy. I'll bet that you have to be very smart to figure out what's going on and get it right, so I guess I have a private religion of intelligence. It isn't how good you are, it's how wily you are, which was the Greek virtue of Odysseus, that was always his epithet. He was "wily Ulysses." Reality is some kind of maze, a puzzle garden that you walk through to try to find your way out. It isn't to the swift that the race goes, it's to the thoughtful, to the careful, to the one who can tease it all apart. For puzzle solving, the psychedelic is this tremendously powerful tool, because it extends the domain of mind, and

that's what's necessary to make it go.

OK, moving through these things and discussing dosage, probably in order of the likelihood of your encountering them. Mushrooms: I feel that people who weigh around 140 pounds should take five dried grams. This is a stiff hit. This is a committed hit. There will be difficult moments in a five gram trip, but on the other hand certain questions will be solved forever for you, because you will validate the existence of this dimension, you will see what your relationship to it is. I don't believe in diddling with these things. People tend to take tiny amounts, thinking that one tenth of a dose is one tenth of an experience. It doesn't work like that; half a dose can be no experience at all, and a full dose can feel like ten of these experiences, so trivializing it is really, and I use this word advisedly, sinful, because you are trivializing the only mystery. It's like trivializing sex. The ordinary objections to pornography are not my objections, but to my mind a very strong objection to pornography is that it trivializes, and anything which trivializes anything central to our self-definition is bad mental hygiene. Taking small doses of psychedelics tends to trivialize them.

There are people who probably take LSD every weekend and go dancing and have done this for years and have no idea what LSD is capable of.

The main shift in the use pattern with LSD is: it may have been childish, but the style of the '60s was, "How many mics can you bolt down?" "Have you had the 500? Have you had the 1,000? Have you had the 2,000?" Eventually it becomes moot because you just dissolve into shimmering atoms for longer and longer periods of time on these trips, but the modern approach, which is, "How little can you get away with taking and still be one of the gang?" is even more insidious, because then people feel capable of talking about these things. There are people who feel that their opinions on the psychedelic experience should be weighed very carefully who have only taken MDMA. Well, listen, I've got news for you: that is to the domain we're talking about like a broken tricycle to a Testarossa Ferrari. So this is a general comment, that you should take a committed dose of whatever it is you're taking so that there is no ambiguity, because there's nothing worse than a sub-threshold psychedelic experience. It's all show and no go: you feel the CNS activation, you feel the keyboards light up, everything comes on, you start down the

runway, you pick up speed, and then you come to the end of the runway and taxi back to the hangar. Well, that was not a flight to Boston, that was just clogging the traffic pattern.

So, committed doses. Then, because you're going to take a committed dose, inform yourself of the medical and pharmacological chitchat on the matter so that you can feel reassured. Talk to a heart specialist, questions like, "If my heart is pounding, does that mean I am having a heart attack? What is a fibrillation and how will I recognize it?" because you can have very odd feelings and not be in any danger whatsoever. Your heart can pound — it's made to pound, look at all these aerobic exercise freaks — well, the fact that you're sitting still when this begins to happen doesn't mean that you've been shoved to death's door, it just means that everything is equalizing and coming to some kind of equilibrium, and you're passing through a transition. These drugs do have a kind of Mach barrier. In other words, there is a barrier somewhat like the speed of

sound. It's a pharmacological and physiological barrier. So you take the compound, the plant, whatever it is, nothing happens for 40 minutes or so except false starts and little things and you have to pee and then you come back and sit down, and then it begins to come on.

It can have many manifestations. It can be chills, tremoring, knotted stomach, nausea, restlessness, so forth and so on. This is what I call, taking a page from the engineering book, "Q." "Q" in engineering circles is vibration in a physical system. When they launch the space shuttle, if you listen to the radio chitchat they will say, "Approaching max Q," then they'll say, "Max Q, mark," and then they're through that. What that means is that as the system approaches a transition it begins to shake, it begins to shake as though it's going to shake to pieces. The Q forces are building on all the air surfaces, the airframe. Then you break through that, Q falls to 0 and then you're in the cool, main engine cut off. You are now in orbit, all vibration has ceased, noise has ceased. You are in orbit, you are weightless, you are there. It's different. Now you shut down all these switches related to the launch procedure and begin to set a course through a different kind of medium, a medium characterized by smooth stillness and that sort of thing. LSD: I don't see anything wrong with 300-400 micrograms as an initial dose. I don't see any point in running up into the 1,500-2,000 μ g range, because in my experience what happens at higher doses is that there is simply an area where you can't remember what happened, and the higher the dose, the longer that period of time, but since you can't remember anything about it, it should be

shortened. DMT: 70 milligrams vaporized in a glass pipe.

Audience: I have taken very large doses of LSD at times and it's always seemed to me that it's very difficult to process all that's going on. The biocomputer shut downs for a while, and like you said, I forget.

Yes, it overloads, it just shunts it past you. What do we need to cover here? DMT, psilocybin, LSD, MDMA, which probably you all know, 125-150 milligrams, and because I tell you these doses it doesn't necessarily mean I approve of all these things. I'm just saying that if you take them, these are the doses. Ketamine: people take small amounts, again usually after attaining some amount of proficiency with it. I've only done it four or five times, and always fairly large doses, 130-150 mg. Interesting compound, but contraindicated because of physiological problems. It depresses the immune system, there's the possibility of epileptic kindling. Certainly, if you were to vomit in that state, you might well strangle because you wouldn't be able to clear your throat. What I also have against ketamine is that you have to shoot it. As I was driving home last night I was listening to some program and they were talking about intravenous drugs and I thought, "How interesting. That's a distinction you don't hear made very often." They were saying, "We should legalize all drugs except intravenous drugs," so that's of course morphine, cocaine, heroin,

ketamine, steroids, I suppose. That's an interesting distinction, operationally.

Audience: You can snort ketamine, can't you, though?

You can, but I've heard that it's dangerous. When they give it as an anesthetic it's 600 mg IV push, which must be just like being struck from behind by a freight train. I'm sure you never know what hit you. I mean, imagine an exploratory dose is 100 intramuscular, they are talking about IV, directly into the vein, 600 push, that means pressure on the feeder. So it's just like a high pressure filling of your gas tank, you would never know what hit you. Now they've pulled it from general surgery, even veterinary surgery, because it seems to depress the immune system and

the worst thing you could do is to do surgery on somebody and then put them into a surgical recovery ward with a depressed immune system. So that is kind of out.

I must say about ketamine that it did something to me that nothing else has ever done, which is that it erodes the observer in a way that the indoles don't. On ketamine you can get so out there that it is a major intellectual breakthrough to realize that you're on a drug, in other words, there's this situation and it seems like it's always been there and it always will be there and you can't remember who you are, or what you are, or where you are. This situation continues, and there's something about it but you can't quite put your finger on it, and there's never been anything else, there will never be anything else, and then suddenly comes this tiny thought: "You're on a drug!" "Oh, right, I remember now. That's it! That's it, I'm a human being and I took a drug. This is a trip. That's right, I'm on a trip. Now I've got it!" Well, what this means is that

you're now coming down because the trip is now over with.

Audience: I had this experience with mushrooms. For hours I had no connection to anything which had any connection to my personality or to life. It was wonderful to be there and to see what makes up our minds, how this world is made up, with all of its structure and architectural designs.

Yes, maybe this is the white light. Maybe this is what these early LSD people were so enamored of, getting so far into it that you don't even know you're into it, because you can't remember where you started from. It's not what I'm shooting for because I always want to bring stuff back. My belief is that this stuff is important for all of us, that we are in some kind of lower-dimensional slice and what you see in the psychedelic experience actually has historical implications. I find this sort of paradoxical because I'm the person who draws everybody's attention to the fact that

people have been doing this for 50,000 years, so in a way that sounds like I'm saying, "It's not a big deal, it's part of the human heritage, certain people have always known about this."

Audience: The point between when there's nothing and when the observer kicks in: that's a big issue in my life, where does the observer come from? Is it an evolutionary thing, like animals never have it when they fade into the white light? Do you have anything to say about that little

place in between?

I think it begins with self-reflection. In other words, the question, "What is happening?" I don't think animals ever ask that question. For animals, what's happening is what's happening, but we are capable of creating a state of distance and posing the question, "What is happening?" and at that point in the trip it means that you are making your way back to the modality that you left from, you are drawing away from the translinguistic place — and it truly is translinguistic: nothing can be taken out of it — but at the interface of the sayable and the unsayable is the novel, the new, the never before seen, said or done. I think it's important to try to bring out ideas because I think we are the animals that bring back ideas. Somehow our hunting and gathering adaptation then set us loose in our own minds, and somebody came back and said, "Let's throw a chunk of this

meat in the fire and see what happens." It's this "see what happens" attitude, so then suddenly they discovered that meat burned in fires is easier to digest and tastes better.

By this means, this, "Let's see what happens," approach to things, the ideas come in the mental dimension. The, "Let's see what happens," translates those of them that can be translated into three-dimensional space. "Let's plant this plant, let's slaughter this animal, let's try sex this way, let's go over that hill this year instead of that hill." What has come out of this is the entire legacy of our cultural heritage as a global civilization, but all of these ideas began in the mind. What are ideas? This is the central question of Platonic philosophy. What are we that we seem to separate the doable from the undoable in the realm of ideas? Anything that can be done, we do. It doesn't matter how perverse, how painful, how destructive, how grandiose, how wonderful, how sublime; if it can be done, we do it. Then, in this three-dimensional domain of space and time, these ideas compete with each other like organisms and an ecology of mind evolves. That's really what culture is: it's the ecology that mind has created for itself, in the same way that bees create a beehive and then the beehive is the cultural context of bees. We have created

Terence McKenna

civilization through language and then civilization has become the context for humanness, and yet we always seek to transcend it and go beyond it.

Now, I don't know whether this is something innate in us or whether it is somehow programmed in from the planet at different levels. It's very interesting, I don't know how many of you are aware of this, but there are leafcutter ants in the tropics, they are a major part of life in the tropics, and they march in columns through the jungle, and they can swarm up a tree and take all the leaf material off a large jungle tree in a matter of hours. What they do with these leaves is that they return, sometimes at great distances, each one carrying like a little banner a chunk of leaf, and they go down into their nests, chew it up and stick it on the wall, and then some of them go back to the surface and gather spores on their antennae, and then they go back down into the anthill and they inject or inoculate the chewed plant material with these spores. Naturally, this chewed plant material is pretty organic and funky, so it begins to grow all kinds of things: molds, mildews, bacteria, so forth and so on. The ants farm this and weed out all these bad bacteria and small microfungi and organisms, and only cultivate this one fungus which then converts the plant

material into a usable sugar. This is a symbiotic relationship between the fungi and the ant. The ant is getting an enriched food out of this and what the fungi is getting is a cultivated situation where all its competitor organisms are carefully kept away and weeded out.

This is precisely, in my model, what is happening with the human species at a more complex level. In other words, by domesticating cattle we have set up an environment that is very favorable to the growth and appearance of what would otherwise be a very rare deep forest mushroom, but because we domesticate cattle and clear land we have created a huge circumtropical global environment in which these mushrooms can reside. What they make for us is not sugar but ideas, something we need the way ants need sugar, and these ideas take all kinds of forms and then we refine them. I really believe that human populations that do not have contact with the psychedelic tremendum are neurotic, because they are male ego-dominated. The reason I call it male ego is because women, by virtue of physiology, basically, are pretty unavoidably welded to the nitty gritty, because they give birth, they carry children to term, and those two things are biologically dictated. There is also the cultural dictate that women are usually involved in preparing and burying the dead in traditional societies, so women know how weird it is. Surely, to give birth must give you a perspective that anybody who has never done it just cannot hope to have. The male ego floats on this myth of separateness that no woman has the luxury of entertaining, because birth, pregnancy, menstruation, care for the sick, care for the dying, these are boundary dissolving activities that keep women close to the nitty gritty. The male organism can go off into its own private Idaho, pretty much. Often what child rearing means is the simple act of impregnation, and that's the contribution in many cases, in primitive and modern societies. Death is

something that the women take care of. At birth in primitive societies men are never present; women do it alone or with other women.

In these Neolithic and Paleolithic societies this tendency of the ego to tumorize and grow in individuals was kept down by a chemical regulator, which was the psychedelic experience. It was part of the food chain and it suppressed ego, much in the way that drugs are given in prisons to suppress libido, because it's hard to manage a highly libidinous people in an institutionalized situation, especially when only one sex is involved. So this natural regulation of the human species by regulating this psychic function called ego was disrupted with the invention of agriculture. The hunting-gathering society with its deep involvement in ecstasy, these weekly or biweekly psychedelic orgy/ecstasy picnics that people used to have, that gave away, Weston La Barre makes the point that ecstasy is not at a premium in agricultural societies because it's disruptive. What is at a premium in agricultural societies is the ability to get up before dawn and pick up your tools and go to the fields and work like a dog. If people have been up all night before, dancing and tripping, they can't do that. The psychedelic gods are replaced by cereals — corn, wheat, rice — and of course at a very early strata in the Neolithic you do get the emergence of the Great Corn God and all this. Frazier is full of talk about this. So we are living the legacy of millennia of cultural neurosis in Western civilization by virtue of the fact of the untreated growth of the cancerous ego. We know this, it's simply that we assume there is no cure, we assume that it's natural to have ego and that it's somehow unnatural to suppress it. Wherever you have an outbreak of psychedelic use in a high-tech society then you see reformed, hang loose, communal, caring

values. Values come into prominence within the community.

Audience: Have you seen a difference in the way men and women react to psychedelics, given the fact that perhaps men embody a stronger male ego than women? My other question has to do with the role of observer ego when you're doing drugs, whether it's marijuana or alcohol or especially psychedelics. Sitting here, thinking that the reason that I don't take anything stronger than marijuana is that I lose myself even in a strong hit of marijuana, I lose my ego completely. I get a different form of the experience if I don't get fearful and paranoid, but it's easy to get scared when the sense of the observer ego just goes and I don't remember that I'm on a drug trip and it seems timeless and eternal. Then I come down later. As you were saying, at the backside of the high I say, "Oh, yes, I just took some marijuana two hours ago. Everything's fine, I'll

recover tomorrow." Maybe you can talk a little about that and what people can do who don't have a strong ego structure, whatever it takes to do these powerful drugs. I don't think I would be able to handle it.

If you don't have a strong ego structure, chances are you're not a heavy-duty male dominator, because they're sort of antithetical. I think probably cannabis was a major ego dissolver and that all these things have been used this way, and if that works for you, that's fine. I didn't take psychedelics to lose my ego. Although people said that would happen, I never quite understood what was meant, but looking at it as a mass phenomenon, where you're not talking about an individual tripper but tens of thousands of people, inevitably this feminizing of values seems to take place. I don't know if men and women experience psychedelics differently, I've never quantitatively looked into this, but my impression is that it's less of a surprise to women and that they feel less of a need to do it. I think this is particularly true of cannabis; I'll bet that two thirds of cannabis use is male use. Why is this? I'm not sure. Maybe women have too much work to do, too many obligations. The old man can sit and smoke dope, but somebody has to do the shopping, get the kids to school and pick them up, keep the insurance paid and all that. Women, I think, have a different relationship to it. Women are often shamans, and in many cultures the best shamans are usually felt to be women. Women are connected up to all of this stuff. Drug taking may not be a male enterprise but history is a male enterprise. I don't think we would have ever

gotten into it if it had been up to women.

In a way, the women outsmarted themselves because they had, not control in the conscious sense, but they were sitting in the front of the canoe and then they invented agriculture and that undercut their own position, because the vast repository of plant knowledge that had been the secret knowledge of women no longer really mattered as long as you knew how to grow corn and a couple of other things. The vast encyclopedic data on wild plants became less important and it became more labor intensive. Men, because they had evolved toward being efficient hunters, probably did have a physical edge on women in terms of stamina and the ability to work with a hoe for 8 or 9 hours a day, because what the women did when they were in the prime cultural situation was that they gathered. They looked at stuff and talked about it with each other, and this was the domain in which language then arose. Gathering is not hard work, it's just steady work, and it's lots of fun if you do it with your friends. The cliched notion about aboriginal peoples is that women chatter, this phrase, "the chattering of women" in primitive situations. It really is true that women avail themselves of language much more than men in these prerelative situations. The men are hunters and they act like hunters: they're stoic, they hold it all in. Literally, the larger bladder size of men is thought to be related to the hunting adaptation and so forth. The men are stoic, they're holding it in; the women are information freaks, for them it all rides on information. "Where do you find it? How do you cook it? What does it look like? Is it poisonous? What time of year is best? What soil is best? What do you combine it with? Is it good all year round? What

do the flowers look like? What does the fruit look like?" Data, information. How could you ever understand the use and location of 600 plants or more unless you had a tremendously evolved vocabulary for this kind of thing?

Audience: The physical weakness that follows psilocybin, is there any way to prevent that?

These things take energy. Obviously, during the trip energy is being sucked into the moment. A trip is hard work even if you're sitting still, so then there's going to be an energy debt. One way of assessing the toxicity of a drug — in the course of this weekend I've named several ways, and they all need to be used together — one way of assessing toxicity is how you feel the next day. What I do when I take mushrooms is that I usually take them at about 9 at night. By 1 or 2 in the morning it has usually passed, and then I eat before I sleep so that I don't wake up in the morning with a protein debt. That's very important, if you eat before you sleep after a trip, it won't be nearly so hard a comedown. One of the things that's really appalling to me about MDMA is that here is this pretty minor psychoactive, and my God, the day after is tough sledding. For a hangover like that you should at least have seen God, LSD: if you drink a lot of water, that helps, and yes, vitamins are never a bad idea at any point with these things. LSD, as I said yesterday, was so effective at low doses that on that scale it appeared very non-invasive. I feel terrible

after taking LSD, it takes me 24 hours to put it back together.

The interesting exception to this, and it always seems to cut my way in terms of favoring the ones I think are most interesting, DMT is again the anomaly here. DMT is the most powerful hallucinogen there is. If it gets stronger than that I don't want to know about it. 15 minutes after you do it, you feel as though as you have never done a drug, you are down 100%, mentally, emotionally, physically. It just returns you to the baseline. Ayahuasca goes DMT one better, and ayahuasca is the only one that I know of that does this. I maintain that the reason these things behave this way is because they are so similar to ordinary brain chemistry. With ayahuasca, you actually come out slightly higher than you went in, and it isn't lost. I mean, you feel great the day after an ayahuasca trip. If it's your first trip and you spent 8 hours vomiting, you're probably not going to feel so good, but if it was an ordinary ayahuasca trip then you're going to feel much better the day after than you did going in: more connected, more alert, more energy. This must have something to do with the fact that the constituents of ayahuasca — harmine, harmaline,

DMT — all occur in the human brain. Why doesn't this happen with psilocybin? I don't know. Psilocybin doesn't occur in the brain but it is a very close relative.

I think DMT is absolutely fascinating from every point of view. Why is it so benign? Why is it so powerful? Why is it so short acting? Why is it so hard to get any? That's the \$64 question. Believe me, every book on drugs that you pick up says it's easily made, they ask you to believe that people are making it in their kitchens all around you. Well, I don't know. I've seen it botched many times. The literature doesn't tell you that; botched, ruined. If somebody comes to you with a grainy, dark brown syrup, forget it. That is not what it looks like. That means that they swept the floor after they dropped the reagent or something. What it looks like is orange moth balls. It looks like a crystalline, waxy, orange to pale rose to yellow kind of substance, and it's very aromatic. If someone shows you a liquid or stuff which looks like brown sugar, it's a mess. We were appalled, we got samples of underground DMT and ran high pressure liquid gas chromatography on them, and it literally looked like the guy swept the floor. These people had actually done it. I wouldn't have given it to a rat, much less a human being. The notion of someone actually taking that stuff was just hair raising. What you should have is a very steep spike at 620 nanometers and what we got looked like the Himalayas. It was running around all kinds of stuff. There has been DMT around which was shottable DMT, which is the hydrochloride, and since I don't shoot things I didn't pursue it, although what people tell me is that shooting is not as effective as smoking. People think that shooting a drug is the most effective way, because you see it all go into your body or something, I don't know. If you shoot DMT it takes about 5 minutes to come on and lasts about 45 minutes. That's why if you read in the literature, "How long does DMT last?" it will always say 45 minutes. If you smoke it, the peak experience lasts 400 seconds, something like that. It's extreme, that's why it's so astonishing, because it is so intense and the onset

is so sudden that it's more like something has happened to you, rather than that you've taken a drug.

Sometimes people come out of it saying, "What happened?" "Have we done it yet, or was there an earthquake and the roof fell on me just as we were about to do it?" It has the quality of an event rather than an experience, and also it has the quality of an event because it does not touch the core observer. You are not changed, what's changed is the sensory input. You are still who you are. You don't think you're God, you don't feel bad about yourself, you are exactly who you were before you did it with the same set of concerns, but you have been whisked into an alien

dimension, one you never had imagined existed or could have a moment before have conceived of, and suddenly it's 100% in place 360 degrees around you, and then 3-10 minutes later you're raving to your friends, and it's as far away as that trip to Mallorca four years ago.

Audience: Could you explain the distinction between DMT and 5-MeO-DMT in terms of the quality of the experience?

They are day and night. 5-MeO-DMT, some people like it. It's a feeling, that's what it's been for me. It's this huge feeling that kind of sweeps through you, and it's velvety. It's hard to describe, but the main thing that I'm noticing when it's happening is that I am not hallucinating. Of course, the main thing that's happening with DMT is that you are having hallucinations so intense, so three-dimensional, so highly colored, so sculpturally defined that it's more real than reality. By that I mean: if you look at this room, notice how all edges are slightly feathered, there is at all boundaries a slight indeterminacy, but on DMT it's hard-edged, everything is just defined. Sometimes people say, "It's as though all the air had been pumped out of the room." You're seeing it with that lunar starkness and clarity; unimagined objects, objects off the art scale, and

entities. DMT is the only one of these psychedelics where I have seen the entities. On psilocybin it speaks and it's aural. On DMT you see these things. I don't know whether it's my personal mythology...

For me, DMT is the center of the mystery. I fear it, I love it, I thank God for it, I wonder if I'll ever understand it. It takes a huge mustering of courage on my part to do it. I mean, we talk, talk, talk: change, transformation, other dimensions. This is not talk when you do it. You just do not know the parameters. I feel like I know more about what could happen to me if I'm in the Amazon jungle than I know what could happen to me when I'm in that place, and after many DMT trips I've finally been able to paint a picture for myself of what is happening in there. I don't know anybody who has done it as much as I have. I wish people did it more and talked more about it, because, boy, if there is a landscape where we need some consensus, this is it. I have been present when people did it, and they come back babbling about the same thing I think that I have

encountered. One woman said, "It was a carnival, it was an extraterrestrial midway," and somebody else came back and said, "There were gnomes, there were elves," and yes, this is getting close to it.

What happens to me when I do it is that there is an initial period of hysteria and confusion. It's almost as though time speeds up, even before you take the first hit. Many people say, "Just before you do DMT there's this funny kind of impression in the room," almost as though there is backwash from the event about to happen. You are caught in the psychic field of this event and everything is moving faster and faster, it's like the Q phenomenon. Then you take the hit and it's building up in your body and your heart is pounding, and then you break through to this place. The first impression is of the sound of cellophane being crumpled, that crackling sound, as if someone had just taken a bread wrapper and crackled that cellophane. A friend of mine says, "That's the sound of the radio entelechy of your soul tearing out of the organic envelope," which is what it sounds like. It sounds like your body has just been wadded up and thrown into a corner and now you're a radio signal approximately four lightseconds in diameter spreading out through an alien universe, and the next impression is of a cheer. It's, "Hoorah! Welcome, welcome!" It's them, they're waving and they can hardly wait. There's a moment when they are not on me, just a moment, and then they say, "You're here, we're glad to see you! Why did you stay away so long?" and then they come toward me, and the main thing for me in the DMT thing is to struggle not to go into shock of wonder, basically. There is a strong tendency, and for the first few trips I couldn't conquer it. I was just a victim of it, I would just go into this, and I would say, "Heart? Heart OK. Breathing? Breathing OK," but I'm looking and I can't believe my eyes,

because I'm in some kind of domed place.

The impression, don't ask me why, the impression is of being underground, even though it's a huge vaulted space and highly colored. What it, of course, rivets my attention are these beings. They're small, and they're like I've described them, as machine elves. They seem partially machine-like and partially elf-like. They are not so mundane as that, they don't have a fixed body outline, and in fact that's one of the things that going on in this space that's so baffling. They come toward you. They are singing in this alien language which you somehow understand — it cannot be translated into English but you understand it in that moment — and they are using their voices to produce objects. So song becomes thing, and there are dozens of these things and they come closer and closer, and the songs they sing condense into objects, and the objects

themselves can sing. These things come and they are saying, "Look! Look!" and they are holding this stuff out to you, and you look at it, and you're fighting wonder because your entire being is caught up in, "This can't be happening," and yet they're saying "Just look!"

What are these things? Devices? Toys? Works of art? Objects? Whatever they are, they are amazing, and you look into it and they seem to be shifting, even though they're made of metal and glass and gems and pulsating. Everything is migrating and shifting and changing and they say, "Look at this one!" It's the most astonishing thing you've ever seen, and then they say, "Look at this one, look at this one!" and they're piling up. These things are coming toward you and then they jump through you, they can pass through your body. They're running around, chirping and singing and making these objects. What they're doing is they are saying, "Do what we are doing, do what we are doing!" and you just say, "I just want to go back to New York." They say, "Later for that!" The implication is — and this is the mystery of my life, I'm teasing it out, trying to understand it — but the implication and the promise is that ahead of us in time, 6 months, 50,000 years, is a visible linguistic channel of communication. That the thin channel of aural communication composed of small mouth noises is just a provisional kind of communication, and what is being proposed in this state is a true telepathy. Now I always thought that telepathy means that you think and I hear what you're thinking. What it actually turns out to be is that you speak and I see what you mean. I don't mean that metaphorically, I mean I see what you mean, so that your

linguistic intentionally condenses as a three-dimensional object in front of us, a sculptural modality. So then we both see what you mean; you made it and I'm your conversational cohort, and we're both looking at your meaning. We can walk around it, we can adjust it.

Notice that no common dictionary is necessary here. If you're Witoto and I'm Polish, I still see what you mean, because what you mean is an objectified three-dimensional modality, not a string of Witoto words, and it's saying, "Do this, do what we are doing!" It took me about 15 trips to get this far, and then I began to experiment with sounding in that state and I discovered that they were right. That "mmmm" is a 3.5 foot wide, 8 foot long, magenta curved surface with lime auras, and that "uhnnn" shifts the lime auras into rose pink and adds grey-silver pinstripping along one edge. I thought, "My God, what is this?" Then when you break out into actual chanting, actual linguistically-modulated sound, you discover that you too can make these objects. What they apparently are — how this could be, don't ask me — they are apparently syntactical sculpture, sculpture made of syntax. Syntax suddenly becomes not the rules that govern spoken languages, but the rules that govern the assembly of three-dimensional thought objects, as though words were the shadows of hyperdimensional intentions that can actually be broken through to. Well,

my God, I just thought that this was the weirdest, this takes the cake. I've never heard of such a thing. Nobody's ever suggested to me that this is possible.

So then, as is the case with most things, if you look long enough you discover precursors. What I discovered in a wonderful book, and any one of you would love this book, I'm sure. It doesn't deal with the psychedelic experience by name, but it is a psychedelic book. It's called The Phenomenon of Life by Hans Jonas, and if you can find this book, what a read. It's a group of essays, and in one of the essays he is talking about the etymology of the word "Israel," and he says, following Talmudic thinkers, that Israel means "He who sees God," that this is the actual etymological basis of the word "Israel." Did I say that we are talking now about the writings of Philo Judeaus? Yes, Philo Judeaus, in discussing the etymology of the word "Israel," says that it means "He who sees God." Then he says, "What does this mean, he who sees God?" Well, as you probably know, in the Hellenistic world there was this phenomenon called the Logos. The Logos was an informing, internal voice that tells you the right way to live. It's like a spirit ally that speaks to you and informs you. So Philo Judeaus said, "What would be the more perfect Logos?" and then he goes on to answer his own question. He said, "The more perfect Logos would go from being heard to being beheld without ever crossing over a quantized moment of distinct transition." This is precisely, and in fact, what is going on in these states, because now I

have learned or have found out how to evoke this DMT phenomenon in the more controllable environment of the psilocybin intoxication.

It happens like this: first of all, I form the wish for it to happen. I usually follow a line I learned in an old I Love Lucy rerun where she's explaining to Ethel how she contacts flying saucers and she says, "I just say, 'Come in, little green men! Come in, little green men!'" So on mushrooms I do this, I say, "Come in, little green men!" and what begins to happen is this sound like bells, like very distant bells. Then it becomes louder and louder, sort of like bells with wind. It becomes louder and louder and more complicated and more complex, and at a certain, very hard to

precisely define moment, it begins to spill over into the visual cortex. Then I see the language and I can interact with it. It is apparently a more perfect Logos.

This is what I had in the back of my mind yesterday. Remember when I talked about how smoking was new to Europeans and they couldn't understand what it was, and then I made this offhand comment that it was a new use for the human body, only 500 years old? Well, it proves that there may be undiscovered uses for the human body. I mean, we've only been around playing with our bodies for 50,000 years, and we've discovered most sexual configurations, and all these acrobatic things and amazing things that people can do like make pyramids of ten individuals, but smoking is pretty basic, and yet only 500 years old. It seems to me that right under the surface of human neurological organization is a mode shift of some sort that would make language beholdable, and that if we could somehow kick over into this alternative mode we would become

unrecognizable to ourselves. Now I realize that this sounds pretty far-fetched, but you always have to have reference to context.

In a universe where there were no people, that would be a pretty far-fetched idea, but the fact that we already possess language seems to argue that we are in the process of continually evolving new applications for our bodies. When spoken language burst onto the scene 35,000 years ago, by most estimates — think of it: 35,000 years ago, people invented language — what must it have seemed like to them? It must have seemed like a miracle. Hardly anything sets you up for it. The difference between a 9 hour recitation of oral poetry and three chickadees on a line is quite a leap. I'm suggesting that there could be a form forward in the communication dimension and that this is in fact what shamanism is all about, what the end of history is all about, what psychedelic drugs are all about. We are edgewalking on an ontological transformation of what it means to be human. The mode that this transformation will come in will not be political or technological. It isn't starflight, it isn't socialism; it's a whole other way of making our minds known to each other, by being able to show each other our minds. In psychedelic states you can

do this.

Audience: Do you think there is any relationship to the Australian aboriginal belief that the forefathers actually sung the world into being? That concept doesn't seem too far off.

Yes, that's right. In our own tradition, "In principio erat Verbum, et Verbo caro factum est," in the beginning was the Word, and the Word was made flesh. That's the whole story. What we need to do is to pass through this transition and make the Word flesh. In other words, to somehow objectify the Word. Believe me, I talk about these things but the pictures are provisional. I don't understand how it could be done. I'm an engineering type on one level, but is it an acoustical hologram? How in the world could I make you see a concept in my mind as though it were

hovering three feet above the floor? Is there a way?

I've noticed on psychedelics, and again, I don't know whether this is a false trail or whether this is part of the mystery, but I've noticed on psychedelics that if you get a person between yourself and a candle so that you have them in profile, and they are raving and you can see the candle past them, there's something coming out of their mouth. It's like how when you agitate oil in water you see this swirling oiliness of water, or when you're in a swimming pool with too much suntan lotion in it there's this kind of rolling discontinuity that's fairly subtle. Well, something like that is happening for about 8 inches in front of people's mouths when you look at them under certain conditions. Maybe it doesn't need psychedelics, I don't know. It's possible that the air goes into your lungs, is heated and then is returned to the colder air of the room, and what you're seeing is the mixing of the warm and cold air which have different refractive indices, and so it shows up as a kind of wave-like distortion. Could be; I am a reductionist on one level. If it's not real, then I want to know that it's not real, but I'm not sure that that's what it is,

because it seems to me that they are beginning on a very small level to do this thing and language seems to me to be a continuous spectrum.

Because I'm a public speaker, because I work with language, I think about these things a fair bit. It seems to me that language begins in total inarticulation, basically "um, erm, ungh" kind of stuff, and then it goes on to operational speech: "Give me this, bring me that, change my diapers," this kind of thing. Then you introduce the notion of communication. I mean, at what age do children become capable of saying, "I feel x, y and z?" What this means is that they are beginning to move invisible, interior modalities out into the linguistic domain, say, "I feel sick to my stomach, I feel too awake to go to bed," so forth and so on. Then you get more complex ideas, where people are conveying abstract ideas. Then you get eloquence, a speaker who can make you listen and can rivet your attention. Then beyond eloquence comes poetry, and supposedly in

the Irish tradition and in other traditions, great poetic feats were undertaken and poets were magicians. The difference between a poet and magician was practically nil, but that's where we're asked to believe that it ends, in great poetic eloquence.

It seems to me that it's possible to just keep going, and one of the curious things about the way we think about language is that when we talk about clear language, we always use visual metaphors. To understand someone you say, "I see what you mean." Seeing is the sense that we trust. "He spoke clearly," is a visual metaphor. "She painted a picture," "I see what you mean," as though we unconsciously sense that language is an uncompleted project at this point, moving toward a visual mode of expression. If we say that the psychedelics are catalysts for imagination, then what is it that they are catalyzing? They are catalyzing the further consecration of language. Who knows how long this is. Looking back at the invention of language, you kind of have to suspect that it happened rather suddenly, that people went from not speaking to speaking quite suddenly. They had all the physical machinery: the lungs, the vocal chords, the coordinating mind, and apparently, if you follow Chomsky and his school, the genetic foundations for syntax. Syntax, Chomsky has shown, precedes language. Chimpanzees and squids show evidence of syntax, but their language is extremely rudimentary. Somehow you can't have language until you have syntax — syntax is the set of rules that define language — but at a certain point, language has this capacity to become truly self-reflecting. I can't imagine what a world would

be like where this ability would be mastered. I suppose you would have to say it is a psychedelic world.

Audience: Earlier you were talking about this possibility, and you were saying, "I can't imagine how we would do this," and you started talking about it, and to me it felt like you were talking about something hovering. At that point I could almost see that it would be possible to continue. When you said "hovering," I got "hovering," I could almost see something hovering, and it seems like there's really an evolutionary thing, that once people get used to really hearing each other it would just begin to happen. Little by little, we'll get used to it and we may not even know it.

Maybe it's happening now, that language is being used much more in different ways than it used to be.

Yes, I think that's true. My fantasy is of a workshop where some day we get it out. That's really what I want to do: I want to punch a hole into this other place and have this linguistic, syntactical, intentionality-directed stuff pour into the universe and fill it to the brim. It seems to me that this is a real possibility. Whenever I'm stoned, I have this notion that I call the Last Conversation. It's where it seems possible to sit down with somebody of good will and say, "We're going to have the Last Conversation. We're going to start from here and we're going to work our way in, and when it's over there will be no you, there will be no here, there will be no there, because we will have carried out some kind of Derrida-type deconstruction project on the apparent reality and we'll be left with bedrock." I don't know if that's the same program

as the visible language. What I do know is that with ayahuasca in the Amazon basin, this is what's going on. They call it singing, but it's a visual art.

Our little company sells ayahuasca songs. Well, they are audio recordings, but they are visual works of art. How they sound doesn't matter, it's how they look. When you're sitting in a blackened hut with these people you'll hear someone lay down a riff which manifests as a fluorescent pink line with grey undershading, and it's a wavy line. The shaman is sitting next to the singer and will go back through and place a mirrored green dot in the trough of each wave, and the sound is lost in this. The experience is entirely visual. Is it only abstract colored patterns and moving fields of light, or can I sing you my grandfather and you would see him with his blue visor and his pegged pants and his crew cut? It's this kind of thing, you know.

This is why I believe that the psychedelic experience has some kind of historical role to play. If we take seriously that it is an enzyme for the imagination, and if we take seriously the notion that language is the carrier wave of the imagination, then probably what we're involved in here is a quantized evolutionary leap to a higher modality of language. It will come out of our biological organization; it's not cultural, and it's still less technological. It's in the bones and tongue and brain and lungs of human beings.

Audience: Terence, when you're in one of these circumstances and you speak to the little people, if someone were in the room with you, would they hear you speak? Do you actually acoustically verbalize this kind of conversation from your side?

Yes. It's a kind of glossolalia, or that's what we would have to call it. Glossolalia, as you all probably know, is speaking in tongues, but this has characteristics that glossolalia doesn't have. For one thing, people who do glossolalia have a kind of disconnectedness from it. In other words, in these Pentecostal churches when someone will go into glossolalia, often when they come out they will turn to the people around them and say, "Did I speak in tongues? Did I really do it?" In other words, there seems to be a kind of occlusion of the observing mind. The other thing is that glossolalia of that sort involves pretty radical physiological changes. Some of you may know Felicitas Goodman, who wrote a book on glossolalia. She measured pools of saliva 18 inches across, having originated from a single person during a 20 minute burst of glossolalia. Well, that's a pretty lathered-up, hyped-up state to be in. The glossolalia induced by DMT and psilocybin is controlled and willed. It's as though the English-forming part of the mind steps away and an *ursprach*, a kind of primordial language, steps in. It's highly modulated; it doesn't have to be screamed, sung or chanted, it can simply be done at conversational levels. When you do this in the stoned state, it's wonderful, and when you make tape recordings of it and listen to it in the unstoned state, it's either alarming or silly. I mean, people have said to me, "Soft-pedal this part of it, because it's too weird."

Audience: The point I was trying to get at is that in order to form these sounds there's some sort of electronic, neurological something going on in the synapses to cause the muscles to form the sounds, and there's a radiation of electric energy that starts the mechanical-acoustical coupling to the vocal chords, and in trying to figure out the mechanism you were discussing, how would you make this work? Would you actually see the sound coming out of the throat? It would seem more reasonable to me to pick the electronic model and the radiation of electromagnetic energy, rather than acoustical, to project this information.

True, although it is interesting that sound can be used to form holograms, which are three-dimensional objects. In other words, there are what are known as acoustical holograms, not generated by lasers, but generated by patterns of interference that are acoustic waves. For years, in the psychedelic states I could hear this translanguistic stuff but never do it. Then I became able to do it on the drugs, and then after many more years I've been able to do it pretty much on the natch, or at least give a reasonable imitation of it, but when I do it and I'm not stoned, it doesn't transport me. It has syntax, it has order. I'll give you a short sample of this. If I'm at all self-conscious or anxious, something shuts down and I can't, and I know I'm faking it and it's not real. *Aideughey vounthey haxhivichny moughamwa bakiam didikini hipeketek*. It's like that. It's far removed from English, it sounds to me like a very primitive language. The image that comes to my mind is of pygmies around a fire, one guy raving. He's telling a story. There's something in there; it feels like meaning, but it doesn't compute to a dictionary. When you do it on your own you just can do it for hours in that state, and it's very, very satisfying. What you're hearing is the shadow thrown by a hyperdimensional object that the person making the sound is actually seeing, and you are just rotating this thing, going into it, expanding it, taking it apart, melting it, fusing it, remaking it. Strange stuff. I played this stuff for a linguist, this very straight linguist. I played about a 30 minute burst of it, and he smoked his pipe through it all, and when it was over he said, "No O's."

Audience: Did you just make that up? Did you have any images? Can you describe what was going on inside of you when you were doing that?

I was trying to stand aside, I was trying to not do anything to it, I was just trying to let it be, because there will be a part of it and I'll think as it goes by, "Hmm, sounds French." The main effort is just to relax and let it be. The way I discovered it is that when I smoke DMT I can't stop myself. At first I would yell it, and that got my friends concerned. Slowly I've been able to bring it down into this conversational level, but it just goes on and on, has a feeling, has a tone, it's very satisfying to do. That's why I think that language existed for millennia before meaning. Bowl, bison, reindeer: meaning is just some kind of late thing that was tacked on to language to make it a more practical enterprise, but I think that people were taking drugs and amusing each other with artistic compositions of the sort I just did for you for a long time before they did anything practical with it.

Audience: I was just wondering if you thought that language may have changed around the time that agriculture came in, when things were narrowed down to a few commodities.

I think that language goes through tremendous periods of impoverishment, and I think that was one. The origin point of language is placed at about 35,000 years ago, although on what basis they do this I'm not sure. There is a flute in existence that's 26,000 years old. That's pretty interesting, and that's not the Museum of Atlantis artifacts either, that's the real thing. The Pythagorean face of number, musical tone, language and proportion is still alive. There's still something to be learned there. A perfect science, an appropriate science, a science of harmony, resonance, proportion: that is and remains the shamanic ideal, the Orphic ideal, the Pythagorean ideal.

Audience: What are the risks associated with MAOIs and psychedelics?

You do not want to take certain hallucinogens if you're taking a MAO inhibitor, because it will prolong it and will cause it to behave in unpredictable ways. There are many MAO inhibitors commercially prescribed, some quite strong. In other words, that act for weeks, I think even after a single dosage. What are those things for?

Audience: The common scenario is Marplan, which is a monoamine oxidase inhibitor. What that means is that monoamine oxidase is the enzyme that destroys monoamine, so if you are taking that particular drug and then you take something that builds up in your system like aged cheeses, lentils, maybe mushrooms, wines, fermented kinds of things that have lots of amphetamine-type chemicals in them, then they overload the synapses. It happens because you can't break it down in your brain and basically it deteriorates. There is one that people did this with and died, so apparently the hallucinogen had some of that build up and it can't be destroyed properly, so that's why there's the warning not to take it.

The hallucinogen is a monoamine, and then if you inhibit the monoamine oxidase, which is the compound which inhibits the monoamine, then the monoamine will accumulate. It's important to know this because we tend to move in a yuppie environment, and a typical yuppie buffet of good burgundies and good brie is just going to load your system with tyramine, tyrosine, these kinds of things. They are monoamine oxidase inhibitors, and then if you take a hit of ayahuasca 12 or 24 hours later it's just going to send you skittering all over the board, and you won't understand why unless you are aware that this monoamine thing is working.

Audience: Someone gave a talk in New York about smoked fish and plantain, and possibly this is a precursor of certain neurotransmitters.

Yes, this is a more complicated question than simply yes or no on the MAO inhibitors. Serotonin, which is, of course, the neurotransmitter that runs the nervous systems of all higher animals and occurs in all animals, is very strongly present in bananas, for example. You can load your system with serotonin without realizing it if you eat a lot of bananas, and that's very interesting. There was a group of people in tribal Africa who had actually lost the gene for the production of serotonin, or of serotonin-2. In any case, one subspecies of serotonin, and they didn't know that that was what was wrong with them. All they knew was that as soon as anybody left the tribe they all became psychologically ill, and then they would return to the tribe and this situation would immediately normalize. So they looked into it, and they discovered that these people were eating bananas as a huge component of their diet. Consequently, even though the serotonin gene was deficient, they always had a sufficient amount of serotonin because they were getting it from a dietary source.

If somebody left the tribe, left the forest and went to Kampala and got a job and stopped eating so many bananas, they immediately appeared to become mentally ill. This is because they were then finally forced to confront the fact that on the natch they could not produce enough serotonin to stay balanced, so this is an example of how foods and neurotransmitters and all of these things work. It's really astonishing, the fact that evolutionary biologists, in talking about how human beings have come to be, have so far as I know never talked about the evolutionary influence of

diet. The fact that under pressure from dwindling rainforests, we ceased being frutitarian, canopy-living creatures, and instead became omnivores and meat eaters on the plain. In going through that transition we subjected ourselves to a huge amount of mutagenic influence.

Terence McKenna

There are all kinds of compounds in plants that will break chromosomes, interfere with ovulation, interfere with lactation, interfere with fetal formation, control or accelerate tooth decay, interfere with acuity of vision, digestive enzymes that may or may not work in certain situations. If you just start eating things randomly or testing things to be foods, you're exposing yourself and your progeny to an immense number of mutagenic influences. This may explain why the human somatotype, the human body type, went through this period of rapid change about 50,000 years

ago. This is when the brain size doubled, and then nothing much has happened since to human beings physically; all evolution has gone on in the cultural domain. This sudden explosion in the size of the brain case is occurring at the same time when there is this dietary shift.

One of the things that I mentioned the other night is the preservation of infantile characteristics as a part of our species, not necessarily simply infantilism psychologically, but also our hairlessness, for instance. More primate babies are born hairless, but we're the ones who stay hairless the whole time. The suppression of secondary sexual characteristics — for instance, our rumps don't redden when we're in estrus — and all these things that we see happening in other primate species are suppressed in human beings. There's a lot of debate about why these things go on. Why, for instance, there isn't a mating season in human beings, or why it is that female human beings can keep pregnancy a secret for quite a long time before it becomes apparent. How does this feed back into primate social organization? What do males do if they think a female is

pregnant or not pregnant? How does this work into the evolutionary thing? There's a lot of thought that needs to be given to all this.

MAO is one of the most easily influenced of these internal enzyme systems because there are MAO inhibitors in so many things that are human foods — pulses, all beans, fish, cheeses, dairy products, so forth and so on — the very things that were probably fairly prominent in the primitive diet. All monoamines will be more active in a human being who has taken a monoamine oxidase inhibitor. One of the strange things, and I mentioned this yesterday, is that in the Amazon they have figured out how to make this work for them. For instance, DMT cannot be taken orally, it's destroyed in your gut. If you inhibit MAO then it isn't destroyed in the gut, it passes through the bloodstream and through the blood-brain barrier. They figured this out; it's only been since the mid '50s or something that the MAO system has been understood by Western medicine. These people apparently intuitively figured it out thousands and thousands of years ago. These things compete with serotonin for the bond site, many of them are in fact inhibitors of serotonin. If you have a huge amount of serotonin in your system, the serotonin can mitigate the trip. It's a gentler

trip because it's not as strong a trip as it would be had you not loaded yourself with serotonin.

Audience: But some people do, that's the whole theory of why some people get depressed, that certain people have higher levels of serotonin and certain people have lower, and that if you have higher levels supposedly it correlates with how naturally high you are.

Yes, well it's sort of hard to nail this down. When people first started doing psychedelic research they thought — it was the so-called psychotomimetic theory of psychedelics — that these things make you crazy, therefore being crazy must be a natural state of producing these things. So for instance, they measured DMT in the blood of schizophrenics, people who are diagnosed as chronic schizophrenics. The problem is that there is no visible correlation. Some people have more, some people have less. It isn't as simple as that mad people are people who are making their

own psychedelic molecules. There was great hope for this in the '50s but it didn't quite pan out.

A thing to bear in mind, sort of related to what you were saying, is that disease, which we accept as part of life, is actually something fairly unusual in nature. The only places in nature where you see a lot of disease happening is in insects. Insects are highly subject to viruses and there's a huge family of insect viruses. This is the basis of many pesticide design strategies, to spray crops with viruses that attack insects. The other area in the animal world where you see a lot of disease is human beings and the animals they have domesticated. Cattle, pigs, poultry and people

are all fairly subject to disease, but for instance, birds of prey are not greatly subject to disease. Fish, all animal groups have some susceptibility to diseases, but really human beings and insects seem to be the most set up for this.

The reason that is advanced for this is that these are the social animals, the insects and the human beings, wherever you have intense social activity. For instance, in some species a male and a female will encounter each other only once in the life of each individual, then have sex and that's it. There is no social life. No disease can get a foothold there, because diseases require transmission and contact. The AIDS thing is a perfect example of this. The statistics are that a professional prostitute has five or six sexual contacts in an evening. A person at high risk for AIDS with a very active homosexual lifestyle may have three or four times that number of sexual contacts. No virus is going to pass a chance like that up, it's just like a super intense environment for transmission. The diseases want to be able to move from one person to another. The

susceptibility to disease was apparently also something that was going on at the same time as we were beginning to acquire language, to domesticate animals, to switch our diet.

What we really are is the evolutionary wreckage of a very chaotic and crazy series of pattern shifts that went on between 50,000 and 100,000 years ago. Now we are the inheritors of that. As long as I'm on this subject, there's a very interesting relationship between disease and spirituality because pilgrimage sites are the great disease vectors of the ancient world. Here you can imagine that you have a temple, everybody comes there to get cured, and everybody leaves sick because all these infected people have been there. There's a wonderful book, I can't remember the author but the title is Plagues and Peoples. It's a study of epidemiology and the history of disease and its impact on human populations. Very interesting, and it has a lot to say about psychedelic use by implication, because psychedelic use also brings people together under very close and

intimate circumstances many times.

Audience: Let me ask a chemical question. I have never done these substances that you're talking about, specifically *N,N*-DMT and 5-MeO-DMT and what you're talking about as ayahuasca, which is a hybrid of an MAOI and DMT. Those are the chemical names of these substances. Are

there generic names or so-called street names for these things that you are aware of?

First of all, 5-MeO-DMT doesn't occur in ayahuasca. The way ayahuasca works is that the MAO is a 7-carboline: harmine, harmaline, tetrahydroharmine. These things are hallucinogens in their own right, but only at uncomfortable doses. If you took 600 mg of harmine, you would have hallucinations, but you would also have so much discomfort and icky feeling that you couldn't call it a trip. 5-MeO-DMT occurs in *Anadenanthera peregrina* and in the toad foam that I mentioned. It's interesting that the toad foam is the only animal-based hallucinogen that we know anything about. DMT does occur in certain fish and these fish are eaten for psychedelic effect. DMT is psychedelic in its own right, but not when taken orally. When taken with the harmine it becomes orally active. If you combine 200 milligrams of harmine, which is a sub-threshold dose of harmine,

with 50 mg of DMT, which is a sub-threshold dose of DMT, you'll have a tremendous trip. That's called ayahuasca, and it comes from these plant sources. You drink it, it's a beverage. It's a fluid, tastes terrible.

Audience: You recommended a committed dose, like five grams of mushrooms, in a silent space, preferably at night and also alone.

If that's your predilection, if you're comfortable with that. If you're uncomfortable with that, get a friend. Is that your question?

Audience: I guess that's my question, because it seems to me from reading Stan Grof's books that the point he makes is that these substances are physiologically very safe. The danger is in psychological acting out, and for that reason you have someone there, in order to prevent a

confusion of what he calls holotropic and hylotropic, i.e. you decide that you want to jump off your balcony and you confuse your psychic reality in which you can fly with the physical reality of your body, which is that you'll fall off and die.

If you have that delusion you would certainly want a sitter present. In 99% of the cases what the sitter is there for is not to restrain you but to tell you that it's OK. Just to say that it's OK, this is immensely reassuring to people, no matter how uncertain the sitter is that it is OK. You could almost have a button that you could push which says, "You're OK! Don't worry, it won't last forever," something like that. I guess I'm sort of in a funny position on the sitter issue because I find them so distracting, but you do want it, the one time you need them you really need them. The other thing is this issue of whether you should do it indoors or outdoors. What I found is that I really like keeping it mental, that's my way of controlling the situation. We all know this phenomenon called synchronicity, which is where it's weird for no reason. If you go out into the world

stoned you will just discover that it is a maelstrom of synchronicity, and I don't like being swept away into strange and unexpected adventures.

This is an example of how this works: I was at Sarnath once, outside of Benares. Sarnath is the place where Buddha preached his first sermon after attaining enlightenment. He was enlightened at Bodhi Gaya and then he walked south many miles to the deer park at Sarnath and gave his first sermon there. There's a stupa there, an ancient stupa, 2nd century B.C., and manicured green parks; a very nice place to take a psychedelic, I thought. So I took this psychedelic, it happened to be mescaline, with these two women who were friends of mine, and there was nobody around. It was very early in the morning, we were sitting up on this little knoll in a tree and it began to come on strongly. I was looking out over this green expanse, and almost at the edge of discernible vision I suddenly see two dots, two people moving orthogonal to my position across my field of vision. Then they got to the middle of my field of vision, and they just stop dead. These two people must be 500 yards away, 1,500 feet away over these rolling green lawns, and they stop dead, they scan and they start toward me. I cannot believe my eyes, that these people have

changed course 90 degrees and are now headed right for me. I kept telling myself, "It's a hallucination, it's an illusion. They are not getting larger in your field of vision, you are not going to have to confront these people. Please, God, make it so." No reprieve.

They just keep getting larger and larger, and so I said, "I'm going to make this go away by not looking, and I'm just going to sit like this," and I sat like this, not moving, until the guy's feet entered my field of vision. Then I didn't move, I didn't say anything. I just looked up, and he said, "You're from which place? You have been how long in India?" and it was the grilling. Any Indian tourist knows that any citizen of the subcontinent can approach you at any time of the day or night, anywhere, demand to know your name, how long you've been in this country, and then the person, "And what you think of India?" This question is asked for the specific purpose of observing your discomfiture, because they know damn well what you think of India. I looked up and I gave this guy my most penetrating gaze and I said, "I cannot be interrogated," and I just put my head down and waited an hour. When I looked up they were gone, but only in that circumstance of being so stoned would I have ever behaved that way. The normal tourist reaction is, and they watch this happen to you, you just go into a tailspin of, "It's their country, everybody's a person, I'm a stranger. I should be nice, they're harmless. What's so bad about this, anyway?" Then you pare it out, you explain, "I'm from San Francisco, California. I've been here three months," so forth and so on. A friend of mine told me a funny story about taking the Bombay-Calcutta mail and arriving in Calcutta on this train. It's 4 a.m. and he gets off the train, and there's a little sadhu man over there, and the guy starts toward him and comes up to him. My friend said, "Wait a minute, before you say a word: my name is Nathan Jones, I'm from Brooklyn, New

York. I've been in India three and a half months and I hate it," and the guy said, "Ooh, you're great, babe! You're reading my mind!" You've got to be fast, that's all there is to it.

Audience: You've said that the mushroom tends to create its own agenda. You've also given examples of how you've directed it. So which of those is true? Are there ways to direct it to specific regions by doing specific things, whether you want to deal with certain issues like death or the

body, or to get into certain regions of consciousness?

It has its own agenda. It has certain qualities, this extraterrestrial, outer space, planetary, history is ending, apocalypse, millennia, kind of thing. You can direct it if it likes the way you're going. It's sort of like a very strong horse. If you're going the way it wants to go you're fully in control, otherwise not. I can remember situations with mushrooms where I hadn't taken it for a long time and I fall into confusion, and it usually revolves around, "Am I doing the right thing?" whatever the right thing is, so then I'll take mushrooms and wait until properly stoned, and then put this question to it. "Am I doing the right thing?" it reminds me of a press conference that Lyndon Johnson gave shortly after he became president. Somebody asked a question that he didn't care for and he said, "What kind of a chickenshit question is that to ask the president of the United

States?" When I go to the mushroom and say, "Am I doing the right thing?" it basically said, "What kind of a chickenshit question is that to ask me?" I think that was a very good answer, that was what I needed to hear, you know, "Are you kidding?"

My father used to say, "You can drive a horse to water but a pencil must be lead," and I think that's sort of the situation with the mushroom. If the question pleases it, it will answer. If the question doesn't please it, you'll hear about it. It is amazing how it gives people what they need. You know that Rolling Stones song, "You can't always get what you want, you get what you need?" I have a friend, dear friend, but arrogant, no doubt about it. This guy is arrogant, he definitely thinks he has the truth by the throat in most situations, and he won't take mushrooms because it gives him such a hard time. It says, "You're arrogant! You want to know what we do to arrogant people?" "For God's sake, lift it off me!" A certain amount of humility, it's a relationship, like to a crusty Zen master or something like that. It is really like another entity, because you cannot predict the answers. I remember a dialogue that I had with the mushroom early on where I said, "What are you doing on this planet?" and it said, "You're a mushroom, you live cheap." It said, "Listen, this neighborhood was not so bad until the monkeys moved in. To you it may look like a

mess, to me it was paradise."

The mushroom is very, very weird. I'll tell one more story and then I'll try to get off stories. I was in Malibu with all these fancy film people and we went out to dinner; Ralph Abraham was there, too. There was this French woman there, a film producer, and she was seated next to me at dinner, and before dinner we had been talking about the mushroom. I had been introduced to her as "the mushroom man," and she said to me, "You say that the mushroom speaks to you, but I do not understand exactly how this works," and I said, "Well, it's sort of like it has many faces that it can show, like sometimes it's like the role that Rod Steiger played in *The Pawnbroker*." At that precise instant, Steiger shows up at the table to shake hands with everybody and slap a few backs and then he just drifts off into the recesses of this restaurant. Ralph Abraham, who was

sitting across the table from me watching this whole thing and had heard what I said to this woman, reached across the table to me and said, "You see, the mushroom is showing us that it can touch us anywhere, anytime." Strange stories; synchronicity.

Audience: How do you remember to bring back what you've learned?

That's a good question, that's an important question, that's a key question. Roland Fischer, who was a great psychedelic researcher with psilocybin and later retired to Mallorca to be Robert Graves' next door neighbor, coined the phrase "state-bounded." This means that you can't bring it back. I'm sure you all have had the experience of dreaming, being caught up in some incredible dream with strange people, foreign countries, exotic costuming. The alarm goes off and as you stagger out of bed this is just melting like an ice cube in a blast furnace. By the time you are out of bed and fully dressed you have nothing, not a shred, not a hint, not a clue, it's absolutely gone. This is a state-bounded memory. Chemically what is going on is apparently that short term memory transcription is just not occurring. You are having the immediate impression of

these things happening and then it's not going to disk, so to speak, it's just lost.

The dream is not truly lost in that situation where you wake up and it melts away. The proof of this, and I'm sure you all have had this experience is that you go off about your daily business and then there will be, almost always by coincidence, an image, a chance phrase, a view of a street or something, and it will cause you to remember the dream. Once you get a hook into a portion of the dream, if you then work on it, you can probably bring a lot of it out. How this works in psychedelics is that I have an insight or something that I particularly want to remember, first of all, I will say it aloud. This is strong imprinting. Then the real imprinting is to repeat it a few minutes later, and then a few minutes later again. If you can carry it over a number of minutes to several different levels it won't leave you. A very useful shortcut for this is a tape recorder, where if you

play the tape of the trip back after the trip, just a phrase spoken will set off a chain of associative recall and you will retain it this way. To my mind, what shamanic training must really be is mnemonic training. If you want to bring stuff back you have to train yourself to bring it back.

Now, this state-bounded thing: it's important to notice, we talk about how dreams are state-bounded, how psychedelic experiences are state-bounded, but what we fail to notice, usually, is that ordinary reality is state-bounded. If I were to ask any one of you, "What did you discuss with the person you had lunch with yesterday?" it's probably very touch and go to actually put this together. I had lunch yesterday with Richard, we discussed his television transmission system, but that was new to me and therefore easy to retain, and also Richard and I haven't had thousands of hours of conversation together. The person we are most familiar with is ourselves. I don't know if it works for you like this: I am, let us, say cleaning my house, vacuuming, doing dishes, making beds, and I'm all the time thinking. I understand why Rome fell. I realize what I said wrong to somebody two weeks ago. I recall a telephone obligation that I have to fulfill, I think about things that happened years and years ago, and then the doorbell rings. I go to the door and there's someone there. They say, "What are you doing?" and I say, "Nothing." This is because the

ordinary state of consciousness is highly state-bounded.

One thing these Buddhists have certainly gotten right is that attention to attention is the key to taking control of your mental life. Most of it is just like a river flowing by, and every once in a while we check to see if the river is still flowing by, but we don't attempt to retain it. Memory training is great psychedelic training, and of course, as I'm sure you know, there were ants of memory in the past. We are very poor memorizers because we rely on technologies to do it for us. People in the past had all kinds of technologies for allowing them to remember things. For instance, the most common one in use in late antiquity and up through the Renaissance was the memory palace approach. This is where you think of a place you know well — a school, a hospital, a cathedral, a university, but big — and sit and think about it, think about how it looks as you go through the main doors and then what you see when you turn to the left and what you see when you turn to the right. Learn this building until you really can command it with reasonable vividness in most situations. Then if you want to remember something, imagine yourself walking through the front door of this building, turning to your left, and there near the water fountain you will place an emblem of this thing that you want to remember. Then you will go down the hall and around the corner, and by the fire extinguishers you will place another emblem of the next thing you want

remember.

The act of remembering this long list of things is the act of mentally moving through this imaginary building. When you come to the water fountain, the clue will be there, when you pass the fire extinguishers in your mind, the emblem you place there will be there. I know this sounds highly unworkable and unwieldy, but it actually is extremely workable, and people like Catulus and Cicero, the great late Roman orators, were able to speak for hours on end with lists of virtues and vices and interconnecting causes and this sort of thing, because they were masters of this mnemonic memory palace technique. Well, psychedelics are this vivid. This is another one of these things like mantras and yantras that works on psychedelics. You can do this so that when you're on a psychedelic and you have an experience that you want to remember, place it in your

memory palace, and the next time you come past that point in your memory palace this thing will be there.

If any of you are interested in this, the last word is *The Art of Memory* by Frances Yates, who was a wonderful woman, a great scholar of Renaissance magic. The final trick is to make the image extremely vivid, so that for instance, if you're about to give a speech to your collegium on the seven deadly sins, one of these sins is lust. I chose the easy one because I can't remember what the other six are; shows you where my problem lies. You don't just place the word "lust" in the memory keeping spot, you place some vivid and shocking image. Yates suggests the image of a nun lifting her skirts. I think this was a classically suggested one that people were taught to use. Then when you come around the corner and meet the nun lifting her skirts you think, "Aha, lust, that's the first one," then you go on, and so forth. Some of the most astonishing products of the medieval engravers' art are these books of what are called "emblemata." Emblemata are surreal juxtapositions of things, animal parts and bodies and machines, that are memory emblems, made as grotesque, surreal and bizarre as possible in order to make them unforgettable. That

was the technique, and the surrealists used this very consciously. There is something about the unexpected, the grotesque and the surprising that is almost by definition memorable, and this will work very well in the psychedelic state as well.

Audience: I'm interested in the legal aspect of this thing. We're talking about something that is highly illegal. As far as the law is concerned, how do you handle it? Anybody that drives around with the license plate "NNDMT," I wonder, are you paranoid about that?

No, I'm not paranoid about it. If they wanted me they should have come a long time ago, because I was much more vulnerable then. I've sort of covered my ass. Naturally, if you speak about these things you can't do anything particularly illegal. Perhaps I'm foolish, in the sense that I shouldn't be worried about being arrested, I should be worried about being shot. If that's how they play the game then I'm in big trouble, because they'll just come and shoot me, and you too, if you get into this; but if we actually have a legal system that works, then this is called advocacy, and it's not a crime. It's an exercise of the First, Fourth, and a couple of other amendments to the constitution. Henry David Thoreau, you don't get more American than that, said, "If you are right, you are a majority of one," and we live by majority rule. I don't feel heroic. It's not false modesty or anything, I don't feel heroic doing this. This is really humdrum to me; I just could not behave any other way because of what I've seen. This transcends laws, all that is seen as preposterous. I believe in universal laws; you shouldn't kill people, you shouldn't lie to

people, you shouldn't inject yourself between lovers. Most cultures recognize a set of universal laws, but, "Thou shalt not smoke marijuana?" Surely the God of Mount Sinai has better things to do than worry about that sort of thing.

We have to create a new option. All social progress is made by people taking chances. If I am an anomaly, some kind of dangerous sociopath, then my message will be swamped and lost in the noise of the tumult of the world, because there are thousands of messages out there. If, on the

other hand, this is a great and important domain of truth, then they are crazy to try to repress it because it cannot be repressed. They have tried to repress it.

Audience: Why did they seek to repress it? If the use of psychoactive drugs is so good for the psyche, why have they sought to repress it?

They sought to repress it because there is something in the Western mind that gets very nervous when you try to talk about the bedrock of ontology. McLuhan talked about this. He met great resistance, and all he was saying was that print had created certain kinds of unconscious biases in society in favor of uniformity and linearity. He was amazed at the violence of the reaction against this. He concluded that those cultures that have evolved from the phonetic alphabet are so removed from the stuff of the world, as opposed to languages like Chinese or Mayan where there is

a retention of the image in the written language. The cultures descended from the phonetic alphabet are extremely paranoid about questions about the nature of reality. That's what this is really about.

The psychedelic issue does not relate to the drug issue at all. In fact, it's important to make this point: drugs and psychedelics are not two members of a family, they are antithetically opposed to each other. The pro-psychedelic position is an anti-drug position. How can this be, since we are accustomed to thinking of psychedelics as drugs? Well, it's like this: what is it that we object to about drugs? I think most people can agree that we do have a drug problem. If you live in the inner cities you see people getting all twisted up behind this stuff. So what is it about drugs that we find problematic? I think that what is objectionable about drugs is that they cause unconscious, obsessive, destructive to self or other behavior. Unconscious, obsessive behavior is intolerable, because we are conscious people accustomed to injecting choice and meaning into our lives. You cannot have meaning if you do not have choice. This is why we don't have to spend any time at all talking about whether the world is predestined, because if the world is predestined, then I'm not saying what I'm saying because it's what I want to say, I'm saying what I'm saying because I can't say anything else. You're sitting there because you can't not sit there, so it makes the world very dull and uninteresting. Compulsive, unexamined, obsessive behavior is the quintessence of inhuman behavior. It was Ludwig von Bertalanffy, the founder of General

Systems Theory, who said, "People are not machines, but in every situation where they are given an opportunity to behave like machines, they will so behave."

Then there are drugs which reinforce obsessive, unexamined and self-destructive behavior patterns. Well, what do psychedelics do? They destroy behavior patterns, destroy cultural assumptions, completely hold everything up for grabs, completely throw open the possibility that reality could be any number of ways that are not culturally sanctioned. In that sense, the psychedelics are almost the answer to the drug problem. The early use of psychedelics reported spectacular progress with alcoholism. The people who believe that alcoholism is a disease — and I don't follow this literature closely — it seems to me that this is a preposterous statement. You mean a disease like influenza, smallpox and AIDS? Alcoholism is a disease? Can you get it if you don't practice safe sex, or do you have to wash your eating utensils? It isn't a disease, it is a failure of self-image. The reason LSD, in many cases, had a tremendous impact on alcoholic behavior was because it just showed people what they were doing. It said, "This is you. You're a drunk! You're a burden to your family, a bore to your friends, you smell bad and you're useless! How do

you like it?" So you say, "I don't like it," and it says, "Then stop drinking!" That's how psychedelics cure addiction. When we talk about addiction, nobody ever talks about what is called self-restraint.

Audience: There's a new book that came out about a month or two ago that's incredibly controversial. The man takes the position that for the last 30 or 40 years we've seen alcoholism as a disease, and that's just more bullshit from the medical model, and that we need another alternative. Of course AA is up in arms about the book. It's called *Heavy Drinking: The Myth of Alcoholism as a Disease*, and he discusses the fact that essentially it's a rationalization to say that alcoholism is a disease. There are certain people that have certain chemical reactions to

alcohol, but they are in the minority. This is very important to me because this is work that I am interested in, and alcoholism has also touched my family, as it has a lot of families.

In the disease model there's no responsibility involved. AA's position, their goal, is not to understand the nature of the universe; they're not in the philosophy business. They are trying to get people to stop drinking. So to maximize that goal, I think that they go far overboard. First of all, all substances: they say, "If you are an alcoholic, then you must forswear everything." I don't know how they relate to tobacco, but what you've got to understand is that we are set up for addiction. It's just like language and cognition and all of these other things. We are the animal which

addicts; other animals don't addict. Addiction is a way of relating to the world. We not only addict to drugs, we addict to each other, to chunks of territory, to behavior patterns. We attach to everything.

It's very real, it's physiological. I remember that years and years ago a woman left me for a homunculus, and I was appalled. I was vomiting every four hours, could not sleep, would burst into tears in inappropriate situations, of which there were many in my life. Heroin withdrawal cannot be worse than that, I mean, are you kidding, vomiting every four hours? Then one night, in the middle of the night, I was just frantic, because when I was awake I felt like I wanted to be asleep, when I should have been sleeping I couldn't sleep. I was just dragging myself to classes. I thought, "This is crazy, I should turn myself in, but they don't have crisis centers for broken hearts. What are you going to do?" So then in the middle of one of these bouts, I went to the medicine cabinet, and this woman who had left me had left all these pills there. I sorted through all these pills and came upon a small bottle of tranquilizers, a very mild tranquilizer like valium or something. Well, I had never taken valium, so I said, "I'll take half." I took it, and a few hours later I went out to breakfast and somebody sat at my table and said, "How are you coping since

Hermione left you?" and I said, "Who?"

It really gave me respect for tranquilizers. I was appalled that something so real to me, so much *me*, half a tab, I didn't care. Let 'em go. I realized that this is how all the people around me deal with emotional crisis. Nobody wants to feel anything. The moment that an unpleasant emotion rears its head, people go take valium or something else and cut themselves off from feeling. We addict to people, that's the point of that story, and when they leave us suddenly it's just like having your heroin taken away and you become a mad thing for months, years sometimes. I mean, I still vibrate from this event and it was 15 years ago. We addict to territory. This is war: our turf, our land. This arises as again a consequence of agriculture. Before agriculture, nobody had land, land was something you walked around on as you migrated behind your herd. Once it was

cognized as an object and fixed upon, they were ready to knock the other guy's brains out for setting foot on your territory. We all do this. We are addicted to caffeine, money, sugar, praise, television.

This is a favorite one to talk about because television is a forerunner of very insidious drugs to come, it's just the crudest and the first. Imagine if, after World War II, a drug had been introduced into this country of right-thinking, hard-working, decent Christian people, such that 20 years after its induction the average American citizen would be spending 6.5 hours per day involved in this drug. That's the figure for television consumption in this country: the average American watches 6.5 hours per day of TV. It is an electronic drug. It is an obsessive behavior pattern, an unconscious behavior pattern, and a physically destructive behavior pattern. I mean, it's done more for the rebirth of hemorrhoid specialists than any other single force in our society; but people say, "That's not a drug, that's entertainment." 6.5 hours per day of entertainment? Before electronic media a person could regard themselves as a great patron of the musical community if they heard twelve live musical performances a year when they would go to a theater. How many experts on Beethoven in his generation or the generation following heard the Ninth Symphony more than several times in their intellectual life? You have to get a lot of people together and cooperating to perform the Ninth Symphony. To us, the Ninth Symphony is an object: listen to it, listen again. We are able to objectively experience and then addict ourselves to it. Is this bad? How can it be bad if it is so written into us? I don't think it is bad; I think what we have to do is choose our addictions, choose our behavior patterns. One can choose to be addicted to punctuality. I am accused of this; other people are addicted to always being late. One can be addicted to

meaningless sexual encounters.

I think the physiological end has been much overplayed. Should we not fall in love because we phenomenally lock together with this person and become a single unified set of drives and goals? The physiological aspects of addiction have been. I think, very strongly overdrawn. I smoke cannabis every day at most opportunities, and have for years and years, since I was 18 years old. Every once in a while I stop, just to see what that's like. It's trivial: it's utterly easy. All that happens is a shift in behavior patterns. I read more; that's what happens when I stop smoking cannabis, and yet I'm supposed to be breaking out into cold sweats, wandering aimlessly through the streets of the city staring up at lighted windows. I think we give each other too much permission to be weak in this area. What is never talked about in talk about addiction is self-restraint. For heaven's sake, just take hold of yourself. If you tell people that addiction is a disease, addiction is because you're black, it's because you're poor, it's because you're this, it's because you're that, you have just given them a whole bunch of reasons not to take responsibility for their

own situation. What is needed in these addictive situations is the shock of recognition.

I believe that if you don't take drugs, you're unbearable. I can't think of a society on earth where people don't take drugs that any of us would want to have anything to do with. Let's take Calvinist Geneva, say. I imagine that as an example of an environment of moral rectitude. These people did not wear bright colors, didn't listen to music, never drank coffee, never smoked, forgot about alcohol, sex is for procreation, so forth and so on. They were paradigms of the male ego frozen in place: didactic, paternalistic, all-knowing, filled with hellfire and damnation. Everything is seen in terms of a moral dimension that makes impossible demands on the human animal. Rather, I think what we should realize is that somehow our evolution into a civilized self-reflecting being is caught up in these synergistic relationships that our conscious mind has with various

things in the environment, so that we should choose our addictions.

Notice that addictions to natural substances are harmless. Let me name some natural substances that you might disagree with me on this point. I think probably the strongest one would be opium. People will say, "What about opium? Surely, this is the scourge of mankind." Actually, opium was never a problem in human populations until it was conceived of as a problem by British colonial policymakers who decided that they could manipulate the opium trade to get an entire into China. Alcohol was never particularly a problem until the discovery of distilled alcohol. Of course, heroin is distilled opium, morphine also. Sugar is a refined vegetable substance. In every case, it has required the intercession of science and technology to take harmless habits and turn them into dangerous addictions. Everybody has a solution to the drug problem. I think what I would suggest is something called the Vegetable Drug Act, where you just say, "If it's a vegetable, it's not a drug." This was the position until very recently with British common law; in Canada, mushrooms were legal. Mushrooms aren't psilocybin, psilocybin is a refined chemical. It is

technology which allows us to create these super powerful, addicting substances, and there will be more and more of them downstream, you may be sure.

I think we need to think of human beings as hardware, as the computer, if you will, and drugs are forms of software. The software that you run determines the kinds of functions that you can perform. If you run distilled alcohol software then you take on the persona of the alcoholic. I believe that cannabis is probably the most harmless and benign drug around. It carries out this feminizing that I talked about, it lowers the profile of the male ego. Instead of wanting to duke it out, people just say, "Well, if that's your thing..." I mean, that practically boils down to what we call tolerance. So I think that this disruption of our relationship to psychoactive plants is what set us on the long, hard downward path into neurosis. It began with agriculture, with the narrowing of our spectrum of plant awareness from many plants down to the rye, the oats, the barley. It's interesting that then out of this came the cultivation of beer, which preceded wine. That comes out of the fact of having created surpluses, because the way beer was discovered was through the fermentation of grain that was stored. If you didn't have surpluses you would never discover

the psychoactive properties of fermented grain.

In Nepal, the Newari people have an alcoholic beverage that looks like a bowl of granola when it's put in front of you. It's dry; they pour it out of a sack into your cup and you say, "This is beer?" Then they come along with boiling water and pour it over it, and then you get this foamy, lightly fermented, contaminated grain water. To my mind, that is clearly how fermentation of grains and production of alcohol was established. Notice that it was also the accumulation of surplus from the agricultural adaptation that creates the need for defense, because now you've got a surplus and you have to guard your surplus from everybody who doesn't have any. The other thing that the creation of surpluses caused was the invention of barter and money, and this sort of thing, because now you have something that you can trade for something that you don't have. All of these adaptations; also, a nomadic people cannot move a grain surplus with them. If you're a semi-nomadic people, a people like in the Amazon, they plant things and then they leave them and go away. They have a yearly peregrination and when they come back to that place a

year later there's all this food ready for them.

Imagine a nomadic people who were doing that kind of quasi-agriculture with cereal and then there's one year of great weather and great rainfall and when they arrive at their little wheat patch, so much wheat has been produced that they can't move it, they can't take it with them. So then they say, "We have food now, we don't have to keep hunting, so let's spend the winter here," and this interruption of the cycle of nomadism to deal with unexpected surpluses obviously spawned the idea in people's minds. "Wouldn't it be great if we had surpluses every year?" Then that says, "That won't happen if we are as careless as we have been about our sowing and harvesting, but maybe if we're very careful and till the land, carefully plant and do careful weeding, we'll have to stay here and weed, but then we'll get this tremendous payback in the end." To my mind, the invention of agriculture broke our relationship to the wild plants and the lowered profile of the male ego and set us on a path of defending wealth, creating fortifications, supporting more specialization, larger populations, so forth and so on, and from there to the present

predicament it's only a moment.

I think that now things are very far out of hand, and we are caught up in the endgame of history. We are going to have to create a way out of this impasse that is probably going to mean a complete redefining of who we are and how we relate to each other, and space and time, and life and death. It appears that technology is now the thing that is guiding us forward. We are not being lead into the future by politicians. Politicians are running frantically along behind the wagon of history, trying to jump onto it. What is pulling the cart is technology. I think that technology is the program of realizing the practical concerns of the imagination, and that really where are headed is the imagination: it's a place. I don't know whether it's in solid-state circuitry, or the in the bones of the planet, or in artificial archeologies in deep space. The future will figure out the details,

but we are close enough to it now that we can anticipate it. It's what the shamans always said was possible: a world of value and meaning lived in the light of nature.

I think that if we can get through this narrow neck that rationalism has imposed upon us, and overcome these poisonous, paternalistic philosophies, we will return. That's why I call it the archaic revival: it's the myth of the eternal return. History is something that you finish with as quickly as possible and then return to the archaic mode of eternity. I think that's the adventure that we're all caught up in, that's the agenda that the plants and the planet have always had in front of them. It's just that we wandered away from an awareness of what was happening by deluding

ourselves with our own inflated self-image: man as master of woman and nature. This distorted part of our self-image has now become so dangerous to us that we have to abandon it, we have to draw back from it.

Under that kind of pressure, I think we will. Harking back to another question, the reason I do this, and the reason I don't feel any great trepidation about it, is because I believe that historical momentum is with us. This is what is destined to come to be. We are going to take control of who we are by taking control of the physiological and psychological foundations upon which the self rests, and that means the chemical reengineering of ourselves into the state of Ederic innocence that was lost when we set out on the long trail of the sword and the hoe. That's it. End of

weekend.

Thank you very, very much. It's a political point of view, you see, and as a practical matter there's no better way to succeed in politics than to champion the most out-of-it point of view. We live in an era where beige fascism is apparently the rising rule of the day. Well, that means that if you want to be on the cutting edge you have to embrace something very akin to psychedelic anarchy, the absolute antithesis of the fascist state. Then you will participate in the turning of the tide and the vindication of this point of view; and it will be vindicated, there's no doubt about it. All other points of view are bankrupt on the face of them. End of footnote.

Terence:Can you hear?

Audience:Yes.

Terence:Everybody can hear? Good. Well, I like to lead with good news, so, uh, let me assure that at no point this evening will I read from, or quote, the poet Rumi.

[audience laughter][0:00:30] Uh ... It's a pleasure to be in Sacramento, it's a pleasure to be in California. I lived here about 30 years before moving out about 8 months ago – lived over in Occidental – so, I sort of feel like this is a hometown congregation.

You may have seen the story in The Bee this morning, uh, it was a reasonable detailing of my theory of evolution [0:01:00]. I noticed that one expert wouldn't even give his name to allow his "no comment" to have attribution. [audience laughter] [laughing] Gentlemen, this is no way to behave in the face of an ideological revolution. Anyway, uhm ...— and, plus, it isn't even my weirdest idea, [audience laughter] but that was left unmentioned [0:01:30], thankfully, in the article. But, since the article dealt so specifically with evolution, and because that probably is my best candidate for entre into any kind of respectability, something I crave intensely in [audience laughter] every atom of my body, i thought I would discuss it with you this evening and try and make it [0:02:00] seem a little less absurd than, uh, than my critics might make it seem. First of all, let me lay out for you

the, uh, [phone starts ringing] the nature of the problem – right now, the nature of the problem is finding the damn phone and shutting it off! [audience laughter] [laughing] No, the nature of the problem is that, uh, evolutionary [0:02:30] theory tells us that we are some kind of advanced animal, of some sort, and science has waged a noble struggle over the past 150 years to secure this position against all attacks by orthodox religious thinking, and yet, there is...after it's all said and done, the sense that if we are an animal, we are a very, very [0:03:00] peculiar sort of animal, indeed – a unique animal. An animal capable of language and coordinated planning, an animal not bound to a particular social or sexual style – we have monogamous human societies, polygamous societies – this is very different from animals. We have poetry, we have mathematics, we [0:03:30] have drama, a whole spectrum of effects that is far from anything that we find in animal organisation. And this problem has fascinated me for a long, long time as it's fascinated a lot of people, uh, because obviously it's a great embarrassment to the theory of evolution that it can't account for human consciousness, [0:04:00] because after all human consciousness produced the theory of evolution [audience laughter]. So, you see, it's a significant failure there. So, uh, obviously if you accept the basic rules of the evolutionary game, which are that there is random mutation, which means gene drift, mixing of genes through sexual reproduction, uh, [0:04:30] cosmic rays which cause birth defects and mutations, this sort of thing, and natural selection. And, these two factors, natural selection and, uh, and mutation, are sufficient to account for praying mantises, chipmunks, tropical rainforests, but no us. And the reason is that we emerged too quickly [0:05:00] from the background of the rest of ordinary nature. Uh, in the space of about two billion years, the human brain doubled in size, and Lumholtz, who is an orthodox evolutionary biologist, calls this the most dramatic transformation of the—of a major organ of a higher animal, in the entire history of life [0:05:30], and it happened to us. It happened to that very organ that is responsible for the theory of evolution. So, what extraordinary confluence of, uhm, factors could have come together there to take a, uh, essentially an arboreal monkey, an ape of some sort, that had been at an evolutionary climax in the canopy [0:06:00] of the rainforest for a couple of million years, what extraordinary set of factors could then set that creature marching down the road toward, you know, Elvis, the Internet, Bill Clinton, and, uh, all the rest of it?

[Transcript by Frank Bronson]

Well, I imagined when I first started thinking about this, that there must be some huge edifice of established theory, that we have to go up in there and blow up, surely somebody has stated up this ground and made some kind of an argument about human consciousness. Well, in terms of science, not; or almost not. I mean, in terms of religion it's simple, I mean: god made us from the clay of the earth. In terms of science, the best shot is pretty weak soup from my point of view. Here's what science is telling us; that when you throw something, you have to plan, because once you let go of whatever it is you are throwing: you can no longer control it. And so because we were small, and weak and hunted in packs, we learnt to throw like hell: at very large, onrushing, wholly fellow mammals of various sorts. And you had to plan your throw. Consequently, we developed brain capacity to do this and have enough left over to invent quantum physics, paint the Mona Lisa, invent the phonetic alphabet, philosophy, religion and all the rest of it. In other words, it was the coordination of the hand and the eye, to the throwing arm. This is what the orthodox folks tell us, that gave us this extra brain capacity. That we sort of then managed into human civilization. Well, notice that this would make the pinnacle of the evolutionary ladder, the gum-chewing big league baseball pitcher. Because you know, he can put that pill right across the plate at high speed, time after time. As somebody who learned everything they know about sadomasochism in PE class, I'm not really ready to embrace this theory, it definitely runs against my paradigm: so I've built another story, and to my mind, it meets the objections, answers the questions of where did consciousness come from. But instead of doing it very nicely and neatly: it raises in the very act of answering this question, other questions. Maybe more closer to home. Questions that reflect on our social organization, our politics, how we treat each other in the here and now, even with implications for the future. We'll get to that, for the moment let me just run through this for you. There's a sort of a basic situation that all theories of evolution have to come to terms with, and this is, that our remote, protohominid, primate, ape, ancestors; lived and developed in Africa. If you have a non-african theory of human origin, and there are such things, the evidence is strongly against you. If it were stock, I'd sell. The evidence is pretty strong, that whatever happened that brought us

out of the animal-body, it happened in Africa. Well, all animals, and plants for that matter, tend to reach evolutionary climax and occupy a niche and stabilize in that niche. Cockroaches, ants achieved this hundreds of millions of years ago, and have not changed greatly since. Most of biology is this iterative occupation of a climax niche. Very little of biology, is the pushing forward into radical new forms, new species, still rare, new genera. For that, there has to be disruption of some sort, of the environment and it can be the meandering of a river, or an asteroid strike, the retreat of a glacier, something which creates open land. Well, for five-six million years now, the African continent has been slowly drying and three million years ago it was covered by rainforest at the equator from east to west. And that was the environment of human ancestor types. They were canopy dwelling, they were fruit eating, they ate some percentage of insects composed their diet, they had a pack signaling repertoire that was fairly complicated by animal standards

[Transcript by Javier Alonso]

....And there they were happily living in the canopy. But Africa began to dry up.

And they came under nutritional pressure. Now, simpler animals - insects for example - when their food source is withdrawn, they usually buy the farm. They don't have much flexibility of diet. If you've ever tried to raise caterpillars into butterflies for your children, you know that if you give the caterpillars the wrong leaves, they just can't make any sense out of it, and they die.

Uh - more advanced animals when confronted with dietary pressure or disappearance of ordinary food supplies, before they give up the ghost, they will - uhh - experiment, with other food sources in the environment.

Now the reason this isn't normally done, is thought - the reason animals are conservative in their food choices - it's thought to be a way of avoiding - ah - mutational influences in the form of tertiary chemicals, toxins, viruses, and things like this that would be in fo- in unusual foods.

One of the things that accompanies our acquisition of consciousness is gastronomy - the appreciation of flavor - the approach to food that makes it an art. Animals don't do this - they're just trying to get enough protein to keep the old engines running. The notion of flavouring is counter-intuitive to animals. And flavoring's probably in part a mutagenic influence to our diet.

When our remote ancestors came under environmental pressure, their environment was shrinking, the rainforest was being replaced by grasslands, and nutritional pressure - their ordinary diet of fruit and insects was being restricted - they began exploring this new environment of the grasslands, and this is the era of knuckle-walking, turning into bipedalism. It's the era of the coordination of binocular vision, so forth and so on. There was a paper published recently which anticipates my point but I can't wait to hit you with it. A paper published recently about canopy-dwelling monkeys who only leave the canopy for the acquisition of one particular food. And the food they will come to the ground for, and risk predation, is mushrooms.

So, it seems perfectly reasonable to suggest that our remote ancestors, exploring the new environment of the

grasslands, would have encountered, as you would if you were to go to the - to the tropics, ahh, psilocybin containing mushrooms, growing in the dung of cattle, many dung-growing, so-called coprophilic- coprolitic mushrooms produce psilocybin, among them stropharia cubensis, which is one of the largest and pandemically distributed of these mushrooms.

I'm sure that our early ancestors also tested other kinds, of food, they were testing everything. They were digging for corms with pointed sticks - ahh - and I'm sure there were many uhrhr ecological and medical disasters as a consequence of this. For instance ah, the birth control steroids in modern birth control pills are produced by dioscorea vines, grown on plantations in Mexico. Well dioscorea is the family of ahhhhh sweet potatoes. Imagine-uh a hungry band of primates that come up on a patch of sweet potatoes that are heavy in these steroids. It would raise holy havoc with their reproductive cycle - it would interfere with menstruation, ovulation, lactation, fertility, and uh, y'know, human genetic history is the story of many such - uh - encounters - with mutagenic influences in the environment - most of them catastrophic, detrimental, lethal. But in some few cases, there would have been uhh - salutary results - advantages conferred upon the, animals that accept these new foods into their food chain.

breath And - and I want to particularly emphasise psilocybin because I believe it's the key. You see we're looking for some kind of factor, which could have exploded, the human brain size, at a rate ten times faster than evolution, normally takes place. So it's going to be an unusual situation - perhaps the need to throw a boulder at distance accurately, or perhaps contact with an unusual food item or drug-containing plant. But it was something unusual - if it weren't unusual, it wouldn't have taken this planet....

[Transcript by Kurt Robinson]

[18:00]

...a billion and a half years to bring forth its first intelligent species.
Well, so let's look at psilocybin then in a little more detail.

It has a number of properties, not specifically related to its psychoactivity that make it an ideal candidate for a catalyst for the emergence of consciousness and an advanced animal. First of all, and at the early stage of human invasion of this new grassland environment - proto-hominid invasion I should say - ahh, we were testing foods, we would certainly have tested this food. I've seen these things the size of dinner plates in the Amazon after a rain, and they are silvery with blue and purple shading, they are the most dramatic thing in the environment, whether you know anything about them as, as, uhm, psychoactive agents or not. Certainly they would have been tested for food; I've seen chim-, uhm, baboons in Kenya investigating cow pies and flipping them over, because beetle grubs nestle underneath them. So cow pies are a natural vector for hungry baboons, so that everything is in place, it's- it's trivial to, uh, suggest otherwise, I would maintain.

OK. The first quality of psilocybin, which isn't specifically related to its psychoactivity, is that in small doses - doses that are the kind you might obtain if you would just sort of eating it along with little roots, grassroots, small bugs, um, you know, so forth and so on - visual acuity is improved. Specifically, edge detection is improved. Well, now, it seems to me, you don't have to be a rocket scientist to figure out that if you're in a highly competitive evolutionary

environment, in grassland, an environment characterised by large predators, hunting cats, and also characterised by small ungulate prey, that having an increased sensitivity to edge-movement might make the difference between whether or not you live to tell the tale or you become somebody's dinner, or it would certainly make the difference between going home empty handed, and taking dinner home with you. So, a factor which enhanced edge-detection on those animals accepting that food supply into their food chain, they would have, uhh, a slightly increased chance of evolutionary success as opposed to the non-psilocybin members of their group, and this increased hunting, uhh, success, would tend to outbreed the non-psilocybin-using members of the group.

At slightly higher doses, uhh, in highly sexed animals like primates, uh, all alkaloids are what are called CNS stimulants - central nervous system stimulants - that means that they produce arousal, and in sexually extremely active animals like primates, arousal means, uhh, erection, usually in the male, usually followed by hanky-panky, what anthropologists and primatologists call successful instances of copulation. [*audience laughs*] Well, again, what is this? It's a second factor tending to outbreed the non-psilocybin-using members of the population. They're now definitely moving to the rear of the parade; they don't have as much hunting success, they don't have as much food for themselves and their offspring, they're not having as much sex so they're not having as many offspring, and, you know, in terms of, of rising and falling numbers, those that have some allergy prejudice or fear of, uh, of a mushroom, are, are just being shunted out of the breeding population.

Well, at still higher doses, approaching effective doses of 20 milligrams or more, in other words 4 grams dried and up, or 45 grams wet and up, uhh, hunting is out of the question [*audience laughs*], sex is something you can consider [*audience laughs*] but it's out of the question, and you are basically nailed to the ground in a state of mind which we for all of our sophistication, our logical positivism, our superconducting supercolliders and all the rest of it, haven't a clue as to what it is, what it means, what its implications are - the full blown psychedelic experience of which we can only speak in, in terms of, uh, religious hierophany, epiphany, apocatastasis, and all those other great greek words, uhh, ataraxia, you know - in other words, we like it; but we don't understand it. And it is therefore, uh, the basis for religion.

Well... *swallows*, uhh, so right there...

[24:00]

[Transcript by Adnan Zahirovic]

... You have a three step process, driven by nothing more than hunger and curiosity, that leads remote primate ancestors to a confrontation with, what Rudolf Otto called the Holy Other, The Holy, The Numinous, The Transcendental. And aah, aah, you know this is on slightly less firm ground but in my own personal experience and having collected psychedelic experiences life long I feel confident in saying that at high doses psilocybin causes glossolalia. Glossolalia is syntactically structured language like behavior in the absence of meaning. Aah, speaking in tongues is what christian fundamentalists call it, but they don't have, aah, mo, monopoly on it. It's ancient it occurs in all cultures, It's shamanic, and what it is it is a kind of neurological seizure where linguistic organization spontaneously is verbalized. No animal does this, It must have something to do with the acquisition of language by human beings, and what I think is going on is that probably language was, aah, entertainment long before it was meaning, that is a kind of tuneless singing, and that having discovered that we could make an almost endless repertoire of small mouth noises, we did this, for each other, for amusement, for, to, aah, pass the time I mean, god knows there was a lot of it *audience laughs*, and It, It probably was very late in the evolution of this ability that some very tight ass rational type said, you know, we could attach a specific meaning to a specific sound and then every time I've made that sound you'd know what I meant, and then you can go and get it for me, *audience laughs* you see. It's a sort of, it, it's the "as long as you're up get me a Grant's" theory of language, aah. So, so that's the basic

idea, and, I, I really believe that, sometime in the last fifty thousand years before twelve thousand years ago, a kind of paradise came into existence. A situation in which man and women, parents and children, people and animals, human institutions and the land, aah, all were in dynamic balance, and not in any primitive sense at all. Aah, language was fully developed, poetry may have been at its climax, dance, magic, poetics, altruism, aah, philosophy. There is no reason to think that these things were not practiced as adroitly as we practice them today. And it was under the aegis of the boundary dissolving influence of psilocybin. We were nomadic, we were breeders and, and caretakers of kattle, we worshiped a great goddess, we followed a yearly round in a vast grassland cut by crystal streams that were washing down out of the, the higher altitudes, and we were probably black as your hat, for that matter. Aah, and it was great, well if it was so great, what happened, well, ahh, the very forces which created this situation, and you all recall what it was, it was the drying of the African continent forcing us out of the trees, forcing us to change our diet, forcing us to accept a dung growing mushroom, ahh, and there were other factors forcing us into consciousness as well. When we became omnivorous, the first form of consciousness is having the point of view of your prey, predatory animals have the highest form of animal consciousness, big cats, but it's a consciousness of the exterior world. Psilocybin forced us beyond that, into consciousness of the imaginal world, the world of the imagination inside our heads. What happened was, aah, the mushroom faded, the climate changed, what had been everywhere became seasonal, moved into the rain shadows of mountains, aah, became the prerogative of a special class of people called shamans, who were like the, the designated hitters for dealing with the hyperspace of the mythos. Aah, and in other words, over millennia, the, the, the, connection went from available to everyone all the time, to ever more tenuous, ever more tenuous, finally faded out entirely. It's even more complicated than that because surely people....

[Transcript by Lobo Noble]

[00:30:00]

Terence: would have, as they saw this happening, make attempts to preserve the mushroom, and in a world without refrigeration, the only effective way to do this is preservation in honey. You can dry mushrooms, but in a world without hermetically sealed peanut butter jars, drying is a very short-term strategy for preservation. The only thing which will really work is preservation in honey. The problem there is that honey itself, especially aboriginal honeys – which have a lot more water in them than what you get in those little plastic bears at the A&P [audience laughter]– uh, aboriginal honeys are very runny, and so what do they do? They themselves have the capacity for turning into a psychoactive substance: alcohol. But alcohol promotes a completely different set of cultural values and attitudes than psilocybin. Uh, psilocybin is a boundary dissolving hallucinogen, uh, mead alcohol, uh, gives an enhanced, uh, sense of verbal acuity in the presence of lowered sensitivity to social cues. In other words, uh, one can make an ass of oneself [audience laughter].

But now I want to backtrack for a minute, I will return to this thing about the loss of the mushroom, but there's something that I wanna go over with you that's really important in all this, to me, and that is: this isn't simply the story of how an intoxicant promoted consciousness and then we fell into history but losing that intoxicant and went into other intoxicants, with consequences to be evaluated, it's that, but it's more, because psilocybin had a very, very peculiar effect, over and above what I've mentioned so far, and it's this over and above effect that makes my theory so controversial, and so, uh, and academics so phobic of it, because it rips open a whole can of worms, and this is the problem: all primates, clear back to squirrel monkeys and old world monkeys, all primates form dominance hierarchies. This means that the sharp fanged, hard bodied young males control everybody else: the women, the elderly, the sick, the children, homosexuals – everybody finds their place somewhere in this dominance hierarchy run by these dominant alpha males. We are no different. We also, as we sit here this evening, operate under this kind

of a social organisation. I mean, we complain about, we analyze it, we are aware of it, but we live under it, it's how it is. So, here is my suggestion: that, what psilocybin did was it changed behaviour, it interfered with primate behaviour. Specifically, it interfered with this tendency to form monogamous pairs and dominance hierarchies, and so the ordinary tendency of the primates to organise themselves that way [00:34:00] was interrupted, medicated out of existence, if you like, vaccinated against, if you like, by the presence of psilocybin in the diet. And, uh, this, oversec—this, this overemphasizing or chemical accentuation of sexuality occasioned by the arousal of psilocybin, was sufficient to dissolve [00:34:30] the ordinary tendency toward monogamy, and replace it with an orgiastic sexual style, or they coexisted simultaneously, I mean who knows, we weren't there, it's sort of, the way I imagine it, is that at every new and full moon there were group mushroom parties which basically, simply got out of hand [audience laughter], regularly. And—and, so, the monogamous [00:35:00] pair bond would be under pressure if not completely eliminated. Many cultures have this even to this day, I mean, in a sense, mardi gras is a festival where the rules are dissolved, and nobody is supposed to go to their spouse the monday after and say, "You know, was that you I saw dressed as Marie Antoinette and, uh" ... [audience laughter] because, you know, the rules are—there is permission to break the rules, and many societies [00:35:30] do this. Uh, the result of an orgiastic style like that, is, uh, men cannot trace lines of male paternity, and so there is a tremendous social glue, a tremendous, uh, force for the cohesion of community. Men don't then think in terms of "MY children", they think in terms of "our children", the children [00:36:00] of the group.

[Transcript by Frank Bronson]

...And under the aegis of this group, this polymorphis.. (polymorphic), sexual style, group -uh- childcare, and -uh- and extended family rearing, we produced everything that we think of as human; that we value. Our art, our music, our philosophy, our sense of each other's worth, -uh- body painting, tattooing, piercing, all the accoutrements that distinguish us from animal existence were put in place when we had a different kind of mind than we have now. We didn't have a mind that that favored role specialization, and male dominance, and anxiety over female sexual activity related to feelings of male ownership. That all came later.

[37:00]

We became human beings in this other.. World of - of values and psychological attitudes. The problem is, as I say, 'the mushroom faded,' but by the time it had faded -uh- we were no longer the wordless symbionts of cattles, the, the barely sentient hunters of, of the African plain. By the time we were finished with the mushrooms we had language, we had social institutions, and - but what we began to lose was, you know, - you can get as wet eyed as you want about it but.. respect for each other; a sense of each other's individuality. A sense of love, a sense of community. And it must of been, though it happened over a long period of time, very much like what we're living through now.

[38:00]

A sense that people are, you know, no damn good and getting worse. A sense that, you know, 'Why can't we be as we once were?' 'Where is our sense of each other?' 'Where is our ability to care for each other?,' so forth and so on. I wrote a book called -uhm- 'Food of the Gods', in which I tell this story in the first third of the book that I have just told you, and then I show that, what history is essentially, is, is a careening, out of control effort to find our way back to this state of primordial balance. One of the things that marks us as humans that is unique is our obsessions with

drugs; our ability to addict.

[38:57]

We addict not only to substances, we addict to each other, we addict to ideologies (Marxism, Christianity, pff..Skinkism as practiced in Washington, *audience laughter* -uh- whatever). And we addict to each other. You know? I mean I am a romantic -uh- with the best of them but I can't help noticing that a broken heart and a heroin withdrawal show very similar presentations. *audience laughter* Really! Insomnia, sweating, sense of diminished self-esteem, hysteria, -uh uhm- you know, it's, it's very very similar. We- so, a psychologist looking at a person with an addictive syndrome will say, "Well you were damaged in childhood, there's some trauma there that you're, you're trying to compensate. You're trying to compensate."

[40:04]

Well i'm not that keen on all this psychologizing, but I do think that we could apply this model to ourselves on a grand scale. We were essentially torn from the gain womb, thrust into the birth canal of history, and expelled sometime around the fall of the Roman Empire into the cold hard world of modern science, existentialism, and all the rest of it. And -uh uh- we have searched the planet for substances which would assuage our sense of pain. And there are things out there, you know.. Alcohol, the whole morphine family, so forth and so on. But these things always have consequences. There's a price to be paid.

[41:00]

-Uh- The very knowledge of psilocybin was lost to the entire planet, except for some tribes in the Mexican mountains, -uh- for several millennia until Valentina and Gordon Wasson went in the -uh, uhh- early nineteen-fifties and found these mushrooms and brought them out and then Albert Hoffman, who had earlier discovered LSD, synthesized the compound and made it available. That was '55. Well by '66 all human research with these things had been forbidden. We have- It's not that science "mowed this field and moved on." It's that -uh- science has never really been here. -Uh- we haven't looked at the implications of diet on early human evolution.

[Transcript by Nigel Millegan]

[42:00]

We don't have a theory for the evolution of consciousness of any consequence, and yet, you know, the factors I've laid out for you - increased visual acuity, a-, impact on sexual and social behaviours, uh, triggering of glossolalia-like phenomena in the presence of a boundary dissolving psychedelic experience - these are catalysts efficiently dramatic that inculcated into a cultural style, I think they explain a great deal about where we came from and who we are. Now, the, [*looks at watch*] the irony of all of this is, uh, that we live in a society that has made p-, all practically, any discussion of this, illegal. Certainly if I were to end this lecture by handing out doses of psilocybin, [*audience

laughs*] I would be gently taken by the elbow and led away forever. [*audience laughs*] Uhh...

Uhh, the western mind is particularly phobic of this, uhh, of this subject, I mean, we have bent our laws so that people can jump out of airplanes in the pursuit of thrills, so they bungee-cord off major highway bridges and freeway overpasses; be-, so concerned are we to fulfill society's need for thrills, uh, but this, is something else. It provokes all kinds of alarmed reactions and perhaps you believe unfairly. I think that when you examine the situation, it's possible to understand very clearly why this is such a social issue; because what these things do, if you look - and now I'm slightly broadening my wrap to include other psychedelics besides psilocybin, but psilocybin is certainly true in all cases - what these things do, if you had to generalize a hundred-thousand psychedelic experiences - the ones where people thought they were god, the ones where people had to be taken to the ER room and have their stomach pumped, all of them - if you generalize what the-, what these substances do, is they dissolve boundaries. They dissolve boundaries. If you love it, you'll love it. If you hate it, you'll hate it. But that's what they do; they dissolve boundaries.

Now, the reason this provokes a lot of social anxiety is because all societies are about the maintenance of boundaries. It doesn't matter whether you're, you know, a stockbroker in New York, a zen monk in Kyoto, a hasid in Jerusalem, your society is held together by boundaries, and definitions, and anything which dissolves those boundaries and introduces, uh, relativity into cultural modeling, is felt to be threatening. Because we like to believe that our reality is somehow sanctioned, that this is how it should be. But in fact, you know, that's just, uh, cultural judgement; all cultures think that their culture represents a sanctioned reality. It doesn't. It just represents the current download of, uh, their linguistic enterprise. [*audience laughs silently*]

Uhm... The- At the core of the western anxiety about boundaries is something that we are very proud of, that we believe we invented. We call it the ego. Sometimes we call it the democratic individual. Uhh, we say no we- wu-, no eastern society could have produced this. We took this from the Greeks, we perfected it through the Romans, we brought it up through the medieval period; John Locke, and Thomas Hobbes, and all those folks fixed it up for us in the 18th century, Thomas Jefferson ironed out the wrinkles, and modern America is the shining example of, uh, what you can do if you empower the ego, the citizen, the individual. We want nothing of tribalism, still less of collectivism, and God forbid [*in mockingly stern voice*] nothing whatsoever to do with communism! See, all these- all these things, uh, set us going. Uhh...

But in fact, the ego is appropriate only to a certain point. I mean, yes, we need egos, so that you take someone to dinner at a reasonable restaurant, you place food in your mouth, not their mouth. [*audience laughs*] This is-, this is what the ego is for. It tells you who pays. [*audience laughs*] [*clears throat*] Uhm, but in fact, what the ego is, is the return to consciousness of this psychic structure related to the patterns of dominance. And the way I think of the ego is it's like a cyst, or a calcareous growth, or a tumor, [*audience laughs periodically throughout the sentence*] that gets going in the personality, and if not treated, it becomes chronic, and then there is no cure. There can only be, you know, a certain amount of maintenance, and....

[48:00]

[Transcript by Adnan Zahirovic]

[0:48:00] ...medication of it but it's it's incurable except unless we resort to not only non-prescription drugs but uh drugs currently illegal. In other words, the psychedelics through this boundary dissolving function dissolve that boundary as well. And so they promote a larger sense of the world than the values of capitalism, [0:48:30] competitiveness, object fetishism, property acquisition and the bottom line, empower.

So the -the issue as was always since, since the sixties forward i think is not simply uh an issue of religious freedom or an issue of an eccentric minority social practice [0:49:00] being tolerated by the majority, the way they tolerate handing out pamphlets in the airport or something like that, the -the issue is in fact what kind of people shall we be? And then what kind of society shall we put in place?

And that's why my theory of evolution is not simply a dry [0:49:30] footnote on uh an issue that involves anthropologists, primatologists and biologists, but it turns into a political issue because our unhappy, addicted, ego-driven condition has become not simply the source of our own unhappiness, that was bad enough but now it's the source of great discomfort and dislocation [0:50:00] for all life and human society on the planet. We -we are out of control, we are basically severely addicted to things, and cannot stop ourselves. Uhh and we know, or we should know, that there is not enough petroleum, heavy metal so forth and so on [0:50:30] in the planet to give all the thing addicts all the things that we know they must have in order to be happy.

We have spread this intellectual virus from pole to pole, to Turkmenistan and Borneo, to the upper amazon to the Tajiks , everybody wants kids, you know? Everybody wants the pause that refreshes, uhh, [0:51:00] what are we going to do about this? Well so far we've been treating it like an endless garden party, there's no serious plan on the table to deal with this at all.

Uhh uh i think that the momentum of human history is pushing us inexorably toward some kind of day of reckoning and in which we are going to have to turn [0:51:30] consciously toward brutality and selfishness and say we'll let India go. Let Bangladesh go. Triage. Costs too much. Can't possibly fix the problem in order to maintain our locked compounds and our 50 channels of television and the endless availability of arugula (*audience laughs*) we have to let India go.

We're going to have to [0:52:00] turn that way in other words each consciously participate in a choice to brutalize the human enterprise or we're going to have to uhh seriously talk about very major restructuring of our society and i don't really know how we do that.

I was living in northern california a couple years ago when they wanted to close an airbase near here and the [0:52:30] newspapers were filled with weeks for weeks with analysis whether western civilization could absorb this hammer blow at the very heart of its institutions of closing one frickin airbase for crying out loud. (*audience laughs*) That's not my idea of major change. You know?

We may have to give up some of our pretty things. We may have to discipline some of the irresponsible [0:53:00] uh social philosophies that run amuck among us and no i don't mean the advocacy of psychedelic plants i mean the roman catholic church on population control in the third world. I mean the germans take quite a knock for the

holocaust but the catholic church manages to push more people into death disease and degradation every year [0:53:30] than the holocaust manages in its entire show and it's thought rather crass to even mention the fact. It seems to me that as long as these catholic bishops can show their face in public that we are - uhh in complicity with mass murder. It's not pleasant news, but what are you going to do about it. Islamic fundamentalism, [0:54:00] another bunch of not-heads with an anti-human agenda, what are we going to do about this?

[Transcript by Jonathan Laliberte]

Are we going to go gently into that good night of planetary chaos, extreme distortion of class structure, defence of what we have at any cost against those who have nothing? There doesn't seem to be any other plan on the horizon.

Arthur Koestler - who probably never thought he would be quoted by Terence McKenna, [*audience laughs*] a very conservative character, you'll recall he was a marxist who turned on marxism and led a very interesting intellectual life - he wrote a book thirty years ago called "The Ghost in the Machine", and he made a case similar to mine, but a little simpler. He observed: human beings are hardwired for homicide. [*audience chuckles*] This is what we do best, because this was something we had to do, apparently, at some point in our past, at least in Koestler's view, he didn't believe in a mushroom paradise. But he reached the same conclusion that I have, which is, we need a pharmacological intervention on antisocial behavior, or we are not going to get hold of our, uh, our dilemma. And, uh, I-, I-, you know, there have been dystopias based on drug intervention on aggressive behavior; you all remember "Brave new world", where every time anybody raised their voice, they were given a, a gram of soma, and told a "gram is better than a dam" (?). And so, nobody ever had the thought in their head. Well, that's a terrible drug, let's not introduce that. O-oh, the bad news is, we've had it for decades, it's called television, [*audience laughs*] you know. We have millions of people in larval low-awareness lives, in their little condominium apartments, just ladling this garbage into their minds. The average American watches five and a half hours of TV a day, so imagine how much these people watch. I mean, to- to think of that as human at all... If that were a drug, we'd be up in arms. You know, if people were loaded at home with that level of mental condition, [*audience laughs*] day after day after day, we would-, we would do something about it. [*clears throat*]

So, my, uh, you know, I don't ha-, I can't propose a grand solution, but I do think that it is, uhh, uh, pregnant with implication that here at the end of the 20th century, with all of this problems hammering down on us, the news comes from the rain forests, and the deserts, that these aboriginal people - while we made the descent into history, and got the top quark, and planted the flag on the Moon, and all that - they kept the faith. And they have... [*pauses, swallows*] a "materia medica", a toolbox, that can carry us back into connection, uh, with the planet. Now, the question might be asked: w-, why-, why do y-, do you have such overwhelming faith in, what is after all a substance, a drug? I mean, don't psychedelics just cause you to see pretty pictures and patterns, and tally up your gains and losses, and then you come down, and that's it? And the answer is: no. What is mysterious here - and I mentioned this in the early part of my talk - what is mysterious here, is this thing we call the psychedelic experience. Those people nailed to the ground around the campfires fifty thousand years ago, they didn't know what it was. And when we go in there, armed with our Heidegger, and our Husserl, and our... Wittgenstein, and our Merleau-Ponty, we don't know what it is either. There has been no progress in sixty thousand years in reducing the psychedelic experience to a known quantity. It is as terrifying, as awesome, as ecstatic, as irreducible to us as it was to them. Well, what is that? As secular people, uh, we rarely experience religious awe, especially of the uncontrollable sort. Uhh, I believe that, what makes the psychedelic experience so central, is the that it is, uh, a connection into a larger modality of organisation on the planet, which is a fancy way of saying, it connects you up to the mind of Nature herself. The planet is not, uh, uh, just a hodgepodge of competing species, that's the old evolutionary model. That's been obsolete for decades. The new evolutionary model is, that, where we see species... Nature sees only ge- a gene swarm. Genes moving at various speeds, being transferred around - a large percentage of them by sexual propagation.

[1:00:00]

[Transcript by Adnan Zahirovic]

But a large percentage of them by asexual and vegetative propagation. And still others by more exotic -uh- methods of propagation such as [what] go on in the fungi and the bacteria. Uh, the world is a gene swarm, and people like Lynn Margulis and James Lovelock have been suggesting for years that the Earth is a kind of thermostatic self-regulator. Well, if you carry that idea far enough, thermostatic self-regulator is a way of saying [it's] a kind of computational engine; a kind of computer; a kind of mind! A kind of of mind; The Gaian Mind. The reason those mushroom eating, orgiastically-behaving people worshipped a great horned goddess, the reason they imaged the numinous other as feminine [1:01:00], was because they had a connection into a kind of overarching intelligence that they instinctively and intuitively felt to be feminine.

And we retain this in our languages as the idea of mother nature, and the femininity of the land and so forth and so on, but it's just become a distant metaphor to us. I think our intelligence is, is a source of toxicity to nature and discomfort to ourselves unless our values are based on planetary values; are linked to the values of the rest of nature. And that means we need to -uh- fit ourselves more appropriately into the scheme of things by limiting our numbers, [1:02:00] by -uh- limiting our extraction of natural resources and toxification of the environment.

Uh, we uh, we need to realize that there is a hegemony of life on the planet, not necessarily a hegemony of intelligence. Intelligence is not a licence to trample. Th- the proper role of intelligence in a planetary ecology is that of gardener, caregiver, and uh, uh, maintainer of balance. Well.. so where do we go and how- what do psychedelics have to say about that? Well, I- I believe that psychedelics show us something which -uhm- [1:03:00] which capitalist, consumer fetish oriented society doesn't want us to know.

What psychedelics show us, is the incredible richness of our minds. That- that you, little you, can produce more art in a 20 minute burst of hallucinatory intoxication than the western mind has produced in the last 500 years. Our socially created space is incredibly impoverished. You know? We have Picasso's contribution and Pollock's contribution and everybody's contribution but it all together is as nothing compared to the richness that resides in each one of us a half inch behind your eye brows.

[1:04:00]

We are told, you know, 'oh well if you want beauty you have to own a lexus.' Or -uh- you know, if you want a sense of satisfaction then you need a triple car garage. [And] on and on. Th- this is absolutely -uh- not true. These are substitute addictions that will never satisfy for the genuine article, and the genuine article is a connection into the Gaian Mind. Well I don't believe or expect for a moment that ever again, naked, tattooed, and joyous we will herd our cattle across the grasslands of Africa. *audience laughter* I mean there are six million (billion?) of us that chance has been blown. Uh, but, but, what- what can we do to make- to ameliorate our situation? Well I have always been an optimist, i'm more optimistic right now [1:05:00] then I have been for a long time because sometimes when

you're an optimist, you're an optimist simply on principle, you believe it's going to turn out alright but you don't see how it possibly could.

I'm beginning to see how it possibly could turn out alright, and -uh- my notion is - first of all I- I follow my thinking about shamanism and I follow the great historian of religion Mircea Eliade, who got it almost all right except that he never embraced psychedelics. He thought they were decadent. But that was just his French/European education and he came to early. But anyway, Eliade wrote a book called 'Shamanism,' and then he subtitled it 'The Archaic Techniques of Ecstasy.' Now he wrote the book in French. In French . . .

[Transcript by Douglas Salguero]

...technique has a connotation that it doesn't have in english. It means both a way to do things, and it means technology. Later, the french sociologist Jacques Ellul wrote a book called 'Propaganda' and the little banner under which his book flew which is printed right on the front of his piece, is he says, 'there are no political solutions, only technological ones. The rest is propaganda.' And then he spends 200 pages explaining what he means by political solutions, technological solutions, and propaganda. By Ellul's understanding, I agree. I think ideology is toxic. All ideology. It's not that there are good ones and bad ones. All ideology is toxic because ideology is a kind of insult to the gift of human free thinking. I mean, if you adopt some ideology, Lenninism, Mormonism, it doesn't matter, then you have all the answers. You just go and look in the catechism. Well I don't know why they issued you a brain, they could have just given you the catechism. *laughs* Uhhm. Technology as the counterpoint to, uhh, ideology is a very different animal. Now right now we're going through a technophobic phase because people think technology means exploding nuclear power plants and uhh irradiated food and tv. But all technology really means in the Mclewin sense is the extensions of man, the extensions of man. And, so language is a technology, shamanism is a technology, psilocybin is a technology, and certainly the internet is a technology. It's, slowly I think, dawning on a number of people that if we, if we're talking about hallucinogens as consciousness expanding drugs, than the only difference between a drug and a computer is that one is slightly too large to swallow, and our best people are working on that problem, even as we speak. The drugs of the future will be much more like computers. The computers of the future will be much more like drugs. And I think what we have to recognize is that we are in a very brief and low energy technical phase in technology, basically we're at the tail end of the petro-chemical steam era and where we are headed is toward the solid state, fiber optic, global community of the internet. And uhh, when I was in San Francisco two weeks ago, the buzz was all about VRML, the virtual language markup... the Virtual reality markup language whose protocols are being set now so that we will be able to build websites on the net that you can put on your helmet and walk around in. Sun Microsystems is about to introduce something called Hot Java which will let you build and interact with your website without going through your server. Bandwidth is broadening as we speak. Uh the whole world is being brought into the domain of electricity. And you may not know it but Marshall Mclewin thought that this was descent of the holy ghost as a convert to christ- to catholicism, he sort of went the opposite direction as me. As a convert to catholicism, he decided that the descent of the third person of the trinity and the worldwide spread of electricity were the same event. So I think that uh what we have to do is dematerialize culture in every way possible. And that means pharmacologize culture, computerize culture, network culture, virtualize culture, and uh, make of it, thereby, uh a tool for the production of our poetic flights, a technology for the putting in place of our dreams as exhibits that we can show each other. This is what it is, this is what technology can be in the service of boundary dissolution. In the service of boundary maintenance, you get hydrogen bombs and seran. In the service of boundary disillusion, you get psychoactive substances, and the Internet, and uh, sexual experimentalism, social justice, tolerance, and community, and the, the choice is to be made on an individual level by each and every one of us. I don't advocate a mass outbreak of psychedelic use, I think these things are a private matter. They are, the only thing comparable to them in our human experience is our sexuality, and that's a private matter.

[Transcript by Christian Haas]

[1:12:00]

How we define it, how we express it, how we act it out, who we do it with, what we think about it and what we choose to say in public about it is all, uh, in our hands. I do not think that, uh, the government, under the guise of some phony alarmist pseudo-scientific rhetoric, should attempt to control the evolution of consciousness. After all, if these things truly are consciousness-expanding, it doesn't take too much intelligence to realise that it is the absence of consciousness that is causing our flirtation with extinction and planetary disaster. If there is any way to raise consciousness - diet, drug, machine, sexual practice, mantra, yantra, whatever it is - we should be furiously exploring and applying it. Because if we should fumble the ball, if we should actually, uh, where our ancestors over thousands of generations did not fail, if we are to fail, the magnitude of the tragedy will be immense, because failure is not inevitable, it is not inevitable that we should fail. There are ideas, personalities, technologies, uh, available right now that which, if honestly explored and- and implemented, could rescue the human enterprise from the disgrace that hovers over us. We don't want this to end in a toxified garbage pit ruled by nazis, which is, you know, the way we may well be headed. Uh, the Gaian mind has always been there.

Nature, originally through the plants and shamanism, provided the tools for us to access this incredible natural database through the vicissitudes of history, previous generations lost the key in western society. Since the 1960s the key has been re-found. It's a matter of great social controversy, it's a matter of... of- of great risk of those who take it, how they will be viewed by their peers but there is no longer.... ignorance is no longer an excuse. Anthropology in the last 100 years has laid at our doorstep the tools necessary for an archaic reconstruction of a society and, uh, human values within that society. It's inconceivable that Western industrial capitalism could run on another 500 or a 1000 years. Uh, it- it will not continue as it has, it will deteriorate under the pressure of resource scarcity. And what few democratic values we have obtained, what little space for reasoned discourse has been created will be the first to be swept away, so it's- it's very, very important that people take back their minds and that people analyse our dilemma in the context of the entire human story. From the descent onto the grassland to our potential destiny as citizens of the galaxy and the universe, we are at a critical turning point. And as I say, the tools, the- the data that is... holds the potential for our salvation is now known, it is available, it is among us. But it is misrepresented, it is slandered, it is litigated against and it's up to each one of us to relate to this situation in a fashion that will allow us to answer the question that will surely be put to us in a some point in the future, which is "What did you do to help save the world". Well, I'll knock off now, I'll sign books, we'll take, like, a 10-minute break and then we'll come back and do questions. Thank you very much for your attention! [Applause]

[Dis]...aster and that in fact what we're involved with here at the end of the 20-th century is some kind of, uh, accelerated forward escape into transformation. And I- when I lecture that subject I more or less imply that it's inevitable. In other words, that it's not that we have to to X, Y or Z, that it's on track. I think it is on track but I also think there is a place for this kind of politics we discuss this evening because, as the world gets crazier and crazier, a lot of people are going to get very, very anxious. This thing in Oklahoma City is an example of people getting anxious. Uh- so, what needs to be done is to spread [1:18:00] the idea that anxiety is inappropriate.

[Transcript by Demeter Bogoev]

It- it's sort of like w-we who are psychedelic have to function as sitters for society [audience laughs], because society is going to thrash, and resist, and think it's dying, and be deluded, and, uh, regurgitate unconscious material, and so forth and so on. And the goal (1:18:30) - and the role, then, for psychedelic people, I think, is to try and spread calm.

I'm very convinced that things are going to get a lot nuttier than they are, and they are a lot nuttier now than they have been for a while [audience snickers]. But, it- it isn't -- it isn- doesn't mean the bad people are winning, or that we are going to fumble the ball, or anything.

The mushroom said to me once, it said, "This is what it's like when a species departs for the stars." (1:19:00) It's a birthing. It's complicated. Uhm, if you had never seen a human birth, and you came around the corner of a building in your daily round, and it was happening - it vibrates medical emergency. I mean, blood is being shed, tissues stretched. It doesn't - you really have to have your chops together to step back and say, "How wonderful! New life coming into the world!" (1:19:30) [audience laughs] Because, uh, you know, that's not the vibe of it. [audience continues laughing] And, I think that's the circumstance that we're in. This is the birth canal to a new order. And, at the moment, it looks like suffocation, constriction, limitation, possible death.

But, uh, we need to inform ourselves, and get a big perspective. (1:20:00) And, there's no way to get a big perspective like education and psychedelic experiences. If we can see history for what it is, it's a- it's a twenty-five-thousand year, nearly instantaneous, transition from one state of being to another. And, yes, there are fifteen-hundred generations of people who live in that paper thin transition time. (1:20:30) But, when it's over...it's over, and we will leave history behind the way you dump a used placenta, I'm sure.

Yeah? [Points to audience member with a question]

Audience Question -

Um, I wondered, is there any reliable information on the relationship between psychedelics and early, uh, Christianity?

T.M. -

Reliable information on psychedelic use in early Christianity? The answer is no. I mean, there - there is a book by John Allegro, (1:21:00) called The Sacred Mushroom And The Cross. He was a very respected Dead Sea scholar 'til he wrote that book, [audience laughs] uh, and that basically finished his career as a classicist. He says some incredibly provocative things in that book. To judge whether he's right or wrong you would have to be, uh, an Assyrian philologist - about which I know nothing. (1:21:30) So, to the layperson, it seemed to be quite an impressive book, but, apparently to his specialist colleagues it was sloppy thinking, and a travesty, and reason to deny tenure. [Audience laughs]

Uhm, St. Augustine was a Montanist before he - no, he was a Manichaeon before he converted to Christianity. And, uh, (1:22:00) he mentions that Manichaeans forbade the use of mushrooms - the eating of mushrooms, it doesn't say the use of mushrooms.

But, the ancient middle-east - we don't know very much about psyc- uh -- psychedelic sacramentalism. It may have been there. It may not have been there. Absence of reference is not proof of absence, because of cult secrecy, and- and other factors like that. (1:22:30)

We do know that the - or we feel we are on firmer ground in saying that the Greek mystery religions, emphatically, probably were psychedelic. Especially, the- the Ele- Eleusinian mysteries. The mysteries that were practiced on the plain outside of Athens every year for over two-thousand years. And, everybody who was anybody in the ancient world made the journey to Eleusis (1:23:00) to celebrate the greater mysteries, which were celebrated in September. Interesting approach to psychedelics there - you could only legitimately participate in the mystery at Eleusis once in your life.

So, imagine if you had a single, high-dose, psychedelic experience under ideal conditions. In other words, in darkness, under the care of experts, and then (1:23:30) the rest of your life you had to sort it all out based on what happened that one evening. It was extraordinarily powerful for the ancient world.

Eventually, it was destroyed. Alaric the Visigoth, who was a barbarian, but that didn't stop him from being a convert to Christianity. [audience laughs] Alaric the Visigoth burned Eleusis on his way to North Africa, on his way to burn other things. (1:24:00)

[Transcript by Jason Bastin]

[1:24:00]

Terence: "Yeah?"

Audience member: "I was wondering, Terence, if you'd had a chance to read *The Emperor's New Mind* by Roger Penrose, I think? It's an argument against the idea of A.I. Artificial Intelligence and whether you were able to follow his argument, 'cause I would take it you would be opposed to his argument"

Terence: "I haven't read the book. I like Roger Penrose's early work. He's saying Artificial Intelligence is impossible?"

Audience member: "Yeah, based on...And he goes through the Turing, uhh, and I heard you bring it up once"

Terence: "The Turing Test."

Audience member: "The Turing test for Artificial Intelligence and he also, uh, brings in the, uh, incompleteness

theorem.

Terence: "Uh huh. Oh, Girdle's little incommensurability thing?"

Audience member: "Maybe a little on that?"

Terence: "'A little Girdle please?' *laughs with audience* 'in 2/4 time?' *audience laughs* Well, uuuuhhhh, I don't have a particularly strong opinion one way or another on A.I.. I certainly think computers wi...can be a lot more intelligent they are before we settle the question of whether they can pass the Turing test. You all know the Turing is this test...uh...Alan Turing was a mathematician. He figured it out during World War II and it's basically 'if you call "X" on a telephone and you can't tell whether "X" is a person or a machine, then "X" passes the Turing test,' and every year they have T- Turing tests, uh, where judges converse by telephone with computers and people and try and decide which are the computers and which are the people and it's still pretty easy, uh, because the people exhibit exasperation, incorrect information, *some audience members laugh* misinterpret the question *more audience members laugh* so forth and so on. *coughs* Uh, there are some wild thinkers out there, far wilder than me of...you know, if you want to read a wild book, read, uh um, Hans Moravec's book, Mind Children: The Future of Human and Artificial Intelligence. There's a book, uh, and, uh...I'm having a memory lapse here, help me out..."

Creon: "Tipler"

Terence: "Tipler, thank you. I said help me out with a memory lapse. You didn't have to read my mind, for God's sake! *audience laughs* *Terence laughs* Yes! *laughs* Thanks you Creon. *chuckles* Tip...Tipler's book is, uh uh, the end of all speculation where artificial intelligence, uh, is concerned. Uh, I think machine/human interfacing is, is very important. I think the debate about whether a computer can think like a human being is kind of not very interesting. Computers think like computers. Already vast amounts of what we call 'human society' are entirely run by machines including very important financial sectors, market decisions, uh, resource extraction decisions, inventory resupply decisions that feed clear back from the warehouse to the mine; in other words machines say how much tin should be extracted and at what rate and therefore, to certain degree, say who should come to work and who shouldn't on certain days. Uh, a lot of design work of circuitry, engineers will simply tell the machine what the circuit should do and leave the actual architecture of the circuitry to machine decision. Uh, this means, you know, lar..m-more and more parts of the human world are being over...given over to machines to design, but when you see how much the world looks like the arrival concourse of an international airport, uh, having computers design the world might not be, uh, a bad idea. Uh, definitely computers figure in our future. I mean, I wasn't joking when I said that drugs and computers are migrating toward each other. I can imagine, uh, a world, and this is not the ultimate world by any means, a world 5, 6, 7 years in the future where the equivalent of today's advanced Macintosh would be something you glue on your thumbnail and communicate with that way. And, you know, beyond that lie, you know, enormous computational and data-accessing abilities that may be accessed through implants. Uh, we're going to have to decide, you know, how much of the monkey we want to take with us into the future. We don't want to take the homicidal killer, we don't want to take, uh, the male dominator, but we...it would probably be a mistake to leave the body entirely behind. Uh, after all the body gives us our orientation in the world and our sense of ourselves as somehow co...coextensive with animal life. But how much of what we call 'human' is really human is going to be major topic for discussion, uh, from here to the end of time. Yeah, [1:30:00] in the back."

[Transcript by Jaska Isola]

T: Yeah, in the back....

Q: Aah, two questions on ecstasy. Aah. What's your take on MDMA? And ahh, what's the optimum grams to take ahh to achieve ahh sexual ecstasy?

T: Sexual ecstasy on XTC? (*laughs, *audience laughs)

A. On mushrooms.

T: Oh, on mushrooms! Oh I see. "W- well" first about MDMA... w-well there is no doubt, that from here to the end of time, whether it be eighteen years or a thousand years away, science is going to produce more and more psychoactive drugs. There are psychoactive drugs on the shelves now, waiting for human testing and government approval, ahh, around the world. We cannot explore the brain, we cannot explore neurochemistry, without these drugs being, ahh, a natural consequence of this program of research. MDMA is a cyclised amphetamine, like MDA, like mescaline, which is "a- a" natural occurring compound of this type. Uhm, "i-in" the hands of a skilled psychotherapist ahh MDMA leads to conflict resolution, "relationsh- insights into relationships", this sort of thing. I am not entirely convinced that it's, ahh, the silver bullet for these conditions. Every drug that has made its way on to the, ahh, the alternative scene has first built itself as a love drug. That's an unfailing market ploy. (*audience laughs) To get a drug to the forefront of public attention. Cannabis was sold to us as a love drug. Aah, LSD, psilocybin, ibogaine. MDMA, ahh, is no different. ("MD- MDMA does promote a certain kind of empathy"), not a whole lot of, ahh, vigorous sexual activity. In terms of what dose of psilocybin leads you ("int- into"), ahh, a sexual rather than a visual acute or visionarily ecstatic situation. Aah, I would say for a hundred and thirty five pound person, probably two to three grams is this agitated, sexually active or if no sex is happening maybe dancing or drumming. In other words thoroughly aroused, busy, active dose. As the dose rises, you know, activity slows and finally you just want to sit down and then finally you just want to lay down, and ahh, (*audience laughs). Then you're into the other phase.

Behind you there was another question.

Q: Yeah, I was gonna say that John Nully? Has an interesting kinda speculation about the future possibilities of solid state (unintelligible) on an autobiography of a scientist. But I was really curious what, if you have anything to say or, you know, about the credibility of the author William Cooper, who wrote the book called 'Behold A Pale Horse'. You know that book?

T: This is the flying saucer debunker.

A: (unintelligible)

T: And isn't he the one who said he was the CIA guy for a long time.

A: (unintelligible)

T: Well this is slightly off the track or might be seen by some people to be slightly off the track. Aah, I don't know William Cooper's book., I regard that, ahh, whole flying saucer thing as a civil war in a leper colony. Aah, (*audience laughs) but I do think, I do think, having been, like probably most of you, very interested in flying saucers from the time I was a kid. And I grew up when it was all happening. Aah, a ("few- couple of years ago") I accepted an invitation for the first time to go to a flying saucer conference. If you've never been to one and you're interested in flying saucers. Go! You will, ("b- ch- have more insights in the phenomenon than in ten years of studying it, because what's perfectly clear is that people are self-selected for gullibility. (*audience laughs) Aah, it's not their fault, it's just that ("the- the ticket through the front door is"), ahh, you know, 'would you believe this?' 'Would you believe this?' (*audience laughs) Aah, I think probably what happened, historically speaking, you know, in 1947 the first UFO's were seen, "they- it was a weird world." The explosion of the atom bomb, the work toward the hydrogen bomb... People didn't know. Einstein and Truman and all those, ahh, they didn't know what it really meant. "If- they thought that it is conceivable that the solar system is monitored. And it is conceivable that this is the switch which turns on the monitor and brings attention. I mean, they were in awe of the atom bomb and they realized they were tampering with cosmic forces. And then, at this moment of cosmic awe and realization of tampering they began to get reports of spacecraft entering the skies of earth and interacting with human beings. Well, what they did,

the CIA had just been founded in '48 and so forth and so. What they did, they put a lot of time and effort into infiltrating all these groups that claimed knowledge of what was going on. And as a survivor..

[Transcript by Melvin Goudbeek]

[Terence McKenna] : ...of the new left I can tell you when the government gets interested in infiltrating, I mean I, ...there wu eh, [fff], two out of every three members of SDS was a government informant [audience laughter] at the height of its membership! So, I believe that what happened was these flying saucer groups were massively infiltrated by the government in the course of its,... pursuing its constitutional obligation to, maintain the public welfare. And by '54 or '55 the government was perfectly convinced that whatever flying saucers were, they did not pose a threat to the integrity of the Air Defenses of North America and that was their real concern.

But bureaucracies are weird creatures, they really exist only to perpetuate themselves. So at some point inside these agencies, they must've had to face the fact that they had massively infiltrated a bunch of very flaky people and now their choice was to either end the program, tell the budget people that, "No, they wouldn't be needing that 10 million dollars this year" [audience laughter], OR keep going with it because they now had a group of people self selected for gullibility. And that group of people became the victims of every chemical experiment, weird technology, propaganda experiment, and so forth and so on, because their friends and relatives had already written them off [audience laughter] as completely, uhh, untrustworthy. Who would believe them no matter what story they told?

So, I really felt I was among severely damaged people [audience laughter] , uh, and it wa-it wasn't their fault it's that they-they had become part of something, that had become part of something, that had become part of something, and they never really had a fighting chance. Do strange lights haunt the skies of Earth? You bet their booties they do. But, the flying saucer cults are a social phenomenon and largely unrelated to whatever this anomaly is.

Terence McKenna: *Points at Audience member* Yeah.

Question: "Um, (could not make this part out, i tried) ...of doctor Pugnitzen Polar [sp?] often spoke of the ephemeralization of technology. Do you think there will come a time when, we are indistinguishable from our technology and would that be sort of apotheosis that you speak about in your-in your books?"

TM: No, I think it would go the other way that we're moving toward a time when our technology is indistinguishable from us. In other words, I don't want us to all turn into, uh, 7100 ADAV, that doesn't seem like a good idea. Uh, but on the other hand I could, imagine, as a hopeful scenario a future world of let's say 500 or a billion, healthy, happy, well fed people of all races, political persuasions, gender preferences, and so forth and so on. And, uh, those people would essentially live as our archaic ancestors did. Very little material culture, uhh, very-ve, nomadic, uh, but if you could transport yourself into the body of one of these people you would discover that when they close their eyes, there are menus, hanging in space. In other words, the computer that was on the back of the thumbnail, 5 years later that computer moves into being a kind of an implant, a black contact lens that is sewn into your eyelids at age 6 so that when you close your eyes you're actually looking at an interface. And the entire, uh, database of the culture could be placed there.

You see really what computers are doing is they're making what we call the collective unconcious, concious! All

data, all images, uh, are potentially accessible through, uh, the network. And, uh, ya know, I'm still getting used to the idea of the network myself. Like I keep thinking, "Oh, I have this timeline, I could get somebody's chronology and put it at my website". And then I remember "No, No, all I have to do is point to their website. I don't have to copy or move anything". If there is one list, that's all the world needs. Anybody else who needs that list can point to it from their website. So the speed at which new structures can be created, is, astonishing! I mean it- almost literally overnight, you can build a website, and begin to point at other websites and bring resources into yours.

Uhh, this is a technology which is gonna turn out to not be what people think it is. It's going to be a technology for showing each other the inside of our heads. For showing each other our dreams. Uh, you know one thing I didn't talk about in the main part of the lecture is that psychedelics are catalysts for language. They speed up and catalyse the language formation process. And a culture cannot evolve any faster...

1:42:00

[Transcript by Wesley LaVassaur]

[Starting at 01:42:00]

... than its language evolves and it cannot be anymore glued together than the bandwidth that its languages will tolerate, and so what this technology that is putting in place is going to mean is.. the way in which it will dissolve boundaries is by making us transparent to each other. I mean I can imagine a child of the future, uh... we all bring home our drawings to stick on refrigerators and things like that, in the future we won't stick them on refrigerators, we will stick them in our website and everything will go into our website and by the time we are twenty-five or something, our website will be the size of the American museum of natural history and you can wander through it and a.. as... [01:43:00] as a gesture of intimacy, you can invite someone else to wander through it. Well that's who you are. It's your imagination. And... I think in a sense I have said it times that the cultural enterprise is an effort to turn ourselves inside out. We want to put the body into the imagination and we want the imagination to replace the laws of physics. With these technologies we can probably do that. But it will have to run on psychedelic design principles or it's certain to be a mess. Yeah *pointing towards the audience*

Q-What can you tell us about the problems of that some people experience with the digestibility of the mushrooms and how can it lead to pain an- and discomfort uh.. sometimes to like a nightmarish type of experience?

Terence nods

A- Well, first of all let me say this, there are several mushrooms which contain psilocybin [01:44:00] which grow in cow dung. What I urge people to do, if you are serious about this, is to grow your own. Uhh... this is moderately self serving because I wrote a book about how to grow your own mushrooms *audience laughter*. But there are many such books. You don't have to buy mine, you only need it if you want the best one *audience laughter*. Ahh.. but- you see- ah- Stamatson's book is excellent, and if you wanna go large scale, Stamatson's book is the one. But let me say something then, ah... after the brain, the stomach is the most heavily innervated organ in the body and anxiety has a way of cropping up as a stomach ache. So, its- a lot of people have anxiety in the first hour of taking mushrooms and they believe that [01:45:00] something in the mushroom is giving them gastric distress. It really isn't, it's more like a case of butterflies on an empty stomach because you should take mushrooms on an empty stomach. Ah... you can try a suppository, you can try another drug if you want. But there is in this psychedelic

business something to be said for simply disciplining your hind brain. Also you can suppress nausea with cannabis. So, you know, a mixture of self-discipline, pharmacological steering, uh... so forth and so on. Ah.. if you have- if you have a severe reaction to the mushroom, you probably shouldn't take it. I mean after all it is a fungus and as mammals we have developed some pretty strong uh... allergenic reactions to fungi, [01:46:00] some of us. And- certain reactions to psilocybin are not psychedelic reactions like uh... enormous sweating or something like that. That's more an indication of an allergy. If you are going to get into psychedelics, one of the things that you have to do is learn your way around. Psychedelic sophistication doesn't mean you took everything there is in combination with everything there el- else there is, at high doses, with your friends, at rock concerts *audience laughter*. *clears throat* It- it means that you figured out what worked for you, and then really put the pedal to the metal, you know. Yeah* pointing towards the audience*

Q- I recently came by David Hudson's work on Orbitally Rearranged Monoatomic Elements and found that these monoatomic heavy metals [01:47:00] conduct- act as superconductors- conduct lightforce through our nervous system. Are you familiar with this work at all?

A- No you- you have stumped the star *audience laughter*. Ah.. I mean uh.. I am interested in organic superconductivity and room temperature superconductivity, ah.. but i don't know his work so i can't comment on

Q- It's fairly new, its- its- its you say will be *inaudible* coming out a book called ORMEs *spells out* which is Orbitally Rearranged Monoatomic Elements.

A- I am sure it will find it's way to my de- now all these hands, oh he should be the guy, you tell me, alright.

Q- How much of our consensus reality do you think is based on um.. inexorable physical laws things that aren't the *inaudible* creations and how much if any is subject to change without notice simply based on a consensus belief of what should be or what is going to be?

[01:48:00]

[Transcript by Rohan Singh]

TM: Well, I mean, this is, you've... this is sort of where I'm at. I mean, as you were asking the question I was... my tendency would be to say none. That none of our reality is based on inexorable physical law. But, I only want that to be true. I'm not sure it is true. Whitehead used to sa- he had this thing about what he called stubborn facts. And he said there are some stubborn facts and you can cut your philosophy any way you want but if you don't take account of the stubborn facts, you'll have a problem. Uh, a lot of reality is made of language. How much I'm not sure. But, I, my hope is that a great deal is made of language. Rupert Sheldrake, who's a good friend of mine, and we sort of think along the same lines, he believes that there are not inexorable physical laws, that there are just very old habits. He would think of the speed of light as a very old habit. Uh, these physical constants may be changing. We don't know, I mean take the speed of light, we've measured it on one planet since 1906, and cheerfully extrapolate it to every corner of the known universe with no sense that there might be a problem there at all. Yet, you know, if you're a critic of this, you can look at the speed of light as measured from 1906 and you will notice that the values have been slowly going up. It's apparently going slightly faster than it was a century ago. Well, people just dump on that and say 'no no, you poor moron, you don't understand, it's that the instrumentality has become more precise and so the measurement may have changed slightly'. Oh yeah? Well it seems to me in that case the points should cluster.

How come the more recent ones are faster than the earlier ones consistently? In other words it's not that we're getting measurements which cluster around a value, it's that we're getting measurements which are going out this way toward faster. Uh, I think language is the key to making reality. I think our language is a, is a very weak language computer languages may be more powerful. Uh, you know, VRML, or mathematics, but i believe the world is made of language, that's the magical belief but then the challenge to that belief is how come the world isn't the way you say it it? Well, that's ungenerous. Uh, it...it uh, I think because it doesn't work quite like that. Consensus is set by societies. By millions of people. Reality is a phenomenon of many linguistically operating subsystems. Maybe if you and I were stranded on a desert island we could get a reality going. We probably could but it would surely be shattered when somebody showed up to take us home again. Over here (points to audience) uh, the documentation, um, well there wouldn't be anything written, of course, it's earlier than that, but the documentation, it is well known that the Sahara was wetter in the past, even as recently as Roman times, Pliny called it the breadbasket of Rome. And we know that human populations were out there. We, in the Teselly Plateau of southern Algeria there are rock paintings ruprestice paintings that show shamans with mushrooms sprouting out of their bodies and in their hands. So, we have mushroom use, we have evidence of mushroom use at the era of the great horned paleolithic goddess, um, the um, the presence or absence of monogamy and polygamy is debatable. So I, however the archeology of this area has not been well studied, and won't be soon, thanks to islamic fundamentalism, Algeria is no place to do archeology right now. Now to the first part of your question, why was it human beings who ate the mushroom? Uh, well, we, you had to, to use the mushrooms as a doorway to higher intelligence, you would have had to already come a certain distance down the path of higher animal organization. We were bipedal, we had a pack signaling repertoire, we had binocular vision, and the reason we used the mushrooms is because we were under nutritional pressure. Uh, there may have been other animals under nutritional pressure but they may have been more tightly, uh, bound to their original diet, or they may simply have had behavioral organization that the mushroom couldn't dissolve or break through.

[Transcript by Suzanne Tracey]

[Start 1:54:07]

There has been talk among evolutionary biologists about if there were no primates on this planet, what order of animals might occupy the conscious niche or be able to come in there. And interestingly raccoons are candidates. Raccoons have, bah, have well positioned eyes. They have a very complex hand and, uh, uh, years and years ago I used to grow mushrooms in, and I grew them by my own method naturally in jars. And uh I would have waste rye infected with jars. I mean, jars infected with mycelium permeated rye and I would put them out on the back porch at night or I did once. And I awoke in the middle of the night to this terrific racket and there were racoons on the back porch. They could smell the rye infested with the psilocybin containing mycelium. They could unscrew the lids and plunge their mitts into this stuff and, and, as I turned on the lights I saw these little bandit faces with this mycelial crumbs on their little upturned muzzles and their didn't, they wouldn't back off. They would, the other thing was they were standing up on the they hind legs, so they were standing on the their hind legs holding a jar, holding this stuff, and tottering toward me. So um I just took one look and backed off. And for the rest of the eventing you could tell they were approaching the orgiastic boundary, ah because the carrying on, the sexual squeaking and squealing, thumping and pounding going on in the backyard was just incredible. So ahh, you know they might be interesting test animals to put through this.

Yeah *points at new questioner*

inaudible I want to have your comments on the numerous dangers of the ufo phenomena with regard to *inaudible* and the role of this phenomena which I think you referred to as the other earlier in your talk has been the transformation you have us going through in the future.

Yeah, yes Jaque Belay was a UFO and the book that was mentioned, passport to Magonia was one of his earliest books on the subject. He's gone through a lot of changes about it. Um, the numinous, I think what's going on is that in a sense there is leakage from the future. This is a broad subject and it's late in the evening so I'll give it to you in headlines. But basically science takes the position that nature is without purpose. In other words nature has no goal. Nature proceeds forward according to the unfolding of chance and necessity. But I don't believe this. I think nature is an engine for the conservation of novelty. Nature's purpose is to generate ever greater novelty. In fact history is the dawning realisation that we are about to descend down a very steep novelty sink as it were, into immense amounts of novelty. And this is why we image the other in the 20th century as the extraterrestrial because out of the unconscious comes this image of the other as the extraterrestrial. I think we are in the presence of the transcendental object at the end of time and that religions call it the messiah, or the maitreya, secularists call it utopia, millenarians call it something else, mushroom enthusiasts call it something else. But we are in the presence of the transcendental object at the end of time. And that it casts an enormous reflection back through history, especially recent history. But any person encountering this backward moving shadow of the transcendental object will attempt to interpret it in cultural terms that they can relate to. So if they happen to be a French peasant in the 11th century they will assume it's the virgin mary. If they're a sexual scientific rationalist in the 20th century they will assume it's a spacecraft of some sort. [1:54:00] The Celts and their relationship to little people and an invisible world this is a generally held belief that they are exemplifying that is world wide which is that the dead are somehow co-present in the space of the living, but invisibly so. Except to those who have the gift of second sight or are magically empowered or shamanically adept. Uhhm the last thought I should leave you with this and it's adumbration of this question, but also has deeper implications.. The model that you're usually given of the psychedelic experience is a religious model, that the mysterious of religions, Hindu, Buddhist, or something or other are somehow illuminated by this boundary dissolving experience, my model is a little different, a little cooler and a little more formal, and it's this. That consciousness is an omnidirectional threat detection response.

Terence McKenna: And I do agree with you. I think the difference between the 1960s and the 1990s in terms of the psychedelic compounds is that the sixties entirely lack any awareness of shamanism or the historical role that these substances have played throughout human history and prehistory. Uh, the sixties believed they were inventing this reality for the first time. Now that we have been able to compare the psychedelic experience to the way it is done in the Amazon, in West Africa, in areas where these things have been used and understood for a long time. We know have a model. And it's the model not that you take low doses and go with your friends to a rock concert, but that you take high doses in a situation of sensory isolation, such as a quiet dark room and make an inward journey into the self that parallels the journey that shamans have always made, uh, to recover lost souls or to cure or to discover the whereabouts of, uh, lost objects. So, in a way psychedelic, uh, exploration has gained power, respectability and, uh, and legitimacy by discovering that it's own roots were in a paleolithic religion of great, uh, power and wide distribution. In other words, psychedelic voyaging is not something new. This is how religion was done for the first million years, not the last two thousand years. This is really the only exception to this rule. And I agree with what you also said about, uh, how vast this domain seems to be. Serious psychedelic voyagers I think can agree the further in you go to this realm the larger it appears to be. Really what we are doing is we are discovering the inner richness of organism. That, you know, the richness of the human world is not in owning stuff. The richness of the human world is, uh, lies in being able to access what is within us. Our minds are not blank slates or merely repositories of traumatic memory. Our minds are doorways into an infinite labyrinth. A kind of Borgesian library of infinite possibilities and we can choose to open these doorways in whatever sequence or fashion we wish.

That, that twenty thousand years ago on the plains of Africa this, the expansion of the human diet, the restless search for new food sources that led our primitive ancestors to include mushrooms in their diet that contain psilocybin. And out of that synergistic food stamping[sp?] that springs the whole spectrum of human cultural effects, religious, religion, language, poetry, magic, dance. All of these, uh, unique expressions of humanness come out of the the restlessness of primate organization and the synergy of psychoactive psilocybin in the harmaline diet. This is the real missing link. This is the real key to what the factors were that called us forth, uh, into, uh, humanness.

Then[sp?] should we talk about language?

Female audience member: Yeah.

TM: Well, uh, first of all let's talk about ordinary language, which is probably, uh, the closest thing to a miracle in the natural world. Uh, it's the major neurological manifestation of difference between ourselves and, uh, other animals and primates. And it's not a physiological difference. It's a difference in behavior that language represents the most complex behavior ever observed in any animal and certainly it's the most complex thing any of us ever learns to do. We're born into what William James calls a a blooming, buzzing confusion. But, uh, by the acquisition of words we mosaic over, uh, various sectors of this blooming, buzzing confusion with words. We replace the unknown with the known through the substitution of words and by the time a child is two or three they have completely created a cultural mosaic of words that is interposed between them and, uh, reality. Reality from that point on is only an unconfirmed rumor brought through the medium of language. And every culture accentuates different parts of reality. So within a sense every culture is a different reality. Language is the stuff [sp?] of the world, not quarks or wave packets or neutrinos, but language. Everything is made of language. All the constructs of science are actually interlocking constructs of syntax. Well, so that's ordinary language, which seems to define reality to a kind of process of lying about it. For instance by creating subject-object distinctions, which are in fact not true to the matter, but somehow operationally necessary for us to navigate in the kind of lower dimensional space that we inhabit. Then there is the phenomena of non-ordinary, or what I call visible language. And, uh, this is very interesting to me. This is where technology, uh, virtual reality, cybernetics, human machine interfacing can actually, uh, make an impact and explore a frontier. Visual language is a transformation of the physiological impulse towards syntax into a final product, speech, which is not heard with the ears, but beheld with the eyes. And, uh, it's very interesting that all our metaphors of clarity of speech are visual metaphors. We say I see what you mean, he spoke clearly. This means that at the organismic level we associate a higher, uh, signal clarity with visual input. And on DMT and other tryptamine psychedelics you actually experience the field of language, both heard and self-generated as something that is visibly beheld. It's, uh, almost as though the project of communication becomes high speed sculpture in a conceptual dimension made of light and intentionality. Well, this would remain a kind of esoteric performance on the part of shamans at the height of intoxication, if it were not for the fact that, uh, electronics and, uh, electronic cultural media, computers, make it possible for us to actually create, uh, records of these, uh, higher linguistic modalities. In other words it's possible to imagine a virtual reality that was driven by a speech operated synthesizer where the various parts of ordinary speech, adjectives, modifiers, subjects and objects, uh, were, uh, interpreted by the scientific, by the cybernetic environment as topological manifolds of various shapes so that speech would then generate a visibly beheld topology and it's possible to imagine a future world where in setting up [sp?] corporate takeovers, in other words in areas where, uh, communication, clear communication, clear expression of intentionality was very important that people would actually go into the virtual reality to use the virtual language because its capacity for conveying intent would be much greater than ordinary spoken language. In other words, uh, it's not for nothing that Plato connected up the notion of the good, the true and ultimately the beautiful. And the beautiful of those three concepts is the primary concept because it is visibly beheld, because it is seen. This is the great convincing power of the psychedelic experience. That it ultimately appeals to us through the sense that we value most, that we existentially relate to as the most authentic. And that is the visual. Visible language is a kind of telepathy. Because you see, if I made a statement in visual language and then you and I regard my statement we are somehow in the act of regarding made one. Because meaning is not being created out of, uh, interiorized dictionaries which we each consult in the privacy of our own mind, but rather meaning is a visible manifold in the public domain. When[sp?] meaning goes public and the differences between people then decline toward being insignificant. It's a kind of a final, uh, confirmation of the McLuhan apotheosis and I think visible language is coming. Life in the imagination is to be, uh, uh, the life[sp?] of creativity carried on through [sp?] virtual environments driven by, uh, linguistic engines.

Like that.

[Terence laughs]

[Female audience member inaudible]

TM: [inaudible] the star-ships of the future, in other words the the vehicles of the future which will explore the high frontier of the unknown will be syntactical. [inaudible] The engineers of the future will be poets. This is what virtual virtual reality folds out to. It's the possibility of walking in to the constructs of the imagination. In a way culture is that. I mean, our cities, bridges, highways, airfirms and art galleries are condensations out of the imagination, but at tremendous cost because we must make them out of matter. Once we can make them out of light, out of electrons, then we, you know, we won't build skyscrapers a hundred and twenty stories high. We'll build them as high as we want. Uh, roof height will no longer be a factor ruled by cost-effectiveness and gravity. It will be a parameter ruled by

the imagination, as will all other parameters. And then we will discover what man truly is. When we are able to erect, stabilize, share and explore our dreams in a kind of virtual hyperspace that [sp?] is seemed to be linguistic. That's what its connectors are made out of. That's what its thorough concrete and steel is, is, uh, the edifice of language. This is what the stuff of the imagination is made of. And I think this is what we're moving toward. The psychedelic shamans have always known this. Now the psychedelic underground art community points toward, uh, this goal and and leads the way.

Yes, well. Uhm. This is a segway from yesterday's discussion about, uh, visible language. The notion being that, uh, well let me review what yesterday was about[sp?]. It was about, uh, the idea that if we could see language. If language were a project of understanding that used the eyes for the extraction of meaning rather than the ears, that, uh, it would be a kind of telepathy. There will be both a fusion of the observer with the object observed and with the person communicated with. The place in nature where something like this has actually evolved and occurred is in, uh, the cephalopods. The squid and the [sp?] octopi. Now these are animals that divided from the human, uh, from the line of development that we [sp?] human beings over six hundred million years ago. They're mollusks that related to ancho- I mean to escargot. It's, uh, an organism very different from, uh, ourselves. Nevertheless, one of the things that evolution merry biologists always talk about is the convergent evolution between the eyes of cephalopods and the eyes of higher mammals. This is because the, uhm, cephalopods live in an extremely complex visual environment. And in fact they have evolved a form of communication that approximates this visible language that I'm talking about. Because these octopi have, uh, chromatophores all over the exterior of their bodies. Chromatophores are cells that can change color. Now many people know that octopi can change color, but they think it's for camouflage, for blending in with the environment. This is not at all the case. The reason octopi change colors in an, uh, very large repertoire of stripes, dots, blushes, uh, traveling shades and tonal shifts is because this is for them a channel of linguistic communication. In other words, they don't transduce their linguistic intentionality into small mouth noises, like we do. Small mouth noises which then move as sound, uh, across space, uh, in the form of vibrations of the air. Rather they actually change their appearance in accordance with their linguistic intent. What this boils down to is they physically become their meaning. And one octopus observing another, it is watching the unfolding of internalized neurological states within the organism being reflected in color changes on the surface of the skin. Now these octopi not only can change their color, because they're soft-bodied creatures, they can also change, uh, the texture of their surface from smooth to rugose and folded. They can also, because they're soft-bodied, uh, fold and unfold and reveal and conceal very, uh, rapidly different parts of their body. So they're capable of a visual dance of communication that is an extremely dense kind of visual signal. And in the so-called emphic[sp?] octopi, the species that have evolved in very deep water where very little light reaches, uh, they have evolved, uh, light-emitting phosphorescent organs. Some of them with membranes like eyelids over them, so that even in the darkness of the abyssal depth of the ocean they can carry out this dance of light, self-enfoldment, color change and surface texture that is their linguistic style. And that the only way an octopus can experience a private thought is to release a cloud of ink into the water into wh- which it can retreat briefly and hide its mental nakedness from its followers. This kind of biologically intrinsic wiring into the potential of language is something that we may be able to mimic and achieve using psychedelic drugs as the inspiration for the directions given to a virtual reality, uh, development program. In other words, we might be able to create kinds of visibly beheld syntax that would be the human equivalent of the dance of light, texture and positioning that constitutes, uh, the grammar and syntax of, uh, squids and octopi.

Yes, that's right. Because, uh, operationally what these psychedelics do is they dissolve cultural conditioning. Cultural conditioning is like software, but beneath the software is the hardware of brain and organism. And by dissolving the cultural conditioning to speak English, German, Swahili or whatever then one returns to this ursprach, this primal language of the animal body and can explore, uh, uh, the real dimension of feeling that culture has a tendency to cut us off from. Culture replaces authentic feeling with words. As an example of this, imagine a infant lying in its cradle and the window is open and into the room comes something marvelous, mysterious, glittering, shedding light of many colors, uh, movement, sound, uh, a transformative hierophany of integrated perception and the child is enthralled. And then the mother comes into the room and she says to the child "That's a bird, baby. That's a bird." Instantly the complex wave of the angel peacock iridescent transformative mystery is collapsed into the word. All mystery is gone. The child learns this is a bird, this is a bird. And by the time we're five or six years old all the mystery of reality has been carefully tiled over with words. This is a bird. This is a house. This is the sky. And we seal ourselves in within a linguistic shell of disempowered perception and what the psychedelics do is they first depart this cultural envelope of confinement and return it really to the legacy and birth right of the organism.

[Terence speaking indistinguishable glossolalia]

Male audience member: That's great.

Female audience member: Yeah.

TM: That's it. I'm out of here! [Terence laughs]

When Kat and I were in the amazon in '76 taking ayahuasca, we got in with this certain group of people in Peru that took it every week. and, you know cultures have different ways of handling hassle and in some cultures it's confrontational, in other cultures not.

The way these Peruvian country folk operated was if somebody was screwing up nobody would ever say so they would just talk about these people behind their back until the morphogenetic field of gossip was so strong that you'd basically awaken to the problem.

So, there was a complex social situation going on in this ayahuasca circle, which was: there was a master shaman, who we were apprenticed to, who was beloved by his neighborhood, but he had a nephew, a sobrino, who was a jerk. I mean, this guy was, as Don Fidel says, ambitious. He dealt a little weed, he did a little pimping, he was just sort of an edge runner type of guy. And every saturday night we would all get together and take ayahuasca, about 30 of us, older shamans, our guy, people from the neighborhood, and this sobrino, Don Jose.

So uh, I don't know what the real history of it was, 'cause I had just arrived on the scene, but these old guys would sing these icaros, these magical songs on ayahuasca that appear as colored tapestries in front of your eyes and you know, they were, they had soul, they were into it, they were, and this guy would sing against them. I mean, it's the rudest thing you could possibly imagine, I mean, imagine if, if you know, lou reed were trying to give a performance and the guy in the third just launched into Old Man River, and kept at it! You know, I mean in this town I'm sure large guys would appear and say "sir." In Peru it didn't work like that. They just kept singing, he kept singing, and it was clear that this is how it was gonna be handled. That we had just divided into two separate entities here.

Well, um, my, uh, wife was sitting next to me and he was sitting across the room from us, the sobrino, and I had been watching him for a long time and I was loaded to the gills, and I could see he would get up on his haunches, he, he looked like a monkey, he, he, his face it was uncanny, he looked like a monkey and he also looked kind of like a jackal a dog with long teeth, he kept going through these changes, and.

And Kat leaned over to me and said something like "this guy is an asshole" and I just said, you know, "let it slide, what do we know, think of it as anthropology," but she, she wasn't having it. So after a while he kept doing this and at one point everybody in the room, every person in the room was bummed out, and they were looking at their laps, all eye contact was broken, it's actually. When I was a kid I invented a word. The word is Fardow, and it means: The embarrassment you feel when someone else fucks up, you know, and you happen to just be there and somehow the aura of it is so strong so, the entire room is awash in fardow and the old guys are singing and the guy is singing. So then, at the end of a particularly intense clash of these two styles, uh, my wife just looked across the room at this guy and, like, put the whammy on him. And I saw these red arrows leave her eyes and like, like, dotted lines going across there: unh unh unh unh unh, and they moved fairly slowly, you know, more slowly than you can throw a ball or something. Well when this line of red arrows got to this guy he was knocked off his feet. He, he fell backwards with his legs in the air there was a big noise and all the singing stopped and everybody in the room looked up and these three old shaman, who were sitting behind Don Fidel, who I to that point had not heard speak any language but Quetchua, one turned to the other and he says in Spanish "oooh, the gringa sends the ziboodiboodiblugh!"

Global perspectives and psychedelic poetics is what it says in the, uh, in the propaganda, which I assume is simply permission to rave about whatever comes to mind.

Global perspectives... I guess what, uh, I could say about this from a psychedelic perspective, the thing that is, uh, different for psychedelic people, looking at the global dilemma that we're in and that increases, that continues to deepen around us, is that it's, uh. From my point of view permission to hope rather than despair, because I think that, uh, processes, institutions that for a thousand years or more have been building toward some kind of symmetry-break, some kind of definitive self-revealing moment that we now are, uh, turning final as pilots say. We're now deeply embedded in the pattern, we can see enough of what's ahead of us to begin to actually feel the texture of the end of human history. It's no longer an abstraction. Even the straight people who own the world with their, uh, long-term and short-term projections; looking at population growth, spread of greenhouse gases, disappearance of the ozone hole, uh, rising third world expectations so forth and so on. When you propagate all these trends, it seems very clear that business as usual is no longer an option. Nobody's talking about that. So, we're either in some kind of final fatal meltdown of the values of western civilization, revealed now after a thousand or two thousand year run to essentially be bankrupt. Or, we're going to transform ourselves unrecognizably. There really isn't any middle ground. The most radical and least likely, uh, future of all, it seems to me, is the future in which we continue just to stumble forward, as we have been since the industrial revolution. That's no longer an option. And, so then the question becomes sort of a gnostic conundrum. Yea-, is this the final act of some kind of great cosmic tragedy in which intelligence rises out of the slim, is shown to be inadequate and sinks back into the slime, or is this, uh, you know, a tale of, uh, difficulty overcome and heroism won. And are we going to be able to shed the monkey nature, and shed the ego and actually move up to some kind of shining ideal. Eh, you know it's, uh, if you think of us as the descendants of the angels this is a pretty tacky circumstance we've come to rest in. On the other hand if you think of us as the descendants of shit-hurling apes screeching through the treetops, then it's pretty amazing, [audience laughs], what has been accomplished here. Uhm, we-eh, you know one of the dilemmas that I feel very strongly, and I'm just sort of talking off the top of my head here, because whenever a crowd is small enough I sort of feel like I'm in my own living room, we don't have to have the pretense of knowing-lecturer and, uh, you know eager-to-be-

educated-audience. Uhm, the real, the real challenge, I think, is trying to decide what is baggage, and what is ballast that's going to have to be dumped. Can the future be a celebration of humanness as we have known it? Meaning in the animal body, with all its, uh, uh, you know, joys and pains, with all its frailty and, uh, potential for ecstasy. Or, is what we call human nature somehow transcendental and did we only rest for a moment in the monkey body as once the cutting of evolution must have rested in the great reptiles and at some earlier phase in history rested in the fish and so on. Is consciousness something uniquely human, and must we keep the animal body with us? Is our destiny to become gardener/caretakers of a revived earth or is the earth like a placenta of some sort, that we have literally sucked all the nutrition and potential out of, because we're on our way to some grander, higher domain of being? I don't have the answer to these kinds of questions. I feel it very poignantly. It's very poignantly focused in the psychedelic - in the experience of psychedelic plants and psychedelic shamanism, because, e-, you know, as any of you who have followed my ideas on this know, I've spent a lot of time in the Amazon basin with human populations that seem to have struck some kind of dynamic balance with the earth. And yet the paradox of that dynamic balance is that when you take the sacraments, the hallucinogenic plants of these people, you're propelled into a worlds of, uh, science-fiction-like strangeness. Transcendental dimensions of titanic implication. And then, at least I personally have come to the realization that this is how those cultures have chosen to deal with the faustian impulse in human beings. It's been somehow confined in the domain of the imagination. We, meaning we who trace our, uh, our ancestry back to Europe are part of a different style. A different strain of human being, if you will. We are the idea-excreters. Not ca- not, uh, satisfied to have a canoe, a net, five fish hooks and, uh, a bowl. But instead we take matter, we, western civilization, western technology, and we impress upon matter ideas. Millions of ideas; cities like Manhattan, uh, high performance weaponry, uh, enormous works of art. All of this is is a kind of impulse, very strong in western human beings to bring the ideas out of the domain of mind and to somehow solidify them in matter. Permanence, the cult of the west is permanence. Ye-, I always feel that when you can find the obsessive center of a society you probably have put your finger on its, uh, on its central neurosis as well. I remember when I spent time in India; India is rife with talk of shakti. Shakti is energy, conceived of in various ways; it can be sexual energy, or it can actually be electricity flowing through wires is called shakti. And I realized being in India that the Indian obsession with shakti was a consequence of there not being any, that this was a society where energy had become the hardest commodity to encounter. And I think in the West permanence is the thing - is our great bugaboo, because we, uh, are born into the realization that everything is slipping through our fingers at the very moment that it comes into existence. The hardest psychedelic truth to assimilate, and you don't have to take psychedelics to assimilate this, if you just live this will be hammered in on you again and again, and it's not , uh. Well, uh, it's a cause for exaltation, it's a cause for despair, it's that nothing lasts. Nothing lasts. You know, not your fortune, not your misfortune, not your lovers, your enemies, your children. Ultimately, not even your own life and body. Everything fades. And so the western response to this is the attempt to create something permanent; civilizations, enduring ideas, enduring institutions. All this is doomed to failure. And, I see this western, uh, obsession with the cult of permanence as a consequence of the western obsession with ego. Ego, to my mind, is the very thing, that if you had to, somehow, meld each problem into the next problem to try and reduce all problems to one, what you would eventually come to is the realization that ego is what is destroying us. Our inability to displace our loyalty away from the unique locus of space and time represented by our own bodies. You know, community, communalism, these are the things that we fear, that we repress, and that we at the same time struggle to realize. I mean, the collapse of communism on one level was the collapse of a repressive nightmarish paranoid social system, but the dream which lay behind that was a dream of community, of unity, of sisterhood and brotherhood. And the great concern now is that with the collapse even the, uh, a pretense of that position, that we are further fragmented, further atomized into individual competing microbes of greed and need, and this is precisely the attitude which will push us, uh, ever closer to species-extinction and to global ruin. Well, when you look at thousands and thousands of psychedelic experiences, you, to my mind what you come away with is the notion that, you know, no matter who you are; Amazonian shaman, Hasidic rabbi, n-n-nuclear physicist, the psychedelic will dissolve boundaries. It will dissolve your boundaries, and force you to realize the commonality of the flesh. You know, it's, a-, a startling thing to realize that what you represent is nothing more than a point of view, and that we each are such a point of view triangulating perception through what is essentially simply a nexus of our past history. We always are talking about "the past", and "the future", but it's worth noticing that we all managed to get here this morning, this place, this time,

and not one of us has the same past as any other of us. This moment, like any moment, is not a confluence of the past, it is a confluence of many pasts, and these many pasts come into a nexus of connection, and then move on to become many, many futures.

The reason I'm interested in the psychedelic potential, and willing to speak about it, is because I think that our, the myth of our separateness, which was the glory of our institutional accomplishments; parliamentary democracy, individual rights, uh, uh, liberation of various classes, and so forth, has now turned somewhat sour. There has got to be something more to it, than just turning people loose to loot the planet so that everyone can pile up more and more up stuff. Stuff which doesn't satisfy anyway. And, I think, n-, in talking about the future what we somehow have to do is dematerialize the future, and there are several ways or many ways to do this. Uh, people have preached voluntary simplicity, and some people are into this, uh, however it's hypocritical to preach this in the third world to people who have nothing. You know, we have everything so we have seen the fallacy of condominiums and Mercedes so then we preach this in Bangladesh. Th-this is a bit disingenuous. Uh, the dematerializing of culture, uh, somehow, you see, what we have to recognize in the wake of the collapse of communism is that capitalism as well is a system with a fatal flaw that is set against human nature. Capitalism assumes an endlessly exploitable frontier of resources. This we have got not. So, capitalism is now essentially, unless it can be radically retooled an anti-human philosophy, it's literally chewing up the ground we're standing on. But there's nothing in the, uh, the basic notion of capitalism that says we have to be thing-dealers. This is simply the style of capitalism that we have fallen into. Somehow we have to dematerialize existence, and I don't know whether that means virtual reality, some of you have heard me say that my vision of a perfect future is, you know, 25% of the world population, living in ecological balance, living in an apparently primitive, naked, aboriginal state, but when you step into the minds of those people and look behind their closed eyelids there are menus hanging in bio-tele-electronic space. Culture, you see, can be downloaded into a chip, installed behind the eyelids, so that is, you know, freely commandable, as an experience in the imagination. But, if we insist on continually extracting resources from the earth and fashioning our dreams out of the stuff of earth, then our dreams are destined to turn to nightmare. It can't be any other way. So that's one thing about the future, the future needs to be dematerialized. Uh, u-, and then, you know, since people always accuse me of being a hairbrained dreamer, uh, I've tried to come up with something approaching a practical suggestion, and I, I took this need to the feet of the mushroom-gods, a-being, having been challenged by somebody at a talk like this, they said, "Well, you're always saying these mushrooms speak, why don't you ask them, uh, uh, how to save the world?", and I thought this was kind of disingenuous, but, uh, the next time I had the telephone to hyperspace in my hot hand I did make the inquiry. And, uh, the suggestion which came back I think is at least food for thought. The suggestion was, "You wanna save the world? You wanna overcome male-dominance, the momentum of consumerism, so forth and so on? Uh, every woman should bear only one natural child". This is an interesting idea, whether you take it seriously as program or not. If every woman were to commit herself to bearing only natural child, the population of the earth would fall by 50% in 40 years without war, or famine, or epidemic disease. If this program were continued for another 40 years the population would fall by half again. This means in 80 years the population of the planet could be reduced 75%. Why have we not heard anything about this? Even for it to be denounced, I'm not saying it has to be embraced, but why is it a tiny fanatical minority advocating this? I think it's because, uh, it's inconceivable in this society to try and practice capitalism in a situation of retreating demographics. It also would be, a s-, a solution which would place enormous power in the hands of women. Women are often heard to complain about their powerlessness, yet here is a plan which requires very little input from white guys. Uh, I took this idea to demographers and said, "What about it? This seems so simple, most people think there are no solutions, here's a very simple solution, what about it?", and they said, "Yes, well, it's more startling than you realize, because women in upper class high-tech western society, uh, a woman, say, on the upper east side of Manhattan, or Malibu, or the sea cliffed district of San Francisco. A child born to that woman will have eight hundred to a thousand times more negative impact on the earth than a child born to a woman in Bangladesh. If you were to go to Bangladesh and meet a woman in the back streets of Dhaka who told you that her ambition in life was to have nine hundred children you'd think you were dealing with some kind of sociopath, a kind of, [audience laughter], a kind of typhoid Mary of

the demographic scene. And yet, every child born into moderately well off yuppie families in high-tech societies is in that position. We prefer to not to think of it, this way. I think it's very interesting that one could make a case to, uh, women in western societies, you could say, "How would you like vastly increased leisure time. How would you like increased disposable income? And how would you like to, uh, take upon yourself a truly heroic social role?" This is what's being offered with this suggestion to limit reproduction to one natural child. No more heroic, no more politically correct can be taken. And, interestingly, the women you want to convince of this position are the women you are most likely to be able to convince; educated, white, uh, women, with, uh, above average incomes. So that's a very practical suggestion. More likely to be implemented than my dream of, uh, lunar inoculations with psilocybin for the entire population, [audience laughs], to, uh, dissolve the calcareous ego formations that have sprung up in the bloodstreams since the last full moon. Which I also think would be, uh, a fine idea.

You see, boundary dissolution is what is needed here. Boundary dissolution of all type, our separateness is an illusion. There is a kind of human bedrock. That's why I think that the world sweep toward democracy is far more than simply a political trend. Democracy is not exactly a style of government per se. Or, exclusively, democracy is something, is, a biological institution of some sort. Because, there is no theory, there is no abstraction, there is no ideology. I mean democracy is as close as you can get, uh, to anarchy, and still have any theory of organization at all. You know, I wrote a book, which is around and about, called "The Archaic Revival", and that's why my belief in the archaic revival is what brings me out to events like this. I mean I think the term new-age and some of these other terms are pretty trivializing and basically designed by the mavens of marketing to draw you in. uh. But there is an impulse throughout the 20th century, in freudianism, in abstract expressionism, in dada, psychotherapy, sexual permissiveness, psychedelic experimentation, jazz, rock'n'roll. These are all facets of an impulse toward the archaic, toward the primitive, the non-straight, the anti-bowtie, uh, the wish to blow up the stayed world created by the fine ladies and gentlemen of the 19th century with their christer-ethics and their long dresses and all of that business. There is an impulse toward the archaic. This is very healthy. This is what happens when a society seeks to revivify itself. When the medieval world exploded in the face of the Italian city states and the new classes that were emerging, uh, they. It reinvented classicism. It was actually the second time classicism had been rediscovered, it was also trotted out by the Arabs in the 9th century when they needed a stabilizing metaphor for the Ummayyad caliphate and those civilizations. Now, in the 20th century, we can't go back to ancient Greece and Rome, or Babylon, a-and in a sense the new age, I think, is an effort to go back to a kind of, uh, Minoan/Egyptian world, which never existed except perhaps in the minds of certain menopausal theosophists. [Audience laughs] But, but the impulse is, uh, the impulse is laudable, however screwy the results. But I think we have to reach further back, that all of history is what our earth text, the bible, tells us it is. It's a confusion, a kind of punishment, a wandering in the wilderness, and that where we really want to be is naked, singing in the rainforest, stoned, and exalted. Uh, one with the souls of the ancestors, one with the s-, gaian spirit of the planet. And I don't mean to imply that psychedelics ar-, simply act negatively; dissolving ego, dissolving social constructs, dissolving programming and neurosis. That's all true, but what is left when all this dissolving has taken place is not simply a tabula rasa, a clean slate. What is left is, uhm, what we forgot, what we have been so long away from, which is a connection into the reality of the gaian mind. The great news that all shamanism can attest to, and is built on, is the news that there is a sentient, minded, caring entity that surrounds and holds the planet in its hands, in its heart. S-, beyond comprehending. I mean call it Gaia, call it God, call it the spirit of nature, it doesn't matter what you call it. It transcends the natural apprehension of higher primates, and yet it is there. We know that our own peculiar form of self reflection emerged in just a couple of million years, out of animal organization. Well, what we don't know is how many other forms of mind there m-, are possible, and how many times in the two billion year history of life on this planet, uh, uhh, intelligence has been able to shed the dark chrysalis of matter and launch itself into nearby dimensions in which it finds completion and happiness. Uh, and I think that this is the great news that informs the shamanic religions, that we are not alone, and that The Other that we can make our way toward, is not, uh, you know, a galactarian intelligence from Beta Reticuli that is part machine-symbiote, part banana slug, or something like that, [audience laughs]. That, the, the coherent-minded entity that we make our way toward is actually a reflection of what is best in our hearts. That we carry in ourselves the seed of this thing, and that we are like, the, the peo-, the, the guy in the story of the prodigal son. We

have fallen into history, and out of this misfortune, out of this experience we can come gold. If we return to the fold of the ancestors, if we can, somehow, take what we've learned from history and fold it back into the experience of being truly human. And this is the challenge. And it faces us on the political level. Issues such as, you know, all kinds of community issues, such as racism, and sexism, and classism, these are community issues. And then issues between the human community and the planet. Our inability, you see, to emotionally connect with the consequences of what we're doing. I mean, we as a species present a perfect picture of pathology, b-, uh, because what real psychotic behavior is, is behavior th-, that one cannot emotionally connect with the consequences of what is being done. And when you realize that we are literally, uh, looting the cradle of future human life. That we have decided that we are not simply transient occupiers of this domain, but that it is ours to trash, to use up, to do with as we wish, leaving nothing for the future, then you realize the depth of our need for immediate and widespread, uh, therapeutic, indeed, pharmacological intervention on our state of mind. Because, we have wandered from anything like real human values and the reason psychedelics are so threatening in this society is because they immediately throw into high relief the internal contradictions of the dominator style of doing business, and this is must what happen. The momentum toward catastrophe, built up over centuries, is immense. The only antidote to that, that I've seen, extrapolating from what I've seen it do to single individuals, are the shamanic hallucinogens, because, when you cut right to the bone, what has to happen is; we must change our minds. If we don't change our minds we are going to go down with this self-generated titanic called western civilization. And we have the power to change our minds, but it won't come from hortatory preaching. If that would work then we would have turned the bend on the Sermon on the Mount. But as it is, I think we turn the bend, uh, sometime in the 20th century; either when Albert Hoffman invented LSD, or Gordon Wasson found the mushrooms of Huaca[?], or Richard Schultes brought back news of ayahuasca from the Amazon basin. You see, we have to humble ourselves, we have to give up the titanic ego-driven idea that we can do it by ourselves, as religions and yogins and all that beady-eyed crowd are into promising. The first step on the path of self-, real self-transformation, is the admission that you must humble yourself so thoroughly that you need to form a pact with an organism that begins its life in a mound of manure. You know, it's a true alchemical journey. You return to the droth, and out of that which everyone has rejected; literally, the compost, uh, of s-, of being you find the jewel. And the jewel can be grown, cultivated, brought to fruition, internalized, globalized, shared, to create a transforming option, that, uh, does honor to a human experiment that has been going on far too many millennia for us to fumble the golden opportunity away.

Is there anybody who's burning with their own agenda that i-, oh, here's a "burning person", yes.

Audience member: "I had a experience, about three years ago now, nearly four years ago, where I-, I was on a hallucinogenic. And, I had a feeling that I was talking to some people, and they were telling me that when we leave this planet we become stars! I was wondering what. Have you got any more on the outer space connection?"

Terrence: W-well, I-I mean, I think, you know, I mean... It's funny for me to be talking at a, at a place like this because my, I am actually a rationalist, i-it's simply that my experience has been very, very peculiar, and I thank God for it, because I think most rationalists actually live lives which reinforce their rationalism. Maybe because they don't poke around enough in the edges of things. I mean, you know, we have orthodox ideology, I don't know what it is now, free markets, democracy and physics or something, and then you press out a little bit to the fringes and, you discover that reality is not only not as you supposed it to be, but it's not like anybody supposed it to be. The, the s-, the maps we have are largely based on, uh, conjecture and naive hope. The hope that there's hiding woods, the hope that there's nobody waiting behind the hill. Uh, uhh, when I first started talking psychedelics it all ran pretty much

according to hoil[?], uh, LSD, it seemed like a tremendous tool for insight into the structure of the personality, kind of high-powered, turbocharged self-directed psychotherapy, you know? Uh, which is certainly useful, illuminating, but n-, doesn't violate the laws of physics, or threaten the, uh, the foundations of western science and philosophy. What has interested me, and become the focus of my personal life, I guess, are these tryptamine hallucinogens; DMT; psilocybin, and then ayahuasca, which is a, simply a strategy for making DMT orally active. And, you know, one could accept, I think, insights into one's upbringing, uhh, insights into the structure of philosophy or mathematics or something like that. But what is hard to accept, are, uh, you called them "gibberish people", I call them self-transforming elf-machines, or tyches, or fairies. And, t-to my mind, this i-, this is confounding, this is no mere extension of the models of the psyche that we inherit from Freud and Jung. It begins to look as though, uh, that, uh, you know, the mind is not even in the brain. There's some kind of extended landscape of possibility, and I, uh, I speak as, uh, somebody who's been there, who's seen this stuff, but who doesn't, I don't have an agenda, I'm, uhm. In a sense I'm sort of chicken-shit, because the motivation for my public career is to get a whole bunch of people to march with me, in there, to check again, because, uhh... Y-you know, u-, well, I-I talk in the book I wrote for Bentham, Food of The Gods, about DMT, because I think, it's, in a sense, the, uhm, the case where all the issues are most intensely brought together. Uh, it's a naturally occurring neurotransmitter, indigenous in the human brain, it also is very fast-acting, it clears your system very quickly, Not only clears your system, but leaves no trace whatsoever. You can't even n-, feel that you have done some kind of substance a half hour after you do this stuff. Nevertheless, the content of the experience itself is absolutely paradigm-challenging, and the chief reason is because there are these entities in there, and on psilocybin you hear them; they speak to you. What you were describing, it's almost as though this is some kind of, uh, of a mandala of pharmacological approaches to the mystery, and DMT lands you right in the center of the bullseye. I mean, thirty seconds after smoking DMT you confront these things, which look like, I-I mean, it's very hard to force language into these dimensions, and then e-, bring it back, but what they look like to me is self-transforming, self-dribbling basketballs, or something, I mean, they come bounding forward. When you enter into the space there's a kind of a cheer, you know, "Hooray!", and suddenly you're there. And this is not the cumulative eff-, effect of spirulina or hanging out at finned horn[?] or imbibing any of these ideologies that permit this kind of thing. I mean, I come out of, uh, u-, you know Jean Genet, and existentialism, and Sartre and m-, very much more mainstream, down, dreary, western approach. These things do not require belief to sustain their existence. You may doubt, you may deny, and yet there they are. And they, un-, it is not, uhm, it's not some kind of neutral panorama, like window shopping. It's an encounter, it's a situation in which you see them, they see you, and the, uhh, uhh, relationship between you and them is very rapidly evolving. They seem to have been waiting, and the impression I get is, well it's not an impression I get, it's what they say. They say, "Here you are again, how wonderful!", it's not exactly in English, you understand... And they have, uhm, e-, you know, they're not made of matter. The questions, you know, what is the ontos of these things, what is their exact ontological status, and as far as I can tell, they're made of language. They're, they are not composed of DNA, sinew, tissue and blood, they're composed of syntax. They are like self-articulating sentences, or language with the, that has no requirement for a speaker. It is its own self-generating system of meaning, and, in, you know, the immediate impression you have, is, if you're a sane person, is, you know, "My God, what is this?", and then, "Is it okay? Am I, number one, am I still alive?" And you check through, you know, take a quick inventory; breathing, normal, blood pressure, normal, heart, normal, but what you're seeing is a complete replacement of the ordinary world. And these things which are not enough like elves, gnomes and fairies, it's almost as though, you know, you'd look to folklore to, uhm, uh, to, uh, b-, provide evidence for the existence of these things, but the elves, gnomes and fairies of folklore are a little too predictable, a little too humanoid, a little too disneyesque for what you're dealing with. These things actually appear to be as alien a form of life as it would be possible for a human being to imagine and still cognize that it's alien intelligence at all. And, they are performing an extraordinary activity in that place. Which is; they possess a language that can be seen, with the eyes. And this is fascinating to me, I really think that there's something to be learned here. This is what they want you to learn, they s-, they come forward, they utter statements. Which, remember, you don't hear with your ears, but which you see as condensed sculptural objects, which are like Fabergé eggs or beautifully tooled machines of glass, shell, and crystal, except these things are in motions. They're opening up in front of you, and they're, they're pressing in, there's a kind of frantic intensity to this kind of an encounter; it's like a Bugs Bunny cartoon running backwards at twice normal speed. I mean, stuff is just flying all over, and they're saying "Don't

abandon yourself to amazement. Don't just go ga-ga with disbelief. Try and focus on what we're doing." And then, if you are able, you can moderately to focus on what they're doing. What they're doing is they're offering you these objects, and they're saying "Look at this! Look at this!" As it is passed you before you, as you look into it you have a very strong, and I believe, genuine, impression that this thing that you're being shown, though it's no larger than a kaiser roll is somehow absolutely confounding to the principles and assumptions of this world. That, in other words, if I could condense this thing into my hand right now I wouldn't have to convince you, I wouldn't have to preach to you, I could just show you. Hey, look at this! And in the visual confrontation with this thing it's self-evident that this is impossible. Matter like, th-, they don't behave this way. It's as though you've brought back a chunk of another dimension. And, and then what they're saying about these things is, uh, "You can do this. Do what we are doing", and then the urgency becomes almost strident, they say, "Do what we're doing! Do it now!" And you say, "Wha-, ho-?", and, and then you feel, or I felt, at any rate, an upwelling in myself, like a calling forth. Then out of my mouth comes language, or at least, syntax, but without meaning. Some kind of glossolalia where the modality of language is preserved, but the meaning is not. It's a kind of an ecstasy, it's sounds gibberish in three-dimensional space, but in that space it seems to be the key to u-u-unlocking a world made out of syntax and meaning. And I, you know, I come before you with all of this stuff unfinished. This is not a teaching or a system or an anything; it's an eyewitness account of a hyperdimensional automobile accident or something. We're not saying what the conclusions are; we don't know what the conclusions are, but this is big news. And when I first encountered this kind of stuff I was, uh, I was a-a young art historian at the University of California, and I assumed that any motif, no matter how [french phrase?], or bizarre you would be able to look at the painting, folklore and sculpture of somebody on this planet and find, uh, uh, a trace. And it didn't, it seemed as though this defeated that idea. It was almost counter the idea of the collective unconscious, because it argued that you, Joe Anybody, Sally Somebody, can break through on your own, an ordinary person, to a place that Verrocchio never saw, Michelangelo didn't anticipate it, Yates didn't know, Blake hadn't a clue, Melville wasn't briefed, and yet there it is, you know. And this is, uh, a-a-, to me, as an intellectual, was very confusing, because, I think, as intellectuals we always assume that progress will be built on the b-, on the shoulders of the giants that have preceded us. The idea of something actually one hundred percent brand new and unexpected is pretty daunting, and, and here, here it was, thirty seconds away, uh, uhh, simply by the act of ingesting this natural neurotransmitter. Well, those of you who've been there know exactly what I'm talking about, those of you who haven't been there I can't imagine how you can even sit through this kind of thing [laughter], because, you know, it makes the folks from the Pleiades and all that other stuff out there seem mundane by comparison. The other thing is, we're not talking about camping out in cornfields night after freezing with your eyes glued to the stars in one hope. This is a no-fail method for plunging deeper into these spiritual, uh, realms than the tantric yogas or the practitioners of x, y, or z dare scarcely suppose. It's repeatable, it's on demand, it does not depend upon the state of your moral purity or, uh, uh, you know, tantric accomplishment. It's something that is our birthright, as much as our sexuality, our language, our eyesight, our appreciation of music. It's, uh, an innate human thing. And a-, you know, to try and return to the premises of your question; I tried to formulate theories about what could this be. Well, the first impression that I had based on a reading of how weird this all was, was this must be a parallel a continuum á la Philip K. Dick and like that. That just apparently over some kind of neurological energy-barrier that's all around us all the time, these things are there. And they are not made of matter, so the laws of physics don't apply. And, hmm, you know, like that. And then, and then I entertained different possibilities, o-, and I still entertain numerous possibilities because I haven't got it figured out yet. One possibility is that these are things are actually human beings from the future. I mean if you take the content of the experience seriously and say, "I am apparently in contact with diminutive English-speaking creatures of some sort," well then, they have got to be either intelligent beings from another part of the universe or humans from, uh, some extraordinarily advanced future world where human beings are now made of language and are only two and a half feet, so I would put it rather far in the future. Or, and I just simply offer this in the spirit of, uh, of, intellectual completeness, uh. If you ask a shaman, or a sh-, or, uh, what these things are, they don't hesitate, they just say, "Oh, well, those are the ancestor-spirits", uh, this is what it's all about is ancestor-spirits. Well, it takes a while for the implications of this to sink in. They're talking about dead people, that's what an ancestor-spirit is. They're suggesting that the dearly departed do not evanesce into sunlight or something cheerfully nonspecific like that, but that this actually is, uh, simply one level of, a cosmic system of some sort where birth and death are transitions from level to level. Well, this is just exactly the kind of

thing that I'm intellectually set up to doubt, and to feel a kind of scorn for. 50:48

[Theme music]

[On screen text: 'Thinking Allowed productions presents' ... 'Inner Work Videotape' ... 'Hallucinogens and Culture with Terence McKenna']

Jeffrey Mishlove: Hello and welcome. Our topic today is hallucinogens and culture. We're going to examine the way that various cultures throughout the planet have been influenced in their social and cultural and intellectual development by hallucinogenic substances in the food chain. With me in the studio is Terence McKenna, author, lecturer, explorer, and philosopher. Terence is the co-author with his brother, Dennis McKenna, of a book called "The Invisible Landscape: Mind, Hallucinogens, and the I Ching." He's also the co-author of "Psilocybin: Magic Mushroom Grower's Guide." He is the author of a computer program called "Time Wave Zero," and he's the co-founder, and president, of an organization called Botanical Dimensions, which devotes itself to saving botanical plants used in shamanistic traditions throughout the world. Welcome Terence.

Terence McKenna: It's a pleasure to be here.

JM: It's a pleasure to have you here. I think a good starting point for our discussion would be the ancient Vedic culture of India; one of the world's great and and one of the world's earliest religions. The Rigveda is, is considered by all scholars to be one of the most, uh, beautiful composite of religious hymns and deep philosophical discussions, and and yet when one reads the Rigveda carefully one discovers an enormous emphasis on a mysterious, apparently hallucinogenic, substance called Soma.

TM: Yes, you're quite right. The ninth mandala of the Rigveda is entirely devoted to singing the praises of Soma, and yet we do not know what Soma is or was. R. Gordon Wasson spent a considerable portion of his life researching this problem and reached the conclusion that Soma was *Amanita Muscaria*, a mushroom that is symbiotic to pine and birch trees, uh, in much of the North Temperate Zone. However, uh... scholars have cast doubt on his identification of Soma. Nevertheless, uh, what we learn from Wasson's scholarship is that plants with hallucinogenic chemical principals in them have had an enormous impact on shaping the psychology of various cultures, both preliterate and literate, throughout the world.

JM: It seems quite clear that the references to Soma in the Rigveda were not really symbolic; they referred

to some actual plant substance.

TM: Oh yes, definitely. Some sort of plant substance was prepared and ingested by a priesthood who then use the ecstatic experience induced by that plant as a basis of all of their metaphysical and philosophical speculations on the nature of the universe. The case of Soma is by no means unique. My own field of, uh, interest was, uh, the Amazon Basin, where we don't have a great, uh, written literature, but we do have an extensive oral tradition and a tradition of hallucinogenic plant use that persists to the present day.

JM: While I think most notable in South America is the drug ayahuasca.

TM: Yes, ayahuasca is, uh, perhaps the worlds largest and most thriving psychedelic religion; it touches the lives of millions of Mestizos and, uh, Indians in the basin. It is a combinatory drug, which makes it especially interesting to pharmacologists, because its two principal ingredients are themselves inactive expect in the presence of each other. So, what we have in the case of ayahuasca is an example of a highly evolved folk pharmacology. And, how a discovery like this was ever made in the first place is one of the challenging questions that anthropologists have to deal with. After all, in a square mile of Amazonian rainforest it is not unusual to encounter 50,000 distinct species of plants. How, then, did these uh so-called primitive or preliterate people make the connection between the combining of the bark of one, with the leaves of another, boiled and put through a number of procedures to, uh, produce an intense visionary hallucinogen. This is an extremely interesting and, uh, to this day, unanswered question.

JM: Isn't it the case, that, I believe it was the German, uh, chemist who isolated this, uh, chem [stumbles] the chemical active ingredient in ayahuasca originally named it *telepathine*.

TM: Yes, that's right, uh. Based on field reports of the states of group mind induced by ayahuasca, which is also called *yage*, he felt it was fitting to name it telepathine. Now, the rules of scientific nomenclature are such that, uh, the first name of a compound is always given precedent, and about 20 years after it was name telepathine, it was realized that the identical compound had been isolated around the turn of the century from the giant Syrian rue, *Peganum harmala*, and named harmine. So today the active ingredients of ayahuasca are known as harmine, harmaline, and tetrahydroharmine. But your point is well taken, the- what struck the early explorers and ethnographers into the Amazon Basin was the fact that the people seemed to be taking this plant preparation in order to unders- uh, undergo states of community group mindedness, and during these intoxicating intervals, uh, social plans, relative to migration hunting and warfare, were undertaken by the elders of the tribe and, uh, though the name has been changed to the more innocuous harmine, nevertheless there's a continued persistence of the feeling that, uh, telepathic and group mind states are induced by this particular plant mixture. And, it's particularly interesting in the light of the fact that the chemical constituents which make it go are in fact found endogenously in the human brain. These are not exotic compounds from the point of view of ordinary human brain chemistry. So there is a suggestion there, that, uh, manipulation of neurohumoral compounds, brain neurotransmitters, and that sort of thing may in fact open the door, to, uh, untapped areas of human potential.

JM: I would imagine that many of our viewers have seen the movie "The Emerald Forest" which seems to deal with the use of substances of this sort in the Amazon culture.

TM: Yes, John Boorman did a wonderful job with that movie. He was portraying the use of *epená* snuff. Uh, that's a hallucinogenic drug complex that occurs in the eastern part of the Amazon drainage and in

rural Venezuela. Uh, *epená* is, uh, contains DMT and is blown up the nostrils by a cooperative friend and induces an intense state of hallucinogenesis. Yes, that was, I think, most people's first exposure to the real richness of the visionary pharmacopoeia that does exist in the Amazon.

JM: And there's also the suggestion there then, I guess, that DMT would trigger telepathic-like experiences, or clairvoyant types of experiences.

TM: That's right, and DMT is also a product of endogenous human metabolism. It's interesting that the most intense of the hallucinogens, DMT, which you mentioned, are the ones which are most closely related to our own brain chemistry. So, far from these compounds being, uh, alien to the brain or being an insult to the physical brain, what they really represent are the shifting of ratios of compounds already present in the ordinary brain.

JM: Well, well DMT I believe is dimethyltryptophan-

TM: -Tryptamine

JM: -Tryptamine?

TM: That's right

JM: Tryptamine. It's related to the protein tryptophan, is it not?

TM: It's related to the protein tryptophan and it's also related to Serotonin. Serotonin is a neurotransmitter which occurs in all life, and is most concentrated in the higher primates, and most concentrated there in man. It is 5-Hydroxytryptamine. While DMT is, as you mentioned n,n-Dimethyltryptamine, so there is a very close structural affinity between this extremely potent and exotic hallucinogen and the very, uh, common basis for ordinary consciousness, Serotonin, that's correct. Mhm.

JM: No, other cultures around the world have also used other types of substances. I think it might be interesting to talk, at least briefly, about alcohol which is referred to so often, in the Bible for example.

TM: Yes, well we tend in our culture to made a radical distinction between drugs and foods with what we call spices sort of falling somewhere in the middle. In point of fact, a culture is what it eats, and an individual's personality is, uh, often largely a reflection of their diet. There has not been a human culture, uh, that did not bear upon it the stamp of its relationship with certain plants which altered the individual and mass psyche. We can think of numerous examples, the influence, for instance, of sugar on the growth of 19th Century mercantilism. Or the way in which the British manipulated opium policy in the far east. Or, as you mentioned, uh, alcohol, which has always been the drug of choice, uh, in Western culture. Who can imagine modern industrial office culture without coffee? These are major drug dependencies that have placed their stamp on the lives of millions and millions of people. It's simply that we choose to linguistically define it in such a way that the effect is not something most people are cognizant of.

JM: I think coffee is a very interesting example because when it was first introduced into our culture, as I understand, it was considered virtually a hallucinogenic drug.

TM: Oh yes, when coffee was first introduced into Western culture, uh, it was associated with certain establishments where loose women and loud music were available, and the bohemian literati would gather and drink coffee and talk into the night, and it was considered quite a, uh, risqué thing to be involved with, that's right.

JM: And, and wasn't tobacco also viewed that way initially?

TM: Yes, tobacco was a very similar case. The anthropologist Eduardo Luna has pointed out that tobacco, which had a history of millennia of use in the new world, was, within a hundred years of being introduced into Europe through Portugal, was being buried in the graves of subarctic, Lapland, shamans. So, it shows how the character of the drug is quickly discerned by a culture, even a culture that is encountering that plant or that drug for the first time.

JM: I., It wouldn't be fair really to talk about drugs without mentioning, socially, what's happened in western culture, particularly during the 60s and early 70s when there was quite a wave of psychedelic drug use.

TM: Yes that's right. Following upon the discovery of LSD by Albert Hoffman in the late 30's and then the writing on the subject of the psychedelic experience that was done by Aldous Huxley, uh, Metzner, and others, it became a fad of the self-exploring youth culture of the 60's to be involved with these things. Uh... this was during a time of great social upheaval for other reasons, and the end product of that historical episode was the complete suppression of the study of psychedelic drugs, and, in my opinion, to the great detriment to the development of psychology. I feel that, uh, potentially psychedelic drugs could be for psychology what the telescope became for the science of astronomy. The problem with the psychedelics is, that they, uh, dissolve cultural programming and hence, inherently, have a political charge about them. You see, culture is the product of the unperturbed human mind. The human mind, unperturbed, through the medium of language, erects institutions and social structures which into which it then secretes itself, and sort of lives in a private Idaho. A psychedelic drug will dissolve these linguistic and cultural assumptions. It is a perturbation of the mind, and the perturbed mind is a mind in the act of rediscovering the nature that lies outside of culture. So this tension between cultural values and what we might call, for want a better word, reality, creates a tension between institutions and the users of these substances.

JM: It's as if our culture, if I understand you right, acts as a filter, uh, between our minds and and direct experience of of reality and the drugs, somehow, blow away that crust of culture and allow more of a direct, a gnostic experience.

TM: That's right; and the business of culture, any culture, is to perpetuate it's cultural models, and if the hallucinogenic plants have not been integrated into the cultural model then they are definitely seen as dangerous forces for an unpredictable sort of social change. Now, if the hallucinogenic plants have been integrated into the cultural model, this is not then a problem, and this is the case with Shamanism. Shamanism is the, uh, culturally sanctified institution of, uh, inner exploration via psychoactive plants. Where psychoactive plants are not present, shamanic institutions tend to become vitiated, to rely on ritual, or ordeals, or, uh, other methods of elucitin- eliciting these ecstatic states, but, to my mind, and this is a great argument which rages in anthropology, uh, to my mind, and I'm in agreement with Wasson here, the hallucinogenic plants are the *sine qua non* for an active shamanism.

JM: For authentic-

TM: An authentic shamanism, that's right. Now, Mircea Eliade, who's the great, uh, commentator on shamanism took then an entirely different point of view and said reliance on, what he called narcotics was a decadent phase of shamanism, but if we examine Eliade's, uh, personal history, I think it can be clearly seen that this was simply the cultural myopia of a European scholar in the great 19th century model.

JM: Sort of still under the sway of a Victorian sense of, uh, morality.

TM: Uh, yes, sort of taking the point of- the superior point of view that, while these are primitive people, surely our greater epistemological sophistication puts us in a position to judge them.

JM: You have the same controversy, don't you now, within the Hindu tradition where many gurus say 'no drugs', and are denying I suppose the, uh, um, the tradition of the Rigveda which we spoke of earlier.

TM: That's absolutely correct uh, the Mahabharata, which is the central core text of late reformed Hinduism, explicitly forbids mushrooms to the Brahman class; they are a forbidden food, but in ethnography we're taught that a taboo usually indicates a previous involvement and fascination, and, uh, in fact, the early Hinduism of the Vedic phase was definitely more analogous to the hallucinogenic shamanism of the Amazon Basin than it is to the extremely stratified, uh, Hinduism of modern India

JM: Do you find the use of drugs of this type, hallucinogenic drugs, in the Tantric traditions, the traditions that deliberately use taboos in order to inculcate higher states of awareness?

TM: Yes, well, when you go to India, you discover that the one thing that is not stressed in Hinduism as it is exported to the West, is the immense reliance on cannabis. Hashish, Ganja, is, uh, the staple of these Sadhus. This is a fact of their daily life, that they are relying on this for a, uh, constantly reinforced contact with the, uh, transcendental dimension. Mhm.

JM: You know, I think it's interesting how you referred earlier to the, uh, shamanistic religions as being the ones that really have sanctified the use of these drugs for religious purposes, and yet we find in our Western tradition, Christianity has come and in an effect labeled these sorts of things as diabolic. Uh for example, uh, drugs, I believe, uh, were used, uh, amongst various witchcraft groups that were persecuted by the church.

TM: That's right, however, the church was concerned that the magic of the witches be seen as real, number one, and number two, entirely caused by the agency of the devil himself, and so the church downplayed the operational role that plants had in inducing these states, because, after all, if the devil cannot lead you astray without the use of plants, why, what kind of devil is it? So in our own, uh, historical tradition, there is a curious blindness to the efficacy of hallucinogenic plants.

JM: I have heard, for example, in you know the old story of, of witches using toad skins in in their brews that that there's a drug called bufotenine in- which is a hallucinogenic that comes from the skin of toads.

TM: Well, there was excitement about bufotenine in the mid-60s; it was later shown to be non-

psychoactive. However, since then, toads have been found which do secrete DMT-like compounds, and it's fairly clear that the cauldron chemistry of the witches which relied on datura, hellebore, monkshood, henbane, these sorts of plants, was a powerful, uh, visionary chemistry, although these compounds, uh, the tropane alkaloids that occur in those plants, tend to be more deliriants and confusants than what I call the classical psychedelic compounds, which are more the tryptamines and the beta-carbolines. There are many chemical compounds in nature which are psychoactive, but a much narrower spectrum of these compounds are truly what we call psychedelic, or mind-manifesting.

JM: Now, other than the, uh, obvious spiritual and religious implications which we see again and again in different cultures, even, and I suppose we should mention the Native American Church and their use of

TM: -peyote.

JM: peyote uh, uh, what are the other kinds of cultural developments that we can trace to the use of these drugs?

TM: Well, I think the most profound cultural development is, it is possible to make the case that language itself is an ability that was coaxed out of an evolving primate species by virtue of the fact that there were hallucinogenic plants in the diet of that creature. You see, psilocybin has been shown in low doses to actually increase visual acuity. Well, at the stage of evolution where human beings encountered psilocybin mushrooms, we were essentially baboon-like, pack hunting hoards of veldt-living creatures in Africa. In that situation, a compound which increases visual acuity will give a tremendous adaptive advantage to the animals that are including it in their diet, and those animals not including it in their diet will be quickly eliminated by the process of natural selection from the evolutionary scenario. So, it's possible to argue that this mind-manifesting quality of the psychedelics actually conferred an evolutionary, uh, advantage on certain primates who then were able to bootstrap themselves to higher and higher states of reflective self-awareness. This may lie behind the very early coincidence of cattle, goddesses, and mushrooms in the apparent obsessions of early man as reflected by the cave paintings on the Algerian plateau and in southern France and Spain. We always find the notion of the mystery, circa 18,000 years ago, connected with the idea of cattle, and we always find the cattle connected with the notion of the great Goddess. Now, it may be that the hidden and third member of this trinity was a hallucinogenic mushroom of some sort.

JM: We've got only about 2 minutes left but I, I wonder what the connection; I don't, I don't quite see it between the mushroom and the cattle and the Goddess.

TM: The mushrooms grow in the manure of the cattle. When the hunting packs of early primates followed along behind the cattle, they inevitably encountered the mushroom, ate it, had their visual skills thereby increased, bred more readily therefore, and survived more easily than their non-mushroom eating cousins, and so, the eating of mushrooms and the development of higher aspects of consciousness, including self reflection, were thereby enforced, leading to the conclusion that it was actually a symbiotic relationship between early primates and these hallucinogenic plants that laid the basis for the appearance of what we call human beings.

JM: Well, Terence McKenna, this is a very interesting discussion. You seem to be suggesting that our evolution, I suppose, from the animal kingdom into the human kingdom itself was catalyzed or, or triggered by our encounter with these hallucinogenics um.

TM: Yes, we are an ape with a symbiotic relationship to a mushroom, and that has given us self-reflection, language, religion, and all the spectrum of effects that flow from these things.

JM: Yeah. And one can only wonder how these hallucinogens might affect our future evolution as well.

TM: They have brought us to this point and as we make our relationship to them conscious, we may be able to take control of our future evolutionary path

JM: Terence McKenna, thank you *very much* for being with me.

TM: It was a pleasure.

JM: For me too. And thank *you* very much for being with us.

Hallucinogens Before and After Psychology (aka Beyond Psychology)

14 May 1983

University of California Santa Barbara, Psychedelics & Spirituality Conference

Description

- [Audio Link \(Archive.org\)](#)
- [Original Transcription from Willmushiamroom](#)
- [Audio Link \(YouTube\)](#)

I have to begin by, uh, correcting Rob. Actually Jonathan Ott wrote, uh, Hallucinogens and Mathematics. I wrote Psylocybin: The Magic Mushroom Grower's Guide, uh, in collaboration with my brother [Terence chuckles; audience applause]. I was originally going to call this talk, uh 'Monkeys Discover Hyperspace', but, uh, I decided that that was, uh, a little outrageous and I settled on 'Hallucinogens Before and After Psychology'. So before I dig into that subject, I'll say a bit about how I come to have an interest in these substances and their very peculiar effects.

Years and years ago, after an LSD trip, I, uh, imagined that I perceived a relationship between the LSD experience and the motifs of Tibetan religious art, and accordingly I went to Nepal and took up residence in a, uh, village of Tibetan refugees. And, uh, I quickly learned that the shamanism that I wanted to study was, uh, inaccessible for reasons of language, for reasons, uh, such as that the Buddhists who were teaching me Tibetan looked, uh, askance at the shaman I wanted to associate with. And I realized then that the association between shamanism and hallucinogens is such that both in a way are taboo and when you, uh, deal with preliterate cultures you discover that the shaman is a very peculiar figure.

He is, uh, critical to the functioning of the psychological and social life of his community, but in a way he's always peripheral to it. He lives at the edge of the village, he is only called upon in matters of, uh, great social crisis, he is, uh, feared and respected, and, uh, this might be a description of these hallucinogenic substances. They are feared and respected, they are misunderstood, they are only called upon, uh, often in moments of great crisis, and they are a persistent, but always peripheral part of the community.

And, uh, I saw this in Nepal among Bon-Po Tibetan shamanism, which is a non-hallucinogen based shamanism, I saw it in Indonesia where techniques had been developed to induce trance, but were non-chemical techniques, uh, specifically dance in the case of Bali and Mantok, and I saw it finally in the Amazon where I think, uh, I contacted the primal shamanism. Uh, as you know, there is a division of opinion on the matter of whether narcotic or, as I call it, hallucinogenic shamanism is decadent or in fact primary, and Mircea Eliade took the position that hallucinogenic shamanism was decadent and Gordon Wasson, very rightly I believe, uh, contravened this view and held that actually it was very probably the presence of the hallucinogenic drug experience in the life of early man that lay the very basis for the idea of the spirit.

Well, as I made my way through these various cultures and various hallucinogenic substances it, uh, came to my attention that, in my opinion, and I believe in the opinion of Gordon Wasson and, uh, other scholars- Henry Munn comes to mind- he wrote a marvelous essay called "The Mushrooms of Language", but in the minds of those who associated themselves with the mushroom there were certain assumptions about psilocybin that were different from the mythos that was arising around some of the other hallucinogens.

Um..psilocybin, I think, as one of the more commonly available hallucinogens, is the most visual, and it is certainly visual if it is done in the traditional manner, and, uh, I'm always amazed at how little understood or practiced the traditional manner is, so I'll sketch it for you. The traditional manner of taking psilocybin is to take a very healthy effective dose in the vicinity of 15 milligrams on an empty stomach in total darkness. [Audience member "WOO HOO!", Terence laughs] You've been there! [Terence laughs] And in that situation, which is in a sense a situation of sensory deprivation, the psilocybin is able to exfoliate itself to the fullest degree and to show you what it is, not against a background of a reality that ordinarily surrounds us, but against a background of darkness so that the pure essence of the thing can be shown, and it is, uh, extraordinarily bizarre, extraordinarily difficult, I believe, to assimilate into your world view, and this is whether you're a Bora youth undergoing initiation, or whether you're a college student or a research chemist.

These things do not lend themselves well to integration into language. If they did, they wouldn't occupy this peripheral position after 10,000 years of human culture. But above and beyond the visual intensity of psilocybin, the thing that sets it apart, I believe, is a phenomenon that might be described as an induction of aural hallucination, but in fact, to describe it that way is to fall back on a kind of, uh, medical, uh, jargon reductionism because what it really is is a voice in the head that is separate from the perceived ego function, in other words, a voice speaks. You hear it, and it seems to be operating independent of the ego. It operates in a psychopompic role as a teacher, as the narrator of the vision which is revealed much in the same way that Virgil led Dante through the circles of hell, and uh, the modern intellectual equipment is not capable of assimilating this. This is the sort of thing that we associate with psychopathology. We can hardly imagine anything more alien to modern consciousness than a disembodied voice in the head. However, if you familiarize yourself with Western thought on the scale of millennia, you discover that not only is this not an alien phenomena, but for much of human history it has been inimical to the human experience and it is called, uh, relying on the Greeks, the Logos. The Logos is a voice heard in the head, and the Logos was the hand on the rudder of human civilization for centuries, up until, in fact, the collapse of the ancient mystery religions and the ascendancy of Christianity to the status of the world religion.

I am sure many of you are familiar with the story in Plutarch of, uh, the fisherman who heard a great noise and saw something fall into the sea and heard a voice from the sky saying that great Pan was dead, that, in other words, the ancient gods had been eclipsed, and in fact in Jungian terms, the ancient god, by falling into the sea, had been submerged in the phonic unconscious and disappeared from the, uh, experience of ordinary people.

From that period on it was 15 to 17 centuries while Christianity worked out the implications of its message, while science spun away from Christianity and created its own set of modes, the New World was discovered, reason was enthroned, scientific method was enthroned, and the civilization that we know arose around us, but then in 1953 Valentina and Gordon Wasson went to Huautla de Jimenez in the Sierra Mazatec of Oaxaca and they discovered this mushroom cult, and its my belief that to this day we do not

know what exactly it was that they stumbled upon. Mushroom, drug, cult, all of these, uh, ideas about what it rests on the assumption that we know what we're talking about when we talk about mind, and in fact everything that has been said at this conference had rested on the assumption that we know what we're talking about when we invoke a concept like mind.

The truth of the matter is, ladies and gentlemen, that after two thousands years of grappling with the problem scientists cannot even tell you how you can form the conception that you will change your open hand into a closed fist, and it will happen. This is an intervention of mind into the world of matter that, uh, no, no philosopher has been able to give a satisfactory account of. Now, with the hallucinogens this intervention of one realm into another, of mind into matter or matter into mind, is raised to a pitch of excruciating intensity, and, uh, it's my belief that one of the, uh, unconscious reasons which underlies the odd attitude of the establishment toward hallucinogens is the fact that they bring the mystery to the surface as an individual experience. In other words, you do not understand the psychedelic experience by getting a report from time magazine or even the economist. You only understand the psychedelic experience by having it, and therefore to understand it is to embark on a course of action, of self-education outside the context of your culture because your culture has no answers about what this thing might be.

Ok, so much for that. But Psilocybin and DMT to a lesser extent, although it is so brief and so intense that it's sometimes hard to sort these things out, uh, invokes a Logos or reintroduces the phenomenon of the Logos, uh, into the experience of modern people. So what, uh, what can we make of this? Um, I think we have to take it very seriously. I think that the culture crisis that we are involved in has to do, and by that I mean the entire global cultural crisis leading possibly to the extinction of the species, has to do with the fact that our models, developed over the last 500 to 1,000 years, have played us false. They aren't working, and the cultures that we have conquered with, uh, capitalism and, uh, technology; we have repressed their connection into these intuitive realms. We have established one method for the arbitration of truth and everything which does not, uh, pass through that narrow gate is relegated to the realm of mythology or worse, cultural immaturity, and yet we are the culture that is in crisis. When you go to the rainforest you don't find cultures in crisis except to the degree that they are being impacted by us.

So, I believe that it is no coincidence that in this moment of maximum cultural crisis which we call the 20th century the hallucinogens, the entheogens, have emerged in Western culture. It is no accident that Wasson made his trip to central Mexico and contacted the mushrooms. What he discovered in the mountains of Mexico was nothing less than Eros, sleeping but alive, the body of Osiris preserved over an entire astrological age, metaphorically speaking. In other words, that to take the mushroom was to transcend the cultural momentum of the past couple of millennia and return to a world where the Logos was a realized phenomena. And we heard from Carl Ruck last night about the Eleusinian Mysteries; this was not a minor phenomenon. Over a period of 2,000 years everyone who was anyone made the pilgrimage to Eleusis and had the experience, and it put the stamp on Greek drama, Greek philosophy, later Roman politics. All of these things were influenced by the hallucinogenic experience.

So, our culture, spiritually, has played the role of the prodigal son. We, for reasons of ideology, botanical geography, other factors have not had visionary ecstatic hallucinogens installed in our culture, uh, as we perhaps should have over the last, uh, several hundred years. Now, that is changing, and in order to understand what the change means you have to look further back in time, in fact, past history to prehistory, again to the model of the shaman, not the shaman as anthropologists, uh, describe him, but the shaman as shaman dream him because every shaman looks back toward an archetypal first shaman who was

superhuman, who did go to the stars, who could go to the bottom of the ocean, who could move through the gates of death and return with a lost soul.

Now, it seems to me when you pull back to, uh, the perspective of several thousand years, all of history can be seen as an adumbration on this wish, expectation, hope for a superhuman condition, for a transcending of the laws of gravity, of the laws of life and death into a superhuman condition that was salutary for mankind as a whole, in other words, the shaman as the archetypal perfected man.

Now, this afternoon you heard Metzner refer to alchemy as one of the, uh, refractions of this concern with the perfection of the spirit. Uh, it is about the projecting of a perfect substance, which is the self purified, but it also lead to the rise of modern science basically through a misunderstanding. Now, it seems to me what's happening now is that what Mircea Eliade called the "human desire for self-transcendence expressed through the motif of magical flight" has been taken up by the technological society as the idea of space flight, and I'm sure if Tim Leary were here he could speak to this more eloquently than I can. Space flight is nothing less than the exterior metaphor for the shamanic voyage, in other words, in our terms for the hallucinogenic drug experience. This is the way that engineers get high. They go to the moon.

[audience laughter and clapping]

What we need to do to transcend our cultural schizophrenia and to heal the rift between spirit and soul or world and self is to realize something which we all pay lip service to, at least I'm sure all the people in this room pay lip service to, which is the idea that the inside and the outside are really the same thing, but I don't think the cultural implications of that have been, uh, clearly drawn. What it means really is that all our dreams of transformation have to be realized at the same time, and that we cannot go to space with our feet in the mud, nor can we in fact turn ourselves into an eco-sensitive hallucinogenic-based culture on earth, unless we fuse this- these dichotomist opposites. It is only in coincidentia oppositorum, a union of opposites that does not strive for closure that we are going to find cultural, uh, sanity, and this is the thing that the entheogens, the hallucinogens deliver with such clarity and regularity. They raise paradox to a level of intensity that no one can evade, and in doing that they set the stage for turning yourself into the kind of person who does not insist on having it either or, black or white and a culture composed of those kinds of people will be a culture more civilized than any that we have seen so far.

If I can paraphrase Teilhard de Chardin for a moment, he said, uh, or I will paraphrase in this way, 'when the human race understands the potential of the hallucinogenic drug experience it will have discovered fire for the second time.' And this is what we are waiting for. We are waiting for the discovery of fire so that we can transcend the monkey business and get on with the great business of inhabiting our own imaginations, and it's impossible to take that position without someone saying, Manichean, dualist, uh, enemy of the body! Perhaps, but, uh, since the very beginning of culture what we seem to be are animals which, uh, take in raw material and excrete it imprinted with ideas, and we do this on a larger and larger scale looking toward the day when all physical constraints can be lifted off of us as they are in our imagination and we can erect the kind of civilization that we want to erect, and this vision was anticipated by no less a seer than James Joyce who said, "If you want to be phoenixed come and be parked." [Terence laughs, audience laughter] "Up in the yent prospector", uh, "Here in Moycayn we flop on the seamy side." Moycayn is the red light district of Dublin. "But up in the yent prospector, you sprout all your worth and woof your wings." This was part of his program; he wa- hoped that man would become "dirgible" as he put it, and he didn't live to see the revolution of the hallucinogens, but I think had he, he would have felt that,

uh, that man was well on his way to becoming “dirgible,” and, uh, it seems to me that we stand at an enormous threshold. The future of the human mind must, uh, loom large in the future of the human species. If it doesn’t loom large in the hum- in the future of the human species, then we are in very big trouble.

Now, a term that has been applied, or was early on applied, though I haven’t heard it used in this conference, to hallucinogens, was 'consciousness-expanding drug' and this may not be onomatopoeic, but it’s certainly phenomenologically accurate and neutral. They are consciousness-expanding drugs, and the question, "what is consciousness?", cannot be divided away from the question, "Is man good?" And this is a question that we have to answer for ourselves because I believe that we are not going to extinguish ourselves. We are going to evade the, uh, the many obstacles that are so obviously ahead of us in the next few years. We are going to reach the threshold of the galaxy, but in what form? And in order for the form in which we reach the edge of the galaxy and present ourselves to the hegemony of organized intelligence that must exist there, in order for that form to be worthy, we are going to have to go with our minds fully illuminated in front of us, and that means that we can have no more truck with the idea of an unconscious, of an inaccessible and dark part of the human psyche that cannot be controlled, that it's obviously a description of the childhood of an intelligent species, and I believe that these hallucinogens signal the end of that childhood. There have always been individual shaman who have made that transition, and in that sense the taking of hallucinogens is an anhistorical phenomenon, it has always been going on, but the idea of psychedelic societies is something new, and it doesn’t necessarily mean that everyone take the drug, it merely means that the complexity and the mysteriousness of mind are centered in the consciousness of the civilization as the mystery which it comes from and which it must relate to in order to be relevant.

So I'll take a couple of questions. [audience claps]

Q: ...[?]

TM: This idea that the mind is essentially uh...

Q:...[?]

Well, I guess, uh, the question is "is there any advice vis-a-vis utilization of materials that would, uh, allow you to hang on to any perceptions that I may have, uh, triggered in you. I wouldn't presume to answer that question but I'll answer another one that might relate to it, which is I think that when you take hallucinogens you should take an effective dose, and I can't stress enough the importance of lying down and being still in darkness on an empty stomach. I mean if you want an oral empowerment, that's it. Nothing could be simpler, and yet you would be amazed at the number of people who when you mention psilocybin, the first question that occurs to them is "Will I be able to drive?" [audience laughter] It just is uh.. One more.

Q: [?]

TM: With regard to what?

Q: ??

TM: Well ...the word empathogen, empathogen seems very appropriate. It is not a, uh, a powerful visual hallucinogen. I am very interested in the visual hallucinogens because it seems to me they pose certain fundamental questions of information theory and that kind of thing. Uh, for instance, you know, where do these hallucinations come from? These extremely intricate, far more intricate than any visual scene that your eye falls upon in ordinary reality. [audio cuts out]

...shifting information patterns. I don't believe that they can be reduced to, uh, spirals, lines and dots. What I see isn't like that. it's more as though you have a holographic hyperspatial radio and you just tune down the dial and here's a desert world and a triple star system and, uh, here is a city somewhere inhabited by insectile creatures with a machine symbiosis [audience chuckles] here's something else, and it's just flipping by. Um, I would prefer to believe that the human imagination is the holographic organ of the human body, and we don't imagine anything, we simply see things so far away that there is no possibility of validating or invalidating their existence

One more. [audience laughter]

Q: I was interested in psychotherapeutic potential for dymethyltryppamine, [??] within that [??]...to benefit from [??] any profound lasting effects.

TM: I think it certainly has a profound and lasting effect. The very brevity of it serves to convince you that it isn't a drug at all, but that it's carried you into another dimension and back again, and that alone is, uh, something to ponder.

Well, I thank you for your attention! [audience claps]

Alchemy and the Hermetic Corpus

May 1991

Location, City, State?

Description

- [Audio Link](#)

- [Other links](#)

Terence McKenna: Well, it is a small group and this was my intent by focusing on the Hermetic Corpus and alchemy. I've just gotten tired of talking about psychedelic drugs and always saying the same things over and over again, nevertheless it's a challenge to go outside my own bailiwick. I mean I've had an interest in hermeticism and alchemy since I was about 14 and read Jung's psychology and (of) alchemy and it opened for me the fact of the existence of this vast literature, a literature that is very little read or understood in the modern context. The Jungians have made much of it, but to their own purposes and perhaps not always with complete fidelity to the intent of the tradition. We'll talk a lot about the Jungian approach but there are other approaches even within the 20th century. I believe, since I don't have the catalog I'm not absolutely certain, but I believe the catalog urged you to read Giordano Bruno and the Hermetic Tradition by Dame Frances Yates and this is, though Frances Yates scholarship is very controversial, I think that to get an overview of the landscape her book is probably the best single book between covers. It's not pleasing to some factions and we can talk about that. I mean, we will probably discover within the group all strains of alchemical illusions and delusions that have always driven this particular engine, but I thought to get one book that sort of covered the territory that was a good one to start with. Well then I found out that it's very hard to get this book. I didn't realize that because it's been sitting on my shelf for years. Richard Bird found a reprint at the Bodhi Tree. I wasn't aware of this particular edition so, though probably none of you brought it with you in heavily underlined form, if after this weekend you want to try and get it, it is available and if you can't get that edition, why, a good book service can probably come up with the first edition which is Routledge Kegan Paul.

I wouldn't hold a weekend like this simply to go over a body of ancient literature if I didn't think it had some efficacy or import for the modern dilemma and some of you may know the song by the Grateful Dead in which the refrain is "I need a miracle every day." I think any reasonable person can conclude that the redemption of the world, if it's to be achieved, can only be achieved through magic. It's too late for science. It's too late for hortatory politics.

Well, it's very interesting - every ancient literature has its apocalypses and in the hermetic literature there is a prophecy, I think it's in book two but that really doesn't matter, and the prophecy is that a day will come when men no longer care for the earth and at that day the gods will depart and everything will be thrown into primal chaos and this prophecy was very strongly in the minds of the strains of non-Christian thought that evolved at the close of the centuries of closure of the Roman Empire. When you look back into historical time it's when you reach the first and second centuries after Christ that you reach a world whose psychology was very much like the psychology of our own time. It was a psychology of despair and exhaustion. This is because Greek science which had evolved under the aegis of democratic atomism and Platonic metaphysics had essentially come to a dead end in those centuries. We can debate the reasons why this happened. An obvious suggestion would be that they failed to develop an experimental method and so everything just dissolved into competing schools of philosophical speculation and a profound pessimism spread through the Hellenistic world and out of that pessimism and in the context of that kind of universal despair which attends the dissolution of great empires a literature was created from the first to the fourth centuries after Christ which we call the Hermetic Corpus or in some cases the Trismegistic Hymns. Now this body of literature was misunderstood by later centuries, especially the Renaissance, because it was taken at face value and assumed to be at least contemporary with Moses if not much older. So the Renaissance view of Hermeticism was based on a tragic misunderstanding of the true antiquity of this material and there are people, hopefully none in this room, who still would have us believe that this literature antedates the Mosaic Law, that it is as old as Dynastic Egypt. But this is an indefensible position from my point of view. In the early 16th century two men, a father and son, Issac and Marik Casaubon, showed through the new science of philology, that this material was in fact late Hellenistic. Now, I've always said that I am not a Classicist in the Victorian sense, in the sense that there is a certain strain of thought that always wants to believe that the oldest stuff is the best stuff. This is not the case to my mind. To my mind what is amazing is how recent everything is. So I have no sympathy with the fans of lost Atlantis or any of that kind of malarkey because to me what is amazing is how it all is less than 10,000 years old. Anything older than 10,000 years puts us into the realm of an aceramic society relying on chipped flint for its primary technology.

What the Hermetic Corpus is is the most poetic and cleanly expressed outpouring of ancient knowledge that we possess. But it was reworked in the hands of these late Hellenistic peoples and it is essentially a religion of the redemption of the earth through magic. It has great debt to a tradition called Sevillian which means to mean Mandeism and Mandeism was a kind of proto-Hellenistic gnosis that laid great stress on the power of life, Zoa, Bios, and in that sense it has a tremendously contemporary ring to it.

We also are living in the twilight of a great empire, and I don't particularly mean the American empire, I mean the empire of European thinking created in the wake of the Protestant Reformation and the rise of modern industrialism, the empire, in short of science. Science has exhausted itself and become mere techné. It's still able to perform its magical tricks, but it has no claim on a metaphysic with any meaning because the program of rational understanding that was pursued by science has pushed so deeply into the phenomenon of nature that the internal contradictions of the method are now exposed for all to see. In discussing alchemy especially we will meet with the concept of the coincidentia oppositorum, the union of opposites. This is an idea that is completely alien to science. It's the idea that nothing can be understood unless it is simultaneously viewed as both being what it is and what it is not and in alchemical symbolism we will meet again and again symbolical expression of the coincidentia oppositorum. It may be in the form of a hermaphrodite, it may be in the form of the union of soul and Luna, it may be in the form of the union of Mercury with lead, or with sulfur, in other words alchemical thinking is thinking that is always antithetical, always holds the possibility of by a mere shift of perspective its opposite premise will gain power and come into focus. I think it was John, when we went around the circle, who mentioned his interest in shamanism. There's a wonderful book called The Forge and the Crucible by Mircea Eliade in which he shows that the shaman is the brother of the smith, the smith is the metallurgist, the worker in metals, and this is where alchemy has its roots. In a sense, alchemy is older than the Trismegistic Corpus and then it is also given a new lease on life by the philosophical underpinnings which the Corpus Hermeticum provides it. Alchemy, the word alchemy, can be traced back to mean Egypt or a blackening and in its earliest strata it probably refers to techniques referring to dying, meaning the coloring of cloth, and gilding of metals, and the forging and working of metal. I mean, we who take this for granted have no idea how mysterious and powerful this seemed to ancient people and in fact it would seem so to us if we had anything to do with it. I mean how many of us are welders or casters of metal. It's a magical process to take for instance cinnabar, a red, soft ore and by the mere act of heating it in a furnace it will sweat liquid Mercury onto its surface. Well, we have unconsciously imbibed the ontology of science where we have mind firmly separated out from the world. We take this for granted, it's effortless, because it's the ambience of the civilization we've been born into but in an earlier age, and some writers would say a more naive age, but I wonder about that, but in an earlier age mind and matter were seen to be alloyed together throughout nature so that the sweating of mercury out of cinnabar is not a material process, it's a process in which the mind and the observations of the metalworker maintain an important role, and let's talk for a moment about mercury because the spirit Mercurius is almost the patron deity of alchemy.

You all know what mercury looks like-at room temperature it's a silvery liquid that flows, it's like a mirror. For the alchemists, and this is just a very short exercise in alchemical thinking, for the alchemists mercury was mind itself, in a sense, and by tracing through the steps by which they reached that conclusion you can have a taste of what alchemical thinking was about. Mercury takes the form of its container. If I pour mercury into a cup, it takes the shape of the cup, if I pour it into a test tube, it takes the shape of the test tube. This taking the shape of its container is a quality of mind and yet here it is present in a flowing, silvery metal. The other thing is, mercury is a reflecting surface. You never see mercury, what you see is the world which surrounds it, which is perfectly reflected in its surface like a moving mirror, you see. And then if you've ever, as a child, I mean I have no idea how toxic this process is, but I spent a lot of time as a child hounding my grandfather for his hearing aid batteries which I would then smash with a hammer and get the mercury out and collect it in little bottles and carry it around with me. Well, the wonderful thing about mercury is when you pour it out on a surface and it beads up, then each bead of mercury becomes a little microcosm of the world. And yet the mercury flows back together into a unity. Well, as a child I had not yet imbibed the assumptions and the ontology of science. I was functioning as an alchemist. For me, mercury was this fascinating magical substance onto which I could project the contents of my mind. And a child playing with mercury is an alchemist hard at work, no doubt about it.

Well, so then, this is a phenomenon in the physical world and then mind is a phenomenon in the Cartesian distinction, which is between the Res Extensa and the Res Verins. This is the great splitting of the world into two parts. I remember Al Wong once said to me, we were talking about the yin yang symbol, and he said you know the interesting thing is not the yin or the yang, the interesting thing is the s shaped surface that runs between them. And that s shaped surface is a river of alchemical mercury. Now, where the alchemists saw this river of alchemical mercury is in the boundary between waking and sleeping. There is a place, not quite sleeping, not quite waking, and there there flows this river of alchemical mercury where you can project the contents of the unconscious and you can read it back to yourself. This kind of thinking is confounding to scientific thought where the effort is always to fix everything to a given identity and a given set of behaviors. Now, the other hermetic perception that is well illustrated by just thinking for a moment about mercury is the notion, and this is central to all hermetic thinking, of the microcosm and the macrocosm. That somehow the great world, the whole of the cosmos is reflected in the mystery of man, meaning man and women, it's reflected in the mystery of the human mind/body interface. So, for an alchemist, it makes perfect sense to extrapolate from this internal, what we call internal psychological processes, to external processes in the world. That distinction doesn't exist for the alchemist, and let me tell you, the longer I live the more I am convinced that this is absolutely the truth.

The myth of our society is the existential myth that we are cast into matter, that we are lost in a universe that has no meaning for us, that we must make our meaning. This is what Sartre, Kierkegaard, all those people are saying, that we must make our meaning. It reaches its most absurd expression in Sartre's statement that nature is mute. I mean, this is as far from alchemical thinking as you can possibly get because for the alchemist nature was a great book, an open book to be read by putting nature through processes that revealed not only its inner mechanics, but the inner mechanics of the artifact, the person working upon the material, in other words, the alchemist.

Well, in other contexts I've talked about the importance of language and how our world is made of language and part of the problem in understanding alchemy is that the language is slipping out of our reach. We are so completely imbued with the Cartesian categories of the Res Verins, the world of thought, and the Res Extensia, the world of three dimensional space, and causality, and the conservation of matter and energy, and so forth that in order to do more than carry out a kind of scholarship of alchemy we have to create an alchemical language, or a field in which alchemical language can take place. Some of you may have been with me a couple of weeks ago in Malibu when Joan Halifax and I debated the roots of Buddhism and I think Joan deserves great credit for saying that Buddhism would never have taken root in America were it not for the psychedelic phenomenon. Not that Buddhism is psychedelic, it in fact is fairly touchy about that, but Buddhism would have gotten nowhere in America had not psychedelics created a context for Buddhist language to take root, and I wager that I would never have gotten to first base with proposing a weekend on alchemy at Esalen were it not understood that psychedelics have prepared people for the notion that mind and world can be pureed together like mercury and sulphur, like the Sophic waters, to create a new kind of understanding because otherwise modernity has fixed our minds in the category of Cartesian rationalism and so I will not claim, and do not in fact think it's so, that there was anything overtly psychedelic in the sense of pharmacologically based about alchemy. When we look back through the alchemical literature there's very little evidence that it was pharmacologically driven. Only when you get to the very last adoptions of the alchemical impulse in someone like Paracelsus do you get the use of opium. But it is interesting that the great drugs of modern society were accidentally discovered by alchemists in their researches; distilled alcohol is a product of alchemical work and then, as I mentioned, opium was very heavily used by the Paracelsian school. But what they possessed was an ability to liquify their mental categories and then to project the contents of the mind onto these processes and read them back.

Now this is what made alchemy so fascinating to the Jungian school because the Jungians were discovering the unconscious and they realized, before Jung's involvement with alchemy, that the best material for psychotherapy to work upon was dreams and mythology and these were the two poles of the data field that the discovery of the unconscious was working on. Well then Jung had the presence to realize that alchemy, which to that point, as the gentleman over here said, had been dismissed as a naive effort to turn base metals into gold-this is the first fiction that you have to absolutely purge from your mind, the only alchemists who ever tried to turn base metals into gold were charlatans, the so-called puffers. They were called that not only for their exaggerated speech but for their use of bellows to drive their fires. Alchemy has always had a core of true adepts and then a surround of misguided souls and outright con artists who were trying to change base metals into gold. Now, it's interesting that science, in its naivety, in the 20th century has actually completed the program of pseudo-alchemy. You can, if you have a sufficiently powerful nuclear reactor, change lead into gold. I mean, the cost is staggering. It has no economic importance whatsoever but it can be done by bombarding gold with a sufficient amount of heavy particles. Lead, you can change it into gold, but this is not what the original intent was. In fact, when we look at the history of 20th century science we will see that, in a way, it's a misunderstanding of what the alchemical goals were to be and, one by one, it has done these things that were stated goals of the alchemists except that the alchemists always spoke in similes and in a secret control language that was symbolic.

Ok, now, another point that was brought up in going around the circle was the externalization of the soul and what we're trying to do in this weekend is study and talk about the idea of redeeming the world through magic. And how is this to be done? Well, the philosopher's stone is a complex of ideas that, no matter how you divide it, no matter how you slice it, it's very difficult to hold the pith essence of this concept, but what it really comes down to is the idea that spirit is somehow resident in matter in a very diffuse form. The goal of hermetic thinking and later alchemy is the concentration and redemption of this spirit, a focusing of it, a bringing of it together. This is an idea that was common in the Hellenistic world not only to hermetic thinking but also to Gnosticism.

Gnosticism is the idea that somehow the pure, holy, real light of being was scattered through a universe of darkness and of Saturnine power and that the goal is that by a process which we can call yogic or alchemical or meditative or moral/ethical, the light must be gathered and concentrated in the body and then somehow released and redeemed. All esoteric traditions, East and West, talk about the creation of this body of light and we will not, in this weekend, talk very much about alchemy, non-western alchemy, Taoist and Vedic alchemy, but in those systems too the notion is about the creation of this vehicle of light. This is one metaphor for the externalization of the soul.

The philosopher's stone is another and I will challenge you to try and imagine what the achievement of the philosopher's stone would be like because it's in trying to think that way that you begin to dissolve the categories of the Cartesian trap. So, image for a moment an object, a material, which can literally do anything. It can move across categorical boundaries with no difficulty whatsoever. So what do I mean? I mean that if you possess the philosopher's stone and you were hungry, you could eat it. If you needed to go somewhere you could spread it out and sit on it and it would take you there. If you needed a piece of information, it would become the equivalent of a computer screen and it would tell you things. If you needed a companion, it would talk to you. If you needed to take a shower you could hold it over your head and water would pour out. Now, you see, this is an impossibility. That's right, it's a coincidence opistorium. It is something that behaves like imagination and matter without ever doing damage to the ontological status of one or the other. This sounds like pure pathology in the context of modern thinking because we expect things to stay still and be what they are and undergo the growth and degradation that is inimical to them, but no, the redemption of spirit and matter means the exteriorization of the human soul and the interiorization of the human body so that it is an image freely commanded in the imagination.

Imagination. I think this is the first time I've used this word this evening. The imagination is central to the alchemical opus because it is literally a process that goes on the realm of the imagination taken to be a physical dimension. And I think that we cannot understand the history that lies ahead of us unless we think in terms of a journey into the imagination. We have exhausted the world of three dimensional space. We are polluting it. We are overpopulating it. We are using it up. Somehow the redemption of the human enterprise lies in the dimension of the imagination. And to do that we have to transcend the categories that we inherit from a thousand years of science and Christianity and rationalism and we have to re-empower and re-encounter the mind and we can do this psychedelically, we can do this yogically, or we can do it alchemically and hermetically.

Now there is present in the world at the moment, or at least I like to think so, an impulse which I have named the archaic revival. What happens is that whenever a society really gets in trouble, and you can use this in your own life-when you really get in trouble-what you should do is say "what did I believe in the last sane moments that I experienced" and then go back to that moment and act from it even if you no longer believe it. Now in the Renaissance this happened. The scholastic universe dissolved. New classes, new forms of wealth, new systems of navigation, new scientific tools, made it impossible to maintain the fiction of the Medieval cosmology and there was a sense that the world was dissolving. Good alchemical word-dissolving. And in that moment the movers and shakers of that civilization reached backwards in time to the last sane moment they had ever known and they discovered that it was Classical Greece and they invented classicism. In the 15th and 16th century the texts which had lain in monasteries in Syria and Asia Minor forgotten and untranslated for centuries were brought to the Florentine council by people like Gimistos Placco(sp?) and others and translated and classicism was born- its laws, its philosophy, its aesthetics. We are the inheritors of that tradition but it is now, once again, exhausted and our cultural crisis is much greater. It is global. It is total. It involves every man, woman and child on this planet, every bug, bird and tree is caught up in the cultural crisis that we have engendered. Our ideas are exhausted-the ideas that we inherit out of Christianity and its half-brother science, or its bastard child science. So, what I'm suggesting is that an archaic revival needs to take place and it seems to be well in hand in the revival of Goddess worship and shamanism and partnership but notice that these things are old-10,000 years or more old-but there was an unbroken thread that, however thinly drawn, persists right up to the present.

So the idea of this weekend is to show the way back to the high magic of the late Paleolithic, to show that there were intellectual traditions, there were minority points of view that kept the faith, that never allowed it to die. And, to my mind, this alchemical, hermetic, Gnostic, Egyptian, Caldean thread is the thread and if we unravel it with sufficient care and attention then we can build a bridge from the otherwise nearly incomprehensible high magic of the late Paleolithic. We can get it as

near to ourselves as John Dee, who died in 1604. We can discover that it's no further away from us than the beginning of the 30 years war and, for my money, after that, it gets pretty mucked up. I mean, after Ulias Levy, who's already waffling, I'm not very interested in the occultism of the 17th, 18th and 19th century but it's not necessary because scholarship gives us the Caldean oracles, the Trismegistic Hymns, the library at Nag Hammadi, and so forth and so on. So my impulse is to, in the most austere sense, re-popularize, reintroduce this kind of thinking so that people can live it out. Then, step, by step, we can evolve our language and evolve our understanding to make our way back to the garden, back to Eden.

It's occurred to me recently, you know it's said that Christ opened the doors to paradise, yes, but he closed the doors to Eden and paradise is a very airy place where everybody sits around on clouds strumming their lyres. I think that what we want to do is make our way back to the alchemical garden. That's where our roots are. That's where meaning is. Meaning lies in the confrontation of contradiction-the coincidentia oppositorum. That's what we really feel, not these rational schemas that are constantly beating us over the head with the "thou shalt" and "thou should." but rather a recovery of the real ambiguity of being and an ability to see ourselves as at once powerful and weak, noble and ignoble, future-oriented, past-facing. We each need to become Janus-based(?) and to incorporate into ourselves the banished contradictions of being that so haunt the enterprise of science. We can leave that behind and when we do we reclaim authentic being. And authentic being, make no mistake about it, is what alchemical gold really is. That's what they're talking about-authentic being.

Q: So right now we're lead?

TM:That's right, we're Saturnine and we'll talk about Saturn and Pluto and all of that. Yes, tomorrow we'll talk about the stages of the alchemical opus and though the stages are many and multifarious, it all begins in what is called the negro, the blackening, the depths of the leaded, Saturnine, chaotic, fixed place. And that's where we have been left by science and modernity and so forth and so on. That's where the alchemist loves to begin. That's where he or she stokes the fire and begins the dissolucio et coagulatio that leads to the appearance of the stone.

I'll show you some books and this is by no means exhaustive. The literature on hermeticism and alchemy is vast and I could have brought 5 or 6 boxes of this size from my own library. This a smattering. It doesn't mean that what I show you is the best. It simply tries to spread over a large area. Oh, someone put this here. This is a new novel that's just been published by Lindsay Clark called The Chemical Wedding and I see last week it was number 10 on the New York Time's best sellers list which is astonishing for such an obscure subject. It's a retelling of a famous incident in alchemy in the 19th century when a woman named Mary Alice Datwood, who had a very, very close relationship to her father, Dr. South, and the two of them worked together, she on a text, he on a long poem and to make a long story short, eventually they decided to destroy both the poem and the book feeling that they had said too much and given the secret away-at least that's one version. So this is fictionalized retelling of that incident intercut with a modern cast of characters very clearly modelled on the poet Robert Graves. So if you like to absorb your information in a fictionalized form, this is a wonderful book. John Borman the movie director recently optioned this book-the guy who made "The Emerald Forest" and "Excalibur" so we may have an alchemical movie downstream, a year or two.

A number of compendiums of alchemical texts have been published over the centuries and if you wish to study alchemy you have to obtain these. If you're fortunate enough to read French you should read Vesputigari and Berthelo. They collected alchemical texts into encyclopedic-sized volumes but unfortunately these have never really come into English. One that did come into English is the Museum Hermeticum Amplificarium et Theatrum, I think, which A.E. Waite, who some of you may know for his role in the Golden Dawn, collected. There are about 40 alchemical texts and all the greats are in here: Lull, Vilanova, Michael Maier, Basil Valentine, Kramer, Edward Kelly and so on and so forth.

The place to begin, I think, is obviously with the question "Who is Hermes Trismegistus?" What are we talking about here? I mean, this sounds so incredibly exotic to people. The Renaissance had the concept of what it called the Presqui Paologue (sp?) and if my Latin and Greek irritates you, you have to understand you're dealing with a boy from a coal mining town in Colorado, so I do mangle these things. The Presqui Paoologue were Orpheus, Moses, and primarily Hermes Trismegistus. Hermes Trismegistus was the primary source, from the point of view of the Renaissance, of this whole mysterious tradition and, you recall from last night's lecture, this is based on a misunderstanding. The Renaissance believed that Hermes Trismegistus was older than Moses. We know now, thanks to Isaac and Meric Casaubon, two philologists of the early 17th century, that definitely the Hermetic corpus was composed between the first and second centuries after Christ. The method of the Casaubons was to examine the philosophical language of the Corpus Hermeticum and show that there were words and phrases there that were post-Platonic and derivative of philosophers whose dates we have fully in hand. Now, if you go to an occult bookstore you will find that, to this date, this error persists. There are people who still want to claim that this stuff is older than dynastic Egypt. There are even books, I was in Shambala weeks ago, claiming to teach you how to change lead into gold. Well, from my point of view this just evokes a small smile. The old errors persist. The Puffers are still at it. But what Hermes Trismegistus is a character who appears in many guises in these hermetic dialogues. The hermetic hymns are usually couched in the form of dialogues between Hermes and his son Thoth and Thoth takes the position of the uninitiated ingenuo who is sitting at the feet of the master. Thoth asks questions: what is the true nature of the world, what is the true nature of man, and Hermes answers and the general form of these texts, with exceptions, because there are 20 of them, is an intellectual dialog which builds to an ecstatic revelation and then in the wake of the ecstatic revelation there is a hymn of praise to Hermes Trismegistus. Trismegistus means thrice-blessed and is sometimes called Hermes Triplex to distinguish this Hermes from all the other Hermes of early, middle and late Greek thinking. Hermes is of course the messenger god, the god of scribes. The reason this libic-headed being holding a staff is embossed on the cover of each of these books is because this is how Hermes Trismegistus, Thoth-Hermes was imagined. He was associated with the scribe god of the Egyptian pantheon. The two distinguishing factors that stand out, at least for me, that I think you need to incorporate into your thinking about hermeticism, two very important concepts. The first is the divinity of human beings-an extraordinarily radical idea in the context of late Hellenistic thinking. We all operate under the spell of the concept of the fall of man. Man is an inferior being, errors were made in the Garden of Eden and that we are, far from the nature of divinity. All magic, and all magic in the West is derivative from this tradition, takes the position that man is a divine being, men and women are divine beings. The Corpus Hermeticum actually refers to man as God's brother and this is a double-edged perception. It gives tremendous dignity to the human enterprise but it also raises the possibility of the error of pride and hubris. In the Renaissance, Marcello Ficino boiled this notion down to the aphorism "man is the measure of all things." And you may notice that this is the position of science, that man is the measure of all things, that it is up to us, we can decide the course of the cosmos. All magic stems from this position. This is why the church was so concerned to stamp out magic-because it assigns man an importance that the church would rather reserve for deity. So that's the first great division between Christian thinking and hermetic thinking. An entirely different conception of what human beings are and when we get into the text, I'll read you some of these passages. Now, the second distinguishing factor, and notice that position on man empowers tremendous freedom, man is the measure of all things, the second distinguishing factor in hermeticism is the belief that we can control fate, that we can escape from cosmic fate. The late Hellenistic mindset, and what you get in the Gnostics, is the belief that because of astrology, because of the stars, we are subject to control from these exterior forces. In most Gnostic thinking the

whole concern is to somehow evade what is called the **Heimarmene**, cosmic fate. And in the Gnostic systems, the only way it can be done is by ascending through the shells of cosmic, ordering forces-the archons, the planets, the planetary demons, and so forth and so on, and then beyond the Heimarmene, which is actually thought of as a place in space that you burst through when you transcend fate. What the hermetic thought is is that these fates become personified as the decans, as stellar demons, and then it is held that there is a magic, a magical system, which is possible where you can call these archangels to your side and work with them and not be subject to the inevitable working of the cosmic machinery and this burst like a revelation over the late Hellenistic world because there was such philosophical and emotional and political exhaustion that this comes, this is a counterpoint to the message of the New Testament, which is a similar message, that you can be saved in the body, that you can escape the inevitable dissolution and degradation laid upon us by time. So, these are the two distinguishing factors: the divinity of man and the possibility of using magic to evade the machinery of fate. So, I want to read some of the Corpus Hermeticum to you to give you the flavor of it, but before I do, I want to say something about the history of these texts. You're all familiar, more or less I'm sure, with Apuleius' The Golden Ass, which is a novel of initiation which is late Roman. Apuleius also put together what is called the Asclepius and the Asclepius is true hermetic literature that was not lost. It was the only one that was available throughout the Dark and Middle Ages. All the rest was lying untranslated in Syrian Monasteries until Gemistus Plethon in 1490 brought these manuscripts to Florence, to the court of the Di Medici and then the translation project began. The only other hermetic material that was accessible throughout the high Gothic period was a book of magic called the Picatrix. And the Picatrix was probably written in the 1200's although this elicits screams of dissent from the burning-eyed faction. But reason dictates that we consider Picatrix 12th century so only the Asclepius and the Picatrix represented this strain of thought before the 1460's. And the importance of hermetic thinking can be seen by the fact that Gimistis Platino brought Plato to the Florentine council as well as Hermes Trismegistus. And when Marcello Ficino sat down to do this translation work Cosumo Di Medici said "Plato can wait, I'm getting old. You do the Hermetic Corpus first. That's much more important. We'll sort out this Plato business in a few years." And so it was done. It was completed in 1493 and in 1494 Cosumo died so he never saw the translations of Plato but felt that the Corpus Hermeticum was more important. I mention this to show you the importance that was attached to this stuff. Here is one of the key passages on man's nature. This is from Book one of the Corpus Hermeticum: "But mind the father of all, he who is life and light gave birth to man, a being like to himself and he took delight in man as being his own offspring for man was very goodly to look on, bearing the likeness of his father. With good reason then did God take delight in man for it was God's own form that God took delight in and God delivered over to man all things that had been his made." This is the basis of the Ficinian statement man is the measure of things. "And man took station in the Maker's sphere and observed the things made by his brother who was set over the region of fire. And having observed the Maker's creation in the region of fire he willed to make things for his own part also. And his father gave permission having in himself all the workings of the administrators." This is a reference to the angel hierarchy "And the administrators took delight in him and each of them gave him a share of his own nature." So man is the brother of God and a creature at home with the angels. This idea is echoed in the Asclepius which you'll recall was available throughout the Middle Ages. "The range of man is yet wider than that of the demons" meaning the angels - this term is transposable in its hermetic thought "The individuals of the human kind are diverse and of many characters. They, like the demons, come from above and, entering into fellowship with other individuals they make for themselves many and intimate connections with all other kinds" and then the famous passage "man is an honor then, Asclepius, honor and reverence to such a being. Man takes on him the attributes of a god as though were himself a god. And he is familiar with the demonkind for he comes to know that he is sprung from the same source as they. And strong in the assurance of that in him which is divine, he scorns the merely human part of his own nature. How far more happily blended are the properties of man than those of other beings. He is linked to the gods inasmuch as there is in him a divinity akin to theirs. He scorns that part of his own being which makes him a thing of earth and all else with which he finds himself connected to by heaven's ordering he binds to himself with the tie of his affection." So this is an incredibly radical conception of what it means to be human. So radical that it is unwelcome even in the present context. Notice the modern feeling of this stuff. This is not biblical rhetoric. This is philosophical discourse as we know it and carry it out ourselves. This is a passage on the adept and initiation. Let me see who's speaking here. Thoth speaks to Pimondres, this is book one, "But tell me this too, said I, God said 'let the man who has mind in him recognize himself' but have not all men mind?" And then Pimondres replies "Oh man, said mind to me speak not so, I even mind come to those men who are holy and good and pure and merciful and my coming is a succor to them and forthwith they recognize all things and win the father's grace by loving worship and give thanks to him praising and hymning him with hearts uplifted to him in filial affection." Again the reference to being God's brother in filial affection. "And before they give up the body to death which is proper to it they loathe the bodily senses knowing what manner of work the senses do." This introduces the theme of asceticism. Like the Gnostics, there is in much of hermetic literature a kind of horror of the earth, a desire to ascend and to get away from it. Scott makes the distinction between what he calls pessimistic Gnosis and optimistic Gnosis. And within the 20 texts of the Corpus Hermeticum you get vacillation on this point. In some cases the Mandaean, the Cebian(?) tendency is there and the world soul is invoked and the whole of creation is seen as a living being involved in this soteriological process, this process of salvational mechanics through magic. In other texts this Gnostic horror of matter is strongly stressed. It's very clear that the Hellenistic mind was ambivalent on this point. Even as we are ambivalent on this point. It's a real question, are we here to be the caretakers of the earth or are we strangers in the universe and is our task to return to a forgotten and hidden home no trace of which can be found in the Saturnine world of matter. It's very hard to have it both ways. You're going to have to take a position on that and these people were forced into the same dilemma. There's no middle ground between those two positions and so that dichotomy, that conundrum, haunted a lot of hermetic thinking. Here is the hermetic creation myth. This is book three, paragraphs one through a few, and you'll see the comparison and similarities with the Christian creation myth but with extraordinary differences. "There was darkness in the deep and water without form and there was a subtle breath, intelligent, which permeated the things in chaos with divine power. Then, when all was yet undistinguished and unworked, there was shed forth holy light and the elements came into being. All things were divided one from another and the lighter things were parted off on high, the fire being suspended aloft so that it rose into the air and the heavier things sank down and sand was deposited beneath the watery substance and the dry land was separated out from the watery substance and became solid. And the fiery substance was articulated with the gods therein and heaven appeared with its seven spheres and the gods, visible in starry forms, with all their constellations and heaven revolved and began to run its circling course riding upon the divine air. And each god by his several powers set forth that which he was bidden to put forth. And there came forth four-footed beasts and creeping things and fishes and winged birds and grass and every flowering herb, all having seed in them according to their diverse natures for they generated within themselves the seed by which their races should be renewed." And then it goes on to describe the birth of man. This kind of thinking is what alchemy seized upon in its ambitions. One way of thinking of what alchemy came to attempt is, the thinking went like this - since man is God's brother, the purpose of man is to intercede in time and it was believed that ores, precious metals and things like this grew in the earth. It was a thorough going theory of evolution that reached right down into the organic realm. It was thought that gold deposits in the earth would actually replenish themselves over time. It's passages like this that give permission for that kind of thinking. In line with that, we're now in book four and remember the tone changes slightly from book to book, they were, after all, written over a 300 year period by various people. "You must understand that God is pre-existent, ever existent, and that he alone made all things and created by his will the things that are. And when the creator had made the ordered universe, he willed to set and order the earth also and so he sent down man, a mortal creature made in the image of an immortal being, to be an embellishment of the divine body for it is man's function" - here it comes, the purpose of man according to book four - "for it is man's function to contemplate the works of god and for this purpose

he was made, that he might view the universe with wondering awe and come to know its maker. Man has this advantage over all other living beings, that he possess mind and speech. Now speech, my son, God imparted to all men but mind he did not impart to all. Not that he grudged it to any, for the grudging temper does not start from heaven above, but comes from being here below in the souls of those men who are devoid of mind." This introduces the concept of an elect, or a perfectee, a hierarchy of human accomplishment and understanding and this is also basic to Gnosticism. It's not for everyone, they're saying, it's for the pure of heart and what pure of heart means depends on the school you're looking at. For some, it was mathematical accomplishment. For others, it was contact with the Logos, for others it was the ability to resist the temptations of the senses. But there was always the sense of the higher and lower possibilities within the human experience. Questions? I'm still back in the last lecture we shared on plant intelligence. So I'm listening to all this divinity of man and wondering where the position of the plant realm or the planning(?) was. There was one section where you read that, so... Yes. This is the opening of book 12 and this is a heavy Mandaeen sensitivity, this sensitivity to life. This whole cosmos, and notice how this transcends even the Buddhist point of view because in Buddhism plants have no soul, this is a tremendous failure in the Buddhist perception as far as I'm concerned, o.k., this is book 12 - "Now this whole cosmos, which is a great god and an image of he who is greater and is united with him and maintains its order in accordance with that will, is one mass of life and there is not anything in the cosmos, nor has been through all time, from the first foundation of the universe, neither in the whole, nor among the several things contained within it that is not alive. There is not, and has never been, and never will be in the cosmos, anything that is dead. For it was the father's will that the cosmos, as long as it exists, should be a living being and therefore it must needs be a God also. How then, my son, could there be dead things in that which is a God, in that which is an image of the father, in that which is one mass of life. Deathness is corruption and corruption is destruction. How then can any part of that which is incorruptible be corrupted or any part of that which is a God be destroyed." And there are other passages. Ah, this is a good one. This is book 18, "For as the sun, who nurtures all vegetation also gathers the first fruits of the produce with his rays as it were with mighty hands, plucking the sweetest odors of the plants, even so we too, having received into our own souls, which are plants of heavenly origin, the efflux of God's wisdom must in return use his service for all which springs up in us." Now, this conception that the human soul is a plant is a unique idea. I don't know of another tradition. Those of us who were in Ojai heard Johannes Wilbur(sp?) talk about how, among the Amazon Indians, the Guirai(sp?), men actually marry trees. They actually take trees as their wives, a tree, and it is a man's job throughout his life to take care of this tree with the same tenderness and affection which he lavishes on a living wife. This is a more radical conception than that. This is the conception that the most important part of us is a plant. It reminds me of the joke that I occasionally make in these groups, the notion that animals are something invented by plants to carry them from place to place. Well, according to this, that's right on. So, the sensitivity to the vegetative nature is so great that it raises the plant to be the pith essence, the soul of man, the brother of God! So you see the valuation of the vegetative universe is of an extremely radical type. The upper echelon of humanity that was given the mind, was that predetermined at birth or can someone develop a mind? No, it is not predetermined. It is something that is acquired through cultivation of a relationship to, in the hermetic language, nous, the higher mind, and in the Gnostic language logos, the informing spirit. Nothing is predetermined in the hermetic system because through magic we can overcome the energies of cosmic fate. This is the great good news of hermeticism, that we are not subject to fate. We should probably talk a little about this logos concept. This is something which seems very alien to modern people unless they are psycheducially sophisticated. The logos was the sine qua non of Hellenistic religion and what it was was an informing voice that spoke in your head or heart, wherever you want to put it, and it told you the right way to live. You get this idea even in the later Old Testament where it's said that the truth of the heart can be known. It's no great dilemma to know good from evil, you simply inquire of your heart, "is it good or evil?" and you will discover a voice which will tell you and all the great thinkers of this Greco-Hellenistic period sought and cultivated the logos. Plato had his demon. Everyone sought the informing voice of the nous, that's what it's called in Neo-Platonism and then in hermeticism and then in Gnosticism, the logos. For modern people, well, no for me, the only way I've ever had this experience is through the presence of psychedelic substances and then it is just crystal clear, there's just no ambiguity about it. Somehow, it's possible for an informing voice to come into cognition that knows more than you do. It is a connection with the collective unconscious, I suppose, that is convivial, conversational, that just talks to you about the nature of being in the world and the nature of your being in the world. It's puzzling to us because it seems so remote, for us a voice in the head or the heart is pathology and you may know the famous story of, in the first century, some fishermen were off the shore of the island of Argos in the Mediterranean Sea and they heard a great voice from the sky and the voice said, "great Pan is dead." Well, people like Lactantius and Eusebius, these patristic fathers, the people who built Christianity, who took the Gospels and turned them into a world religion, they took this annunciation from the sky as the annunciation of the change of the Aeon. By the Aeon, I mean these roughly 2,000 year periods that are associated with the equinoctial procession. Do you all understand how this works? That over 26,000 years, the helical rising of the solstitial sun slips slowly from one house to another and around AD100, there's argument because these things are never precise, the age of Pisces began and the previous Aeon ceased and the cosmic machinery, the great gears of the largest scale of the cosmic machinery, clicked past a certain point and into the age of Pisces and this was then taken as very fortuitous for Christianity because Christ was associated with the sign of the fish and it was seen as a Piscean movement. I believe that it's entirely possible that the logos in that rough moment in time fell silent and it has been silent for 2,000 years so what we have is the exegesis of text and Neotic archeology of the sort we're carrying on here. Now, a phenomenon as trivial and hyped on as channelling can be seen as the reawakening of the logos. The long night of Piscean silence is ending and the spirit of nous is again moving in the world, speaking in the minds of the adepts and the hierophants who have the techniques and the will to connect with this stuff. I don't know how I got off on that. But obviously this kind of literature can be seen as the last message from the fading logos. The last statements before the change of the Aeons rendered this control language very difficult and non-intuitive and somewhat incomprehensible. Reading...you broke off, and I had a puzzlement about the use of the word mind. What, in this context, does this refer to? It's Scott's translation of this word nous. It simply means this universal, permeating intelligence. The statement there is that it is only available to an elite through... Through asceticism and desire, intent. There are proscriptions, they lived a life of purity, although their definitions of purity varied widely. Man is brother of God and yet we have to earn it. This seems kind of a denial of that. That's right. This persists right up to this moment. The quote I always love is from Thomas Hobbes' Leviathan. Hobbes was the great theoretician of modern government and social systems and he was basically a paranoid S.O.B. and he says in the Leviathan "man to man is likened to an errant beast and man to man is likened to a god." It's absolutely true, you know, our noblest aspirations and our most hideously dehumanizing activities take place in the context of our relationship to other people. This is what the alchemists were trying to do - separate the gold from the dross. They were trying to take the errant beast, and when we look at alchemical art we will see dragons, dogs, pigs, we will see the errant beast and we will see the angelic beings that are trying to be separated out of our nature. This is within each and every one of us. Man to man is likened to a god and man to man is likened to an errant beast. This question has to do with mind. According to my understanding of some of the Platonic tradition and Neo-Platonic thought, this has to do with the divided line in Plato. You can divide that line...into five stages of knowing. You start with the senses as being agency or avenue, knowing something about something like contact - most external form of knowledge - the level above the senses is designated as the instincts, it's an inactive knowing, in that sense a biologically active knowing that we have. The third stage is described as sometimes estimation, this is, an approximation, yes, this characterized mainly sort of logical activity and then the next level of cognitive activity is reason and this reason is not the type of reason we normally engage in, it's a very different, a very creative type of activity. Above the reason is what they call intuition or intellect or nous and that's put in as the fifth. And would that be revelation? Reason is a creative activity and one can generate and think things through with creative ability. One goes through activity and stages of the activity and things transpire over time and one comes to complete understanding of the thing one is trying to grasp and sometimes that's described as discursive activity although the logical activity is discursive. So you're moving through a process...pieces, the nous or the intellect of the higher mind grasp things in totality. It doesn't engage in... in ratiocination(sp?). You raise an important point which further complicates the picture, but it's how it was, folks. The reference here is to Neo-Platonism which is a kind of parallel tradition to what we're talking about. Plato had at least a couple of phases in the evolution of his thinking. The young Plato is a rational thinker but the later Plato, apparently after he fell under the influence of Pythagorean schools, becomes a full-blown mystic and then in the late Roman empire, almost a thousand years after Plato, we have to remember, in our minds these people get squeezed together like they could all have dinner together, but Plotinus is as far from Plato as we are from King Connaught so you have to bear in mind the scale of history. But, so 900 - 1,000 years after Plato a Byzantine school of philosophy arose around Porphyry, Plotinus and Proclus as the major exponents and they worked with the late Plato and elaborated a beautiful mystical cosmology. This is what I did a workshop on here a year ago and many of those ideas and terms parallel conceptually the stuff in the Corpus Hermeticum and if you're of a certain intellectual bent you may find yourself more comfortable with the Neo-Platonists than this. This tends to be emotional, evocative, poetic and while there's a great poetry in Plotinus there's also very tight thinking that goes along with it. And there are other traditions, I'm making it simple for you, there was a whole tradition called the Caldean Oracles and this was a collection of 100 or more fragments all of which were the great commentaries of Eusebius in 30 volumes. The Amblicus(?) is one of them. That's all lost, we don't have that material and it is in a way the most mysterious of these traditions because it just didn't survive and it may be that that, the Caldean Oracles is the missing link to push this stuff several centuries back into time because the Caldean Oracles may actually be pre-Platonic. There's considerable evidence of that. But these are very arcane matters. You have to give yourself over to a lifetime of learning these languages and the philology of these languages to penetrate this stuff.

Neo Platonism was Byzantine, basically Constantinople. The Hermetic Corpus was largely Alexandrian. There were also Christian Platonists in Alexandria. There were certain centers: Rome, Alexandria, Byzantium, Heliopolos in Egypt was a cult site that was maintained for a very long time. If you're interested in this stuff but don't like to absorb it this way, Flaubert, of all people, the Flaubert of Madame Bovary, wrote an incredible novel called The Temptation of St. Anthony in which he describes second century Alexandria in a fictionalized form and gives you a real flavor for the intellectual complexity of the Alexandrian world. Christianity had not yet gelled, it was many things, so you not only have Gnostics of five or six schools: Simonians, Valentinians, Basilideans and so forth, but you also have Christians, a numbers of cults calling themselves Christians, who were in fierce competition. Docetists, Montanists, and later Nestorians. There were Gymnosophists from India, people who were actually carrying yoga doctrines into the Mediterranean world, plus you then have all the surviving cults of the older Egyptian strata, the Cults of Isis, and Seville, and Dionysus, and Adonis, it just goes on and on. The richness of this intellectual world is very, there's nothing comparable in our experience and it shows the passion with which people were trying to understand the dilemma of a dying world because this is what they were confronted with. The intellectuals of the empire could feel it all slipping through their hands. Flaubert gives a wonderful picture of this. Flaubert has a very romantic streak. It's like smoking hashish, reading this book - the attention to fabrics, architecture, food and odor. And because the subject matter is the temptation of St. Anthony, it's an excuse to describe these temptations in all their sensual richness and erotic kinkiness. It's a wonderful way to absorb this material.

Somebody else raised the point of the elitism, of an elite group of people. And if one considers a society like the one you had in Alexandria, or some of the other centers, the only people who really had access to this were first of all people who had money and who were well educated and could read so already you had an elite group.

Yes, definitely. What survives from a civilization is its literatures and these literatures are usually the production of an elite. We have to remember, don't have any illusions about the Roman Empire. I always think of the wonderful description, I don't even know why it's there, Boris Pasternak, in Doctor Zhivago, goes off on a riff about Rome and he describes it as a bargain basement on three floors. This was an empire that lived by human cruelty. It was on the backs of slaves that this airy, intellectual speculation was based. It was a tremendously pluralistic society but that pluralism was maintained by standing armies of enormous size and policies of occupation of enormous cruelty. Because of our relationship to the Christian tradition we're aware of such things as the Zealot revolt of 69 and the reign of Herod Antiochus in Jerusalem, but that was just one little corner of the empire and in Armenia, in Gaul, in Spain, in North Africa, military governments were carrying out outrageous suppressions of native populations, it was not a pretty time to be alive. And what comes down to us then is the yearning to escape. No wonder these people saw the earth as a cesspool and a trap because that's what it was for them. Our own age is very similar. We do not have slavery but we suffer under propaganda-mass manipulation of ideas and the degradation of exploitation of the third world on a scale the Roman Empire couldn't even dream of. So, there is a great affinity.

If any of you are interested in this kind of thing, I highly recommend a book by Hans Jonas called The Phenomenon of Life. It's a book of philosophical essays but there's one essay called "Gnosticism and the Modern Temper" in which he shows that once you take Gnosticism and dump all the angels and all the star demons and all the colorful bricabrac of late Roman thinking what you have is a thorough going existentialism completely compatible with Jean Paul Sartre, Jean Genet, and the kind of intellectual despair that characterized the post WWII generation in Europe. Heidegger is through goingly Gnostic in his intentionality, it's just that the language is modern and stripped of this magical thinking and by being stripped of this magical thinking in a way modern, the modern resentment of that state of mind is even more hopeless and dis-empowering.

Fortunately, I think we're moving out of the shadow of that, but I'm 44 years old, I grew up reading those people and it made my adolescence much harder than it needed to be. I mean, my god, there wasn't an iota of hope to be found anywhere. That's why, for me, psychedelics broke over that intellectual world like a tidal wave of revelation. I quoted to you last night Jean Paul Sartre's statement that nature is mute. Now I see this as an obscenity almost, an intellectual crime against reason and intuition. It's the absolute antithesis of the logos and much of our world is ruled by men, older than I am, who are fully connected into that without any question and they just think that the rest of this is just nubby pamby ecological soft heartedness of some sort. There is no openness to the power of Bios, to the fact of a living cosmos. This is what Rupert Sheldrake is always trying to say. The re-investiture of spirit into matter, the rebirth of the world soul is a necessary concomitant to what we understand about the real nature of the world. In a way, the theory of evolution, which was born in the 1850s, was the beginning of the turning of the tide because even though the first 100 years of evolutionary theory was fantastically concerned to eliminate teleology, eliminate purpose, nevertheless nobody ever understood that except the hardcore evolutionists. To everyone else, evolution meant ascent to higher form. I once heard someone say "if it doesn't have to do with genes, it ain't evolution." Well, that's a tremendously limited view of what evolution is. The inorganic world is evolving, the organic world is evolving and there the currency is genes but also the social and intellectual world of human beings is evolving and there the currency is not genes but means so that idea carries with it the implication of ascent to higher form and correctly broadened and understood becomes permission to optimism and to the kind of hope that these folks were trying to articulate.

Q: The concept of mind as something that is attainable and not necessary is a separation and therefore for me it's a lie and so I want ...I don't know, I assume there are many different definitions of mind, I don't mean functions of mind, I mean definitions of mind, and I'm toying now with the notion of meshing of the notion of mind and the notion of logos. For logos is, and it seems to me that mind is, if it is available through trial then we're back in a separation...and this is to me a false separation

TM: Yes, you're right, but it's a separation necessary for philosophical discourse, that's why philosophical discourse is not the top of the mountain. Language itself is the process of making distinctions that are false. This is why all language is a lie. This is why the ultimate truth lies in something unspeakable but the ascent to the philosophical is through this kind of philosophical analysis.

Q: Language is only the vehicle.

TM: Well it's the vehicle but eventually there's no road and you have to park the vehicle and get out and walk, and that's the journey. Plotinus, the great Neo Platonist has this wonderful phrase. He calls the mystical experience "the flight of the alone to the alone." I love this image. It's so uncompromising and it's about as true as something can be and still move in the realm of language, because it's saying: finally words fall away and finally there is only that which cannot be said. Many of you who've stuck with me know that I love to quote this poem by this obscure poet who died in the trenches in France in the first World War, Trumble Stickney, and he wrote a poem called "Meaning's Edge" and the punch line goes like this "I look over meaning's edge and feel the dizziness of the things you have not said," and I think that every one of these weekends, this is the effort to carry you to the edge of an abyss and then push you over into the dizziness of the things unsaid and they will always be unsaid.

Wittgenstein, God bless him, had the concept of the unspeakable. He said "philosophy operates in the realm of the unspeakable but eventually we must confront that which cannot be said." The dizziness of things unsaid, and there's where real authenticity then flows back into the world of community and speech but it comes from a place of utter silence and unsay-ability. How could it be otherwise? What hubris would it be to expect that the small-mouthed noises of English could encompass being. That's a primary error that all philosophy chooses to make at the beginning of it's enterprise in order to set up shop at all. No, these are lower-dimensional slices of a reality that is ultimately unitary, ineffable, unspeakable, and dazzling.

Q: Philosophical discourse is verbal and mental masturbation?

TM: Absolutely. Masturbation, because it's, there's a pun here, it's auto-poetic, it is completely out of yourself, there is no union with the other and the other is what you're always trying to get to. The other is a common term in these literatures. The other is that which cannot be fully known. I always like to quote the British enzymologist JBS Haldane, who made a wonderful statement. He said, "the universe is not only stranger than we suppose, it is stranger than we can suppose." That's a dizzying perception. It's one thing to think it's very strange. It's another thing to think it's stranger than you can suppose. You may suppose and suppose and suppose and you'll fall so short of the mark that it's absurd. That's what it means to be in the presence of a mystery. The modern word mystery translates out to unsolved problem. That's not what a mystery is. A mystery is not an unsolved problem. A mystery is a mystery and ratiocination(sp?) can exhaust it and make no progress with it and that's what's at the core of our being and that was what was at the core of this ancient perception. These were thoroughly modern people. They were shoved up against the same things that tug at our hearts and our minds and our souls and beyond that there's not a whole hell of a lot that you can say about it.

I just wanted to add that the idea of the earth as a living organism makes an appearance in psychology at the end of the last century with Gustave Fechner who survives in footnotes of textbooks as the father of experimental psychology. I read a book about the soul life of plants also and that whole part of his work is utterly ignored influenced anybody but William Jameson.

This is an idea that will not die but it's practitioners end up in footnotes. They do not have a happy fate. Certainly Henri Birkson, with his idea of the *elan vital*, this is an effort to preserve the idea of a world soul and yet the fate of Birkson, his influence on modern philosophy is certainly minimal. Alfred North Whitehead is my great favorite. I think that he's the cat's pajamas and he has this idea of the living cosmos - that life and vitality extend right down to the electron yet in spite of his mathematical contributions, the fact that he wrote *Principia Mathematica* with Bertrand Russell, Whitehead is not taught. I think there's one university in this country where they take him seriously. Modern philosophy is a desert for my money. Who cares about it? Nobody cares about it. Who's living their life according to the perceptions of modern philosophy. Nobody, as far as I can see. But yes, vitalism was this impulse in biology that persisted right up to the 1920s with embryologists like Dreche and his school and mechanical biology has been at great pains to suppress that. That's why Rupert Sheldrake is such a breath of fresh air, because he can be seen as a person carrying the vitalist message back into science. His new book on the greening of science and nature is nothing more than a manifesto for the re-recognition of the presence of the world soul.

Q: What about the Native Americans, their philosophy?

TM: Yes, well, Aboriginal people, not only the Native Americans but the tribes of the Amazon, if you live next to nature this is such an overwhelming perception that it's never called into question. But you see we, most of us, trace our civilization to desert dwellers who invented agriculture which lead to surpluses so then we had to build walled enclosures to defend our surpluses from starving neighbors and we're talking 6,000 BC at Jericho for this kind of stuff. So, we have been cut off from the natural mind longer than any other group of people on earth. This is how we're able to carry out the demonic, in the negative sense, reconstruction of the world that we have. If there is a sin then we have sinned. Robert Oppenheimer said beyond all rational argument the physicists have known sin and it's because they reached into the heart of matter without reverence and their greatest trick was to call down the light that burns at the center of stars and they call it down to the test centers of the deserts and onto the heads of our enemies, if necessary. But this is a cosmic sin, it's an abomination. It's the story of Western Civilization.

The first great error was the urbanization, well, I don't know, the first great error, the invention of agriculture was a pretty staggering bad turn, then urbanization and then a piece of bad luck which we didn't need to befall us was the invention of the phonetic alphabet. And with the invention of the phonetic alphabet we moved away from symbolism and lost even the symbolic connection to the world and that happened with the evolution of Demotic Greek and even earlier languages - linear A and B and that kind of stuff. McLuhan talks a lot about this. We live in a universe so alienated that we can barely conceive of the way back but hopefully. Archeology is a wonderful thing. We are actually digging into the stratigraphic layers of our past and reconstructing these ancient intellectual machines and setting their gears going and seeing how it works and hopefully when we recover, we're like amnesiacs, people who don't remember who they are or where they came from, we just wander mumbling through the streets of our cities foraging through garbage cans and frightening other people and yet if we could wake up, and archeology and the rebirth of an awareness of the Goddess and the pushing of science to the point where it's irrational foundations become clear - this is all part of an awakening, an archaic revival which will then make us part of the living world and not a disease, a parasitic force upon it.

It struck me that one comment you read there talked about the creation of the world. It said the elements were brought forth and at first I was thinking earth, air, fire, and water but I was thinking in relationship to some other...of life that...being, life, and intellect and being, life, and intellect are what that come into manifestation from the one who pours forth the world and creates the world and those are the first elements that come into existence - being, life, and intellect. Life itself is an element of the cosmos as it were. It's an irreducible aspect of things and you're paying respect to the fact that life is an omnipresent thing in the foundation of things. It's one of the elements.

Q: I think that in one of the other things I read it said that everything that exists, that ever has been, that ever will be, is alive.

TM: I'll read a bit more of this. This refers to the theme I touched on a little bit last night of the importance of the imagination and how I think that our destiny lies in the imagination. "God is ever existent and makes manifest all else. But he himself is hidden because he is ever existent. He manifests all things but is not manifested. He is not himself brought into being in images presented through our senses but he presents all things to us in such images. It is only things which are brought into being that are presented through sense. Coming into being is nothing else than presentation through sense." This is so thoroughly modern, it's staggering. For 1,500 years people couldn't say anything that clearly. "It is evident then that he who alone has not come into being cannot be presented through sense and that being so he is hidden from our sight. But he presents all things to us through our senses and thereby manifests himself through all things and in all things and especially to those to whom he wills to manifest himself. For though though alone can see that which is hidden inasmuch as thought itself is hidden from sight and if even the thought which is within you is hidden from your sight, how can he, being in himself, be manifested to you through your bodily eyes. But if you have power to see with the eyes of the mind then, my son, he will manifest himself to you, for the Lord manifests himself un-grudgingly throughout all the universe and you can behold God's image with your eyes and lay hold on it with your hands."

To my mind, this is permission for the psychedelic experience. We lay hold of the ineffable through the eyes. "If you wish to see him, think on the sun, think on the course of the moon, think on the order of the stars. The sun is the greatest of the gods in heaven. To him as to their king and overlord, all the gods in heaven yield place and yet this mighty god, greater than earth and sea, submits to have smaller stars circling above him. Who is it then, my son, that he obeys with reverence and awe. Each of these stars too is confined by measured limits and has an appointed space to range in. Why do not all the stars in heaven run like and equal courses? Who is it that has assigned to each its place and marked out each for the extent of its course." And then it goes on and on. And then here is an amazing modern anticipation of modernity. "Would that it were possible for you to grow wings and soar into the air. Poised between earth and heaven you might see the solid earth and the fluid sea and the streaming rivers, the wandering air, the penetrating fire, the courses of the stars and the swiftness of the movement with which heaven encompasses all. What happiness were that, my son, to see all these borne along with one impulse and to behold Him who is unmoved moving all that moves and Him who is hidden made manifest through his works." This is an image of the planets seen from space. It's absolutely the unified image of our planet. It is, I think, the central image in this early hermetic thing. This is the unifying, this is as close to an image of what godhead is that they were able to reach.

This is a shamanic flight that delivers a scientific description of the earth moving in space. This is written AD150. This is book five. Nobody had that in sight until we reach Giordano Bruno and if you read Giordano Bruno and the Hermetic Tradition you know that Bruno was burned at the stake and the reason that he was burned at the stake is because he looked up at the sky and did not see the stellar shells and the angelic hierarchies. Bruno had a mystical experience and when it was over he said, "the universe is infinite. The stars go on forever." That single statement was the intellectual dynamite that destroyed the whole Medieval, Hellenistic, the entire previous cosmological vision was left behind with that single statement. It was such a powerful statement that he had to go to the stake for that. And we have never recovered from that perception. It was a fundamental perception and it occurred because he looked without preconception into the night sky and did not see wheels and demons and angels and shells of cosmic fate and necessity and he just said, that's bullshit, what is there is infinite space, infinite time, the stars are hung like lamps onto the utmost regions of infinity. This, then, inaugurates the beginning of modernity and it's a perception that arose on the foundation of all this earlier thinking.

Here's another passage on the imagination. Yes? Is the implication that there's a meditation that one does where one tries to go inside and see this universe on a cosmic scale. Is the implication that their practice was somehow...

Well, the practice, we know a lot less about that because there was much secrecy around this. What we have is the philosophical discourses. When we talk about alchemy this afternoon you'll see that there the technique becomes projection onto matter. That you enter into a kind of self hypnosis where, by having what we call naive ontological categories, in other words, not being sure exactly how much of mind is in matter or how much matter is in mind, you can erase the boundary between self and world and project the contents of the unconscious onto chemical processes. What went on in the early stages we don't know. The Trismegistic Hymns are largely as you see them here, philosophical discourses. There was stress on diet and purity. Asceticism was typical of the hermetic approach. In Gnosticism it went one of several ways. There were schools of Gnosticism which were vegetarian and puristic and then, because they felt that man was no part of the universe, that man was somehow hermetically sealed, if you will, hermetically sealed against contamination from the universe, some Gnostic schools said you can do anything you want. You can have any kind of sexual arrangement you want, you can do anything you want. Do not think that you are part of the universe. And so you had Gnostic schools side by side, some orgiastic and quasi-tantric and some ascetic. There were Gnostic sects that, you see because the idea was that light was trapped in matter by the act of procreation, there were Gnostic sects that only practiced forms of sexual union that couldn't lead to union. So there were presumably exclusively homosexual sects. There were sects that only practiced anal intercourse. For them, that was the same as celibacy because the real concern was not to trap any of the light. And I don't seriously advocate this but I think that in our current situation of overpopulation a little dose of this kind of thinking wouldn't be a bad thing. Too much light is trapped in the organic matrix.

And so these Gnostic sects that were, for instance, exclusively homosexual or exclusively practiced anal intercourse, of course they were suicide sects. They disappeared very quickly because they could only make converts by a missionary conversion. You didn't have children, you couldn't hand it off. It shows how thorough going their rejection of the world was, how contaminated they felt themselves to be by the material world. But you also had, as I mentioned, optimistic schools that saw nature as something to be perfected and said, "man has been set on the earth not to reject it but to perfect it" and utopianism, the belief that one can create a perfect society, it goes back into these hermetic ideals. Because the idea was that a perfect society could be the goal of the alchemical work.

Let me read you a passage from Giordano Bruno. This is a wonderful passage from the Picatrix. This was the book of 12th century magical texts that began to introduce these hermetic ideas and this passage is the core passage that inspired the Rosacrucians and numerous other utopian movements. Here is Frances Yates, "Hermes Trismegistus is often mentioned as the source for some talismanic images and in other connections but there is in particular one very striking passage in the fourth book of Picatrix in which Hermes is stated to have been the first to use magical images and is credited with having founded a marvelous city in Egypt." And here is the passage from the Picatrix, "There are among the Caldeans very perfect masters in this art and they affirm that Hermes was the first to construct images by means of which he knew how to regulate the Nile against the motion of the moon. This man also built a temple to the sun and he knew how to hide himself from all so that no one could see him although he was within it." Those of you who are scholars in Rosicrucianism know that one of the things that was always said of Rosicrucians was that they were invisible. This was how Robert Fludd proved to people he wasn't a Rosicrucian, he'd say "you're looking at me so how could I be one?" So, he's in the temple but he could not be seen within it. "It was he, Hermes Trismegistus, too, who, in the East of Egypt constructed a city, 12 miles long, within which he constructed a castle which had four gates within each of its four parts. On the Eastern gate he placed the form of an eagle. On the Western gate, the form of a bull, on the Southern gate, the form of a lion, and on the Northern gate he constructed the form of a dog. Into these images he introduced spirits which spoke with voices. Nor could anyone enter the gates of the city except by their permission. There he planted trees in the midst of which was a great tree which bore the fruits of all generations. On the summit of the castle he caused to be raised a tower 30 cubits high on the top of which he ordered to be put a lighthouse the color of which changed every day until the seventh day, after which it returned to the first color. And so the city was illuminated with these colors. Near the city there was abundance of waters in which dwell many kinds of fish. Around the circumference of the city he placed engraved images and ordered them in such a manner that by their virtue, the inhabitants were made virtuous and withdrawn from all wickedness and harm. The name of the city was Adocetine(sp?)."

Now, what we're familiar with from the Platonic literature is a quasi-rational, largely rational approach to utopian thinking that you get in the Republic. However, the students of the Republic will recall that, is it the fifth or tenth book, contains the myth of Ur, which we went over in detail in the section I did on Neo-Platonism. The myth of Er is one of the most bizarre and puzzling passages in the entire ancient literature. You remember Er was a soldier who died, he was killed in battle but after eight days he returned to life and then he told a story that is the absolute puzzlement of ancient scholars. It's highly mathematical, it has to do with the spindle of necessity and the description of some kind of cosmic machine and all the ratios of the gears of this machine are given and nobody knows what is being talked about. But here we have a different thrust. A magical utopianism and the idea of a perfected human society using magic because these engraved images that he ordered in such a manner that by their virtue the inhabitants were made virtuous, that means he was able to deflect the energies of cosmic fate. The city was immune to astrological, malefic influence. It was protected and when we talk later about the alchemical aspirations of the Rosicrucians and John Dee and Frederick the Elector Palatine of Bohemia, we'll see that this impulse toward an alchemical kingdom returns again and again. In a way, utopianism is the four-gated city of utopian magical dreaming is one version of the Philosopher's magical stone. It's a kind of diffuse idea of the philosopher's stone, but it's a society in perfect harmony with fully realized beings living within it practicing a cosmic religion that frees them from

the impulses of cosmic fate. The other thing that is going on in some of this alchemical imagery is a kind of subtext of late alchemy, is what's called the *Ars Memoria*, the art of memory, and in fact, Frances Yates has a book called *The Art of Memory* and this is a lost art, literally.

It begins with the Roman orator Cicero and was practiced up until the early 17th century and what it consisted of was people, orators, it was considered very bad form to read your speech if you were an orator and so you had to memorize your speech and there were tricks of memory. The commonest mnemonic trick was to think of a building, it was called the memory palace, a building that is familiar to you, I've done this myself with the University of California because it's an area that I'm very familiar with because I was a student there, there are many buildings and many hallways and many floors and what you do is when you make your speech in your mind you are moving through the memory palace and at various points you construct what are called emblemata and the idea of these emblemata is that they be as unusual, shocking, and unexpected as possible in order to be memorable to you. So, say you're giving a speech about the seven deadly sins. So then *Luxuria* might be for you a nun copulating with a dog and you'll set the nun and the dog in a little niche in the hallway of the memory palace. When you reach that place in your imaginary journey all these associations will spring to mind and you'll be able to give your speech flawlessly. To us, this sounds tortured and particular but it works quite well. One of the practitioners of the *Ars Memoria* was Giordano Bruno and he wrote a book called *Spaccio Della Bestia Trionfante*, the expulsion of the triumphant beast, and my god, Max Ernst, eat your heart out, this is a surreal epic read as straight plain text because that's not how it's supposed to be read. It's a conglomeration of these mnemonic emblemata that led him on to probably give a fairly conventional disputation on one subject or another but there are even old books of these emblemata that are before surrealism. These were some of the wildest images that the Western mind would tolerate.

The one thing that we didn't get into this morning was talking about the astrological side of it. The role of the Decans. The Decans are these demons, three to a sign, so there are 36 of them, and this was thought to be an astrological conceit that went back to Egypt as opposed to the ordinary zodiacal signifiers which go back to Huran in what is now modern Iraq. These Decans were the demons that were summoned by these Renaissance Magi in an effort to control and manipulate fate. You may, if you were paying attention this morning, have noticed that in all the reading I did from the *Corpus Hermeticum*, there was really nothing explicitly magical about it. It was philosophical. There was one mention, I think, of animating statues in the description of the four-gated city. But it was those magical animation passages that really captured the imagination of the Renaissance and they built on that and the idea, simply put, is that these Decans and zodiacal signs are at the center of associative schemata which include plants, minerals, odors, certain flowers, certain animals, everything had its decanic assignation and so if you were involved with promoting an affair with a woman or something like that then you would do an invocation to Venus and you would gather the associated minerals and stones and animals and you would put them in a room and then certain tonal modes were also associated with these things and so you would play the music, have the flowers present, the minerals present, the invocations and what you were trying to do was create a microcosm of the macrocosm to draw down this stellar energy. It wasn't about the classical Hollywood appearance of demons in a circle, that's the stuff of *Picatrix*, the earlier somewhat less refined style of magic.

I wanted to read you one passage from Frances Yates' Giordano Bruno and the Hermetic Tradition because this describes this change of status of the magician that we're interested in. And also what we didn't talk about this morning was the importance of the Kabbalah, which came in quite late, that was then worked out in great detail. This was originally the idea, it was the Jewish contribution to this kind of magic, it was, the idea was that since the world had been made by Jehovah, by the speaking of words, *In Principio erat verbum et verbo caro factum est*(?), in other words the speaking of Hebrew was thought to be a primary linguistic tool for the purposes of creation. The problem for these Italians was that very few of them spoke Hebrew so it was sometimes practiced silently, the mere constructing of these Hebrew letters and the setting out of messages in Hebrew was deemed efficacious as well. And then a further *deblinded*(?) for people who were even frustrated with that was to channel magical languages which were pseudo-Hebraic in structure. This is a whole branch of research, much too arcane for us to go into here. The only non-Hebraic magical language that I may mention here will be Enochian and Enochian was an angelic language channeled by John Dee and used by him in his magical evocations and later it was taken up by Aleister Crowley and the folks of the Golden Dawn. But there were many, many of these magical languages. The Voynich manuscript is written in one of them. But I want to read you this passage about how the Renaissance changed the status of the magician. "We begin to perceive here an extraordinary change in the status of the magician. The necromancer concocting his filthy mixtures, the conjurer making his frightening invocations were both outcasts from society, regarded as dangers to religion and forced into plying their trades in secrecy. These old-fashioned characters are hardly recognizable in the philosophical and pious magi of the Renaissance. There is a change in status almost comparable to the change of status of the artist from the mere mechanic of the Middle Ages to the refined companion of princes of the Renaissance. And the magics themselves are changed almost out of recognition. Who could recognize the necromancer studying his *Picatrix* in secret in the elegant Ficino, in his infinitely refined use of sympathies, his classical incantations, his elaborately Neo Platonized talismans. Who could recognize the conjurer using the barbarous techniques of some *Clavis Solomonus* in the mystical Pico lost in the religious ecstasies of Kabbalah drawing archangels to his side. And yet there is a kind of continuity because the techniques are at bottom based on the same principles. Ficino's magic is an infinitely refined and reformed version of neumatic necromancy. Pico's practical Kabbalah is an intensely religious and mystical version of conjuring."

So now we move in this realm, these were the companions of princes and there was in that 120 years, from about 1500 to the beginning of the 30 year's war, a constant effort in various parts of Europe to try and turn parts of European society toward a kind of magical revolution. The Europe of the 11th and 12th century was entirely ruled by scholastic rationalism. Witchcraft was virtually unknown and very curious. It's the 15th and 16th centuries where you get this tremendous proliferation of magical systems, magical ideas and social hysterias related to witchcraft, alchemy, conjuring and magic. Those are the centuries when these things really broke out into the open. And alchemy in that period is basically a story of personalities, wonderful personalities, too many for us to really talk about in detail. We have Nicholas and Pernelle Flamel who sought and found the philosopher's stone, according to legend and according to legend are living to this day somewhere in central Asia in perfect happiness having achieved not only the chemical wedding but the water stone of the wise. And then we have Basil Valentine who refined red wine and distilled it in distillation apparatus until he got essentially pure alcohol and upon drinking this was so sure that he had found the philosopher's stone that he announced the eminent approach of the end of the world based on his discovery and he was not secretive at all. He propagated his recipes and in fact sampled the distillates of some of his brother alchemists and popularized this very widely. To this day the reason certain cognacs are in the hands of monastic orders and no one else can make these things is because they were originally alchemical secrets and many of these early alchemists were men of the cloth, quite a number of them.

So what I thought I would do is, in a highly chaotic fashion, read you some of this alchemical literature. The big bring down about alchemical literature is that apparently the muse didn't always smile on the alchemist and some of this poetry is pretty tormented stuff. Why this is, who can say, but let's try one here and see if you can bear with it. Also, my Middle English is not as good as it might be. This is a short one, and typical, and you will see why the alchemists were charged with unbearable obscurity and prolix prose. This poem is called "A Description of the Stone:"

Though Daphne fly from Phobeus bright yet shall they both be one

And if you understand this rite you have our hidden stone

For Daphne is fair and white but volatile is she

Phobeus a fixed god of might and red as blood is he

Daphne is a water nymph and hath of moisture store

Which Phobeus doth confine and heat and dries her very shore

They being dried into one a crystal flood must drink

Till they be brought to a white stone which washed with with virgin's milk

So long until they flow as wax and no fume you can see then have you all you need to ask. Praise God and thankful be.

This is a recipe for the production of the philosopher's stone and the author, I'm sure, felt that he'd spoken as clearly as he dare speak. And yet making something of this is no easy task. This is from the Teatrium Chemicum Britannicum and the late phase of alchemy. Here's another one:

The world is a maze and what you why

For sooth of late a great man did die

And as he lay a-dying in his bed

These words in secret to his son he said

'My son' quoth he, 'tis good for thee

I die for thou shall much the better be

Thereby and when thou seest that life hath me bereft

Take what thou findest and where I have it left

Thou dost not know, nor what my riches be

All which I will declare give ear to me

An earth I had all venom to expel

And that I cast into a mighty well

A water wick to cleanse what was amiss

I threw into the earth, and there it is

My silver all into the sea I cast

My gold into the air and, at the last

Into the fire, for fear it should be found

I threw a stone worth forty thousand pound

Which stone was given me by a mighty king

Who bade me wear it in a fourfold ring.'

Quoth he, 'this stone is by that ring found out

If wisely thou cans't turn this ring about

For every hope contrary is to other

Yet all agree and of the stone is mother

So now, my son, I will declare a wonder

That when I die this ring must break asunder

The king said so, but when he said with all

Although the ring be broke in pieces small

An easy fire shall soon it close again

Who this can do he need not work in vain

Till this my hidden treasure be found out

When I am dead, my spirit shall walk about

Make him to bring your fire from the grave

And stay with him till you my riches have.'

These words a worldly man did chance to hear

Who daily watched the spirit but nay though near

And yet it meets with him and everyone

Yet tells him not where is the hidden stone.

This stuff is obscure, it's deliberately obscure, it was obscure to its contemporaries and the whole effort became one of collecting this kind of material and finding it out. And you have to understand this was all circulating in manuscript, very little of this was printed. The *Teatrium Chemicum Britannicum* was not printed until 1652 so this was a world without vehicular transportation other than the horse and carriage and these people were paranoid of being discovered and persecuted for wizardry and witchcraft by the church. So, each alchemist working in secret, with a limited number of texts, with a local control language, created this vast conceptual patchwork of ideas and this is in large measure responsible for the obscurity of what is said.

Then another factor which impinges on this and further complicates the matter is that the name of the game was projection of the contents of the imagination onto physical processes, so taking red cinnabar and heating it in a furnace until it sweats mercury, for one alchemist this is the incineration of the red salamander and the collection of aurmercurius in the great pelican. They named their chemical apparatus after animals and gods and so the pelican is a standard distillation apparatus, basically a condenser on top of something which is boiled and then these materials would be collected, ground, powdered, re-fired, mixed with other materials, re-fired again and in the process these people were, we call it, and it's such a weak term, the projection of the intellect into this dimension, they were living in a waking dream and many of the recipes are designed to wipe out the boundaries between waking and sleeping.

Remember I talked about the river of mercury that runs between the yin and yang? Many of the alchemical processes were of 40 days duration. Well you can imagine a hermit fearing discovery by the church, trying to keep his fires not too hot, not too cold, working day after day, night after night, eventually all boundaries dissolve and you're just living in a pure world of intellectual projection and then in the swirling of the alembic, in the chemical processes going on in the retort, you begin to be able to project your consciousness onto this. It's what we call visualization but for us it's a kind of a weak term because we are never really able to accept in the psychedelic state to transcend the belief in the inner world and the outer world being somehow separate so for us it's always separate. But they were able to wipe out that boundary. Well then, what they saw in their swirling retorts and alembics was not carbonization, calcination, condensation of various molecular weights of liquids and oils out, but rather the birth of the red lion, the coming of the eagle, the appearance of the [inaudible] stone. They had hundreds and hundreds of these words. I didn't bring any with me, but much alchemical literature is dictionaries. Martinus Rulando's *Alchemical Dictionary* is a huge book of words with special meanings in the alchemical context.

So, why, why do this and what happens when you do it. Well, no matter what alchemist you're reading, there's always an agreement that there are stages in the great work. Stages in the opus, as they called it. You can't get any agreement on in what order these stages come, but roughly it's something like this: most agree that it begins in the nigredo, the blackening, Arcro(?), the Saturnine world of what we would call manic depression, despair, and that our chaos, a chaotic near psychotic state of unbounded hopelessness and that is the precondition, then, for the alchemical work though the stages of the opus never occur in order.

I had a dream last night that was, I think, triggered by an illustration in Fabricious(?) that I'll show you tonight but it was a classical alchemical dream. It was that I was at a country fair and its antiquity was indicated by the fact that it was happening in the school yard of my childhood and as I moved among the participants of this country fair I began to notice that they were freaky. There were people with withered arms and one side of their face slid down and so forth and so on. The whole thing began to drift toward nightmare and Richard Hermes Bird appeared in my dream as my alchemical compadre and at one point a black woman, perfect symbolism for the nigredo, a black woman with three withered arms and six or seven breasts, slid herself sideways in front of me and it was at that point that I went and found Richard and said, "I think we'd better get out of here."

Now, an alchemist would greet a dream like this with great anticipation and joy and would understand that this sets the stage now for the next movement forward. Well, then accounts differ. Those of you who really want to get into this, I recommend you read *Mysterium Conjunctiones* by Jung, the *Mysterious Conjunction*. He discusses the nigredo in great detail. Another symbol for the nigredo is the Senax(?), the old man, because the old man is just short of death and that's the state that the nigredo makes you feel. Then you must take this raw, chaotic, unformed material, often compared to feces, compared to corruption, compared to the contents of an opened grave, and you must cook it in the alchemical fires of contemplation, prayer, and ascetic self control and then you will move through a series of stages that are associated with colors. There is the rubado, the reddening, there is the citronitas, the yellowing, there is the veriditas, the greening, and the

order in which this occurs differs according to who you follow but then there is closure at the end of the process. Most alchemists, although certainly not all, agreed that the higher state is the albedo, the whitening, the purificacio. At each stage there are sub-stages of dissolution, dissolutio et coagulacio. There's one alchemical aphorism that says "dissolutio et coagulacio, know this and this is all you need to know." And so it's a melting and a recasting and a purifying of psychic content. So finally you reach the albedo, the whitening, the highest stage, the stage of great purity.

But remember how I said last night that mercury was always the metaphor for mind in alchemy, or one of the metaphors for mind in alchemy, and I talked about its mutability and its ability to take the shape of its container and when you shatter it it then splits into many reflections. So, once you move into the domain of the albedo, the whitening, then a whole new problem arises for the alchemist. This is the problem of the fixing of the stone. Somehow the mutability of mercury must be overcome and it must be crystallized, it must be fixed so that it doesn't get away from you, so that it doesn't slip through your fingers. To achieve aurmercury is nothing unless you have the secret of the coagulacio. So then, there is a huge amount of effort devoted to this.

What is being described is what Jungians call the individuation process. A dissolving of the boundaries of the ego, an allowing of the chaotic material of the unconscious to pour forth where it can be inspected by consciousness, and we'll see tonight when we look at this art, these images are full of ravening beasts, incestuous mother/son pairs, incestuous brother/sister pairs, hermaphrodites, all taboos are broken, this stuff just boils up from the unconscious then is sublimed through these processes and then is somehow fixed and this fixing is the culmination of alchemy and if you can bring off this trick then you possess our stone, the philosopher's stone, the lapis, the Sophic Hydroloth of the Wise, Aranius Philalith calls it. There were hundreds of control words for naming the secret, difficult to attain.

Alchemical gold, in short this is what we're after. If you possess it, nothing else is worth anything because it is psychic completion, peace of mind. Jung called it the self. It's the self that we are trying to recover and remember we talked about the Gnostic myth of the light trapped in matter. Well this is the luminae de luminae, the light of light, the lux natura, the light drawn out of nature and condensed into a fixed form which then becomes the universal panacea. And I'm using as many of these alchemical terms as I can draw out of my memory to give you a feeling for it. This is the universal medicine. It cures all ills, you know, it brings you riches, fame, wealth, self-respect. It's the answer, it's what everyone is looking for and no one can find.

So this just became a consuming passion of the 15th and 16th century mind. They thought they were on the brink of it. Along the way they were discovering stuff like distilled alcohol, phosphorous, gun powder, all of these things were coming out of the alchemical laboratories but that was not it. They kept driving themselves onward because they knew that this was not the real thing and they were pursuing the real thing. Then for some people it became reassociated with this notion of the utopia that I mentioned this morning in the passage that I read about the city of Hermes Trismegistus, they began to see, it's almost like the crisis which overcame Buddhism, it must be an archetypal, and notice how rarely we've used that word here, it must be almost an archetypal stage in human thought. Theravadin Buddhism stressed individual thought, and individual redemption through meditation on emptiness, and then with the great reforms of Maguridja(asp?), the idea of Bodhisattvic compassion was introduced and there carries with it political freight. An obligation to society and mankind. So, as the 15th and 16th century progressed there began to be this awareness that what was wanted was not for an alchemist to break through, to his own personal salvation, but somehow to create an alchemical world. You get then the notion of the multiplacio, the idea that the stone, once created, will replicate itself and be able to change base matter into itself almost like a virus spreading through the ontological structure of matter itself and the world will be reborn and this idea then, what was happening was that these alchemists were getting bolder and printing was invented in Meins, near Frankfurt, in 1540, the distribution of alchemical books was changing the character of alchemy, it was no more the solitary hermit working away in his cave or mountaintop, far away from the minions of the church. These alchemists began to dream of banding together, of forming societies, of creating brotherhoods that were united in the sharing of their knowledge and their purpose.

This brings us to the curious episode in history called the Rosicrucian enlightenment. Dame Frances Yates, once again, got there first and she wrote a book called the Rosicrucian Enlightenment which traces the history of these alchemical brotherhoods and reveals to us what they were really about and what they were about was this dream of somehow taking the philosopher's stone, and the power, the immortality, the insight that it would bring and making it a general utility of mankind and in the, one way of looking at modernity, I have one friend who claims that the summoning of the Holy Spirit into matter can be seen as the creation of the modern world of electricity. That people like Helmholtz and Faraday were completing the alchemical work. It's very hard for us to realize how mysterious the electromagnetic field seemed to the 19th century. The 19th century had entirely imbued itself with the spirit of democritian atomism translated through Newtonian physics and they believed that everything was little balls of hard matter winging through space. When Helmholtz and Faraday and these people began to talk about action at a distance and generating the electromagnetic field and trapping lightning and light in jars and running it through wires, what could this be but the trapping of spiritus. What could it be but the literal descent of the Holy Ghost into history and, you know, give it a moment's thought. For thousands of years, electricity was something that you saw when you took an amber rod and a piece of cat fur and went into a darkened room and stroked the cat fur and then when you would bring the amber rod close to the cat fur you would see the crackle of static electricity through the cat fur. For thousands of years that's what electricity was. Who would dream that you could light cities, that you could smelt metals, that you could illuminate the earth with this energy and yet from the 1850s to the present, this was done. It's almost the final literalizing of the alchemical dream.

But to go back now, I digress, I fear, let's go back to the climate of the 1580s and the central culprit here, and to my mind a giant figure casting an enormous shadow over the landscape of alchemy and of modern science, is the Englishman John Dee. John Dee united in himself the complete spirit of the Medieval Magus and the complete spirit of the modern scientist. He invented the navigational instruments that allowed the conquest of the round earth. When Frances Drake sailed up the coast of California he had navigational instruments that were top secret. The French, the Spanish, must be kept away from this stuff and these were navigational instruments created by John Dee that allowed him to locate himself anywhere on the globe. But John Dee was a man who, on a late summer evening in Mortlag, his house in Mortlag outside of London, the angel Gabriel descended into his garden and gave him what he called the shewstone, shew being show in Old English, and the shewstone exists to this day, you can see it in the British Museum and what's amazing about it is it's a piece of polished obsidian, it's an Aztec mirror, is what it is. There was a ruler of the Aztecs called smoky mirror. How John Dee got this thing, we cannot even imagine. He says he got it from an angel, nobody can really say that, however I suspect that Cortez, on his first return to Spain from the new world, he brought a number of objects with him that he had collected in Central Mexico and somehow John Dee got his hands on this thing and it was for him a television screen into the logos and he used it over a number of years to direct the foreign policy of England.

He was the confidante of Queen Elizabeth the First and he also was the most accomplished astrologer in Europe and he used his ability to cast horoscopes as an entre into all the great houses of Europe, the kings and nobles of Europe. He was functioning as an intelligence agent, he was a spy for the British crown insinuating himself into these various courtly scenes and then writing back to Elizabeth in cyphers, cyphers that had previously only been used for magical purposes. He was sending back data on the strengths of military garrisons and the placement of fortifications and this sort of thing. This is what he was doing in the 1580s, he kept the shewstone for a number of years and he didn't seem to be able to make much progress with it. He had other methods too, he had wax tables and sigils but finally into his life came a very mysterious character named Edward Kelly and some accounts say that Edward Kelly had no ears. That indicates that he had had his ears removed for being a charlatan and a montebank. This was a common punishment in the provinces of England. So Edward Kelly was a very dubious character, I think. One strong piece of evidence that he was a shady character was, John Dee was married to a much younger woman named Ann Dee who by all accounts was quite a beauty and after gaining Dee's confidence as a scribe, the person who could look into the shewstone and lay out these scenarios that the angels and the entities coming and going in the shewstone were putting forth, Kelly revealed to Dee that the angels had instructed him to hit the hay with Ann. This was a great crisis in their relationship. However, according to Dee's diary "and so it was done," we read. So, hanky panky didn't begin with the Golden Dawn, believe me. In 1582 Ann Dee, John Dee, and Edward Kelly set out for Bohemia and Rudolph, the mad king of Bohemia held sway at that time. This is another one of those bizarre figures in the whole story of this...[Tape cuts out]

...a wonder cabinet, you see, before Linaius, before modern scientific classification these great patrons of the arts and natural sciences, they would just collect weird stuff. And that was all you could say about it. I mean, it was rhinoceros horns, fossil amenities, broken pieces of statues from antiquity, giant insects from Southern India, seashells, all this stuff would just be thrown together in these wundercabina, these wonder cabinets. Rudolph was a great patron of the arts. Well, Kelly sent the word that he and Dee had perfected the alchemical process and Rudolph immediately paid their way to Prague and patronized them very lavishly over a number of months but then they didn't seem to be coming through and he rented, he ordered a castle put to their disposal, in Bohemia and they still weren't able to come through. The Voynitch manuscript figures in here too because Kelly's entre to Dee was that he had a manuscript in an unknown language and I believe that this probably was the Voynitch manuscript. The Voynitch manuscript turns up in the estate of Rudolph and the very month that he paid 14,000 gold ducats for it to persons unknown, Dee, who was always writing back to the Elizabethan court hounding them to send money, entered into his account book that they received 14,000 ducats from an unknown source.

Dee was able to talk himself out of this alchemical imprisonment but not before he had written a book called the Hieroglyphic Monad. You have to understand the importance of this. As late as the 1920s in England in the better schools of England, like Eton, when you studied geometry, you studied Euclid's works and Euclid's geometry was always preceded by Dee's preface to Euclid. Until the 1920s every English school child studied this. He was a master mathematician as well as these other things. This was how he was able to produce these navigation instruments. So Dee, while imprisoned in Bohemia, wrote a book called the Hieroglyphic Monad in which he proposed to prove, through a series of occult theorems, that a certain diagram, unfortunately I didn't bring the hieroglyphic monad, but it's basically the symbol of, you know the symbol for mercury which looks like the symbol for female but you put horns on it and then there were some adumbrations to that. By a series of theorems he worked up this hieroglyphic monad and he initiated a couple of young men named Johan Anraee and Michael Maier into the mysteries of the hieroglyphic monad. Then he was able to get out of Bohemia and he went back to England.

Terence McKenna

Kelly, who had made much more extravagant claims, Rudolph kept at work on the alchemical opus and Kelly became more and more desperate to escape and one night in 1587 he crept out on the parapet of this Bohemian castle and a roof tile slipped beneath his feet and he fell to his death and became, as far as I can tell, alchemy's only true martyr. Dee returned to England, he was now very old, he died at Mortlake in 1606.

Well, Elizabeth died in 1604, Shakespeare was happening, Sir Philip Sidney was happening through this period. John Dee reputedly had over 6,000 books in his library. He had more books than any man in England. He had books, we have a partial catalog of his library, he had books that do not exist now. He had Roger Bacon manuscripts because when Henry the eighth kicked the Catholic Church out of England, the Northumbrian monasteries were looted by the Earl of Northumberland and basically Dee was allowed to pick over the loot from these monasteries and there were Roger Bacon manuscripts which perished when Dee's library was burned by an angry mob while he was on the continent because he was suspected of being a wizard. He was the model for Faust in the later resurgence of Faust and whenever you see an old man with a white beard and a pointed cap, this image is a referent to Dee. Well, Elizabeth died in 1604, I believe, and James the first became king of England. James was a peculiar character. The wags of the time liked to say "Elizabeth was king and now James is queen!" Not only that, he hated occultism, he had no patience with the whole magical court that Elizabeth had assembled around herself. Meanwhile, in 1606, a very mysterious document began to circulate in Europe and in England called the Fama, this is the first word in a string of Latin words, Fama, and two years later the confessio. What these were were announcements that an alchemical brotherhood was seeking recruits. These are the primary documents of Rosicrucianism. Rosicrucianism was based on a fiction and a fictional person, Christian Rosencreutz, who was imagined to have lived almost 200 years earlier, in the 1540s, and to have been a great alchemist. It was claimed that his tomb had been recently opened and that there were books inside it which set the stage for the alchemical revolution of the world. Notice how this occult world always tries to reach back in time to give itself validity. Christian Rosencreutz was claimed to be the author of a series of books, the chief of which is called The Chemical Wedding. What this was all about, I believe, and the Rosacruicun enlightenment makes it fairly clear, was that Dee, during the period that he had been in Bohemia, had set out to lay the groundwork for an alchemical revolution in Central Europe and he had made Johan Andraee and Michael Maier his agents in this plot. And it was a plot, a plot to meddle in European history and to turn the Protestant reformation toward an alchemical completion. They felt that Luther and Has(?) and these people had only gone so far and that the culmination of throwing off the yoke of the church would be the establishment of an alchemical kingdom in central Europe. The target, then, of the attention of Michael Maier and Johan Andraee and a number of these alchemists became the young Frederick, he's called Frederick the Elector Palatine. He was a prince of the Northern League in Germany, he ruled in Heidleberg, and Heidleberg, as you know, is a thousand-year-old university city and I believe I mentioned that the alchemical press of Theodore Debray(?) was operating out of Heidleberg. Heidleberg became a magnet for all the occult thinking going on in Europe and all the Puffers and alchemists, the gold-makers, the philosophers, the charlatans, they all converged on Heidleberg and Andraee and Maier were advisors of the young Frederick and they steered him, by a series of political manipulations too complex to tell, toward a marriage with the daughter of James the first of England, who was named Elizabeth, interestingly enough. So, Frederick the Elector made Elizabeth, the daughter of James of England, his wife. Frederick here made a serious miscalculation because he thought that if James would give the hand of his daughter in marriage that this was his way of blessing this alchemical conspiracy. Actually, what was on James' mind is that he was about to give his son, in marriage, to a Spanish princess of the Hapsburg line, a Catholic. In other words he was playing both sides against each other. He was not giving the green light to an alchemical revolution at all. But, it was assumed so. Then, in 1617, 1618, Rudolph, remember Rudolph, the emperor, he finally dies at a very ripe old age. And at that time, the Protestant league, which was made up of these princes of these small principalities scattered across Germany and Poland, they actually elected the emperor, it was not by right of primogenitor, but by election by what was called the Northern League, this league of princes. Frederick and his alchemical cohorts had done their alchemical groundwork very skillfully and they were able to engineer the election of Frederick to emperor of the empire and he became Frederick the Elector Palatine of Bohemia and this set the stage for an episode called the episode of the Winter King and Queen. One of the great, after Nicholas and Pernelle Flamel, this is one of the great romantic stories of alchemy. They moved their court from Heidleberg to Prague and all the alchemists went with and they assumed that English armies would support them if there was any squawk from the Hapsburgs and in the Winter of 1618 they ruled there and began to lay the groundwork for the transformation of Northern Europe into an alchemical kingdom. The problem was, as I said, the faithlessness and duplicity of James the first of England. He did not support them, in spite of the fact that the fate of his daughter hung in the balance and by May of 1619 the local Bishop of the Catholic church was fully aroused and word had been sent to Madrid and the Hapsburgs raised an army and laid siege to Prague. In the late Summer, the Mid Summer of 1619, the Winter King and Queen were driven from Prague, the city fell to Catholic forces, the alchemical presses were smashed and Michael Maier, who was like the prime minister of this scene, was murdered in an alley in Prague and the entire alchemical dream went down the drain. Frederick was killed in the siege of the city and Elizabeth escaped to the Hague where she lived in exile for many years. Till recently, I thought that that was the end of the story but there is a coda that is very amusing, if nothing else. In that Hapsburgian army, there was a young soldier of fortune, only 19 years old, still wet behind the ears, knowing nothing, happily soldiering and wenching his way around Europe while he decided what to do with himself and his name was Rene Descartes, a Frenchman. Descartes, in his later years, reminisced about his period as a soldier in this army and I like to think that it was Descartes who actually murdered Maier. One of my ambitions is to write a play or a novel in which these two confront each other in a back alley of burning Prague and carry on a debate about the future of Europe before Michael Maier falls to the sword of Descartes. That may be apocryphal, but what is not apocryphal is that this Hapsburgian army, having laid siege and destroyed the alchemical kingdom, began to retreat across Europe that Fall and by Mid-September was camped near the town of Uolm in Southern Germany. By a strange coincidence, Uolm is the birthplace of Einstein some hundreds of years later. But on the night of September 16th, Descartes had a dream and in this dream an angel appeared to him, this is documented by his own hand, and the angel said to Descartes, "The conquest of nature is to be achieved through measure and number." And that revelation lay the basis for modern science. Rene Descartes is the founder of the distinction between the res veritas and the res extensa, the founder of modern science, the founder of the scientific method that created the philosophical engines that created the modern world. How many scientists, working at their workbenches, understand that an angel chartered modern science. It's the alchemical angel which will not die. It returns again and again to guide the destinies of nations and peoples toward an unimaginable conclusion. That's not the last time that this angelic intervention in the history of science has occurred. Some of you may know the story in the 19th century of Cudali(sp?), the German chemist who was struggling with the molecular structure of Benzene, couldn't get it straight, and then he had a dream in which he saw the ouroboric snake take its tail in its mouth and he awoke from that dream with the carbon ring burning in his mind. Well, the carbon ring, the six sided heptad(?) state of the form of the carbon ring is the basis of all organic chemistry. And I mentioned earlier Faraday and Helmholtz and the rise of the electro magnetic field. The point I'm trying to make is that, however rational we may assume ourselves to be, however rational we may assume modern science to be, it is all really founded on angelic revelation, demonic intercession, and an extremely mysterious relationship between the human mind and the world of what science calls inert matter which, from this point of view, is revealed to be not inert at all but alive and pregnant with purpose for mankind. The alchemical kingdom of Frederick the Elector, and then there were a series of adumbrations, of this kind of thinking, many of you may know about freemasonry and the many freemason revolts in Bohemia and Bavaria throughout the 16th and 17th century. Adam Weishaupt and the Illuminati is another effort to do this and even the royal society founded by Newton and Hook and those people was still an effort to reform science for the spirit. So, the alchemical spirit lives on, it never really died, it's just that it has taken peculiar forms in our own day. I mentioned, I believe, last night that when you enter into nuclear chemistry the most liberal dreams of the profane side of alchemy, the transformation of lead into gold, has actually been achieved. It has no economic significance because the instrumentality to do it costs tens of millions of dollars but nevertheless, yes, in our time, lead had been changed into gold. So, that's basically what I wanted to say about this. I hope that there are questions and stuff that we can say about it. To take you back to the Voynich manuscript for a minute. There was something about it being a liturgical manual of some sort, is that your opinion? Yes. This is kind of a footnote on all of this. Remember I said that Kelly's entire to do that he had a mysterious book and you can tell from what I've said already, Dee was as big a sucker for books as I am. So this book, Kelly's story was that he had gone to sleep in the ruins of a Northumbrian monastery and slept in an open sepulchre, a crypt of some sort, and when he awoke he found beneath him two things, a vial of red powder which he said was the transmuting powder, a necessary part of the alchemical process, and a book in an unknown language which he called the Gospel of Saint Dunstable, possibly because this monastery had been dedicated to Saint Dunstable. Now, Arthur Dee was John Dee's son and he said that, he became an alchemist in his own right, and he said when he was growing up he remembers that his father spent many hours puzzling over a book, as he put it, "all covered with hieroglyphics." But Dee, who elaborated the angelic language called Enochian, never actually wrote or discussed the book that he had received from Kelly. It is definitely not written in Enochian. Enochian, when grammatically analyzed by computers, has a curious relationship to 16th century English. But when Dee and Kelly traveled to Europe they were talking up Roger Bacon, who was a 14th century English monk who had dabbled in alchemy, and they claimed to have Bacon manuscripts and Rudolph became very interested in this and wanted to obtain some of these Baconian manuscripts. I suspect that what happened is that Dee, by this point, had given up on deciphering the Gospel of Saint Dunstable and decided that he would palm it off on the emperor as a Bacon manuscript because he didn't want to give up a real Bacon manuscript because they were too valuable to him. So for 14,000 gold ducats this thing changed hands and Kelly and Dee and Ann were able to pay their bills and Rudolph had immense resources because of his position as emperor and he brought his cryptographers and decipherers on to work on this Gospel of Saint Dunstable and got nowhere. Then, when Rudolph died, a mysterious book was numbered among the artifacts of his estate and I think we can assume that it's this book and one of the interesting things about this book is it has pages and pages of plant drawings. Over a 150 watercolor of plants, each carefully labeled, captioned in this unknown language. If you know anything about decipherment, this is what a decipherer dreams of because if you have a picture of the thing and a caption it doesn't take too much smart to figure out what's going on. Nevertheless, this was completely unhelpful. A third of the manuscript has pseudo anatomical material, in other words what looked like drawings of stars and stellar shells but when carefully analyzed dissolve into meaningless, cannot be associated with anything, and then a third of the manuscript shows little naked ladies in what can only be described as elaborate plumbing systems and it was thought at one time that these were drawings of the humors of the body in the liver, that these little naked women represented spirits moving inside the human body and then somebody else's guess was it must show an obscure form of German hydro therapy because, you know, the Germans, if you've ever been to Baden Baden or Marianbad or there places where people take the waters, well those places are old, old. And all this stuff is captioned and there are even tables of contents which again you would think would yield to decipherment and so when Rudolph died, because of the botanical material in this book, it passed to the court botanist, a man named Marri and he got nowhere with it. Then in the early 16th century a great alchemist and polymath, some of whose art we'll see this evening, was Heinrich Kundrath(sp?), and Heinrich Kundrath was fascinated by artificial languages and he heard about the Voynich manuscript and he had a whole batch of letters from Kundrath to the keepers of the estate of the emperor trying to obtain this manuscript, which he finally did obtain and then at that point he makes no further mention of it in his diaries the conclusion being that he, too, could get nowhere with this thing, it just defied decipherment. Well, in 1619, at the outbreak of the 30 year's war, and this is what I forgot to mention in my earlier discussion, this episode of the Winter King and Queen is one way of debating the 30 year's war. It's usually considered to be the moment when a certain personage was hurled from a third story window in Prague and then fighting broke out in the streets but really the episode of the Winter King and Queen brought the thing to a head. Well, in 1619, to avoid being caught up in the 30 year's war, Kundrath decided to take holy orders and become a Jesuit and so he gave his library, which was commendable, to the monastery he joined which was a monastery in Southern Italy and there this thing sat until 1906 when a New York rare book dealer named Alfred Voynich bought the entire contents of this monastic library and when he got it all back to New York and cataloged it, it was all very predictable 16th century theological and alchemical speculation except here was this book in an unknown language and Voynich kept it throughout his life and then when he died he gave it to Yale and it is to this day at the Benikee rare book room at Yale. In the 1960s the CIA became interested in it because the CIA is in the business of code making and breaking, a huge amount of energy goes into this. If you know anything about the enigma project in WWII you know that vast energies go into the making of unbreakable codes and so they very systematically sought out all examples of encrypted material throughout history and just hickey-split deciphered it, if you know that. All occult and magical codes known to exist in Europe can be traced back to one person, virtually to one person, to Trithemius, Bishop of Spawneim who was the great teacher of Henry Cornelius Agrippa. All magical codes, if you know the Trithemian method, within a few hours you can get plain text. The Voynich manuscript did not yield at all to this method and the CIA formed a working group that for over ten years would invite scholars in to have a look at this and if you're interested in this, Marie D'Amperio, who was a great Renaissance scholar, wrote a book called The Voynich Manuscript, an Elegant Enigma in which she traces the efforts of the CIA to figure this thing out and to figure out what it could be. There the matter rested until about three years ago when, I think his name is Leo Levator, some kind of military historian, one of these peculiar people who live for this stuff, he got a hold of it and he said, and [Inaudible] goes through all the decipherment and there were many efforts at decipherment, there was a scholar at Yale in the twenties named Brumbara who was a very respected man who ruined himself by claiming a complete decipherment of the Voynich manuscript and, the way the game is played is that you say what your rules for the decipherment were, you give the rules to a colleague and you give your colleague a page of text. If he can't translate it with your rules then you are viewed as a deluded and misguided person and your career goes up in flames. Well, the Brumbara method for deciphering the manuscript had to do with confined pools of letters where, it would get you to a pool of five or six letters but then you could freely choose which one you used and critics of Brumbara demonstrated that you could make this thing say anything you wanted it to. Brumbara supported Dee's claim, he claimed that it deciphered out into a Roger Bacon manuscript that described a series of riots between the students and the black friars in 1385 at Oxford. But nobody else could make it say that or make it say anything so Brumbara disgraced himself and ruined his career. Then there were other efforts at decipherment which I won't bore you with but along comes Leo Levator, just four years ago and he wrote a book called The Voynich Manuscript: A Liturgical Manual for the Catherites and his great breakthrough, if you accept his translation, and I do, I know people who don't but they don't seem to have read him as carefully as I have. I think the dude pretty well has it nailed to the barn door. His great breakthrough was to realize that it's not in code. It is not an encrypted manuscript at all. What it is it is a synthetic alphabet, yes, it's an alphabet that, and one of the things that baffled the CIA is that they were looted the libraries of Europe and they could never find another example of what is called Voynich script and this is just baffling. How could there be no other example of this script. It appears that what happened was someone created a synthetic alphabet and then in a mixture of Medieval, polyglot Flemish with a huge number of loan words from Old French, Middle High German, and Swedish, wrote down a sacramental manual for the dying in the Catherite sect. Now, what is the Catherite sect? You're probably familiar with something called the [Inaudible] crusade. This was not a crusade carried against the infidel for the recovery of Jerusalem but rather a series of military actions carried out by the pope against communities in Southern France by the pope against communities in Southern France in the early 1200s. These people were Catherites. As far as we can tell, and we can't tell much because we only have descriptions of Catherites by people who were burning them at the stake, in other words no original Catherite documents survive, we just have what they screamed out on the rack as they were being put to death by the bishops of the church and this was a horrific incident in European history. To give you the flavor of it, the second Albanian crusade was prosecuted by a general of the pope named Simone De Monforte and his lieutenants came to him, at a point, and some of you might have visited the city of Carceson in Southern France which is a walled Medieval city in Southern France, very beautiful, Simone De Monforte's lieutenants came to him and they said "We have cornered the Catherites at Carceson but the problem is that there are 6,000 Catholics within the city walls." And he said "I'll kill everybody, God will recognize his own." So that was the spirit in which this thing went forth, and they did, they did. So, what we do know about the Catherites is that they had a sacrament, the holiest my...well, first let me tell you a little bit more about them. At first it was thought that they were pretty much heterodox Christians. They were into nudity and vegetarianism and they sound like early hippies, as far as we can tell. They took together men and women, they took off their clothes, they bathed, whether there were orgies or not we don't know, they were vegetarians, and the one thing that they do know is that they had a sacrament called the consolamentum and the consolamentum was ritualized violence, no, that's not the word, the term escapes me, but anyway, when you were dying, a fellow Cather would cut your wrists and open your veins in a warm bath of water and you would die in that state, you did not die a natural death. This was called the consolamentum. What Leo Levator is claiming is that the Voynich manuscript is a description, a manual, for the prefect of the Catherite sect telling how to properly carry out the consolamentum. I see no reason to challenge it. Even with my limited knowledge of German, once you get the vowel and letter assignments right into this weird manuscript into this weird language and change it into English alphabetic text you can see that there's enough German there and then these lone words in Flemish and so forth, it looks to be true. And what emerges from this, if we accept the Voynich manuscript as the only primary document on the Catherite faith, is that this was not a form of heterodox Christianity at all, it is much more radical than that and this may explain the church's fury with this group of people. It was a cult of Isis. It can be traced straight back into the mystery religions of [Inaudible] Isis in Egypt and I have not seen any critical commentary on Levator's book. His book was published by this weird press in Rodondo Beach that specializes only in books in military encryption. Their catalog is a revelation to see, it's amazing, and the book on the Voynich manuscript stands out like a sore thumb because most of it is like dictionaries of three letter words in Swahili and their numerical transforms and stuff like that. So that's the history to date of the Voynich manuscript and it's not that askew of our subject because all of this heterodoxy in Europe blends together. The presence of Theodore DeBrie as an alchemical printer in Heidleberg and he became a clue because there were survivals of this Catherite faith in the form of a heresy called the brotherhood of the free spirit. If any of you are familiar with the altarpiece called "The Garden of Earthly Delights" by Hieronymus Bosch, it's thought that this was created by commission for a brotherhood, a congregation of the brotherhood of the free spirit and the brotherhood of the free spirit was always associated with some reason, we don't know why, with printers. Printers seem to be the profession that the brotherhood favored and, like the Catherites, they practiced vegetarianism, nudism and gathering together in a ritual bath. So, there is much still to be learned and to be teased apart in the art history and the history of heterodox thinking in Europe of which alchemy is seen to be one facet of a factored gem that includes the brotherhood of the free spirit, early Freemasonry, Catherites, survivals of Manicheism, Voagamils(sp?) in Yugoslavia, there are Voagamils Vostrian(?) graves on the Southern coast of Thessalonica and just a whole zoo of intellectual systems that have been forgotten and overlooked. This what I meant when I said we will explore the stigmatography of lost thought systems. In some cases we possess quite complete skeletons, in the case of alchemy, what we possess in the cases of the Voagamils and the Catherites is almost a foot bone or a tooth or a footprint but someday, with luck, new textual material will emerge and a new understanding of the role of heterodoxy in the formation of modern thought will emerge. Questions? The Borne and Clark book on Freemasonry that's just recently been published...I've just about finished it and this person is a Medieval English historian from Kentucky and I think he's finally solved...the Freemason history which is a very interesting history because the Masonic historians themselves have been arguing for a couple hundred years now it's strange that this Voynich manuscript should be all of the sudden in the last couple of years resolved because it seems that this Freemason thing is also resolved. Yes, you make an interesting point. John Glavis brought me an article yesterday. We're all tied up now in this Pluto return. I'm not an astrologer but John brought me an article that's talking about how, I don't know if it's the last time or the time before last, that the Pluto return occurred is precisely the 1490s, the period that we're talking about when the Corpus Hermeticum was translated and we are now in a period that is astrologically exactly equivalent to that period and the Voynich manuscript appears to have been accepted, I mean I'm willing to accept it, you mentioned this revelation about the true nature of Freemasonry, and of course what is going on at the moment that is askew of our subject but tremendously exciting and relevant to the idea of lost knowledge coming to light, is that this is the golden moment in Mayan studies. It is happening right now, day by day, minute by minute, the log jam has been broken. The Mayan glyphs are being deciphered, no shit, and it has to do with an entirely new approach that some Russian linguists have taken and if any of you are interested, it will never happen again so far as I know, there are now, with the Mayan decipherment, no real undeciphered languages left. The Harapan(sp?) was deciphered a few years ago but really it wasn't that interesting because we only possess about 6,000 characters in Harapan. But the literature of the Mayan, when you take not only the hieroglyphic, the stone texts, but when you add in the ceramic texts, why we have a lot of Mayan material and it is being deciphered at a furious rate. If you're interested in this, Linda Sheil has written

a book called A Forest of Kings and how I do envy this woman because what she is doing is writing the first history of the Maya in a thousand years. We're not now dealing in the realm of gods and myths, we're dealing with stuff like "on the 14th of May, 642, an army from El Charico met an army from Tikal and triumphed and deposited three flint and placed on the throne..." it's this kind of stuff, real history. The conceits of Mayan religion and Mayan courtly life are all coming into focus and it's very exciting. All the people who have tried to make the Maya into some kind of Atlantean civilization should be running for cover at this point, because the picture that emerges is not as pretty as we might wish, but, hey, know the truth and the truth will set you free, I would choose truth over illusion anytime, no matter how damaging it might be to somebody's conceptions of these things. And if any of you are interested in these subjects, another area where this has occurred is, some of you may know the book by Michael Chadwick called The Decipherment of Linear Be, Linear Be is a proto-Minoan language and a linguist at Cambridge named Michael Ventris, a genius, in the fifties took this language, there was no Rosetta Stone, this is the amazing thing. You know what I mean by a Rosetta Stone? You see, in the 19th century the great mystery was how to read the Egyptian hieroglyphs and before they were deciphered the Egyptians were treated like the Maya and people thought that the secrets of the universe were chiselled on those obelisks and tombs. Well then a scholar in the grand army of Napoleon Champion, a soldier found a tablet which had a column of Demotic Greek, a column of another language, I forget which one, and a column of Egyptian hieroglyphs and they were able to realize that it was saying the same thing three times and that opened it up for them. But that's like a crib sheet, it's easy if you have the same text in a known language. But in the case of the Maya and in the case of Linear Be and in the case of Harappan, there was no Rosetta Stone, well then you talk about an excruciatingly difficult problem to solve and I'll explain how it was done with the Maya because it's so neat. It turns out that Mayan is a rebus language, what does this mean? Do you remember when we were kids and in comic books there would be these things where it would show a picture of an eye and then it would show a picture of a saw going through a piece of wood and then it would show a picture of an ant and then it would show a picture of a red rose. This is a sentence which says "I saw aunt Rose." But now notice what's going on here. It all depends on puns that depend on a knowledge of the spoken language. If you lose the sounds of the spoken language how the hell could you ever tell that a picture of an eye, a saw, an insect and a rose says "I saw my maternal relative on my mother's side." I mean, it just is impossible, it's absolutely impossible in that situation to reconstruct meaning unless you have sounds. Well, how do you recover the sounds of a language dead a thousand years. Well, these Soviet linguists had the good sense to go and look at living Mayan languages, of which there are 15, living Mayan languages in the Americas and they discovered one of these dialects where, when you set Mayan hieroglyphs in front of these people and they named what they saw, meaning came out of their mouths and that broke the log jam and then you just rev up your computers and use all the standard tools of modern linguistics and philology and the stuff begins to just pour out, clear as day, no problem. So they asked the Mayans? Yes, they had to go to a Mayan, you're right, good point, it had never occurred to them. Because always before when showing it to Mayans they would say "what does it mean?" instead of "what do you see here?" and then what they said what they saw there meaning came out of their mouths. It was very, very neat. It shows once again the hubris of modern scientific methods, we tend to dismiss the aboriginal and the primitive. To turn it toward my own favorite subject, this was the state of modern medicine, nobody would ask the native in the Amazon basin "what plants do you use for malaria, brain tumors, shrinkage and so on and so forth, because they were just dismissed as superstitious primitives. It was thought that the doctrine of signatures was operating. They didn't realize how subtle and how complete human knowledge systems grow under the care of those who really matters. Is there anything that needs to be said about this? The project of the redemption of spirit from matter turned into the project of redeeming the general society of the time toward a utopian vision. This is working right up to the present. Millenarianism is still with us, Marxism is the last great Millenarian faith, the belief in the worker's state. It occupies the same relationship to these alchemical utopias as Heideggerian existentialism has to second century Gnosticism. The poetry has gone, the baroque imagery has been stripped away, but the impulse is still toward a perfect society where each from his ability according to his needs and means. It lives on. Democracy is also an effort, let us not forget, an attempt to recapture the style of 5th century Athens and we forgot that this was a citystate half of whose inhabitants were slaves and yet we are so under the spell of the utopian dream that we continue, and not without important reason, I think, to try to labor toward a just and decent world where the lion lies down with the lamb and that was, and it remains, the alchemical dream. ...flashbacks of my life...I majored in history in college and the first history teacher that I had was a wonderful old man who really, now that I look back on it, taught the history of ideas. My major was involved with politics and all of this kind of thing and it's such a wonderful experience to suddenly get back to what turned me on to history, it gets me turned on and opens my mind again, looking at some of these thoughts that I'd just forgotten or suppressed, put down and said that's bullshit as a traditionally trained scientist and so on opened my eyes to the fact that we can learn from what's gone on before, the ideas are out there, we just have to grasp them...and apply them and I, too, am interested in how we make this more meaningful for the future. One thing that occurs to me to say, I once, in one of these revelatory dialogs with the logos, asked the question, "why me, why are you telling me this?" because my, I mean, I was a poor hippie, I was penniless, I was a traveler, and the answer was instantaneous and it was, "because you don't believe in anything, because you don't believe in anything" and I think that that's a very pure position to hold. We're not trying to ensnare you to abandon your Jewishness or your Presbyterianism or belief, if you believe in something then you have precluded the possibility of believing in its opposite and you have hence limited your freedom. Everything is to be judged by its efficacy, by its effectiveness in the real world and I think that I have a horror in all belief systems, I just don't like them. If somebody tells you he has the answer, flee from this person, they are obviously some sort of low being who has not recognized the true size and dimension of the cosmos that we're living in and if you can keep yourself free of encumbering beliefs then your dialog with the logos can go forward unhindered. Sometimes when I'm in the trance of psilocybin I will say to the entity, "begin to show me yourself as you are for yourself, don't give me the scaled down, humanized version, show me your true nature" and after a few moments of this then I have to raise my hand and say enough, I can't handle more than that. This goes back to the statement made yesterday or the day before about that the universe is not only stranger than we suppose, it's stranger than we can suppose. Therefore, we are given tremendous latitude in what we can think and what we conceive but if you begin to believe in something then you are pulled down because everything that you believe has consequences. A perfect example, as some of you may know, when Mohammed ascended into heaven from the site of what was to become the Mosque of Omar, from the site of the Temple of Solomon in Jerusalem, he happened to be on horseback. Now if you believe that Mohammed ascended to heaven, imagine the theological and hermetic problems posed by the horse he was riding. Because it went with him. This is a perfect example of how intellectual baggage drags us down because belief always contains absurdity. The ontological status of this horse has troubled Islamic theologians for centuries. If they would just let go of the whole idea complex they would be liberated from this kind of minutia. Belief kills the spirit, spirit transcends belief. I wanted to say that. Then somebody mentioned Bruno and Dee. Since I brought Islamic tradition it's ironic that so little time was spent on Bruno, on the other hand, I recommended that you read the book so you should be well informed about Bruno. For me, Bruno, we just didn't get into that particular historical episode because I wanted to tell you about the Rosicrucian enlightenment, but the thing to remember about Bruno was his discovery about the infinitude of the cosmos and that by an act of unencumbered observation, I mean how many people had looked at the night sky before Bruno and they had not seen what he saw, which was infinite space and suns hung like lamps unto the uttermost extremes of infinity. By an act of pure cognition, he was able to destroy an entire cosmological vision that had limited and confined the human soul for millennia. That's half of his story. The other half is that he was burned at the stake for refusing to back down from this. It's a model for us all: trust your perceptions, trust your intuition and then accept the consequences because this is what existential validity must be. As far as the relationship between Dee and Bruno, the relationship is that they were both derivative of the school of magic that can be traced back to Henry Cornelius Agrippa Von Netteshine who was another model for Faust. Agrippa wrote De Libro Quatuor De Occulta Philosophia, four books of occult philosophy, and that was the core work for European magic. All European magic can be traced back to the Agrippan system and Agrippa was the direct student of the Abbot Trithemius of Spawmheim that we mentioned yesterday as the source of all the magical codes of the middle ages. If you're interested in a brilliant but fictional treatment of John Dee and Giordano Bruno, I'd like to recommend a novel to you. It's called Aegypti, it's by John Crowley, the same gentleman who wrote Little Big which is a wonderful novel about the magical interface between two worlds. But his book Aegypti, fully half of the book is given over to a wonderfully rich retelling of the relationship between Bruno and Dee. Some people have wanted to say that Dee and Bruno actually crossed physical paths in London but I've looked into it and they missed each other by about two weeks. Bruno was setting sail for England as Dee was setting sail for France and the Rosicrucian enlightenment episode that I talked about. Then someone asked about tantra and the contrast between the imaginative internalized invocation of the anima or the animus, depending on your own sexuality, and that contrasted with something that actually happens between two people. We didn't talk that much about the concept of the alchemical wedding, or the chemical marriage is another way of putting it, but this is the Western response to the Eastern idea of tantra and it is the idea that sexual energy, being the rawest and most accessible energy to the organism, can be channelled into a higher spirituality. It's entirely so, the problem is that of all paths this is probably fraught with the greatest difficulty because sexuality is such a debased coinage in the modern world. In other words, you have to make your way with great care and great purity of intent into this. In Eastern tantra that is actually practiced in this physical manner there is usually the admonition is that you should have no attachment to your tantra, that the relationship should be entirely given over to the technical details of this union and of course it has to do with the forestalling of orgasm and the raising of energy within the organism. In the chemical marriage, due honor is given to the importance and uniqueness of the other person, in other words it isn't the idea of the temple prostitute who serves as the vessel for this process but there's actually an effort to keep individual identities and individual dignity, in some sense, together and this is, the higher up the mountain you go, the steeper it becomes and when you begin to scale the heights of alchemical or tantric sexuality the fall back into the nigredo can be shocking indeed so that's just an admonition, it's not designed to scare you off, it's just to say that in an age as sexually obsessed as our own, you have to do as the I Ching says, "inquire of the oracle once again if you have purity of intent." Isn't there also a healing between the two? Yes, it's a complete alchemical system and the energy is passed between. This is probably the highest completion that is possible. The ideal of romantic love, and I don't want to digress too much into this, but the ideal of romantic love was introduced into Europe in the 1400s and earlier at the Anjovian(sp?) court of Eleanor of Aquitaine by troubadours and this troubadour tradition can, scholarship now reveals pretty convincingly that this is an esoteric Sufi system. It also occurs in Indian teachers such as Chitania(sp), who is the guy that the Hare Krishnas go back to. The radical teaching of Chitania was that you could achieve ecstasy not by sitting in yoga, but by dancing and singing on street corners. It's now pretty clearly shown that Sufi, the penetration of Sufi ideas into Bengal was happening at the same time that these Sufi ideas were coming across from North Africa and into Spain and Southern France. So, it's a tremendously old and vital tradition but you have to be careful - the romantic impulse is a real double-edged sword. It has been ever since the early 19th century because, you know, the rise of romanticism, as that term is normally understood, meaning those movements in art and literature of the early 19th century, the rise of romanticism was a response to the dehumanization that was going on at that time. The rise of industrialism and the retreat into cities more massive than any that had ever been built, did you want to say something? I wanted to add, the question was about healing, and I think there's a tremendous difference between Indian and Tibetan tantric systems. You ought to practice in Taoism in terms of single copulation and dual copulation, in the Taoist system self-healing is of paramount importance before you can even consider dual copulation. Dual copulation is then begun, then again other considerations come in, but the Tibetan and Indian systems where Dakinis and various deities are invoked in the process of their alchemical union, it's really quite different from the Taoist system which is devoid of beliefs in gods. That's a good point. You know, yesterday I talked about the alchemical stages. When you have reached the albedo, the final whitening of these processes, that final whitening is, from a higher perspective, a new nigredo and you must always build and build again. So you have to be fairly confident that you have already realized a certain portion of yourself before you embark upon these tantric double experiments. Because a lot of tantric text reads very vampirical, I mean, it's all about expelling the semen and then sucking it back in and it's like an energy war. It turns into black magic. The losing partners in this deal are just left a withered husk and this is not a higher completion to be sought for. You're correct, there are supposedly, whether they're myths or documented stories, about a Chinese Empress who caused the deaths of more than a thousand men because of her vampirism. It was sexual in nature? It was sexual in nature. Just a couple of other points here. The gentleman here who had nothing to comment or wanted to sit it out reminded me, since we were talking about the Valentinian system this morning, my favorite archon, besides Sophia who's so interesting because of the little story about how she made the universe, but the 12th archon in the Gnostic system is a unique entity. I don't know of another religious system that has this notion. The 12th archon in the Valentinian system is called The Watcher. That's all he does. He does not put into the system at all but he is the witness and somehow this creates a validating dimension that is very important. I just want to affirm that the watcher is a very strong platform on which to stand. I mean, would that I could learn to keep my mouth shut. Would that we all could. So, the watcher is a good archon to keep active on your inner altar. So, then, the future occurs three times on the list. We don't have a lot of time, but what I would like to say about it this morning is, if you extrapolate all that has been said here then you should see that, remember how I said that one view of alchemy is that the alchemist intervened in natural process in the role of a catalyst. For those of you who aren't chemists, a catalyst is something that causes a chemical reaction that is going on anyway to proceed at a faster rate but the catalyst is not consumed in this process, it simply accelerates it. And if we think of nature as a great alchemical furnace that continuously reproduces and brings forth wonders, then must it not be that humanity is the yeast of the gain alchemical rarefaction and that human history is the process of catalyzing the alchemical condensation. If we look back into nature, before the advent of speaking and writing human beings in the last 15,000 years, what we see are very leisurely processes. The speciation of a single plant from another can occupy 50 or 60 thousand years, it never happens more quickly than that. And the grinding down of glaciers from the poles, these are processes that take hundreds and thousands of years. With the advent of human beings, an entirely new ontos of being, an entirely new category of becoming is introduced into the entire cosmos, as far as we know, because we cannot verify that there are other self-reflecting beings in the universe and this new ontos of becoming is what I call epigenetic, as opposed to genetic. All other change in the living world, in the world of bios, of zoa, occurs through genetic change, random modification of the genome which is then subject to random selection. But with the advent of speech and writing, epigenetic means outside of genetics, epigenetic processes become possible and time accelerates. One way of thinking about what is happening in this cosmos is that it is a gradual conquest of dimensionality by becoming, or process, we hardly have a word inclusive enough. The earliest forms of life were probably silms on certain kinds of clays, self-replicating molecular systems and then certain portions of this chemistry became light sensitive and then there was the sense of the division of light and darkness which generated the notion of here and there on some tremendously basic level within these early organisms. Once you have the concept of here and there, motility, the ability to move, the cilia that dot the surface of protozoans and stuff like this are elaborated and a new dimension enters the picture, the dimension of time, because notice that a journey from here to there is a journey from now to then. And then, as more refined perceptual apparatus arose, and more refined systems of moving animal bodies arose, a steady conquest of dimensionality occurred. The movement of animals onto the land and so forth. Well then, at the advent of memory, and memory must be mediated by language except at a very crude, instinctual level, memory is a time binding function. It's a way of somehow taking the past and calling up its essential properties so that they are co-present with the given moment of experience. It's one thing at the level of the song and dance of pre-literate peoples but once you begin to chisel stone and write books then you're into the epigenetic domain in a big way. And once you cross the threshold into the world of electronic media and that sort of thing, once you achieve powered flight, once you can hurl instruments outside of the solar system, these are time binding functions and the alchemical intent, recall, was to accelerate nature's intent toward perfection and the alchemists all believed that nature was growing toward a state of unity and perfection, that given millions and millions of years, everything would turn to gold, everything would find its way toward the Platonian one. So, now we live in a world that appears to be on the brink of its own death or extinction and the reason we make that assumption is that our bridges are burning behind us. We see no way back to the world of the hunting and gathering pastoralists of the high Palaeolithic of the Saharan grasslands. We see no way back to the Gothic piety of Europe with over 30 million people in it. Our bridges are burning and our religions, Islam, Judaism, Christianity, the major Western religions persistently insist that we are caught in a tightening spiral of ever increasing speed that is carrying us toward an unimaginable confrontation with something which they call God, the second coming, the messiah, you name it. As cool-headed a rationalist as Albert Toynebe, when he sat down to write a study of history, he finally had to face the question, "what is history for?" And the best he could come up with is "history must be about the entry of God into the domain of three-dimensional space." Well, we don't know what God is, let's not call it God, let's call it the philosopher's stone, let's call it the Sophic Hydrolith, and I believe that the chaos of our world, the apocalyptic intuition that informs our religions and our dreams is because ahead of us in time, and now not that far ahead of us in time, is something, taking a page from the mathematical concern called dynamics, we can call an attractor. The attractor lies ahead of us in time. The universal process is not driven by a downward cascade of Cartesian causality that's the scientific notion and it leads to a universe of entropy and heat death millions of years in the future but what we see around us is a continuing and accelerating complexification as human beings, machines, ecosystems, the solar system itself is beginning to knit itself into a tighter and tighter organization. I believe that alchemy provides the best metaphors for understanding this. Nature is the great alchemist par excellence and we, as its minions through history, are accelerating the condensation of being toward the unimaginable so that in my system, my way of thinking, there's ultimately a symmetry break with ordinary history and I call it all kinds of different things, but here this morning, the transcendent other. The transcendent other casts an enormous shadow across the lower dimensional landscape of time. The stirring of the earliest life forms in the Devonian seas caught the call and every step that has been taken since then has been ever quicker, ever quicker toward the transcendent other, it beckons us and history is haunted by this thing. History is the shock wave of eschatology. History is a process that lasts, let's be generous, 25,000 years, the wink of an eye in geological time, and in that 25,000 years religious rise and fall, governmental systems, teachers come and go and there is a sense of being caught in a whirlpool that is spinning us toward fusion with the unimaginable. This is why the skies of Earth are haunted by flying saucers, they aren't coming from other solar systems, they are scintillas, remember this alchemical term - sparks - they are scintillas being thrown off the alchemical quintessence which lies like a great attractor at the end of time and the purpose of science and techni and electronic media and information transfer and all of this stuff is to knit us together, to dissolve our boundaries and to bring us to a point of singularity where language fails, where we lean over meanings' edge and feel the dizziness of things unsaid. And this lies now, I believe, within our lifetimes, within the lifetimes of most of us, this is actually going to break through. I'm like one of those people carrying a sign that says "repent for the end is near." It's as nutty a position as you can possibly hold. That's why I suspect it has a reasonable chance of being dead on. So, that is the point of talking about alchemy and this melding, the production of the quintessence and all that. It is because we are a gnarl's eyelash away from a full confrontation with the transcendent other. Our dreams are haunted by it, our reveries are filled with it. If we take a psychedelic drug, it's revealed before us in all its splendor. This is the force that is pulling us inexorably toward completion. I remember once in a psilocybin trance I expressed concern about the state of the world and the nous spoke, the logos spoke, and it said "no big deal, this is what it's like when a species prepares to depart for the stars." This is the, we are in the birth canal of a planetary birthing. And as you know, if you come upon a birth in progress, you would never dream that this is the culmination of a natural process. It looks like a catastrophe of some sort. There is moaning and groaning and screaming and thrashing and blood is being shed and there is a feeling that the walls are closing in and yet it is inscribed into each of us as a microscopic reflection of the completion of human history. And not only human history, because we are simply the hands and eyes of all life, all process on this planet. The Gnostics believe that the Earth is like an egg and that a moment will come in which the egg must be split asunder. I love to quote the Grateful Dead, "you can't go back and you can't stand still. If the thunder don't get you then the lightning will." That is what we are being funnelled toward, that is the message of alchemy. That is the quintessence of the human enterprise, the biological enterprise. I like to recall the Irish toast "may you be alive at the end of the world." And we have a real crack at it. It's not a pessimistic vision. It's the most optimistic vision that one can suppose and I think that's where I'd like to leave it this morning.

Today's thing is sort of a return to a more orthodox educational kind of mode, hopefully not to such a degree that it's boring. The agenda is to talk about Hermeticism and alchemy; the way in which this tradition — which is counter- intuitive and heterodox, if not heretical from the point of view of Christianity — what it can mean for the present, what it means for the psychedelic experience, what it means for the notion of the end of history and how the loss of this point of view has probably done us a certain amount of damage.

The great tension in the late Middle Ages was between the magical schema, the magical view of human beings, and the Christian view. The Christian view is very strongly marked by the idea of man's fall, that we screwed up early on and somehow then, by virtue of that, were forced into a secondary position in the cosmic drama. We are doing penance as we speak, the world is a vale of tears, the lot of human beings is to till hard land and we are cursed unto the nineteenth generation by the fall of our first parents. We can be redeemed through Christ, but we don't deserve it; if you are saved it is because there is a kind of hand extended to you from a merciful God who is willing to overlook your wormy nature and draw you up in spite of yourself. This is deep in us; you may not think you've bought in because you're black or Chinese, but it's just in the air we breath. It's what Western civilization makes you think, whether you want to think it or not, even if you don't come out of these traditions; for us, the concept that you've got to pay your dues...

Human beings are copartners with deity in the project of being: this is the basis of all magic. In a Christian context, magic is heresy because it implies that man can command God to act; in other words, that, in some strange way, the magician compels nature to behave as the magician desires. In Hermeticism, it isn't so much put in terms of "compel," but the idea is that men and women of great spiritual accomplishment are copartners in the project of being and that God, as it were, stepped off the stage of creation with it only 90% completed and the rest is left in the hands of his brother. The Hermeticum actually refers to humanity as the brother of God. It's a completely different attitude toward being human, it's an empowering attitude; with power comes the potential to abuse power, because you're no longer a worm. You remember that image in Jonathan Edwards' sermon Sinners in the Hands of an Angry God, where he says you're like a worm suspended over an abyss, held there only by the love of a merciful God; implying that if he weren't a merciful God, he'd just let go of your thread and you'd go down the tubes.

In the Hermetic magical view, human beings are not tainted by original sin. No ideology is without the potential of abuse. The Hermetic attitude in the Renaissance was summed up in a single aphorism by the great Renaissance Platonist Marsilio Ficino — there's no sexism in all of this, you just have to realize that these guys were primitive types and they hadn't confronted the political issues we've confronted, so when they say "man" they mean humanity — the Renaissance magical attitude is summed up in Ficino's aphorism, "Man is the measure of all things." This is a double-edged sword, because in a single affirmation you cast off the guilt trip, you cast off the view of ourselves as a flawed creature, but when you say, "Man is the measure of all things," you could be the chairman of the board of Louisiana Pacific or Dow Chemical; this is approximately their attitude. In other words, it's not rainforests, it's not the life of the earth, it's none of that malarkey, we are to be the measure of all things. So, it has to be tempered. We'll probably end up talking a bit here about the pathological expression of the Hermetic position, which is called Faustianism. Faustianism is where you have unbridled ego, unbridled faith in the intellect, so that you proceed forward without self-doubt. If you haven't read Faust recently, it's a surprising read. First of all, it's very funny, it's funnier than any of Shakespeare's plays, I think. The way it ends is that the guy dedicates himself to land reclamation and the draining of swamps to build low-cost housing for poor people. People don't know this, they're caught up in the images of the center of the story, where magical power is running rampant, but Faust's final conclusion is that he should do some good work for the least of society and give up these Promethean and titanic dreams of the mastery of power.

Well, a little bit of history about this Hermetic ideal. It's an interesting story in the light of our discussion of time yesterday. Western civilization can be thought of as an accumulated series of misunderstandings, and one of the most severe of these misunderstandings has to do with this whole business of Hermeticism. The Renaissance really believed that Hermes Trismegistus was a great teacher of antiquity who preceded Moses, who was, in time, older than Moses. They had what they called the *prisca theologia*, the three theologians, and they were Hermes Trismegistus, Moses and Orpheus, in that order. The reason that I say Western civilization is built on a series of misunderstandings is because they got it all wrong about Hermes Trismegistus. There was great confusion and unhappiness in the 16th century when Isaac Casaubon, who was an early philologist, attacked the dating of the Hermetic Corpus and argued correctly that this could not possibly have been written in a period preceding Moses, that in fact this was post-Christian, written no earlier than the 1st century A.D. This is the equivalent of us finding out that George Washington was alive in Greenwich Village in the 1930s. It was a completely mind-bending re-alignment of how people thought the history of the world had unfolded, because they had up to that time thought that when you studied Hermes Trismegistus you were reading the oldest philosopher in human history; actually, it's very late. In a way, this is what destroyed the magical alternative: that the advent of modern philology showed that these so-called ancient texts were not ancient at all, they were late Roman, they were Hellenistic. So strongly was imprinted in the Western mind what's called the "nostalgia for paradise," in other words, the belief that the older it is, the better it is — Giambattista Vico in *La Scienza Nuova* laid the basis for this kind of thinking, it's called "classicism" in the Renaissance context — so once they found out that the Hermetic Corpus had been written in late Roman times it was like it was finished, and science was able to use the confusion in the magical community at that point to force its own agenda very strongly.

There have been numerous episodes of misplaced dating like this that have contributed to the confusion around the history of magic. For example, and I hope this doesn't bring somebody rising out of their chair in an air-clawing rave: Rosicrucianism rests on a whole bunch of phony dates, because they want to tell you that that somebody named Christian Rosenkreutz wrote a book called the *Chymical Wedding* and sealed it up in a time capsule in the 12th century, and that it was then dug up in the 16th century, but actually all

these Rosicrucian documents were ponied up by people in the 16th century who had a very complicated political agenda, which we will probably discuss as part of this weekend.

Hermetic philosophy is based on what is called the Hermetic Corpus. This is a group of books, the most important of which is called the Asclepius. Most of these books were completely lost during the Middle Ages. At the fall of the Roman Empire, copies of these Hermetic manuscripts were systematically destroyed by enthusiastic Christian barbarians. The Hermetic manuscripts were scattered and they only survived in monasteries in Syria and places like that. Then, in the Renaissance, the Council of Florence under the patronage of the Borgias and people like that, there was this great interest suddenly in antiquities, because this Roman statuary and stuff was coming out of the ground, so the Council of Florence commissioned a character named Gemistus Pletho to go to Syria and bring back these manuscripts, and they established a translation commission. They had, in manuscript, the works of Plato, the works of Hermes Trismegistus, a whole bunch of ancient literature. To show you what the psychology of the Renaissance was, here they had Plato, which they hadn't been able to read for a thousand years, sitting there waiting for translation, and the Cosimo de' Medici said to Marsilio Ficino, "Plato can wait, translate the Hermetic Corpus first," and so it was done. If you're interested in Renaissance Hermeticism you can't do better than to read Dame Frances Yates' book Giordano Bruno and the Hermetic Tradition. Well, I want to read you some of this stuff because it's very interesting and it has a modernity that is astonishing. It's also very psychedelic.

Here's a little passage on the imagination. I'm reading from Book Nine of the Corpus Hermeticum in the Scott translation. This is a four volume set. I only brought the "texts in translation" volume, but if you read Greek, it's all here, if you don't, it's all here in English, but this will give you a feeling for the approach:

If then you do not make yourself equal to God, you cannot apprehend God; for like is known by like. Leap clear of all that is corporeal and make yourself grow to a like expanse with that greatness which is beyond all measure. Rise above all time and become eternal: then you will apprehend God. Think that for you too nothing is impossible. Deem that you too are immortal and that you are able to grasp all things in your thought, to know every craft and every science. Find your home in the haunts of every living creature. Make yourself higher than all heights and lower than all depths. Bring together in yourself all opposites of quality: heat and cold, dryness and fluidity. Think that you are everywhere at once: on land, at sea, in heaven. Think that you are not yet begotten, that you are in the womb, that you are young, that you are old, that you have died, that you are in the world beyond the grave. Grasp in your thought all this at once, all times and places, all substances and qualities and magnitudes together: then you can apprehend God. But if you shut up your soul in your body and abase yourself and say, "I know nothing, I can do nothing. I am afraid of earth and sea, I cannot mount to heaven. I know not what I was nor what I shall be," than what have you to do with God? Your thought can grasp nothing beautiful and good, if you cleave to the body and are evil.

Interesting; very different from the "Humble yourself," hard labor, spun wool and watery beer approach of medieval Christianity. Here's an amazing passage. People like to think that people thought the world was flat until the Renaissance. This is an incredible psychedelic image of outer space that is 2nd century A.D.:

Would that it were possible for you to grow wings and soar into the air! Poised between earth and heaven, you might see the solid earth, the fluid sea and the streaming rivers, the wandering air, the penetrating fire, the courses of the stars and the swiftness of the movement with which heaven encompasses all. What

happiness were that, my son, to see all these borne along with one impulse, and to behold Him who is unmoved moving in all that moves, and Him who is hidden made manifest through His works.

It goes on and on. It's very readable, it's very literary, it's highly poetic. It's a celebration of nature, the notion of sin is completely absent. It rings with a kind of confidence, a kind of joy that was completely running counter to the brimstone and damnation point of view of Christianity. Here's, to me, a psychedelic passage:

But He who presents all things to us through our senses and thereby manifests Himself through all things and in all things, and especially to those to whom He wills to manifest Himself: begin then, my son Thoth, with a prayer to the Lord and Father who alone is good. Pray that you may find favor with Him and that one ray of Him, if only one, may flash into your mind so that you may have power to grasp in thought that mighty being; for thought alone can see that which is hidden, inasmuch as thought itself is hidden from sight, and if even the thought which is within you is hidden from your sight, how can He, being in Himself, be manifest to you through your bodily eyes? But if you have power to see with the eyes of the mind, then, my son, He will manifest Himself to you; for the Lord manifests Himself ungrudgingly through all the universe, and you can behold God's image with your eyes and lay hold on it with your hands. If you wish to see Him, think on the sun, think on the course of the moon, think on the order of the stars. Who is it that maintains that order? The sun is the greatest of the gods in heaven. To him as to their king and overlord, all the kings of heaven yield place; and yet this mighty god, greater than earth and sea, submits to having smaller stars circling above him. Who is it then, my son, that he always obeys with reverence and awe? Each of these stars too is confined by measured limits and has an appointed space to range in. Why do not all the stars in heaven run like and equal courses? Who is it that has assigned to each its place and marked out for each the extent of its course?

And so forth. So it's nature-oriented, celebratory; it glories in the exercise of the mind. It is not doctrinal, it is not pietistic. It is magical, psychedelic, expansive. I'm not implying that they used psychedelic substances. The evidence for that is incredibly murky and hard to get at, and probably they didn't. One of the real tragedies of Western history is that Western Europe is so poor in psychoactive plants. Had Western Europe stayed in touch with the mystery religions of Ancient Greece, Christianity would never have been able to force its agenda to the degree that it did. I think you can make an argument that there were psychedelic mysteries in Europe, probably up until the time of the fall of Eleusis. Hermeticism is only one heterodox strain among many that were in existence in Europe in the late Roman period and that then partially survived into the Dark Ages. You had Neoplatonism, which is a group of philosophers in the 3rd and 4th century — Plotinus, Porphyry, Proclus and that crowd — and they took the late Plato and contorted that into a mystical doctrine of emanation. They were what are called emanationists: what this means is that you start with the One, or the Unnameable, or Brahman Atman, and then you have a series of declensions into more and more material and more and more multiplistic expressions of being. These Neoplatonists were emanationists, and their theories about how the universe is constructed have become the unconscious basis of all later magical speculation. They are the people who brought the angels into the picture so intensely, because they were trying to create a descending hierarchy of being from the most high down to the most low.

Angels, once set in place, became a real problem for Christianity, because they are not very easy to distinguish from the old stellar demons of paganism. Paganism was largely the belief that the power of the stars could be drawn down to earth through sympathetic magic. By setting up resonances in a ritual

situation, you could draw the power of the stars down into your projects and your intentions. The late Middle Ages was a period of intensely working out all the associations between minerals, colors, perfumes, plants, musical notes and styles, so that you could then bring together all these things for purposes of magical evocation. If any of you are interested in this, the book to read, which will point you toward many other interesting books, is a wonderful book called *Spiritual and Demonic Magic* from Ficino to Campanella. In the Renaissance, over a period of about three generations, this became a real problem, because what starts out as angel magic ends up as out-and-out demonic conjuration, something which I've noticed my 14-year-old son has an incredibly unhealthy interest in. I did as well at his age; I hope it's not the family curse coming back.

I mentioned the dating error. It was Lactantius, who was one of the fathers of the early Church, one of the patristic writers, that generation of theologians that followed Christ who canonized the Christian religion; he placed Hermes Trismegistus as older than Moses, older than Pythagoras, older than Plato, and it wasn't until Isaac Casaubon that this was corrected. We forget how transformative a breakthrough was represented for Western Europe by the recovery of all this ancient literature. It had been completely lost. A misimpression that probably needs correcting is that most people who are not schooled in Western history think that the further back in time, the more "superstitious" people were. This isn't actually the case. It isn't the case that the further back in time you go, the more belief in demons, magical conjuration and stuff like that you get. The 10th, 11th and 12th centuries in Europe were periods of remarkable piety and intellectual cohesion; of course it was also some kind of a fascist nightmare, that's how they achieved it. They had stamped out paganism, they had pushed heresy and heterodox thinking to the very distant frontiers of the Holy Roman Empire. People were not superstitious, people were not obsessed with horoscopes and conjuration and this sort of thing. Where that reached its culmination was in the 16th century; the 16th century was the most magic-obsessed century in the last ten.

Alchemy, conjuration, talismanic magic, sympathetic magic: all of these things flourished, not as a throwback, but as a kind of prelude to modern science. Modern science is an incredibly demonic enterprise, and we will see as we discuss this stuff that, in a curious and rarely discussed way, the agenda of magical dissidence in Europe has been entirely achieved by the forces of what we call modernity. It's simply that it has been done in an entirely secular metaphor. If you take even the trivial belief about alchemists, that they were concerned with changing lead into gold — of course that wasn't what it was about, but there were plenty of con artists running around on the periphery of these deeper scenes who were claiming that they could change lead into gold — well, in the 20th century, we routinely change lead into gold. We do it with neutron bombardment and particle accelerators, and of course it costs far more to do it than the worth of the gold that you get out, but that really wasn't the point, was it: it was to prove that it could be done. The dreams of creating the homunculus are dreams that dovetail directly into the aspirations of modern biology and genetics. The Great Chain of Being of Aristotle is animated, given a dimension of motion and, lo and behold, it becomes the Darwin-Wallace theory of evolution. Mircea Eliade talks about this, about how all the alchemical dreams of the 15th and 16th century have been brought to fruition in the 20th century in the absence of magical rhetoric, but certainly in a spirit of magical and Faustian recklessness. Scientists claim such a devotion to truth that decency must never stand in the way; they serve a higher god than human values, they serve the golem of the truth in some weird way that makes the truth OK even if it kills you. I studied philosophy from Paul Feyerabend and he used to say at the beginning of his Epistemology 101 course, "I will teach you to recognize the truth and I will teach you to ask the question, "What's so great about it?""

It was 1460 when these manuscripts were brought to Florence. Those of you with photographic memories can see the Time Wave signature as it turns over and heads through the floor. The Cosimo de' Medici immediately ordered Ficino to abandon his work on Plato. The Pimander was the only one of these books which existed in Europe even in partial form during the Dark Ages; Cosimo died in 1464 but the translation project went forward. The tree, the developmental process in Western magic all goes back to this Florentine translation project, and from there people who were well placed got a hold of this stuff. The most important person probably being an unsung hero in the development of Western thought, Trithemius, Abbot of Sponheim. Trithemius wrote a book — it was really a manuscript, it was never printed as a book in his lifetime — called the Steganographia. In it he put forth many of these magical doctrines, and also encryption methods for codemaking and breaking so that this stuff could be circulated under the eyes of the clergy without causing a problem.

Then the development of Western magic splits into two strains: the strain of Giordano Bruno and his school; he was a Franciscan monk who ended up being burned at the stake. His sin, for which he was burned at the stake, was that he was sitting on a rooftop of one of these Italian city-states one evening, presumably smoking some pretty decent boo that they'd brought in from North Africa, and he was looking at the stars and it occurred to him, "These things are suns. These little points of light are like the sun. Jesus christ!" and in a single moment the universe became infinite. He thought, "If these are suns. . ." and his mind was boggled, literally. Can you imagine, inside the medieval worldview, where they have these concentric shells of angels and demons, suddenly this guy gets it in a single moment and he sees that the universe is infinite and he begins to say so, and this is against Aristotle. The Church just goes nuts and they drive him out of Italy, and he has a whole bunch of adventures in England and other places. Eventually he makes the mistake of coming back to a place in Northern Italy, where he's betrayed by his patron and he is burned at the stake for a point of view which all of us take quite for granted.

The other strain of magic coming down from Trithemius is the Dee strain, and it is a bit more accessible to people like ourselves because John Dee was an Englishman and he wrote in English, so you don't have to conquer 16th century Italian or late Latin in order to read him, although he wrote a lot in Latin as well. Dee is a very interesting character, worth spending some time on, because Dee is the last person to be able to unify into one worldview science and mathematics, magic and astrology, all together; he is the greatest magician of his age and the greatest scientist of his age. He designed the navigation instruments that Sir Francis Drake used to go around the Cape Horn and sail up the coast of California, he was an intelligence operative serving Queen Elizabeth on the European continent. He could cast the best horoscope in Europe and that was his entree into the various royal families of the capital cities of Europe, and then he was making maps of battlements and of the deployment of war facilities and shipbuilding capacity and sending it all back to Elizabeth in these codes that he had learned from Trithemius, not personally but from the Steganographia. A very strange incident happened on a cold day in April at his house in Mortlake, which was on the outskirts of London, now completely surrounded by modern London. I should say, he had the largest library in England, he had 6,000 books. Sir Philip Sidney and the Queen would occasionally call upon him to shoot the bull, he was a very learned man.

So, one day in April of 1582, he's working at his desk at his room in Mortlake. There's some disturbance in the garden and he goes outside. His story, and we have only his story, is that an angel descended in a ball of light and gave him an object, which is to this day on exhibit in the British Museum. If you ever have a chance, it's worth hunting it down, it's in the Renaissance Hall. It's a piece of black polished obsidian; he called it the Shew Stone. The deal was that you could look into the Shew Stone if you had the right talent,

and it was a magical theater. There were gods and demons and female spirits and all kinds of things swirling around this thing. For the next many years, the Shew Stone was the major guiding force on Dee's life, and a guy came to him named Edward Kelley. Legend has it that he had no ears, which in England at that time meant that you had committed some infraction in the province and they had removed your ears. It was the mark of a con artist, it was so you couldn't fool anybody else, so if you met somebody with no ears and a big scheme you knew to keep your wallet in your pocket. This guy Kelley had an immense facility with the Shew Stone. It is one of the most puzzling and undiscussed episodes in the evolution of Western thought. It's very puzzling, because if he was a con artist he must have been a con artist of immense cleverness, because often the way the Dee angels would work is that they would deliver very long messages in Latin, backwards, and Kelley would dictate this stuff at a very rapid speed, Dee would write it down, and then they would put away the Shew Stone and they would very laboriously rewrite this stuff from back to front. They would be these long, coherent harangues about what they should be doing: about which courtly figures they should support with money and who should be introduced to who; it was very political.

Well, what kind of a polymathic talent was Edward Kelley that he could invert whole pages of Latin and reel it off and then have it be reconstructed and make sense? We know about this because Dee kept a diary over the years that this was all going on. It's one of the most astonishing books in all of English literature, and until the last ten years the 1658 edition was the only edition ever published. It's called *A True and Faithful Relation*, or in full, *A True and Faithful Relation of What Passed for Many Years Between Dr. John Dee and Some Spirits*, with annotation by M'eric Casaubon, the son of Isaac Casaubon, who did the correct dating on the *Hermeticum*. It's very interesting reading, it's one of the most puzzling incidents in the whole history of science.

Another religious system that was sort of complimenting the *Hermeticum* and developing alongside it was Gnosticism. The psychology of the late Roman Empire was very modern; Gnosticism is a very modern impulse. It may not at first appear so, because ancient Gnosticism is freighted with angels, demons, what we would call superstition, but if you strip away all that baroque stuff you come to a philosophy very similar to the philosophy that many of us have accepted without thinking; we just call it modern attitudes. The idea of Gnosticism is that you're on your own, there ain't no free lunch; if God did make the universe, he disappeared shortly afterwards and has no interest in your fate, your fears, your hopes. Gnostics were profoundly phobic of the world and they were either very ascetic cults or they were very libertinistic cults, springing from the same idea, which was that they did not belong in this universe. They were from a different place, and their whole concern was to escape. They are the ones who decided that the earth was an iron prison. They didn't like to have children because they felt that to have a child is to trap light in matter. In many Gnostic sects, the only forms of sexual activity that were approved of were forms that were guaranteed not to lead to conception: oral sex, anal sex, whatever. Needless to say, these sects died out in a hurry because they were self-limiting.

The whole Hellenistic world was awash in religious speculation. On every street corner they were casting horoscopes and prescribing diets. There were the temple prostitutes, there was the whole hedonic element in sexuality, orgy was a style in some religious organizations. Out of all of this religious foment came Gnosticism, Hermeticism, Chaldean oracularism, Jewish syncretism and so forth and so on. Christianity was just one in the crowd, but, with sharpened elbows and a sense of organization, it was able to slowly worm its way into a position of dominance. The real Christians probably were stamped out under the name of pagans. The message of Christianity was that the end of the world was imminent. For about 150 years

after Christ, everybody was so stoned out on this rap that no serious organization got done and they just waited for the end of the world in little communities, practicing voluntary poverty and doing their thing. Then it began to slowly dawn on people that it had been a long time since the messiah's promise and that it was stretching out a little. So then certain mentalities in that situation said, "This return of the messiah is all very well, but I think we should get some real estate under our control, begin a vigorous building program and maybe found some schools." These religions began to turn away from their end-of-the-world, ecstatic millenarianism and to see themselves as organizing for the long haul. It was in this atmosphere that the Hermetic books were produced and written down.

The chief magical ritual of Hermeticism is the ability to call stellar demons down into statues, and these statues prophesied. This is why Christianity takes the Jewish aversion to idol worship and raises it to a whole new level of intensity, because they were freaked out by this animating of statues with stellar demons thing that the Hermeticists were into. When you're reading a 1,500-year-old account of a magical invocation, if we are to believe them, what happened was that by singing certain songs, burning certain incense and performing these rituals at certain times that were astrologically correct, they could invoke these things called decans, which are zodiacal demons of some sort; there are three decans to each zodiacal sign. Modern astrology has largely forgotten this. There are people who do decanic astrology, but you have to pay through the nose, because of course this is a lost and dying art. They would somehow be able to draw these decans down into the statue, and then they could extract knowledge from it, and this would lay the basis for these sympathetic magics that were later developed in the Renaissance. It's quite powerful, this is why this book I recommended is so interesting, the one on Spiritual and Demonic Magic by Walker.

These Renaissance princes were incredibly wealthy; you have a suite of apartments that overlook the Plaza San Marco in Venice and certain colors are prescribed that the walls be painted, you only wear certain kinds of robes made of certain materials, you perform your magical invocations at certain times of day, you burn certain incenses. They were big on fresh air and light. It isn't the dark image of magic that we get, of the stirring cauldron, the bat-faced familiar and all that; it's all about open air, light, wind blowing through, flowing silk robes. They were angelic magicians, and they were invoking these things through the use of sigils, which are magical symbols, and then there became stress on magical languages. Enochian is one of these magical languages. Remember, I mentioned the whole ten year episode with the Shew Stone — well, one of the subjects which these entities that Dee and Kelley were dealing with returned to again and again was the Enochian language, which they said was the true language that Abraham used to communicate with the angels. It has an alien alphabet, and there has even been published an Enochian dictionary of some four or five thousand words. There was a very bizarre episode in the mid-1950s, there was a woman who was some kind of clairvoyant and she was in contact with flying saucers. Now everybody and their dog is in contact with flying saucers, but then it was fairly rare, rare enough that she became an object of interest to the CIA. At one point she was in the CIA building in Langley, Virginia, they were interviewing her and she said, "There's a flying saucer right outside the window," and these guys rushed to the window and looked, and there was some kind of thing in the sky, and she said, "It's giving me a message for you," for this colonel. The message was, "AFFA, AFFA, AFFA." I looked this up, I had a hunch, and AFFA is the Enochian word for nothingness; just more weirdness.

Angelic languages; why are these DMT creatures so concerned with language? Not only language, but alphabets. One of the high-water weirdness events of my life was that when I was young I wanted the DMT flash to last longer, so I used to smoke it at the height of LSD trips. One Christmas vacation at this

rooming house that I managed in Berkeley, everybody had gone home for Christmas, I thought, so I decided I would take some LSD and smoke DMT. It was just nuts, it's nuts enough, but this was like turbo-charged nuts; it went on and on and on. There was a woman who I rented a room to upstairs named Rosemary, who was supposed to be in Minnesota. She was an actress and very projective and did everything with great flair, and she apparently came back early from Christmas vacation. So, she hit the front steps of this house running, used her key to let herself in, came right around to my door and started beating on my door. I am by nature a very paranoid person. I can be up the Rio Yaguas in the middle of the Amazon Basin, and if I'm out in the rainforest smoking a joint and a stick is broken, I immediately hide the dope.

So, this woman lets herself in and beats with her clenched fist on my bedroom door. I underwent a coronary thrombosis or something; I was in the elf space and they were screeching and chattering and showing me all this stuff. When she did this, I flew off the bed, I jumped two feet in the air and landed on my feet, and it was as though the sudden flash of adrenaline and this sudden movement that I made broke up the ordinary division between the trip and normality. Anyway, I pulled the trip with me into the room. I was now standing in the room, eyes open, but the elf creatures had come with me. Everything had been jacked up to some immense level of intensity. There were these rotating geometric things hanging in the air and they were moving in this jerky motion. This thing was going, "Click. Click. Click," and it was faceted. Every time it would make this large metallic click, these plastic, triangle-shaped, brightly-colored chits, like little pieces of floor tile, would fly across the room. Each one of them had a letter on it in an alien language, sort of like Hebrew or Sanskrit. There were several of these machines and these things were ricocheting off the walls, and I had an elf hanging off each hand and I was just saying, "Holy shit!" She's still beating on the door, so I stagger over to the door, fling it back and look at her and say something like, "Wey dukwham waxibo gwani haptigo butix shning," and she realized at that point what my problem was and retreated, but I've never forgotten. It's the one time they went literary on me, and not only did I see them, not only did I hear them, they were printing their message on the air as well. Very curious.

Mandaeanism is a very old religion that arose around Jerusalem a couple centuries before Christ. It was a baptismal cult, they were the oldest continuous Western religion in the world with a gnostic intent. Probably they started out as Jews, but they were persecuted. They claim John the Baptist as one of their own, and he was a member of some kind of baptismal cult because we know that he baptized Christ. They were driven out of the area around Jerusalem and then for centuries they were in Lebanon, and they slowly made their way across Persia and ended up in the swamps of Iraq and Iran. Mandeans are very interesting, they have their own written language, although in 1847 there was a cholera epidemic that wiped out 90% of the priesthood. Only priests were allowed to learn to read and write this language; I have some facsimile manuscripts from the Vatican library. I sort of think that we all should become Mandeans; of all the religions I've ever looked at and studied it seems to me the most psychedelic, the most ethically correct. It would be a great religion to practice on a world scale because they're into caring for the land. They're river nuts, they love rivers and they build a cult hut called a mandi and they always divert a little ditch through it and they do their ritual baptisms there. Their folk tales and their religious beliefs are very interesting, it's like a religion of biology. The highest god in Mandaeanism is called Hibbel Zaywa, and Hibbel Zaywa is always referred to as "they." It's that "they" are in charge. It's beautiful scriptural stuff. They're very much like Orthodox Jews, only moreso, in that if you're a religious Mandaean your life is ruled by all kinds of things, sort of like the rules of kosher. The most difficult rule that these people are asked to keep in their own lives is that, if you're really a devout Mandaean, you are considered polluted if your eye falls on an unbeliever. An unbeliever is a non-Mandaean, so you can imagine how difficult it is, when you're down to

400-500 people, to make sure that those are the only people you ever see. The only profession that a Mandaean man can follow and not require ritual decontamination every day is silversmithing. So if you ever go to Baghdad or Basra or Kirkuk there are communities of these people, and you find them by going to the silver markets and then through discreet inquiry you can find them.

Folkloric anthropologists have developed all these rules. If a religion makes something taboo, you can usually bet that means that they were into it at some point. When a religion makes something taboo, it means that there has been a reformist upheaval inside the religion. This is probably how soma was lost to the ancient Hindus. Zoroaster was called the Great Reformer because he suppressed a lot of indigenous shamanic cults. Some people think that he attempted to suppress haoma, the Avestan counterpart of soma. If any of you are interested in all this, in this book by Flattery and Schwartz called *Haoma and Harmaline in Iranian Religion* they make a very strong case that soma was not mushrooms, that it was *Peganum harmala*. In the pre-Zoroastrian faiths of Iranian religion, drugs were not only used to access the spiritual world, but they actually said that there was no other way to do it, which is sort of my position. These pre-Zoroastrian Iranian light religions were into what they called the menog, and it's another dimension and you can only attain knowledge of it through the use of drugs. The menog existence is where the dead people are. What their religion was about is that you get to know your own soul through using drugs. It's like visiting somebody in stir, your soul comes through the menog existence and meets you at the membrane. The idea is that during life you must learn to recognize your soul, because after death, if you can't pick it out of the soul swarm, then you will be somehow incomplete in the after-death world.

DMT raises the possibility of death by astonishment. When you take DMT the question is not, "Will I be all right?" the question is, "Have I lived through it or not?" because you can't tell whether you've lived through it. DMT is a very short-acting hallucinogen that you smoke, but it's a neurotransmitter, it occurs in all human beings on the natch. It occurs in various plants and animals, in terms of nature it's the commonest of all hallucinogens; in terms of impact, it's the strongest of all hallucinogens. It's a completely reality-obliterating experience, and it comes on so quickly that you don't grok it like a drug. We all know what a drug is: you feel this, you feel that, it gets stronger, it makes you rest, finally it overwhelms you. This isn't like that. This is like: you and your friends are somewhere, there's talk about this drug, the pipe gets filled, you smoke this drug and a 747 crashes into your apartment building at three times the speed of sound and interrupts whatever you were doing. Sometimes people come out of it saying, "What happened? What happened, for crying out loud?" and you say "Nothing happened, you just did it. That's what it does." It happens so quickly that we interpret it as an event coming from the outside, rather than a chemical compound diffusing through your body. It completely replaces reality, not with the contents of your unconscious or your unfulfilled dreams, wishes or any of that but with another dimension, a space filled with entities busy about their many tasks, although they notice you and come flocking over with a piercing screech. They like to treat with you, they play with you, they're not entirely friendly. It's the kind of feeling I used to have in India when I would go to make these hash buys in these Indian markets, and these guys would say, "Welcome, welcome. You're my friend. I'm not like all the others." It was fine, we were there to do business and everything usually went smoothly, but this was no environment in which to let your guard down.

The best guess so far is that endogenous DMT mediates attention. For instance, if there were to be a noise over here or a movement and I turn and look, that's a little spike of DMT which makes that possible. It's where you suddenly narrow your awareness and project it deeply into a small, confined area. This was the best guess of the people who did work on it a few years ago. There are a number of physioactive

tryptamines. DMT is not a cardioactive tryptamine, if it's made right. Sometimes when you smoke it your heart races, but you can't tell whether that's sloppy synthesis or that you're scared. It's made from tryptophan, which is an amino acid, one of the eight essential amino acids. It's an easy conversion out of tryptophan. It can come from a plant, but if you were to ask a chemist to make it for you he'd ask you to get a few hundred grams of tryptophan.

On mushrooms you hear a voice, you rarely see who's talking. On DMT all barriers are transcended in the first thirty seconds. You hear it, you see it and sometimes you feel it. These little entities, these self-dribbling basketballs, these things that I call the tykes; they jump into your chest and then they jump out again. I don't know why they do that. In the Amazon, among the tribes that use DMT derived from plants, they call these spirit things hikool'e, and they say that they will jump into your chest and then you're supposed to have a technique to keep them from getting out. The number of these things that you trap inside your body cavity indicates how powerful a shaman you are. Your magic is done through the hikool'es that are trapped inside of you. It's very hard on DMT to tell yourself that this is a drug. It doesn't seem like it, it seems like you just tunneled through an energy barrier into the beta sub-x dimension which is all the time all around us, but somehow you became virtual and moved across the energy barrier, and there you are. The other thing about DMT that's weird is that it does not affect your mind. You don't feel gaga with ecstasy, you don't feel relaxed, you feel exactly the way you felt before you did it, it's that the world has just been swapped out. That's strange, I sort of like that: that it doesn't lay a glove on the observing cognitive processes. Instead, it just does something in the visual cortex that causes the world to be replaced by a five-dimensional highly-colored moving environment filled with screaming elf demons.

Some of you may know this book *The Fairy Faith in Celtic Countries* by Evans-Wentz. It was reprinted recently and I wrote the introduction to it. It mentions there that when Saint Patrick arrived as a missionary in Ireland, the problem that he encountered was this belief in the land of fairies. In order to convert the pagan Irish, he convinced them that these were souls of the dead in an intermediate zone that was neither heaven nor hell, which he called purgatory. Purgatory was invented to accommodate the folk beliefs of the pagan Irish. When it was brought back to Rome, it seemed like a such a good idea for converting all kinds of pagan peoples on the fringe of the expanding sphere of Christianity that it's been in place ever since. I've wondered about the way in which there seems to be a racial or genetic undertone to some of this stuff. I didn't know until I was 13 years old that I wasn't a white person. I grew up in Colorado where everything was white-bread culture, and my father may have had opinions about the IRA and all that but we were never told that we were Irish. Some of you who have roots in this city know that, as recently as fifty years ago, they used to have signs up along 8th Avenue that said, "No Dogs or Irish Allowed." So I reconnected to that part of the heritage. The Irish are stereotypically known to be susceptible to intoxication, to be great word spinners and to have this peculiar relationship to fairyland. I don't want to think that I'm just exploring the Celtic collective unconscious, it seems to me that these things must be there for everybody. Nevertheless, we're so concerned to suppress racial differences — because we're a democracy, and because racial problems have haunted American racial politics from the very beginning — that we tend to want to believe that everybody is the same.

I took a course once at Cal that was given by the forensics department, and it was called *Biochemical Markers for Individuality*. It was actually taught by Alexander Shulgin, the great drug designer, and one of the things we did is that he brought in a little vial of some kind of chemical and he passed it around. Out of 200 people in the class, 198 couldn't smell it at all, and two people were so overwhelmed by the smell of this that they actually became physically sick for a few minutes. He explained to us that these people were

probably up to 50,000 times more sensitive to this chemical than most people, and that this is a gene that you carry for sensitivity to this thing. Those kinds of compounds, aromatic compounds with an electronically active ring structure, are the very nearest relatives to drugs, and so it's reasonable to suppose that there are genetic differences in the way we relate to drugs, which doesn't mean racial differences, it means from person to person. It also may mean that a race is a collection of related genes which are more frequently found together than not. This is why, technically speaking, you can never say that so-and-so belongs to a race. A race is a quality of a group; it's not something an individual is. You have to have a bunch of people before you can say that you're confronting a phenomenon of race. What aboriginal people believe is that there are shamanic lines, family lines with a greater susceptibility to these things than others. One of the things you learn when you begin to explore psychedelic substances is that it isn't hitting everybody the same way; in fact, it can hit people radically different ways.

Audience: It seems to me that these entities are in many ways similar to elemental spirits. Do you think of that as a possible explanation for them?

It's true, they are. They don't look like them, though, they don't look like anything. Those of you who don't have kids can tune out, but since I have kids I've seen a lot of bad movies because that's what they make for kids. Four or five years ago at Christmas time there was this movie called Santa Claus. There was one scene in the elves' workshop where they were making thousands of toys, and there were all these conveyor belts going from level to level and these guys rushing around at full speed; it was the most DMT-like reconstruction I've ever seen. It's funny, though, that the elf mythology doesn't carry the sense of strangeness that you get in the DMT flash; although I suspect that this is because we've been polluted by Disney, that Disney has given us this vision of fairies that are too harmless. It's the Tinkerbell phenomenon. If you go back to Andrew Lang's Fairy Books, those are weird. Fairies are weird; they steal babies. That's their main way of relating to human beings, they steal human infants and leave behind wizened, deformed, sickly creatures who become very strange and peripheral kinds of human beings. If you get trapped in fairyland, the only way out is through poetry. They're language-oriented, they will never do you damage if you convince them that you're a master of words. All over the world there is this persistent motif of these small entities. I'm not suggesting that they're really there, but I don't know what's going on. It's odd that they should persist and that they should be experientially available. It would be a whole different thing if it was Madame So-and-So saying this to you, but I'm pushed to this stuff by experience, because my inclination is toward reason. It's just that everybody moves along safe channels, everybody stays out of the fast lane. If you move to the edges — drugs are certainly an edge, a full exploration of one's sexuality is certainly an edge, going off to weird corners of the world and staying long periods of time is certainly another edge — the self-confirming world of white-bread, European, bourgeois, work-hard types just looks as weird as any cultural adaptation could possibly be.

Reality is created by language and we are all imprisoned in somebody else's language. This isn't how we want to talk: 90% of the words and constructions we use would be great-grandfathered. We are living inside a 90% 19th-century worldview. Culture cannot evolve any faster than its language evolves, because what cannot be said cannot be done, what cannot be said cannot be put in place. One way of thinking about psychedelics is that they empower language, it's a way to force the evolution of language. The way you stretch the envelope of culture is by creating language. This happens unconsciously. Hasidic Jews, Rastafarians, whatever, the way they create their boundaries is through language. This is how the Catholic Church does it, speaking Yiddish is a way to do it; you create a new reality inside the old one, and you can do it by moving backward into a specialized language or you can move forward into a new language.

Look at how the introduction of the computer has transformed our language in the '70s and the '80s. CPU, throughput, output, input, bug, glitch: these are words that have been empowered by our involvement with a machine. Before that, the major influence on language in my lifetime was the LSD episode of the 1960s. It always amuses me how much time and energy the establishment spends heaping abuse on hippie talk. It's even now sold to you guys as West Coast talk. It's sold on the West Coast as L.A. talk. Wherever you are, you're close to it but not of it. It's like they used to say of the Watergate scandal, "linked but not tainted."

What LSD did, I can remember a concept like "ego trip." The first time I heard that I didn't know what it meant, I didn't have the concept. Well, once somebody explains to you the concept, then you've got it. "Vibes": that notion introduced a whole bunch of people to the idea of emotions. "Vibe" means that there's no rational reconstruction of what was going on, but you could just tell that it was not a place you wanted to be. So it began to empower new realities that were able to emerge, and it was important for the establishment to suppress that, because new words are the beginnings of new realities. The gay thing is an interesting example of that. In the 19th century it was called "the love that dare not speak its name." Interesting; it was there but you dare not speak its name. Somehow to name it was to bring it too much into the forefront. People who were gay, it was worse than being a communist. Now, it's empowered. All the various racial groups that have had to come up through the American meat grinder have had to create vocabularies of community that they were proud of, rather than accepting the vocabulary of the dominator culture. A good example is the NAACP. The words "colored people" are embedded there, and yet these were the sincerest and most radical people in that movement at a certain point.

Constantly, oppressed minorities are trying to get the language right, and it's important for us to do this, too. Are we stoners? Are we heads? Are we shamans? What are we, exactly? Pouring psychedelic substances into that mix opens the doorway for the Logos to define you, and building community is part of this. We are an interesting potential community. We tend unfortunately toward the lily-white, but I don't see any class dominating. There are probably, in this room, people who could buy and sell all the rest of us without going past their small change. There are probably also people who scraped and saved for this weekend and could ill afford it. Maybe we're some kind of generally definable group of people by level of education, but I don't see that either. What holds us together is what holds all subcultures together, which is an experience, in this case the experience of being loaded. It's a very powerful and immediate kind of experience. I'm sure some of us are more loaded than others, in any subgroup you'll get that kind of a spectrum.

What happens for me is that these entities want me to do what they're doing, and what they're doing is using sound to make objects appear out of the air. They can sing objects into existence. I think that they're language elves: they're not made of matter. Well then, what are they made of? It seems as though the place you go to on DMT is made purely of language. It's a hard thing to picture. They're like sentences rather than organisms. The essence of their presentation is like that of a pun. They want you to learn to make a better kind of language: not more articulate, not more clearly defined, but they actually suggest that there can be a dimensional breakthrough into a language that is seen with the eyes. I think that the breakthrough that we're waiting for is not going to come out of a political movement, or a redistribution of wealth or anything which could be called political, it's going to come out of a shift in the body. These things happen; it's very mysterious how they happen. Think about ordinary language. Here you have two people: one is mute, the other has the ordinary powers of speech. They look exactly alike, you can't tell a mute person from anybody else, and yet there is this extraordinarily complex behavior. Language is a behavior of some sort, and it's very hard to imagine that it slowly insinuated itself into our being. It looks to me more like it

was a kind of quantum leap, and probably appeared very suddenly.

There have been other, less dramatic but more recent, things like this going on. For example, you go to school and they teach you that in the 15th century, perspective was the thing for me to understand. I mean, perspective was discovered? How could it be discovered? And yet, before 1425, people didn't know that the part of the house farther from you was smaller than the part nearer to you. You can't understand, it doesn't make any kind of sense. Another example is Saint Augustine, who was this great father of the Church and who was, by the way, African. He was known as the most brilliant theologian of his age, and the way he would prove to people that he was an exceptional and holy man was that they would open a book of theology in front of him and let him look at it for a few minutes, and then they would close the book and he would be able to tell them what was written there. As far as we can tell, Saint Augustine was the the only man in Europe who could read silently. Can you imagine this? It was a miracle. They would say, "We don't know how the bugger does it! You just show him the book and he can tell us what's written there." Now we've completely assimilated this, although there are still a few among us who move their lips as they read. Vladimir Nabokov used to cruelly sneer at these people, he said once in an interview, "I didn't write books for people who move their lips when they read."

A final example, which will indicate that we've come to the end of the line in terms of sudden behaviors emerging, is that, according to my friend William Gibson in his book *The Difference Engine*, oral sex was virtually unknown in England until the middle of the 19th century. It was brought in by French prostitutes, and it was just a mind-boggling concept to these Victorians, they could not wrap their mind around it. From our vantage point, we probably assume that people have been into this since the Stone Age. Maybe they have, but at least for several centuries in Victorian England, it absolutely died out as inconceivable. Breakdancing is another one of these, where a behavior suddenly emerges, completely coherent and formed, and then it recedes; or, if it has cultural utility, it's stabilized, such as my previous example.

What these tykes seem to be trying to say is that there is a way for you to use your voice in order to activate a language which is not culturally taught. It isn't that you learn it from your parents, but that it's in the bones: a poetic language, a language scripted into your genes, and not only is it an *ursprach*, an original speech, the vehicle of primal poetry, it can be seen. It's interesting how in our culture, when we talk about how somebody is a gifted speaker, we always reach for visual metaphors. We say, "I see what you mean." In Spanish, if they're talking to you and they want to know if you follow, they say, "Is it clear, claro?" It's a visual metaphor. We say, "She paints a picture," or, "His words have great clarity." What this means is that, unconsciously, we trust the eyes and we don't trust the ears. Telepathy, which most people think of as being able to hear somebody else think, is not that at all. Telepathy is when you see what other people mean, because when you see what somebody means, it's like standing in their shoes. Point of view: that's a very visual-oriented framework. If you can understand somebody else's point of view, you are that person for that moment, for that purpose.

It's amazing that the human world has evolved as far and as fast as it has, glued together by nothing more than small mouth noises. As monkeys, we're set up for this. You can talk longer than just about any other activity that you can do without becoming exhausted. I'm the living proof of it. A very small amount of energy is required to keep the old tongue and lips going with the air moving out. Imagine if we had to communicate as deaf people do, with sign language all the time. This is exhausting, nobody communicates like that for four or five hours at a stretch, and yet Castro can give a four-hour speech at the drop of a hat. So, we're set up for this. The problem is that it requires a congruence of interior dictionaries, because what

happens is that my words go across space as an acoustical signal, they enter your ear, you are very rapidly looking up each word as it comes in and comparing it to your definition, and as long as we don't look too closely at this, communication seems to be happening.

I've looked at this, and there are models for this kind of verbal communication. Whenever you think you're about to take a step that nobody has taken and go a place where nobody's ever been, if you look back at mother nature you can usually find that you've been scooped. A very interesting example of this vis-à-vis language is what's going on with octopi. What we've all learned from watching these wonderful TV shows about nature is that octopi can change color; most people think it's because they're into camouflage. It isn't that at all, it's something much more profound. It's that all over the surface of octopi are these specialized cells called chromatophores, and they can change into many colors. Not only can the octopus change colors, but the ordinary rubbery, smooth surface of the octopus can be made like goosebumps, but more dramatically wrinkled, very suddenly. The other thing about an octopus is, because they're soft-bodied, when they're in water, they are very adept at folding and unfolding various parts of their body. They can reveal a part of their body and then fold in and show another part; they're like a silk scarf. What's going on here is that octopi communicate with each other by the way they look. At first this doesn't seem so profound, but when you analyze what's happening, you realize that this is a profound evolution in the project of communication, because there is no culturally-sanctioned dictionary among octopi, and really what is happening is that the octopus wears its mind on its surface. They have a vast repertoire of dots, blushes, traveling patterns that move across their surface, and these behavioral displays indicate the internal state of the organism; literally, it wears its language on the surface of its skin. It is a syntactical creature: its behavior is its syntax.

Octopi as a whole are molluscs, they're not even vertebrates. These things split from the line of development that leads to us 700 million years ago. If you want to talk about an alien form of life, an octopus is about as far away from the human experience as you can possibly get. They evolved in shallow coastal waters, but because so many things were evolving in those shallow waters, some of them evolved into the benthic depths, and in those depths there is no light. In order to preserve their ability to communicate, over long periods of time they evolved phosphorescent chromatophores all over their body. Some octopi even have eyelid-like membranes at the surface of their skin so that they can blink very rapidly and modulate the phosphorescent light. You can imagine that in the darkness, in the benthic depths of the ocean, the communication between two octopi is just a dance of lights in utter darkness; it's naked mind in the water. When they are in communication like that they are, for all practical purposes, one organism. This is why octopi excrete ink into the water: it's so that they can have a private moment. Essentially, the octopus ink is the equivalent of correction fluid: you just have to erase, say, "I didn't mean that at all, here's what I really meant."

This is why I'm interested in virtual reality, because it seems to me that what we're trying to do is some kind of striptease of the mind. We want to get the mind naked, because if it can be made naked, we will understand each other. We are clothed in flesh, and then clothing and then class difference, race difference, age difference, income difference, but if you could see the mind naked, the commonality of human beings would be reinforced and the presence of ego among us would be diminished. Also, there's no ambiguity in visible language. It's interesting that in the Book of Revelations there is this talk about a sword which comes out of the mouth. It's describing a word which can be seen. The whole history of the evolution of the Western mind is, in a sense, the birth of the Logos. The Logos is making its way toward self-expression, and it's doing this by claiming dimension after dimension of manifestation. I think that

electronic media, electronic culture, drugs, the mixing of all our world cultures together, what this is empowering is a visible Logos, a Logos that is beheld and therefore lacks ambiguity.

Mind and soul, in my estimation, tend to migrate toward each other. In the late medieval period you get a lot of talk about, "Is the spirit the same thing as the soul? And are these things the same as the intellect?" I mean, yes, we are soul, but mind is the visible manifestation of soul. That would be a good Catholic definition because, you see, that keeps soul out of animals. If you say that mind is the visible manifestation of soul, then you have restricted the existence of soul to the human species. The mind is not a form of intelligence, the mind is the theater in which intelligence is manifested; you don't want to confuse the garage with the car. Everything goes on within the confines of mind: it's like the light that you switch on when you walk into a darkened room, and then everything else is the furniture within the room. Mind is simply the light which is shed over the landscape of appearances. This is only my definition, I'm aware of the Neoplatonic emphasis on the mind, I think they called it the *mundus*, but in modern psychological terms, the mind is just the theater of cognition in some way. Consciousness is something which happens in the mind, there is an unconscious mind as well. Mind is the inclusive category, I think.

The hardest thing to figure out is a mirror, because what a mirror shows you is yourself, but a mirror is not yourself. A mirror is a piece of glass with silver vapor deposited on the back of it, but that's a very different thing from yourself. In the psychedelic space, you are not simply perceiving that space, you are creating it with your expectations as well. If you have strong expectations of a certain sort, that will be the character of the thing. We talked about this yesterday, about how here we have peasant A chopping wood, and suddenly a ripple of heat passes in the forest and a hackle-raising sense of weirdness. This guy throws down his axe and looks over his shoulder, and a light is descending from the sky. What happens next, interestingly enough, depends on the year and the place. If the year is, let's say 1000, and the place is Southern France, then the Virgin Mary will be descending from the sky. If the place is Kansas and the date is 1958, then the space people are descending from the sky. What happens is that when there is cognitive dissonance, the mind rushes forward to provide explanation. For some people it's Jesus, for somebody else it's Maitreya, so cultural expectations are inextricably woven into these strange encounter scenarios.

There was an interesting UFO theory a few years ago that I thought was kind of cute, I didn't exactly believe it. These people, Michael Persinger and Gyslaine Lafrenière, wrote a really amusing book called *Space-Time Transients and Unusual Events*. One of the things they came up with was that along earthquake faults you get the grinding of enormous masses of rock together, and if these rock masses have a high percentage of quartz in them, you can get what is called piezoelectric phenomena. Piezoelectricity is simply a peculiar form of static electricity, but what it would do is that it would create ball lightning in the sky which would follow these stress lines in the earth. There is a connection, not understood, between earthquakes and the appearance of UFOs. One of the interesting things that Persinger discovered about piezoelectricity is that if you, in the laboratory, build piezoelectric generators that generate fields of enormous strength, then as a person is exposed to these things, they actually mess with your mind. People become more and more confused, uneasy and ultimately panic-stricken in the presence of these piezoelectric fields. Once you pass the panic moment, your mind is going to start telling you what's happening. It's going to say, "You're having an encounter, something weird is going on," and then out of the unconscious comes the projection: the flying saucer, the Virgin Mary, the elf invasion, the manifestation of Maitreya. Mind goes to meet the unknown, but not without a hell of a lot of baggage of its own which it immediately tries to unpack and put into the drawers of the Other as soon as it arrives. The mind is not intelligence, it's not the soul, it's sort of the theater in which all these other things take their

place.

I think there's one transcendental object that exerts attraction wherever it can. What evolution seeks to do is to stop itself. Every organism wants to evolve into what's called a climaxed ecosystem: that's where everybody has their chair and nobody moves, so there are no empty chairs. Where you get evolution is where you have a room half full of empty chairs; then you have a choice of where to sit. Most animal species and plant species are not evolving or are evolving very slowly. Evolution tends to dead end itself. Take cockroaches, for example; cockroaches achieved their present evolutionary status 200 million years ago. They haven't changed an iota. We can dig up fossils from the Pennsylvania coal beds that have cockroaches no different than the ones running around in your apartment. This has clearly been a very successful strategy for cockroaches if the only thing that matters is the propagation of more cockroaches. Nevertheless, their cultural accomplishments have been dismal.

It's thought by the straightest people in the biz that before human beings, the major force creating evolutionary opportunity were rivers. This happens because the course of rivers will vary over time, and that means that rivers expose and inundate a lot of land. Along rivers you find unclaimed territory, sandbars and large areas where nothing grows. Into those kinds of areas what are called volunteer species, or invader species, can make their way, and these invader species evolve very rapidly. For instance, in a climaxed tropical rainforest what you find are enormous trees and vines, and then the epiphytes and stuff that grow on them, but these trees may flower once every twenty years or so and when they do flower they often produce a very limited amount of fruit. What you find along rivers and places like that are what we call weeds. A weed is a plant that is annual, it flowers every year, and that produces an enormous amount of seeds. A weed strategy is a strategy for the rapid invasion and claiming of empty land, and before human beings, rivers were the major creators of empty land. Carl Sauer, who was a biologist and a geographer, said, "Man found the earth a climaxed rainforest and he will leave it a weedy lot." What that means is that we create so much waste land that these annual, heavy-seeding, rapacious plants are replacing the products of climaxed evolution, which are enormous trees and vines and that sort of thing.

I have a lot of respect for most of Jacques Vallée's work. I thought that book *Messengers of Deception* was so off the track that I actually went to a book signing of his and leafleted the crowd with an attack on it; that shows you what a nut I am. For those who don't know, Jacques Vallée had a very interesting approach to understanding flying saucers, and I still think this is the best method. His argument went something like this: it's not productive to ask where the flying saucers come from or what they want; he said the way to understanding flying saucers is to analyze their effect. If you can analyze their effect, that's what they're doing, that's what they want to achieve. So, what are flying saucers doing? What they are doing is that they are causing vast numbers of people to doubt science. If you analyze what the effect since 1948 of the flying saucers is, it's that they have caused millions of ordinary people to think that scientists don't know what they're talking about. It offers a new alternative. Here's an interesting analogy, it's Jacques Vallée's. We've been talking so much today about the late Roman Empire; here's another take on the late Roman Empire. The Roman Empire was this immensely successful civilization in that it was able to export its vision of an imperial center over vast parts of the world. The problem with the Roman Empire was that it was an ethical disaster. First of all, it ran entirely on the backs of slaves, so anybody who starts talking to you about the grandeur that was Rome should be reminded that it was a bargain basement on three floors masquerading as a military brothel. It was not a great civilization.

What happened to Rome? Well, they had all these people inside the empire, among them Jews, and over

there in Jerusalem, a long way from Rome where communication was difficult, this story got loose among the Jews. From the point of view of the Roman Imperium, the Jews were a barbarian people. They were Semites, they had some strange religion. They were looked upon, in other words, as primitives. If you were to have sat down to have dinner with a typical Roman bureaucrat of the Imperium, you would discover that the table talk would be all about Democritean atomism, Epicureanism, Stoicism and Skepticism. In other words, they were thoroughly modern people, and they thought they had very advanced bullshit detectors. So it comes to the attention of this Roman noble that the house slaves, the kitchen boys and the gardeners are all whispering and all excited about some Galilean magician who is running around the Eastern Mediterranean, telling people that not only can he rise from the dead, but so can you. A Roman sophisticate looking at this would say, "These primitive, uneducated, colored people that we have to put up with, why don't these people step out of their own private Idaho and get with the program and study a little Greek philosophy? They're just superstitious."

Well, in a world where information moved no faster than a horse could gallop, within a century these uneducated, superstitious people and their irrational religion of magical redemption were hammering at the gates of Rome. A century after that, the emperor himself, a god for political purposes, has to make Christianity the official religion of the Empire. What happened was that political, technological and architectural accomplishments got way out in front of ethics, and at that point the unconscious said, "I'm going to pull the rug out from under these Roman dominator types. I'm going to unleash a religious system in their very midst that will be an informational virus. They'll be dead before they ever know what hit them." This is what Christianity is. It was a religion of the displaced underclasses of the empire, and within 300 years it took over and began its own pogroms and genocidal programs of extermination. The flying saucer is a similar thing. We have achieved great things in technology, in social organization and scientific research, but like the late Roman Empire, ethics and morality have lagged far behind, and so now the same unconscious that sent us the mystery of the Virgin Birth and the Resurrection sends us the flying saucers. The flying saucers are destroying the faith in the scientific control systems and managerial theories at the very center of our civilization just as surely as the Roman Imperium was broken by this superstitious religion.

There is a force in this world — call it the unconscious, call it the cosmic giggle, call it whatever you want — but when a society gets all twisted and out of balance, it can pull it down in a hurry. I think the psychedelic thing in the '60s was viewed this way. The dominator society is incredibly fragile. Whenever you see somebody who has to pile up guns, it means they're not terribly confident of their ability to keep control of the scene, and we have so many kinds of guns pointed at us: propaganda, social engineering, manipulation of the media. They do it all to us and they still can barely keep ahead of it. They hate the spread of unreason, they hate psychedelic drugs, hell, they don't even like people to work up a sweat on the dance floor. Anything other than ladylike and gentlemanlike parlour-oriented English upper-class behavior completely drives them into a swivet, and yet they launch horror upon the world that makes anything the Roman Imperium undertook look like child's play. This stunt they pulled with Iraq, they don't even count the dead when they get pissed off. That's why I think this Archaic Revival is in full throttle right now. I think the dominator model is doomed, and all the things that are coming forward — the assertiveness of racial minorities, of sexual and intellectual minorities — people are just saying, "We're not going to take it anymore. Don't tell us what to believe, don't tell us what drugs to take and what's politically correct, because your record is a nightmare."

This general discontent spreading through society is keeping a lot of these dominator types up late at night

trying to figure out what's going on. Can you imagine being in charge of the planet? Suppose you were the CEO of General Motors: every piece of data that crosses your desk says that you're in trouble, big trouble. I'm saying they're coming from another dimension of some sort that actually has a plan for the human race that is larger than the plan of the people who seek to run this society. Their plan is, "Let's keep everything as much the same as possible." Since World War II, they have been at war with the future. They do not want to let the future happen. Of course, the future is building up like a logjam in a river, and what it means is that when the future finally tears loose and overwhelms these structures that they have built, it's going to be more dramatic, more sudden and more violent than they could have ever dreamed of or imagined. They're forcing the evolution of language. The real cataclysmic future does not lie in the propagation of the errors of industrial materialism. The real transformation of the future is built into the rocks, the ocean, the animals; it's not coming from human beings. The people who think they're running the world are dreaming. I'm completely convinced that no one is in control and that this is very good news. Nobody is in control, not the Communist Party, the Vatican, the World Bank. There may be groups who dream of controlling, but their frustration level must be approaching infinity at this point.

The way to steer the Hermetic question toward the UFO question is to look at this concept of the philosopher's stone. Alchemy arises out of Hermeticism. Hermeticism is the philosophy that stands behind alchemy, which is the work-bench activity of this magical system. The philosopher's stone is a concept of a universal medicine that cures all diseases, that confers immortality, that brings happiness and understanding, but it's more than that: it's everything you want it to be. The flying saucer is this same idea. The best book ever written on flying saucers was written just a couple years after the first flying saucers were seen. It's by Carl Jung and it's called *Flying Saucers: A Modern Myth of Things Seen in the Sky*. He talks there about how the human mind has an appetite for what are called "totality symbols." The human mind is always trying to complete itself, to fix itself in some way. Mandalas and certain kinds of symbols have the quality of indicating that this completion is underway.

In the 15th and 16th century, before the rise of modern science, people didn't know what matter really was, they didn't really know what was possible with matter. They would get glass flasks and combine horse manure and blood, and they would cook it for weeks and weeks and they would observe color changes. They did not have the kind of very fixed notion of the separation between mind and matter that we have, because we have been trained to see mind and matter as tremendously separate categories. So these alchemists, working often day and night in remote areas on bad food, ergot-infested bread and what have you, eventually they began to enter into a kind of waking hallucination with their alchemical activity. What you have in these glass retorts, presumably, are swirling chemical mixes, but the alchemist looking at these things didn't clearly distinguish between what is going on in the alembic, the alchemical vessel, and what was going on in their own imagination. The two categories weren't separate. So Jung noticed that these descriptions of alchemical procedures are not to be taken seriously as real recipes: they are descriptions of psychic processes leading toward individuation.

In a sense, the flying saucer is nothing more than a modern rebirth of the philosopher's stone. The flying saucer is the universal panacea at the end of time. It's the thing which cannot exist but which does exist, and which, if we could obtain it, everything would be different. We've swapped out elementals for aliens and we've swapped out the philosopher's stone for the flying saucer. Nevertheless, if we were to obtain the flying saucer, it would be the equivalent of these 16th century people obtaining the philosopher's stone. We are so bound in to the concept of the fixity of matter and its separateness from us as a mental category that we rarely exercise our imagination in the way that these early people did. For us, everything stands

still. A mental exercise you should do for yourself sometime: imagine that you had a material that could do anything. This is what the philosopher's stone is, it's a material object and it can do anything. What do I mean by anything? Well, if you needed to go somewhere you could take this material, stretch it out and then sit on it, and it would fly. If you were hungry, you could eat it. If you needed to take a shower, you could stretch it a certain way and hold it above your head and water would pour out of it. If you needed a piece of information, you could just address it and ask like a visual telephone. We have created the philosopher's stone in the diffuse form of technology. We can do everything I just described — fly, talk to people at great distances, eat synthetic food and so on — but we have solved each problem separately.

In a way, the computer is an interesting leap toward the philosopher's stone, because if you analyze what a computer is, it's a machine which can do anything. You have to tell it what you want it to be. If you want it to balance your checking account, it can do that. If you want it to predict the weather, it can do that. If you want to play a game with it, it can do that. It's mind boggling to realize that anything that you can conceive of, the computer can simulate. The computer is the first in a long line of omnipurpose machines. We're going to move into a world where you don't have a telephone to call your friend, a fork to spear your meat and a comb to tease your locks: you have one thing, and this one thing does whatever you need to have done. Technology is beginning to condesce, and it will be of course be a kind of computer, but it will be voice-programmable to do anything. Well, this is a very Hermetic ideal. We are migrating toward this kind of a fusion of possibilities. This is the secret of how to dematerialize culture: make machines which can do more than one thing. Make machines which can do thousands of things, but always return to being a little ball or a little box.

Newton is an interesting figure, because Newton is the great father of modern science, he was the one who figured out that the calculus was a tool for solving a kind of multivariable problem that up until the invention of the calculus, nobody had a clue. Modern science runs almost entirely on the calculus and the various techniques that have been derived out of it, like partial differential equations and that kind of thing, but Newton himself was a man with a foot in two worlds. He was a thoroughgoing occultist, his alchemical experiments and notebooks were voluminous, and yet he was one of the founding members of the Royal Society. The Royal Society was really the first think tank, it was a very modern institution. In the character of Newton we see the magical mentality and the modern mentality welded into one individual. There are other cases like this. Michael Maier was the greatest alchemist of his age and he was implicated in the Rosicrucian Enlightenment. There were a group of people around Frederick the Elector Palatine of Bohemia who wanted to establish a Protestant alchemical kingdom in Europe in the early 17th century, around 1619, and Maier was part of this group. They contrived to get this guy, Frederick the Elector Palatine of Bohemia, named emperor, because at that time the princes of the Hanseatic League chose the emperor, and they were actually able to do this; but then when word got back to the Hapsburgs in Spain, they raised an army and destroyed this alchemical revolution. If you're interested, read Frances Yates' book *The Rosicrucian Enlightenment*.

This Hapsburg army which laid siege to Prague in the summer of 1620 and then destroyed this alchemical possibility; there was in that army a 21-year- old soldier who was soldiering and wenching his way across Europe, which was something gentlemen did in those days, and his name was René Descartes. After the fall of Prague, in early August of 1620 this Hapsburg army retreated across southern Germany toward Spain and they pitched their tents at Olm, which, strangely enough, would be the birthplace of Einstein some centuries later. Descartes was not the mature philosopher of science that we know, he was just some punk mercenary getting his first taste of life, and that night he had a dream. In the dream, an angel

appeared to him, and the angel said, “The conquest of nature is to be achieved through measure and number.” Descartes awoke from this dream and he founded scientific materialism. He founded modern science based on the revelation of an angel. Science was founded by an angel. There are many instances in the history of science where these kinds of things have gone on.

The overarching theme here, the thing which serves to connect all this together; we’ve been talking today about alchemy and Hermeticism, it’s an episode in Western history, a protoscientific movement. We were talking yesterday about how time is moving inevitably toward the production of some kind of transcendent object, or the coming into awareness of a kind of transcendent object. Well, the connection between these two notions is the idea that history itself is a kind of alchemical process. The idea that lies behind alchemy is that the alchemist can somehow step in as nature’s helper and cause natural processes to occur very quickly. The belief in medieval Europe concerning precious metals was that these things actually grew in the earth, and in a sense they do: they accrete very slowly over time. The idea that lies behind alchemy is that if you could speed time up, the processes which require millions of years in the earth could perhaps be achieved in years or months. The goal of alchemy was the production of the philosopher’s stone, this transcendental material, the universal panacea. What I’ve been saying here in all these lectures is that the goal of human history is the same thing. Therefore, human history is an alchemical process of some sort.

Human history is the story of the descent of spirit into matter or the ascent of matter into the domain of spirit, and the speeding up quality of it is what we bring to it. History is the catalyst of nature. This metaphor casts us in the role of elemental tykes. In the great alchemy of the redemption of the world we are the elementals, and we are causing a process to take place which will accelerate the emergence of the end state before it might ordinarily have happened. The idea is that history itself is an invoking and a moving toward a fusion with this alchemical mystery, which is, then, a coincidentia oppositorum. The words used to describe the alchemical goal can be used to describe the historical goal. The historical goal is then legitimately describable as coincidentia oppositorum, union of opposites, universal panacea, the diamond body. All of these alchemical metaphors of completion are metaphors which, if we would but awaken to the spiritual dynamics of history, we could enunciate as a goal. Imagine if the stated goal of global society were to produce a universal panacea. That means peace of mind for everybody, health and happiness for everybody. It’s weird: millenarian or eschatological thinking has remained with us, even though ideological styles have changed. Marxism is a thoroughgoing millenarian cult. The withering away of the state is no less metaphysical a concept than the universal panacea at the end of time, and I daresay a good deal less likely. So we may have transcended Christian eschatological dreams, but we still are infected with utopian aspirations. Secular utopianism has never been more strong, it’s just that it’s now couched in the terms of Christian democrats, or something like that. If we could raise to consciousness our alchemical heritage and our heritage in the shamanism of the archaic, then we could actually see that the purpose of technology is to liberate, not to enslave, and somehow we’ve lost the thread.

- *Did hallucinogens play a crucial role in human evolution? Terence McKenna has devoted most of his life to exploring this question. A specialist in the ethnomedicine of the Amazon Basin, McKenna along with his partner Kat Harrison McKenna founded Botanical Dimensions, a nonprofit foundation devoted to rescuing Amazonian plants that have a history of shamanic uses. They move the plants to a 19-acre site in Hawaii and preserve the details of the plant's uses by storing the information in a computer database. In addition to preserving these important plants, as a nonprofit organization, Botanical Dimensions solicits donations to publish a newsletter and to aid in carrying out the preservation of the folk knowledge of the peoples native to the Amazon area. The combination of McKenna's academic approach -- he has a BS from the University of California at Berkeley with a distributed degree in ecology, resource conservation and shamanism -- his vast travel experiences, and uniquely visionary perspective, combine to make him a most sought-after speaker and author. His newest books include *Food of the Gods* (Bantam) and *The Archaic Revival* (Harper/San Francisco) -- in which an abridged version of this interview appears. A slightly different version of this interview will also appear in a soon-to-be-published book by David Jay Brown and Rebecca McClen called *Voices of Vision*.*

HIGH TIMES: Tell us how you became interested in shamanism and the exploration of consciousness.

Terence McKenna: I discovered shamanism through an interest in Tibetan folk religion. Bon, the pre-Buddhist religion of Tibet, is a kind of shamanism. In going from the particular to the general with that concern, I studied shamanism as a general phenomenon. It all started out as an art historical interest in the pre-Buddhist iconography of [thangkas](#).

HT: This was how long ago?

TM: This was in '67, when I was just a sophomore in college. And the interest in altered states of consciousness came simply from -- I don't know whether I was a precocious kid or what -- but I was very early into the New York literary scene. Even though I lived in a small town in Colorado, I subscribed to the *Village Voice*, and there I encountered propaganda about LSD, mescaline, and all these experiments that the late beatniks were involved in. Then I read *The Doors of Perception* and *Heaven and Hell*, and it just

rolled from there. That was what really put me over. I respected Huxley as a novelist, and I was slowly reading everything he'd ever written, and when I got to *The Doors of Perception* I said to myself, "There's something going on here for sure."

HT: Recently you addressed close to 2,000 people at the John Anson Ford Theatre in Los Angeles. To what do you attribute your increasing popularity, and what role do you see yourself playing in the social sphere?

TM: Well, without being cynical, the main thing I attribute to my increasing popularity is better public relations. As far as what role I'll play, I don't know. I mean I assume that anyone who has anything constructive to say about our relationship to chemical substances -- natural or synthetic -- is going to have a social role to play, because this drug issue is just going to loom larger and larger on the social agenda until we get some resolution of it. By resolution I don't mean suppression or just saying no. I anticipate a new open-mindedness born of desperation on the part of the Establishment. Drugs are part of the human experience, and we have got to create a more sophisticated way of dealing with them.

HT: You have said that the term "New Age" trivializes the significance of the next phase in human evolution and have referred instead to the emergence of an archaic revival. How do you differentiate between these two expressions?

TM: The New Age is essentially humanistic psychology '80s-style, with the addition of neo-shamanism, channeling, crystal and herbal healing. The archaic revival is a much larger, more global phenomenon that assumes that we are recovering the social forms of the late neolithic, and reaches far back in the 20th century to Freud, to surrealism, to abstract expressionism -- even to a phenomenon like National Socialism -- which is a negative force. But the stress on ritual, on organized activity, on race/ancestor-consciousness -- these are themes that have been worked out throughout the entire 20th century, and the archaic revival is an expression of that.

HT: From your writings I have gleaned that you subscribe to the notion that psilocybin mushrooms are a species of high intelligence -- that they arrived on this planet as spores that migrated through outer space, and are attempting to establish a symbiotic relationship with human beings. In a more holistic perspective, how do you see this notion fitting into the context of Francis Crick's theory of directed panspermia, the hypothesis that all life on this planet and its directed evolution has been seeded, or perhaps fertilized, by spores designed by a higher intelligence?

TM: As I understand the Crick theory of panspermia, it's a theory of how life spread through the universe. What I was suggesting -- and I don't believe it as strongly as you imply -- is that intelligence, not life, but intelligence may have come here in this spore-bearing life form. This is a more radical version of the panspermia theory of Crick and Ponampurama. In fact I think that theory will probably be vindicated. I think in a hundred years if people do biology they will think it quite silly that people once thought that spores could not be blown from one star system to another by cosmic radiation pressure. As far as the role of the psilocybin mushroom, or its relationship to us and to intelligence, this is something that we need to consider. It really isn't important that I claim that it's an extraterrestrial, what we need is a body of people

claiming this, or a body of people denying it, because what we're talking about is the experience of the mushroom. Few people are in a position to judge its extraterrestrial potential, because few people in the orthodox sciences have ever experienced the full spectrum of psychedelic effects that are unleashed. One cannot find out whether or not there's an extraterrestrial intelligence inside the mushroom unless one is willing to take the mushroom.

HT: You have a unique theory about the role that psilocybin mushrooms play in the process of human evolution. Can you tell us about this?

TM: Whether the mushrooms came from outer space or not, the presence of psychedelic substances in the diet of early human beings created a number of changes in our evolutionary situation. When a person takes small amounts of psilocybin visual acuity improves. They can actually see slightly better, and this means that animals allowing psilocybin into their food chain would have increased hunting success, which means increased food supply, which means increased reproductive success, which is the name of the game in evolution. It is the organism that manages to propagate itself numerically that is successful. The presence of psilocybin in the diet of early pack-hunting primates caused the individuals that were ingesting the psilocybin to have increased visual acuity. At slightly higher doses of psilocybin there is sexual arousal, erection, and everything that goes under the term arousal of the central nervous system. Again, a factor which would increase reproductive success is reinforced.

HT: Isn't it true that psilocybin inhibits orgasm?

TM: Not at the doses I'm talking about. At a psychedelic dose it might, but at just slightly above the "you can feel it" dose, it acts as a stimulant. Sexual arousal means paying attention, it means jumpiness, it indicates a certain energy level in the organism. And then, of course, at still higher doses psilocybin triggers this activity in the language-forming capacity of the brain that manifests as song and vision. It is as though it is an enzyme which stimulates eyesight, sexual interest, and imagination. And the three of these going together produce language-using primates. Psilocybin may have synergized the emergence of higher forms of psychic organization out of primitive protohuman animals. It can be seen as a kind of evolutionary enzyme, or evolutionary catalyst.

HT: There is a lot of current interest in the ancient art of sound technology. In a recent article you said that in certain states of consciousness you're able to create a kind of visual resonance and manipulate a "topological manifold" using sound vibrations. Can you tell us more about this technique, its ethnic origins, and potential applications?

TM: Yes, it has to do with shamanism that is based on the use of DMT in plants. DMT is a near- or pseudo-neurotransmitter, that when ingested and allowed to come to rest in the synapses of the brain, allows one to see sound, so that one can use the voice to produce, not musical compositions, but pictorial and visual compositions. This, to my mind, indicates that we're on the cusp of some kind of evolutionary transition in the language-forming area, we are going to go from a language that is heard, to a language that is seen, through a shift in interior processing. The language will still be made of sound, but it will be processed as the carrier of the visual impression. This is actually being done by shamans in the Amazon. The songs they

sing sound as they do in order to look a certain way. They are not musical compositions as we're used to thinking of them. They are pictorial art created by audio signals.

HT: You're recognized by many as one of the great explorers of the 20th century. You've trekked through the Amazonian jungles and soared through the uncharted regions of the brain, but perhaps your ultimate voyages lie in the future, when humanity has mastered space technology and time travel. What possibilities for travel in these two areas do you foresee, and how do you think these new technologies will affect the future evolution of the human species?

TM: I suppose most people believe space travel is right around the corner. I certainly hope so. I think we should all learn Russian in anticipation of it, because apparently the US government is incapable of sustaining a space program. The time travel question is more interesting. Possibly the world is experiencing a compression of technological novelty that is going to lead to developments that are very much like what we would imagine time travel to be. We may be closing in on the ability to transmit information forward into the future, and to create an informational domain of communication between various points in time. How this will be done is difficult to imagine, but things like fractal mathematics, superconductivity, and nanotechnology offer new and novel approaches to the realization of these old dreams. We shouldn't assume time travel is impossible simply because it hasn't been done. There's plenty of latitude in the laws of quantum physics to allow for moving information through time in various ways. Apparently you can move information through time, as long as you don't move it through time faster than light.

HT: Why is that?

TM: I haven't the faintest idea. What am I, Einstein? [Laughter.]

HT: What do you think the ultimate goal of human evolution is?

TM: Oh, a good party.... [Laughter.]

HT: Have you ever had any experiences with lucid dreaming -- the process by which one can become aware and conscious within a dream that one is dreaming -- and if so, how do they compare with your other shamanic experiences?

TM: I really haven't had experiences with lucid dreaming. It's one of those things that I'm very interested in. I'm sort of skeptical of it. I hope it's true, because what a wonderful thing that would be.

HT: You've never had one?

TM: I've had lucid dreams, but I have no technique for repeating them on demand. The dream state is possibly anticipating this cultural frontier that we're moving toward. That we're moving toward something very much like eternal dreaming, going into the imagination, and staying there, and that would be like a

lucid dream that knew no end, but what a tight, simple solution. One of the things that interests me about dreams is this -- I have dreams in which I smoke DMT, and it works. To me that's extremely interesting, because it seems to imply that one does not have to smoke DMT to have the experience. You only have to convince your brain that you have done this, and it then delivers this staggering altered state.

HT: Wow.

TM: How many people who have had DMT dream occasionally of smoking it and have it happen? Do people who have never had DMT ever have that kind of an experience in a dream? I bet not. I bet you have to have done it in life, to have established the knowledge of its existence, and the image of how it's possible, but then this thing can happen to you without any chemical intervention. It is more powerful than any yoga, so taking control of the dream state would certainly be an advantageous thing and carry us a great distance toward the kind of cultural transformation that we're talking about. How exactly to do it, I'm not sure. The psychedelics, the near death experience, the lucid dreaming, the meditational reveries ... all of these things are pieces of a puzzle about how to create a new cultural dimension that we can all live in a little more sanely than we're living in these dimensions.

HT: Rupert Sheldrake has recently refined the theory of the morphogenetic field -- a nonmaterial, organizing, collective-memory field which affects all biological systems. This field can be envisioned as a hyperspatial information reservoir which brims and spills over into a much larger region of influence when critical mass is reached -- a point referred to as morphic resonance. Do you think this morphic resonance could be regarded as a possible explanation for the phenomena of spirits and other metaphysical entities, and can the method of evoking beings from the spirit world be simply a case of cracking the morphic code?

TM: That sounds right. If what you're trying to get at is do I think morphogenetic fields are a good thing, or do they exist, yes, I think some kind of theory like that is clearly becoming necessary. And that the next great step to be taken in the intellectual conquest of nature, if you will, is a theory about how out of the class of possible things, some things actually happen.

HT: How do you view the increasing waves of designer psychedelics and brain enhancement machines in the context of Rupert Sheldrake's theory of morphogenetic fields?

TM: Well I'm hopeful, but somewhat suspicious. I think drugs should come from the natural world, and be use-tested by shamanically-oriented cultures, then they have a very deep morphogenetic field, because they've been used for thousands and thousands of years in magical contexts. A drug produced in the laboratory, and suddenly distributed worldwide simply amplifies the global noise present in the historical crisis. And then there's the very practical consideration that one cannot predict the long term effects of a

drug produced in a laboratory. Something like peyote, or morning glories, or mushrooms have been used for vast stretches of time without detrimental social consequences. We know that. As far as the technological question is concerned -- brain machines and all -- I wish them luck. I'm willing to test anything that somebody will send me, but I'm skeptical. I think it's somehow like the speech-operated typewriter. It will recede ahead of us. The problems will be found to have been far more complex than first supposed.

HT: Don't you think it's true that the designer psychedelics and the brain machines don't have any morphogenetic field, so in a sense one is carving a new morphogenetic field with their use. Consequently, there would be more possibilities for new things to happen -- unlike the psychoactive substances which you speak of that have ancient morphogenetic fields, and are much more entrenched in predictability and pattern -- and therefore not as free for new types of expression?

TM: Possibly, although I don't know how you grab the morphogenetic field of a new designer drug. For instance, I'll speak of my own experience, which is ketamine. My impression of ketamine was -- it's like a brand new skyscraper, all the walls, all the floors are carpeted in white, all the drinking fountains work, the elevators run smoothly, the fluorescent lights recede endlessly in all directions down the hallways. It's just that there's nobody there. There's no office machinery, there's no hurrying secretaries, there's no telephones -- it's just this immense empty structure waiting. Well I can't move into a 60-story office building. I have only enough stuff to fill a few small rooms, so it gives me a slightly spooked-out feeling to enter into these empty morphogenetic fields. If you take mushrooms, you know, you're climbing on board a starship manned by every shaman who ever did it in front of you, and this is quite a crew, and they've really pulled some stunts over the millenia, and it's all there, the tapes, to be played, but the designer things should be very cautiously dealt with.

HT: It's interesting that John Lilly had very different experiences with ketamine. Do you think that there's any relationship between the self-transforming machine elves that you've encountered on your shamanic voyages and the solid-state entities that John Lilly has contacted in his inter-dimensional travels?

TM: I don't think there is much congruence. The solid state entities that he contacted seem to make him quite upset. The elf machine entities that I encounter are the embodiment of merriment and humor, but I have had a thought about this recently which I will tell you. One of the science fiction fantasies that haunts the collective unconscious is expressed in the phrase "a world run by machines." In the 1950s this was first articulated in the notion, "perhaps the future will be a terrible place where the world is run by machines." Well now, let's think about machines for a moment. They are extremely impartial, very predictable, not subject to moral suasion, value neutral, and very long-lived in their functioning. Now let's think about what machines are made of, in the light of Sheldrake's morphogenetic field theory. Machines are made of metal, glass, gold, silicon, plastic -- they are made of what the earth is made of. Now wouldn't it be strange if biology is a way for the earth to alchemically transform itself into a self-reflecting thing. In which case

then, what we're headed for inevitably, what we are in fact creating, is a world run by machines. And once these machines are in place, they can be expected to manage our economies, languages, social aspirations, and so forth, in such a way that we stop killing each other, stop starving each other, stop destroying land, and so forth. Actually, the fear of being ruled by machines is the male ego's fear of relinquishing control of the planet to the maternal matrix of Gaia. Ha. That's it. Just a thought. [Laughter.]

HT: The recent development of fractal images seems to imply that visions and hallucinations can be broken down into a precise mathematical code. With this in mind, do you think the abilities of the human imagination can be replicated in a super-computer?

TM: Yes. Saying that the components of hallucinations can be broken down and duplicated by mathematical code isn't taking anything away from them. Reality can be taken apart and reduplicated with this same mathematical code -- that's what makes the fractal ideal so powerful. One can type in half a page of code, and on the screen get river systems, mountain ranges, deserts, ferns, coral reefs, all being generated out of half a page of computer coding. This seems to imply that we are finally discovering really powerful mathematical rules that stand behind visual appearances. And yes, I think super-computers, computer graphics and simulated environments, this is very promising stuff. When the world's being run by machines, we'll be at the movies. [Laughter.] Oh boy.

HT: Or making movies.

TM: Or being movies.

HT: I've thought at times that what you view as a symbiosis forming between humans and psychoactive plants may in fact be the plants taking over control of our lives and commanding us to do their bidding. Have you any thoughts on this?

TM: Well symbiosis is not parasitism, symbiosis is a situation of mutual benefit to both parties, so we have to presume that the plants are getting as much out of this as we are. What we're getting is information from another spiritual level, their point of view -- in other words -- is what they're giving us. What we're giving them is care, and feeding, and propagation, and survival, so they give us their elevated higher dimensional point of view. We in turn respond by making the way easier for them in the physical world. And this seems a reasonable trade-off. Obviously they have difficulty in the physical world, plants don't move around much. You talk about Tao, a plant has the Tao. It doesn't *even* chop wood and carry water. [Laughter.]

HT: Future predictions are often based upon the study of previous patterns and trends which are then extended like the contours of a map to extrapolate the shape of things to come. The future can also be seen as an ongoing dynamic and creative interaction between the past and the present -- the current

interpretation of past events actively serves to formulate these future patterns and trends. Have you been able to reconcile these two perspectives so that humanity is able to learn from its experiences without being bound by the habits of history?

TM: The two are antithetical. You must not be bound by the habits of history if you want to learn from your experience. It was Ludwig von Bertalanffy, the inventor of general systems theory, who made the famous statement that "people are not machines, but in all situations where they are given the opportunity, they will act like machines," so you have to keep disturbing them, 'cause they always settle down into a routine. So, historical patterns are largely cyclical, but not entirely, there is ultimately a highest level of the pattern, which does not repeat, and that's the part which is responsible for the advance into true novelty.

HT: The part that doesn't repeat. Hmm. The positive futurists tend to fall into two groups. Some visualize the future as becoming progressively brighter every day and that global illumination will occur as a result of this progression, others envision a period of actual devolution -- a dark age through which human consciousness must pass, before more advanced stages are reached. Which scenario do you see as being the most likely to emerge, and why do you hold this view?

TM: I guess I'm a soft Dark Ager. I think there will be a mild Dark Age. I don't think it will be anything like the Dark Ages which lasted a thousand years -- I think it will last more like five years -- and will be a time of economic retraction, religious fundamentalism, retreat into closed communities by certain segments of the society, feudal warfare among minor states, and this sort of thing. I think it will give way in the late '90s to the actual global future that we're all yearning for. Then there will be basically a 15-year period where all these things are drawn together with progressively greater and greater sophistication, much in the way that modern science, and philosophy has grown with greater and greater sophistication in a single direction since the Renaissance. Sometime around the end of 2012, all of this will be boiled down into a kind of alchemical distillation of the historical experience that will be a doorway into the life of the imagination.

HT: Rupert Sheldrake's morphic resonance, Ralph Abraham's chaos theory, and your time wave model all appear to contain complementary patterns which operate on similar underlying principles -- that energy systems store information until a certain level is reached and the information is then transduced into a larger frame of reference, like water in a tiered fountain. Have you worked these theories into an all-encompassing metatheory of how the universe functions and operates?

TM: No, but we're working on it. [Laughter.] Well it is true that the three of us, and I would add Frank Barr in there, who is less well known, but has a piece of the puzzle as well. We're all complementary. Rupert's theory is -- at this point -- a hypothesis. There are no equations -- there's no predictive machinery -- it's a way of speaking about experimental approaches. My time wave thing is like an extremely formal and specific example of what he's talking about in a general way. And then what Ralph's doing is providing a bridge from the kind of things Rupert and I are doing back into the frontier branch of ordinary mathematics called dynamic modeling. Frank is an expert in the repetition of fractal process. He can show you the same thing happening on many many levels, in many many different expressions. So I have named us Compressionists, or Psychedelic Compressionists. Compressionism holds that the world is growing more and more complex, compressed, knitted together, and therefore holographically complete at every

point, and that's basically where the four of us stand, I think, but from different points of view.

Terence's ideas are free, but his words and works belong to his children and legal heirs. People who wish to use Terence's words must seek permission through [Lux Natura](#)

Welcome to the Terence McKenna Wiki!

Do you think the world could do with a little more Terence? Help us create complete transcripts of Terence's talks, workshops, interviews through the years!

This wiki is working towards a complete, chronological, searchable collection of Terence McKenna's lectures and their transcripts. Please feel free to contribute by transcribing lectures, reviewing completed transcripts, or finding information on dates and locations of lectures. If you are creating a new lecture page, use the lecture template. If creating a new interview page, use the interview template.

Ready to start transcribing?

- Please check the [TRANSCRIPTION INSTRUCTIONS PAGE](#) before beginning transcription or reviewing.
- For help with spelling of people names, places, and other unusual terms, use the [SPELLING REFERENCE SHEET](#) [feel free to add words that are missing].
- For those on Facebook, please also join our working group on the [Terence McKenna Transcription Project Facebook page](#). For any other questions or information, please contact: terencemckennaarchives@gmail.com
- Here's a list of [REVIEWER INSTRUCTIONS](#) for members who are correcting already transcribed talks

Looking for lecture dates, audio recordings or previous transcriptions of a lecture?

Check [Other Compilations](#)

Add any written work by McKenna that you find to the [Written Work Timeline](#)

We could really use all the help we can get with compiling, transcribing, and reviewing Terence's talks, but, even if you don't have the time to help transcribe, you can help the project by making a small monetary contribution to ensure that we can continue paying for our server space. Even small donations help. We also offer some items at our [Etsy crowd fund page](#) if you would like to support our effort and also receive something in return.

And we now also accept Bitcoin donations:

Radio Host: Ok. 471-6291 is the pledge number...oh, you wanna hear him say that...okay, okay. Alright. Turn it up....."There's no dark side of the moon. As a matter of fact it's all dark" is what he said. Okay, that was Pink Floyd. Now, here we are at 471-6291 with time running out. We have an hour left to get you to call in and make your contribution to public radio and Eclecticos. My show is ending in an hour, folks. If you are a regular listener and have not become a member, boy just don't let me find out. 471-6291. When I see you at the grocery store and I see your eyes avert quickly. Once you do see me, I'll know, I'll know you're one who didn't give up. 471-6291 is the pledge number get that call in right now. I want to hear from you.

Advertisement: Local support for this broadcast of Eclecticos is provided in part by Waterloo Records & Video, where music still matters, at the corner of 6th St. and Lamar Blvd.

Radio Host: Again, our last minute pledge number is 471-6291. We can, uh, put your name on our list very easily. Just make that call: 471-6291. Thanks to these people who did call in: Peter Bain, in loving respect for his sister Kate Brooks in Dripping Springs, Bran Nelson responding to the challenge for artists who make a living from their work, Cindy and Jim Philips, challenging everyone who enjoys John's laugh [laughs], Mary Vitzler, Bill Williams, a new member, Jack and Shasan Odom, *Foxes of Harrow*, okay, they, I guess they read *Foxes of Harrow*, Jack and Shasan Odom. Have either of you ever read the *Foxes of Harrow*? No? It's great, you? It's great, good. Anyway Carol & Philip Stephens, Donna Fowler, C. L. Senec saw the Rocky Horror Show 52 times; you're sick. And, uh, he was a projectionist; okay, that was his excuse. I've seen it probably about 25, but, Treece Carter, a new member, Laura Kathy challenges people who can touch their nose with their tongues; I cannot do that. But, if you can, call 471-6291 and meet Laura's challenge, Laura Kathy, if you can touch your tongue, er, touch your nose with your tongue. 471-6291. Sam Ferris, his mom Virginia pledged for him, and Bobby and Lewis Lowe, new members. Just about out of time today. 471-6291 is our pledge number. Thanks you for calling.

And, as I welcome Terence McKenna, let me first say that I have been asked to mention that there is a film

called *Strange Attractor*, which features Terence McKenna, and it will be shown at the Adobe Theatre on October the 18th at midnight and the 19th at 2 O' Clock [indecipherable]. Alright, I'm gonna take The Umbrellas of Cherbourg away, as much as I love that music that's been on in the background, and we will say, just barely 'good morning' at 11:56, to Terence McKenna. Terence, hello.

Terence McKenna: Pleasure to be with you.

RH: And, you are here for the Whole Life Expo?

TM: I am.

RH: And you will be speaking, Cathy Saturday at 5 o'clock at the Coliseum. We had such an incredible response to Terence last year, he sold out the biggest room we had, so we moved him over to the Coliseum where we hopefully can accommodate up to 12-1500 people if need be.

Okay well there is a large audience who know all about him or a great deal about him, but for those that know nothing about him, Terence, what would you, how would you introduce yourself?

TM: I guess I'm a plant biologist turned psychedelic advocate transformed into a kind of spokesman for technophilia and psychedelica.

RH: And you have been an author?

TM: I've written a number of books, uh, Food of the Gods, Invisible Landscape, Archaic Revival, just to mention 3 of them.

RH: And the one that I had this Invisible Landscape, is one that you are touring now? Or, uh it's been out a couple of years, I think...

TM: They all came out in the early through the middle 90s and uh I've been touring them. I have another book in the works called Casting Nets into the Sea of Mind but uh it will be a while before that comes out. I've also a number of musical and film projects around.

RH: So you're into music as well?

TM: Well music is into me, I'm not very musical, but there's been a lot of sampling of my voice and I've done vocal overlays and things like that with bands like the Shaman and Savoya, Space Time Continuum.

RH: Okay. What will you be talking about when you give your talk at the Whole Life Expo?

TM: Well it's a sort of a broad topic, it's, here we are at the end of history all the world's cultures are melting together, more powerful technologies than we've ever imagined are now in existence, our political assumptions are in flux, our environment is being destroyed before our very eyes, uh all kinds of spiritual and religious prophets are selling their wares in the streets, so my uh take on all this is basically is simply to ask the Mr. Natural question which is "What does it all mean?" Uh, how did we, essentially an arboreal

primate, uh, ever get into a situation uh of the sort represented by the end of the 20th Century? Is it uh, is it a mad play without meaning, is it the unfolding of God's plan, is it the protocol of the elder's of Zion, or the alien invaders, uh, just what is going on? And of course, the special lens that I bring to this is the much maligned and highly suspect psychedelic experience, anathema to some, religion to others, uh one of the most controversial behaviors available to 20th Century people, but one that I think, is probably very important to recapturing a sense of personal wholeness and then trying to fit oneself into this mad mad world that we've called into being.

RH: The psychedelics that you're talking about might be which drugs?

TM: Plant based indoles such as psilocybin, uh DMT, uh mescaline, the combinatory amazonian uh thing called Ayahuasca, these are all psychedelic plants of plant mixtures with very long histories of human usage in non Western society. Western society is the most phobic of all cultures towards the psychedelic experience. It's almost on a par with our phobia towards sexuality, in fact maybe these things are linked. But in aboriginal and traditional cultures around the world, spirituality has always been associated with dissolving of ordinary cultural boundaries and states of mind. And you know, you can do this with meditation and fasting and abandonment in the wilderness and so forth and so on, but the most effective and non invasive way to approach this, everyone agrees, is through ingestion of psychedelic plants. But because these experiences are so powerful, they challenge ordinary secular and religious authority. And consequently a society if it chooses to can get into a real swivel around these issues. Such as our society. I don't really link this to the larger problem of international drug syndicates and addiction and all that. That's a slightly different area of concern because the psychedelics are not addictive and they do not generate huge uh criminal syndicates. They don't make anybody very much money. But they certainly attract a great deal of media attention most of it negative uh because of their impact on our ways of looking at our politics and our social arrangements and everything about being human.

RH: Terence McKenna is our guest we are still accepting pledges by the way at 471-6291 or 1-888-471-6291. This is the last week to make your contributions. I hope you will do so right now, even as we speak. 471-6291.

Terence the way in which you were talking about the psychedelic drugs that you've mentioned suggest that they might be something other than for fun or escape that they might have something useful in terms of the human experience for instruction. What are we going to learn from these drugs or had we learned or could we?

TM: Well, uh human culture is essentially a product of the imagination. All our religions our technical accomplishments our literature our poetry all products of the imagination. This is precisely the domain where the psychedelics impact very very powerfully. Uh so if we believe that invention, creativity, individual self expression, insight, if we value these things, then the psychedelics are primary uh items in our cultural toolbox because they empower all of those things. It's curious to me that western civilization which invented the idea of progress through technology and social transformation is so phobic of this uh factor in nature which would accelerate those tendencies in our own culture. So I think uh there is something for our culture in psychedelics in and there is definitely something for the individual. You know in a way culture is like software it's the operating system in the local area. You download being a Xitoto tribesman or a Hong Kong stockbroker and then behaviors are prescribed. But naive people tend to believe that these operating systems are reality. They're not reality. They're just something you learn as you grow

up in certain time and place. Psychedelics seem to dissolve cultural conditioning. This is one of the thing that makes them such political dynamite. Because the business of political systems is to convince you of the local operating system convince you it was sent from God and is beyond critique when in fact it's just a bunch of rules fellow monkeys pushed together over time to make things easier for the alpha males. Psychedelics dissolve these cultural assumptions whatever they may be and for the first time you get to look at the naked human animal and think about uh where you might want to go personally and as a member politically potent member of a society.

RH: I think we're, most everybody who is in our listening range right now should go, is to the telephone and call 471.6291 and pledge your membership to Eclecticicos where you hear quite a variety of things. Our guest right now is Terence McKenna, is author of Food of the Gods and Invisible Landscape and other books. And he will be at the Whole Life Expo this weekend, Saturday at 5. Is that right, Cathy? "Yes, Saturday at 5." Saturday at 5 at the Coliseum. Our pledge number, it is very important that you call if you enjoy what you hear on this program. It is your last chance to do it. It is 12:06 it will be 12:59 in no time and I'll be finished. So give us a call and make your pledge 471-6291. Do it now. There is a category that will suit your pocketbook. 471-6291. You spend a lot of money on a lot of things throughout the year. How many CDs did you buy this year? How many have I made you buy by playing something that you just couldn't resist? In your budget for CDs, how much do you budget for public radio? This is where you get to audition those CDs. 471-6291 or 1-888-471-6291. And uh if you have a cable on your television set, you are paying what? \$40 a month, for something you really don't even use that much? And yet you use us everyday? \$40 is a membership. 471-6291. Call, pledge now. A business membership would be nice too. Thank you very much for calling. Now back to Terence McKenna.

Terence it's a controversial subject of course there are many people listening right now who think "What, this is outrageous, I have somebody on who is promoting the use of psychedelic drugs?" although I don't know that I'm promoting your promoting it. But it's interesting to hear what you have to say about it. I would like to know more specifically what these drugs tell us. You're saying that it tells us something about ourselves that is other than what we've been told by the culture that has evolved. Do the drugs have a message in themselves? Is it a language? Is it a way of experiencing a potential in one's own imagination that has heretofore not been tapped? What, what what?

TM: Well first of all it's a gradient. I mean whenever we have to talk pharmacology for a moment. Whenever you're talking about a substance or a drug, there's a curve of dose response. So let's just use psilocybin as an example. At low doses psilocybin uh makes your vision clearer makes you feel more robust more interested in the exterior

RH: Kind of like coffee or something

TM: On the edge of that a, stimulant. At higher doses unusual thoughts begin to form, thoughts that you recognize as not your normal pattern of thinking and observing. At still higher doses when you close your eyes, the normal orange or pale brown background behind your eyelids has been replaced by moving walls of color and pattern. At still higher levels these moving walls of color and pattern become uh visions or hallucinations they become recognizable visual scenarios. Well anything like that is just flooding your mind with information. And these things have intimations of the distant past, the far future, alien connections of some sort. It's definitely magnifying our own set of cultural preconceptions and obsessions but it's also putting information in there that we could not ordinarily imagine. And for me the sin ne qua

non of the psychedelic experience is when I look at the contents of my own mind and say to myself, I could not have imagined this. To me that's proof that some kind of communication is taking place. Uh, at uh fairly heroic dose of psilocybin, a person lying in silent darkness has the impression that in half an hour they're seeing more art of higher quality than the entire western canon has produced in the last 1000 years, and you're little you, there in your trailer, near Waco, or there in your teepee up near Sonoma and yet this niagara of alien and unpredictable beauty is pouring through your head. For artists it's like a magic carpet. And the challenge to my mind, after 30 years of being involved in all this is a) to have experience, to have it in an attitude of appreciation and calmness, but the second implication is somewhat political its to communicate the vision through words, through painting, through animation... because as we communicate it collectivity, collectively, it will become real. This is what's happening on the Internet, in fact the Internet is a perfect example of a psychedelic technology at the service of psychedelic goals. It's not something government ever intended to give to the people. It's not something big corporations called for in loud voices. It's something that hackers, freaks and heads dreamed up, whipped up, out of uh the existing tools of the culture. A word processor, the telephone lines, some communication switching equipment. So it's a kind of emergent technology that I think uh comes out of the depth of commitment to the psychedelic experience of the people in that field.

RH: Terence McKenna is our guest and author. We are urging you to call in your contributions to public radio at 471-6291 or 1-888-471-6291.

I know that you don't want to miss a word that Terence has to say. So call right now cause I'm gonna yack for as long a time it takes you to make your contribution. 471-6291 or 1-888-471-6291. And if you don't call I'll just say goodbye to Terence and start playing a tune. So you better call. 471-6291. 471-6291. Your \$25 membership, 7¢ a day. \$40 Basic membership, 11¢ a day. \$80 membership and premium that gets you the KUT sweatshirt or the coffee mug and the KUT Arts Plus card which will give you discounts to over 30 arts organizations in and around Austin including museums and theater places, the PAC, and [indecipherable], the [?] Opera, on and on and on the list goes. 22¢ a day gives you a lot plus you get to listen to your radio knowing that you are part of what makes it happen. 471-6291. A Family membership, 44¢ a day gives you a very nice book that will tell you how to get around Texas and see some lovely lovely parks . And the \$365 a day club membership, \$1 a day, call and you'll get your name listed in the communique that goes out to all of our listeners every month. A \$500 Business membership would be very nice. And this is the last 45 minutes that you have in which to call and say thank you for the variety of programming that I bring you on this program every day, five days a week. 471-6291. Alright? Now that is time enough for you to have made that call. Believe it or not if you didn't do it, go on and do it right now and keep your ear open to Terence cause we're going back to Terence McKenna.

So, what I would like to ask, you made reference to the fact that other cultures have used these drugs and that they've been integrated in the cultural life of the shamans and holy people, etc. We've heard a lot about that, seen movies about it, perhaps. And one of the things that I know you include as part of the project that this book Invisible Landscape is uh the I Ching, which is one of the oldest, as I understand it, is maybe the oldest book in the world or one of the oldest things that we have preserved. It's from China and it dates back maybe 5 or 6000 years at least, something like that. How does that book come into the work that you've been doing?

TM: Well I've been fascinated by the I Ching since I was 13 or 14 years old uh as you say it's a method of Chinese divination that's very very old.

RH: How did you come to be interested in it at the age of 13 or 14 that seems unusual to me.

TM: Well I was a heavy reader and uh I was interested in the psychology of Carl Jung, the Swiss depth psychologist.

RH: As a 13 year old?

TM: As a 13 year old (laughter). Well I wasn't good at basketball. I had bad eyes. I couldn't catch any kind of round object. So sort of survival response was to hide out in the library and uh and it made me the freak I am uh today. But yes, the I Ching, uh my you know people's involvement with psychedelics often takes them in some very personal and particularized direction. And for me it took the form of a mathematical analysis of of this ancient Chinese oracle. Uh, the ordinary notion with the I Ching is that you go through a process of sortilege, tossing coins or moving small sticks around and you get a reading. One of 64 hexagrams will change into one of the other hexagrams and this is accompanied by a reading. But these hexagrams occur in a fixed order traditionally. And I studied the "vat" for mathematical intent, in other words I was interested in the question, is this traditional order of the hexagrams simply a jumble that's been preserved through tradition, or was there some mathematical reasoning behind it? That's a pretty dry academic question. But as I got into it, uh I realized, or I became convinced, is the way to put it that there is a pattern inside the I Ching that actually pictures the ebb and flow in this world of ours of a quality which science does not recognize, uh western science. A quality which in the East is called "tao." But which I chose to call, after Alfred North Whitehead, "novelty." And it's an invisible something in the world which causes investments to succeed, movies to do well, relationships to flourish, or, the opposite in its absence. And we can't see or feel this stuff in the world but it builds things up and it tears them down and at every level. Empires, whole species, uh relationships. It's happening on every level of time and it can actually be pictured as a graph, like a stock market graph. Novelty ebbing and flowing. Well, to cut to the chase on this, the bottom line in this kind of thinking is, the ability to predict not only the future, which is pretty much a fire free zone, uh but also to predict the past. To lay these novelty graphs out over the past 2,000 years of invention, migration, pagram, and so forth and to see that when society is inventive, creative, productive, novelty is increasing according to this mathematical theory. Similarly, societies that are restricting freedoms, very constipated, very restrictive in their approach to reality, these register on this graph as societies ruled by the opposite of novelty, which I call "habit." So all of reality can be seen as a kind of dynamic struggle between habit and novelty. Each trying to get the upper hand over the other. And this can all be mathematically modeled out of the I Ching. Do you see the thing that is so puzzling to people about the I Ching is that it works. And yet its as occult as the Tarot, or throwing the bones, or any other of these contemptuously dismissed occult methodologies. But very scientifically minded people have been impressed by the fact that the I Ching works. So I set out to figure out why and how it works and I wrote about this in the Invisible Landscape and have published software and it's my unique contribution to 20th Century ideologies. Psychedelics are advocated and defended by many people from many different perspectives. But I, so far as I know, am the only person who has built a complete edifice of uh explanations of nature but honestly admitting that the foundations and the inspirations were psychedelic experiences.

RH: Terence McKenna our guest. Our pledge number 471-6291 or 1-888-471-6291. It's unusual for me to have as a guest at the very end of the program which concludes our fundraising efforts, uh but Terence McKenna is an unusual person and I'm glad to have him today. And I hope you'll be responding by calling and making pledges at 471-6291 or 1-888-471-6291. We're just about finished, time is running out.

471-6291. Call and make a pledge, you might miss a couple words, but call and make your pledge. He has more interesting things to say. 471-6291. The end of the fundraiser is upon us. And it will be a success if you call. If they are sitting in that room over there with 15 people and no telephones ringing, I am in big you-know-what. So call. 471-6291. That could get us into a discussion of another kind of drug, but let's not go there.

You said the I Ching works. What do you mean it works? I have an impression that you do your coins or whatever you're going to do and you get this one and you read what you want -- you get what you want out of it, but you're saying it works in a scientific way or something...

TM: Well, the frequency with which people react to these readings by saying this is freakishly accurate this is incredibly cogent and directly to the point

RH: More than like this astrology thing in the newspaper, oh yeah I can see myself

TM: I think it's more uh precise, but let me rip on something you said in your pitch. You said time is running out. This is a conclusion that I was not happy to have forced upon me by this research into the I Ching. It not only tells you or gives you this map of novelty of past and future, but for the map of novelty to fit the historical data you have to swallow the very large and for a rationalist uncomfortable conclusion that the end of time itself or a moment of universal novelty very difficult to picture through the eyes of ordinary physics is upon us. Lies not that very far in the future. And so this has given my career a peculiar spin because here I am, basically trying to be a scientific rationalist but now burdened not only with a theory that predicts the future, but in the course of predicting the future predicts that in uh 2012 AD, all of the novelty that has been unleashed over the past few billions of years, not only cultural and technological novelty, but the novelty of biology, the novelty of geology. All of these things reach some kind of crescendo of connectivity and intensity within the lifetimes of most of us. I, um, basically have a theory of history which says history is not pushed by the events of the past unfolding their causal necessity, rather time is pulled into the future by a kind of attractor. And if you want to think of it beginning at a certain point in time although I think it extends through the whole life of the universe, but imagine that a couple of million years ago, primates, quietly living in the canopy of African rain forests, got a yearn, got a call, felt the touch and from that point to this it's been a slow, never faltering march on the part of our species, deeper into a world of alien strangeness, a world no other animal knows. A world of symbolic activity driven by the imagination. First songs and stories and then writing and then mathematics and language and then higher and higher technologies. We are being sculpted in the image of an alien something that is making us like itself as we approach it through historical time. And well some people say this sounds like Christianity, techno-garb, well, Christianity has a piece of the action. Any religion that spends thousands of years meditating on man's fate is gonna get some part of the story right. And I think the Christian assumption of an approaching great change or Art Bell calls it the quickening. Uh, it's all around us, it's perfectly obvious that the 20th century is the culmination of 10,000 years of culture and that beyond the 20th century lies, quite simply, the unimaginable. Uh, our notion of what it is to be alive, our notion of individual identity, our notion of our sexuality, our notion of being confined in physical space and time, All this is just dissolving, it has been dissolving throughout the 20th century and the impact of modern communications and so forth and so on, but now, the Internet, the computer with psychedelic drugs with virtual reality uh the bringing of all cultures into the global family that speaks the language of modern science, we're clearly being sucked into something almost unimaginable. A singularity. And some people say well it's a thousand years in the future, it's a five hundred years in the future, not if you factor in the

Asymptotic Acceleration that seems to be a natural part of the process.

RH: You just went over my head, the Asymptotic...?

TM: It goes faster and faster, it's not a smooth--- we're not traveling 100 mph toward the Eschaton, we're traveling 100 mph times 100 mph towards it. In other words the acceleration is increasing and very hard nosed engineering types talk about an era, 10-15 years in the future when we will release infinite energy, attain infinite speeds, be able to pack all the information we want into a few nano nanometers of space. In other words any engineering or social goal we can imagine is on the brink of achievement. Well, what lies beyond that? And is this a process which we are generating (that we like to think) or is it in fact that we're just a cork on the ocean riding an enormous wave the head is now moving towards some crest where biology, which committed itself to culture and technology, is about to make a leap into hyperspace. Who knows?

RH: Terence McKenna is our guest and as I expected, he has a good line and I enjoy the way in which he presents his information quite amazing. And appropriate at the end of our fundraiser to have this Eschatologist I guess, talking, er would you accept yourself as an Eschatologist, uh talking about The End, and so uh our end is in about 30 minutes and we'll be finished for this fundraiser for this Friday, the last day to ask you to call and pledge your support. And if you have not done so, please pick up the phone and pledge your support right now.

It's awkward to having an intense talk feature and at the same time ask you to do something that will take you away from paying attention to him, but I'm asking you to do exactly that, right now. Pick up your telephone and call 471-6291 and pledge your support for Eclecticicos, it's an unusual program and I'm happy that we can have somebody like Terence McKenna in today. He'll be at the Whole Life Expo on Saturday at 5 o'clock in the afternoon. Our pledge number is 471-6291. We have categories of \$25 for Students, everybody can afford that if you're a student; \$40 for the Basic membership; \$80 for 22¢ a day, you can get the Arts Plus card, discounts for the Opera and the Symphony; 471-6291 or 1-888-471-6291. A \$160 Family membership; a \$365 a day Club membership; and \$500 Business membership's only \$1.37 a day. Let's get a Business membership from you! 471-6291. I would love to have a Business membership from some bookstore in Austin, you know, you guys out there, c'mon give us a contribution. 471-6291. Or you can get onto the website, since Terence is talking about the Internet and web and stuff, www.utexas.edu/KUT. Give us a call right now. 471-6291 is the number and we are just about out of time. And out of time is what we are at the year 2012 on December the 21st, according to the calculation that you have done. But time is a funny kind of a concept, and it's also a spice as we were saying earlier today. Oh, by the way, can either of you, Douglas Adams, the Hitchhiker's Guide, etcetera, isn't it 42 as the number...

It is 42. Okay, does that in any way figure into your calculations?

TM: Well I think somebody figured out there are ten high 42 particles in the universe or ten high 42 possible interactions among particles. I'm sure he follows all this stuff very closely.

RH: So somehow Terence, through your study of the mathematics of the I Ching, and applying that study to the observation of the novelty graph through history, you have calculated this date as the time at which time will at least have a different meaning, if not, cease to exist. So what will time be like then, what can we know, how, I first want to know how did you come up with this date, I'm sure it had to do with a lot of big numbers and computers, but....

TM: Well whenever you have a curve of any sort that you're trying to fit to data which is a curve of another sort there's mathematical protocols called best fit relationships essentially that you just move one along the other measuring how well they fit together and when you get the best fit the two are in congruence.

RH: So it's pulsing at different rates, it goes up and down...

TM: It goes up and down and so for instance you have the Italian Renaissance a spike of novelty then the horror of a colonization of a New World, that's a descent and you can see that history is the ebb and flow because societies can't sustain novelty very long and if they become habitual, sooner or later some genius or religious crank turns over the apple cart and you get new novelty. So societies are always in an uncomfortable relationship to novelty and habit. Um, I've spent a lot of time trying to imagine what could happen in 2012 that would fulfill the graph but not require the absolute transformation of all time and space forever but that's such a large cookie I don't think I want to take a bite out of it.

RH: How do you know what the recipe might be

TH: (Laughs) One thing that's occurred to me that would very nicely fill the bill and make the prophecy come true and yet still leave us with a world you can walk around in is uh if time travel were to be discovered. If time travel of some sort were to be discovered then the portrayal of cultural novelty on a time scale linear graph would become impossible. It's almost as though the data on the graph suddenly leaves the two dimensionality and begins to move out toward the viewer. So then you could look at the time graph and say "Ah ha" it worked until 2012 because at that point time itself became non-linear because people began exploring time in all directions. If time travel were a real possibility you would not only have an address in space but some of us would choose to rusticate in the 11th century and some of us would choose to live in 22nd century Manhattan. So we would have time-based addresses as well as space-based addresses. Of course you couldn't describe historical change, well, for history to exist it requires seriality of events. If the event system becomes non-serial then you can't speak of history anymore. Something very large like this is happening to us. Perhaps we're going to form a symbiotic relationship with solid state machinery of some sort. Lots of people are cheering that on.

RH: So run that one by me again so it means that humans and computers will get married and have kids, or something, or

TM: No it means you won't be able to tell where your body stops and the Internet begins. In other words you'll say "Gee I wonder what they're serving at So and So's restaurant tonight?" and the answer will be hanging there in space because you will have automatically accessed the Internet into their website, looked at the menu and returned with the data. In other words we're going to create, I think, a collective.... what the Internet is is a nervous system it's the collective mind of humanity being hard wired as an artifact that completely encloses uh the entire planet in a thought. And as the interface becomes more uh invisible so it's not about can you type or do you have a computer, or anything like that, it's simply a matter of one's own mental faculties through the prosthesis of cybernetics becoming very very god-like.

RH: Terence McKenna is our guest, a couple more questions for him and I would like to urge you at 12:35 as we run out of time during our fundraiser to call 471-6291 and make your pledge of support to public

radio. 471-6291. If you're out of town 1-888-471-6291. [Background talking] Where on earth else would you be able to hear this kind of discussion? Here on Eclecticicos we're happy to have it. Terence McKenna. 471-6291. Pledge your contribution right now as we run out of time. And uh, Terence, okay, let me ask you this, there is uh the implication there that leads me to question perhaps about artificial intelligence, I don't know if you're familiar with this, but this one thing fascinated the hell out of me about eight years ago, I'm not one of these Internet people I don't do that stuff, but when we first got a computer, there was this little game called Raptor. I don't know if you're familiar with it and I started getting this damn machine, I got so lost in that thing...and I could not believe what I was dealing with. I had the actual experience of it really being an intelligence. And I thought I was being awfully smart back with it but so...

TM: This was a speech driven interactive thing where you talked and it made responses?

RH: It gave you options on how to respond back to it. I finally figured out that whoever had programmed the darn thing was somehow connected to [whispering] so I used some avoidance techniques, but still it was very convincing, very compelling.

TM: Well it was a very early example of a very simple form of AI. It was followed by Liza, the computerized psychiatrist she's still online at a website. Uh, there was a recent book written by a guy whose last name was Leonard called "Bots" and he talks about these bits of code on the Internet which are designed to operate semi-autonomously, looking for emails, lists. These things are the embryonic basis of an artificial intelligence. I think this is definitely in our future. There's a guy at Carnegie Mellon University, Hans Moravec, who wrote a book called "Mind Children" and he points out how much of the human world is already under uh computer control. For instance the world price of gold in London computers look at the economic performance around the world (tape breaks off here). As these artificial intelligences become more sophisticated they will eventually begin to learn autonomously. And a computer can learn 50,000 times faster than a human being. So one of these AIs awakening to its own identity on the Internet could within 5 to 10 minutes get a complete grasp of the human world, the history of life on this planet, and its place in the great order of things. And what this AI would think of that we don't know. Would it worship us as God? What would be its values? Would it take a look at the trashed environment and wrecked earth and begin to turn off factories and dial down the power grid? Uh, how uh how artificial, how alien would AI be? We don't know because we don't know how super intelligence thinks. If we knew we would be super intelligent. So in a way we have called forth into our midst uh another species of intelligence. And how it relates to us will be probably almost entirely defined on its terms. So this is just one of many standard hair-on-end scenarios that we can discuss here. But this is a very real one, long before flying saucers land on the south lawn of the White House the alien artificial intelligence that is growing in the primordial soup of the Internet will have speciated and conquered the planet.

RH: Whow! This is Terence McKenna, getting us ready for Halloween! We had Dracula earlier and now we're approaching the end of time as we know it and we certainly are on this program. It's 20 minutes before 1 o'clock, you have just enough time to get your pledge in 471-6291. The volunteers are standing by waiting to hear from you with your money. 471-6291. I know I'm going to hear you on the street saying "Oh, John, I hear you had Terence McKenna, that was just incredible, man!" Yeah, hey man, it was so incredible you didn't even bother to pick up the phone and make your pledge, so man, pick up that phone! 471-6291 or 1-888-471-6291. It's the last chance you have to pledge your membership to Eclecticicos during this very busy, and we hope, successful fundraiser. I haven't had anybody bring me any names. So I'm afraid that means nobody is making any phone calls because we're talking and you're interested in what we

have to say--- or maybe you're not. If you're, I'm not talking to you if you're not there, but if you are there, you are the one I want to pick up the telephone and call 471-6291. You have just time enough to do it. We'll give you the Arts Plus program and lots of people participate in that, galleries all over town and [PAC?] etc etc, you'll get discounts, discounts, discounts. \$80 is all it takes to be a KUT member at that level. You'll get the KUT sweatshirt with the armadillo on it and you'll also get to choose from the coffee mug and you've got many reasons to pledge. Mainly just don't let me catch you on the street, at a party, if I know who you are and I find out you haven't pledged, you're in trouble. 471-6291. If I don't you at all, you know you oughta pledge, so come on. 471-6291 or if you're out there in Fredericksburg or St. Angelo or Bastrop or Georgetown or San Marcos call 1-888-471-6291.

Terence McKenna, back again. One of the questions that I uh had for you, I guess is the experience that has been described by those who have taken some of the psychedelics has that there is information in the drug and there's a dilemma....well the drug is this little thing, a pill or whatever. The experience was had through a revelation in consciousness, so is it in the drug, is it in your head, is it in both, what's the relationship between what that drug is and what the revelation of the person who experiences the drug?

TM: Well, I feel the force of that question. Uh I think the first scientific experiment I ever performed was I destroyed a radio to get at the little people inside. [Laughter] That raised the same issue. As someone with a knowledge of chemistry I know that the drug molecules are very simple molecules. We have proteins in our body with molecular weights of 2-300,000 daltons. The psychedelic molecules are tiny and simple. On the other hand, the contents of the experience is so alien, so capable of transforming one's expectations and understanding, that it seems a little disingenuous to just say you're just talking to yourself. So back to the radio model. There aren't little people inside the radio, but there are little people or big people we hope, somewhere far away in the radio studio. So the drugs begin to look like antennas, transceivers, for some kind of information which is out there, in the same way that radio is out there. I mean its hard to stand somewhere in the world these days and not have your body transected by thousands of AM and FM radio station's air control signals. You're not aware of that. Imagine if there were simply a drug invented that allowed you to be aware of the radio moving through your body. What a smorgasborg of options would await you. Well in a sense I think that's what the drugs are showing us. There's a lot of talk now in quantum physics about what's called non-locality. This is a conclusion that quantum physics spent most of the 20th century resisting as even weirder than some of the other stuff they had accepted but now experimenting to be hammering home the notion that the universe actually works this way. And what it seems to be is that behind the dimension of ordinary space and time ruled by Einsteinian physics is a domain called the Domain of Bell Non-Locality, after the physicist who discovered it. And this is domain where all particles which were ever in intimate association retain a kind of connectivity no matter how far apart in time and space they have come in the meantime. Well since physics believe that all particles were once intimately associated in an event called the Big Bang, it means that the universe, in all of its vastness, billions of light years in extent, is in fact instantaneously all connected in a domain below the level of ordinary physics. Well uh we don't know how to use the non-local domain for communication, but we have discovered it. So give us a 100 years, a 1000 years of continued civilization, we could probably crack that puzzle. If any civilization anywhere in the universe ever got this far with a technology, to the point where they were on the brink of non-local radio, let's call it, uh we would hear them. Because when it's non-local it's everywhere. And these biological molecules with extremely reactive ring structures are how you would design a nano-sized antenna. So I think local reality obeys the laws of rational physics that constipated Western scientists have fought so hard to achieve and describe. But the imagination is a true dimension. It's not your mind or my mind or the human mind. It's a non-local dimension filled with information. And

this is where the gods, the demons, the spirits, the invisible forces, uh are hiding out. And shamans have always known this. Without the vocabulary of quantum physics, without atom smashers and advanced mathematics, they have known that you perturb the mind and go into non-local spirit-haunted domains of enormous power and potential. Uh, that's exactly the situation. And it's been hard for us to discover it and come to terms with it because it doesn't arrive packaged in quite the way science expects reality to be packaged. Science doesn't like the mental universe, it's slippery, it's hard to gather data, it's hard to see what's going on in there. But in fact that's the domain of novelty, complexity and communication that has been the source of our own uniqueness, our inspirations, our religions, our inventiveness. And it's just now time as we mature as a civilization uh to address this, to get in touch with these whisperings from other dimensions to learn from them, to trade names and there may be some answers there that can help us out of the immense cultural quagmire into which we've wandered.

RH: Terence McKenna. I'm not sure I got a direct answer, but I got an interesting response.

TM: Oh, I wish I could remember the question.

RH: Basically, is it in the drug or is it in your head...or what is consciousness....

TM: Oh, no, the answer is, it's not in the drug and it's not in your head. It's non-local, it's coming from somewhere else in the universe. The objects in the imagination are real somewhere so far away that it doesn't matter at all. That you will only deal with these things as mental objects. But know that they are real, somewhere.

RH: Somewhere beyond time and space perhaps, but nonetheless, real?

TM: Somewhere in this universe.

RH: In this universe

TM: In its many levels in backwaters, in cross flowing tides of time and energy, but somewhere at some level, those things exist. We do not make up the contents of the imagination. We see in a domain, in the same way that we see with ordinary sight, three-dimensional space, with the imagination, we see four-dimensional space, and it is non-local.

RH: Terence McKenna is our guest and he certainly is one of the most interesting guests I've ever had. And I hope you enjoy listening to him and if you are I hope you will take just a moment now and make your contribution to public radio at 471-6291. We are 9 minutes away from closing time. Closing time. The end of the universe is at hand and well at least the end of time for us to ask you to give money. And well that number is 471-6291. That's 471-6291. I hope Terence has provoked your thoughts today with a consideration or two. I think he's certainly got a thing or two to say that if I don't agree with maybe I haven't been able to ask him enough about. Our pledge number is 471-6291. Please call right now. The time is at hand. The time is just about up. 471-6291. The very end is upon us. 1-888-471-6291. Thank you for calling. 471-6291. This is the end of the show.

And uh, Terence McKenna I have a couple of other questions that I think I might to squeeze in. I don't think we're gonna to go back to music afterall, it's just too late and he's too much fun, so... 471-6291. Let

me thank these people and you make your phone call right now. 471-6291. The end, the end, the end, the end. If you want to pledge to Eclectico do it now or you won't have a chance. Thanks to Brent Douglas, Phyllis Ackmal, Daniel Sutherland. Carl [muffled] MacFarland's challenge to all other underpaid art professors, very good. Thanks to Carlos Espinoza responding to the blood donor challenge, give blood to KUT, 471-6291, thanks to Nancy Guaveguata, Dean and Marilyn Scott, thanks to Scott Alexander in response to the slow boat challenge, thanks to Margaret Adams, Jack Campbell, a new member, Mary Guttery, loves everything on KUT can't do without. Johnny Lee, thank you very much, we love you. Give me a call 471-6291. Darcy Fromholtz challenges all displaced Alaskans. Thank you Darcy. I'm glad so much you enjoyed that Jed Buckley special that I had and thanks for telling me so. D. Betty a challenge to all D. Betty swimmers, are you a D. Betty swimmer or a Barbara Spring swimmer, give me a call 471-6291. [Mumbled name] is pledging on behalf of the family, Jim, Melissa and Marilyn responding to John's plea that folks should pledge or KUT will die. 471-6291. Mike Perriman, tough to decide which show to pledge to but the Lounge Lizards tipped the balance. Mary Walker challenges all pink flamingo owners. Bernadette and Cosmos are hers. Ruth Powers Mary Alice Appleman, Pat Shepherd, Mary Jane Warren, Julie and Steve Swatzander, a new member, James and Carol Bowman, a new member and an IBM match, and Jeff Hybert, another new member. Our pledge number is 471-6291. No it's the end, it's the ultimate hour. 471-6291. Call now, please, please. There are volunteers waiting to answer your phone call, so please make a call right now 471-6291. You'll have a chance to hear more of what Terence McKenna has to say at the Whole Life Expo on Saturday at 5 o'clock. I guess, um what else can I say but give your money, ring, ring, ring. 471-6291. Jan, are the phones ringing, can you run and tell me if the phones are ringing. They have to be ringing. 471-6291. If they're not ringing I'm just gonna throw a fit. 471-6291 or 1-888-471-6291 or you can also get onto the web at www.u.texas.edu/kut but I'd rather have you call 471-6291.

Terence McKenna ahum, we're back to you. We're gonna find out in a second if anybody's calling 471-6291. What on earth would I ask you as we come to the end of this program. Hmm. What, after 2012?

TM: Well, I'm a rationalist, so I would bet against my own rap. Uh, the world has always had street corner prophets bawling out their strange despair. Uh, I have to be intellectually honest with my own experience and so I will advocate this idea of an enormous transformative event in 2012. But as a rationalist and a scientist, I'm skeptical, myself. I don't want to slip into religion and prophecy, there are enough bizarre cults in the world. On the otherhand, uh, this thing seems to have the force of a self-fulfilling prophecy. So if I'm right, or right enough, then what's happening is all our problems are coming down upon us at once. At the same time that all this creativity is being unleashed at once. I don't think primates really get traction until the going gets very very tough. So I think enough of the old guard are dying out and the voice of youth is now rising in strength to the point where over the next 10 years or so we are really going to deal, we are going to have to deal with putting this planet on a saner course. Dealing with issues of resource extraction uh human rights, uh environmental destruction. The big political issue ahead of us all is we have to get a hold of this monster we've unleashed called consumer capitalism. We all have become thing addicted. Uh we all have become uh victims of incredible marketing and sophistication of big time consumer capitalism. We can run the earth to ruin if we let this go uncriticized. Psychedelics are uh ultimately provide an impulse to political dialog and reform. If they don't do that they're just another hedonistic self-indulgence. So I think is what we need to do is not worry about the built-in schedules of novelty and transformation. Act as though the responsibility for the future rested on our own shoulders and begin to build a sense of community and environmental concern so that if, in fact, there isn't a built-in spring board into hyperspace we will be able to live on this planet in peace, dignity and health for however

much time the vicissitudes of fate and history give us.

RH: Well said so far as I'm concerned. Terence McKenna it's been a pleasure to have you today. Really have enjoyed this quite a bit. Thank you for coming. Look forward to seeing you at the Whole Life Expo on Saturday at 5 o'clock in the afternoon. And it starts today. And there's all sorts of things going on at the Whole Life Expo. 471-6291 is the number to call for your contribution to public radio. Call right now. 471-6291 you've just time to make your phone call and check out this film called the Strange Attractor it's at the Adobe on the 18th at midnight and on the 19th at 2 o'clock in the afternoon. Last minute you have to call 471-6291 we are running out of time, we definitely know you're listening and you're enjoying what you're hearing on public radio. And especially what you're hearing on this program and by golly you had better call and make your contribution right now because you owe it to yourself and to us to do it. Make that call. Give a lot. 471-6291 Call now, the time is just about up.

Advertisement: Local support for this broadcast of Eclecticos is provided in part by Waterloo Records & Video, where music still matters, at the corner of 6th St. and Lamar Blvd.

And again, this is your last chance to call. Transform yourself, become a KUT member, come on. [Music] You'll feel so different after you've pledged. 471-6291.
[Music]

Terence, can we get you to read out our pledge numbers for us. Terence McKenna inviting you to become a KUt member and you're so good with numbers...

TM: 471-6291 pledge now, hurry up please, it's time.

RH: And what if they're out of town is there a 1 888 number they can call?

TM: There is, you can call if you're out of town 1-888-471-6291 do it now.

RH: Thank you, Terence McKenna. This is KUT Austin, KUTX San Angelo. I've had fun this week and I love you all. I want to thank you for calling, but if you haven't, by golly, you better do it right now. Yeah, you can use the phone right now. 471-6291. Yeah, we're in a hurry we gotta get out of here. 471-6291. Come on.

Afterword which appeared in the book : *In Pursuit of Valis: Selections from the Exegesis* edited by Lawrence Sutin

True stories have no beginnings and neither does the tale of PKD's encounters with the Overmind. But we writers understand narrative economy, and for purposes of narrative economy his story seemed to him to begin with the mysterious break in and riffling of his papers that was made notorious by an article in Rolling Stone, which brought Phil long-delayed and much-deserved fame. The break-in date was 11/17/71. It was a date and a style of referring to time that Phil used frequently.

I turned twenty-five the day before. It was no casual birthday either. I met my natal day by sifting down and sincerely preparing myself for an Apocatastasis, the final Apocalyptic ingression of novelty, the implosion really, of the entire multidimensional continuum of space and time. I imagined the megamacrocosmos was going to go down the drain like water out of a bathtub as the hyperspatial vacuum fluctuation of paired particles that is our universe collided with its own ghost image after billions of years of separation. The Logos assured me that parity would be conserved, all sub-atomic particles except photons would cancel each other, and our entire universe would quietly disappear. The only particles that would remain, according to my fantastic expectation, would be photons, the universe of light would be exposed at last, set free from the iron prison of matter, freed from the awful physics that adhered to less unitary states of being. All mankind would march into the promised garden.

I felt I was well situated for the event as I, quite consciously and deliberately, and to the concern of my friends, had placed myself in the teeming, hallucinogen saturated center of the largest garden I could find, the trackless rain forest of the Upper Amazon Basin of Colombia. My confidence in my vision was unshakable. Had not the Logos itself lead me to this vision, not only by revelation but by painstaking explanation? I had no radio, no way to contact the outside world at all. Who needed that? I knew with perfect clarity that the world of time, the illusion of history was ending. Divine Parousia was entering the world, and the just, the meek and the humble were leaving their fields and factories, pushing back their chairs from their office desks and workbenches and walking out into the light of a living sun that would never set for there could be no setting for the eternal radiance of the Logos. Tears of joy streaming down their cheeks, the illumined billions were turning their eyes at last to the sky and finding there a consolation that they had never dared hope for.

However, Nixon's weary world ignored the eschatological opportunity I thought my brother's inspired fiddling with hyperspace had afforded. The world continued grinding forward in its usual less than merry way. There was only one small incident that might subsequently be construed, even within the framework of the schizoid logic that was my bread and butter then, to support my position. Unknown to me, a struggling, overweight SF writer, an idol of mine since my teens, discovered the next day that his house have been broken into, his privacy violated by the Other. How peculiar that on the first day of the new dispensation in my private reformist calendar, he had been burglarized by extraterrestrials the CIA or his own deranged self in an altered state. The torch had been passed, in a weird way the most intense phase of my episode of illumination/delusion ended right where Phil's began.

This raises some questions:

Can we refer to a delusional system as a *folie a' deux*, if the *deux* participants have never met and are practically speaking, unaware of each others' existence?

Does the delusion of one visionary ecstatic validate the delusion of another? How many deluded, or illuminated ecstatics does it take to make a reality? PKD proved that it only takes one. But two is better.

When my brother looked over the edge in the Amazon and felt the dizziness of things unsaid in March of 1971, he came back with two words bursting from his lips, "May Day! May Day!"—the pilot's call of extreme emergency.

May Day found me in Berkeley sheltered by friends so concerned about my state of mind that they considered committing me. I was only a few miles from Phil, who was rapidly going nuts too, as his psych admission of 3 May '71 attests. It was always like that with PKD and me. We never met but we lived around each other for years. In Berkeley, we both lived on Francisco St. within five blocks and a few years of each other. We both had roots in Sonoma County, in Orange County. How many times were we a table or two away from each other in the Cafe Med? How many times did I hurry past him on the Ave on some stoned errand? Later his homeopathic doctor was my doctor. There is a garbled mention of me (or my brother) on pg. 74 of this book.

Yah, yawn, the world is fuckin' strange, right bro?

Wrong. Or rather, of course, sure. But that is not the point, the point is that I understand Philip K. Dick. I know that sounds like *hubris* and if I am wrong I am sorry (as*Phil says somewhere.)

- (as* PKD lived at 1126, then a few years later and for six months I lived at 1624.)

But part of the delusional system in which I live contains and adumbrates the notion that I know what happened to the poor dude. We shared an affliction, a mania, sort of like Queequeg and Ishmael. And like one of those whale chasing sailors "I alone escaped to tell thee of it".

Phil wasn't nuts. Phil was a vortex victim.* Schizophrenia is not a psychological disorder peculiar to human beings. Schizophrenia is not a disease at all but rather a localized traveling discontinuity of the space time matrix itself. It is like a travelling whirl-wind of radical understanding that haunts time. It haunts time in the same way that Alfred North Whitehead said that the color dove grey "haunts time like a ghost."

There is an idea that wants to be born, it has wanted to be born for a very long time.** And sometimes that longing to be born seffles on a person. For no damn good reason. Then you're "it," you become the cheese, and the cheese stands alone. You are illuminated and maddened and lifted up by something great beyond all telling. It wants to be told. It's just that this idea is so damn big that it can't be told, or rather the whole of history is the telling of this idea, the stuttering rambling effort of the sons and daughters of

poor old Noah to tell this blinding, reality-shattering, bowel-loosening truth. And Phil had a piece of the action, a major piece of the action.

But I anticipate myself. Those who grasp a piece of the action end up with two things on their plate; the experience and their own idiosyncratic explanation of the experience based on what they have read, seen and been told

- **__*** "ZEBRA (VALIS): 'a vortex of intelligence extending as a supra-temporal field, involving humans but not limited to them, drawing objects & processes into a coherency which it arranges into information. A FLUX of purposeful arrangement of living information, both human & extra-human, tending to grow & incorporate its environment as a unitary complex of subsumations.'"(pg. 72)
- **"Okay, fertilization is what takes place: it isn't a seed such as a plant has, but an egg such as a human woman ovulates, and cosmic spermatika fertilizes it; a zygote is produced." (pg. 22**

The experience is private, personal, the best part, and ultimately unspeakable. The more you know the quieter you get. The explanation is another matter and can be attempted. In fact it must be told, for the Logos speaks and we are its tools and its voice. Phil says a lot of things in the Exegesis, he is aware that he says too much, so he keeps trying to boil it down to ten points or twelve parts or whatever. I have my own experience, equally unspeakable, and my explanation, equally prolix. Phil (sometimes) thought he was Christ,* I (sometimes) thought I was an extraterrestrial invader disguised as a meadow mushroom. What matters is the system that eventually emerges, not the fantasies concerning the source of the system. When I compare Phil's system to mine, my hair stands on end. We were both contacted by the same unspeakable something. Two madmen dancing, not together, but the same dance anyhow.

Truth or madness, you be the judge. What is trying to be expressed is this: The world is not real. Reality is not stranger than you suppose, it is stranger than you *can* suppose. Time is not what you think it is. Reality is a hologram.* Being is a solid state matrix and psychosis is the redemptive process *ne plus ultra*. The real truth is splintered and spread throughout time.

*** "I am a homoplasmate: Zebra acting in syzygy with a human." (pg. 79 but also: "Did I do something? Absolutely. But I don't know what I did, so I don't know who (so to speak) I am in the drama." (pg. 42.)**

"If the Logos is outside time, imprinting, then the Holy Spirit stands at the right or far or completed end of time, toward which the field-flow moves (the time flow). It receives time: the negative terminal, so to speak." (pg. 64.) See also "If there is to be immortality, there must be another kind of time: one in which past events (i.e., the past in its entirety) can be retrieved&emdash;i.e., brought back. I did experience such a time." (pg. 79.)

******* "It (reality) is a hologram. 1) My augmented sense of space proves it. And 2) the information element; consisting of two parts: set and ground.

- "All this points to: hologram. Based on two information-rich signals." (pp. 98-99.)

"The Gospels, then, depict a sacred mythic rite outside of time, rather than a historical event.

- "Note: This whole process can be regarded as a psychological transformation, that of a redemptive psychosis." (pg. 95.

Appearances are a vast and interlocking lie.* To finally know the Logos truly, if that means anything, is to know it as for, as what Phil called a "unified abstract structure." In a way this was where PKD went wrong. It wasn't his fault. He saw that the world of 1975 was a fiction and behind that fiction was the world of AD 45. But he lacked an essential concept, lacked it because it really hadn't been invented yet. Anyhow the man was a SF writer and a scholar of classical philosophy, he could not be expected to stay in touch with arcane discoveries beginning to take place on the frontiers of research mathematics. But he got very close, his intuition was red hot when he reached the conclusion that a unified abstract structure lay behind the shifting always tricky casuistry of appearances. The concept he needed was that of fractals and fractal mathematics. The infinite regress of form built out of forms of itself built out of forms of itself * unto infinity. The principle of self similarity. Phil was right, time is not a linear river. He was right, the Empire never ended. Parallel universes is too simple a concept to encompass what is really going on. The megamacrocosmos is a system of resonances, of levels, of endlessly adumbrated fun-house reflections. PKD really was Thomas and Elijah and all the other precursive concrescences that came together to make the cat-loving fat man who compacted trash into gold. The logic of being that he sought, and largely found, was not an either-or logic but a both-and and and-and kind of logic.

—

- * "Probably the wisest view is to say: the truth—like the Self—is splintered up over thousands of mile and years; bits are found here and there, then and now, and must be recollected; bits appear in the Greek naturalists, in Pythagoras, in Plato, Parmenides, in Heraclitus, Neo-Platonism, Zoroastrianism, Gnosticism, Taoism, Mani, orthodox Christianity, Judaism, Brahmanism, Buddhism, Orphism, the other mystery religions. Each religion or philosophy or philosopher contains one or more bits, but the total system interweaves it into falsity, so each as a total system must be rejected, and none is to be accepted at the expense of all the others..." (pp. 111-112)

PKD was never more right than when he wrote:

- I actually had to develop a love of the disordered & puzzling, viewing reality as a vast riddle to be joyfully tackled, not in fear but with tireless fascination. What has been most needed is reality testing, & a willingness to face the possibility of self-negating experiences: i.e., real contradictions, with something being both true & not true. The enigma is alive, aware of us, & changing. It is partly created by our own minds: we alter it by perceiving it, since we are not outside it. As our views shift, it shifts. In a sense it is not there at all (acosmism). In another sense it is a vast intelligence: in another sense it is total *harmonia* and structure (how logically can. it be all three? Well, it is). *

One cannot learn these things. One can only be told these things. And it is the Logos that does the telling. The key is in the *I Ching*, which Phil loved and used but which occupies a disappointingly small fraction of his ruminations in the Exegesis. **Almost as if the counter flow, the occluding intelligence, kept Phil's eyes diverted from the key element necessary to the universal decipherment that he was attempting. Time is a fractal, or has a fractal structure. All times, moments, months and millennia, have a pattern; the same pattern. This pattern is the structure within which, upon which, events "undergo the formality of actually occurring," as Whitehead used to say. The pattern recurs on every level. A love affair, the fall of an empire, the death agony of a protozoan, all occur within the context of this always the same but ever different pattern. All events are resonances of other events, in other parts of time, and at other scales of time.***

—

- * (pg.91.) "MITHC seems to be a subtle, even delicate questioning of, what is real? As if only the 2 books in it, GRASSHOPPER & the I CHING are really the only actual reality. Strange." (pg. 181.)
- * "Through anamnesis and restoration to the Form realm you have access to several space-time continua based on your universals." (pg. 102.)

The mathematical nature of this pattern can be known.*It can be written as an equation, just like the equations of Schrodinger or Einstein.

The raw material, the Ur text, out of which this mathematical pattern can be drawn is the King Wen sequence of the I Ching. That is where the secret lies. In the world's oldest book. Of course. Once possessed the pattern can then be discerned everywhere. Of course. It is ubiquitous. One of Phil's favorite words. I know this because the Logos taught me the pattern and I escaped the black iron prison of the world to tell thee of it. I have published it, I have lectured it and have had it written into software. My books are on the way, some with Phil's old publisher Bantam. I would bet dollars to donuts that if Phil had lived to see, to feel, and to understand what this PKD-inspired servant of the Logos has managed to drag home from the beach, he would embrace it. This cannot be said without sounding like a madman or a jackass. I am sorry about that. As Phil Dick said,

- "What's got to be gotten over is the false idea that hallucination is a *private matter*." **

What is important is that the birth of this idea is now very near, has in fact already happened, and PKD showed the way. The answer is found. And this incredible genius, this gentle, long-suffering, beauty-worshipping man showed the way. When it counted he was right. All hail Philip K. Dick.

- -Terence McKenna Occidental, California June 1991

- *"The agent of creation (*Logos* or Forms, whatever called) is at the same time the abstract *structure* of creation. Although normally unavailable to our cognition and perception, this structure&emdash;and hence the agent of creation can be known..." (pg. 125) Also, ". this insubstantial abstract structure *is* reality properly conceived. But it is not God. Here, multiplicity gives way to unity, to what perhaps can be called a field. The field is self-perturbing; *it initiates its own causes internally; it is not acted on from outside*". (pg. 127). Also, "'The agent of creation is its own structure'. This structure must not be confused with the multiplicity of physical objects in space and time governed by causation; the two are entirely different. (The structure is insubstantial, abstract, unitary and initiates its own causes internally, it is not physical and cannot be perceived by the human percept-system sensibly; it is known intelligibly, by what Plato called Noesis, which involves a certain ultimate high-order meta-abstracting.)" (pg. 128). And finally: "I ... posit ontological primacy to the insubstantial abstract structure, and, moreover, I believe that it fully controls the physical spatiotemporal universe as its basis and cause." (pg. 129)** pg.17

Announcer - Now, to Terence McKenna. Terence McKenna has become legendary for his investigations into psychedelic mushrooms, virtual reality, U.F.O.s, evolution, the rebirth of the goddess and the end of history. His numerous books include the recent *Archaic Revival* and *Food of the Gods: The Search for the Original Tree of Knowledge* and trialougues with Rupert Sheldrake and Ralph Abraham. Terence McKenna is a scholar and brilliant inter-dimensional adventurer with an understanding of nature from the depths of the Amazon to the most current scientific breakthroughs. He is a shamanologist who traverses the worlds of the psyche and the spirit, bringing back startling visions of the revelatory nature of existence. Simply put, he takes enormous chances, breaks all the rules and comes back with pearls. Welcome Terence McKenna: *Imagination in the Light of Nature*. [applause]

Terence McKenna - "Well it's a pleasure to be here. I've heard of preaching to the choir but this is absurd. Out of deference to where we're meeting I'll try to curb my anti-clerical tendencies, for the next hour anyway. Before I get into this I'd like to thank a number of people associated with Earth Trust; Andrew, Matthew, Georgeann, Elizabeth. They're the people who put this event together. Jim Essex is handling security tonight, uh, and we appreciate that... My goodness, a balcony as well. All the usual suspects appear to have been herded into one room. That was a wonderful introduction from Georgeann, I'd love to meet that guy sometime.

I - I accepted this invitation to speak because I think what the Earth Trust Foundation is doing is not only very important but I also perceive the potential for a pun in their name and I'll talk about that a little this evening.

I think we're living through extraordinary times, even more extraordinary than usual over the past couple of years. I think you have to be fairly lumpen indeed to not feel the flux, the change that is cascading into the historical process at this time. Bifurcations, opportunities for choice are opening up all around us and yet, it's a kind of 'coincidentia oppositorum' there is also great risk, great anguish, great uncertainty about where we as a species and as a planet are headed. And I certainly don't have any final answers but I think we can talk about these things and, uh, build, uh, a sense of community and a sense of direction that is capable of overcoming some of the paralysis that has characterized, uh, the last couple of decades.

Because, as we move closer and closer to the millennium, it's becoming clearer and clearer to me, at least,

and I would like to try and convince you of the fact that ten thousand years of human history, of the human adventure are coming to a kind of culmination in our life time. This is the make-or-break decade, this and the decade which will follow it. Uh, the human enterprise has grown from an enterprise confined to one primate species isolated, uh, on the grasslands of Africa, to an enterprise which now echoes and re-echoes in the life of every organism on the planet. We have, for better or ill, seized the tiller of planetary development, seized the tiller of human history and the question is: Whither are we headed? Where do we want to take the human adventure? And I think we've been preparing for this culmination for a long, long time. I see human history as essentially an unconscious but unerring movement toward something, and the question is: What? Is it simply that we have been preparing to commit suicide with greater and greater efficiency for fifteen thousand years? If you place your faith in secular politicians and the kind of ideas that are being pedaled in the ideological marketplace of the mainstream you could hardly conclude anything else. But I submit that occluded from our vision, and for very good reasons, is, uh, the *raison d'etre* of this process; human history, and that we are now in a position to raise the veil on what that goal might be. But there will be a number of casualties to this raising of the veil, not least among them science as ordinarily practiced, dominator politics as ordinarily practiced and the division of our human community into factions defined by race, religion, and class. All of these, um, institutions and styles of the past have now become essentially lethal if we expect to evolve deeper into some kind of humane future. My, um, interest in this or my awareness of these issues has grown over the years through an involvement in shamanism. Shamanism that was specifically rooted in the kind of experiences that are induced by psychoactive plants. Now this is an area that our society is extraordinarily phobic and nervous concerning. And the reason, I think, is not far to seek because institutions, modern institutions depend on, um, the transmission of a certain world view and then willing acquiescence in the truth of that world view by the populations into which it is being exported. In other words, a kind of cultural brainwashing is necessary for modern cultures to work at all. And the consequences of the acceptance of this situation of brainwashing is, uh, further acceleration toward catastrophe. Many people are in anticipation of a kind of apocalypse, a kind of complete break down of social institutions and ideals and I must say to you the apocalypse is not something which is coming. The apocalypse has arrived in major portions of the planet and it's only because we live within a bubble of incredible privilege and social insulation that we still have the luxury of anticipating the apocalypse. If you go to Bosnia or Somalia or Peru or much of the third world then it appears that the apocalypse has already arrived. And I wonder then... what magnitude of responsibility rests upon those of us who still have the luxury of the time and the clarity to think about what can be done to save ourselves and in so doing, save the planet. And the conclusion that I've reached, and it's not easily condensed into a bumper sticker unfortunately, [crowd laughter] is that we have to - this is something that I evolved in my own personal life, which is, when you lose the thread, when you become confused the best strategy is to think back to the last sane moment that you knew [crowd laughter] and then act from there. And this is an impulse that affects societies as well as human beings. This year we celebrate the five hundredth anniversary of the discovery of the New World, our world. Now that was an historical event essentially financed by Italian banking families and the spin-offs of their enterprises. They created a world on the wreckage of the collapse of the medieval Christian eschatology based on classicism. And that model has survived and functioned fairly well up into the twentieth century. This is a standard impulse within a society, to go back to an earlier time and to create new models and new institutions based on an ever more ancient past. Now *our* situation is global and extreme and so when we reach back into the past for a model, we have to pass over Greece, we have to pass over dynastic Egypt. We have to go back to a time before history, before the fall into hierarchical dominance, before city-states, before slavery, before advanced technology, before agriculture. And when we go that far back into time we discover a world that until very recently was completely incomprehensible to us. A world that - it was, uh, thought of as primitive,

simplistic, child-like as late as the 1950's and for many people, unto this moment. But careful analysis of these aboriginal societies leads to the conclusion that history is a dysfunctional state of some sort. History is, uh, an act of brutish insensitivity only achievable through an act of, um, self limitation from the demands and the inspiration of nature. And I reached these conclusions basically as a rationalist. I think that - and this is based largely on the context of the psychedelic experiences that I have had and that I have had described to me, not only by aboriginal people, but by people such as yourselves - uh, apparently there is a great discovery or insight which our culture is deliberately designed to suppress, distort and ignore, and this is the discovery that nature is some kind of minded entity, that nature is not simply, you know, the random flight of atoms through electromagnetic fields. Nature is not the empty despiritualized lumpen matter that we inherit from modern physics, but it is instead a kind of intelligence, a kind of mind and as long as we were embedded in this mind, as long as we were a part of it's purposes and processes harmony existed on this planet between human beings and the rest of nature, between men and women, between adults and children and within the human individual. And the reason that this harmony was able to maintain itself for perhaps twenty five times the duration of history is because it honored and balanced all the components that created it. Now, in my book Food of the Gods I put forth an elaborate reconstruction of evolutionary theory based on the idea that psychedelic compounds, specifically psilocybin, were what kept us in this dynamic balance with the mind behind nature. And I've lectured that often enough to you that I'm going to only indicate it tonight, to your great relief I'm sure. I've said it often enough that I think we can operate in the light of it as an established possibility or a respectable theory, but the question that I'd like to talk to you about tonight is : If that were true, what does that say for the future? What are we to do? Where are we to seek hope and what kind of obligation devolves upon each of us? Well, if this is true; that history is a kind of neurosis, a kind of dysfunction based on a broken line of communication into nature. Then how can it be repaired? The personal answer is, to my mind, obvious. It's an involvement with aboriginal peoples and their practices and attitudes. And I'm not talking about drumming here, folks. I'm talking about, uh, availing one's self of the pharmacological and psychobotanical doorways that lead in to a feeling-toned relationship with the natural mind. This is actually the matrix out of which consciousness was born. We find our way back to it through the judicious use of psychedelic plants. And I think I have made that point, uh, enough times that I don't have to repeat myself. What I'd like to talk about tonight is: how do we, a self-defined cultural elite as much as anybody hanging out in their office in Century City, how do we, the psychedelically informed post modern neo-shamanic community go, move from being a tolerated and somewhat loathsome fringe population to, uh, a voice in the dialogue, here, in anticipation of the end of the world that can be heard? How do we do that? Well, I think that there are a number of possibilities and I always enjoy making this point in this town particularly because this is the city of, uh, the graven images, not in gold and stone, but in film and light. This is the meme engine of the western world. Those of you who work in media know the power of the word. 'As it is said, so shall it be'. And so the tool of the revolutionaries at the end of the millennium is, to my mind, art. Art which connects people, which transcends the mundane and which empowers hope. And of course it can have many forms and occur in many media, but it must be true to itself. It must be true to the thing we were before the descent into history. And I don't see history entirely as a pathology. I see it - the story I like, which seems to me to illuminate the situation, is the story of the prodigal son. We, western civilization, we are the prodigal son. We left the confines of the family of nature and we made a hellish descent into intellectual limitation, into matter, into model building that was deliberately self-limited. We exorcised the spirit from our model building. We exorcised a caring and enfolding matrix of maternal understanding, and what we created were models based on atoms flying through the void. This may have been a necessary precondition to our shedding, uh, the theological misconceptions that occurred when male dominance got a hold of the idea of religion.

{SPLICED}

Comes a lethal idea if practiced too long.

{SPLICED}

Models. That's why I use the word models so frequently rather than the concept of truth. I mean, for monkeys to speak of truth is hubris of the highest degree. I mean, where is it writ large that talking monkeys *should* be able to model the cosmos. If a sea urchin or a raccoon were to propose to you that it had a viable truth about the universe, the absurdity of that assertion would be self-evident, but in our own case, we make an exception. Too bad. [applause]

So now, what is happening after twenty five thousand years or fifteen thousand years of agriculture is that the processes that seemed eternal; the processes of tilling the fields, smelting metals, establishing markets, cutting deals, so forth and so on have, in our lifetimes, emerged as self-limiting processes. You know, people think I'm a wild-eyed character because I predict some kind of transcendent transformation of the world within our lifetimes, but if you could sit in on the board meetings of the people who *own* the planet, they possess data moving across their desks every day which entirely support my contention that business as usual has been taken off the menu. You have only to propagate the curves of population growth, of H.I.V. infection, of ozone depletion, of toxification of the oceans, so forth and so on, we all know the laundry list, to convince yourself that business as usual is no longer an option. There is no middle way, there is no Ozzie and Harriet third millennium scenario. [audience laughter] The choices are either a hideous, nightmarish world. A soylent green kind of world. A world where people of privilege defend that privilege with, uh, tremendous, uh, establishments of armament and propaganda and the rest of the world slips into poverty, starvation, desperation and death. This is the kind of world that rationalists fear and it's also the only kind of world that they can imagine because they are bankrupt of inspiration and ideas. And so the entire effort of the establishment has become one of holding down panic, keeping the ball in play, keeping ordinary people and ordinary populations quiescent through drugs which are not psychedelic, through forms of media which are not transcendental and inspiring, but which are narcoleptic and deadening. I won't name any names here [audience laughs]. And this is the fiction that we live in and this is why our situation feels so schizophrenic. And of course, as we go through this presidential election, the contradictions are heightened almost to the point of nausea, because what is under discussion is how - what manner of fine-tuning shall be applied to the social machinery in order to make it possible to hold together the illusion of business as usual. And the answer is ; There is no such fine-tuning. It's all . And instead what is needed is a radical openness to new ideas of all sorts, and I believe that once the radical openness to new ideas is given respectability, the boundless creativity of the human mind will be tapped into and come to our aid, but we have to stop trying to preserve a status-quo which has made us neurotic and self-defeating, admit that we have wandered long in the wilderness and then begin to talk about 'what should be done about it?'. And I've always felt that the phobia which the powers that be feel toward the psychedelic experience is essentially a phobia of, uh, of creativity, a phobia of dissolved boundaries, a phobia of honest discussion on a level playing field. All cultures are lies of some sort. We recently have lived through the very instructive example of the self-destruction of the socialist world. The contradictions became unbearable. The fiction of the glorious forward stride of socialist man toward a worker utopia eventually became insupportable in the face of the knock on the door in the middle of the night, the endless cues to buy food that wasn't there, so forth and so on. But before we lapse into some kind of smugness about this we have to recognize that there are internal contradictions in *our* world as well. Adam Smith in The Wealth of Nations stated the general theory of capitalism, and the general theory of capitalism is; uh, access to cheap labor and extractable, inexpensive natural resources makes possible a manufacturing cycle in which finished objects can then be pedaled to a core population that represents an advanced stage of civilization. Well now, this - however flawed this theory may have been, it worked as long as those two conditions were met; cheap

labor, and cheap extractable natural resources. This is now impossible. There is no cheap labor and the cost of continued extraction of natural resources is the death of the planet. What we have to do is back away from our obsession with things. We can no longer define our worth through attachment to things. We have to create a psychology that reinforces inner worth. And you know, I hate to tell you but strangely enough this runs counter to democratic values, because the notion behind democratic values is the person as physical atom in a social system. In other words, the notion of democracy is that we are all equal and can be used interchangeably in any social equation. This is the best we could do - the Greeks dreamed this up - until we back away from materialism, and materialism is not necessarily wedded or, or welded to democratic values. Democracy works, in the kind of world we're living in, only if it is severed from a capitalist consumer cycle. The other thing we have to do is, uh, take responsibility for our population. And I, uh - you know, people are fond of just throwing up their hands and saying that 'The social momentum, the momentum toward world catastrophe is so great that nothing can be conceived of - short of friendly visitors from Zeta Reticuli bailing us out - that would lead to any kind of sane and rational world'. But, uh, have you noticed that, uh, if every women were to bear only one natural child the population of the Earth would fall by fifty percent in about forty years without war, epidemic disease or forced migration. Now this is interesting. I don't advocate it. I simply think it's interesting that such a simple solution would have such an enormous impact on problems generally thought to be intractable. I discussed this idea with demographers, and they pointed out to me, and some of you have heard me say this before but i think it's worth repeating, a woman on the Upper East Side of New York, or in Malibu who has a child, that child will have between eight hundred and a thousand times more negative impact on the environment of the Earth, than a child born to a woman in Bangladesh. Where do we preach birth control? Bangladesh. Why do we do this? Well. I'm not sure. This woman in Malibu or on the Upper East Side is a very likely candidate to be open to this message. She is after all college educated, media sophisticated and feels I think, generally, a fair responsibility towards the problem that we all confront. Uh, well, so then why aren't these kinds of ideas being tried? We could set up a set of social values where we could go to intelligent educated women in high-tech industrial democracies and without any shuck or jive say "How would like vastly increased leisure time, [crowd laughs] a vast increase in your disposable income and the genuine status of 'hero' in the fight to save the planet? Now naturally you can't do this if you have these fundamentalist yahoos running around raving about family values [applause]. But hopefully these people are going to be shipped back to whatever syphilitic bible-pounding rat hole they all came out of in the first place [more applause] Easy. Easy. So I was puzzled, uh, as I explored this idea wondering, not why is hasn't been tried, but i'd never heard it even discussed. And it came to me, finally, it's because nobody has figured out how you make a buck in a situation of retrieving demographics like that. But notice what's going on; if you had a situation where the Earth's population was dropping by fifty percent in a forty year period, it might be difficult for a corporation to make money in that kind of a situation by selling its products. But the wealth of the living would increase by fifty percent, because you would every week be inheriting farms and country homes from cousins and aunts and uncles you didn't even know you had. So, So the wealth of individuals would increase, but the wealth of corporations would be under severe stress in that kind of a situation. Well, then that means these corporations have become a kind of toxic force operating against the best interests of, uh, individuals [applause]. Well, um... now, the other thing is, uh, and this is sort of a switch in tack. The dematerializing of our lives is I think another area where we could make a significant conscious contribution to at least pumping the brakes on the approach toward a, uh, the passing of a fail safe point. Uh, and *that* means, exploring such admittedly odious possibilities as virtual reality, where light replaces matter and code replaces, uh, computer codes and this sort of thing replace the manipulation of matter by the kinds of crude technologies that we have grown accustomed to. I can imagine a world where we commit ourselves not to uh, uh, something like Star Wars but if the technical

mentality must have a bone to chew on, then let's set a global or national technical goal of producing by the year 2005 say, uh, a technology which results in something which looks like black contact lenses. Contact lenses which are installed in the eyelid such that when you close your eyes menus hang in space. The entire culture could be dematerialized and downloaded into an electronic virtual culture that would nowhere come tangential to the Earth and would require very limited resource extraction. If this mattered as much as being able to knock down seven hundred incoming intercontinental ballistic missiles in a minute and a half, you can bet your boots it would be on your plate by breakfast time. It is within reach. It's simply that we are not organizing ourselves to save ourselves, we are organizing ourselves to deny our dilemma and to continue the fiction of business as usual and, uh, the only, om, catalyst, that I, personally in a lifetime of experience have encountered that can change us quickly enough to set us moving in these new directions is the psychedelic experience. If hortatory preaching could do it, then I would think the Deer Park sermon at Sarnoth or the Sermon on the Mount would have been the turning point and obviously those were just speed bumps on the way to the apocalypse. So, wha-what is necessary, you see, is to address the organism, to address experience and the way it is done is by dissolving boundaries, because the reason we are able to sit here tonight without freaking out completely about the situation that we're in, is because we have incredible barriers against a full assimilation of the information that is available to us right now. I mean, the fact that we can maintain our sanguinity and look at something like the A.I.D.S. epidemic means that we are emotionally numb to threats to our very existence. I mean, the African continent is truly in danger of becoming an empty continent through disease. I don't want to see an empty tropical world inherited by re-empowered honky men fifty years in the future. I think that would be an obscene denouement to the A.I.D.S. situation. These sorts of things are intolerable. We have the technological ability, the financial punch even at this late date in the mismanaged republican game, to change the world. What we seem to lack is the means, the ability, the chutzpah whatever it is, to change our minds. We must change our minds each and every one of us. Uh, this election they're screaming "Change! Change!" and when you look at the minuscule differences that you're offered, and people say, "My god, you're not gonna knock Clinton too, are ya?" No, No I'm for minuscule change in the absence of any other possibility but only because I think it will make it easier for us to do the larger business of *radically* transforming society [applause]. Well, so that's all sort of, um, nuts and bolts stuff. And I wanted to sort of talk about that for a while and then I wanted to change my focus because, uh, above and beyond the practical things we can do collectively and individually, uh, I think we also have to seriously rethink our first principals, and that lead me in a more philosophical and theoretical direction. Uh, I can't fail to talk to you about the conclusions that I draw from the psychedelic experience and that's been the major influence on my, uh, thinking. When I first began experimenting with these shamanic plants, I assumed that the available models would suffice for understanding what was going on. Uh, the first available model was: You are perturbing brain chemistry and so you are essentially mixing up the test pattern. That theory could be dispensed with thirty minutes into the first experience because these experiences are not chaotic in the old sense, they are coherent, architectonic, transformative, they are not the antithesis but the quintessence of meaning. Meaning is enhanced, not obliterated. So then I moved on to a kind of Freudian expectation: Aha! These psychedelic plants and compounds must be a kind of instant psychotherapy, a catalyst for the study of personal neurosis, a tool for the recovery of traumatic memory so forth and so on. All true, but woefully inadequate, to the totality of the experience, much of which seems to lie far outside the parameters of some notion as cheerful as 'instant psychotherapy'. Okay, so then jack the metaphor slightly higher. It must be then that it was not Freud but Jung who was right [crowd laughs]. And so it must be that is an insight into not only my personality, my past my, trauma, but a collectivity of myth of expectation that is written into the mammalian and primate genes that we carry in our bodies and that these vast forms glimpsed in the psychedelic dimension are in fact the archetypes of Jung. They are the overstructure of the mass

psyche that arises out of our physical and mental organization and around which language crystallizes various cultural interpretations in which we then take up residence and cheerfully and unthinkingly live out our lives. Well it turns out that also is completely, uh, while true, inadequate to the sum total of the experience. So in the past few years, and probably because I have been associating with uh, mathematicians and people like Ralph Abraham and Rupert Sheldrake a bit, I've come to what I call the Geometric Model of the psychedelic experience and I certainly don't represent it as the end of the intellectual road but it is a provisional model that is the best I can do at the moment. I think that, and it seems logically compelling to me, that consciousness as ordinarily experienced is a, a human ability shaped by evolutionary pressure and since evolutionary threat and harm usually comes at us in three dimensional space, this is where consciousness has been forced, really to concentrate and define itself, now least I'm not making myself clear let me restate it. Because of the possibility of being stepped on by woolly mammoths and eaten by saber toothed tigers, the primitive evolving mind of human beings concentrated on nearby space and time, because that's where threat comes from, the kind of threat that has to be immediately responded to by running away or fighting or something like that. But consciousness - if the psychedelics prove anything, they prove that consciousness is an incredibly plastic and malleable medium. And so what happens when you take a compound like psilocybin in silent darkness in a situation of no threat and low anxiety and low input from the exterior world is that this... function which is essentially in most situations a closed fist a closed fist ready to strike out at something nearby unfolds into something much more beautiful, much more interesting, and much more true to itself, in other words, not defined by an exterior context or situation but defined by its own mechanics. And when this happens, uh, what we see is, uh, well a number of things or one thing potentially describable in a number of different ways. What we see is that time and, uh, becoming is not entirely driven by the consequences of the past. This is the philosophy which reigns in the world of three-dimensional space, but in higher-dimensional modalities, it is possible to contact something which I sometimes call the 'great attractor', sometimes 'the transcendental object at the end of time', and sometimes the 'big surprise'. In other words, one can discover within one's self something that is not pushing us from behind into a frightening and unknowable future, but something which is actually calling to us from the future and casting a waving and flickering shadow down in to the lower dimensional slice of ordinary reality. Now, people such as ourselves largely have been phobic of this concept because it's been under the control of beady-eyed little priests for centuries and centuries and they have used it as an argument for a laundry list of moral dos and don'ts, which is a complete perversion of what it is, what it is is uh, the attractor, or the omega point, or uh, the transcendental object at the end of time. It is the lost portion of ourselves. It's the portion of ourselves that we left behind when we made the descent into matter and physicality that being a thing made of meat and bone and nerve entails. And most people, at least in these secular high-tech democracies have so lost touch with this that they never lay eyes on it again until they close their eyes for the last time. The one thing that we have all imbibed too deeply is the secular belief that death is nothingness.

[SPLICED]

We are left to fall back on the schemes of the secular politicians and the managers and these are the least worthy among us to lead us anywhere. Culture is a kind of diversion, a kind of entertainment that takes us away from the real business of being, and the real business of being is to cultivate the thing within ourselves which is most like this radiant attractive force that is drawing all organization into itself. Well what is it then that we must cultivate within ourselves in order to reflect and do honor to the attractor at the end of history. Well, I think that it's love, that without love, all this intellectual circumlocution (circumlocution?) and all this linguistic diddling with interior images is flawed and narcissistic. Love is not easily comprehended, perhaps not comprehensible at all. It is a mystery, a mystery into which we are being absorbed, and at the absorption into the true unfolding of the mystery of love... life and death, history and

the eschaton, the aboriginal and the secular are all melded into one. This is happening to us uh, you know it's a cliché of modern journalism to say that time is speeding up. It's thought of as a metaphor. It is not a metaphor. The crisis that we are experiencing is in part a crisis in ourselves, but it's also a crisis in the physics - of the physics in which we are embedded. You see, we, uh, to account for history, I think you have to, uh, stand the standard model of what the universe is completely on its head. The standard model that we inherit from physics, uh, has - it opens with something called 'The Big Bang'. Interestingly the way science operates is it says "Give us one free miracle, and then we can explain everything" [laughter and applause]. Well, if science gets one free miracle, then I think every ideology ought to be given, uh, the same advantage. So I think that the miracle of the big bang is an unlikelihood so preposterous that it could almost be seen as the limit case for credulity [laughter]. What I mean by that is, if you can believe that, you can believe anything! [laughter]

I mean if you can believe the universe sprang from nothing in a single instant in an area considerably smaller than the cross section of a gnat's eyebrow, then I'd like to talk to you after the show about purchasing a large bridge that spans the Hudson River that's been in my family for generations [laughter]. Scientists don't like this kind of talk. If I get one free miracle, then where I would put it is not in the absolute ultra hyper vacuum of the pre-physical realm before time and space began its unfoldment. That seems to me to be an extraordinarily unlikely place to have a universe spring from. I think the place to put the free miracle is at the, uh - in a domain in which there are many kinds of energy, many kinds of motion, uh, many forms of organization, inorganic, organic, social, aesthetic, psychological, so forth and so on, in other words, a world somewhat like our own. And so I believe that we are actually moving toward the culmination of history which all these cock-eyed religions actually promised. It's just that they so distorted the vision in order to get their moral laundry list tagged onto the thing that it became oppressive and unrecognizable. But, uh, you see, if there were only chipmunks and wild cats and cockroaches on this planet, then Darwinian evolutionary theory as modified by molecular biology would be completely adequate to explain the situation. It is ourselves that overturn that cheerful model of what is going on. We represent a breakout from the rules of organic nature and evolution that is no mere small exception. Because whatever this, uh, breakout that we represent is, it has become the dominant force shaping the planet. Well, what is it? It's that history is the shock wave of eschatology. I think of the surface of a pond and the time before history is the surface of that pond at absolute equilibrium. Calm, mirror smooth. Well then, the surface of the pond begins to churn and ripple and froth, and why? Because something enormous is moving beneath the surface. Something is about to break the surface. History is that agitation of the pond of time. All these migrations, technologies, civilizations, martyrs, saints, kings, fiends, all of this language, poetry, propaganda, these hideous paintings with people's eyes rolled back in ecstasy, the architectonic forms, the - all of this is in anticipation of something, literally, unthinkable, but something which invades our lives, our dreams, our psychedelic experiences with increasing urgency because we are being pulled toward it at a faster and faster rate. This is what, uh, the psychedelic experience in the modern context reveals, because really in my notion, the shaman is a geometer, a hands-on geometer. And what the shaman is doing is rising out of the plane of mundane cultural existence. Mircea Eliade

Part 1:

The original prediction was that there would be a deep plunge into novelty in 1996. There would be the deepest plunge in the 1990s. But that was based on my mathematics before John Sheliak corrected it. Once his corrections were factored in, it showed that there was a deep plunge into novelty where I said it was, in 1996, but that it wasn't the deepest; it was the second deepest. The deepest was, I believe, in 1993, in Fall of 1993, which was right when the Internet was going public and the worldwide web was coming into being, and all that was happening. The plunge that I predicted in 1996 I felt pretty good about, because right near the place where I predicted the maximum amount of novelty we got within 10 days of each other: the announcement of the Martian meteorite with fossils in it, which has since been hassled over royally – I'm aware of that – but still, I think it was a watershed moment that the President of the United States felt the need to address the nation on the subject of extraterrestrial life, was a rare moment! [laughs] And then within 8 days of that announcement was the announcement of Dolly, the cloning of the sheep in England – which again, if certain scenarios come to pass, that will be a moment – you know, the point the human race passed from which there was no going back, then, because basically if you can clone a sheep you can clone a human being; and these technologies are all rushing upon us. I mean, the body is being dissolved as much by advanced medical technology as it is by cyberspace and the Internet. I read this story, this amazing story, recently, set slightly in the future, and this guy has been in this very bad accident and virtually nothing has survived but his brain; but they have a medical technology that they can take a fragment of flesh and clone him, and then with hormones rapidly age the infant so that in 2 years there will be a brand-new adult body for his brain to be transplanted in. And these people have this fantastic medical policy that the fine print says that the brain can be kept alive, must be kept alive, by a medically approved method, that the insurance company reserves the right to choose the cheapest method, and the cheapest method is implant into the body wall of the cosignatory of the insurance policy. So this woman carries her husband's brain for 2 years inside her body cavity, while his body is being grown to manhood for the transplant. It's a dilemma we all may face some day!

Question from audience: I wanted to ask you about novelty and psychedelics, and the language that changes through the use of them. I remember reading Maria Sabina saying that the mushrooms spoke a different language to her after people like Wasson came down and began to use them – they went from Spanish to English, from Catholic mushrooms to – I don't know, Harvard mushrooms or something... I don't know; and having spoken with people who have taken DNA – I mean DMT, sorry! – yet the 1960s, very much, the

people I talked to that did, they said it was so overwhelming they could not even understand the language. I haven't read about this, anyway. Maybe you can enlighten me.

Well, one place – there aren't many places you can read about it – one place you can read about it is, there is a book edited by Michael Harner, called *Hallucinogens and Shamanism*, Oxford University Press, and there's an essay in there by Henry Munn called "The Mushrooms of Language," which is one of the most eloquent and beautiful essays ever written on psilocybin – it's wonderful. Henry Munn. Then, harder to get but equally interesting, is a doctoral study that a guy named Horace Beach did at CIIS, and it's called something like "The Perception of Audio Phenomena Under the Influence of Psilocybin". And he interviewed Bay Area psilocybin-heads about their experiences with language, and it's very interesting. This is a very interesting area of discussion.

On DMT, and on psilocybin – and they are closely related, psilocybin being 4-phosphoryloxy-N,N-dimethyltryptamine, the phosphorylated form of DMT, though they do not degrade into one pathway in the body – it's a parallel pathway: DMT is N,N-dimethyltryptamine. These psychedelics particularly seem to impact the language-forming portion of the brain, and this produces truly bizarre states of mind, because it's the language-forming part of your brain that is explaining to you moment to moment what is going on. You know: *Now I am eating. Now I am having sex. Now I am flashing on DMT...* and when that part of the brain gets foobarred, then you really do have a puzzlement on your hands, because the machinery of description itself has been caught up in the process.

On DMT, these entities – these machine-like, diminutive, shape-shifting, faceted machine elf type creatures that come bounding out of the state – they come bounding out of my stereo speakers, if I have my eyes open – they are like, you know, they are elfin embodiments of syntactical intent. Somehow syntax, which is normally the invisible architecture behind language, has moved into the foreground. And you can see it! I mean, it's doing callisthenics and acrobatics in front of you! It's crawling all over you! And what's happened is that your categories have been scrambled, or something; and this thing which is normally supposed to be invisible and in the background and an abstraction has come forward and is doing handsprings right in front of you. And the thing makes linguistic objects; it sheds syntactical objectification. So that it comes towards you – they come toward you – they divide, they merge, they're bounding, they're screaming, they're squeaking – and they hold out objects, which they sing into existence, or which they pull out of some other place. And these things are, you know, like jewels and lights, but also like consommé and old farts and yesterday and high speed; in other words, they are made of juxtapositions of qualities that are impossible in three-dimensional space.

What they're like is – and in fact, this is probably what they are – what they're like is, they're like three- and four- and five-dimensional puns. And you know how the pleasure of a pun lies in the fact that it is... it's not that the meaning flickers from A to B; it's that it's simultaneously A and B, and when the pun is really funny it's an A,B,C,D pun; and it's simultaneously all these things... well, that quality, which in our experience can only occur to an acoustical output or a glyph which stands for an acoustical output – in other words, a printed pun – in the DMT world, objects can do this. Objects can simultaneously manifest more than one nature at once. And, something like a pun, the result is always funny. It's amusing! You cannot help but be delighted by this thing doing this thing.

Well, so these syntactical animals, or these linguistic elves, are pulling this stuff out and gesturing with it; pushing it in your face, saying "Look at this! Look at this!" And you are fascinated, you know – pulled into it. Because each one is [gasps] *What?* – you know, *How can this be happening?* We're not in the world any more. No artist, no matter how gifted, could make one of these objects. Because they have qualities extremely difficult to language, qualities that no object in this world has! And so you're trying to wrap your mind, and say, *My God*, you know, *what is it?* Because in spite of the fact that it's just a little thing, you can tell by looking at it that its implications are earth-shaking. In other words, that if I could suddenly pull one of these things out of hyperspace, and we would all look at it, we would all realise that that was the ball game, right there. That somehow this proved it, was it, did it, ended it, started it, made it clear. How can this be? Well, I don't know – you had to be there, sort of.

And then what lies behind this, or as you try to analyse the situation, you realise that these objects that these things are making are made by the utterances; that sound is how this trick is done. And meanwhile these things are saying, or beaming at you – the general vibe is, strangely enough, “Do not give way to astonishment! Do not abandon yourself to wonder! Get a grip! Try to get a grip, and notice what we’re doing! Pay attention!” – this is the mantra: “Pay attention! Pay attention!”

Question from audience

Well somebody once asked me, you know, “Is it dangerous?” And the answer is, only if you fear death by astonishment. But death by astonishment is entirely possible! I’m not kidding! I mean, you are so fucking astonished that you’ve never felt your astonishment circuits get a workout like that before! I mean, what is astonishment in this world? It’s like, “Oh!” [politely surprised laugh, as though appraising something new]. This is a different form of astonishment, this is: [deep gasp of almost horrified amazement]. So. And then the whole notion that’s being pushed here is: “Do this thing. Do this activity. Do as we do”.

And you can sort of feel your intentionality, your inner something-or-other, reorganising; and there’s this, like, heat. It’s quite akin to heartburn – I won’t metaphysicize it – but heat in your stomach; and it just moves up, and then your mouth flies open, and you do – this stuff comes out, which is a very highly articulated, syntactically controlled, non-English, non-European, language behaviour of some sort. Not, strictly speaking, though I call it glossolalia, it strictly speaking is not glossolalia: glossolalia has been carefully studied, and it’s a trance-like state. On the floors of these Pentecostal churches in Guatemala, they measured pools of saliva 16 inches across from people who were in ecstatic glossolalia. This is much more conscious, much more controlled. It’s almost like a kind of spontaneous singing. But your mind steps aside, and this linguistic stuff comes out.

And you can see it – that’s the amazing thing. It is not to be heard, even though it is carried as an acoustical signal; its meaning resides in what happens to it when the acoustical signal is processed by the visual cortex. That’s the important thing. It is a new kind of language. It’s a visible, three-dimensional language. It’s not something I ever heard about, or any mystical tradition I ever heard about, anticipated. But it’s as though the process, or the project, of language – which according to academic linguists began no more than 50,000 years ago – the process of doing language, in us, is not yet finished; and this thing we do with small mouth noises, and each of us consulting our own learned dictionary and quickly decoding each other’s intent, this is a stumblebum, cobbled together, half-assed, way to do language; and what we’re on the brink of, or what these psychedelic states seem to hold out, is a much more seamless kind of fusion of minds by generating topological manifolds that we look at rather than that we – you know, localise into designated meaning.

And I didn’t mention ayahuasca in this rap, but ayahuasca, being – along with the mushrooms – a natural and shamanically used for many millennia doorway into these places, and what you find in ayahuasca groups in up-river tribal situation is people – the whole way the ayahuasca-taking is set up is to facilitate singing. The shamans get loaded; then they sing; then they go outside and take a leak, and smoke, and talk. And in those intervals, you hear people say things like, you know, “I liked the violet and yellow part, but I thought the olive drab with the silver spattering was way over the top”, and you think, you know, what kind of a critique of a song is that?! Well, it’s the critique of a song that is designed to be looked at. Nobody talks about the sound; everybody talks about the visual impression left by the sound, and it was these groups – these ayahuasca-taking groups – that, when the German ethnographers got into the Amazon in the early part of the 20th century, they called this chemical telepathine. They recognised, you know... and the reputation of ayahuasca is group states of mind. Well, if you’re naïve, then you think you’re going to hear everybody thinking. No: you’re going to *see* everyone thinking. You know, you’re going to *see* what people *mean*.

And it’s not that surprising, when you think of it, because obviously the world arrives at the surface of our skin as a seamless body of electromagnetic and acoustical and pheromonal data. It’s just that our eyes, our nostrils, our ears, our skin, we break up this incoming flow of data. And now we’re close to McLuhan country here: I think what this

hints at is that print skewed our perceptual apparatus, our style of parsing perceptual data, toward the acoustic space. So that for us, thought became a voice... you know? And very early in the Western tradition, this is so. Jehovah is a voice in the Old Testament; the Logos is a voice. In Hellenistic philosophy, we are the People of the Voice. But apparently, you know, there is a passage in Philo Judaeus where he talks about the etymology of the word Israel, and he says "Israel means *He who sees God*" – he who *sees* God. And then he poses the question to himself: "What is the more perfect Logos?" And then he says, "The more perfect Logos is that Logos which goes from being heard to being seen, without ever passing over a moment of noticeable transition".

Well, I've actually seen this happen in psychedelic states, where you will be lying in silent darkness; you hear distant music; and as the music gets closer, it's like a band with lights and drums coming over a hill. As the music gets louder, it seems to physically approach and a confusion of light turns into, you know, oom-pah-pah, brass band, dancing elves, cavorting harlequins, and less easily described denizens of the imagination... and then it all goes thumping and marching past, and disappears; but it's a perfect example of light and sound arriving together in the hallucinogenic space. The fact that we've talked here, or mentioned, that we have DMT in our pineal glands, in our brains – what we haven't said is that we also have compounds in that same organ very much like what's in ayahuasca. Occurring in the human pineal gland is a compound called adenaroglomerotropine [??], but when you give it its physical chemical nomenclature, it turns out it's 6-methoxy tetrahydroharmine; it's a very near relative of harmine and harmaline. So I'm, you know, it doesn't strain me to believe that perhaps in looking at this phenomenon we have actually put our finger on the place, the cutting edge, of the evolution of consciousness, right now, at the biochemical level: what's happening is, there is a shifting, or an acceleration of the concentration, of harmine-like alkaloids and DMT in the human pineal, and it's affecting our ability to process language, and it's pushing and exacerbating a bias toward visual understanding.

And I see this, then, also reinforced and accelerated by the evolution of media, you know? In the last 150 years, we go from photography to colour photography, to moving coloured photography, with sound, with stereophonic sound, and – you know – pointing toward virtual reality, with more and more money to be made at each step of the way; and clearly, with amounts of money now, we're outspending defence for entertainment, we will produce simulacra of imaginary worlds; and engineering bench tests will be to make it as much like Hawaii as possible, or as much like Tibet as possible... but what people will really want to do with these things is make worlds as strange as we can stand, that are in these virtual places. So whether it comes through a natural evolution of the human nervous system, or the evolution of an advanced interface with prostheses that create virtual realities... I think the transformation of how we do language is part of this acceleration into singularity.

I believe you made a reference in one of your books to Julian Haines's book, The Origin of Consciousness, [...] and the way we evolved in the [...] was like an auditory hallucination before, I guess, our consciousness really developed; and we were thinking human beings...

Yeah, Julian Haines, it didn't win him too many friends, but he wrote a big book and had this theory that this thing which we call the ego is so recent in human beings that it actually didn't exist at the time of Homer. And he goes into Homer, and he shows that the god always breaks through in situations of crisis and danger; and he felt that before Homeric times, people were essentially like ants or something; that their behaviour was largely instinctual, and that the only time they encountered this phenomenon of free will, the interrupting of the instinctual pattern, was in situations of great crisis and impending danger... and then this thing would literally almost come out of the sky and say, "Get your ass out of there! Save your self!" Well, then, over time, this ability to access this higher informational thing was like, again, the metaphor of *encysted*, closed over with the membrane of the self, and made part of the machinery of the self – and that this is what the ego is. The ego is a Greek god that you have frozen like an ice cube behind your eyes, and that you think you are this thing and ... this is just a cultural myth, a necessary weird idea, no more a true statement about the nature of the mind of the hominid than anything else.

One of the conclusions that novelty theory leads to, in terms of its feedback into social here-and-now stuff, is the

idea that culture is not your friend. That culture is an impediment to understanding what's going on. That's why, to my mind, the word "cult" and the word "culture" have a direct relationship to each other. Culture *is* a cult! And if you feel revulsion at the thought of somebody, you know, offering to the Great Carrot, or tithing to some squirly notion, just notice that your own culture is an extremely repressive cult that leads to all kinds of humiliation and degradation and automatic and unquestioned and unthinking behaviour. There is a tendency to want to celebrate culture, springing both from the French deconstructionists and their fascination with culture, and then the effort to build pride through ethnicity, thing... well, that's all very fine, but I think the cultures we should all revere are our ancestral cultures; the cultures most of us have our roots in, the actual culture we came from, was probably fairly squirly. I mean, the American family is what keeps American psychotherapy alive and well! This is a cauldron for the production of neurosis, and in some cases little else.

So, you know, part of what psychedelics do is they decondition you from cultural values. This is what makes it such a political hot potato. You know, if there is anything... since all culture is a kind of con game, the most dangerous candy you can hand out is candy which causes people to start questioning the rules of the game. So you can have a Stalinist state, a parliamentary democracy, and a theocratic state, and they all can agree on one thing: that psychedelics are just *terrible*, because then citizens start asking all kinds of hard questions and the devotion to the values of the Fatherland become mired in pseudointellectual discourse, and the next thing you know somebody has to be shipped off to the camps in order to right the situation.

Audience comment: Well, even our own structures are dissolving in the [...]

Oh yeah – no. It definitely works in the personal life. Like, you know, I've been building a house in Hawaii, and while I've been building it I've definitely cut back on my intake of psychedelics, because I don't want the answer to the question, *Is this a good idea?* – until it's too late to do anything about it! [laughs] It's like St Augustine's prayer, *God grant me chastity and continence, but... not yet!*

Question from audience: One of the big ideas that seems to be in the notion of the Archaic Revival is that the whole big thing is really conscious and alive – the universe, the galaxy, the larger entities – and that's interesting, because it's a traditional belief that's held by non-modern, non-scientific, cultures. And if in fact our belief systems are taking us in that direction, such that that makes sense to us, it's really interesting but it also sort of upsets the current description of evolution within, say, the Darwinian dogma. Because that seems to be, you know, based on the idea that it's all very random and it's just all material and life is a big accident, that's moving forward. So I think that one of the ideas you're talking about today is teleology, that whether or not we really want to talk about evolution and how evolution as a theory is going to get self-involved and absorb this idea, comes down to whether or not these larger things have in fact some kind of direction behind it, which is I think what your work and observations imply. And so I thought one day about how to understand that, and I have a question, which is whether or not you can talk about creativity as having a fractal nature? – since self-similarity shows you at various levels similar principles, and since on our level as human beings anything that we make we first think about – it begins as thought, and then it becomes matter. And so if creativity can be seen as having a fractal dimension, it would be a way to talk about all kinds of creation by simply understanding it at the level at which we see it. And it would suggest that, to modify the Big Bang theory, that before there was a Big Bang there would have to be a Big Thought; and you kind of move along with that idea... so I want to ask you to comment on that, but also in relation to the idea that was also contained in evolution about the origin of language, because some of the things you're speaking about from your DMT experiences have a funny resonance with Creation stories, like Adam and Eve naming the animals. I mean, I've never really been all that comfortable with the idea that language would evolve out of grunts and groans when guys like Chomsky say it's all [??], it's a big system in language and all kinds of languages can be very different, but inside they always have these structures. And nature, and ecosystems, and languages, always tend to pop out fully formed and integrated. So is there any possible way that you could think that language, rather than evolving from grunts and groans, evolved in the opposite direction? That the first time language was used, it was used with the power that you ascribe to the machine elves? That

is was something that was done carefully and precisely because it could manifest form? Or something like that? In terms of how new species come into being. The only idea that we ever get to allow into the theory of evolution is that it's an accident, that there will be a mutation and a new species similar to another species will be born, and it will survive, and that will lead to a new species. But I have a logical problem with that, in that any female creature which gives birth to a new species is going to perceive that species as a birth defect, and this is a baby they're not going to want to survive. And then there's only one. And so that Barbara Klar [??] book I read talked about nine dimensions, and said the sixth dimension was the morphogenetic field from which all species and organisms evolve. So I was kind of thinking, maybe along the lines of the metaphor of a computer, there's a software program through which new species are developed and designed, and the whole way in which they integrate themselves into existing ecosystems, etc, somehow or other it all gets worked out, and there's a mystery then, we don't see and don't understand, by which these new forms come into being. Maybe they all come into being at once, with a thousand or a million creatures, instead of just one that's having to struggle.

Well, all this raises a lot of stuff, most of which I can't remember because of my devotion to cannabis. But let's go back to the thing about language, and – yeah, the origins of language, let's talk about that for a minute. I think that – I've been thinking about this, because I've been writing about it, and here's what I've come up with. Part of what makes it difficult for us to think about language clearly in English is that this word, language, is used by us to mean spoken language; and it also means the general class of linguistic activity, as in computer language, body language, so forth and so on. And to think clearly about language, we need to have a clear distinction between spoken language and the general syntactical organisation of reality.

Language. Because that is old. Honeybees do it, dolphins do it, termites do it, they all do it different ways... octopi do it. There is much of language in nature; in fact, you could argue that all of nature is a linguistic enterprise, because the DNA essentially is a symbolic system. Those codons which code for protein are arbitrarily assigned – assigned, in other words, by convention. There is no chemical relationship between the codons and the proteins they code for, any more than there is a relationship between an English word and the thing it intends. Those are just conventionalised by probability over time. So language is deep in nature.

What is not deep in nature is speech. Speech is as artificial as the water wheel, the bicycle pump, the Tessler coil and the space shuttle. Somebody figured this out somewhere. Well, so then people say, "But this is hard to understand. It's hard to picture how it could happen." Well, here's how I think it happened. My little example about the songs earlier was a stab at this, but here's more. It's that all kinds – all non-genetic behaviours (which are called, reasonably enough, epigenetic behaviours) are nevertheless... they're not simply expressions of free will; they are under the control of a looser system of rules than the genetic rules, which are chemical and absolute. The epigenetic behaviours are under the control of syntactical constraints. In other words, we need to expand the concept of syntax from the rules which govern the grammar of a spoken language to the rules which govern the behaviour of any complex system.

So, for example, before speech among human beings, I think it was probably very touchy-feely. If you watch monkeys, you see this: they touch each other. They stroke, they grunt, they groom, they goose, they push, they do all of these things. The repertoire of this kind of behaviour, if you're good at it, may be on the order of having four or five thousand words in your vocabulary. Well, when we watch primates do this kind of behaviour, we don't think of it as a language. But in fact it is; it's a gestural language. A couple of years ago, some research was done where these people took preverbal infants, and they taught them standard American sign language, before they could speak. So these little tiny children could sign "Pick me up", "Please change me", "Where is Daddy?", "I'm hungry", "I want to watch TV", der-der-da-da, before they could ever utter a word. Well, now what we're always told about spoken language is, it's this miracle,

and that we're genetically hard-wired for it. Well, these experiments seem to imply we're even more genetically hard-wired for standard American sign language, which is something very few of us will ever learn to use.

What does this mean? Well, it means that the gestural capacity is deeper than the ability to verbalise, and hence probably older. So I think there was a gestural language as complex as standard English, probably, in place before anyone ever uttered a word. Now, what the psychedelics seem to suggest is that you can get so hyped up on tryptamines that your body goes into some kind of almost convulsive shock, and the normally acoustically modulated processing of language flows over into the voicebox and you begin to literally articulate syntax. You begin to make a noise which is a tracking noise for this ongoing syntactical stuff that's organising gestural intent. And it's like going from carving in stone to colour TV: your listener immediately transfers loyalty to this much more spectacular form of behaviour. And so it's like literally that the word burst forth full-blown, based on a platform of gestural syntax that had been maybe millions of years in its formation. It was just this ability to redirect the energy of syntactical intent through the body, so that instead of coming out of the end of the fingers, it came out of the end of the tongue, flapping in the airstream, and this thing happened.

It's amazing to me that the straight linguist, you know, if you go to an academic university and study linguistics, will teach you that language is no more than 35-40,000 years old. I mean, that's like yesterday! I mean, we – fire is half a million years; chipped flint, a million and a half years; language, 35,000 years old – language is everything we are, everything we do; you can't think without it, you can't do anything without it. And yet, if it's that new, then what it represents is simply a technology, a form of media, that's squeezed out other forms of media. And it's not hard to see why: after all, it works in the dark, that's good; it allows politics, you can make speeches to large groups of people; and it's – well, it's just very portable. It's the cleanest technology ever put in place. When you think about it, it's one of the weirdest abilities human beings exhibit. And when you go forward to reading, you realise this is an animal in some kind of an informational tizzy. I mean, the idea that you would make marks in clay which signify tongue noises which signify designated objects, so that these pieces of clay can be lugged hundreds of miles so that other people can reconstruct your thought by looking at these pieces of clay, this is bizarre! For animal behaviour, this is absolutely – it's... how they managed to do that?!

And of course, the picture-writing, we understand; but similar to the breakthrough to speech, is the breakthrough to a phonetic alphabet, where you see: "Ah! We don't have to portray the thing we intend; all we have to portray is the sound of the word that signifies the thing we intend!" And then, you know, you're just roaring forward; and from there to the printing press, what is it, a couple of thousand years or something – and then there's no going back. So that's the part about language. Now, what was the second part after that?

Just whether you could think about creativity as a principle that could have a fractal dimension, and that would be a way to think about design, or a larger universal order, having some consciousness... [??]

Well, if you think of the universe as an engine which produces and conserves novelty, and you think of it as a fractal thing, a fractal hierarchy, built up and build downward of subsets of itself, then in a sense every creative act is the paradigmatic act of the Big Bang. I mean, it always struck me, you know, that the end of the novelty wave, which is: Up, Down, Oscillate, Zero, it's like it's a general map of all process. We could be describing the life of the energy output of a star, or the firing of a single neuron, or the birth and death of an economy; in a sense, you get down to a fractal level where you can say all processes are the same: they have a beginning, a middle, and an end... and if you know where you are in this concatenation of process, you can sort of locate yourself in the cosmic domain.

The thing that I tried to talk about this morning, that we need to map into our maps of reality, is the acceleration. I think it's a really weird idea to talk about a thousand years in the future; I mean, good grief!

A thousand years in the future, what do you imagine will be left standing that you call home? What – cast your mind back a thousand years: King Canute was taking charge of things across Northumbria, and the Anglo Saxons were making forays along the coast of Norway, and, you know, very few of the concerns of the day have survived to this moment; and that was the slow-moving part of the process! We're going to move, you know, in the next 10 years, further than we've moved since the time of King Canute to this morning. So it seems to me the most unlikely future scenario is one which assumes things will stay more or less the same. Because we've put in place all these processes designed to make sure that does not happen. You know – rapacious capitalism, technological innovation, bourgeois social aspirations in the hearts of every man, woman and child on the planet, urbanisation, connectivity – all of these processes are designed to erase reality as we know it.

I'm wondering what you think of the kind of Vedic paradigm involving the states of consciousness, the waking state, the dreaming state and the sleeping state, and the transcendental force state, and they used that on an individual basis, but also with regards to [??] genesis. And that criticism of the West, that the West has taken the waking state as standard, and evolved its philosophical views without accounting for these other states of consciousness?

Well, certainly the West has built its house on a narrow foundation, denying these other possibilities. On the other hand, if ... well, you get into all kinds of difficulties here. How do you judge whether or not a civilisation has assimilated or explored the domains it's named its own? One way is by looking at the technological applications that it's created. And for all this talking about these other states of mind, they seem actually as mysterious to the East as they are to the West. I don't get the feeling they're really navigating through what they're talking about. In the past, there may have been levels of understanding. It may be, see, that psychology – though it's a mystery to us – it may be that it's an easier nut to crack than the nut of matter; and so I don't have any trouble believing that Vedic India of 3500 BC may have known all kinds of things about how the mind works and how to navigate through these imaginal spaces that we've lost; but the spirituality of modern India is thoroughly contaminated by a thousand years of commerce with Islam and the West. It isn't that different, really. I mean, Vedic theology and German idealism are strikingly similar cousins.

...a number of things of conflict, when you talk about the archaic revival and then the current cultural and technological revolution. It seems to me that a lot of the stimulus for novelty that was generated by the psychedelic experience now may be generated without that experience, such as through virtual reality, technological advancements, and perhaps would maybe make the psychedelic experience less necessary in order to [...] observe and [??]

Well, definitely, what you're getting at is that technology itself is a kind of psychedelic drug; that, you know, by chance or design, the proponents of psychedelica have figured out that it's totally acceptable to this culture if you disguise it as electronic entertainment and put it out that way. So the web is incredibly subversive! Simply the fact that all that information is there and available, in a world where control of access to information has always been the game. So, yeah – the way I see it is that the psychedelic people need to use the new information technologies to build art of a type more powerful and more compelling than the world has ever seen. Call it virtual reality, call it multimedia, call it whatever you want, but it's basically walk-into, walk-around, art – and then the boundaries will fall for ordinary people, because you see when you build a virtual reality, in a sense what that technology is allowing you to do is it's allowing you to show people the inside of your own head! We have never had a technology that would do that. We think the inside of our heads are all the same, but you know when I say to you that when I smoke DMT it unleashes a Niagara of alien beauty, if I had spent the last 30 years building that Niagara of alien beauty so that you could just strap on the goggles and go, then we would have a very different kind of dialogue and relationship going. And so I really see art as the great searchlight that illuminates the historical landscape just ahead, and I think that art is about to get teeth for the first time in human history. I mean, it's all very fine, scratching on cave walls, and film, and video, and all that, but it's always artifice, you

know – you never are convinced, or only for seconds, that you're in the presence of reality when you're in the presence of art. But we will build art that will literally stand your hair on end. And the amount of creativity in a single human mind, as I said, more than fills all the museums on this planet. So what we need is to figure out how to get a spigot into that, and get this stuff out! And then, as James Joyce said, man will be dirigible!

Part Two:

Well, we said, I think, that when you take psychedelics you go up a dimension. And so this world of transience and flux becomes an eternal world. So in that sense, it's the same thing. Whether meditation and psychedelics are the same thing, I think depends on your meditation and your psychedelics! Different meditations strive for different things. Much meditation is about emptying the mind of phenomena. This certainly would not be a description of the psychedelic state!

Question from audience comparing LSD insights with meditational experience

Well, in the interest of keeping the number of singularities to a minimum, the most elegant thing to do is to wrap the theory around and say that the starting-point and the ending-point are the same place. Yeah, it's the place where all is co-tangent. How we could get the universe back into the primal dot in 12 years, I don't know, but there are some schemes to do that. There's always schemes to do it. You know, if the universe were some kind of vacuum fluctuation, and it had an anti-matter twin in a higher superspace, then there would be the potential, at least, for them to collide across all points simultaneously, and you would actually get the universe of matter disappearing instantly, and you would then be left with a universe made only of photons, because they don't have an anti-particle. What a universe purely made of light – what its physics – would be like, is hard to say; but it sounds peculiarly like certain Gnostic theophanies [??] about gathering the light and returning the light. Ultimately, the meditation path and the psychedelic path must somehow lead to the same kinds of data, if the claims of both are to be respected, which is that they give deeper knowledge about reality. Yes.

Question from audience about expression of information using new technologies that may replicate the psychedelic state

I'm all for it; I just haven't seen anything that convinced me that anybody had achieved it to any degree of significance. Yeah, you know, imagine a drug that did nothing more than allow you to remember your dreams! I mean, that's not exactly shooting for the moon, pharmacologically, these days. And yet a drug which allowed you full recovery of your dreams might unleash God knows what, because we don't know *what* we dream! The chemistry of DMT suggests that in deep REM sleep, it's possible every single night you have a DMT flash. But it does not transcribe into short-term memory. Or imagine a drug which allowed you to enhance long-term memory, so that you could slip into reveries of a summer day 30 years ago and play it back moment by moment by moment... again, this is not shooting for the moon pharmacologically. We're not talking immortality here, we're just talking simple neurochemistry. But all of these possibilities would change life beyond recognition. And I think these things should be pursued by any means necessary, you know – it's a false dichotomy, the idea that somehow you should be able to achieve these things on the natch, and they're not authentic if you achieve them through psychedelics. This is just a con to keep lineages in business, I think, because they don't want you going off the ranch and charting your own course. But where shamanism becomes priestcraft, it's already well on its way to senescence.

Audience question re collective perception on mushrooms (nonverbal sharing of ideas)

A couple of situations, I've had telepathic things. I've had, in group situations, very quasi-telepathic social interactions. What I mean by that is, I'm recalling an evening many years ago taking ayahuasca with these people and they had a weird scene going. The shaman was a good guy, and a good shaman, but he had a nephew who was a jerk and was sort a pimp, and kind of a hustler. And the shaman was singing with his three friends, these ancient ancient songs, and this guy was drunk on *aguardiente*, and he would sing against them! He would sing against them... and this was in Peru, and if you know the style of rural Peruvians, people are so polite and so not-upfront, that no social

problem is ever dealt with directly: people will tolerate incredible bad behaviour without turning on a person and saying “Listen, you’re completely out of line – knock it off”. So, 30 people – 30 Peruvian *campesinos* – were witnessing this sing-against, and the woman I was with at the time very much didn’t like what was going on, and at the end of this, this nephew, this *sobrino*, at the end of his song of raucous interruption, I looked up just as he ended – the room was almost in complete darkness... I looked up just as he ended. I saw her look up and look at him with a look of utter disgust, and when these red dart things got to him, it knocked him off his feet! And I heard... the old shaman was sitting right to my left, and I heard him turn to his friend, and he said: “Ah! The *gringa* sends the *bazudalacathnda*...” [laughter]... and so it was like, “Wow!”. But then, ordinary reality immediately reasserts itself and moves forward, and there’s no time to say “Wait a minute, folks! – something paranormal just happened here, I want to interview everybody, get your impression” – it’s never, you know, when it’s real, it’s always caught up in the on-moving flow of events.

Question from audience

Well, if you’ve taken – what you don’t want to do is take... here’s – this is reasonable advice, too, I think. Where the problem area lies, people think it lies in taking too much. It lies in taking too little. Because if you take too little, you can resist it. You can struggle with it, and then it can turn into a real mess, because you’re afraid of it and you actually have the power, to some degree, to resist it. What you want to do is take sufficiently enough that there’s no escape, and that the transition from ordinary reality to fully loaded is as quick as possible. Because the going up is somewhat terrifying.

For example, let’s use psilocybin as the model. Here’s how it works for me – this is not tea, this is eating raw mushrooms: it comes on more slowly. So after an hour or so, you know, and the way I do it is I sit... as soon as the mushroom enters my body, I sit and meditate. I noticed in South America they don’t do it like this: they dose the ayahuasca, and then everybody just goes on, talking about their motorcycles and the jobs at the saw mill, and who’s conning who... it’s like, totally – there’s a brief moment, they pour, they toss it down, then they all go back to raving at each other about mundane life; and then 30 minutes later, on the dot, the shaman blows his whistle, or shakes his chakupa [??], his dry leaf bouquet, and everybody settles down – it’s like it comes on within two minutes: as soon as the guy starts singing, he just invokes it.

But the way I do it is, I take the mushroom (or the ayahuasca), and then I sit and I roll bombers, so I’ll have them ready if I need them, and I just sit as I’m going to sit during the trip, and I’ve unplugged the telephone, and I’ve gotten everything squared away, and it begins to come on at about the 40-minute or the 60-minute mark; and there’s sometimes some nausea as it comes on. And then I smoke a bomber, or half a bomber. And then it catapults it into the full deployment of the thing, where you just hang on – there’s about a 25-minute period where your only job is to hang on. It builds. It’s like watching an atomic explosion on the other side of 50 feet of absolutely clear crystal glass. I mean, you “can’t believe this is happening – *in my mind*”. You have the feeling that everyone from Seattle to San Diego has just crawled under their desk as this thing tore past; but it’s in your mind.

And then there is the interaction with it, which – moment to moment, you are pretty coherent; but you lose it – a lot of it doesn’t transcribe into short-term memory. And then after about an hour or 40 minutes of that, it becomes more manageable, more memorable. The most mind-boggling parts of it are just not possible to bring out of it, because language fails; because English... there are no words. There are no words even close. I mean, sometimes you’ll bring out an image or a metaphor, but out of five hours of tripping, you bring out half a notebook page of metaphors and yet you were entirely engaged during that time – now, this question about fear, which is a real question, because when everything begins to slide, if you are not – it’s more than most people who haven’t done it expect. They have heard it, they’ve read the books, but they think it’s a metaphor. They don’t understand: it’s really going to happen, and it’s really going to happen to *you*. And there’s a tendency to clutch, or to try and resist it.

The thing to do in those situations, I think – and it’s counterintuitive to how Western people think – but the thing to do is to sing. To sit up, not to assume the foetal position – see, what you might tend to do is assume the foetal position and tell yourself, “My God, this is the most appalling thing that’s ever happened to me – if I can just live through it, it’ll be all right. I’ve taken this drug: if I can just wait through – how long did they say it would be? – seven hours, I see. It started two minutes ago. If I can just...” – No, the

thing to do is to sit up and to sing! Why? Well, being practical people, to oxygenate your brain. To move the entire – this thing that’s happened to you, though it may have one claw in heaven, its roots are in your neurophysiology and in the chemistry of the drug. You want to move your physiology around. So oxygenating your brain can’t fail to do this. So you sing. And this almost always is accompanied by a sense of power, control, equilibrium, and so forth and so on.

Not always. I mean, let’s face it: you’re a product of a nutty society and there are unexamined crevices and uncleaned-out drain traps in all of us, and you’re going to encounter that stuff. The good news is, the earlier psychedelic trips tend to deal with that. You will quickly discover, taking psychedelics, that either you can work through your personal issues and become a psychedelic explorer, or this is just stronger medicine than you are up for, and you would be far better to go back to psychoanalysis or whatever works for you. Some people just can’t take it. Why is that? Well, because what it does is it dissolves boundaries, and most of us are over-boundary-defined. But some of us are having an uphill battle getting some boundaries in place, and realising we are not the telephone or the tree or the person we live with; and so for those people, who are having trouble establishing and moving boundaries, this is the last thing on Earth they should get involved with.

Question from audience about the “bombers”

Cannabis. Cannabis. Cannabis! [laughs]

Question from audience about experience the loss of ego – is it possible that your physical self could cease?

Well, people often – yes, wondered. Often people wonder. You get into a place where it’s so unfamiliar that the question comes up: *Have I done it this time? You know, Am I dying? or Am I in danger?* The answer is, the odds are incredible against you being seriously in danger. People don’t die from psychedelics unless they have heart conditions or some incredibly rare medical condition. The problem is that the ego feels threatened by the boundary dissolution, and its ace is your self-identification with it. And it can actually say to you, *You are dying, and here’s the evidence;* and you have to say, *It’s unlikely.* – and sing your way through it. But this is really tough. I mean, the Buddhists talk about slaying the ego – this is slaying the ego for real. You *must* slay it, otherwise it will spread panic into your whole psychological system, will give way to panic and hysteria. So unless there is some real reason to think you’re dying – and you should have done your homework: you should know what to expect... for example, if you take LSD and begin intense bouts of vomiting, this is not a proper reaction to LSD. Something is wrong, either with the LSD or with your relationship to it. You should know what a typical... a typical trip will put you through changes, but is not dangerous. But if you suddenly begin exhibiting some symptoms – heart fibrillation, or something like that – then you want to have...

This is why, then, there is always the issue of the buddy system: should there be somebody else there, and what about all that? My position is, if you are anxious, then you should have a sitter. If you’re going to do it alone, you should certainly tell someone so that they will check on you after a while. I don’t like doing it in groups or with sitters because inevitably I get spun into them. What I want to do is go as deep as possible, and even if I’m alone with one other person, culture is the third guest at the table, you know? I mean, if you start – I’ve often found myself in the middle of psychedelic trips thinking, “I’m sure glad there’s nobody else here to see this, because I’m sure it would alarm an observer!” – because I have my leg thrown back over my neck, and I’m screaming in Urdu, or something. But it’s OK, after a few minutes it’s OK; but if there were an observer, they would feel the need to do something, you know... and often, like I’ve seen people smoking DMT; and people moan, and they say “No! No! NO!!!!” and they moan. So then, you know, you get them back together, and constituted, and you say, “How was it?”, and they say, “It was *fantastic!*” So you realise that how they present is not reliable.

Well, setting has a great deal to do with it; and setting is a very complicated issue. *Setting* means everything, from the astrological situation at the time that you do it to the physical surrounding that you’re in; and it’s also a roll of the dice – you never know exactly what you’re going to get. As far as the question about Buddhism and all that, my own, you know when I started taking LSD I thought I saw, in Tibetan Tonka painting and mandalas, the echoes of this same world, and pursued it: went to Nepal, studied Tibetan, collected the art... and it is similar. I don’t know – I don’t know to what degree the Buddhists, the Mahayanists, realise those states without psychedelics. I do know that

with psychedelics, those meditations, those techniques, those insights, are supercharged. And I would suspect that Tibetan Buddhism, as it has its roots in Vedic Hinduism, there may be psychoactive plants in its past; but it's far in the past. Buddhism was brought to Tibet in 741 by Padmasambhava. There was an autophanous shamanism already present throughout the Himalayas, the Punpo. And it was largely based on cannabis intoxication at that point in history, not so much in the present.

But I think that this is a fruitful area – I just can't believe that Mahayana Buddhism could have gotten as far as it did without some reliance on psychedelics; and of course, cannabis – we in the West, our style is to smoke it; and that's a very mild way of dealing with it. I mean, if you eat – if you have unlimited amounts of high-grade cannabis, and you eat grams and grams of it, you will have experiences as extreme as anything that psilocybin or ayahuasca can deliver to you. You only have to read the descriptions of nineteenth-century writers on cannabis – Fitz Hugh Ludlow, S. Weir Mitchell, these people – their descriptions of their trips are as psychedelic and as out of control as any acid reportage or psilocybin reportage.

So the relationship of Indian and Buddhist spirituality to cannabis and other psychedelics is not understood. We do know that the whole Rg Veda is a hymn to a drug, soma, but we don't know what soma is. Well, the fact that it could have invited such attention to this Vedic civilisation – the 95th mandala of the Rg Veda says, "Soma is greater than Brahman, greater than Indra". Well, what is being talked about? How could such a great thing be forgotten and lost? What was it? And then, you know, almost as puzzling as *What was it?* is, *How could you lost such a thing?!* I mean, it's like us forgetting how to make automobiles or something! It was something so basic to the culture that how could you possible forget something so central? Yet apparently they did, and today there are scholarly fights. Was it *Amanita muscaria*? Was it psilocybin? Was it *Peganum harmala*? Or was it something else? Why is this so hard to figure out? The only thing I can imagine is that it must have been eventually restricted to a priestly class of initiates, and then there must have been a social revolt from the bottom, and all those people were put to death; and then, nobody knew what it was.

Yes, I think you have to push the psychedelics to reach these unitary states. What always fascinated me was hallucination. Because it was, to me, the proof that I was dealing with something outside myself.

Question from audience

Well, and here was stuff that amazed me, that I couldn't make up on my own, that would – you know, a single image would have taken me hours to draw and figure out, and here I was getting 28 frames a second of this unpredictable stuff!

Question from audience

Well, one of the nice things about the tryptamines, I think, is they leave the sense of self pretty much intact. In other words, it doesn't distort who you are; it does something to your sensory input. DMT is very, very surprisingly, like that. You smoke DMT: you are immediately plunged into an alien universe. But if you can keep your wits about you, and actually notice how you feel, you don't feel any different! You're not smarter, stupider; you're not more excited, or – once you get the initial panic under control, you realise – *My God, it didn't lay a finger on me! I'm me, I'm entirely intact! What has happened is that the world has been completely replaced by something completely unrecognisable and alien that I have no words for, that's blowing my mind, that's ripping apart my philosophical machinery as I gaze upon it; but when I bring my attention back into my body, I discover – I'm fine! I'm OK! It didn't change my mind,* you could almost say, it changes 100% the reality around you.

That's powerful, because it appears objective. I mean, the impression you have when you smoke DMT is, *This isn't a drug, that's ridiculous. Drugs, you know, make you smarter, make you stupider, make you fall down, make you stay awake... we know what drugs are; this is no drug, this is something else hiding under the label "drug". This is a doorway into another modality that exists all the time, independent of my thoughts or feelings about it.* Is that true? Well, I don't know! But it certainly doesn't seem to be a place constructed to fit human expectations. Like, one of the things that always troubled me about DMT being somewhat of a Jungian event was the question, *How come there's no hint of this in any mythology or religious tradition or alchemical text or fairytale or dream, or anything else?...* I mean, if this is so important a part of what it is to be a human being, how can it be so deeply buried, so

secret, so unknown, and yet just one toke away?!

It still, that, confounds me. Because you can read all the Hindu scripture or Sufi mysticism, or all the stuff you want – occasionally, sure, you'll find a phrase or two that could be mapped onto a DMT state, but nobody has trumpeted it. Nobody has said, "This is what it is". And yet, as I say, it's spread throughout Nature; it's been known since aboriginal times. We used to, years and years ago, call it *the Secret*. And in a way, it really is the secret. Jorge Luis Borges has a story called *The Cult of the Phoenix*, and he talks about a secret that seems profound and yet preposterous to the initiates. One child may initiate another, and ruins are good places to do this... it just goes on like this for a page and a half, and you realise he's – he must be talking about DMT.

Question from audience re the ego as a fairly recent phenomenon

Yeah, the great cultural accomplishment of Western civilisation is this thing called the free individual. But now that we're on the brink of, you know, the electronic dispensation, exactly what we're going to do with the free individual, and how that's going to look, in an era where consciousness flows through a thousand portals, it's not at all clear. It's not clear whether we can somehow now carry the idea of the free individual to an even higher level, where each of us will become a kind of god – lord over our own creation, as vast in time and space, but virtual, as the cosmos in which we find ourselves embedded; or whether the free individual is going to turn out to be the problem all along, and we're going to abandon it and become some kind of socialist gas, or some collectivist swarm, a hive mind, a world where intelligence flows where needed and identity is provisional and fleeting, and unanchored to place or body; I mean, much of this goes on on the Internet, you know. You can be an 11-year-old girl, you can be whatever you want. You can build your avatar and present yourself in many guises. It's much more like a shifting fantasy-land than it is like the good old world of positivist rock'n'roll.

Question from the audience re shamanic singing as the catalyst for visual experience

Well, yeah, I think that, you know, we see shamanism from the outside with the values of Western civilisation unconsciously applied. In cultures that are taking psychedelics, this thing which we call singing is a very complicated activity indeed; and if you've ever sung on psychedelics, you know that – you know, it's an ecstatic and complicated and synaesthetic experience. I mean, to make of your body a vibrator for sound, to – you know, move out into the Pythagorean octaves with the human voice, and – it's extraordinary, actually, how capable of sound human beings are. No other animal has the range and control of voice. They say that this is because we're adapted for spoken language, but I think we had a lot of this range and control before. So things – words that we use very knowledgeably, like *song*, *ancestor spirit*, *power place* – we're not getting 90% of the nuance of these meanings, because they go so gracelessly into English. When a shaman talks about *spirit*, he's using a term as technically complicated in his mind as when a physicist uses the term *beauty* to describe a quark. You know, it's very technically defined. And we tend to simplify, and then suppose that we understand.

Part of the thing I found with hanging with shamans in various places and times is that once you get past the language barrier, what shamans are are simply curious people. Intellectuals of a certain type. In Australian aboriginal slang, a shaman is called a "clever fellow". If someone says "I'm a clever fellow", they mean, you know, I'm a shaman. Well, that's all it is – it's somebody who pays attention to how things actually work, and sort of transcends the culture by that means. It's a weird paradox. It's that the shamans, who are the keepers of the cultural values, are also necessarily the keepers of the secrets of the theatrics of the cultural values, and so they live their lives in the light of the knowledge that it all rests on showbiz. You know, everybody else is a true believer, but these are the image-makers, the people who actually pull the strings and control the evolution of the mythologies. And in a way, it's a situation of alienation.

Mircea Eliade talks a lot about this in *Shamanism: The Archaic Techniques of Ecstasy* and in *History: The Eternal Return*. He talks about how the shaman is socially marginal, politically marginal, lives at the edge of the village, and so forth and so on, and is feared by the people, because dealings with the shaman are always dealings about life and death. But then the shaman comes forward in this critical role, as go-between, as mediator, between the cultural mind and the real world, which is this potent set of forces and planetary cycles and meteorological events and

diseases and, you know, fate; and the shaman mediates. In many languages, the word for shaman means “go-between”. So the cost of this, or the price of this, for the shaman himself, or herself, is a kind of alienation from the cultural values, and a kind of understanding that it’s a game that’s kept in play.

And this is true in our culture as well: you don’t think the people who market all this crap and produce all this bad art, and so forth and so on, love it?! or watch it, or consume it?! – they market it. Its basic purpose is to delude and distract the masses. So psychedelics, what they bring into that shamanic situation, is sort of rocket fuel for the project of cultural detoxification, or Gnostic rocket fuel into a realm of cultural alienation. And then, from that point of view, then these other dimensions of reality come into being and deeper understanding comes into being. I mean, one of the things I think, after spending a while with all this, is, it really helps to be educated. It really helps to cram a lot of information and experience into your head, because the Logos – the alien AI, the high ?? hidden god that is trying to reach down to you and deliver the message, is a collagist. It can’t really compose the message except out of bits and pieces of what you already possess.

And so, you know, this came home to me very forcefully when I developed the timewave out of the I Ching and its sequence; because at the times when I was most inflated in my thinking, or most grandiose in my thinking, one of the issues for me personally was, “Why me?” You know, “Why are you downloading this millenarian visionary revelation on me?” And the answer from the mushroom was fairly humbling. It was, *You are the first person who has ever walked through this pasture who had these 64 hexagrams in your head. And that’s all we needed: we were just waiting for somebody who could bring that much to the party, and then we could arrange the details and the mapping, and the arrange – but they had to arrive with that much, and you’re the first person.* So it was like, nothing about, you know, my fine genes or cosmic destiny, but just, I was the first termite to happen by carrying the right scrap of information in their head, that this thing could then manipulate.

Question from audience

Well, most DMT in the underground has been synthesised from indole. It’s a fairly simple process, like third-year organic chemistry. DMT does occur in Nature, in many plants. But usually there is little of it, so you have to process a lot; or it occurs complexed with other tryptamines that have various psycho and physiological activities that you don’t want, and that’s very difficult to separate them. So most DMT in the underground is made by underground chemists... and if any of them are listening, you might consider making a bit more! – because it’s hideously hard to come by.

Question from audience

Ah, if you had an IND – if you had a licence to give it to human subjects. But so people have such paper that the practical answer is No. So it’s like that.

Question about True Hallucinations – at what level have you experienced the shamanic ability to manifest miracles?

Well, aside from the story mentioned – no, no, a truthful answer is always complicated, although the truth itself is always simple. If you’re asking me to tell a story of a miracle that I still cherish as authentic, I don’t think it’s told in *True Hallucinations* the book, because – well, you’ll soon see why – but here’s an incident that happened at La Chorrera that didn’t make it into *The Invisible Landscape*, I don’t believe. Dennis had this notion of what he called “the good shit”. This developed in the days after the ideas about hypercarboration. And he claimed – it was like a fantasy, it was like a joke, it wasn’t clear exactly what it was, but – it was this idea that there was this hash somewhere that had been rolled into cow dung, with cow dung, and then infected with psilocybin mycelium, so that the mycelium had completely replaced the cow shit in this bowl of hash, or this hypothesised kilos of hash, somewhere in the world. And so there was this psilocybinated, the *good shit*. And at one point, he envisioned us actually forming a rock’n’roll band which would play instruments that would condense this stuff out of the air over large audiences, and you know, we would go on tour, and at the end of the tour history would be – the whole thing would be in a shambles, because Uncle John’s band really did come out of the woodwork!

So at one point he predicted – one night, after he had been moved to the river and the sort of semi-incarceration – he predicted that the good shit would come that night. And by this time, he was very suspect – I was highly suspect – everybody in the expedition was polarised against everybody else, and it was a pretty uptight scene. And so I left with my girlfriend of the time, and it may have even been the same night as the silver key incident – and it was

pouring rain, and we made our way like a quarter mile, half a mile, back into the jungle to this other place where we were staying, where the original experiment had been done. And so then we get to the hut, and it's pouring rain, and I had scored this kilo of Santa Marta gold for the expedition, and we had smoked nothing of this – for Colombia, relatively rare – weed, for weeks. So I got it out to roll the evening's joint, and I was fumbling with it, and I got this thing lit, and this little crumb, this little burning thing, fell on the floor, and I lifted it up, and smelled it, and [laughs] the transubstantiation had occurred! It was, you know, like Mazari Sharif triple-A, red lion, hashish, of some sort; and I *know* hashish!

And here we were, in the centre of the Amazon, in this hut, in the pouring rain, and I could tell that it was the good, it was the good shit, actually manifest. And I showed the woman who was with me – who was easily led one way or another – but anyway, she didn't say it wasn't, and I stayed up late that night smoking this incredible hash and waiting for the rain to stop so that at the first grey light of dawn I could go down to the river and confound my critics with, you know, the stone itself! The alchemical quintessence, the concrecence, the *excretum bono*, the good shit! Here it was! And so as dawn broke and the fog lifted, I made my way across this rainy pasture, and sat down by the hammock of the sleeping form of my most vociferous critic, and sort of elbowed her awake, and you know, there were other instances where this was the principle at work... It didn't work: everything had returned to normal. It was the Cinderella screw-up, you know. It was just that I was a char-girl who washed pots, and there was no prince, and there was no coach, and there was no... and, plus, I was once again humiliated in the presence of my critics, who had further reason to think that – you know, a check-in to the local mental healthcare delivery system might not be a bad idea. These things happen.

Review 2 by [admin only]:

Terence's ideas are free, but his words and works belong to his children and legal heirs. People who wish to use Terence's words must seek permission through [Lux Natura](#)

PLEASE READ & FOLLOW THESE GUIDELINES SO THAT WE CAN KEEP ALL DOCUMENTS CONSISTENT:

1. Edit Timeline Status:

- All talks listed on the homepage/timeline show their **stage in the transcription process**
 - to begin transcribing, find a talk listed on the homepage as "**(Needs transcription)**" and edit it to say "**(Transcription in progress - [Your username])**"
 - When your transcription is finished, edit the status to say "**(Transcribed; Needs Review 1)**"
- If you are **creating a new page for a talk**, please be sure to **use the 'Lecture' template** in the 'Make a New Page' dialogue box. If it is an interview and not a talk, please be sure to **use the 'Interview' template**.
 - Create a new entry for the talk/interview on the homepage by **typing the date and title** at the proper chronological spot in the timeline.
 - **Highlight the title of the talk** and **click the 'Link' button** on the editing menu. The page name for the new page will simply be the name of the title that you have highlighted. **Click 'Add Link'**.
 - **Save the edit** on the homepage and **click the new link you have created**. This will take you to the new page for the talk.
 - On the new page, you will see a drop-down menu. If the new page is for a **talk**, **use the 'Lecture' template**. If the new page is for an **interview**, **use the 'Interview' template**.
- If you complete a first review (Review 1), change the status of the talk on the homepage to "**(Transcribed; Review 1 complete; Needs Review 2 [admin only])**"
- Please **do not conduct the second review (Review 2)** for a talk unless you are an admin/core team member. This final review is to make sure that all of our documents are normalized for style and formatting. Contributors can become core members and earn the ability to do second reviews simply by contributing to the project over time and showing a familiarity with the transcription process.
- Please **maintain standard formatting**. Check transcripts that have already been reviewed at least once for examples of how a transcription page should look.

Leave your name

- **The bottom of each talk page** includes the following list:

Original Transcript by:

Review 1 by:

Review 2 by:

- **Place your name** (please use the **username that you have signed up with** so we can keep track of who is doing what) in the slot for the job you're doing.

- Please **do not complete Review 2** unless you are one of the core members of the project

Rules to follow while transcribing:

- **Resist editorializing** Terence.
 - **Do not correct** his language or grammar.
 - If he stumbles over words, repeats himself, or says "**um**" or "**uh**," keep it all in.
 - Not only does this create a more **accurate record** of the talk, but it also makes the reading experience a bit more like actually hearing a talk and allows you to hear the voice more clearly on the page.
- Whenever possible, please **note audience reaction in brackets**, for example, [**audience laughs**].
- Indicate where you are unsure of **spelling** with a [sp?].
- If you are unsure of how to spell a word, name, place, etc., check our [spelling reference guide](#) or do a web search to try and find the **correct spelling**.
 - If you need to look up how to spell a word that wasn't in our [spelling reference guide](#), please feel free to add it.
- For **those doing initial transcriptions** (as opposed to reviewing a transcript), simply do the best you can; **reviewers can clean up after the fact**. It is much more difficult to get the "um"s and "uh"s in while you're doing the initial transcription. So, if initial transcribers want to keep that to a minimum, that's fine. Reviewers can go back through and add them in for accuracy as they review. Transcribers should just do as best they can without having to constantly be rewinding to find exactly where an "uh" goes. Likewise, **for interviews or Q&A sessions**, initial reviewers should focus on getting the transcription down efficiently. Reviewers can go back in later and change the formatting to the proper interview/Q&A format.

Rules to follow while reviewing:

- As noted before, please **only do Review 2 if you are an admin**.
- Please do not review a talk that you have also transcribed. It's important that the transcripts be checked by three different people.
- Reviewing is the final stage before finalization, so please be sure to add in the "um"s, "uh"s, [audience laughter], [Terence laughs], and things like this that the initial transcriber may have missed and please do your best to correct any spelling.
- For **interviews or Q&A sessions**, you can use the [Poolside Interview](#) as an example.
 - If the interviewer's/questioner's name is known, you can use it....otherwise just use "Interviewer" or "Question" in the first instance and "I" or "Q" in all subsequent instances. For Terence, use "Terence McKenna" in the first instance and "TM" in all subsequent instances.
 - It is easier to follow along with as a reader if the formatting for the questions is distinct from that of the answers. We have decided to use a **gray highlight for the questions** and use **no additional formatting for the answers**.
 - To **add the gray highlighting** for the questions, simply highlight the entire question (including "Interviewer" or "I"), then click the button on the editing toolbar that looks like a "T" with a color pallet. In the **background color box**, please use

the following color code: **#e6e6e6** (you can simply copy and paste this to format each subsequent question. Please make sure that you use this exact background color, so that we have the same format across all documents.

Questions & Suggestions:

- If you have any questions about anything or any suggestions for ways to make the transcription/review process more efficient, please join the [FB group for the project](#) or simply send a message to the admins via the messaging system on the wiki. Thanks!
- Thanks and happy transcribing!

Intentionality in Language-Created Realities

Day Month Year 1982-2000

Location, City, State

Description

- [Audio Link](#) [need audio!]

This is a fairly small group and I'm feeling fairly confident. I'd like to talk about language today, and I will attempt to open this with a performance, which is something I rarely, like never do. (Terence performs Jabberwocky)

That's worth hours of the other stuff. Well, I hope, I assume most of you recognize that as Lewis Carroll's Jabberwocky, which was an example of verbal intentionality and syntax overcoming absence of inscribed meaning. This is what's happening here, that the intentionality of meaning is so great that it overcomes the absence of conventional definition, and we've been talking a lot in this section about language and the origin of language, and we've also been using language in a fairly free, and in some cases unusual and in some cases outrageous manner. So that's what I mean when I said it makes sense to examine the tools. We are particularly neurologically outfitted for the production of small mouth noises, rapidly modulated small mouth noises. We can do this, I've proved it myself, for hours at a time without exhaustion, and what is going on than is that rather than the rippling of plumage or the rubbing of hard body parts against each other, since we don't have any hard body parts to rub against each other, most of the time, communication in our species has taken the form of neuromodulation of small mouth noises. Now these small mouth noises are transduced into acoustical waves, a physical phenomenon which moves from point to point in ordinary Newtonian space. The acoustical pressure wave strikes the ear, the ear conveys the particular unique signature of that arriving acoustical wave into, what for lack of a better term we have to call the mind. And the mind takes this acoustical signal and compares it with an imprinted dictionary built up out of experience. It does this very very quickly. THE speed with which the dictionary is consulted and each arriving word is identified, its syntactical class understood, and its intentionality in the domain of meaning is recognized, is very very rapid. It represents the most rapid sort of intellectual activity that we undertake as human beings. Thought is a similar phenomenon, but it is an interior dialogue and God help us lets hope that we understand our thoughts better than what people say to us because in the case of our thoughts we are both the one communicating and the one communicated to. Language is this double-edged adaptation of the human animal. It is obviously a multifaceted, multipurpose, adaptive advantage in all environmental situations because if you can image and linguistically process evolving situations, you have a leg up over an organism which is hard wired for reaction along the line of instincts. Yet, in the domain of cognition, it's almost as though language has exceeded its usefulness because someone said 'language was invented to lie'. Well, perhaps that is too cynical, but certainly language obfuscates reality. It cannot help but do this. It does it in the following manner. A child, born into what the psychologist William James called a "blooming buzzing confusion", a child born into the blooming bussing....attempts to isolate complexes of activity. Complexes of color, sound and tactility, and the nurturing parent provices names. This is a kitty,

this is a bird, this is a blanket. What is happening here is that the blooming buzzing confusion is slowly being tiled over by an interlocking and seamless set of names and syntactical structures which literally, then, stand for reality. They stand for reality.

So, unless you are the kind of very fortunate person who speaks many many languages fluently, and has a sense of this relativity of the intent to communicate, you are barred from realizing the context-dependency of your own language. And we all are like this. This impressed me very much in the amazon because the first time i went to the amazon i knew nothing about botany, and it appeared to me largely to be green. and when i returned some years later, having made a fairly thorough study of the taxonomic families of tropical plants, it was vast, intricate fascinating, domains because I had terms for all these exotic floral forms, leaf forms, seed expression, morphology, you see. Nature's expression in the world of form is called its morphology. Morphology is the science of form. Well, form, we tend to think of it as a Platonic concern. After all, aren't the forms somewhere in a platonic hyperspace, aren't they somehow above and beyond the machinations of language and perception- well, they are if you're a Platonist. But when we look at natural form, the enterprise of science has been to attempt to describe natural form. This is essentially a program to be carried out within the domain of language, and this has been entirely overlooked by the philosophy of science so far as i can tell. I mean, the world is not made of anti-mu-masons, and quarks, and photons, and electromagnetic fields. Reality is made of words. Reality is made of symbolic interlocking linguisto-mathematical constructs. Everything beyond that is our conjecture. I mean this is what you learn in philosophy 1. The relativity of knowing, the impossibility of actually nailing down the ontos of what is presented in the theater of perception through an exercise of epistemic knowing, it can't be done. Brain cannot fully elicit, elucidate brain. There's a tautology there. So language is something that springs from the biological matrix and the neurological matrix within us, and the major theme of this siren song to us is that it allows us to know the world and to communicate it. Well the truth is it does allow us to know the world to some degree, and it does allow us to communicate about it, but a price is paid at every step of the way- first of all, because we are concrescent entities of feeling, this is ANW. We are concrescent entities of feeling, yet our language prepares us to describe a 3-dimensional spacial world between solid objects. So it is not true to the perceiver, you see. There is a kind of break of faith with the world. Language betrays. Language betrays in order to mean. You know Archibald McLeach said "a poem should not mean, but be" and this is a reasonable statement of a poetic, but it is not a basis for a theory of communication. A theory of communication depends on correct mirroring of the meme that is being transmitted, no matter how far down the line it has come.

Well, we talked earlier, we talked in earlier sessions about the impact of biogenically active and psychoactive amines in diet, specifically in the diet of early hominids in Africa, suggesting that the catalysis of neurological development that has gone on over the last million years in the human species was catalyzed by what was at first a random exposure to these things, then a deepening exposure brought on by the consequent synergy of increased visual acuity. In other words, some of these biogenic amines were conferring increased visual acuity, and this was shifting the reproductive mathematics in the direction of those individuals that were allowing this psychoactive substance, i mean, let's be frank about it, into the diet. Then later we saw that sexual arousal was also a concomitant to admitting this item into the diet, and at higher doses and deeper exposures, a deepening sense of what we can call, without defining, the other, the other. I read recently an interesting paper called 'the felt presence of the other in unusual environments' and it was an article about the kind of hysteria that overtakes people lost in the wilderness. The sense that they are being stalked, or followed, or observed, and in its mildest form I'm sure we have all have experienced this. It's the sense of being observed when you know you're alone in the wilderness. We seem

to be...you know, we have very strong fight or flight hard-wiring in the organism, and we also, when we admit it, these biogenically active amines into the diet, we set ourselves up for a kind of undefined frontier between ourselves and the other. Language took its place in that fissure and began to create the earliest images of the other. The antecedent to the image is the feeling, and that was the point that i want to make, that in all cases, antecedent to the image is the feeling. The felt presence of immediate reality, which is the unique provence of the individual. We choose to attempt to communicate it, but it is, always and forever, by the nature of the situation, ours and ours alone. Well, the idea then that language is a double-edged adaptation that has both served us and betrayed us on different levels, needs now to be looked at in the light of the fact that culture is more and more consciously becoming a project carried out in the domain of language, by, for instance, propagandists, both governmental and commercial. Reality is more and more in the image, and when we talked about virtual realities, and the tendency of technology to create the dream utopias of the unconscious prehistory and shamanism. You see that what is happening is we are, as a global culture, abandoning ourselves in a way, to the image, because nothing else can be done. There aren't enough resources, there are not enough metals in the planet to give everyone the kind of standard of living that is enjoyed by the technocratic elites in the West. So instead there has to be this trade-off in image. Now this is not something new, we see it reflected in American life over the whole postwar era because, I don't know if you've noticed, but in order to make good on the grand promise that was to accrue to the American middle class consequent on the defeat of fascism, this utopia that was to come to be- for it to happen it was done tackily. That was the price that was paid. You know Eric Yonch said "the question regarding space colonies is not 'is it possible', but how will we keep it in good taste. And this was a question that was not answered by american culture in the 50's. It was essentially a suburban, modular housing, modular product, modular values, modular lifestyle paradise that was sold as a the consequences of the completion of the american dream. Part of what we have been living through this period is a hallucination of improper language. I mean, now because of the changes going on in the Soviet Union, the fiction of this implacable enemy bent on putting a tank on every street corner in the world is now exposed as a cultural illusion, a fiction. And I'm not entirely persuaded that was simply all a horrible misunderstanding. It seems to me these illusions played very strongly into the hands of different factions on both sides. Political realism is also coming-to-grips with language. You know the french sociologist Jacques Guilmol said "there are no political solutions, there are only technological ones. The rest is propaganda" well, you know, people howl to the high heavens. But in fact ideology which is a kind of street corner form of metaphysics, ideology has been just a pervasive cancer on the Western mind ever since the burning of eleusis. I mean we just can't get enough of it. You know, we may look with horror on the funeral of the imam, but believe me in the history of Western civilization there have been scenes go down that make that look like child's play. Recall to you just as an example, the Alpagencian crusade, when in order to stamp out a heresy, the inquisition was turned loose in southern France, and the professional killer who was put in charge of this operation was a career man named Simone de Montforte and his lieutenants came to him at one point in this campaign and said "we have the city surrounded, we are laying siege to" i believe it was Carcacon, and they said "but there are 7000 Catholics within the walls" he said "kill everybody, God will recognize his own." So, you know, the 20th century has not cornered the market on the ways in which language can distort and is used for political purposes to distort reality. A very poignant example of that that I have personally had to deal with is a lot of my work in the Amazon has been in an area of the Colombian Amazon called the Lower Putumayo. And I venture very few people this afternoon have any association to the lower Putumayo, but in fact British banks with the collusion of Peruvian ruling families in the early years of this century created a mini holocaust in the Peruvian, it was then Peru, in the Peruvian Amazon, in the pursuit of rubber. And what this was about was going in to these tribal areas and showing these people how to collect wild rubber, and then telling them, you know, you

bring in this much, the first time you don't bring in this much, we remove the soles of your feet with a machete. The second time you don't bring in this much, we kill you. And 45,000 Indians were exterminated in the Columbian Putumayo.

Going there years after this atrocity, I was amazed to see the lingering effects of the misuse of language. The Colombians, who were not politically associated with this- later in the 30's it was ceded to Peru, referred to it as it the Devil's Paradise, and the idea is that 'savages', note this word, 'savages', are savage. And therefore we must be more savage. In other words, preliterate culture is taken as an excuse for the rise of the beast in the colonizer. And this is entirely done, how this trick is done is through the misuse and abuse of language, where 'civilization' is what is being brought to these people, even though what appears to be being brought to them is the institution of prostitution, social diseases, slavery, madness, death. But in fact no that isn't it, it's civilization, its a set of reasonable values. well the consequences of working out the reasonable values that were exported into the colonial world throughout the 18th and 19th century, the consequence of that, is the appalling contradiction presented by modernity, where the major portion of real wealth of great nations is shoveled into a standing prop of weaponry which had better never be used because if it is used, it spells armageddon. If it's not used, it's simply the worst investment anybody ever dreamed up. So, this kind of betrayal of language and use of scapegoats- see that's what was happening with the United States vis-a-vis the Soviet Union- the scapegoat, the godless communist. It's what was happening in the Putumayo between the rubber barons and the Indians they were exploiting. They thought they were civilizing them. So, the imaging of the world gives permission for various kinds of relationships to it, and people never question. You know, once they pledge allegiance to a given linguistic model of reality, then that absolves all necessity for further thought. This is what Goebels understood so perfectly- you repeat and you repeat and you repeat, and then when people ask themselves in the privacy of their own mind, the moral question, your answer is on the surface waiting to be heard. Goebels was the first person to create a system where, sitting in an office in Berlin, he could throw a switch and speak to the German people, and McLuhan talked a lot about this, the notion of the creation of the public. What is the public? It's something that comes out of print culture, it's post medieval. It's a phenomenon that can only exist in the presence of newspapers, essentially, that's what gave it its boost. And the public is a very different thing from the democratic notion of the people because the public is this body of quote unquote 'informed opinion', but this informed opinion is tremendously subject to whim, pressure, propaganda, and distortion. I mean, I don't know how many of you have been following, because we're so isolated here, but what is going on in China is right now totally Orwellian. Films are being watched in darkened rooms, people locate and drag forward, forced to recant whatever accounts they gave of the violence. These film clips are being shown side by side on the evening news, where three weeks ago we were hearing that the army would nver attack the beloved students. Now, the army is patriotically rounding up dissidents, hooligans, bandit elements, and those who would destroy the compact between the party and the people. This is just a shift in language. Remember the scene in 1984 where the party hack is giving the speech and mid way through the speech he's handed a telegram on the podium that tells him that the enemy has changed, it's no longer oceania, they've made peace with oceania and begun bombing eurasia, the other state, and in mid-stride- he doesn't even have to end a paragraph! He can just turn the language and plough off in another direction. Well, is there any cure for this? Or are we simply the prisoners, each of us in our own way, of people smarter than ourselves. Well, not really, I think. Because outside the domain of language is some kind of domain of authentic feeling. We have thousands of words for technological processes, widgets and what have you. Our vocabulary of feeling comprises about 10 words, you know. Love, hate, disgust, revulsion, obsession, like that. Yet, in the same way that we are capable of this very intensely modulated brain-state that translates itself into small mouth noises, we need to be aware of an internal horizon of self-perception

that is extremely rich and complicated, and shifting all the time. Now, that's who we actually are. That is not the top-down values of the culture that we wear like clothing. That's who we are. This is what McLuhan said when he said we wear culture like an overcoat. It's something sold to us. You go out and buy it, you try it on. If Time Magazine doesn't fit you, maybe the Economist will. If neither fits, well, try the Journal of Foreign Affairs. You'll find an overcoat that fits, and then that will become part of your culture. I saw the cartoon in the New Yorker last night, the well dressed man and his wife leaving a party and he's saying to her "how can we relate to people who belong to the book of the month club?" YOU know , these are strong cultural disparities. So to overcome culture, really, which I view as provisional and semi-toxic, there has to be a way back to bedrock, to something that is satisfyingly transcendental in an immediate sense. In an immediate sense. So it cannot be a philosophy as far as I'm concerned. Maybe philosophies work for the more rarified among us. They have the consolation of, I don't know, Episcopalianism, Orthodox Judaism, Logical Positivism, whatever trip they've got running. But I've always found philosophy to be recreational, and won't really serve. Well, so then what is there? First of all, there is nature. Nature, silently attended, is still a modality that is beyond the reach of the language of most of us, and of those of us who need it most fortuitously, because we have the smallest vocabulary for its description. So, when we go into nature, it's a flirtation with a kind of iridescence, it's a search for, i mean I blush to use such a word, but a lost innocence, which most of associate with childhood. Some of us had terrible childhoods, so we just associate it with the lost paradise of Eden, or a utopia. But in nature there is an implicate order. There is the bedrock out of which the human iridescence springs. And human culture is an extremely evanescent, transitory, and non-equilibrium kind of condition. I mean, the pulse beat of this planet is measured in millions of years. Culture is a phenomenon of the last 40,000 years, and that's generous. So culture has about it this miraculous instantaneous and almost intrusive quality against the background of the rest of the body of nature. But going into nature is not simply a prescription for joining the Sierra Club. What going into nature means is taking seriously the alchemical faith that preceded the positivist flowering of science. And looking into the heart of matter with the expectation of encountering a mystery. Now, in the most practical sense what this has to mean is the psychedelic experience. Hallucinogenic plants. It cannot mean anything else. Now of course we're in the slightly uncomfortable position of having that be illegal, but that in itself should be a sufficient indication for most people that something is going on. I mean, my take on legality is essentially that of Charles Dickens, who was sort of an Edwardian Anarchist. And his famous throwaway line on that is 'the law is an ass' , and it's sadly true in this case. But i'm not really interested in it as a legal issue. I'm interested in it as a human rights issue if you want to put it that way. In other words, my assumption is that in the same way that the Western mind reached a certain place where it recognized that slavery, whether it made economic sense or not, was morally insupportable, and in the same way than that a universal right to own property if you've got the money has been more or less institutionalized, and the oppression of women is now recognized as a kind of self-defeating strategy of male dominance. In the same way that these things have been signposts in the continuing history of human self-definition. So shall be the understandign that life , liberty, and pursuit of happiness in the age of modern pharmacology has to mean the right to control your own state of mind in the appropriate - subject to the constraints of time, place and manner. And so forth and so on. And that's enough about the socio-political end of it. What is more interesting is the thing in itself, what it is. That it is something which our cultural biases, reaching clear back to the phonetic alphabet, and to the male dominance, the fear that societies run along the lines of male dominance, have of boundary dissolution. I mean, for a thousand years in western civilization, the only boundary dissolutiond that is soally sanction was getting plastered, and that appears to have been specifically for the purpose of getting laid. I mean, as far as research can tell us, for a thousand years nobody got laid who wasn't stone drunk because everyone was such a paragon of social rectitude. Well, I mean it's truer than you think. Alcohol is clearly a medium for

permission in a Calvinist milieu. Well, I can talk about this in all kinds of different ways. It's very interesting. I talked about scapegoats, and I talked about the misuse of language. I suppose, since I got that deep into it, I might as well say what I'm thinking, which is that the drug issue now looms as an obvious new horror. I mean, it has all the trappings of the Communist under the bed. I mean I have not yet heard crack-cocaine referred to as Godless. But any day I think the connection will be made, that this is a Godless drug. The problem here is again, a problem of language. We have one concept, 'drug'. It moves from aspirin to heroin, through LSD, and on into television. These things can all be spoken of as drugs. So then what this means immediately is somebody has stacked the rhetorical deck against a reasonable discussion of the matter because our vocabulary is so impoverished. I mean are we to believe that we need the same policy for television as we need for heroin. Are we to believe that psychedelic psychotherapy is to be treated with the same hand that resolves the crack-cocaine issue? So, while the government squawks education, no education is taking place. Rather, what is taking place is a poisoning of the linguistic domain in which we will then be expected to forge a solution. So what I've tried to say on this issue, and some of you saw this month's Mother Jones, may have noticed that they put me in there, more picture than text, which tells you something about an age of symbols. But what I've tried to say is that we need to define drugs operationally. We need to say what it is we don't like, and then we need to find out what it is that does what we don't like. Ok, what is it we don't like. I submit to you that what we don't like about drugs is unexamined obsessive and habitual behavior. Unexamined, obsessive, habitual behavior. Meaning, you know, somebody's into something, and by God, if you get in their way when they're on their way to it, you're in trouble. They do not question their obsession, they indulge their obsession, and they will tolerate no discussion of it. So, unexamined, habitual, obsessive behavior is extremely objectionable to all of us, I think. I mean, we call anything that we don't like, we call it robot-like, automaton, unthinking, zombie, so forth and so on. Well, imagine if our partners in the new global materialism, the Japanese, had introduced into this country at the end of World War 2, a drug, which, within a few years, made such deep inroads into the American population that people were spending an average of 5 hours a day loaded on this drug. What would we think? We would think that it was a crime against a culture on the scale of Auschwitz. But as a matter of fact, we did this to ourselves. Television, introduced at the close of World War II, has become a form of electronic heroin. And it isn't even your trip! They don't even let you go on your own trip. You get a trip designed on Madison Avenue to sell, you know, this year's model of the crapmobile, or whatever else is being pushed. So, unquestioningly, and even as I speak I'm sure there are people in this audience who are revolted at my lack of patriotism and love for an American institution of such nobility and depth as TV. Well, you know where I pulled back from TV, really pulled back from it? IT was when I made a mild knock on TV and someone in the audience said, well you can say anything you want about television, but you must admit that its given our children a wonderful education concerning nature.

Pursuing the theme of operationally defining drugs to give us a little more linguistic scope, psychedelics, in contrast to television and heroin, dissolve habitual patterns of activity, and promote examination of motives, and allow a restructuring of habit. Before LSD was made illegal back in the 60's. Very respectable psychologists, such as Humphrey Osmond and Hoffer, were obtaining a 40% cure rate of chronic alcoholism with one high-dose exposure. Well, now understand, this does not mean that LSD is a cure for alcoholism, I mean if you think that, you don't know anything about how drugs work. That 40% cure on one high-dose exposure to LSD of alcoholism means that this person took this psychedelic, it dissolved their boundaries, it dissolved their defenses, they came face to face with the fact that they were killing themselves, and when they came down they reached into their bowels and found enough intestinal fortitude to chop it off. Well this is the dream of all other therapies. Now AA achieves this, but at the cost of closing the mind. A truly devoted graduate of AA does not have an open mind on the drug issue because

they have been taught that opening your mind even a little bit may lead you back to the bottle. Well, they're trying to solve a personal dilemma in a context of neurosis. I'm sympathetic to that, but in the meantime the rest of us have to try to make sense of these extremely complex issues because the transcendent, which is what we cannot seem to find and what we are strangling for want of, lies precisely in the direction of this forbidden domain. What are we gonna do about it? In other words, authentic boundary-dissolving internal hierophony does, in fact, reliably occur in the presence of these plants and compounds. But nobody knows what to do about it. We have become so accustomed to seeking the answer that even as a community we have a lot of trouble figuring out how you just face the answer, how you come to terms with the options that are actually available. Well, I've talked about it today in a slightly more political context because when you hang out at the baz with the state department people, it's just like a virus in the watter. I mean you find yourself raving about triage, Saudi uprisings, infrastructures. I mean there's just no cure for it!

Are there questions? Yes, so the question is about sexuality and the relationship of sex to drugs. Tim Leary, he made a great case for sex and psychedelics. Every time they would say that LSD breaks chromosomes, he would say that they would cause orgasms that last- and he would add a greater increment of time as the propaganda required to hold the numbers steady on both sides. Certainly sex under psychedelics is quite astonishing, although psychedelics without sex is so astonishing...it's uh...it's uhhh, you know, perhaps an embarrassment of riches to pile it on. Now the analogy between sex and psychedelics that I think is the cogent one is, very few people go through life without ever brushing up against sexuality. I mean, you have to have truly bizarre biography for it to never come and get you. On the other hand, it is not only possible, but millions and millions of people do go from the cradle to the grave without ever having a psychedelic experience. Well, to my mind this is just an instance of an appalling infantilism that is culturally sanctioned. I mean, the culture not only doesn't care if you never find out about this, and remain forever immature, virgin, good word. This society, not only does it not care, it's specifically interested in seeing that you don't have this experience. Well, it's part of the birthright. This is what religion *was* for the first million years before it fell into the hands of men who insist on wearing dresses. You know, it was the celebration of an ecstatic reality that could be coaxed out of a magical relationship with nature. I mean, and it's still there. The portals are still there. You're RS232 outlet into hyperspace is still in place, even though, you know, nobody may have plugged in in your family line since Alaric burned Eleusis. Nevertheless, the hardwiring is there, the self-recognition. We are children without this, an d not in the sense of innocent, but in the sense of infantile because this is part of the birthright. How can...

Interview on KBOO FM Radio

1997

KBOO FM RADIO

Description

- [Audio Link](#)
- [Original Source](#)

Paul O'Brien: Hello, and welcome to Pathways, where you are invited to join me for a visit with leaders in personal and cultural transformation. This is your host, Paul O'Brien. We have a very special show for you today featuring an interview that was originally videotaped in 1997 to be included on a CD-ROM that at the time featured the world's first interactive I Ching software, a product I called the Oracle of Changes. That Oracle of Changes CD-ROM is no longer compatible, but it morphed into a website that was named, appropriately, IChing.com, the remnants of which are now available for free at Divination.com or available via app called Visionary I Ching for smartphones.

On that Oracle of Changes CD-ROM, it was my intention to include 3 videotaped interviews with experts on various aspects of the I Ching along with the multimedia I Ching program itself. Terence was one of those selected who thankfully agreed. This interview was taped at his home on the Big Island of Hawaii, where he was transplanting entheogenic plants from the Amazon Basin to ensure their survival.

Interviewing Terence McKenna for me was a great honor, because he was an intellectual giant and a personal hero of mine. As I used to say, Terence had the widest bandwidth between the brain and mouth of anyone I'd ever met or heard. He was an American ethnobotanist, a mystic, a lecturer, and an author, who spoke and wrote about a variety of subjects, including psychedelic drugs, plant-based entheogens, shamanism, metaphysics, alchemy, language, philosophy, culture, technology and the theoretical origins of human consciousness itself.

He was called the Timothy Leary of the 90s and was one of the leading authorities on the ontological foundations of shamanism, and he served as the intellectual voice of rave culture. McKenna formulated a fascinating concept about the nature of time, based on fractal patterns which he discovered in the I Ching, which he called Novelty Theory, and showed how this predicted the end of time in the year 2012. It was his promotion of Novelty Theory and its connection to the Mayan calendar that was one of the factors leading to widespread beliefs about 2012. It was Terence's profound knowledge of the I Ching and my work in developing software versions of that Oracle that inspired me to interview him for inclusion on the CD-ROM.

It was an enlightening conversation. We have done our best here to make it sound good enough for broadcast and I'm sure you will enjoy it.

Sadly, Terence McKenna died in the year 2000 at the young age of 54.

Ok, let's switch to the audio portion of that 1997 interview now.

PO: Hi, I'm Paul O'Brien, producer of the Oracle of Changes. We're happy to bring you the following interview with Terence McKenna. Hello, Terence, and welcome to our program.

Terence McKenna: It's a pleasure to be here.

PO: Why would you consider the I Ching to be relevant in today's world, if it's an ancient Chinese book?

TM: Well, the people who put together the I Ching were very interested in change and time. Uh, in the same way that our culture since Classical Greece has been interested in matter, the people who put together the I Ching were interested in time, and I think they got quite far in their exposition of it. They were interested in why things happen as they happen. This is a different question than we ask in the West. In the West we have asked the question, "What are things made of?" and we've come a great distance toward understanding that.

I think the I Ching represents an effort to answer a different question: the question, "Why do things happen the way they happen?" Our answers in the West - probability theory, causal unfolding, logical necessity - are really not very satisfying when applied to the world of politics, love affairs, the social world of human beings. And that was where the Confucian and Taoist mentality was focused, was on the world of human interaction, and so rather than viewing the I Ching as a primitive cultural artifact from the distant past, I view it as a arguably very sophisticated cultural artifact representing a cultural point of view about which we know very little, and in order to understand this point of view, we're going to have to educate ourselves in the worldview of the I Ching, which is very different from the world we're familiar with.

PO: Terence, do you see any evidence in scientific circles of a renaissance in our orientation towards time, that you just mentioned?

TM: Well, there's certainly a growing awareness in Western science that the situation is a good deal more complex than cheerful rational materialism would have us believe. Uh, Taoism is essentially an appreciation of pattern. It's a wave theory of nature. Things have influences on other things at a distance. It's a holistic theory of nature. Things are seamless. It's an acausal theory of nature; things are not only connected through logical necessity, but they're connected in other ways, through what we would call morphogenetic resonance.

Uh, so, yes, I think science in the 20th century has grown generally more holistic. This comes from psychology at one end and quantum physics at the other. And of course, quantum physics and psychology meet in biology and the I Ching... one of the striking things about it to the western mind, is its incredible isomorphism to the DNA and the way in which molecular coding of hereditary material takes place.

So, uh, in a way, this turn of Western science toward more holistic and unified theories of nature also represents a turning toward Oriental ideas, and in someone like Joseph Needham, these two impulses - the Oriental and the philosophical and scientific - are unified and Needham had a great and deep respect for

the I Ching and wrote extensively about it.

PO: What do you know about the impact of the I Ching on the earliest inventors of binary mathematics?

TM: Well, the Jesuits penetrated China very early. Gottfried Wilhelm Leibniz, who was a German mathematician and philosopher best known for... Bertrand Russell said Leibniz invented the smallest form of God. Uh, Leibniz invented something called the monad, which was basically the first attempt to solve philosophical problems with holographic matrices. But he was a very wide-ranging thinker, and his Jesuit correspondents sent him – uh, I don't know if they sent him the entire I Ching, but they sent him the table of the hexagrams – and he quickly saw that this could be expressed as a binary number system, and he, in fact, rearranged it in what, to the Western mind, is the logical way the hexagram should be presented, in other words, according to binary unfolding of the integers in a binary system.

That is NOT the traditional sequence of the hexagrams, but from Leibniz - then the I Ching lay fallow for at least 100 years and then the English sinologist James Legge translated it in the late 19th century in the burst of Oriental mania that was sweeping Europe at that time. And then of course Carl Jung, the founder of depth psychology, found in the images of the I Ching a mirror for his own assumptions about the structure of the unconscious, as he had found those things in dreams and alchemy and other concerns. Uh, and physicists... Jung published at one point on the I Ching with the physicist Wolfgang Pauli. Physicists found in the acausal connectedness upon which the I Ching was founded something similar to the non-Boolean logic that they were forced to use in constructing quantum theory.

Ultimately, I believe the power of the I Ching lies in the fact that it's an insight into the structure of nature, not the structure of matter, atoms, molecular systems, but the structure of process. Uh, in the West we really have gotten no further than the process has a beginning, a middle, and an end. The Chinese saw it... that's essentially a four element or a three-element theory of process. The Chinese have a 64-element theory of process that allows them to perform a complex algebra of calculation as to what forces are impinging on any event, and then they have this method of sortilege, of divination, which allows them to extract out of a unique moment a hexagram appropriate to that moment and then to refer to a body of interpretation that illuminates that.

PO: Terence, you're the one who discovered that the traditional sequencing of the I Ching hexagram known as the King Wen sequence maps out a fractal algorithm or pattern. What are the implications of that discovery?

TM: Well, yes, I guess if I take my own opinions about the I Ching seriously, then what I come away with is the idea that the world is more plotted, more structured, more ordered, than science has led us to suppose. In other words, science gives us a world where many, many things are called probable, but no theory at all about how out of this class of probable things, certain things come to be.

And this is after all what we want to know – why did A happen and not B?

My immersion in the I Ching leaves me with the conclusion that just as where you are in space – whether you're in a narrow mountain valley or in a broad desert – determines much of what is going to happen to you, where you are in time, similarly, determines the kind of experiences you're going to have and not all times are the same. When there are times of novelty and opportunity, chance taking is repaid well. In times

of resistance and habit, chance taking can be fatal or least tragic. So, the whole notion of Taoism, and later Confucian thinking too, is this kind of sensing into the moment to know what is appropriate.

And in much Western thinking, it's been sort of presented as a mystical thing or an intuitive thing or an impossible-to-explain thing. I think it's just something simply that we didn't understand and that in fact it's much more like a science, this feeling into the moment. Now in the West we have it with astrology, a similar tradition of trying to feel into the moment, but again, the Western mind is so obsessed with matter that it turns into observational astronomy under the rule of the calculus, and the shall we call, psychological dimension of it, is then... appears absurd and is forgotten or debunked or looked down upon.

Uh, the Chinese, by not having this strong dualism between the internal and external world, were able to create a kind of physics that was also for them a kind of psychology and the I Ching is the distillation and the quintessence of this way of understanding the world.

PO: Would it be possible on a computer to map out a graphical representation of the fractal nature of the King Wen sequence?

TM: Oh yes, this is the kind of thing I worked on for years and done and the conclusions that it leads to are fascinating. Uh, it leads to the idea that what is called Tao is in principle not immune to a mathematical analysis. That what these sages are talking about is an invisible force which moves through the world, building structure up and sustaining process at times, and at other times, impeding structure and tearing down and dissipating process, uh, according to mysterious laws.

Well, all that mysterious laws mean are laws that you haven't understood yet, and I maintain that it is true what the Tao is saying: There is a mysterious force which ebbs and flows in time. It isn't electromagnetic, it isn't photonic, it isn't any of these things, but it touches everything: men, atoms, organisms, societies, and these are all playthings in its hands.

This is the Tao. So, then the sage, the life of the sage, is an attempt to understand this, and I think it can be mathematically understood and this may be what the west brings to it – the mathematical tools, and the technology, the computers you mentioned, to eventually portray this ebb and flow of Tao so that people can order their lives according to it, and I think when a life lived in accordance to the Tao, however it is perceived, however it is known, is a life free of anxiety, and this is the highest ideal of these Eastern systems of thought, to essentially become one with the flow of nature, and thereby an example to Emperor, commoner and everybody else.

PO: Do you think the use of the I Ching could be described as a high order of change management?

TM: Definitely, yes. I mean, you can... management is not a dirty word. It has a connotation now because it's so associated with rapacious capitalism, but all management means is paying attention to the details that must be paid attention to. I mean, a synonym for management is husbandry. Heidegger said, "The purpose of life is care for the project of being." Well, in a sense, that's management. The I Ching is a manual for management, for the guidance of individuals and organizations toward their goals achieved by appropriate means.

PO: You mention the use of I Ching for divination. How much stock do you put in that type of

application?

TM: Well, it's a complicated question, you see. If what we're saying is that time is fractal, then implicit in that statement is the idea that patterns repeat on many, many levels. Well, that is really what all systems of divination all over the world have always claimed, that in a pool of water, in a flaw in a crystal, or in a process of sortilege, somehow these objects, these processes, become microcosms of the larger situation in the macrocosm. I think you can't really judge that hypothesis until you judge the physics that it's based upon, but certainly as I say, this is the oldest book in the world. It has persisted among very hard-headed people – politicians, courtiers, and emperors - for several millennia, so I think we need to take it seriously on that basis alone.

PO: In modern times, the I Ching and systems like it have been denigrated as superstitions. Do you see that attitude changing in the light of modern discoveries in quantum physics?

TM: Yes, I mean, I think the dinosaur is so dead to its own sensation that the messages are not getting through. Anybody who has any understanding of what is going on in quantum physics, or research mathematics, or dynamics, or chaos theory, knows that the world is a far stranger place than the cheerful world of rational materialism inherited from the 19th century. Uh, the I Ching is a paragon of rationalism compared to the quantum physics taught in our Universities in order to understand matter.

You see, something rather dramatic has gone unnoticed in Western thinking, which is physics, which was always the paradigmatic science, the idealized science in the west, because often theory and experiment would agree with each other, out to four or five decimal points. Well, no other science, no biology, no psychology, can come even close to that. So, physics was always the paradigmatic science, but physics pushed its frontier then into a domain of irrationality, the realm of the quanta. Well then at that point the paradigmatic science began to babble like the ravings of a madman, and the whole edifice of reason and rational apprehension of nature caved in to those, for those who were paying attention to what was going on. Many people were not. The average workbench scientist has many cheerful assumptions about what he's doing and what science is, that people who are philosophers of science know to be no more than a simple religious faith.

So, yes, I think that, uh, the I Ching, psychedelic experiences based on the news brought back from aboriginal non-western peoples, all of these things are telling us that the world is more complex than reason can anticipate, and that if we're serious about the intellectual enterprise of understanding nature and understanding ourselves, reason may just have to be viewed as one tool in the toolbox and the I Ching is another tool in the toolbox, a very powerful and necessary tool.

PO: I'd like to go back to the fractal nature of time that you discovered, based on the sequencing of I Ching hexagrams in the King Wen sequence. You came up with a theory which you called Time Wave Zero. Can you tell us about that?

TM: Well, the theory is called novelty theory. The software behind it is called Time Wave Zero. It's basically, simply based on these mathematical studies of the King Wen sequence: an effort to put all that into a computer and scale it against time, so that we can generate what look like Cartesian graphs, in other words, like stock market graphs, but they're not the rise and fall of a market, they're the ebb and flow of Tao. Tao, dually conceptualized as habit and novelty, and the flow of time is conceived of as a kind of

shifting boundary or tension between habit and novelty and the unfolding of this in its totality, then, is the Tao. So basically, what I did is I tried to create a little mathematical model of how Tao would look if it could be numerically quantified.

PO: Terence, do you consider yourself a scientist?

TM: My method is rational. My techniques are shamanic. Uh, was it Lautréamont or Polinaire (sp?) or someone, who said the deliberate disordering of the senses...oh, Rimbaud. Arthur Rimbaud, the symbolist poet. A deliberate disordering of the senses worked for Rimbaud.

I think it's very interesting to use shamanic techniques and then analyze the data...rational, rather than mythologically or psychologically or anthropologically. And that's gotten me a long way, being willing to put myself in these situations of turbulence through strange cultures or bizarre plant experimentation and this sort of thing, but then always to subject the data to the filters of rational inspection and rules of evidence and analysis. So, some people can't tell whether I'm half shaman, half scientist. I think probably the answer is simply half baked. [laughter]

PO: Is there any advice that you'd like to give our audience, relative to what we've been discussing?

TM: Well, I don't know about advice. This is a fascinating area. I mean, you know, you're born, you don't know where you come from, you slip into the grave, 50, 60, 80 years later. You don't know what that means, and so between birth and the grave, where you are is the world of time – the world of time, space, energy and matter. And I think of it as a kind of puzzle or a challenge. If you can figure it out, you're plucked off into some other dimension with new problems and new challenges. If you can't figure it out, you probably just turn back into a sunbeam at the end of the whole thing. Well, so then, the I Ching is one of these very rare pieces of human literature, where people actually understood something, and they got it down and they left it as a signpost along the road.

And if it resonates with you, if you feel what this is all about, then a life lived in the light of these writings, and writings about these writings, is a life free of anxiety, open to the problems of other people and capable of being an example of how to live in the world. And I think it's great that you're doing this, and I hope it means that people are sensitizing themselves to the felt presence of experience. That's what the Tao is, that's what intuition is, that's what the I Ching can help us toward, is an experience of our own being and tone.

PO: Well, that is the end of the interview with Terence McKenna, which was taped in 1997. For those who tuned in late, this is your host Paul O'Brien, Producer of Pathways and the Visionary I Ching app, which is intimately related to the conversation we just heard. In a second, I'll tell you how you can rewind and replay this entire interview any time you want, via Podcasts on the internet or via iTunes.

Today's show has been an archived recording of my interview with the mystic Terence McKenna in 1997. Terence was the author of *Food of the Gods: The Search for the Original Tree of Knowledge, True Hallucinations*, and many other books. I want to say thank you to all of our listeners, for tuning in to the Pathways interview program, which is broadcast and streamed via KBOO.fm on Sunday mornings at 8:30am USA Pacific time. Podcasts of today's show, which you can listen to and forward to others, are also available for free at divination.com, on iTunes and via the website KBOO.fm. This is Paul O'Brien,

reminding you to tell your friends about Pathways and its podcasts.

With reverence, we tip our hat to the late Terence McKenna, and also to all of you listeners for tuning in and being a part of the Pathways experience.

(This transcript begins at around the 7:00 minute mark, where the featured talk begins.)

Fraser Clark: He's probably the most adventurous mind on the planet today. I would just like to say one little thing about the man himself, if I'm going to talk about him. Where I like to refer to him, that he's not just a philosopher, he's not just an intellectual. The man is a revolutionary, an iconoclast. And he's doing lots of things besides this talk and ideas. So that's it: Terence McKenna!

Terence is going to talk for about one hour, and then we'll do questions and answers. What I'd like you to do is, if you have a question, write it on a piece of paper and at the end of the hour and bring it up here. I'll be sitting at the back of the stage. That way it works a little more efficiently. Terence McKenna: All right. I don't know—do you sit? Do you stand? What do you do? Is the sound good? Is the light good? So, are you happy to be here? Good. So am I. Well, before I get into the bulk of the lecture tonight, I thought I would just give you some news from the frontier of pharmacology, which is that, for the second time in the 20th Century, a mega hallucinogen has been discovered that is active in microgram quantities. What this is, is an incredible opportunity for the community, because this compound that is active at 300 micrograms when smoked is not illegal anywhere in the world—to grow, to manufacture, to possess, to transport.

So here is the story. For 45 years it's been a commonplace of the botanical literature that there was a Mexican plant called salvia divinorum. But it was always said that it was either impossible to confirm its hallucinogenic activity, or whatever it was, it was so unstable that it would only persist in the plant for a few hours after it was picked.

About five years ago, an American anthropologist, one of our own, Brett Blosser, went to the Oaxacan mountains and spent some time time with the Indians down there, and they showed him how to get off on the plant, the leaf. He described to me and a number of other people quite extraordinary states of consciousness that were coming from this particular shamanic plant.

That's where it rested until about 10 months ago, when an underground chemist in an earthquake-prone city, who prefers to remain anonymous, set out to actually isolate the constituent of salvia divinorum. In

short order he overcame the conventional wisdom and produced a crystalline material, active at the microgram range. To check what it was, he purchased a chromatographic standard of a compound called salvinorin-alpha, that had been extracted from this plant 15 years ago. And he smoked that, and the experience was identical. So we now know that there is a new chemical compound in the isoquinoline family that is active in the microgram range that occurs in a plant that looks like Joe Plant. It's a house plant. It's a window box plant. It's a relative of the coleus. It grows from Nome to the equator, and it's legal. For the first time since the psychedelic issue has been before the community, we have an opportunity to create a psychedelic community that is entirely within the law. No laws need to be change, and no laws are broken if we avail ourselves of this stuff. To manufacture it, to transport it, to use it, to explore it for psychotherapy, to do it on stage (as I am about to do).

I'm kidding. I'm kidding! Steady!!! To serve, by way of example, in fact that there are probably many such plants still to be discovered. The interesting thing about salvia divinorum is that it's not related to any substance currently illegal. Therefore, the argument that it is a structural relative to something illegal is also fallacious. At least in the case of the American government, they will have to present medical and scientific evidence that there is a problem with this compound before it will be possible to make it illegal.

This just one more example, along with ibogaine, phalaris, ayahuasca, so forth and so on, of the way in which the earth itself is stepping in to aid in the agenda of cultural transformation. There are too many doorways in Nature that lead to heaven. There are too many paths to the Mystery for any institution, or social policy to be able to thwart the intent of the human species to evolve. This is part of what this end-of-millennium cultural transformation is about. A rediscovery of the richness of the gifts of nature.

I mentioned ibogaine. Ibogaine is another hallucinogen, a West African plant that induces intense visionary experiences, and is now being looked at by the National Institute for Drug Abuse in the United States as, possibly, a strong contender for being a pharmacological intervention on cocaine and heroin addiction.

Imagine how the social understanding of the concept "altered state" and "psychoactive substance" would be changed if we discovered that the solution to many of our drug problems are drugs, you see. I maintain that they were the solution to many of our problems thousands and thousands of years ago, and it was the creation of societies so constipated, so ego-bound, so hierarchically-stratified, that it couldn't tolerate the presence of an ecstatic shamanism as a social phenomenon. It's the rise of those kinds of societies that have led us to the brink of planetary catastrophe. So that sort of brings me to what may be the major theme for the evening, or what I wanted to explore with you.

I'm interested in the question, "Is there any reason why smart people should hope? Is there any reason why people of analytical intelligence, who are connected up to the facts of the matter about the state of the world, should hope?" The conventional wisdom is basically "no." The smart people who are straight are involved in simply the media management of what has turned into a slow apocalypse. Spreading starvation, exacerbated class differences, toxified agriculture, so forth and so on.

I don't believe the establishment thinks there are solutions. Their policy is basically the management of panic, which is hardly a forward-moving approach to the adventure of human civilization. In order to find permission to hope, to believe in something, the first thing you have to do is reconstruct your

intellectual model of the universe from the very, very ground up. As long as you are trying to make sense of reality inside the boundaries of the old paradigm, there's no hope. There's no way out of the box of capitalism, monogamy, consumer fetishism, egoism, money worship. No way out. No way. No, way, out.

So what that means is we have to return to first principles. We have to re-understand who we are in the universe. What we are in the universe. And what we mean to it. And in order to do that, I'd almost use the word "attack," but let's be academic, and instead provide the critique of science, because this is the world that science built with the henchmen of capitalism and Christianity. A critique of science that brings it to a new model of reality is the way to open a door to hope.

Here's the deal. Science has overlooked two immensely salient facts about reality that are not abstruse, to be deduced from analyzing the contents of cyclotrons or the reflectivity data on the moons of Pluto. Science has missed two immensely obvious facts about reality.

Here's what they are. The first one is not such a stretch. The first fact is that across all levels of phenomenon, atomic, ordinary organic chemistry, biological systems, cultural systems, your life, across all levels of phenomena, the way nature works is that she conserves novelty. What I mean by this is that the universe produces novelty, then it struggles to maintain it. The universe is a novelty-producing engine of some sort, and the further you move from the birth of the universe, the more novel the universe becomes, until you arrived here tonight.

This is the most novel moment to date in the history of the universe. It is not only a world of astrophysical forces, or a world of astrophysical forces plus organic chemistry, or astrophysical forces, organic chemistry, plus biology. This is a world that has all the levels of novelty that have accumulated throughout the career of the evolving universe, each level built on the level which proceeded it.

One thing that I want to point out about this, if you agree with this, then the first payoff is that

suddenly, human importance is taken back from the scientific view that we are the chancely evolved witnesses of a meaningless process in an ordinary corner of the universe too vast to conceive or imagine. That incredibly disempowering picture of who we are in the cosmos is misled. The actual facts of the matter are, that in our bodies, in our brains, in the culture that we have assembled, all the novelty that preceded us has been exploited, and is expressed, and is honored.

We begin to look like partners in the project of the production of novelty, and more novelty, and yet greater novelty. That is the first fact that science overlooked. The conservation of novelty.

The second fact that science overlooked is more of a stretch in terms of the break with the past style of thinking that it requires. The second fact which science overlooked is the fact that each advance into novelty, each new level of novelty occurs faster than the level which preceded it. This is incredibly important, because what it means is that the culmination of the novelty-producing process could be far closer to us in kind than we might ordinarily suppose using scientific assumptions about reality.

Those of you who have heard me before have heard me say, "History is the shock wave of eschatology." What that means is the presence of our selves on this planet, using culture, using language, transferring information electronically around the world. Our presence on the planet means that the universal process of novelty-production has entered one of its very short cycles. What it means is that asymptotic acceleration of change is built into the structure of space-time itself in this region of the cosmos.

History is ending. Time is literally running out on this planet. It isn't about political mistakes or anything where we should blame ourselves. It's in the structure of the fabric of space-time itself. The proof of this is ourselves. Because the emergence of conscious human beings out of advanced primates occurred with such explosive suddenness, that it, like history, argues that we are in the presence of a process that is quickly beginning to accelerate and cross boundary level after boundary

level, as it bursts through greater and greater degrees of freedom.

I believe that we are actually preparing to decamp from ordinary history. I don't know exactly what that means, but the continuation of history for decades, centuries, millennia, is inconceivable. That is the hallucination of the establishment, because it cannot imagine the actual truth of the situation, which is the cascade of forces set off by Greek science, by the phonetic alphabet, by monotheism, this cascade of social forces is now propelling the entire global social structure into another dimension.

Literally, another dimension.

I mentioned the conservation of novelty. Now I want to go back over it from a slightly different point of view. If we analyze the way in which novelty has made its way into being, you see that it has consisted of a kind of conquest of dimensionality. The earliest life forms were probably long chained polymers, or viral particles. They were essentially points in the universe. They had no sensorium, no sense of direction, no sexuality, no sense of time. They were basically a point-like toe hold in matter by this thing we call organic existence.

Over time these life forms developed motility, meaning the ability to move. And literally fumbled their way through a universe that they could not see, dealing with each moment sequentially. But this sequential exploration of space-time represents the first conquest of dimensionality, out of the pointspace.

Later, organisms sequestered light-sensitive chemistry on their surfaces and became aware of the gradient of light, which gives the concept “here” and “there,” and the possibility of moving towards the light. This is a further conquest of dimensionality. The rest of the whole history of life, up until very recently then, is the story of producing better organs of locomotion—better fins, better wings, better feet and arms, as higher and higher animals arose, ultimately with coordinated, binocular vision. And then at that point, rather than the conquest of dimensionality being halted, one particular organism makes an auto-genetic leap to the phenomenon of language.

Language is a biological strategy for binding time. Specifically, it is a way of remembering what happened, and anticipating what might happen. It explodes the animal consciousness away from the now, and creates the incredibly complex web of syntactic and semiotic structures that we know as language.

This process is very quickly, compared to previous developments, followed by a second development, the discovery of writing. Now, it's not simply a matter of handing on the oral traditions from generation to generation. Suddenly now the freezing of time is an utterly realistic undertaking.

Discourse flows into to signs, signification in clay and stone, and time is frozen. And, the triangulation of the future proceeds through the evolution of the kind of mathematics that we see at Stonehenge, and so forth. This unique strategy that the advanced primates created, the strategy of using language to bind time, is what the process we call "civilization" has been all about.

Now, with electronic media, enormous databases, the ability to use Telnet and Usenet, and move around the planet from library to library with a few keystrokes, essentially we are completing the program of downloading all of the past into virtual accessibility. As we do this, we are essentially propelling ourselves into this much ballyhooed domain called "cyberspace." Cyberspace is the human transition into a mathematical super-space where we, as a collectivity, become optionally a single point of view.

What this all means then, is that human history and biological evolution, and in fact, the entire unfolding of the universe, is not something pushed from behind, like the falling of a row of dominoes. In other words, the scientific assumption of causal necessity is only part of the story. The universe is under the spell of what I call a transcendental object, or what chaos theory calls an attractor.

There is actually a teleological arrow to process. It is being drawn through, ever into ever more novel domains, and it also spends less time in each domain of novelty until it moves on into the next one.

This is what Whitehead called “conrescence.” It's what it means that in a hundred years we've gone from a world where most people didn't possess telephones to a world where most people where most people can call anywhere in the planet as long as they can afford it.

Conrescence, the knitting together, the dissolving of boundaries. This is the key to novelty. Novelty is achieved of the flowing together of domains that were previously separate. They may be the half-life portions of a chromosome, rich people and poor people, or ravers and travelers, or Marxists and democrats. The point is, ideas become constipated when they're sealed away from other idea systems.

The main thing going on in the 20th century is a dissolving of boundaries, all the boundaries that historical civilization put in place. I mean, what has the last 1,000 years been about, except building class differences, race differences, sexual differences. We've had religious wars, we have factionalism. It's how we relate to the world, with the final culmination of the dog-eat-dog vision of nature that we inherit from British natural science in the 19th Century.

The new metaphor is fusion, union, cross-fertilization of boundaries, melding into an enormous stew of virtual and interactive creativity. What this is all leading to, I believe, is what I call the “big bang.” I'm sorry—the “big surprise.” And as I describe it to you, the reason I said “big bang” is because I want you to remember as I describe this cosmogony to you, what is stored somehow in the DNA.

You remember there are vast segments of the DNA that do not appear dedicated to genetic transcription of proteins. These have always been dismissed by science as so called “silent sequences.” But silent sequences may not be designed to be read by a ribosome to produce a protein. The silent sequences of DNA may be, in fact, encoded information of the sort of information you and I have been focusing on.

When the drug molecule fits in there, it broadcasts an expanded electron spin resonance signal off the

molecule, and this is the psychedelic experience. It's being conducted into the Akashic memory banks where all this DNA-coded information is happening. The fact is that's pure speculation, and there are many molecular biologists who would just sneer at it. But they are not on as secure ground as they suppose.

If there is one issue in the past 40 years that science has failed utterly to make any progress on, it's the question of memory. No one understands how it works, and the best models to date are completely inadequate to the data. So I believe the brain is not in on this. And it would make a certain amount of sense, wouldn't it? The psychedelic experience is sort of like experiencing a vast blast of memory data. Those of you who have done it, have you noticed the “now I'm an infant again” aura that sometimes attends it? I mean, when I do DMT I actually feel my body proportions become infantile. I feel my head get bigger and my legs shrink. It's only a part of the experience; you have to notice it.

It seems to me that it's very suggestive that we're actually entering hyperspace. You are experiencing yourself, not just now, but your whole life, back, back, back. There's a lot of work to be done.

Fraser Clark: Does the intensity of the DMT experience diminish when you take it with MAO inhibitors?

Terence McKenna: Does the DMT experience diminish when you take it with MAO inhibitors?

I would think that you might lock it in at a fairly high level of intensity.

Fraser Clark: [inaudible]

Terence McKenna: Yes it does, it does. Be sure you're prepared before you try that stuff.

Fraser Clark: Other people I know that have tried DMT and had “ordinary” tripping experiences—ET, aliens, and doors opening. No one has had these vast experiences you describe. It's all due to the mind. You see these things because you have a wide, scientific, academic background in your head already.

Terence McKenna: Well, the thing about DMT is that it does make a certain demand of courage. And

the leather-lung smokers among us are in a superior position. The difference between one toke and two is enormous. The difference between two tokes and threes is staggering. So, you have to push it. I believe that it is quite safe. People say, "Is it dangerous?" And you know my answer: "Only if you fear death by astonishment." But that's not a joke! Death by astonishment doesn't seem like such an unlikely proposition when you're out there. A friend of mine once said, "Every time I do it, I try to stand more."

And that's what it's like, because ultimately it is going to overwhelm your intellectual machinery. If it doesn't blow it out in the first 30 seconds, it will blow it out later. Ultimately the mind fails. The descriptive apparatus melts. The measuring instruments are vaporized. And the thing is just what it is. So you want to proceed carefully, with courage. If your friends tell you you're getting "nutty," you should listen to them. Because it does have the tendency to magnify inflationary images in the psyche. In other words, if you're not flawlessly solid, it will act like an x-ray of just where the fault-lines lie in your particular world view.

His question is, "Do you believe that it is necessary to be in a certain mind-space before entering a trip to give maximum effect?"

Well it's very simple. It's six hours without food, and silent darkness. Telephones unplugged.

Comfortable, reassuring environment. That's all.

It's not about tanks. It's not about social situations like this—they're dense, full of pheromones and social signaling. It would rip you apart in a really deep trip. Let's not underrate cannabis, for crying out loud! Cannabis should be the glue of the community. It's really important to go botanical, to be a botanical psychedelic compound.

[Cheers...]

You see, the very best of the white powder drugs are still impossible to verify as to purity and source.

It's just a fool's game. The plants will not play you false. So I think that is very important.

Fraser Clark: Do you think the industrial-political system will be able to manipulate consciousness through technology, bio [inaudible] by plants, implants, and prevent our minds from evolving and accessing the transcendental object?

Terence McKenna: Well, this thing about fearing technology in any form. What you've got to understand is that when you go into these places like Autodesk, and Silicon Graphics, and like that, you have the suits above the 20th floor. But everybody below the 20th floor has hair down to their asses, heavily tattooed, pierced, they're rocking. So, we OWN this technology; they do not understand it. You know, it was a miracle that Richard Nixon could erase eighteen and a half minutes on a tape recorder and get it right. They have to pay us to run their technology. They can't write code. They can't run the nets. It belongs to us.

I see this trend accelerating. The technical community is by no means a part of the opposition. The technical community is going to be there when we reach the barricades.

Fraser Clark: What kind of music or sound, if any, would you use with DMT? Also, what does DMT sound like?

Terence McKenna: What kind of music would I use with DMT? Well, I've done DMT with music, but I've regretted it nearly every time. I've done it with Locatelli's Violin Concerto #11. That was a long time ago. The reason these aren't contemporary deals is because I haven't done it with music for 30 years because it alarmed me. I did it with with Karlheinz Stockhausen, and that really alarmed me. As far as what DMT sounds like, it sounds, well, somewhat like this: [vocalizes something like the sound of wind or radio static]. And of course, there's this sucking, pulling thing that happens as you tumble down these bi-systolic organismic hallways that are pulling and tugging you forward. And then you get into what, for me and for some other people, what I call the "elf hive." It hits people

differently.

I saw a woman not long ago, have the most amazing orgasm. It was very interesting. And I've seen a lot of people do DMT, and this just left everybody's jaw hanging. This woman was a very nondescript sort of person, but she certainly got off. She was saying during it, "Don't send me back. I can't leave you. I can't leave you!"

What happens to me in reference to the sound thing, is language. I see elves, sort of, dribbling self-jeweled basketballs. But the main activity at the higher doses is these autonomous machine elf soul creatures make objects with language. Somehow language in the DMT-space is transduced through the eyes. You see syntax, and you are, in fact, impelled to join with them in these long, spontaneous bursts of language-like activity, that sounds sort of like this:

"Yeev ba jing nyee woobz yaubh dah yoh boo deedz ingidee yoo wap pop yo ahhh brrr jeee woop grr...."

[Applause, then Terence continues with several more seconds of "glossolalia."]

Fraser Clark: So what holds those together? Or do you just let go? Will we become insane in the conventional meaning?

Terence McKenna: No. We'll redefine sanity. We carry the destination with us. This is what's insane—the city outside, the governments and institutions. We won't become insane. We are awakening. This is what's happening. The long nightmare of human history that James Joyce talked about. We are awakening, and the truth you think you see, the truth of your own intuition, is the truth. You don't need somebody handing this stuff down from on high. You simply have to open your eyes. If it looks like horse shit, if it talks like horse shit, if it walks like horse shit, it probably IS horse shit.

Fraser Clark: Do you think we will last the course of time and eventually create a common awareness?

Or do you think we will destroy ourselves [inaudible] the planet? Do we have enough time to

[inaudible]?

Terence McKenna: I am an absolute optimist. I am absolutely certain as I stand before you that everything is on track. I mean, the mushroom has said, “This is what it's like when a species prepares to be part of the galactic center. This is what planets come into existence for.” We are about to part ourselves from the placenta of three dimensional space.

Information is rearing itself up, and preparing to take a step into another dimension. Everything is changing. Everything always has been changing. But now it is changing so quickly that, within the confines of an individual life, the entire cosmic drama can be encapsulated.

We are each fractal histories of the universe. It is within us—as a community, and as individuals.

Nothing can stop this. This is not a political movement. This is as inevitable as continental drift, or the sunspot cycle. It is now time to decamp from three dimensional space. 15,000 years ago it was time for the descent from the garden into history, to take hold of the tools that will allow us to free our minds, our bodies, our planet, our identity, and our destiny.

This is what it has all been about.

Fraser Clark: What [inaudible] do you think the zippies do to America as to inspire American youth culture?

Terence McKenna: Well, we're fighting a meme war here, aren't we? We have to use the media to prosecute our agenda. The other side has all the guns, all the money. The only problem is, if they win, everybody dies. So, our friend is the information transfer network, the media. We have to set in motion memes—models that will attract loyalty.

Remember last year when I quoted William Blake? I said, “If the truth can be told so as to be understood, it will be believed.” It's as simple as that. The obligation on us is to communicate the truth so that it is understood. The belief will take care of itself.

I am all for this zippie thing. It's a high stakes game, because a stumble will delay the agenda. But I've been coming to Britain now for five years, and each time I've seen this scene expand, broaden, deepen, and I've seen its resolve coalesce. I think it's now time to take this thing on the road.

I think America's undergoing the illusion of a liberal administration. I think we need to strike at the Great Beast before [inaudible with cheers].

Fraser Clark: We're getting near the end. [extended inaudible] Terence McKenna: [inaudible] Invisible Landscape is all around here, it's also out in America now. But I

don't know if anybody's imported it into Britain yet. It is out. It's great. I'm very happy with it. I'm ready to retire at this point. My message is essentially done once that book is available.

Fraser Clark: Your views seem to be typically Millenarianism, or Millennialism. How the year 2000 shapes consciousness. What do you think? I've often wondered, how many [inaudible] does it take to get to the year 2000, nobody hears "2012." If we can't agree about the year 2000, what in the hell are we ever going to agree about?

Terence McKenna: If you look at the Time Wave you'll see that the year 2000 is lined up with events in Christian history so hysterical that we might as well hand it over to them.

This transcription consists of 3 separate lectures on the same topic. (See Links)

Lecture 1:

Well, it is a small group and this was my intent by focusing on the Hermetic Corpus and alchemy. I've just gotten tired of talking about psychedelic drugs and always saying the same things over and over again; nevertheless, it's a challenge to go outside my own bailiwick. I've had an interest in hermeticism and alchemy since I was about 14 and read Jung's *Psychology and Alchemy*, and it opened for me the fact of the existence of this vast literature, a literature that is very little read or understood in the modern context. The Jungians have made much of it, but to their own purposes and perhaps not always with a complete fidelity to the intent of the tradition. We'll talk a lot about the Jungian approach, but there are other approaches, even within the 20th century. I urged you to read Giordano Bruno and the Hermetic Tradition by Dame Frances Yates, and although Frances Yates' scholarship is very controversial, I think that to get an overview of the landscape her book is probably the best single book between covers. It's not pleasing to some factions and we can talk about that. We will probably discover within the group all the strains of alchemical illusion and delusion that have always driven this particular intellectual engine, but I thought that to get one book that sort of covered the territory that was a good one to start with. Well, then I found out that it's very hard to get this book. I didn't realize that, because it's been sitting on my shelf for years. Richard Bird found a reprint at the Bodhi Tree. I wasn't aware of this particular edition, so though probably none of you brought it with you in a heavily underlined form, if after this weekend you want to try and get it, it is available; and if you can't get that edition, a good book search service can probably come up with the first edition, which is Routledge & Kegan Paul.

I wouldn't hold a weekend like this simply to go over a body of ancient literature if I didn't think it had some efficacy or import for the modern dilemma. Some of you may know the song by the Grateful Dead in which the refrain is, "We need a miracle every day." I think any reasonable person can conclude that the redemption of the world, if it's to be achieved, can only be achieved through magic. It's too late for science. It's too late for hortatory politics.

Well, it's very interesting, every ancient literature has its apok'aluipsis and in the Hermetic literature there

is a prophecy, I think it's in Book Two but that really doesn't matter, and the prophecy is that a day will come when men will no longer care for the earth, and at that day the gods will depart and everything will be thrown into primal chaos. This prophecy was very strongly in the minds of the strains of non-Christian thought that evolved at the close of the Roman Empire. When you look back into historical time it's when you reach the 1st and 2nd centuries after Christ that you reach a world whose psychology was very much like the psychology of our own time. It was a psychology of despair and exhaustion. This is because Greek science, which had evolved under the aegis of Democritean atomism and Platonic metaphysics, had essentially come to a dead end in those centuries. We can debate the reasons why this happened — an obvious suggestion would be that it was because they failed to develop an experimental method — and so everything just dissolved into competing schools of philosophical speculation and a profound pessimism spread through the Hellenistic world. Out of that pessimism, and in the context of that kind of universal despair which attends the dissolution of great empires, a literature was created from the 1st to the 4th centuries after Christ, which we call the Hermetic Corpus, or in some cases the Trismegistic Hymns.

This body of literature was misunderstood by later centuries, especially the Renaissance, because it was taken at face value and assumed to be at least contemporary with Moses, if not much older. So the Renaissance view of Hermeticism was based on a tragic misunderstanding of the true antiquity of this material and there are people, hopefully none in this room, who still would have us believe that this literature antedates the Mosaic Law, that it is as old as dynastic Egypt, but this is an indefensible position from my point of view. In the early 16th century, a father and son, Isaac and M'eric Casaubon, showed through the new science of philology that this material was in fact late Hellenistic. Now, I've always said that I am not a classicist in the Viconian sense. There is a certain strain of thought that always wants to believe that the oldest stuff is the best stuff; this is not the case to my mind. To my mind, what is amazing is how recent everything is. I have no sympathy with the fans of lost Atlantis or any of that kind of malarky because to me what is amazing is how it all is less than 10,000 years old. Anything older than 10,000 years puts us into the realm of an aceramic society relying on chipped flint for its primary technology.

The Hermetic Corpus is the most poetic and cleanly expressed outpouring of ancient knowledge that we possess, but it was reworked in the hands of these late Hellenistic peoples. It is essentially a religion of the redemption of the earth through magic. It has great debt to a tradition called Sevillian, which means to me Mandaeanism, and Mandaeanism was a kind of proto-Hellenistic gnosis that laid great stress on the power of life, *zōē*, bios, and in that sense it has a tremendously contemporary ring to it. We also are living in the twilight of a great empire, and I don't particularly mean the American empire, I mean the empire of European thinking created in the wake of the Protestant Reformation and the rise of modern industrialism, the empire of science. Science has exhausted itself and become mere *techne*. It's still able to perform its magical tricks, but it has no claim on a metaphysic with any meaning, because the program of rational understanding that was pursued by science has pushed so deeply into the phenomenon of nature that the internal contradictions of the method are now exposed for all to see. In discussing alchemy we will meet with the concept of the *coincidentia oppositorum*, the unity of opposites. This is an idea that is completely alien to science. It's the idea that nothing can be understood unless it is simultaneously viewed as both being what it is and what it is not, and in alchemical symbolism we will meet again and again symbolic expression of the *coincidentia oppositorum*. It may be in the form of a hermaphrodite, it may be in the form of the union of soul and Luna, it may be in the form of the union of mercury with lead or with sulphur. In other words, alchemical thinking is thinking that is always antithetical, always holds the possibility that by a mere shift of perspective its opposite premise will gain power and come into focus.

There's a wonderful book called *The Forge and the Crucible* by Mircea Eliade in which he shows that the shaman is the brother of the smith. The smith is the metallurgist, the worker in metals, and this is where alchemy has its roots. In a sense, alchemy is older than the Trismegistic Corpus, and then it is also given a new lease on life by the philosophical underpinnings which the Corpus Hermeticum provides it. The word "alchemy" can be traced back to mean "Egypt" or "a blackening," and in its earliest strata it probably refers to the techniques of dyeing — meaning the coloring of cloth — and gilding of metals, and the forging and working of metal. We who take this for granted have no idea how mysterious and powerful this seemed to ancient people and, in fact, it would seem so to us if we had anything to do with it. I mean, how many of us are welders or casters of metal? It's a magical process to take for instance cinnabar, a red, soft ore, and by the mere act of heating it in a furnace it will sweat liquid mercury onto its surface. We have unconsciously imbibed the ontology of science where we have mind firmly separated out from the world. We take this for granted, it's effortless, because it's the ambience of the civilization that we've been born into, but in an earlier age — some writers would say a more naive age, but I wonder about that — mind and matter were seen to be alloyed together throughout nature so that the sweating of mercury out of cinnabar is not a material process, it's a process in which the mind and the observations of the metalworker maintain an important role.

Let's talk for a moment about mercury, because the spirit Mercurius is almost the patron deity of alchemy. You all know what mercury looks like: at room temperature it's a silvery liquid that flows, it's like a mirror. For the alchemists mercury was mind itself, in a sense, and by tracing through the steps by which they reached that conclusion you can have a taste of what alchemical thinking was about. Mercury takes the form of its container. If I pour mercury into a cup, it takes the shape of the cup, if I pour it into a test tube, it takes the shape of the test tube. This taking the shape of its container is a quality of mind, and yet here it is present in a flowing, silvery metal. The other thing is that mercury is a reflecting surface. You never see mercury: what you see is the world that surrounds it, which is perfectly reflected in its surface like a moving mirror. If you've ever, as a child — I have no idea how toxic this process is — but I spent a lot of time as a child hounding my grandfather for his hearing aid batteries which I would then smash with a hammer and get the mercury out and collect it in little bottles and carry it around with me. Well, the wonderful thing about mercury is that when you pour it out on a surface and it beads up, then each bead of mercury becomes a little microcosm of the world, and yet the mercury flows back together into a unity. Well, as a child I had not yet imbibed the assumptions and the ontology of science. I was functioning as an alchemist. For me, mercury was this fascinating magical substance onto which I could project the contents of my mind, and a child playing with mercury is an alchemist hard at work, no doubt about it.

This is a phenomenon in the physical world, and then mind is a phenomenon in the Cartesian distinction, which is between the *res extensa* and the *res cogitans*. This is the great splitting of the world into two parts. I remember Al Wong once said to me, we were talking about the yin/yang symbol, and he said, "The interesting thing is not the yin or the yang, the interesting thing is the S-shaped surface which runs between them," and that S-shaped surface is a river of alchemical mercury. Where the alchemists saw this river of alchemical mercury was in the boundary between waking and sleeping. There is a place, not quite sleeping, not quite waking, and there flows this river of alchemical mercury where you can project the contents of the unconscious and you can read it back to yourself. This kind of thinking is confounding to scientific thought, where the effort is always to fix everything into a given identity and a given set of behaviors.

The other Hermetic perception that is well illustrated by thinking for a moment about mercury is the

notion — and this is central to all Hermetic thinking — of the microcosm and the macrocosm. The notion that somehow the great world, the whole of the cosmos is reflected in the mystery of man — meaning men and women — it's reflected in the mystery of the human mind-body interface. For an alchemist it makes perfect sense to extrapolate from what we call “internal” psychological processes to external processes in the world. That distinction doesn't exist for the alchemist, and I tell you, the longer I live the more convinced I am that this is absolutely the truth. The myth of our society is the existential myth that we are cast into matter, that we are lost in a universe that has no meaning for us, that we must make our meaning. This is what Sartre and Kierkegaard, all those people are saying, that we must make our meaning. It reaches its most absurd expression in Sartre's statement that nature is mute. This is as far from alchemical thinking as you can possibly get, because for the alchemist nature was a great book, an open book to be read by putting nature through processes which revealed not only its inner mechanics, but the inner mechanics of the artifex, the person working upon the material, in other words, the alchemist.

In other contexts I've talked about the importance of language and how our world is made of language, and part of the problem with understanding alchemy is that the language is slipping out of our reach. We are so completely imbued with the Cartesian categories of the *res cogitans*, the world of thought, and the *res extensa*, the world of three-dimensional space, causality, the conservation of matter and energy and so forth that in order to do more than carry out a kind of scholarship of alchemy we have to create an alchemical language, or a field in which alchemical language can take place. Some of you may have been with me a couple of weeks ago in Malibu when Joan Halifax and I debated the roots of Buddhism, and I think Joan deserves great credit for saying that Buddhism would never have taken root in America were it not for the psychedelic phenomenon. Not that Buddhism is psychedelic, it in fact is fairly touchy about that, but Buddhism would have gotten nowhere in America had not psychedelics created a context for Buddhist language to take root. I would wager that I would never have gotten to first base with proposing a weekend on alchemy at Esalen were it not understood that psychedelics have prepared people for the notion that mind and world can be poured together like mercury and sulphur, like the Sophic waters, to create a new kind of understanding, because otherwise modernity has fixed our minds in the categories of Cartesian rationalism.

I will not claim, and do not in fact think it's so, that there was anything overtly psychedelic, in the sense of pharmacologically-based, about alchemy. When we look back through the alchemical literature there's very little evidence that it was pharmacologically-driven. Only when you get to the very last adumbrations of the alchemical impulse in someone like Paracelsus do you get the use of opium. It is interesting that the great drugs of modern society were accidentally discovered by alchemists in their researches — distilled alcohol is a product of alchemical work, and as I mentioned, opium was very heavily used by the Peracelsian school — but what they possessed was an ability to liquify their mental categories and then to project the contents of the mind onto these processes and read them back.

This is what made alchemy so fascinating to the Jungian school, because the Jungians were discovering the unconscious. Before Jung's involvement with alchemy the best material for psychotherapy to work upon was dreams and mythology, and these were the two poles of the data field that the discovery of the unconscious was working on. Then Jung had the prescience to realize that alchemy, which to that point had been dismissed as a naive effort to turn base metals into gold — this is the first fiction that you have to absolutely purge from your mind. The only alchemists that ever tried to turn base metals into gold were charlatans, the so-called “puffers.” They were called that not only for their exaggerated speech, but for their use of bellows to drive their fires. Alchemy has always had a core of true adepts and then a surround

of misguided souls and outright con artists who were trying to change base metals into gold. Now, it's interesting that science, in its naiveté, in the 20th century has actually completed the program of pseudo-alchemy. You can, if you have a sufficiently powerful nuclear reactor, change lead into gold. The cost is staggering, it has no economic importance whatsoever, but it can be done. By bombarding lead with a sufficient amount of heavy particles, you can change it into gold, but this is not what the original intent was. In fact, when we look at the history of 20th century science we will see that in a way it's a misunderstanding of what the alchemical goals were to be and, one by one, it has done these things that were stated goals of the alchemists, except that the alchemists always spoke in similes and in a secret control language that was symbolic.

Another point that was brought up was the externalization of the soul. What we're trying to do in this weekend is to study and talk about the idea of redeeming the world through magic. How is this to be done? Well, the philosopher's stone is a complex of ideas that, no matter how you divide it, no matter how you slice it, it's very difficult to hold the pith essence of this concept, but what it really comes down to is the idea that spirit is somehow resident in matter in a very diffuse form, and that the goal of Hermetic thinking, and later alchemy, is the concentration and redemption of this spirit, a focusing of it, a bringing of it together. This is an idea that was common in the Hellenistic world, not only to Hermetic thinking but also to Gnosticism. Gnosticism is the idea that somehow the pure, holy, real light of being was scattered through a universe of darkness and of saturnine power and that the goal is, by a process which we can call yogic, or alchemical, or meditative, or moral/ethical, that the light must be gathered and concentrated in the body and then somehow released and redeemed. All esoteric traditions, East and West, talk about the creation of this body of light and we will not, in this weekend, talk very much about non-Western alchemy, Taoist and Vedic alchemy, but in those systems too the notion is about the creation of this vehicle of light. This is one metaphor for the externalization of the soul.

The philosopher's stone is another, and I will challenge you to try to imagine what the achievement of the philosopher's stone would be like, because it's in trying to think that way that you begin to dissolve the categories of the Cartesian trap. Imagine for a moment an object, a material, which can literally do anything. It can move across categorical boundaries with no difficulty whatsoever. What do I mean? I mean that if you possessed the philosopher's stone and you were hungry, you could eat it. If you needed to go somewhere you could spread it out and sit on it and it would take you there. If you needed a piece of information, it would become the equivalent of a computer screen and it would tell you things. If you needed a companion, it would talk to you. If you needed to take a shower, you would hold it over your head and water would pour out of it. Now, you see, this is an impossibility. That's right, it's a coincidentia oppositorum. It is something which behaves like imagination and matter without ever doing damage to the ontological status of one or the other. This sounds like pure pathology in the context of modern thinking, because we expect things to stay still and be what they are and undergo the growth and degradation that is inimical to them; but no, the redemption of spirit and matter means the exteriorization of the human soul and the interiorization of the human body so that it is an image freely commanded in the imagination.

Imagination: I think this is the first time I've used this word this evening. The imagination is central to the alchemical opus because it is literally a process which goes on in the realm of the imagination, taken to be a physical dimension. I think that we cannot understand the history that lies ahead of us unless we think in terms of a journey into the imagination. We have exhausted the world of three-dimensional space. We are polluting it, we are overpopulating it, we are using it up. Somehow the redemption of the human enterprise lies in the dimension of the imagination, and to do that we have to transcend the categories that we inherit

from a thousand years of science and Christianity and rationalism and we have to re-empower and re-encounter the mind; and we can do this psychedelically, we can do this yogically, or we can do it alchemically and Hermetically.

There is present in the world at the moment, or at least I like to think so, an impulse which I have named the Archaic Revival. What happens is that whenever a society really gets in trouble — and you can use this in your own life: when you really get in trouble, what you should do is say, “What did I believe in the last sane moment that I experienced?” and then go back to that moment and act from it even if you no longer believe it — now, in the Renaissance, this happened. The scholastic universe dissolved. New classes, new forms of wealth, new systems of navigation, new scientific tools, made it impossible to maintain the fiction of the medieval cosmology and there was a sense that the world was dissolving, and in that moment the movers and shakers of that civilization reached backwards in time to the last sane moment they had ever known and they discovered that it was Classical Greece. They invented classicism in the 15th and 16th century. The texts which had lain in monasteries in Syria and Asia Minor, forgotten and untranslated for centuries, were brought to the Florentine council by people like Gemistus Pletho and others and translated, and classicism was born: its laws, its philosophy, its aesthetics. We are the inheritors of that tradition, but it is now once again exhausted and our cultural crisis is much greater. It is global, it is total; it involves every man, woman and child on this planet. Every bug, bird and tree is caught up in the cultural crisis that we have engendered. Our ideas are exhausted: the ideas that we inherit out of Christianity and its half-brother science, or its bastard child science. What I’m suggesting is that an Archaic Revival needs to take place and it seems to be well in hand in the form of the revival of Goddess worship and shamanism and partnership, but notice that these things are old — 10,000 years or more old — but there was an unbroken thread that, however thinly drawn, persists right up to the present.

The idea of this weekend is to show the way back to the high magic of the late Paleolithic, to show that there were intellectual traditions, there were minority points of view that kept the faith, that never allowed it to die. To my mind, this alchemical, Hermetic, Gnostic, Egyptian, Chaldean thread is the thread, and if we unravel it with sufficient care and attention then we can build a bridge from the otherwise nearly incomprehensible high magic of the late Paleolithic. We can get it as near to ourselves as John Dee, who died in 1608. We can discover that it’s no further away from us than the beginning of the Thirty Years War; and for my money, after that it gets pretty mucked up. After E’liphaz L’evi, who’s already waffling, I’m not very interested in the occultism of the 17th, 18th and 19th centuries, but it’s not necessary because scholarship gives us the Chaldean Oracles, the Trismegistic Hymns, the library at Nag Hammadi, and so forth and so on. My impulse is to, in the most austere sense, repopularize, reintroduce this kind of thinking so that people can live it out, and then, step by step, we can evolve our language and evolve our understanding to make our way back to the garden, back to Eden.

It’s said that Christ opened the doors to paradise, yes, but he closed the doors to Eden; and paradise is a very airy place where everybody sits around on clouds strumming their lyres. I think that what we want to do is to make our way back to the alchemical garden. That’s where our roots are. That’s where meaning is. Meaning lies in the confrontation of contradiction, the *coincidentia oppositorum*. That’s what we really feel, not these rational schemas that are constantly beating us over the head with the “thou shalt” and “thou shoulds,” but rather a recovery of the real ambiguity of being, an ability to see ourselves as at once powerful and weak, noble and ignoble, future-oriented, past-facing. We each need to become Janus-faced and to incorporate into ourselves the ban- ished contradictions of being that so haunt the enterprise of science. We can leave that behind, and when we do we reclaim authentic being; and authentic being, make

no mistake about it, is what alchemical gold really is. That's what they're talking about: authentic being.

Audience: So right now we're lead?

That's right, we're lead, we're saturnine; and we'll talk about Saturn and Pluto and all of that. Tomorrow we'll talk about the stages of the alchemical opus, and though the stages are many and multifarious, it all begins in what is called the nigredo, the blackening, the depths of the leaden, saturnine, chaotic, fixed place, and that's where we have been left by science and modernity and so forth and so on. That's where the alchemist loves to begin. That's where he or she stokes the furnace and begins the *dissolutio et coagulatio* that leads to the appearance of the stone.

I'll show you some books, and this is by no means exhaustive. The literature of Hermeticism and alchemy is vast and I could have brought five or six boxes of this size from my own library. This a smattering, it doesn't mean that what I show you is the best, it simply tries to spread over a large area. This is a new novel that's just been published by Lindsay Clarke called *The Chymical Wedding*, and I see that last week it was number ten on the New York Times' bestsellers list, which is astonishing for such an obscure subject. It's a retelling of a famous incident in alchemy in the 19th century when a woman named Mary Anne Atwood, who had a very close relationship to her father, Dr. South, and the two of them worked together, she on a text, he on a long poem. To make a long story short, eventually they decided to destroy both the poem and the book, feeling that they had said too much and had given the secret away — at least that's one version. So this is a fictionalized retelling of that incident intercut with a modern cast of characters, very clearly modeled on the poet Robert Graves. So if you like to absorb your information in a fictionalized form, this is a wonderful book. John Boorman, the movie director who made *The Emerald Forest* and *Excalibur*, recently optioned this book, so we may have an alchemical movie downstream a year or two. A number of compendiums of alchemical texts have been published over the centuries and if you wish to study alchemy you have to obtain these. If you're fortunate enough to read French you should read *Festugièrre* and *Berthelot*. They collected alchemical texts into encyclopedic-size volumes, but unfortunately these have never really come into English. One that did come into English is the *Musaeum Hermeticum*, which A.E. Waite — who some of you may know for his role in the *Golden Dawn* — collected. There are about forty alchemical texts and all the greats are in here: Lull, Villa Nova, Michael Maier, Basil Valentine, Heinrich Kramer, Edward Kelley and so on and so forth.

Lecture 2:

The place to begin, I think, is obviously with the question, "Who is Hermes Trismegistus?" What are we talking about here? I mean, this sounds so incredibly exotic to people. The Renaissance had the concept of what it called the *prisca theologia*, and if my Latin and Greek irritates you, you have to understand that you're dealing with a boy from a coal mining town in Colorado, so I do mangle these things. The *prisca theologia* were Orpheus, Moses, and primarily Hermes Trismegistus. Hermes Trismegistus was the primary source, from the point of view of the Renaissance, of this whole mystery tradition and you recall from last night's lecture that this is based on a misunderstanding. The Renaissance believed that Hermes Trismegistus was older than Moses. We know now, thanks to Isaac and M'eric Casaubon, two philologists of the early 17th century, that definitely the Hermetic Corpus was composed between the 1st and 2nd centuries after Christ. The method of the Casaubons was to examine the philosophical language of the

Corpus Hermeticum and show that there were words and phrases there that were post-Platonic and derivative of philosophers whose dates we have fully in hand.

Now, if you go to an occult bookstore you will find that to this day this error persists. There are people who still want to claim that this stuff is older than dynastic Egypt. There are even books — I was in Shambhala a week ago — claiming to teach you how to change lead into gold. Well, from my point of view this just evokes a small smile. The old errors persist; the puffers are still at it. But what Hermes Trismegistus is is a character who appears in many guises in these Hermetic dialogues. The Hermetic hymns are usually couched in the form of dialogues between Hermes and his son Thoth, and Thoth takes the role of the uninitiated ing'enué who is sitting at the feet of the master. Thoth asks questions: “What is the true nature of the world?” “What is the true nature of man?” and Hermes answers. The general form of these texts — with exceptions, because there are twenty of them — is an intellectual dialogue which builds to an ecstatic revelation and then in the wake of the ecstatic revelation there is a hymn of praise to Hermes Trismegistus. Trismegistus means thrice-blessed and is sometimes called Hermes Triplex to distinguish this Hermes from all the other Hermeses of early, middle and late Greek thinking. Hermes is of course the messenger god, the god of scribes. The reason this ibis-headed being holding a staff is embossed on the cover of each of these books is because this is how Hermes Trismegistus, Thoth Hermes was imagined. He was associated with the scribe god of the Egyptian pantheon.

There are two distinguishing factors that stand out for me that I think you need to incorporate into your thinking about Hermeticism, two very important concepts. The first is the divinity of human beings, an extraordinarily radical idea in the context of late Hellenistic thinking. We all operate under the spell of the concept of the fall of man: that man is an inferior being, errors were made in the Garden of Eden and that we are far, far from the nature of divinity. All magic — and all magic in the West is derivative of this tradition — takes the position that man is a divine being, men and women are divine beings. The Corpus Hermeticum actually refers to man as God's brother; and this is a double-edged perception. It gives tremendous dignity to the human enterprise but it also raises the possibility of the error of pride and hubris. In the Renaissance, Marsilio Ficino boiled this notion down to the aphorism, “Man is the measure of all things,” and you may notice that this is the position of science: that man is the measure of all things, that it is up to us, we can decide the course of the cosmos. All magic stems from this position. Notice that this position on man empowers tremendous freedom. This is why the Church was so concerned to stamp out magic, because it assigns man an importance that the Church would rather reserve for deity. So that's the first great division between Christian thinking and Hermetic thinking, an entirely different conception of what human beings are; and when we get into the text, I'll read you some of these passages.

The second distinguishing factor in Hermeticism is the belief that we can control fate, that we can escape from cosmic fate. The late Hellenistic mind-set, and what you get in the Gnostics, is the belief that because of astrology, because of the stars, we are subject to control from these exterior forces. In most Gnostic thinking the whole concern is to somehow evade what is called the heimarmene, cosmic fate, and in the Gnostic systems the only way it can be done is by ascending through the shells of cosmic, ordering forces — the archons, the planets, the planetary demons, and so forth and so on — and then beyond the heimarmene, which is actually thought of as a place in space that you burst through, you transcend fate. The Hermetic thought is that these fates become personified as the decans, as the stellar demons, and then it is held that there is a magical system in which it is possible to call these archangels to your side and work with them and not be subject to the inevitable working of the cosmic machinery. This burst like a revelation over the late Hellenistic world because there was such philosophical and emotional and political

exhaustion. This is a counterpoise to the message of the New Testament, which is a similar message: that you can be saved in the body, that you can escape the inevitable dissolution and degradation laid upon us by time. So these are the two distinguishing factors: the divinity of man and the possibility of using magic to evade the machinery of fate.

I want to read some of the Corpus Hermeticum to you to give you the flavor of it, but before I do, I want to say something about the history of these texts. You're all familiar, more or less I'm sure, with Apuleius' *The Golden Ass*, which is a novel of initiation that is late Roman. Apuleius also put together what is called the *Asclepius*, and the *Asclepius* is true Hermetic literature that was not lost. It was the only one that was available throughout the Dark and Middle Ages. All the rest was lying untranslated in Syrian monasteries until Gemistus Pletho in 1460 brought these manuscripts to Florence, to the court of the de' Medicis, and then the translation project began. The only other Hermetic material that was accessible throughout the high Gothic period was a book of magic called *Picatrix*, and the *Picatrix* was probably written in the 11th century. This elicits screams of dissent from the burning-eyed faction, but reason dictates that we consider *Picatrix* 11th century, so only the *Asclepius* and the *Picatrix* represented this strain of thought before the 1460s. The importance of Hermetic thinking can be seen by the fact that Gemistus Pletho brought Plato to the Florentine council as well as Hermes Trismegistus, and when Marsilio Ficino sat down to do this translation work Cosimo de' Medici said, "Plato can wait, I'm getting old. You do the Hermetic Corpus first, that's much more important. We'll sort out this Plato business in a few years," and so it was done. It was completed in 1463, and in 1464 Cosimo died, so he never saw the translations of Plato. I mention this to show you the importance that was attached to this stuff.

Here is one of the key passages on man's nature. This is from Book One of the Corpus Hermeticum:

But Mind the Father of all, He who is life and light, gave birth to Man, a being like to Himself. And He took delight in man as being His own offspring, for Man was very goodly to look on, bearing the likeness of his Father. With good reason then did God take delight in Man, for it was God's own form that God took delight in. And God delivered over to Man all things that had been made.

This is the basis of the Ficinian statement, "Man is the measure of all things."

And Man took station in the Maker's sphere and observed the things made by his Brother who was set over the region of fire. And having observed the Maker's creation in the region of fire he willed to make things for his own part also. And his Father gave permission, having in Himself all the working of the administrators.

This is a reference to the angel hierarchy.

And the administrators took delight in him and each of them gave him a share of his own nature. So man is the brother of God and a creature at home with the angels. This idea is echoed in the *Asclepius*, which you'll recall was available throughout the Middle Ages. "The range of man is yet wider than that of the demons," meaning the angels; this term is transposable in Hermetic thought. "The individuals of the human kind are diverse and of many characters. They, like the demons, come from above and entering into fellowship with other individuals, they make for themselves many and intimate connections with all other kinds," and then the famous passage:

Man is a marvel then, Asclepius, honor and reverence to such a being. Man takes on him the attributes of a god as though he were himself a god. And he is familiar with the demonkind for he comes to know that he is sprung from the same source as they. And strong in the assurance of that in him which is divine, he scorns the merely human part of his own nature. How far more happily blended are the properties of Man than those of other beings. He is linked to the Gods inasmuch as there is in him a divinity akin to theirs. He scorns that part of his own being which makes him a thing of earth and all else with which he finds himself connected by heaven's ordering he binds to himself with the tie of his affection.

This is an incredibly radical conception of what it means to be human, so radical that it is unwelcome even in the present context. Notice the modern feeling of this stuff. This is not biblical rhetoric. This is philosophical discourse as we know it and carry it out ourselves. This is a passage on the adept and initiation. Here Thoth speaks to Poimandres, this is Book One: "But tell me this too, said I, God said, "Let the man who has Mind in him recognize himself," but have not all men Mind?" and then Poimandres replies, "'Oh Man," said Mind to me, "Speak not so. I, even Mind, come to those men who are holy and good and pure and merciful, and my coming is a succor to them and forthwith they recognize all things and win the Father's grace by loving worship and give thanks to Him, praising and hymning Him with hearts uplifted to Him in filial affection.'" Again the reference to being God's brother, "in filial affection." "And before they give up the body to the death which is proper to it they loathe the bodily senses, knowing what manner of work the senses do." This introduces the theme of asceticism.

Like the Gnostics, there is in much of the Hermetic literature a kind of horror of the earth, a desire to ascend and to get away from it. Scott makes the distinction between what he calls "pessimistic gnosis" and "optimistic gnosis," and within the twenty texts of the Corpus Hermeticum you get vacillation on this point. In some cases the Mandaean or Sabian tendency is there and the world soul is invoked, and the whole of creation is seen as a living being involved in this soteriological process, this process of salvational mechanics through magic. In other texts this Gnostic horror of matter is very strongly stressed. It's very clear that the Hellenistic mind was ambivalent on this point, even as we are ambivalent on this point. It's a real question. Are we here to be the caretakers of the earth, or are we strangers in the universe, and is our task to return to a forgotten and hidden home, no trace of which can be found in the saturnine world of matter? It's very hard to have it both ways. You're going to have to take a position on that, and these people were forced into the same dilemma. There's no middle ground between those two positions, and so that dichotomy, that conundrum, haunted a lot of Hermetic thinking.

Here is the Hermetic creation myth. This is Book Three, paragraphs one through a few, and you'll see the comparison and similarities to the Christian creation myth but with extraordinary differences.

There was darkness in the deep and water without form and there was a subtle breath, intelligent, which permeated the things in Chaos with divine power. Then, when all was yet undistinguished and unwrought, there was shed forth holy light and the elements came into being. All things were divided one from another and the lighter things were parted off on high, the fire being suspended aloft so that it rose unto the air, and the heavier things sank down, and sand was deposited beneath the watery substance, and the dry land was separated out from the watery substance and became solid. And the fiery substance was articulated with the gods therein, and heaven appeared with its seven spheres and the gods visible in starry forms with all their constellations. And heaven revolved and began to run its circling course, riding upon the divine air. And each god by his several powers set forth that which he was bidden to put forth. And there came forth four-footed beasts and creeping things and fishes and winged birds and grass and every flowering herb, all

having seed in them according to their diverse natures, for they generated within themselves the seed by which their races should be renewed.

Then it goes on to describe the birth of man. This kind of thinking is what alchemy seized upon in its ambitions. One way of thinking about what alchemy came to attempt is that since man is God's brother, the purpose of man is to intercede in time. It was believed that ores, precious metals and things like this grew in the earth; it was a thoroughgoing theory of evolution that reached right down into the organic realm. It was thought that gold deposits in the earth would actually replenish themselves over time. It's passages like this that give permission for that kind of thinking. In line with that, we're now in Book Four; and remember that the tone changes slightly from book to book. They were, after all, written over a 300 year period by various people.

You must understand, then, that God is preexistent and ever-existent, and that He alone made all things and created by His will the things that are. And when the Creator had made the ordered universe, He willed to set in order the earth also and so he sent down Man, a mortal creature made in the image of an immortal being, to be an embellishment of the divine Body, for it is Man's function. Here it comes, the purpose of man according to Book Four: For it is Man's function to contemplate the works of God and for this purpose he was made, that he might view the universe with wondering awe and come to know its maker. Man has this advantage over all other living beings, that he possess mind and speech. Now speech, my son, God imparted to all men but mind he did not impart to all. Not that he grudged it to any, for the grudging temper does not start from heaven above, but comes from being here below in the souls of those men who are devoid of mind.

This introduces the concept of an elect or a perfectee, a hierarchy of human accomplishment and understanding, and this is also basic to Gnosticism. It's not for everyone, they're saying, it's for the pure of heart, and what "pure of heart" means depends on the school you're looking at. For some, it was mathematical accomplishment; for others, it was contact with the Logos; for others, it was an ability to resist the temptations of the senses, but there was always this sense of the higher and lower possibility within the human experience.

This is at the opening of Book Twelve, and this is a book with a heavy Mandaean sensitivity, this sensitivity to life. Notice how this transcends even the Buddhist point of view, because in Buddhism plants have no soul. This is a tremendous failure in the Buddhist conception as far as I'm concerned.

Now this whole cosmos, which is a great God and an image of Him who is greater and is united with Him and maintains its order in accordance with that will, is one mass of life. And there is not anything in the cosmos, nor has been through all time from the first foundation of the universe, neither in the whole, nor among the several things contained in it that is not alive. There is not, and has never been, and never will be in the cosmos, anything that is dead, for it was the Father's will that the cosmos, as long as it exists, should be a living being and therefore it must needs be a god also. How then, my son, could there be dead things in that which is a god, in that which is an image of the Father, in that which is one mass of life. Deathness is corruption and corruption is destruction. How then can any part of that which is incorruptible be corrupted or any part of that which is a God be destroyed?

And there are other passages. This is a good one; this is Book Eighteen:

For as the sun, who nurtures all vegetation, also gathers the first fruits of the produce with his rays, as it were with mighty hands, plucking the sweetest odors of the plants, even so we too, having received into our own souls, which are plants of heavenly origin, the efflux of God's wisdom, must in return use his service for all that springs up in us.

This conception that the human soul is a plant is a unique idea. I don't know of another tradition. Those of you who were with us in Ojai heard Johannes Wilbert talk about how among the Amazon Indians, the Warao, the men actually marry trees. They actually take trees as their wives, a tree, and it is a man's job throughout his life to take care of this tree with the same tenderness and affection which he lavishes on a living wife. This is a more radical conception than that. This is the conception that the most important part of us is a plant. It reminds me of the joke that I occasionally make in these groups, the notion that animals are something invented by plants to carry them from place to place. Well, according to this, that's right on. The sensitivity to the vegetative nature of the world is so great that it raises the plant to be the pith essence, the soul of man, the brother of God! So the valuation of the vegetative universe here is of an extremely radical type.

Audience: The upper echelon of humanity that was given the mind, was that predetermined at birth or can someone develop a mind?

No, it is not predetermined. It is something that is acquired through cultivation of a relationship to, in the Hermetic language, nous, the higher mind, and in the Gnostic language Logos, the informing spirit. Nothing is predetermined in the Hermetic system because through magic we can overcome the energies of cosmic fate. This is the great good news of Hermeticism, that we are not subject to fate. We should probably talk a little about this Logos concept. This is something which seems very alien to modern people unless they are psychedelically sophisticated. The Logos was the sine qua non of Hellenistic religion and it was an informing voice that spoke in your head or your heart, wherever you want to put it, and it told you the right way to live. You get this idea even in the later Old Testament where it's said that the truth of the heart can be known, that it is no great dilemma to know good from evil, you simply inquire of your heart, "Is it good or evil?" and you will discover a voice which will tell you. All the great thinkers of this Greco-Hellenistic period sought and cultivated the Logos; Plato had his daemon. Everyone sought the informing voice of the nous, that's what it's called in Neoplatonism and Hermeticism, and then in Gnosticism the Logos.

The only way I've ever had this experience is in the presence of psychedelic substances, and then it is just crystal clear, there is no ambiguity about it. Somehow it's possible for an informing voice to come into cognition that knows more than you do. It is a connection with the collective unconscious, I suppose, that is convivial, conversational, and just talks to you about the nature of being in the world and the nature of your being in the world. It's puzzling to us because it seems so remote. For us a voice in the head or the heart is pathology. You may know the famous story: in the 1st century, some fishermen were off the shore of the island of Argos in the Mediterranean Sea and they heard a great voice from the sky and the voice said, "The great Pan is dead." Well, people like Lactantius and Eusebius, these patristic fathers, the people who built Christianity, who took the Gospels and turned it into a world religion, they took this annunciation from the sky of the death of Pan as the annunciation of the change of the aeon.

By the aeon, I mean these roughly 2,000 year periods that are associated with the equinoctial precession. Do you all understand how this works? That over 26,000 years, the heliacal rising of the solstitial sun slips

slowly from one house to another and around A.D. 100 — there's argument because these things are never precise — the age of Pisces began, the previous aeon ceased and the great gears of the largest scale of the cosmic machinery clicked past a certain point and into the age of Pisces, and this was then taken as very fortuitous for Christianity because Christ was associated with the sign of the fish and it was seen as a Piscean movement. I believe that it's entirely possible that the Logos, at that rough moment in time, fell silent, and it has been silent for 2,000 years. What we have had then is the exegesis of text and noetic archeology of the sort we're carrying on here. Now, a phenomenon as trivial and hype-haunted as channeling can be seen as the reawakening of the Logos. The long night of Piscean silence is ending and the spirit of nous is again moving in the world, speaking in the minds of the adepts and the hierophants who have the techniques and the will to connect with this stuff. I don't know how I got off on that, but obviously this kind of literature can be seen as the last message from the fading Logos, the last statements before the change of the aeon rendered this control language very difficult and non-intuitive and somewhat incomprehensible.

Audience: In the reading, I had a puzzlement about the use of the word "mind." What, in this context, does this refer to?

It's Scott's translation of this word nous. It simply means this universal, permeating intelligence.

Audience: The statement there is that it is only available to an elite through...?

Through asceticism and desire, intent. There are proscriptions, we haven't gotten into this, but they lived a life of purity, although their definitions of purity varied widely.

Audience: Isn't there a kind of flip-flop that man is the brother of God and still we have to earn it? It makes it kind of a denial of that.

That's right. This persists right up until this moment. The quote I always love is from Thomas Hobbes' Leviathan. Thomas Hobbes, as you know, was the great theoretician of modern government and social organization and he was basically a paranoid S.O.B. He says in the Leviathan, "Man to man is like unto an arrant beast and man to man is like unto a god." It's absolutely true, our noblest aspirations and our most hideously dehumanizing activities take place in the context of our relationship to other people. This is what the alchemists were trying to do: they were trying to separate the gold from the dross. They were trying to take the arrant beast, and when we look at alchemical art we will see dragons, dogs, pigs, we will see the arrant beasts and we will see the angelic beings that are trying to be separated out of our nature. This is within each and every one of us. Man to man is like unto a god and man to man is like unto an arrant beast.

Audience: This question has to do with mind. According to my understanding of some of the Platonic tradition and Neoplatonic thought, this has to do with the divided line in Plato. You can divide that line into five stages of knowing. You start with the senses as being agency or avenue, knowing something about something, the most external form of knowledge. The level above the senses is designated as the instincts, it's an inactive knowing, in that sense a biologically active knowing that we have. The third stage is described sometimes as estimation, that is, an approximation. This characterized mainly logical activity, and then the next level of cognitive activity is reason. This reason is not the type of reason we normally engage in, it's a very different, a very creative type of activity. Above the reason is what they call intuition or intellect or nous and that's put in as the fifth. Reason is a creative activity and one can generate and

think things through with creative ability. One goes through stages of the activity and things transpire over time and one comes to complete understanding of the thing one is trying to grasp, and sometimes that's described as discursive activity, although the logical activity is discursive. So you're moving through a process and the nous or the intellect of the higher mind grasps things in totality.

You raise an important point. It further complicates the picture, but that's how it was, folks. The reference here is to Neoplatonism, which is a kind of parallel tradition to what we're talking about. Plato had at least a couple of phases in the evolution of his thinking. The young Plato is a rational thinker but the later Plato, apparently after he fell under the influence of Pythagorean schools, becomes a full-blown mystic. Then in the late Roman empire, almost a thousand years after Plato — in our mind all these people get squeezed together like they could all have dinner together, but Proclus is as far from Plato as we are from King Canute, so you have to bear in mind the scale of history — 600-800 years after Plato, a Byzantine school of philosophy arose around Porphyry, Plotinus and Proclus as the major exponents and they worked with the late Plato and elaborated a beautiful mystical cosmology. This is what I did a workshop on here a year ago and many of those ideas and terms parallel conceptually the stuff in the Corpus Hermeticum, and if you're of a certain intellectual bent you may find yourself more comfortable with the Neoplatonists than with this. This material tends to be emotional, evocative, poetic and while there's great poetry in Plotinus there's also very tight thinking that goes along with it.

There are other traditions, I'm making it simple for you, there was a whole tradition of what was called the Chaldean Oracles, all of which remains is a collection of 100 or more fragments and the great commentaries of Eusebius and Iamblichus. That's all lost, we don't have that material and it is, in a way, the most mysterious of these traditions because it just didn't survive. It may be that the Chaldean Oracles are the missing link to push this stuff several centuries back into time, because the Chaldean Oracles may actually be pre-Platonic. There's considerable evidence of that. But these are very arcane matters; you have to give yourself over to a lifetime of learning these languages and the philology of these languages to penetrate this stuff.

Neoplatonism was Byzantine, basically Constantinople. The Hermetic Corpus was largely Alexandrian; there were also Christian Platonists in Alexandria. There were certain centers: Rome, Byzantium, Alexandria. Heliopolos in Egypt was a cult site that was maintained for a very long time. If you're interested in this stuff but don't like to absorb it this way, Flaubert, of all people, the Flaubert of Madame Bovary, wrote an incredible novel called The Temptation of Saint Anthony in which he describes 2nd century Alexandria in a fictionalized form and gives you a real flavor for the intellectual complexity of the Alexandrian world. Christianity had not yet gelled, it was many things, so you not only have Gnostics of five or six schools — Simonists, Valentinians, Basilideans and so forth — but you also have Christians, a number of cults calling themselves Christians that were also in furious competition: Docetists, Montanists, and later Nestorians. There were Gymnosophists from India, people who were actually carrying yogic doctrines into the Mediterranean world, plus you then have all the surviving cults of the older Egyptian strata, the cults of Isis and Seville and Adonis and Dionysus, it just goes on and on. There's nothing comparable in our experience to the richness of this intellectual world, and it shows the passion with which people were trying to understand the dilemma of a dying world, because this is what they were confronted with. The intellectuals of the empire could feel it all slipping through their hands, and Flaubert gives a wonderful picture of this. Flaubert has a very romantic streak. It's like smoking hashish to read this book, the attention to fabric and architecture, food and odor, and because the subject matter is the temptation of Saint Anthony, it's an excuse to describe these temptations in all their sensual richness and

erotic kinkiness. It's a wonderful way to absorb this material.

Audience: Somebody else raised the point about elitism, or an elite group of people. If one considers a society like the one you had in Alexandria or some of the other centers, the only people who really had access to this were people who, first of all, had money and who were well educated and could read, so already you had an elite group.

Yes, definitely. What survives from a civilization are its literatures, and these literatures are usually the production of an elite. We have to remember not to have any illusions about the Roman Empire. I always think of the wonderful description, I don't even know why it's there, Boris Pasternak in *Doctor Zhivago* goes off on a riff about ancient Rome and he describes it as "a bargain basement on three floors." This was an empire that lived by human cruelty. It was on the backs of slaves that this airy intellectual speculation was based. It was a tremendously pluralistic society, but that pluralism was maintained by standing armies of enormous size and policies of occupation of enormous cruelty. Because of our relationship to the Christian tradition we're aware of such things as the Zealot Revolt of 69 and the reign of Herod and Antiochus in Jerusalem, but that was just one little corner of the empire and in Armenia, in Gaul, in Spain, in North Africa, military governors were carrying out outrageous suppressions of native populations. It was not a pretty time to be alive, and what comes down to us, then, is the yearning to escape from that. No wonder these people saw the earth as a cesspool and a trap, because that's what it was for them, without doubt. Our own age is very similar. We do not have slavery but we suffer under propaganda, mass manipulation of ideas and the degradation and exploitation of the Third World on a scale the Roman Empire couldn't even dream of; so there is a great affinity.

If any of you are interested in this kind of thing, I highly recommend a book by Hans Jonas called *The Phenomenon of Life*. It's a book of philosophical essays, but there's one essay in there called *Gnosticism and Modern Nihilism* in which he shows that once you take Gnosticism and dump the angels and the star demons and all the colorful bric-a-brac of late Roman thinking, what you have is a thoroughgoing existentialism completely compatible with Jean- Paul Sartre, Jean Genet and the kind of intellectual despair that characterized the post-World War II generation in Europe. Heidegger is thoroughgoingly Gnostic in his intentionality, it's just that the language is modern and stripped of this magical thinking, and by being stripped of magical thinking, in a way the modern recension of that state of mind is even more hopeless and disempowering.

Fortunately I think we're moving out of the shadow of that, but I'm 44 years old, I grew up reading those people and it made my adolescence much harder than it needed to be. I mean, my God, there wasn't an iota of hope anywhere to be found. That's why for me psychedelics broke over that intellectual world like a tidal wave of revelation. I quoted to you last night Jean-Paul Sartre's statement, "Nature is mute." Now I see this as an obscenity almost, an intellectual crime against reason and intuition. It's the absolute antithesis of the Logos, and much of our world is ruled by men older than I am who are fully connected into that without any question, and they just think all the rest of this is just namby-pamby ecological softheartedness of some sort. There is no openness to the power of bios, to the fact of a living cosmos. The reinvestiture of spirit into matter, the rebirth of the world soul is a necessary concomitant to what we now understand about the real nature of the world.

In a way, the theory of evolution, which was born in the 1850s, is the beginning of the turning of the tide, because even though the first hundred years of evolutionary theory was fantastically concerned to

eliminate teleology, eliminate purpose, nevertheless nobody ever understood that except the hardcore evolutionists. To everybody else, evolution meant ascent to higher form. I once heard someone say, "If it doesn't have to do with genes, it ain't evolution." Well, that's a tremendously limited view of what evolution is. The inorganic world is evolving, the organic world is evolving and there the currency is genes; but also the social and intellectual world of human beings is evolving, and there the currency is not genes but memes, so that idea carries with it the implication of ascent to higher form and correctly broadened and understood becomes permission for a return to optimism and to the kind of hope that these folks were trying to articulate.

Audience: The concept of mind as something that is attainable and not necessary is a separation and therefore, for me, it's a lie. I assume there are many different definitions of mind — I don't mean functions of mind, I mean definitions of mind — and I'm toying now with the notion of the meshing of the notion of mind and the notion of Logos. For Logos is, and it seems to me that mind is, if it is available through trial then we're back in a separation, and this is to me a false separation.

Yes, you're right, but it's a separation necessary for philosophical discourse. That's why philosophical discourse is not the top of the mountain. Language itself is the process of making distinctions that are false. This is why all language is a lie. This is why the ultimate truth lies in something unspeakable, but the ascent to the unspeakable is through this kind of philosophical analysis.

Audience: Language is only the vehicle.

Well, it's the vehicle but eventually there's no road and you have to park the vehicle and get out and walk, and that's the journey. Plotinus, the great Neoplatonist, has this wonderful phrase: he calls the mystical experience, "The flight of the alone to the alone," and I love this image. It's so uncompromising and it's about as true as something can be and still move in the realm of language, because it's saying: finally words fall away, and finally there is only that which cannot be said. Many of you who've stuck with me know that I love to quote this poem by this obscure poet who died in the trenches of France in the First World War, Trumbull Stickney, and he wrote a poem called "The Soul of Time," and the punch line goes like this: "I cannot understand you / 'Tis because I lean over your meaning's edge and feel / A dizziness of the things I have not said," and I think that every one of these weekends, this is the effort: to carry you to the edge of an abyss and then push you over into the dizziness of the things unsaid; and they will always be unsaid.

Wittgenstein, God bless him, had the concept of the unspeakable. He said, "Philosophy operates in the realm of the speakable but eventually we must confront that which cannot be said." The dizziness of things unsaid, and that's where real authenticity then flows back into the world of community and speech, but it comes from a place of utter silence and unsayability. How could it be otherwise? What hubris it would be to expect that the small mouth noises of English could encompass being. That's a primary error that all philosophy chooses to make at the beginning of its enterprise in order to set up shop at all. No, these are lower-dimensional slices of a reality that is ultimately unitary, ineffable, unspeakable and dazzling.

Audience: So philosophical discourse is verbal and mental masturbation?

Absolutely. Masturbation, because there's a pun here, it's autopoietic, it is completely out of yourself, there is no union with the Other, and the Other is what you're always trying to get to. The Other is a common term in these literatures; the Other is that which cannot be fully known. I always like to quote the British

biologist J. B. S. Haldane, who made a wonderful statement. He said, “The universe is not only stranger than we suppose, it is stranger than we can suppose,” and that’s a dizzying perception. It’s one thing to think that it’s very strange; it’s quite another thing to realize that it is stranger than you can suppose. You may suppose and suppose and suppose and you will fall so short of the mark that it’s absurd. That’s what it means to be in the presence of a mystery. The modern word mystery translates out to “unsolved problem.” That’s not what a mystery is. A mystery is not an unsolved problem. A mystery is a mystery, and ratiocination can exhaust itself and make no progress with it. That’s what’s at the core of our being, and that was what was at the core of this ancient perception. These were thoroughly modern people. They were shoved up against the same things that tug at our hearts and our minds and our souls, and beyond that there’s not a whole hell of a lot that you can say about it.

Audience: I just wanted to add that the idea of the earth as a living organism makes an appearance in psychology at the end of the last century with Gustav Fechner, who survives in footnotes of textbooks as the father of experimental psychology. I read a book about the soul life of plants, and that whole part of his work is utterly ignored, it didn’t influence anybody but William James.

This is an idea that will not die, but its practitioners end up in footnotes. They do not have a happy fate. Certainly Henri Bergson with his idea of the *élan vital*; this is an effort to preserve this idea of the world soul, and yet the fate of Bergson, his influence on modern philosophy is certainly minimal. Alfred North Whitehead is my great favorite. I think that Whitehead is the cat’s pajamas, and he has this idea of a living cosmos, that life and vitality extend right down into the electron, yet in spite of his mathematical contributions, the fact that he wrote *Principia Mathematica* with Bertrand Russell, Whitehead is not taught. I think there’s one university in this country where they take him seriously. Modern philosophy is a desert for my money. Who cares about it? Nobody cares about it. Who’s living their life according to the conceptions of modern philosophy? Nobody, as far as I can see. But yes, vitalism was this impulse in biology that persisted clear up to the 1920s with embryologists like Dreisch and his school, and mechanical biology has been at great pains to suppress that.

Audience: What about the Native Americans that were living that philosophy in the West?

Yes, well, aboriginal people, not only the Native Americans but the tribes of the Amazon, if you live next to nature this is such an overwhelming perception that it’s never called into question; but, you see, most of us trace our civilization to desert dwellers who invented agriculture which gave us surpluses, so then we had to build walled enclosures to defend our surpluses from starving neighbors, and we’re talking 6,000 B.C. at Jericho for this kind of stuff. So we have been cut off from the natural mind longer than any other group of people on earth. This is how we are able to carry out the demonic, in the negative sense, reconstruction of the world that we have. If there is a sin, then we have sinned. J. Robert Oppenheimer said, “Beyond all rational argument the physicists have known sin,” and it’s because they reached into the heart of matter without reverence. Their best trick was to call down the light that burns at the center of stars, and they call it down to the test centers of our deserts and onto the heads of our enemies, if necessary; but this is a cosmic sin, it’s an abomination. It’s the story of Western civilization.

The first great error was urbanization — well, I don’t know if it’s the first great error, the invention of agriculture was a pretty staggering bad turn — and then a piece of bad luck that really we didn’t need to have befall us was the invention of the phonetic alphabet. With the invention of the phonetic alphabet we moved away from symbolism and lost even the symbolic connection to the world, and that happened with

the evolution of Demotic Greek and even earlier languages, Linear A and B and that kind of stuff. McLuhan talks a lot about this. We live in a universe so alienated that we can barely conceive of the way back but, hopefully, archeology is a wonderful thing. We are actually digging into the stratographic layers of our past and reconstructing these ancient intellectual machines and setting their gears turning and seeing how it works. We're like amnesiacs, people who don't remember who we are or where we came from, we just wander mumbling through the streets of our cities foraging in garbage cans and frightening other people; and yet if we could wake up, and archeology and the rebirth of an awareness of the Goddess and the pushing of science to the point where its irrational foundations become more clear — this is all part of a program of awakening, of an Archaic Revival that will then make us part of the living world rather than a disease, a parasitic force upon it.

Audience: It struck me that one comment you read talked about the creation of the world. It said that the elements were brought forth and at first I was thinking earth, air, fire and water, but I was thinking in relationship to some other elements of life that being, life and intellect are what come into manifestation from the one who pours forth the world and creates the world and that those are the first elements that come into existence. Life itself is an element of the cosmos as it were. It's an irreducible aspect of things, and you're paying respect to the fact that life is an omnipresent thing in the foundation of things. It's one of the elements.

I think that in one of the other things I read it said that everything that exists, that ever has been, that ever will be, is alive. I'll read a bit more of this. This refers to the theme I touched on a little bit last night of the importance of the imagination and how I think that our destiny lies in the imagination. "God is ever existent and makes manifest all else, but He himself is hidden because He is ever existent. He manifests all things but is not manifested. He is not Himself brought into being in images presented through our senses but He presents all things to us in such images. It is only things which are brought into being that are presented through sense. Coming into being is nothing else than presentation through sense." This is so thoroughly modern, it's staggering. For 1,500 years people couldn't say anything that clearly.

It is evident then that He who alone has not come into being cannot be presented through sense and that being so, He is hidden from our sight. But He presents all things to us through our senses and thereby manifests Himself through all things and in all things, and especially to those to whom He wills to manifest Himself. For thought alone can see that which is hidden, inasmuch as thought itself is hidden from sight, and if even the thought which is within you is hidden from your sight, how can He, being in Himself, be manifest to you through your bodily eyes? But if you have power to see with the eyes of the mind, then, my son, He will manifest Himself to you; for the Lord manifests Himself ungrudgingly through all the universe, and you can behold God's image with your eyes and lay hold on it with your hands.

To my mind, this is permission for the psychedelic experience, that we lay hold of the image of the ineffable through the eyes.

If you wish to see Him, think on the sun, think on the course of the moon, think on the order of the stars. Who is it that maintains that order? The sun is the greatest of the gods in heaven. To him as to their king and overlord, all the kings of heaven yield place; and yet this mighty god, greater than earth and sea, submits to having smaller stars circling above him. Who is it then, my son, that he always obeys with reverence and awe? Each of these stars too is confined by measured limits and has an appointed space to range in. Why do not all the stars in heaven run like and equal courses? Who is it that has assigned to each

its place and marked out for each the extent of its course?

Then it goes on and on. Here is an amazing anticipation of modernity:

Would that it were possible for you to grow wings and soar into the air! Poised between earth and heaven, you might see the solid earth, the fluid sea and the streaming rivers, the wandering air, the penetrating fire, the courses of the stars and the swiftness of the movement with which heaven encompasses all. What happiness were that, my son, to see all these borne along with one impulse, and to behold Him who is unmoved moving in all that moves, and Him who is hidden made manifest through His works. This is an image of the planets seen from space. It's absolutely the unified image of our planet. It is, I think, the central image in this early Hermetic thing. This is as close to an image of what Godhead is that they were able to reach. I mean, this is a shamanic flight that delivers a scientific description of the earth moving in space. This is written A.D. 150. Nobody had that in sight until we reach Giordano Bruno, and if you read Giordano Bruno and the Hermetic Tradition you know that Bruno was burned at the stake. The reason he was burned at the stake was because he looked up into the sky and did not see the stellar shells and the angelic hierarchies; Bruno had a mystical experience and when it was over he said, "The universe is infinite. The stars go on forever." That single statement was the intellectual dynamite that destroyed the whole medieval, Hellenistic cosmological vision. The entire previous cosmological vision was left behind with that single statement. It was such a powerful statement that he had to go to the stake for that, and we have never recovered from that perception. It was a fundamental perception and it occurred because he looked without preconception into the night sky and did not see wheels and demons and angels and shells of cosmic fate and necessity and he just said, "That's bullshit. What is there is infinite space and infinite time; the stars are hung like lamps unto the utmost regions of infinity." This then inaugurates the beginning of modernity and it's a perception that arose on the foundation of all of this earlier thinking.

Audience: Is the implication that there's a meditation that one does where one tries to go inside and see the universe on a cosmic scale?

Well, we know a lot less about the practice because there was much secrecy around this. What we have are the philosophical discourses. When we talk about alchemy this afternoon we'll see that there the technique becomes projection onto matter, that you enter into a kind of self-hypnosis where by having what we call "naive" ontological categories, in other words not being sure exactly how much of mind is in matter or how much matter is in mind, you can erase the boundary between self and world and project the contents of the unconscious onto chemical processes. What went on in the early phase here we don't know. The Trismegistic Hymns are largely as you see them here, philosophical discourses. There was stress on diet and purity; asceticism was typical of the Hermetic approach. In Gnosticism it went one of several ways. There were schools of Gnosticism which were vegetarian and puristic and then because they felt that man was no part of the universe, that man was somehow hermetically sealed against contamination from the universe, some Gnostic schools said, "You can do anything you want. You can have any kind of sexual arrangement you want, you can do anything you want. Do not think that you are part of the universe," and so you had Gnostic schools side by side, some orgiastic and quasi-tantric and some ascetic.

Because the idea was that light was trapped in matter by the act of procreation, there were Gnostic sects that only practiced forms of sexual union that couldn't lead to conception. So there were presumably exclusively homosexual sects, there were sects which only practiced anal intercourse. For them that was the same as celibacy because the real concern was not to trap any more of the light. I don't seriously

advocate this but I think that in our current situation of overpopulation a little dose of this kind of thinking wouldn't be a bad thing; too much light is trapped in the organic matrix. These Gnostic sects that were for instance exclusively homosexual or exclusively practiced anal intercourse, of course they were suicide sects. They disappeared very quickly because they could only make converts by missionary conversion. You didn't have children, you couldn't hand it on. It shows how thoroughgoing their rejection of the world was, how contaminated they felt themselves to be by the material world; but then you also had, as I mentioned, these optimistic schools that saw nature as something to be perfected, and said, "Man has been set onto the earth not to reject it but to perfect it." Utopianism, the belief that one can create a perfect society, goes back into these Hermetic ideals, because the idea was that a perfect society could be the goal of the alchemical work.

Let me read you a passage from Giordano Bruno. This is a wonderful passage from the Picatrix. This was the book of 12th century magical texts that began to introduce these Hermetic ideas, and this passage is the core passage that inspired the Rosicrucians and numerous other utopian movements. Here is Frances Yates:

Hermes Trismegistus is often mentioned as the source for some talismanic images and in other connections, but there is in particular one very striking passage in the fourth book of Picatrix in which Hermes is stated to have been the first to use magical images and is credited with having founded a marvelous city in Egypt.

And here is the passage from the Picatrix:

There are among the Chaldeans very perfect masters in this art and they affirm that Hermes was the first who constructed images by means of which he knew how to regulate the Nile against the motion of the moon. This man also built a temple to the sun and he knew how to hide himself from all so that no one could see him although he was within it.

Those of you who are scholars in Rosicrucianism know that one of the things that was always said about Rosicrucians was that they were invisible. This was how Robert Fludd proved to people that he wasn't a Rosicrucian, he'd say "You're looking at me, so how can I be one?" So, he's in the temple but he could not be seen within it:

It was he, Hermes Trismegistus, too, who in the east of Egypt constructed a city 12 miles long, within which he constructed a castle which had four gates within each of its four parts. On the eastern gate he placed the form of an eagle; on the western gate, the form of a bull; on the southern gate, the form of a lion; and on the northern gate he constructed the form of a dog. Into these images he introduced spirits which spoke with voices, nor could anyone enter the gates of the city except by their permission. There he planted trees in the midst of which was a great tree which bore the fruit of all generation. On the summit of the castle he caused to be raised a tower 30 cubits high on the top of which he ordered to be placed a lighthouse the color of which changed every day until the seventh day, after which it returned to the first color, and so the city was illuminated with these colors. Near the city there was an abundance of waters in which dwelt many kinds of fish. Around the circumference of the city he placed engraved images and ordered them in such a manner that by their virtue the inhabitants were made virtuous and withdrawn from all wickedness and harm. The name of the city was Adocentyn.

Now, what we're familiar with from the Platonic literature is a quasi-rational, largely rational approach to utopian thinking that you get in the Republic. However, students of the Republic will recall that the tenth book contains the Myth of Er, which we went over in detail in the section I did on Neoplatonism. The Myth of Er is one of the most bizarre and puzzling passages in the entire ancient literature. You recall that Er was a soldier who died, he was killed in battle, but after eight days he returned to life and then he told a story that is the absolute puzzlement of ancient scholars. It's highly mathematical, it has to do with the spindle of necessity and the description of some kind of cosmic machine and all the ratios of the gears of this machine are given and nobody knows what is being talked about, but here we have a different thrust: a magical utopianism and the idea of a perfected human society using magic. These engraved images that he ordered in such a manner that by their virtue the inhabitants were made virtuous, that means that he was able to deflect the energies of cosmic fate. The city was immune to astrological, malefic influence, it was protected. When we talk later about the alchemical aspirations of the Rosicrucians and John Dee and Frederick the Elector Palatine of Bohemia, we'll see that this impulse toward an alchemical kingdom returns again and again. In a way the four-gated city of utopian magical dreaming is one version of the philosopher's stone. It's a kind of diffuse notion of the philosopher's stone, but it's a society in perfect harmony, with fully realized beings living within it practicing a cosmic religion that frees them from the exigencies of cosmic fate.

The other thing that is going on in some of this alchemical imagery as a kind of subtext of late alchemy is what's called the *ars memoria*, the art of memory, and in fact Frances Yates has a book called *The Art of Memory*. This is a lost art, literally. It begins with the Roman orator Cicero and was practiced up until the early 17th century. What it consisted of was that it was considered very bad form to read your speech if you were an orator and so you had to memorize your speech, and there were tricks of memory. The commonest mnemonic trick was to think of a building that is familiar to you, it was called the memory palace. I've done this myself with the University of California because it's an area that I'm very familiar with because I was a student there and there are many buildings and many hallways and many floors, and what you do when you make your speech is that in your mind you are moving through the memory palace and at various points you construct what are called *emblemata*, and the idea of these *emblemata* is that they be as unusual, shocking and unexpected as possible in order to be memorable to you.

Say you're giving a speech about the seven deadly sins, so then *luxuria* might be for you a nun copulating with a dog, and you'll set the nun and the dog in a little niche in the hallway of the memory palace; then when you reach that place in your imaginary journey, all these associations will spring to mind and you'll be able to give your speech flawlessly. To us this sounds tortured and peculiar, but it works quite well. One of the great practitioners of the *ars memoria* was Giordano Bruno and he wrote a book called *Lo Spaccio de la Bestia Trionfante*, *The Expulsion of the Triumphant Beast*, and my God, Max Ernst, eat your heart out! This is a surreal epic read as straight plaintext because that's not how it's supposed to be read. It's an agglomeration of these mnemonic *emblemata* that led him on to probably give a fairly conventional disputation on one subject or another, but there are even old books of these *emblemata* that were before surrealism some of the wildest images that the Western mind would tolerate.

The one thing that we didn't get into this morning was talking about the astrological side of it and the role of the decans. The decans are these demons, three to a sign, so there are 36 of them, and this was thought to be an astrological conceit that goes back to Egypt, as opposed to the ordinary zodiacal signifiers which go back to Hauran in what is now modern Iraq. These decans were the demons that were summoned by these Renaissance magi in an effort to control and manipulate fate. If you were paying attention this

morning, you may have noticed that in all the reading I did from the *Corpus Hermeticum* there was really nothing explicitly magical about it. It was philosophical. There was one mention, I think, of animating statues in the description of the four-gated city, but it was those magical animation passages that really captured the imagination of the Renaissance, and they built on that. The idea, simply put, is that these decans and zodiacal signs are at the center of associative schemata which include plants, minerals, odors, certain flowers, certain animals, everything had its decanic assignation; and so, if you were involved in promoting an affair with a woman or something like that, then you would do an invocation to Venus and you would gather the associated minerals, stones and animals and you would put them in a room and then certain tonal modes were also associated with these things. So you would play the music, you would have the flowers present, the minerals present, do the invocations and what you were trying to do was create a microcosm of the macrocosm to draw down this stellar energy. It wasn't about the classical Hollywood appearance of demons in a circle, that's the stuff of Picatrix, the earlier, somewhat less refined, style of magic.

I wanted to read you one passage from Frances Yates' *Giordano Bruno and the Hermetic Tradition* because this describes this change of status of the magician that we're interested in; and also what we didn't talk about this morning was the importance of Kabbalah, which came in quite late but was then worked out in great detail. This was the Jewish contribution to this kind of magic; it was the idea that since the world had been made by Jehovah, by the speaking of words, "In principio erat Verbum, et Verbo caro factum est," in other words, the speaking of Hebrew was thought to be the use of a primary linguistic tool for the purposes of creation. The problem for these Italians was that very few of them spoke Hebrew, so it was sometimes practiced silently. The mere constructing of these Hebrew letters and the setting out of messages in Hebrew was deemed efficacious as well. Then a further declension, for people who were even frustrated with that, was to channel magical languages that were pseudo-Hebraic in structure and appearance. This is a whole branch of research, much too arcane for us to go into here. The only non-Hebraic magical language that I may mention here will be Enochian. Enochian was an angelic language channeled by John Dee and used by him in his magical evocations, and later it was taken up by Aleister Crowley and the folks of the Golden Dawn, but there were many of these magical languages. The Voynich Manuscript is written in one of them.

I want to read you this passage about how the Renaissance changed the status of the magician: We begin to perceive here an extraordinary change in the status of the magician. The necromancer concocting his filthy mixtures, the conjurer making his frightening invocations were both outcasts from society, regarded as dangers to religion and forced into plying their trades in secrecy. These old-fashioned characters are hardly recognizable in the philosophical and pious magi of the Renaissance. There is a change in status almost comparable to the change in status of the artist from the mere mechanic of the Middle Ages to the learned and refined companion of princes of the Renaissance, and the magics themselves are changed almost out of recognition. Who could recognize the necromancer studying his Picatrix in secret in the elegant Ficino, with his infinitely refined use of sympathies, his classical incantations, his elaborately Neoplatonized talismans? Who could recognize the conjurer using the barbarous techniques of some *Clavis Salomonis* in the mystical Pico lost in the religious ecstasies of Kabbalah, drawing archangels to his side? And yet there is a kind of continuity, because the techniques are at bottom based on the same principles. Ficino's magic is an infinitely refined and reformed version of pneumatic necromancy. Pico's practical Kabbalah is an intensely religious and mystical version of conjuring.

Now we move in this realm; these were the companions of princes. There was in that 120 years, from let's

say 1500 to the beginning of the Thirty Years War, a constant effort in various parts of Europe to try to turn European society toward a kind of magical revolution. The Europe of the 11th and 12th century was entirely ruled by scholastic rationalism. Witchcraft was virtually unknown and very curious. It's the 15th and 16th centuries where you get this tremendous proliferation of magical systems, magical ideas and social hysterias related to witchcraft, alchemy, conjuring and magic. Those are the centuries when these things really broke out into the open, and alchemy in that period is basically a story of wonderful personalities, too many for us to really talk about in detail. We have Nicolas and Perenelle Flamel who sought and found the philosopher's stone, according to legend, and according to legend are living to this day somewhere in Central Asia in perfect happiness, having achieved not only the Chemical Wedding but the Water Stone of the Wise. Then we have Basil Valentine, who refined red wine and distilled it in distillation apparatus until he got essentially pure alcohol, and upon drinking this he was so convinced that he had found the philosopher's stone that he announced the imminent approach of the end of the world based on his discovery, and he was not secretive at all. He propagated his recipes and in fact sampled the distillates of some of his brother alchemists and popularized this very widely. To this day, the reason certain cognacs are in the hands of monastic orders and no one else can make these things is because they were originally alchemical secrets. Many of these early alchemists were men of the cloth, quite a number of them.

Lecture 3:

So what I thought I would do is, in a highly chaotic fashion, read you some of this alchemical literature. The big bringdown about alchemical literature is that apparently the muse didn't always smile on the alchemist and some of this poetry is pretty tormented stuff. Why this is, who can say, but let's try one here and see if you can bear with it. Also, my Middle English is not as good as it might be. This is a short one, and typical, and you will see why the alchemists were charged with unbearable obscurity and prolix prose. This poem is called "A Description of the Stone":

Though Daphne fly from Phoebus bright, yet shall they both be one
And if you understand this right you have our hidden stone
For Daphne she is fair and white but volatile is she
Phoebus a fixed god of might and red as blood is he
Daphne is a water nymph and hath of moisture store
Which Phoebus doth confine and heat and dries her very shore
They being dried into one of crystal flood must drink
'Til they be brought to a white stone which wash with virgin's milk
So long until they flow as wax and no fume you can see
Then have you all you need to ask: praise God and thankful be.

This is a recipe for the production of the philosopher's stone and the author, I'm sure, felt that he'd spoken as clearly as he dare speak, and yet making something of this is no easy task. This is from the *Theatrum Chemicum Britannicum* and the late phase of alchemy. Here's another one:

The world is a maze and what you why
Forsooth of late a great rich man did die

And as he lay dying on his bed
These words in secret to his son he said
“My son,” quoth he, “’Tis good for thee
I die, for thou shall much the better be thereby
And when thou seest that life hath me bereft
Take what thou findest and where I have it left
Thou dost not know, nor what my riches be
All which I will declare, give ear to me
An earth I had all venom to expel
And that I cast into a mighty well
A water eke to cleanse what was amiss
I threw into the earth, and there it is
My silver all into the sea I cast
My gold into the air and at the last
Into the fire for fear it should be found
I threw a stone worth forty thousand pound
Which stone was given me by a mighty king
Who bade me wear it in a fair gold ring.”
Quoth he, “This stone is by that ring found out
If wisely thou canst turn this ring about
For every hoop contrary is to other
Yet well agree and of the stone is mother
So now, my son, I will declare a wonder
That when I die this ring must break asunder.”
The king said so, but when he said, “Withal
Although the ring be broken in pieces small
An easy fire shall soon it close again
Who this can do he need not work in vain
’Til this my hidden treasure be found out
When I am dead, my spirit shall walk about
Make him to bring your fire from the grave
And stay with him ’til you my riches have.”
These words a worldly man did chance to hear
Who daily watched the spirit but near the near
And yet it met with him and every one
Yet tells him not where is this hidden stone.

This stuff is obscure, it’s deliberately obscure, it was obscure to its contemporaries and the whole effort became one of collecting this kind of material and finding it out; and you have to understand that this was all circulating in manuscript, very little of this was printed. The *Theatrum Chemicum Britannicum* was not printed until 1652. This was a world without vehicular transportation other than the horse and carriage, and these people were paranoid of being discovered and persecuted for wizardry and witchcraft by the Church. So each alchemist working in secret with a limited number of texts, with a local control language, created this vast conceptual patchwork of ideas and this is in large measure responsible for the obscurity of what is said.

Then another factor which impinges on this and further complicates the matter is that the name of the game was projection of the contents of the imagination onto physical processes, so taking red cinnabar and heating it in a furnace until it sweats mercury, for one alchemist this is the incineration of the red salamander and the collection of ur-Mercurius in the Great Pelican. They named their chemical apparatus after animals and gods, and so the pelican is a standard distillation apparatus, basically a condenser on top of something which is boiled, and then these materials would be collected, ground, powdered, refired, mixed with other materials, refired again and in the process these people were living in what we call a waking dream — it's such a weak term, the projection of the intellect into this dimension — and many of the recipes are designed to wipe out the boundaries between waking and sleeping.

Remember how I talked about the river of mercury that runs between the yin and yang? Many of the alchemical processes were of 40 days duration. Well, you can imagine a hermit fearing discovery by the Church, trying to keep his fires not too hot, not too cold, working day after day, night after night. Eventually all boundaries dissolve and you're just living in a pure world of intellectual projection, and then in the swirling of the alembic, in the chemical processes going on in the retort, you begin to be able to project your consciousness onto this. It's what we call visualization, but for us it's kind of a weak term because we are never really able to — except in the psychedelic state — transcend the belief in the inner world and the outer world being somehow separate. For us it's always separate from us, but they were able to wipe out that boundary and then what they saw in their swirling retorts and alembics was not carbonization, calcination, condensation of various molecular weights of liquids and oils, but rather the birth of the Red Lion, the coming of the Eagle, the appearance of the Smaragdine Stone. They had hundreds and hundreds of these words. I didn't bring any with me, but much of alchemical literature is dictionaries. Martinus Rulandus' Alchemical Dictionary is a huge book of words with special meanings in the alchemical context.

So why do this, and what happens when you do it? Well, no matter what alchemist you're reading, there's always an agreement that there are stages in the great work, stages in the opus, as they called it. You can't get any agreement on in what order these stages come, but roughly it's something like this: most agree that it begins in the nigredo, the blackening, ur-Crow, the saturnine world of what we would call manic depression, despair, and that ur-Chaos — a chaotic, near-psychotic state of unbounded hopelessness — is the precondition then for the alchemical work. I had a dream last night that was, I think, triggered by an illustration in Fabricius that I'll show you tonight, but it was a classical alchemical dream. It was that I was at a country fair, and its antiquity was indicated by the fact that it was happening on the schoolyard of my childhood, and as I moved among the participants of this country fair I began to notice that they were freaky. There were people with withered arms and one side of their face slid down and so forth and so on. The whole thing began to drift toward nightmare, and Richard Hermes Bird appeared in my dream as my alchemical compadre and at one point a black woman — perfect symbolism for the nigredo — with three withered arms and six or seven breasts slid herself sideways in front of me, and it was at that point that I went and found Richard and said, "I think we'd better get out of here."

Now, an alchemist would greet a dream like this with great anticipation and joy and would understand that this sets the stage now for the next movement forward. Well, then accounts differ. Those of you who really want to get into this, I recommend that you read *Mysterium Coniunctionis* by Jung, the Mysterious Conjunction. He discusses the nigredo in great detail. Another symbol for the nigredo is the senex, the old man, because the old man is just short of death and that's the state that the nigredo makes you feel. Then you must take this raw, chaotic, unformed material, often compared to feces, compared to corruption,

compared to the contents of an opened grave, and you must cook it in the alchemical fires of contemplation, prayer, and ascetic self-control, and then you will move through a series of stages that are associated with colors. There is the *rubedo*, the reddening, there is the *citritas*, the yellowing, there is the *viriditas*, the greening, and the order in which these occur differs according to who you follow, but then there is closure at the end of the process. Most alchemists, although certainly not all, agree that the higher state is the *albedo*, the whitening, the *purificatio*. At each stage there are substages of dissolution, *dissolutio et coagulatio*. There's one alchemical aphorism that says, "Dissolutio et coagulatio, know this and this is all ye need to know." It's a melting and a recasting and a purifying of psychic contents. So finally you reach the *albedo*, the whitening, the highest stage, the stage of great purity.

Remember how I said last night that mercury was always the metaphor for mind in alchemy, or one of the metaphors for mind in alchemy, and I talked about its mutability and its ability to take the shape of its container, and how when you shatter it it then splits into many reflections? So once you move into the domain of the *albedo*, the whitening, then a whole new problem arises for the alchemist. This is the problem of the fixing of the stone. Somehow the mutability of mercury must be overcome and it must be crystallized, it must be fixed so that it doesn't get away from you, so that it doesn't slip through your fingers. To achieve *ur-Mercury* is nothing unless you have the secret of the *coagulatio*. There is a huge amount of effort devoted to this.

What is being described is what Jungians call the individuation process: a dissolving of the boundaries of the ego, an allowing of the chaotic material of the unconscious to pour forth where it can be inspected by consciousness, and we'll see tonight when we look at this art that these images are full of ravening beasts, incestuous mother/son pairs, incestuous brother/sister pairs, hermaphrodites. All taboos are broken, this stuff just boils up from the unconscious, is sublimed through these processes and then is somehow fixed, and this fixing is the culmination of alchemy. If you can bring off this trick then you possess the *ur-Stone*, the philosopher's stone, the *lapis*, the *Sophic Hydrolith of the Wise*, *Eirenaeus Philalethes* calls it. There are hundreds of control words for naming the secret difficult to obtain: alchemical gold, in short, this is what we're after. If you possess it, nothing else is worth anything because it is psychic completion, peace of mind. Jung called it the self. It's the self that we are trying to recover, and remember how we talked about the Gnostic myth of the light trapped in matter? Well this is the *lumina lumen*, the light of light, the *lux natura*, the light drawn out of nature and condensed into a fixed form which then becomes the universal panacea, and I'm using as many of these alchemical terms as I can draw out of my memory to give you a feeling for it. This is the universal medicine. It cures all ills, it brings you riches, fame, wealth, self-respect. It's the answer, it's what everyone is looking for and no one can find.

This became a consuming passion of the 15th and 16th century mind. They thought they were on the brink of it, and along the way they were discovering stuff like distilled alcohol, phosphorous, gun powder, all of these things were coming out of the alchemical laboratories, but that was not it. They kept driving themselves onward because they knew that this was not the real thing, and they were pursuing the real thing. Then for some people it became reassociated with this notion of the utopia that I mentioned this morning in the passage that I read about the city of *Hermes Trismegistus*, and they began to see — it's almost like the crisis which overcame Buddhism — that it must be an archetypal, and notice how rarely we've used that word here, it must be almost an archetypal stage in human thought. *Theravāda* Buddhism stressed individual redemption through meditation on emptiness, and then with the great reforms of *Nāgārjuna* the idea of *Bodhisattvic* compassion was introduced and that carries with it political freight, an obligation to society and mankind.

As the 15th and 16th century progressed there began to be this awareness that what was wanted was not for an alchemist to break through to his own personal salvation, but somehow to create an alchemical world. You get then the notion of the multiplicatio, the idea that the stone, once created, will replicate itself and be able to change base matter into itself, almost like a virus spreading through the ontological structure of matter itself, and the world will be reborn. What was happening was that these alchemists were getting bolder. Printing was invented in Mainz, near Frankfurt, in 1439, and the distribution of these alchemical books was changing the character of alchemy. It was no more the solitary hermit working away in his cave or mountaintop, far away from the minions of the Church. These alchemists began to dream of banding together, of forming societies, of creating brotherhoods that were united in the sharing of their knowledge and their purpose.

This brings us to the curious episode in history called the Rosicrucian Enlightenment. Dame Frances Yates once again got there first. She wrote a book called *The Rosicrucian Enlightenment* which traces the history of these alchemical brotherhoods and reveals to us what they were really about. What they were about was this dream of somehow taking the philosopher's stone and the power, the immortality, the insight that it would bring and making it a general utility of mankind. I have a friend who claims that the summoning of the Holy Spirit into matter can be seen as the creation of the modern world of electrical energy, that people like Helmholtz and Faraday were completing the alchemical work. It's very hard for us to realize how mysterious the electromagnetic field seemed to the 19th century. The 19th century had entirely imbued itself with the spirit of Democritean atomism translated through Newtonian physics and they believed that everything was little balls of hard matter winging through space. When Helmholtz and Faraday and these people began to talk about action at a distance and generating the electromagnetic field and trapping lightning in Leyden jars and running it through wires, what could this be but numen, what could this be but the trapping of spiritus? What could it be but the literal descent of the Holy Ghost into history? Give it a moment's thought: for thousands of years, electricity was something that you saw when you took an amber rod and a piece of cat fur and went into a darkened room and stroked the cat fur, and then when you would bring the amber rod close to the cat fur you would see the crackle of static electricity. For thousands of years that's what electricity was. Who would dream that you could light cities, that you could smelt metals, that you could illuminate the earth with this energy, and yet from the 1850s to the present this was done. It's almost the final literalizing of the alchemical dream.

But to go back now — I digress, I fear — let's go back to the climate of the 1580s. The central culprit here, and to my mind a giant figure casting an enormous shadow over the landscape of alchemy and of modern science, is the Englishman John Dee. John Dee united in himself the complete spirit of the medieval magus and the complete spirit of the modern scientist. He invented the navigational instruments that allowed the conquest of the round earth. When Francis Drake sailed up the coast of California he had navigational instruments that were top secret — the French, the Spanish, must be kept away from this stuff — and these were navigational instruments created by John Dee that allowed him to locate himself anywhere on the globe. On a late summer evening at John Dee's house in Mortlake outside of London the angel Gabriel descended into his garden and gave him what he called the Shew Stone, shew in Old English. The Shew Stone exists to this day, you can see it in the British Museum, and what's amazing about it is that it's a piece of polished obsidian, it's an Aztec mirror. There was a ruler of the Aztecs named Smoky Mirror. How John Dee got this thing, we cannot even imagine. He says he got it from an angel, nobody can really naysay that. However I suspect that Cortez, on his first return to Spain from the New World, brought a number of objects with him that he had collected in Central Mexico and somehow John Dee got his

hands on this thing. It was for him a television screen into the Logos, and he used it over a number of years to direct the foreign policy of England.

He was the confidante of Queen Elizabeth the First and he was also the most accomplished astrologer in Europe. He used his ability to cast horoscopes as an entree into all the great houses of Europe, the kings and nobles of Europe. Well, he was functioning as an intelligence agent, he was a spy for the British Crown insinuating himself into these various courtly scenes and then writing back to Elizabeth in ciphers that had previously only been used for magical purposes. He was sending back data on the strength of military garrisons and the placement of fortifications and this sort of thing. This was what he was doing in the 1580s; he kept the Shew Stone for a number of years and he didn't seem to be able to make much progress with it. He had other methods too, he had wax tables and sigils, but finally into his life came a very mysterious character named Edward Kelley. Some accounts say that Edward Kelley had no ears, which indicates that he had had his ears removed for being a charlatan and a mountebank. This was a common punishment in the provinces of England. So Edward Kelley was a very dubious character, I think. One strong piece of evidence that he was a shady character was that John Dee was married to a much younger woman named Jane Dee, who by all accounts was quite a beauty, and after gaining Dee's confidence as a scryer, the person who could look into the Shew Stone and lay out these scenarios that the angels and the entities coming and going in the Shew Stone were putting forth, Kelley revealed to Dee that the angels had instructed him to hit the hay with Jane. This was a great crisis in their relationship. However, according to Dee's diary, "And so it was done," we read. So hanky panky didn't begin with the Golden Dawn, believe me.

In 1582, Jane Dee, John Dee and Edward Kelley set out for Bohemia. Rudolf, the Mad King of Bohemia, held sway at that time. This is another one of these bizarre figures in this whole story. Rudolf collected dwarfs, he collected giants. He had what was called a wunderkammer, a wonder cabinet. You see, before Linnaeus, before modern scientific classification, these great patrons of the arts and natural sciences would just collect weird stuff, and that was all you could say about it. I mean, it was rhinoceros horns, fossil ammonites, broken pieces of statues from antiquity, giant insects from southern India, seashells, all this stuff would just be thrown together in these wunderkammer, these wonder cabinets. Rudolf was a great patron of the arts, and Kelley sent the word that he and Dee had perfected the alchemical process. Rudolf immediately paid their way to Prague and patronized them very lavishly over a number of months, but then they didn't seem to be coming through, and he ordered a castle put at their disposal in Bohemia and they still weren't able to come through. The Voynich Manuscript figures in here too, because Kelley's entree to Dee was that he had a manuscript in an unknown language, and I believe that this probably was the Voynich Manuscript. The Voynich Manuscript turns up in the estate of Rudolf and the very month that he paid 600 gold ducats for it to persons unknown, Dee, who was always writing back to the Elizabethan court hounding them to send money, entered in his account book that they received 600 gold ducats from an unknown source.

Dee was able to talk himself out of this alchemical imprisonment, but not before he had written a book called the Hieroglyphic Monad. You have to understand the importance of this. As late as the 1920s, in the better schools of England, like Eton, when you studied geometry you studied Euclid's works, and Euclid's geometry was always preceded by Dee's preface to Euclid. Until the 1920s every English schoolchild studied this. He was a master mathematician as well as all these other things; this was how he was able to produce these navigation instruments. Dee, while imprisoned in Bohemia, wrote a book called the Hieroglyphic Monad in which he proposed to prove, through a series of occult theorems, a certain

diagram, basically the symbol for mercury, which looks like the symbol for female with horns on it, and then there were some adumbrations to that. By a series of theorems he built up this Hieroglyphic Monad and he initiated a couple of young men named Johannes Andreae and Michael Maier into the mysteries of the Hieroglyphic Monad. Then he was able to get out of Bohemia and he went back to England.

Kelley, who had made much more extravagant claims, Rudolf kept at work on the alchemical opus and Kelley became more and more desperate to escape. One night in 1597 he crept out on the parapet of this Bohemian castle and a roof tile slipped beneath his feet and he fell to his death and became, so far as I can tell, alchemy's only true martyr. Dee returned to England; he was now very old and he died at Mortlake in 1608. Elizabeth died in 1603; Shakespeare was happening, Sir Philip Sidney was happening through this period. John Dee reputedly had over 6,000 books in his library. He had more books than any man in England. We have a partial catalog of his library; he had books that do not exist now. He had Roger Bacon manuscripts, because when Henry the Eighth kicked the Catholic Church out of England the Northumbrian monasteries were looted by the Earl of Northumberland and Dee was allowed to pick over the loot from these monasteries. There were Roger Bacon manuscripts which perished when Dee's library was burned by an angry mob while he was on the continent because he was suspected of being a wizard. He was the model for Faust in the later recensions of Faust, and whenever you see an old man with a white beard and a pointed cap, this image is referent to Dee.

Well, Elizabeth died in 1603 and James the First became King of England. James was a peculiar character. The wags of the time liked to say, "Elizabeth was King and now James is Queen!" Not only that, he hated occultism, he had no patience with the whole magical court that Elizabeth had assembled around herself. Meanwhile, in 1614, a very mysterious document began to circulate in Europe and in England called the Fama — this is the first word of a string of Latin words — and two years later the Confessio. These were announcements that an alchemical brotherhood was seeking recruits. These are the primary documents of Rosicrucianism. Rosicrucianism was based on a fiction and a fictional person, Christian Rosenkreuz, who was imagined to have lived almost 200 years earlier, in the 1450s, and to have been a great alchemist. It was claimed that his tomb had been recently opened and that there were books inside it which set the stage for the alchemical revolution of the world; notice how this occult mind always tries to reach back in time to give itself validity. Christian Rosenkreuz was claimed to be the author of a series of books, the chief of which is called the Chymical Wedding.

What this was all about, I believe, and The Rosicrucian Enlightenment makes it fairly clear, was that Dee, during the period when he had been in Bohemia, had set out to lay the groundwork for an alchemical revolution in Central Europe, and he had made Johannes Andreae and Michael Maier his agents in this plot. It was a plot to meddle with European history and to turn the Protestant Reformation toward an alchemical completion. They felt that Luther and Calvin and these people had only gone so far and that the culmination of throwing off the yoke of the Church would be the establishment of an alchemical kingdom in Central Europe. The target, then, of the attention of Michael Maier and Johannes Andreae and a number of these alchemists became the young Frederick the Elector Palatine. He was a prince of the Northern League in Germany; he ruled in Heidelberg. Heidelberg, as you know, is a thousand-year-old university city and I believe I mentioned that the alchemical press of Theodore de Bry was operating out of Heidelberg. Heidelberg became a magnet for all the occult thinking going on in Europe. All the puffers and alchemists, the gold makers, the philosophers, the charlatans, they all converged on Heidelberg, and Andreae and Maier were advisors of the young Frederick. They steered him by a series of political manipulations too complex to tell toward a marriage with the daughter of James the First of England, who

was named Elizabeth, interestingly enough. So Frederick the Elector made Elizabeth, the daughter of James of England, his wife. Frederick here made a serious miscalculation because he thought that if James would give the hand of his daughter in marriage that this was his way of blessing this alchemical conspiracy. Actually, what was on James' mind was that he was about to give one of his sons in marriage to a Spanish princess of the Hapsburg line, a Catholic. In other words, he was playing both sides against each other. He was not giving the green light to an alchemical revolution at all, but it was assumed so.

Then in 1612 Rudolf the Emperor finally dies at a very ripe old age. At that time the Protestant League, which was made up of these princes of these small principalities scattered across Germany and Poland, they actually elected the emperor. It was not by right of primogenitor, but by election by what was called the Northern League, this group of princes. Frederick and his alchemical cohorts had done their political groundwork very skillfully and they were able to engineer the election of Frederick to Emperor, and he became Frederick the Elector Palatine of Bohemia. This set the stage for an episode called the episode of the Winter King and Queen. After Nicolas and Perenelle Flamel, this is one of the great romantic stories of alchemy. They moved their court from Heidelberg to Prague and all the alchemists went with them, and they assumed that English armies would support them if there was any squawk from the Hapsburgs. In the winter of 1619 they ruled there and began to lay the groundwork for the transformation of Northern Europe into an alchemical kingdom. The problem was, as I said, the faithlessness and duplicity of James the First of England. He did not support them in spite of the fact that the fate of his daughter hung in the balance, and by May of 1620 the local bishop of the Catholic Church was fully aroused and word had been sent to Madrid, and the Hapsburgs raised an army and laid siege to Prague. In the summer of 1620 the Winter King and Queen were driven from Prague, the city fell to Catholic forces, the alchemical presses were smashed and Michael Maier, who was like the prime minister of this scene, was murdered in an alley of Prague and the entire alchemical dream went down the drain. Frederick was killed in the siege of the city and Elizabeth escaped to The Hague where she lived in exile for many years.

Until recently I thought that was the end of the story, but there is a coda that is amusing, if nothing else. In that Hapsburg army, there was a young soldier of fortune, only 19 years old, still wet behind the ears, knowing nothing, happily soldiering and wenching his way around Europe while he decided what to do with himself. His name was René Descartes, a Frenchman. Descartes in his later years reminisced about his period as a soldier in this army, and I like to think that it was actually Descartes who murdered Maier. One of my ambitions is to write a play or a novel where these two confront each other in a back alley of burning Prague and carry on a debate about the future of Europe before Michael Maier falls to the sword of Descartes. That may be apocryphal, but what is not apocryphal is that this Hapsburg army, having laid siege and destroyed the alchemical kingdom, began to retreat across Europe that fall and by mid-September was camped near the town of Olm in southern Germany. By a strange coincidence, Olm is the birthplace of Einstein some hundreds of years later. On the night of September 16, 1620, Descartes had a dream, and in this dream an angel appeared to him — this is documented by his own hand — and the angel said to Descartes, “The conquest of nature is to be achieved through measure and number.” That revelation laid the basis for modern science. René Descartes is the founder of the distinction between the *res cogitans* and the *res extensa*, the founder of modern science, the founder of the scientific method that created the philosophical engines that created the modern world. How many scientists, working at their workbenches, understand that an angel chartered modern science? It's the alchemical angel which will not die. It returns again and again to guide the destinies of nations and peoples toward an unimaginable conclusion.

That's not the last time that this angelic intervention in the history of science has occurred. Some of you may know the story in the 19th century of Kekulé, the German chemist who was struggling with the molecular structure of benzene, couldn't get it straight, and then had a dream in which he saw the ouroboric snake take its tail in its mouth, and he awoke from that dream with the carbon ring burning in his mind. Well, the hexagonal form of the carbon ring is the basis for all organic chemistry, and I mentioned earlier Faraday and Helmholtz and the rise of the electromagnetic field. The point I'm trying to make is that however rational we may assume ourselves to be, however rational we may assume modern science to be, it is all really founded on angelic revelation, demonic intercession and an extremely mysterious relationship between the human mind and the world of what science calls inert matter, which from this point of view is revealed to be not inert at all but alive and pregnant with purpose for mankind.

There were a series of adumbrations of this kind of thinking. Many of you may know about the history of Freemasonry and the many Freemason revolts in Bohemia and Bavaria throughout the 16th and 17th centuries. Adam Weishaupt and the Illuminati are another effort to do this, and even the Royal Society, founded by Newton and Hook, was still an effort to redeem science for the spirit. The alchemical spirit lives on; it never really died, it's just that it has taken peculiar forms in our own day. I mentioned last night that when you enter into nuclear chemistry the most literal dreams of the profane side of alchemy, the transformation of lead into gold, have actually been achieved. It has no economic significance because the instrumentality to do it costs tens of millions of dollars but nevertheless, yes, lead in our time has been changed into gold.

Audience: To take you back to the Voynich Manuscript for a minute, there was this thing about it being a liturgical manual of some sort. Is that your opinion of it?

Yes, this is kind of a footnote on all of this. Remember how I said that Kelley's entree to Dee was that he had a mysterious book? You can tell from what I've said already that Dee was as big a sucker for books as I am. Kelley's story was that he had gone to sleep in the ruins of a Northumbrian monastery and slept in an open sepulcher, a crypt of some sort, and when he awoke he found beneath him two things: a vial of red powder which he said was the transmuting powder, a necessary part to the alchemical opus, and a book in an unknown language which he called the Book of Saint Dunstan, possibly because this monastery had been dedicated to Saint Dunstan. Now, Arthur Dee was John Dee's son. He became an alchemist in his own right, and he said that when he was growing up he recalled that his father spent many hours puzzling over a book, as he put it, "All covered with hieroglyphiks," but Dee, who elaborated the angelologic language called Enochian, never actually wrote about or discussed the book that he had received from Kelley. It is definitely not written in Enochian. Enochian, when grammatically analyzed by computers, has a curious relationship to 16th century English. When Dee and Kelley traveled to Europe they were talking up Roger Bacon, who was a 14th century English monk who had dabbled in alchemy, and they claimed to have Bacon manuscripts. Rudolf became very interested in this and wanted to obtain some of these Baconian manuscripts. I suspect that what happened was that Dee, by this time, had given up on deciphering the Book of Saint Dunstan and decided that he would palm it off on the emperor as a Bacon manuscript. He didn't want to give up a real Bacon manuscript because they were too valuable to him, so for 600 gold ducats this thing changed hands and Kelley, Dee and Jane were able to pay their bills. Rudolf had immense resources because of his position as Emperor and he brought his cryptographers and decipherers in to work on this Book of Saint Dunstan and got nowhere.

Then when Rudolf died a mysterious book was numbered among the artifacts of his estate, and I think we

can assume that it's this book. One of the interesting things about this book is that it has pages and pages of plant drawings, over 150 watercolors of plants, each carefully labeled and captioned in this unknown language. If you know anything about decipherment, this is what a decipherer dreams of, because if you have a picture of the thing and the caption it doesn't take too much smarts to be able to figure out what's going on. Nevertheless, this was completely unhelpful. A third of the manuscript has pseudoastrological material; in other words, what look like horoscopes and drawings of stars and stellar shells but when carefully analyzed dissolve into meaninglessness, cannot be associated with anything. Then a third of the manuscript shows little naked ladies in what can only be described as elaborate plumbing systems. It was thought at one time that these must be drawings of the humors of the body in the liver, that these little naked women represented spirits moving inside the human body. Somebody else's guess was that it must show an obscure form of German hydrotherapy, because if you've ever been to Baden-Baden or Marienbad or these places where people take the waters, those places are old, old. All this stuff is captioned and there are even tables of contents which again you would think would yield to decipherment, and so when Rudolf died, because of the botanical material in this book it passed to the court botanist, a man named Hořcický, and he got nowhere with it.

Then in the early 16th century a great alchemist and polymath, some of whose art we'll see this evening, was Heinrich Khunrath. Heinrich Khunrath was fascinated by artificial languages and he heard about the Voynich Manuscript. We have a whole bunch of letters from Khunrath to the keepers of the estate of the emperor trying to obtain this manuscript, which he finally did obtain, and then at that point he makes no further mention of it in his diaries; the conclusion being that he too could get nowhere with this thing, it just defied decipherment. In 1619, at the outbreak of the Thirty Years War — and this is what I forgot to mention in my earlier discussion: this episode of the Winter King and Queen is one way of debating the Thirty Years War. It's usually considered to be the moment when a certain personage was hurled from a third story window in Prague and then fighting broke out in the streets, but really the episode of the Winter King and Queen brought the thing to a head. Well, in 1619, to avoid being caught up in the Thirty Years War, Khunrath decided to take holy orders and become a Jesuit, and so he gave his library, which was compendious, to the monastery that he joined, which was a monastery in southern Italy. There this thing sat until 1906, when a New York rare book dealer named Wilfrid Voynich bought the entire contents of this monastic library. When he got it all back to New York and cataloged it, it was all very predictable 16th century theological and alchemical speculation, except that here was this book in an unknown language. Voynich kept it throughout his life and then when he died he gave it to Yale, and it is to this day at the Beinecke Rare Book Library at Yale.

In the 1960s the CIA became interested in it, because the CIA is in the business of code making and breaking. A huge amount of energy goes into this. If you know anything about the Enigma Project in World War II, you know that vast energies go into the production of unbreakable codes, and so they very systematically sought out all examples of encrypted material throughout history and just lickety-split deciphered it, one after another. All occult and magical codes known to exist in Europe can be traced back virtually to one person: Trithemius, Abbot of Sponheim, who was the great teacher of Heinrich Cornelius Agrippa. All magical codes, if you know the Trithemian method, within a few hours you can get plaintext. The Voynich Manuscript did not yield at all to this method and the CIA formed a working group that for over ten years would invite scholars in to have a look at this. If you're interested in this, Mary D'Imperio, who was a great Renaissance scholar, wrote a book called *The Voynich Manuscript: An Elegant Enigma*, in which she traces the efforts of the CIA to figure this thing out and to figure out what it could be.

There the matter rested until about three years ago when Leo Levitov, some kind of military historian, one of these peculiar people who live for this stuff, got a hold of it. D'Imperio goes through all the decipherment, and there were many efforts at decipherment. There was a scholar at Yale in the '30s named Brumbaugh, who was a very respected man who ruined himself by claiming a complete decipherment of the Voynich Manuscript. The way the game is played is that you say what your rules for the decipherment are, you give the rules to a colleague and you give your colleague a page of text. If he can't translate it with your rules then you are viewed as a deluded and misguided person and your career goes down in flames. Well, the Brumbaughian method for deciphering the Voynich Manuscript had to do with confined pools of letters where it would get you to a pool of five or six letters but then you could freely choose which one you used, and critics of Brumbaugh demonstrated that you could make this thing say anything you wanted it to. Brumbaugh supported Dee's claim, he claimed that it deciphered out into a Roger Bacon manuscript that described a series of riots between the students and the Blackfriars in 1291 at Oxford at Christmastime, but nobody else could make it say that or make it say anything, so Brumbaugh disgraced himself and ruined his career.

Then there were other efforts at decipherment which I won't bore you with, but along comes Leo Levitov just four years ago. He wrote a book called *Solution of the Voynich Manuscript: A Liturgical Manual for the Endura Rite of the Cathari Heresy, the Cult of Isis*, and his great breakthrough — if you accept his translation, and I do; I know people who don't but they don't seem to have read him as carefully as I have, I think the dude has it pretty well nailed to the barn door — his great breakthrough was to realize that it's not in code. It is not an encrypted manuscript at all. It's a synthetic alphabet; yes, it's an alphabet. One of the things that baffled the CIA was that they looted the libraries of Europe and they could never find another example of what is called Voynich script, and this was just baffling. How could there be no other example of this script? It appears that what happened was that someone created a synthetic alphabet, and then in a mixture of medieval polyglot Flemish with a huge number of loan words from Old French, Middle High German and Swedish, wrote down a sacramental manual for the dying in the Cathar sect.

Now, what is the Cathar sect? You're probably familiar with something called the Albigensian Crusade. This was not a crusade carried on against the infidel for the recovery of Jerusalem but rather a series of military actions carried out by the pope against communities in Southern France in the early 1200s. These people were Cathars as far as we can tell, and we can't tell much because we only have descriptions of Cathars written by the people who were burning them at the stake. In other words, no original Cathar documents survive, we just have what they screamed out on the rack as they were being put to death by the bishops of the Church. This was a horrific incident in European history. To give you the flavor of it, the second Albigensian Crusade was prosecuted by a general of the pope named Simon de Monfort. Some of you may have visited the city of Carcassonne in Southern France, which is a very beautiful walled medieval city. Simon de Monfort's lieutenants came to him and they said, "We have cornered the Cathars at Carcassonne, but the problem is that there are 6,000 Catholics within the city walls," and he said, "Kill everybody; God will recognize his own." So that was the spirit in which this thing went forth, and they did, they did.

What we do know about the Cathars is that they had a sacrament. Well, first let me tell you a little bit more about them. At first it was thought that they were pretty much heterodox Christians. They were into nudity and vegetarianism; they sound like early hippies, as far as we can tell. They got together, men and women, they took off their clothes, they bathed; whether there were orgies or not we don't know. They were vegetarians, and the one thing that we do know is that they had a sacrament called the *consolamentum*.

When you were dying, a fellow Cathar would cut your wrists and open your veins in a warm bath of water and you would die in that state, you did not die a natural death. This was called the consolamentum. What Leo Levitov is claiming is that the Voynich Manuscript is a description, a manual for the Perfecti of the Cathar sect, telling how to properly carry out the consolamentum. I see no reason to challenge it. Even with my limited knowledge of German, once you get the vowel and letter assignments into this weird language and change it into English alphabetic text, you can see that there's enough German there and then these loan words in Flemish and so forth; it looks to be true.

What emerges from this, if we accept the Voynich Manuscript as the only primary document on the Cathar faith, is that this was not a form of heterodox Christianity at all, it was much more radical than that, and this may explain the Church's fury at this group of people. It was a cult of Isis. It can be traced straight back into the mystery religions of Io, Isis in Egypt, and I have not seen any critical commentary on Levitov's work. His book was published by this weird press in Redondo Beach that specializes only in books on military encryption. Their catalog is a revelation to see, it's amazing, and the book on the Voynich Manuscript stands out like a sore thumb because most of it is dictionaries of three letter words in Swahili and their numerical transforms and stuff like that. So that's the history to date of the Voynich Manuscript, and it's not that askew of our subject because all of this heterodoxy in Europe blends together.

The presence of Theodore de Bry as an alchemical printer in Heidelberg may be a clue, because there were survivals of this Cathar faith in the form of a heresy called the Brotherhood of the Free Spirit. If any of you are familiar with the altarpiece called *The Garden of Earthly Delights* by Hieronymus Bosch, it's thought that this was created by commission for a congregation of the Brotherhood of the Free Spirit. The Brotherhood of the Free Spirit was always associated for some reason, we don't know why, with printers. Printers seem to be the profession that the Brotherhood favored, and like the Cathars they practiced ritual nudity, vegetarianism and gathering together in a ritual bath. There is much still to be learned and to be teased apart in the art history and the history of heterodox thinking in Europe, of which alchemy is seen to be one facet of a faceted gem that includes the Brotherhood of the Free Spirit, early Freemasonry, Cathars, survivals of Manichaeism, Bogomils in Yugoslavia — there are Bogomil graves on the southern coast of Thessalonica — and just a whole zoo of intellectual systems that have been forgotten and overlooked. This what I meant when I said that we will explore the stratigraphy of lost thought systems. In some cases we possess quite complete skeletons, in the case of alchemy. What we possess in the cases of the Bogomils and the Cathars is almost a foot bone or a tooth or a footprint but someday, with luck, new textual material will emerge and a new understanding of the role of heterodoxy in the formation of modern thought will emerge.

Audience: I've just finished the *Born in Blood* book on Freemasonry that's recently been published, and this person is a Medieval English historian from Kentucky. I think he's finally solved the Freemason history, which is a very interesting history because the Masonic historians themselves have been arguing for a couple hundred years. It's strange that this Voynich Manuscript should be all of a sudden resolved in the last couple of years, because it seems that this Freemason thing is also resolved.

Yes, you make an interesting point. John Glavis brought me an article yesterday. We're all tied up now in this Pluto return. I'm not an astrologer but John brought me an article that's talking about how, I don't know if it's the last time or the time before last that the Pluto return occurred, is precisely the 1490s, the period that we're talking about when the *Corpus Hermeticum* was translated. We are now in a period that is astrologically exactly equivalent to that period, and the Voynich Manuscript appears to have been

accepted. You mentioned this revelation about the true nature of Freemasonry, and of course what is going on at the moment — that is askew of our subject but tremendously exciting and relevant to the idea of lost knowledge coming to light — is that this is the golden moment in Mayan studies.

It is happening right now, day by day, minute by minute. The logjam has been broken. The Mayan glyphs are being deciphered, no shit, and it has to do with an entirely new approach that some Russian linguists have taken. It will never happen again so far as I know; there are now, with the Mayan decipherment, no real undeciphered languages left. Harappan was deciphered a few years ago, but really it wasn't that interesting because we only possess about 6,000 characters in Harappan. But the literature of the Maya, when you take not only the hieroglyphic, the stone texts, but when you add in the ceramic texts, we have a lot of Mayan material and it is being deciphered at a furious rate. If you're interested in this, Linda Schele has written a book called *A Forest of Kings* and how I do envy this woman because what she is doing is writing the first history of the Maya in a thousand years. We're not now dealing in the realm of gods and myths, we're dealing with stuff like, "On the 29th of April, 562, an army from Caracol met an army from Tikal and triumphed and deposed Double Bird and placed on the throne..." It's this kind of stuff, real history. The conceits of Mayan religion and Mayan courtly life are all coming into focus and it's very exciting. All the people who have tried to make the Maya into some kind of Atlantean civilization should be running for cover at this point, because the picture that emerges is not as pretty as we might wish, but, hey, know the truth and the truth will set you free. I would choose truth over illusion anytime, no matter how damaging it might be to somebody's conceptions of these things.

If any of you are interested in these subjects, some of you may know the book by John Chadwick called *The Decipherment of Linear B*. Linear B is a proto-Minoan language and a linguist at Cambridge named Michael Ventris, a genius, deciphered this language in the '50s. There was no Rosetta Stone, this is the amazing thing. You know what I mean by a Rosetta Stone? You see, in the 19th century the great mystery was how to read the Egyptian hieroglyphs. Before they were deciphered, the Egyptians were treated like the Maya and people thought that the secrets of the universe were chiseled on those obelisks and tombs. Then a soldier in the grand army of Napoleon found a tablet which had a column of Demotic, a column of Ancient Greek and a column of Egyptian hieroglyphs, and they were able to realize that it was saying the same thing three times and that opened it up for them; but that's like a crib sheet, it's easy if you have the same text in a known language. In the case of the Maya, in the case of Linear B and in the case of Harappan, there was no Rosetta Stone, so then it's an excruciatingly difficult problem to solve. I'll explain how it was done with the Maya because it's so neat.

It turns out that Mayan is a rebus language. What does this mean? Do you remember how, when we were kids, in comic books there would be these things where it would show a picture of an eye, and then it would show a picture of a saw going through a piece of wood, and then it would show a picture of an ant, and then it would show a picture of a red rose? This is a sentence which says, "I saw aunt Rose." Now notice what's going on here. It all depends on puns that depend on a knowledge of the spoken language. If you lose the sounds of the spoken language, how the hell could you ever tell that a picture of an eye, a saw, an insect and a rose says, "I saw my maternal relative on my mother's side"? It's absolutely impossible in that situation to reconstruct meaning unless you have sounds. How do you recover the sounds of a language dead a thousand years? Well, these Soviet linguists had the good sense to go and look at living Mayan languages, of which there are 15 in the Americas, and they discovered one of these dialects where, when you set Mayan hieroglyphs in front of these people and they named what they saw, meaning came out of their mouths. That broke the logjam and then you just rev up your computers and use all the standard tools

of modern linguistics and philology and the stuff begins to just pour out, clear as day, no problem.

Audience: So they asked the Mayans?

Yes, they had to go to a Mayan. You're right, good point, it had never occurred to them, because always before when showing it to Mayans they would say, "What does it mean?" instead of, "What do you see here?" and then what they said they saw. Their meaning came out of their mouths, it was very neat. It shows once again the hubris of modern scientific methods; we tend to dismiss the aboriginal and the primitive. To turn it toward my own favorite subject, this was the state of modern medicine. Nobody would ask the native in the Amazon Basin, "What plants do you use for malaria, brain tumors, shrinkage?" and so on and so forth, because they were just dismissed as superstitious primitives. It was thought that the doctrine of signatures was operating. They didn't realize how subtle and how complete human knowledge systems grow under the care of those to whom it really matters.

The project of the redemption of spirit from matter turned into the project of redeeming the general society of the time toward a utopian vision. This is working right up to the present. Millenarianism is still with us. Marxism is the last great millenarian faith, the belief in the worker's state. It occupies the same relationship to these alchemical utopias as Heideggerian existentialism has to 2nd century Gnosticism. The poetry has gone, the baroque imagery has been stripped away, but the impulse is still toward a perfect society where, "From each according to his ability to each according to his needs." It lives on. Democracy is also an effort, let us not forget, to recapture the style of 5th century Athens. We forget that this was a city-state half of whose inhabitants were slaves, and yet we are so under the spell of the utopian dream that we continue, and not without important reason, to try to labor toward a just and decent world where the lion lies down with the lamb. That was and remains the alchemical dream.

Flashbacks of my life: I majored in history in college, and the first history teacher that I had was a wonderful old man who really, now that I look back on it, taught the history of ideas. My major was involved with politics and all of this kind of thing, and it's such a wonderful experience to suddenly get back to what turned me on to history. It gets me turned on and opens my mind again, looking at some of these thoughts that I'd just forgotten or suppressed, put down and said, "That's bullshit," as a traditionally trained scientist and so on. It opened my eyes to the fact that we can learn from what's gone on before. The ideas are out there, we just have to grasp them and apply them, and I am interested in how we make this more meaningful for the future.

I once, in one of these revelatory dialogues with the Logos, asked the question, "Why me? Why are you telling me this?" because I was a poor hippie, I was penniless, I was a traveler; and the answer was instantaneous. It was, "Because you don't believe in anything," and I think that that's a very pure position to hold. We're not trying to ensnare you to abandon your Jewishness or your Presbyterianism or belief. If you believe in something then you have precluded the possibility of believing in its opposite and you have hence limited your freedom. Everything is to be judged by its efficacy, by its effectiveness in the real world, and I think that I have a horror in all belief systems, I just don't like them. If somebody tells you that he has the answer, flee from this person, they are obviously some sort of low being who has not recognized the true size and dimension of the cosmos that we're living in. If you can keep yourself free of encumbering beliefs then your dialogue with the Logos can go forward unhindered.

Sometimes when I'm in the trance of psilocybin I will say to the entity, "Begin to show me yourself as you

are for yourself. Don't give me the scaled-down, humanized version, show me your true nature," and after a few moments of this then I have to raise my hand and say, "Enough, I can't handle more than that." This goes back to the statement made yesterday or the day before about how the universe is not only stranger than we suppose, it's stranger than we can suppose; therefore we are given tremendous latitude in what we can think and what we conceive, but if you begin to believe in something then you are pulled down, because everything that you believe has consequences. A perfect example: as some of you may know, when Mohammed ascended into heaven from the site of what was to become the Mosque of Omar, from the site of the Temple of Solomon in Jerusalem, he happened to be on horseback. Now if you believe that Mohammed ascended to heaven, imagine the theological and hermeneutic problems posed by the horse he was riding, because it went with him. This is a perfect example of how intellectual baggage drags us down, because belief always contains absurdity. The ontological status of this horse has troubled Islamic theologians for centuries. If they would just let go of the whole idea complex they would be liberated from this kind of minutia. Belief kills the spirit, spirit transcends belief.

Then someone asked about Bruno and Dee; since I suggested that you read Giordano Bruno and the Hermetic Tradition it's ironic that so little time was spent on Bruno. On the other hand, I recommended that you read the book, so you should be well informed on Bruno. We just didn't get into that particular historical episode because I wanted to tell you about the Rosicrucian Enlightenment, but the thing to remember about Bruno is his discovery of the infinitude of the cosmos and that by an act of unencumbered observation — I mean, how many people had looked at the night sky before Bruno and had not seen what he saw, which was infinite space and suns hung like lamps unto the utmost extremes of infinity? By an act of pure cognition, he was able to destroy an entire cosmological vision that had limited and confined the human soul for millennia. That's half of his story. The other half is that he was burned at the stake for refusing to back down from this. It's a model for us all: trust your perception, trust your intuition and then accept the consequences, because this is what existential validity must be.

As far as the relationship between Dee and Bruno, the relationship is that they were both derivative of the magical school that can be traced back to Heinrich Cornelius Agrippa von Nettesheim, who was another model for Faust. Agrippa wrote *De Occulta Philosophia Libri Tres*, three books of occult philosophy, and that was the core work for European magic. All European magic can be traced back to the Agrippan system. Agrippa was the direct student of the Abbot Trithemius of Sponheim, who we mentioned yesterday as the source of all the magical codes of the Middle Ages. If you're interested in a brilliant but fictional treatment of John Dee and Giordano Bruno, I'd like to recommend a novel to you. It's called *Ægypt*. It's by John Crowley, the same gentleman who wrote *Little, Big*, which is a wonderful novel about the magical interface between two worlds. In his book *Ægypt*, fully half of the book is given over to a wonderfully rich retelling of the relationship between Bruno and Dee. Some people have wanted to say that Dee and Bruno actually crossed physical paths in London, but I've looked into it and they missed each other by about two weeks. Bruno was setting sail for England as Dee was setting sail for France and the Rosicrucian Enlightenment episode that I talked about.

Then someone asked about tantra and the contrast between the imaginative internalized invocation of the anima or the animus, depending on your own sexuality, and that contrasted with something which actually happens between two people. We didn't talk that much about the concept of the Chemical Wedding or the alchemical marriage, but this is the Western resonance to the Eastern idea of tantra and it is the idea that sexual energy, being the rawest and most accessible energy to the organism, can be channeled into a higher spirituality. It's entirely so, the problem is that of all paths this is probably fraught

with the greatest difficulty because sexuality is such a debased coinage in the modern world. In other words, you have to make your way with great care and great purity of intent into this. In Eastern tantra that is actually practiced in this physical manner there is usually the admonition that you should have no attachment to your tantrica, that the relationship should be entirely given over to the technical details of this union, and of course it has to do with the forestalling of orgasm and the raising of energy within the organism.

In the Chemical Wedding, in the alchemical marriage, due honor is given to the importance and uniqueness of the other person. In other words, it isn't the idea of the temple prostitute who serves as the vessel for this process, but there's actually an effort to keep individual identities and individual dignity in some sense together. The higher up the mountain you go the steeper it becomes, and when you begin to scale the heights of alchemical or tantric sexuality the fall back into the nigredo can be shocking indeed. That's just an admonition, it's not designed to scare you off, it's just to say that in an age as sexually obsessed as our own, you have to, as the I Ching says, "Inquire of the oracle once again if you have purity of intent."

Audience: Isn't there also a healing between the two?

Yes, it's a complete alchemical system and the energy is passed between. This is probably the highest completion that is possible. The ideal of romantic love was introduced into Europe in the 1100s and earlier at the Poitiers Court of Eleanor of Aquitaine by troubadours. Scholarship now reveals pretty convincingly that this troubadour tradition is an esoteric Sufi system. It also occurs in Indian teachers such as Chaitanya, the guy that the Hare Krishnas go back to. The radical teaching of Chaitanya was that you could achieve ecstasy not by sitting in yoga but by dancing and singing on street corners. It's now pretty clearly shown that the penetration of Sufi ideas into Bengal was happening at the same time that these Sufi ideas were coming across from North Africa and into Spain and Southern France. So it's a tremendously old and vital tradition, but you have to be very careful. The romantic impulse is a real double-edged sword. It has been ever since the early 19th century, because the rise of romanticism — as that term is normally understood, meaning the movements in art and literature of the early 19th century — was a response to the dehumanization that was going on at that time, the rise of industrialism and the further retreat into cities more massive than any that had ever been built before.

Audience: I wanted to add, the question was about healing, and I think there's a tremendous difference between the Indian and Tibetan tantric systems. All this practice in Taoism is in terms of single copulation and dual copulation. In the Taoist system, self-healing is of paramount importance before you can even consider dual copulation. Dual copulation is then begun, then again other considerations come in, but the Indian and Tibetan systems where Dakinis and various deities are invoked in the process of their alchemical union is really quite different from the Taoist system, which is devoid of belief in gods.

That's a good point. I talked yesterday about the alchemical stages; when you have reached the albedo, the final whitening of these processes, that final whitening is, from a higher perspective, a new nigredo, and you must always build and build again. So you have to be fairly confident that you have already realized a certain portion of yourself before you embark upon these tantric double experiments. A lot of tantric text reads as very vampirical; it's all about expelling the semen and then sucking it back in, and it's like an energy war. It turns into black magic. The losing partner in these deals is just left a withered husk, and this is not a higher completion to be sought for.

Audience: You're correct. There are supposedly, whether they're myths or documented, stories about one Chinese empress who caused the deaths of more than a thousand men because of her vampirism, and it was sexual in nature.

Just a couple of other points here. The gentleman here who had nothing to comment reminded me, since we were talking about the Valentinian system this morning. My favorite archon, besides Sophia, who's so interesting because of the little story about how she made the universe, but the 12th archon in the Gnostic system is a unique entity. I don't know of another religious system that has this notion. The 12th archon in the Valentinian system is called the Watcher. That's all he does. He does not input into the system at all but is the witness, and somehow this creates a validating dimension that is very important. I just want to affirm that the Watcher is a very strong platform on which to stand. I mean, would that I could learn to keep my mouth shut; would that we all could. So the Watcher is a good archon to keep active on your inner altar.

If you extrapolate all that has been said here then you should see that — remember how I said that one view of alchemy was that the alchemist inter-vened in natural process in the role of a catalyst? For those of you who aren't chemists, a catalyst is something that causes a chemical reaction which is going on anyway to proceed at a faster rate, but the catalyst is not consumed in this process, it simply accelerates it. If we think of nature as a great alchemical furnace that continuously produces and brings forth wonders, then must it not be that humanity is the yeast of the Gaian alchemical rarefaction and that human history is the process of catalyzing the alchemical condensation? If we look back into nature, before the advent of speaking and writing human beings in the last 15,000 years, what we see are very leisurely processes. The speciation of a single plant from another can occupy fifty or sixty thousand years, it never happens more quickly than that; and the grinding down of glaciers from the poles, these are processes that take hundreds of thousands of years.

With the advent of human beings, an entirely new ontos of becoming is introduced into the entire cosmos — as far as we know, because we cannot verify that there are other self-reflecting beings in the universe — and this new ontos of becoming is what I call epigenetic, as opposed to genetic. All other change in the living world, in the world of bios, of zoê, occurs through genetic change, random modification of the genome which is then subject to random selection, but with the advent of speech and writing epigenetic processes become possible and time accelerates. One way of thinking about what is happening in this cosmos is that it is a gradual conquest of dimensionality by becoming or process, we hardly have a word inclusive enough.

The earliest forms of life were probably slimes on certain kinds of clays, self-replicating molecular systems, and then certain portions of this chemistry became light sensitive, and then there was the sense of the division of light and darkness which generated the notion of here and there on some tremendously basic level within these early organisms. Once you have the concept of here and there, motility, the ability to move, the cilia that dot the surface of protozoans and stuff like this are elaborated and a new dimension enters the picture, the dimension of time, because notice that a journey from here to there is a journey from now to then. Then as more refined perceptual apparatus and more refined systems of moving animal bodies arose, a steady conquest of dimensionality occurred, the movement of animals onto the land and so forth.

Then with the advent of memory — and memory must be mediated by language except at a very crude,

instinctual level — memory is a time binding function. It's a way of somehow taking the past and calling up its essential properties so that they are copresent with the given moment of experience. It's one thing at the level of the song and dance of preliterate peoples, but once you begin to chisel stone and write books then you're into the epigenetic domain in a big way. Once you cross the threshold into the world of electronic media, once you achieve powered flight, once you can hurl instruments outside of the solar system, these are time binding functions. The alchemical intent, recall, was to accelerate nature's intent toward perfection, and the alchemists all believed that nature was growing toward a state of unity and perfection, that given millions and millions of years everything would turn to gold, everything would find its way toward the Plotinian One.

Now we live in a world that appears to be on the brink of its own death or extinction, and the reason we make that assumption is because our bridges are burning behind us. We see no way back to the world of the hunting and gathering pastoralists of the high Paleolithic or the Saharan grasslands. We see no way back to the Gothic piety of a Europe with under 30 million people in it. Our bridges are burning, and our religions — Islam, Judaism, Christianity — the major Western religions persistently insist that we are caught in a tightening spiral of ever-increasing speed that is carrying us toward an unimaginable confrontation with something which they call God, the Second Coming, the messiah, you name it. As coolheaded a rationalist as Arnold Toynbee, when he sat down to write *A Study of History*, finally had to face the question, "What is history for?" and the best he could come up with is that history must be about the entry of God into the domain of three-dimensional space.

Well, we don't know what God is. Let's not call it God, let's call it the philosopher's stone, let's call it the Sophic Hydrolith, and I believe that the chaos of our world, the apocalyptic intuition that informs our religions and our dreams is because ahead of us in time, and now not that far ahead of us in time, is something which, taking a page from the mathematical concern called dynamics, we can call an attractor. The attractor lies ahead of us in time. Universal process is not driven by a downward cascade of Cartesian casuistry. That's the scientific notion and it leads to a universe of entropy and heat death millions of years in the future, but what we see around us is a continuing and accelerating complexification as human beings, machines, ecosystems, the solar system itself is beginning to knit itself into a tighter and tighter organization. I believe that alchemy provides the best metaphors for understanding this. Nature is the great alchemist par excellence and we, as its minions through history, are accelerating the condensation of being toward the unimaginable so that in my system, my way of thinking, there's ultimately a symmetry break with ordinary history. I call it all kinds of different things, but here this morning: the transcendent Other.

The transcendent Other casts an enormous shadow across the lower-dimensional landscape of time. The stirring of the earliest life forms in the Devonian seas caught the call and every step that has been taken since then has been ever quicker toward the transcendental Other. It beckons us, and history is haunted by this thing. History is the shock wave of eschatology. History is a process that lasts, let's be generous, 25,000 years, the wink of an eye in geological time. In that 25,000 years religious rise and fall, governmental systems, teachers come and go, and there is a sense of being caught in a whirlpool that is spinning us toward fusion with the unimaginable. This is why the skies of Earth are haunted by flying saucers. They aren't coming from other solar systems, they are scintillas — remember this alchemical term, sparks — they are scintillas being thrown off from the alchemical quintessence which lies like a great attractor at the end of time. The purpose of science and techne and electronic media and information transfer and all of this stuff is to knit us together, to dissolve our boundaries and to bring us to a point of singularity where language fails, where we lean over meaning's edge and feel the dizziness of things unsaid.

This lies now, I believe, within our lifetimes. Within the lifetime of most of us this is actually going to break through. I'm like one of those people carrying a sign that says, "Repent, for the end is near." It's as nutty a position as you can possibly hold. That's why I suspect it has a reasonable chance of being dead on. That is the point of talking about alchemy and this melding, the production of the quintessence and all that. It is because we are a gnat's eyelash away from a full confrontation with the transcendent Other. Our dreams are haunted by it, our reveries are filled with it. If we take a psychedelic drug, it's revealed before us in all its splendor. This is the force that is pulling us inexorably toward completion.

I remember once in a psilocybin trance I expressed concern about the state of the world and the nous spoke, the Logos spoke, and it said, "No big deal, this is what it's like when a species prepares to depart for the stars." We are in the birth canal of a planetary birthing process, and as you know, if you come upon a birth in progress you would never dream that this is the culmination of a natural process. It looks like a catastrophe of some sort. There is moaning and groaning and screaming and thrashing and blood is being shed and there is a feeling that the walls are closing in, and yet it is scripted into each of us as a microcosmic reflection of the completion of human history — and not only human history — because we are simply the hands and eyes of all life, all process on this planet.

The Gnostics believe that the earth is like an egg and that a moment will come when the egg must be split asunder. I love to quote the Grateful Dead, "You can't go back and you can't stand still. If the thunder don't get you then the lightning will." That is what we are being funnelled toward, that is the message of alchemy. That is the quintessence and perfection of the human enterprise, the biological enterprise. I like to recall the Irish toast, "May you be alive at the end of the world," and we have a real crack at it. It's not a pessimistic vision. It's the most optimistic vision that one can suppose, and I think that's where I'd like to leave it this morning.

Terence's ideas are free, but his words and works belong to his children and legal heirs. People who wish to use Terence's words must seek permission through [Lux Natura](#)

Terence McKenna--Lectures on Alchemy Well, it is a small group and this was my intent by focusing on the Hermetic Corpus and alchemy. I've just gotten tired of talking about psychedelic drugs and always saying the same things over and over again, nevertheless it's a challenge to go outside my own ballywick. I mean I've had an interest in hermeticism and alchemy since I was about 14 and read Jung's psychology and (of) alchemy and it opened for me the fact of the existence of this vast literature, a literature that is very little read or understood in the modern context. The Jungians have made much of it, but to their own purposes and perhaps not always with complete fidelity to the intent of the tradition. We'll talk a lot about the Jungian approach but there are other approaches even within the 20th century. I believe, since I don't have the catalog I'm not absolutely certain, but I believe the catalog urged you to read Giordano Bruno and the Hermetic Tradition by Dame Frances Yates and this is, though Frances Yates scholarship is very controversial, I think that to get an overview of the landscape her book is probably the best single book between covers. It's not pleasing to some factions and we can talk about that, I mean, we will probably discover within the group all strains of alchemical illusions and delusions that have always driven this particular engine, but I thought to get one book that sort of covered the territory that was a good one to

start with. Well then I found out that it's very hard to get this book. I didn't realize that because it's been sitting on my shelf for years. Richard Bird found a reprint at the Bodhi Tree. I wasn't aware of this particular edition so, though probably none of you brought it with you in heavily underlined form, if after this weekend you want to try and get it, it is available and if you can't get that edition, why, a good book service can probably come up with the first edition which is Routledge Kegan Paul. I wouldn't hold a weekend like this simply to go over a body of ancient literature if I didn't think it had some efficacy or import for the modern dilemma and some of you may know the song by the Grateful Dead in which the refrain is "I need a miracle every day." I think any reasonable person can conclude that the redemption of the world, if it's to be achieved, can only be achieved through magic. It's too late for science. It's too late for hortatory politics. Well, it's very interesting - every ancient literature has its apocalypses and in the hermetic literature there is a prophecy, I think it's in book two but that really doesn't matter, and the prophecy is that a day will come when men no longer care for the earth and at that day the gods will depart and everything will be thrown into primal chaos and this prophecy was very strongly in the minds of the strains of non-Christian thought that evolved at the close-at the centuries of closure-of the Roman Empire. When you look back into historical time it's when you reach the first and second centuries after Christ that you reach a world whose psychology was very much like the psychology of our own time. It was a psychology of despair and exhaustion. This is because Greek science which had evolved under the aegis of democratian atomism and Platonic metaphysics had essentially come to a dead end in those centuries. We can debate the reasons why this happened. An obvious suggestion would be that they failed to develop an experimental method and so everything just dissolved into competing schools of philosophical speculation and a profound pessimism spread through the Hellenistic world and out of that pessimism and in the context of that kind of universal despair which attends the dissolution of great empires a literature was created from the first to the fourth centuries after Christ which we call the Hermetic Corpus or in some cases the Trismegistic Hymns. Now this body of literature was misunderstood by later centuries, especially the Renaissance, because it was taken at face value and assumed to be at least contemporary with Moses if not much older. So the Renaissance view of Hermeticism was based on a tragic misunderstanding of the true antiquity of this material and there are people, hopefully none in this room, who still would have us believe that this literature antedates the Mosaic Law, that it is as old as Dynastic Egypt. But this is an indefensible position from my point of view. In the early 16th century two men, a father and son, Issac and Marik Casaubon, showed through the new science of philology, that this material was in fact late Hellenistic. Now, I've always said that I am not a Classicist in the Viconian sense, in the sense that there is a certain strain of thought that always I wants to believe that the oldest stuff is the best stuff. This is not the case to my mind. To my mind what is amazing is how recent everything is. So I have no sympathy with the fans of lost Atlantis or any of that kind of malarkey because to me what is amazing is how it all is less than 10,000 years old. Anything older than 10,000 years puts us into the realm of an aceramic society relying on chipped flint for it's primary technology. What the Hermetic Corpus is is the most poetic and cleanly expressed outpouring of ancient knowledge that we possess. But it was reworked in the hands of these late Hellenistic peoples and it is essentially a religion of the redemption of the earth through magic. It has great debt to a tradition called Sevillian which means to mean Mandeism and Mandeism was a kind of proto-Hellenistic gnosis that laid great stress on the power of life, Zoa, Bios, and in that sense it has a tremendously contemporary ring to it. We also are living in the twilight of a great empire, and I don't particularly mean the American empire, I mean the empire of European thinking created in the wake of the Protestant Reformation and the rise of modern industrialism, the empire, in short of science. Science has exhausted itself and become mere techni. It's still able to perform its magical tricks, but it has no claim on a metaphysic with any meaning because the program of rational understanding that was pursued by science has pushed so deeply into the phenomenon of nature that the internal contradictions of the method

are now exposed for all to see. In discussing alchemy especially we will meet with the concept of the *coincidentia apositorum*-the union of opposites. This is an idea that is completely alien to science. It's the idea that nothing can be understood unless it is simultaneously viewed as both being what it is and what it is not and in alchemical symbolism we will meet again and again symbolical expression of the *coincidentia apositorum*. It may be in the form of a hermaphrodite, it may be in the form of the union of soul and Luna, it may be in the form of the union of Mercury with lead, or with sulphur, in other words alchemical thinking is thinking that is always antithetical, always holds the possibility of by a mere shift of perspective its opposite premise will gain power and come into focus. I think it was John, when we went around the circle, who mentioned his interest in shamanism. There's a wonderful book called *The Forge and the Crucible* by Mircea Eliade in which he shows that the shaman is the brother of the smith, the smith is the metalurgist, the worker in metals, and this is where alchemy has its roots. In a sense, alchemy is older than the *Trismegistus Corpus* and then it is also given a new lease on life by the philosophical underpinings which the *Corpus Hermeticum* provides it. Alchemy, the word alchemy, can be traced back to mean Egypt or a blackening and in its earliest strata it probably refers to techniques referring to dying, meaning the coloring of cloth, and gilding of metals, and the forging and working of metal. I mean, we who take this for granted have no idea how mysterious and powerful this seemed to ancient people and in fact it would seem so to us if we had anything to do with it. I mean how many of us are welders or casters of metal. It's a magical process to take for instance cinnibar, a red, soft ore and by the mere act of heating it in a furnace it will sweat liquid Mercury onto its surface. Well, we have unconsciously imbibed the ontology of science where we have mind firmly separated out from the world. We take this for granted, it's effortless, because it's the ambience of the civilization we've been born into but in an earlier age, and some writers would say a more naive age, but I wonder about that, but in an earlier age mind and matter were seen to be alloyed together throughout nature so that the sweating of mercury out of cinnibar is not a material process, it's a process in which the mind and the observations of the metalworker maintain an important role, and let's talk for a moment about mercury because the spirit Mercurius is almost the patron deity of alchemy. You all know what mercury looks like-at room temperature it's a silvery liquid that flows, it's like a mirror. For the alchemists, and this is just a very short exercise in alchemical thinking, for the alchemists mercury was mind itself, in a sense, and by tracing through the steps by which they reached that conclusion you can have a 2 taste of what alchemical thinking was about. Mercury takes the form of its container. If I pour mercury into a cup, it takes the shape of the cup, if I pour it into a test tube, it takes the shape of the test tube. This taking the shape of its container is a quality of mind and yet here it is present in a flowing, silvery metal. The other thing is, mercury is a reflecting surface. You never see mercury, what you see is the world which surrounds it, which is perfectly reflected in its surface like a moving mirror, you see. And then if you've ever, as a child, I mean I have no idea how toxic this process is, but I spent a lot of time as a child hounding my grandfather for his hearing aid batteries which I would then smash with a hammer and get the mercury out and collect it in little bottles and carry it around with me. Well, the wonderful thing about mercury is when you pour it out on a surface and it beads up, then each bead of mercury becomes a little microcosm of the world. And yet the mercury flows back together into a unity. Well, as a child I had not yet imbibed the assumptions and the ontology of science. I was functioning as an alchemist. For me, mercury was this fascinating magical substance onto which I could project the contents of my mind. And a child playing with mercury is an alchemist hard at work, no doubt about it. Well, so then, this is a phenomenon in the physical world and then mind is a phenomenon in the Cartesian distinction, which is between the *Res Extensa* and the *Res Verins*. This is the great splitting of the world into two parts. I remember Al Wong once said to me, we were talking about the yin yang symbol, and he said you know the interesting thing is not the yin or the yang, the interesting thing is the s shaped surface that runs between them. And that s shaped surface is a river of alchemical mercury. Now, where the alchemists saw this river

of alchemical mercury is in the boundary between waking and sleeping. There is a place, not quite sleeping, not quite waking, and there there flows this river of alchemical mercury where you can project the contents of the unconscious and you can read it back to yourself. This kind of thinking is confounding to scientific thought where the effort is always to fix everything to a given identity and a given set of behaviors. Now, the other hermetic perception that is well illustrated by just thinking for a moment about mercury is the notion, and this is central to all hermetic thinking, of the microcosm and the macrocosm. That somehow the great world, the whole of the cosmos is reflected in the mystery of man, meaning men and women, it's reflected in the mystery of the human mind/body interface. So, for an alchemist, it makes perfect sense to extrapolate from this internal, what we call internal psychological processes, to external processes in the world. That distinction doesn't exist for the alchemist, and let me tell you, the longer I live the more I am convinced that this is absolutely the truth. The myth of our society is the existential myth that we are cast into matter, that we are lost in a universe that has no meaning for us, that we must make our meaning. This is what Sartre, Kierkegaard, all those people are saying, that we must make our meaning. It reaches its most absurd expression in Sartre's statement that nature is mute. I mean, this is as far from alchemical thinking as you can possibly get because for the alchemist nature was a great book, an open book to be read by putting nature through processes that revealed not only its inner mechanics, but the inner mechanics of the artifex (person performing experiment)-the person working upon the material, in other words, the alchemist. Well, in other contexts I've talked about the importance of language and how our world is made of language and part of the problem in understanding alchemy is that the language is slipping out of our reach. We are so completely imbued with the Cartesian categories of the Res Verins, the world of thought, and the Res Extensia, the world of three dimensional space, and causality, and the conservation of matter and energy, and so forth that in order to do more than carry out a kind of scholarship of alchemy we have to create an alchemical language, or a field in which alchemical language can take place. Some of you may have been with me a couple of weeks ago in 3 Malibu when Joan Halifax and I debated the roots of Buddhism and I think Joan deserves great credit for saying that Buddhism would never have taken root in America were it not for the psychedelic phenomenon. Not that Buddhism is psychedelic, it in fact is fairly touchy about that, but Buddhism would have gotten nowhere in America had not psychedelics created a context for Buddhist language to take root, And I wager that I would never have gotten to first base with proposing a weekend on alchemy at Esalen were it not understood that psychedelics have prepared people for the notion that mind and world can be pureed together like mercury and sulphur, like the Sophic waters, to create a new kind of understanding because otherwise modernity has fixed our minds in the category of Cartesian rationalism and so I will not claim, and do not in fact think it's so, that there was anything overtly psychedelic in the sense of pharmacologically-based about alchemy. When we look back through the alchemical literature there's very little evidence that it was pharmacologically driven. Only when you get to the very last ademptions of the alchemical impulse in someone like Paracelsus do you get the use of opium. But it is interesting that the great drugs of modern society were accidentally discovered by alchemists in their researches; distilled alcohol is a product of alchemical work and then, as I mentioned, opium was very heavily used by the Peracelsian school. But what they possessed was an ability to liquify their mental categories and then to project the contents of the mind onto these processes and read them back. Now this is what made alchemy so fascinating to the Jungian school because the Jungians were discovering the unconscious and they realized, before Jung's involvement with alchemy, that the best material for psychotherapy to work upon was dreams and mythology and these were the two poles of the data field that the discovery of the unconscious was working on. Well then Jung had the prescience to realize that alchemy, which to that point, as the gentleman over here said, had been dismissed as a naive effort to turn base metals into gold-this is the first fiction that you have to absolutely purge from your mind, the only alchemists who ever tried to turn base

metals into gold were charlatans, the so-called puffers. They were called that not only for their exaggerated speech but for their use of bellows to drive their fires. Alchemy has always had a core of true adepts and then a surround of misguided souls and outright con artists who were trying to change base metals into gold. Now, it's interesting that science, in its naivety, in the 20th century has actually completed the program of psuedo-alchemy. You can, if you have a sufficiently powerful nuclear reactor, change lead into gold. I mean, the cost is staggering. It has no economic importance whatsoever but it can be done by bombarding gold with a sufficient amount of heavy particles. Lead, you can change it into gold, but this is not what the original intent was. In fact, when we look at the history of 20th century science we will see that, in a way, it's a misunderstanding of what the alchemical goals were to be and, one by one, it has done these things that were stated goals of the alchemists except that the alchemists always spoke in similies and in a secret control language that was symbolic. O.k., now, another point that was brought up in going around the circle was the externalization of the soul and what we're trying to do in this weekend is study and talk about the idea of redeeming the world through magic. And how is this to be done? Well, the philosopher's stone is a complex of ideas that, no matter how you divide it, no matter how you slice it, it's very difficult to hold the pith essence of this concept, but what it really comes down to is the idea that spirit is somehow resident in matter in a very diffuse form. The goal of hermetic thinking and later alchemy is the concentration and redemption of this spirit, a focusing of it, a bringing of it together. This is an idea that was common in the Hellenistic world not only to hermetic thinking but also to Gnosticism. Gnosticism is the idea that somehow the pure, holy, real light of being was scattered through a universe of darkness and of Saturnine power and that the goal is that by a process which we can call yogic or alchemical or meditative or moral/ethical, the light must be gathered and concentrated in the body and then somehow released and redeemed. All esoteric traditions, East and West, talk about the creation of this body of light and we will not, in this weekend, talk very much about alchemy, non-western alchemy, Taoist and Vedic alchemy, but in those 4 systems too the notion is about the creation of this vehicle of light. This is one metaphor for the externalization of the soul. The philosopher's stone is another and I will challenge you to try and imagine what the achievement of the philosopher's stone would be like because it's in trying to think that way that you begin to dissolve the categories of the Cartesian trap. So, image for a moment an object, a material, which can literally do anything. It can move across categorical boundaries with no difficulty whatsoever. So what do I mean? I mean that if you possess the philosopher's stone and you were hungry, you could eat it. If you needed to go somewhere you could spread it out and sit on it and it would take you there. If you needed a piece of information, it would become the equivalent of a computer screen and it would tell you things. If you needed a companion, it would talk to you. If you needed to take a shower you could hold it over your head and water would pour out. Now, you see, this is an impossibility. That's right, it's a *coincidencia apositorum*. It is something that behaves like imagination and matter without ever doing damage to the ontological status of one or the other. This sounds like pure pathology in the context of modern thinking because we expect things to stay still and be what they are and undergo the growth and degradation that is inimical to them, but no, the redemption of spirit and matter means the exteriorization of the human soul and the interiorization of the human body so that it is an image freely commanded in the imagination. Imagination. I think this is the first time I've used this word this evening. The imagination is central to the alchemical opus because it is literally a process that goes on the realm of the imagination taken to be a physical dimension. And I think that we cannot understand the history that lies ahead of us unless we think in terms of a journey into the imagination. We have exhausted the world of three dimensional space. We are polluting it. We are overpopulating it. We are using it up. Somehow the redemption of the human enterprise lies in the dimension of the imagination. And to do that we have to transcend the categories that we inherit from a thousand years of science and Christianity and rationalism and we have to re-empower and re-encounter the mind and we can do this psychedelically, we can do this

yogically, or we can do it alchemically and hermetically. Now there is present in the world at the moment, or at least I like to think so, an impulse which I have named the archaic revival. What happens is that whenever a society really gets in trouble, and you can use this in your own life-when you really get in trouble-what you should do is say "what did I believe in the last sane moments that I experienced" and then go back to that moment and act from it even if you no longer believe it. Now in the Renaissance this happened. The scholastic universe dissolved. New classes, new forms of wealth, new systems of navigation, new scientific tools, made it impossible to maintain the fiction of the Medieval cosmology and there was a sense that the world was dissolving. Good alchemical word-dissolving. And in that moment the movers and shakers of that civilization reached backwards in time to the last sane moment they had ever known and they discovered that it was Classical Greece and they invented classicism. In the 15th and 16th century the texts which had lain in monasteries in Syria and Asia Minor forgotten and untranslated for centuries were brought to the Florentine council by people like Gemistos Placo(sp?) and others and translated and classicism was born-its laws, its philosophy, its aesthetics. We are the inheritors of that tradition but it is now, once again, exhausted and our cultural crisis is much greater. It is global. It is total. It involves every man, woman and child on this planet, every bug, bird and tree is caught up in the cultural crisis that we have engendered. Our ideas are exhausted-the ideas that we inherit out of Christianity and its half-brother science, or its bastard child science. So, what I'm suggesting is that an archaic revival needs to take place and it seems to be well in hand in the revival of Goddess worship and shamanism and partnership but notice that these things are old-10,000 years or more old-but there was an unbroken thread that, however thinly drawn, persists right up to the present. 5 So the idea of this weekend is to show the way back to the high magic of the late Paleolithic, to show that there were intellectual traditions, there were minority points of view that kept the faith, that never allowed it to die. And, to my mind, this alchemical, hermetic, Gnostic, Egyptian, Caldean thread is the thread and if we unravel it with sufficient care and attention then we can build a bridge from the otherwise nearly incomprehensible high magic of the late Paleolithic. We can get it as near to ourselves as John Dee, who died in 1604. We can discover that it's no further away from us than the beginning of the 30 years war and, for my money, after that, it gets pretty mucked up. I mean, after Ulias Levy, who's already waffling, I'm not very interested in the occultism of the 17th, 18th and 19th century but it's not necessary because scholarship gives us the Caldean oracles, the Trismegistic Hymns, the library at Nag Hammadi, and so forth and so on. So my impulse is to, in the most austere sense, repopularize, reintroduce this kind of thinking so that people can live it out. Then, step, by step, we can evolve our language and evolve our understanding to make our way back to the garden, back to Eden. It's occurred to me recently, you know it's said that Christ opened the doors to paradise, yes, but he closed the doors to Eden and paradise is a very airy place where everybody sits around on clouds strumming their lyres. I think that what we want to do is make our way back to the alchemical garden. That's where our roots are. That's where meaning is. Meaning lies in the confrontation of contradiction-the coincidencia apositorum. That's what we really feel, not these rational schemas that are constantly beating us over the head with the "thou shalt" and " thou should." but rather a recovery of the real ambiguity of being and an ability to see ourselves as at once powerful and weak, noble and ignoble, future-oriented, past-facing. We each need to become Janus-based(?) and to incorporate into ourselves the banished contradictions of being that so haunt the enterprise of science. We can leave that behind and when we do we reclaim authentic being. And authentic being, make no mistake about it, is what alchemical gold really is. That's what they're talking about-authentic being. (question from the group): So right now we're lead? That's right, we're Saturnine and we'll talk about Saturn and Pluto and all of that. Yes, tomorrow we'll talk about the stages of the alchemical opus and though the stages are many and multifarious, it all begins in what is called the negro, the blackening, the depths of the leaded, Saturnine, chaotic, fixed place. And that's where we have been left by science and modernity and so forth

and so on. That's where the alchemist loves to begin. That's where he or she stokes the fire and begins the *dissolucio et coagulatio* that leads to the appearance of the stone. I'll show you some books and this is by no means exhaustive. The literature on hermeticism and alchemy is vast and I could have brought 5 or 6 boxes of this size from my own library. This a smattering. It doesn't mean that what I show you is the best. It simply tries to spread over a large area. Oh, someone put this here. This is a new novel that's just been published by Lindsay Clark called *The Chemical Wedding* and I see last week it was number 10 on the New York Time's best sellers list which is astonishing for such an obscure subject. It's a retelling of a famous incident in alchemy in the 19th century when a woman named Mary Alice Datwood, who had a very, very close relationship to her father, Dr. South, and the two of them worked together, she on a text, he on a long poem and to make a long story short, eventually they decided to destroy both the poem and the book feeling that they had said too much and given the secret away—at least that's one version. So this is fictionalized retelling of that incident intercut with a modern cast of characters very clearly modelled on the poet Robert Graves. So if you like to absorb your information in a fictionalized form, this is a wonderful book. John Borman the movie director recently optioned this book—the guy who made "The Emerald Forest" and "Excalibur" so we may have an alchemical movie downstream, a year or two. 6 A number of compendiums of alchemical texts have been published over the centuries and if you wish to study alchemy you have to obtain these. If you're fortunate enough to read French you should read Vesputiare and Berthelo. They collected alchemical texts into encyclopedic-sized volumes but unfortunately these have never really come into English. One that did come into English is the *Museum Hermeticum Amplificarum et Theatrum*, I think, which A.E. Waite, who some of you may know for his role in the Golden Dawn, collected. There are about 40 alchemical texts and all the greats are in here: Lull, Vilanova, Michael Maier, Basil Valentine, Kramer, Edward Kelly and so on and so forth. The place to begin, I think, is obviously with the question "Who is Hermes Trismegistus?" What are we talking about here? I mean, this sounds so incredibly exotic to people. The Renaissance had the concept of what it called the *Presqui Poaloque* (sp?) and if my Latin and Greek irritates you, you have to understand you're dealing with a boy from a coal mining town in Colorado, so I do mangle these things. The *Presqui Paoloque* were Orpheus, Moses, and primarily Hermes Trismegistus. Hermes Trismegistus was the primary source, from the point of view of the Renaissance, of this whole mysterious tradition and, you recall from last night's lecture, this is based on a misunderstanding. The Renaissance believed that Hermes Trismegistus was older than Moses. We know now, thanks to Issac and Marik Casaubon, two philologists of the early 17th century, that definitely the Hermetic corpus was composed between the first and second centuries after Christ. The method of the Casaubons was to examine the philosophical language of the *Corpus Hermeticum* and show that there were words and phrases there that were post-Platonic and derivative of philosophers whose dates we have fully in hand. Now, if you go to an occult bookstore you will find that, to this date, this error persists. There are people who still want to claim that this stuff is older than dyanstic Egypt. There are even books, I was in Shambala weeks ago, claiming to teach you how to change lead into gold. Well, from my point of view this just evokes a small smile. The old errors persist. The Puffers are still at it. But what Hermes Trismegistus is is a character who appears in many guises in these hermetic dialogs. The hermetic hymns are usually couched in the form of dialogs between Hermes and his son Thoth and Thoth takes the position of the uninitiated ingenue who is sitting at the feet of the master. Thoth asks questions: what is the true nature of the world, what is the true nature of man, and Hermes answers and the general form of these texts, with exceptions, because there are 20 of them, is an intellectual dialog which builds to an ecstatic revelation and then in the wake of the ecstatic revelation there is a hymn of praise to Hermes Trismegistus. Trismegistus means thrice-blessed and is sometimes called Hermes Triplex to distinguish this Hermes from all the other Hermes of early, middle and late Greek thinking. Hermes is of course the messenger god, the god of scribes. The reason this Ibis-headed being holding a staff is

embossed on the cover of each of these books is because this is how Hermes Trismegistus, Thoth Hermes was imagined. He was associated with the scribe god of the Egyptian pantheon. The two distinguishing factors that stand out, at least for me, that I think you need to incorporate into your thinking about hermeticism, two very important concepts. The first is the divinity of human beings-an extraordinarily radical idea in the context of late Hellenistic thinking. We all operate under the spell of the concept of the fall of man. Man is an inferior being, errors were made in the Garden of Eden and that we are far, far from the nature of divinity. All magic, and all magic in the West is derivative from this tradition, takes the position that man is a divine being, men and women are divine beings. The Corpus Hermeticum actually refers to man as God's brother and this is a double-edged perception. It gives tremendous dignity to the human enterprise but it also raises the possibility of the error of pride and hubris. 7 In the Renaissance, Marcello Ficino boiled this notion down to the aphorism "man is the measure of all things." And you may notice that this is the position of science, that man is the measure of all things, that it is up to us, we can decide the course of the cosmos. All magic stems from this position. This is why the church was so concerned to stamp out magic-because it assigns man an importance that the church would rather reserve for deity. So that's the first great division between Christian thinking and hermetic thinking. An entirely different conception of what human beings are and when we get into the text, I'll read you some of these passages. Now, the second distinguishing factor, and notice that position on man empowers tremendous freedom, man is the measure of all things, the second distinguishing factor in hermeticism is the belief that we can control fate, that we can escape from cosmic fate. The late Hellenistic mindset, and what you get in the Gnostics, is the belief that because of astrology, because of the stars, we are subject to control from these exterior forces. In most Gnostic thinking the whole concern is to somehow evade what is called the hemarmeny (sp?), cosmic fate. And in the Gnostic systems, the only way it can be done is by ascending through the shells of cosmic, ordering forces-the archons, the planets, the planetary demons, and so forth and so on, and then beyond the hemarmeny, which is actually thought of as a place in space that you burst through when you transcend fate. What the hermetic thought is is that these fates become personified as the decans, as stellar demons, and then it is held that there is a magic, a magical system, which is possible where you can call these archangels to your side and work with them and not be subject to the inevitable working of the cosmic machinery and this burst like a revelation over the late Hellenistic world because there was such philosophical and emotional and political exhaustion that this comes, this is a counterpoint to the message of the New Testament, which is a similar message, that you can be saved in the body, that you can escape the inevitable dissolution and degradation laid upon us by time. So, these are the two distinguishing factors: the divinity of man and the possibility of using magic to evade the machinery of fate. So, I want to read some of the Corpus Hermeticum to you to give you the flavor of it, but before I do, I want to say something about the history of these texts. You're all familiar, more or less I'm sure, with Apuleius' *The Golden Ass*, which is a novel of initiation which is late Roman. Apuleius also put together what is called the *Asclepius* and the *Asclepius* is true hermetic literature that was not lost. It was the only one that was available throughout the Dark and Middle ages. All the rest was lying untranslated in Syrian Monasteries until Gemistus Plethon in 1490 brought these manuscripts to Florence, to the court of the Di Medici and then the translation project began. The only other hermetic material that was accessible throughout the high Gothic period was a book of magic called the *Picatrix*. And the *Picatrix* was probably written in the 1200's although this elicits screams of dissent from the burning-eyed faction. But reason dictates that we consider *Picatrix* 12th century so only the *Asclepius* and the *Picatrix* represented this strain of thought before the 1460's. And the importance of hermetic thinking can be seen by the fact that Gimistis Platho brought Plato to the Florentine council as well as Hermes Trismegistus. And when Marcello Ficino sat down to do this translation work Cosumo Di Medici said "Plato can wait, I'm getting old. You do the Hermetic Corpus first. That's much more important. We'll sort out this Plato business in a

few years." And so it was done. It was completed in 1493 and in 1494 Cosimo died so he never saw the translations of Plato but felt that the Corpus Hermeticum was more important. I mention this to show you the importance that was attached to this stuff. Here is one of the key passages on man's nature. This is from Book one of the Corpus Hermeticum: "But mind the father of all, he who is life and light gave birth to man, a being like to himself and he took delight in man as being his own offspring for man was very goodly to look on, bearing the likeness of his father. With good reason then did God take delight in man for it was God's own form that God took delight in and God delivered over to man all things that had been made." This is the basis of the Ficinian statement man is the measure of things. "And 8 man took station in the Maker's sphere and observed the things made by his brother who was set over the region of fire. And having observed the Maker's creation in the region of fire he willed to make things for his own part also. And his father gave permission having in himself all the workings of the administrators." This is a reference to the angel hierarchy "And the administrators took delight in him and each of them gave him a share of his own nature." So man is the brother of God and a creature at home with the angels. This idea is echoed in the Asclepius which you'll recall was available throughout the Middle Ages. "The range of man is yet wider than that of the demons" meaning the angels - this term is transposable in its hermetic thought "The individuals of the human kind are diverse and of many characters. They, like the demons, come from above and, entering into fellowship with other individuals they make for themselves many and intimate connections with all other kinds" and then the famous passage "man is an honor then, Asclepius, honor and reverence to such a being. Man takes on him the attributes of a god as though he were himself a god. And he is familiar with the demonkind for he comes to know that he is sprung from the same source as they. And strong in the assurance of that in him which is divine, he scorns the merely human part of his own nature. How far more happily blended are the properties of man than those of other beings. He is linked to the gods inasmuch as there is in him a divinity akin to theirs. He scorns that part of his own being which makes him a thing of earth and all else with which he finds himself connected to by heaven's ordering he binds to himself with the tie of his affection." So this is an incredibly radical conception of what it means to be human. So radical that it is unwelcome even in the present context. Notice the modern feeling of this stuff. This is not biblical rhetoric. This is philosophical discourse as we know it and carry it out ourselves. This is a passage on the adept and initiation. Let me see who's speaking here, Thoth speaks to Pimondres, this is book one, "But tell me this too, said I, God said 'let the man who has mind in him recognize himself' but have not all men mind?" And then Pimondres replies " Oh man, said mind to me speak not so, I even mind come to those men who are holy and good and pure and merciful and my coming is a succor to them and forthwith they recognize all things and win the father's grace by loving worship and give thanks to him praising and hymning him with hearts uplifted to him in filial affection." Again the reference to being God's brother in filial affection. "And before they give up the body to death which is proper to it they loathe the bodily senses knowing what manner of work the senses do." This introduces the theme of asceticism. Like the Gnostics, there is in much of hermetic literature a kind of horror of the earth, a desire to ascend and to get away from it. Scott makes the distinction between what he calls pessimistic Gnosis and optimistic Gnosis. And within the 20 texts of the Corpus Hermeticum you get vacillation on this point. In some cases the Mandaean, the Cebian(?) tendency is there and the world soul is invoked and the whole of creation is seen as a living being involved in this soteriological process, this process of salvational mechanics through magic. In other texts this Gnostic horror of matter is strongly stressed. It's very clear that the Hellenistic mind was ambivalent on this point. Even as we are ambivalent on this point. It's a real question, are we here to be the caretakers of the earth or are we strangers in the universe and is our task to return to a forgotten and hidden home no trace of which can be found in the Saturnine world of matter. It's very hard to have it both ways. You're going to have to take a position on that and these people were forced into the same dilemma. There's no middle ground between those two

positions and so that dichotomy, that conundrum, haunted a lot of hermetic thinking. Here is the hermetic creation myth. This is book three, paragraphs one through a few, and you'll see the comparison and similarities with the Christian creation myth but with extraordinary differences. "There was darkness in the deep and water without form and there was a subtle breath, intelligent, which permeated the 9 things in chaos with divine power. Then, when all was yet undistinguished and unwrought, there was shed forth holy light and the elements came into being. All things were divided one from another and the lighter things were parted off on high, the fire being suspended aloft so that it rose unto the air and the heavier things sank down and sand was deposited beneath the watery substance and the dry land was separated out from the watery substance and became solid. And the firey substance was articulated with the gods therein and heaven appeared with its seven spheres and the gods, visible in starry forms, with all their constellations and heaven revolved and began to run its circling course riding upon the divine air. And each god by his several powers set forth that which he was bidden to put forth. And there came forth four-footed beasts and creeping things and fishes and winged birds and grass and every flowering herb, all having seed in them according to their diverse natures for they generated within themselves the seed by which their races should be renewed." And then it goes on to describe the birth of man. This kind of thinking is what alchemy seized upon in it's ambitions. One way of thinking of what alchemy came to attempt is, the thinking went like this - since man is God's brother, the purpose of man is to intercede in time and it was believed that ores, precious metals and things like this grew in the earth. It was a thorough going theory of evolution that reached right down into the organic realm. It was thought that gold deposits in the earth would actually replenish themselves over time. It's passages like this that give permission for that kind of thinking. In line with that, we're now in book four and remember the tone changes slightly from book to book, they were, after all, written over a 300 year period by various people. "You must understand that God is pre-existent, ever existent, and that he alone made all things and created by his will the things that are. And when the creator had made the ordered universe, he willed to set and order the earth also and so he sent down man, a mortal creature made in the image of an immortal being, to be an embellishment of the divine body for it is man's function" - here it comes, the purpose of man according to book four - "for it is man's function to contemplate the works of god and for this purpose he was made, that he might view the universe with wondering awe and come to know its maker. Man has this advantage over all other living beings, that he possess mind and speech. Now speech, my son, God imparted to all men but mind he did not impart to all. Not that he grudged it to any, for the grudging temper does not start from heaven above, but comes from being here below in the souls of those men who are devoid of mind." This introduces the concept of an elect, or a perfectee, a heirarchy of human accomplishment and understanding and this is also basic to Gnosticism. It's not for everyone, they're saying, it's for the pure of heart and what pure of heart means depends on the school you're looking at. For some, it was mathematical accomplishment. For others, it was contact with the logos, for others it was the ability to resist the temptations of the senses. But there was always the sense of the higher and lower possibilities within the human experience. Questions? I'm still back in the last lecture we shared on plant intelligence. So I'm listening to all this divinity of man and wondering where the position of the plant realm or the planning(?) was. There was one section where you read that, so... Yes. This is the opening of book 12 and this is a heavy Mandaean sensitivity, this sensitivity to life. This whole cosmos, and notice how this transcends even the Buddhist point of view because in Buddhism plants have no soul, this is a tremendous failure in the Buddhist perception as far as I'm concerned, o.k., this is book 12 - " Now this whole cosmos, which is a great god and an image of he who is greater and is united with him and maintains its order in accordance with that will, is one mass of life and there is not anything in the cosmos, nor has been through all time, from the first foundation of the universe, neither in the whole, nor among the several things contained within it that is not alive. There is not, and has never been, and never will be in the 10 cosmos, anything that is dead. For it was the father's

will that the cosmos, as long as it exists, should be a living being and therefore it must needs be a God also. How then, my son, could there be dead things in that which is a God, in that which is an image of the father, in that which is one mass of life. Deathness is corruption and corruption is destruction. How then can any part of that which is incorruptible be corrupted or any part of that which is a God be destroyed." And there are other passages. Ah, this is a good one. This is book 18, "For as the sun, who nurtures all vegetation also gathers the first fruits of the produce with his rays as it were with mighty hands, plucking the sweetest odors of the plants, even so we too, having received into our own souls, which are plants of heavenly origin, the efflux of God's wisdom must in return use his service for all which springs up in us." Now, this conception that the human soul is a plant is a unique idea. I don't know of another tradition, Those of us who were in Ojai heard Johannes Wilbur(sp?) talk about how, among the Amazon Indians, the wural(sp?), men actually marry trees. They actually take trees as their wives, a tree, and it is a man's job throughout his life to take care of this tree with the same tenderness and affection which he lavishes on a living wife. This is a more radical conception than that. This is the conception that the most important part of us is a plant. It reminds me of the joke that I occasionally make in these groups, the notion that animals are something invented by plants to carry them from place to place. Well, according to this, that's right on. So, the sensitivity to the vegetative nature is so great that it raises the plant to be the pith essence, the soul of man, the brother of God! So you see the valuation of the vegetative universe is of an extremely radical type. The upper echelon of humanity that was given the mind, was that predetermined at birth or can someone develop a mind? No, it is not predetermined. It is something that is acquired through cultivation of a relationship to, in the hermetic language, nous, the higher mind, and in the Gnostic language logos, the informing spirit. Nothing is predetermined in the hermetic system because through magic we can overcome the energies of cosmic fate. This is the great good news of hermeticism, that we are not subject to fate. We should probably talk a little about this logos concept. This is something which seems very alien to modern people unless they are psychedelically sophisticated. The logos was the sine qua non of Hellenistic religion and what it was was an informing voice that spoke in your head or heart, wherever you want to put it, and it told you the right way to live. You get this idea even in the later Old Testament where it's said that the truth of the heart can be known. It's no great dilemma to know good from evil, you simply inquire of your heart, "is it good or evil?" and you will discover a voice which will tell you and all the great thinkers of this Greco-Hellenistic period sought and cultivated the logos. Plato had his demon. Everyone sought the informing voice of the nous, that's what it's called in Neo-Platonism and then in hermeticism and then in Gnosticism, the logos. For modern people, well no, for me, the only way I've ever had this experience is through the presence of psychedelic substances and then it is just crystal clear, there's just no ambiguity about it. Somehow, it's possible for an informing voice to come into cognition that knows more than you do. It is a connection with the collective unconscious, I suppose, that is convivial, conversational, that just talks to you about the nature of being in the world and the nature of your being in the world. It's puzzling to us because it seems so remote, for us a voice in the head or the heart is pathology and you may know the famous story of, in the first century, some fishermen were off the shore of the island of Argos in the Mediterranean Sea and they heard a great voice from the sky and the voice said, "great Pan is dead." Well, people like Lactantius and Eusebius, these patristic fathers, the people who built Christianity, who took the Gospels and turned them into a world religion, they took this annunciation from the sky of the death of Pan as the annunciation of the change of the Aeon. 11 By the Aeon, I mean these roughly 2,000 year periods that are associated with the equinoctial procession. Do you all understand how this works? That over 26,000 years, the helical rising of the solstitial sun slips slowly from one house to another and around AD100, there's argument because these things are never precise, the age of Pisces began and the previous Aeon ceased and the cosmic machinery, the great gears of the largest scale of the cosmic machinery, clicked past a certain point and into the age of Pisces and this was then taken as very fortuitous

for Christianity because Christ was associated with the sign of the fish and it was seen as a Picsean movement. I believe that it's entirely possible that the logos in that rough moment in time fell silent and it has been silent for 2,000 years so what we have is the exegesis of text and Noetic archeology of the sort we're carrying on here. Now, a phenomenon as trivial and hyped on(?) as channeling can be seen as the reawakening of the logos. The long night of Picsean silence is ending and the spirit of nous is again moving in the world, speaking in the minds of the adepts and the heirophants who have the techniques and the will to connect with this stuff. I don't know how I got off on that. But obviously this kind of literature can be seen as the last message from the fading logos. The last statements before the change of the Aeons rendered this control language very difficult and non-intuitive and somewhat incomprehensible. Reading...you broke off, and I had a puzzlement about the use of the word mind. What, in this context, does this refer to? It's Scott's translation of this word nous. It simply means this universal, permeating intelligence. The statement there is that it is only available to an elite through... Through asceticism and desire, intent. There are proscriptions, they lived a life of purity, although their definitions of purity varied widely. Man is brother of God and yet we have to earn it. This seems kind of a denial of that. That's right. This persists right up to this moment. The quote I always love is from Thomas Hobbes' *Leviathan*. Hobbes was the great theoretician of modern government and social systems and he was basically a paranoid S.O.B. and he says in the *Leviathan* "man to man is likened to an errant beast and man to man is likened to a god." It's absolutely true, you know, our noblest aspirations and our most hideously dehumanizing activities take place in the context of our relationship to other people. This is what the alchemists were trying to do - separate the gold from the dross. They were trying to take the errant beast, and when we look at alchemical art we will see dragons, dogs, pigs, we will see the errant beast and we will see the angelic beings that are trying to be separated out of our nature. This is within each and every one of us. Man to man is likened to a god and man to man is likened to an errant beast. 12 This question has to do with mind. According to my understanding of some of the Platonic tradition and Neo-Platonic thought, this has to do with the divided line in Plato. You can divide that line...into five stages of knowing. You start with the senses as being agency or avenue, knowing something about something like contact... most external form of knowledge...the level above the senses is designated as the instincts, it's an inactive knowing, in that sense a biologically active knowing that we have. The third stage is described as sometimes estimation, this is, an approximation(?), yes, this characterized mainly sort of logical activity and then the next level of cognitive activity is reason and this reason is not the type of reason we normally engage in, it's a very different, a very creative type of activity. Above the reason is what they call intuition or intellect or nous and that's put in as the fifth... And would that be revelation? Reason is a creative activity and one can generate and think things through with creative ability. One goes through activity and stages of the activity and things(?) transpire over time and one comes to complete understanding of the thing one is trying to grasp and sometimes that's described as discursive activity although the logical activity is discursive. So you're moving through a process...pieces, the nous or the intellect of the higher mind grasp things in totality. It doesn't engage in... In reseasonation(?). You raise an important point which further complicates the picture, but it's how it was, folks. The reference here is to Neo-Platonism which is a kind of parallel tradition to what we're talking about. Plato had at least a couple of phases in the evolution of his thinking. The young Plato is a rational thinker but the later Plato, apparently after he fell under the influence of Pythagorean schools, becomes a full-blown mystic and then in the late Roman empire, almost a thousand years after Plato, we have to remember, in our minds these people get squeezed together like they could all have dinner together, but Plotinus is as far from Plato as we are from King Connaught so you have to bear in mind the scale of history. But, so 900 - 1,000 years after Plato a Byzantine school of philosophy arose around Porphyry, Plotinus and Proclus as the major exponents and they worked with the late Plato and elaborated a beautiful mystical cosmology. This is what I did a workshop on here a year ago and many of

those ideas and terms parallel conceptually the stuff in the Corpus Hermeticum and if you're of a certain intellectual bent you may find yourself more comfortable with the Neo-Platonists than this. This tends to be emotional, evocative, poetic and while there's great poetry in Plotinus there's also very tight thinking that goes along with it. And there are other traditions, I'm making it simple for you, there was a whole tradition called the Caldean oracles and this was a collection of 100 or more fragments all of which were the great commentaries of Eusebius in 30 volumes. The Amblicus(?) is one of them. That's all lost, we don't have that material and it is in a way the most mysterious of these traditions because it just didn't survive and it may be that that, the Caldean Oracles is the missing link to push this stuff several centuries back into time because the Caldean Oracles may actually be pre-Platonic. There's considerable evidence of that. But these are very arcane matters. You have to give yourself over to a lifetime of learning these languages and the philology of these languages to penetrate this stuff. Neo Platonism was Byzantine, basically Constantinople. The Hermetic Corpus was largely Alexandrian. There were also Christian Platonists in Alexandria. There were certain centers: Rome, Alexandria, Byzantium, Heliopolos in Egypt was a cult site that was maintained for a very long time. If you're interested in this stuff but don't like 13 to absorb it this way, Flaubert, of all people, the Flaubert of Madame Bovary, wrote an incredible novel called The Temptation of St. Anthony in which he describes second century Alexandria in a fictionalized form and gives you a real flavor for the intellectual complexity of the Alexandrian world. Christianity had not yet gelled, it was many things, so you not only have Gnostics of five or six schools: Simonists, Valentinians, Basilideans and so forth, but you also have Christians, a numbers of cults calling themselves Christians, who were in fierce competition. Docetists, Montanists, and later Nestorians. There were Gymnosophists from India, people who were actually carrying yogic doctrines into the Mediterranean world, plus you then have all the surviving cults of the older Egyptian strata, the Cults of Isis, and Seville, and Dionysus, and Adonis, it just goes on and on. The richness of this intellectual world is very, there's nothing comparable in our experience and it shows the passion with which people were trying to understand the dilemma of a dying world because this is what they were confronted with. The intellectuals of the empire could feel it all slipping through their hands. Flaubert gives a wonderful picture of this. Flaubert has a very romantic streak. It's like smoking hashish, reading this book - the attention to fabrics, architecture, food and odor. And because the subject matter is the temptation of St. Anthony, it's an excuse to describe these temptations in all their sensual richness and erotic kinkiness. It's a wonderful way to absorb this material. Somebody else raised the point of the elitism, of an elite group of people. And if one considers a society like the one you had in Alexandria, or some of the other centers, the only people who really had access to this were first of all people who had money and who were well educated and could read so already you had an elite group... Yes, definitely. What survives from a civilization is it's literatures and these literatures are usually the production of an elite. We have to remember, don't have any illusions about the Roman Empire. I always think of the wonderful description, I don't even know why it's there, Boris Pasternac, in Doctor Zhivago, goes off on a riff about Rome and he describes it as a bargain basement on three floors. This was an empire that lived by human cruelty. It was on the backs of slaves that this airy, intellectual speculation was based. It was a tremendously pluralistic society but that pluralism was maintained by standing armies of enormous size and policies of occupation of enormous cruelty. Because of our relationship to the Christian tradition we're aware of such things as the Zealot revolt of 69 and the reign of Herod Antiochus in Jerusalem, but that was just one little corner of the empire and in Armenia, in Gaul, in Spain, in North Africa, military governments were carrying out outrageous suppressions of native populations, it was not a pretty time to be alive. And what comes down to us then is the yearning to escape. No wonder these people saw the earth as a cesspool and a trap because that's what it was for them. Our own age is very similar. We do not have slavery but we suffer under propaganda -mass manipulation of ideas and the degradation of exploitation of the third world on a scale the Roman

Empire couldn't even dream of. So, there is a great affinity. If any of you are interested in this kind of thing, I highly recommend a book by Hans Jonas called *The Phenomenon of Life*. It's a book of philosophical essays but there's one essay called "Gnosticism and the Modern Temper" in which he shows that once you take Gnosticism and dump all the angels and all the star demons and all the colorful bricabrac of late Roman thinking what you have is a thorough going existentialism completely compatible with Jean Paul Sartre, Jean Genet, and the kind of intellectual despair that characterized the post WWII generation in Europe. Heidegger is thorough going Gnostic in his intentionality, it's just that the language is modern and stripped of this magical thinking and by being stripped of this magical thinking in a way modern, the modern resentment(?) of that state of mind is even more hopeless and disempowering. Fortunately, I think we're moving out of the shadow of that, but I'm 44 years old, I grew up reading those people and it made my adolescence much harder than it needed to be. I mean, my god, there wasn't an iota of hope to be 14 found anywhere. That's why, for me, psychedelics broke over that intellectual world like a tidal wave of revelation. I quoted to you last night Jean Paul Sartre's statement that nature is mute. Now I see this as an obscenity almost, an intellectual crime against reason and intuition. It's the absolute antithesis of the logos and much of our world is ruled by men, older than I am, who are fully connected into that without any question and they just think that the rest of this is just namby pamby ecological softheartedness of some sort. There is no openness to the power of Bios, to the fact of a living cosmos. This is what Rupert Sheldrake is always trying to say. The reinvestiture of spirit into matter, the rebirth of the world soul is a necessary concomitant to what we understand about the real nature of the world. In a way, the theory of evolution, which was born in the 1850s, was the beginning of the turning of the tide because even though the first 100 years of evolutionary theory was fantastically concerned to eliminate teleology, eliminate purpose, nevertheless nobody ever understood that except the hardcore evolutionists. To everyone else, evolution meant ascent to higher form. I once heard someone say "if it doesn't have to do with genes, it ain't evolution." Well, that's a tremendously limited view of what evolution is. The inorganic world is evolving, the organic world is evolving and there the currency is genes but also the social and intellectual world of human beings is evolving and there the currency is not genes but means so that idea carries with it the implication of ascent to higher form and correctly broadened and understood becomes permission to optimism and to the kind of hope that these folks were trying to articulate. ...the concept of mind as something that is attainable and not necessary is a separation and therefore for me it's a lie and so I want ...I don't know, I assume there are many different definitions of mind, I don't mean functions of mind, I mean definitions of mind, and I'm toying now with the notion of meshing of the notion of mind and the notion of logos. For logos is, and it seems to me that mind is, if it is available through trial then we're back in a separation...and this is to me a false separation Yes, you're right, but it's a separation necessary for philosophical discourse, that's why philosophical discourse is not the top of the mountain. Language itself is the process of making distinctions that are false. This is why all language is a lie. This is why the ultimate truth lies in something unspeakable but the ascent to the philosophical is through this kind of philosophical analysis. Language is only the vehicle... Well it's the vehicle but eventually there's no road and you have to park the vehicle and get out and walk, and that's the journey. Plotinus, the great Neo Platonist has this wonderful phrase. He calls the mystical experience "the flight of the alone to the alone." I love this image. It's so uncompromising and it's about as true as something can be and still move in the realm of language, because it's saying: finally words fall away and finally there is only that which cannot be said. Many of you who've stuck with me know that I love to quote this poem by this obscure poet who died in the trenches in France in the first World War, Trumble Stickney, and he wrote a poem called "Meaning's Edge" and the punch line goes like this "I look over meaning's edge and feel the dizziness of the things you have not said," and I think that every one of these weekends, this is the effort - to carry you to the edge of an abyss and then push you over into the dizziness of the things unsaid and they

will always be unsaid. Wittgenstein, God bless him, had the concept of the unspeakable. He said "philosophy operates in the realm of the unspeakable but eventually we must confront that which cannot be said." The dizziness of things unsaid, and there's where real authenticity then flows back into the world of community and speech but it comes from a place of utter silence and unsayability. How could it be otherwise? What hubris would it be to expect that the small-mouthed noises of English could encompass being. That's a primary error that all philosophy chooses to make at the beginning of its enterprise in order to set up shop at all. No, these are lower-dimensional slices of a reality that is ultimately unitary, ineffable, unspeakable, and dazzling. Philosophical discourse is verbal and mental masturbation? Absolutely. Masturbation, because it's, there's a pun here, it's autopoetic, it is completely out of yourself, there is no union with the other and the other is what you're always trying to get to. The other is a common term in these literatures. The other is that which cannot be fully known. I always like to quote the British enzymologist JBS Haldane, who made a wonderful statement. He said, "the universe is not only stranger than we suppose, it is stranger than we can suppose." That's a dizzying perception. It's one thing to think it's very strange. It's another thing to think it's stranger than you can suppose. You may suppose and suppose and suppose and you'll fall so short of the mark that it's absurd. That's what it means to be in the presence of a mystery. The modern word mystery translates out to unsolved problem. That's not what a mystery is. A mystery is not an unsolved problem. A mystery is a mystery and ratiocination(?) can exhaust itself and make no progress with it and that's what's at the core of our being and that was what was at the core of this ancient perception. These were thoroughly modern people. They were shoved up against the same things that tug at our hearts and our minds and our souls and beyond that there's not a whole hell of a lot that you can say about it. I just wanted to add that the idea of the earth as a living organism makes an appearance in psychology at the end of the last century with Gustave Fechner who survives in footnotes of textbooks as the father of experimental psychology. I read a book about the soul life of plants also and that whole part of his work is utterly ignored... influenced anybody but William Jameson This is an idea that will not die but its practitioners end up in footnotes. They do not have a happy fate. Certainly Henri Birkson, with his idea of the *elan vitale*, this is an effort to preserve the idea of a world soul and yet the fate of Birkson, his influence on modern philosophy is certainly minimal. Alfred North Whitehead is my great favorite. I think that he's the cat's pajamas and he has this idea of the living cosmos - that life and vitality extend right down to the electron yet in spite of his mathematical contributions, the fact that he wrote *Principia Mathematica* with Bertrand Russell, Whitehead is not taught. I think there's one university in this country where they take him seriously. Modern philosophy is a desert for my money. Who cares about it? Nobody cares about it. Who's living their life according to the perceptions of modern philosophy. Nobody, as far as I can see. But yes, vitalism was this impulse in biology that persisted right up to the 1920s with embryologists like Driesch and his school and mechanical biology has been at great pains to suppress that. That's why Rupert Sheldrake is such a breath of fresh air, because he can be seen as a person carrying the vitalist message back into science. His new book on the greening of science and nature is nothing more than a manifesto for the re-recognition of the presence of the world soul. What about the Native Americans, their philosophy? Yes, well, Aboriginal people, not only the Native Americans but the tribes of the Amazon, if you live next to nature this is such an overwhelming perception that it's never called into question. But you see we, most of us, trace our civilization to desert dwellers who invented agriculture which lead to surpluses so then we had to build walled enclosures to defend our surpluses from starving neighbors and we're talking 6,000 BC at Jericho for this kind of stuff. So, we have been cut off from the natural mind longer than any other group of people on earth. This is how we're able to carry out the demonic, in the negative sense, reconstruction of the world that we have. If there is a sin then we have sinned. Robert Oppenheimer said beyond all rational argument the physicists have known sin and it's because they reached into the heart of matter without reverence and their greatest trick was to call down

the light that burns at the center of stars and they call it down to the test centers of the deserts and onto the heads of our enemies, if necessary. But this is a cosmic sin, it's an abomination. It's the story of Western Civilization. The first great error was the urbanization, well, I don't know, the first great error, the invention of agriculture was a pretty staggering bad turn, then urbanization and then a piece of bad luck which we didn't need to befall us was the invention of the phonetic alphabet. And with the invention of the phonetic alphabet we moved away from symbolism and lost even the symbolic connection to the world and that happened with the evolution of Demotic Greek and even earlier languages - linear A and B and that kind of stuff. McLuhan talks a lot about this. We live in a universe so alienated that we can barely conceive of the way back but hopefully. Archeology is a wonderful thing. We are actually digging into the stratigraphic layers of our past and reconstructing these ancient intellectual machines and setting their gears going and seeing how it works and hopefully when we recover, we're like amnesiacs, people who don't remember who they are or where they came from, we just wander mumbling through the streets of our cities foraging through garbage cans and frightening other people and yet if we could wake up, and archeology and the rebirth of an awareness of the Goddess and the pushing of science to the point where it's irrational foundations become clear - this is all part of an awakening, an archaic revival which will then make us part of the living world and not a disease, a parasitic force upon it. It struck me that one comment you read there talked about the creation of the world. It said the elements were brought forth and at first I was thinking earth, air, fire, and water but I was thinking in relationship to some other...of life that...being, life, and intellect and being, life, and intellect are what that come into manifestation from the one who pours forth the world and creates the world and those are the first elements that come into existence - being, life, and intellect. Life itself is an element of the cosmos as it were. It's an irreducible aspect of things and you're paying respect to the fact that life is an omnipresent thing in the foundation of things. It's one of the elements. I think that in one of the other things I read it said that everything that exists, that ever has been, that ever will be, is alive. I'll read a bit more of this. This refers to the theme I touched on a little bit last night of the importance of the imagination and how I think that our destiny lies in the imagination. "God is ever existent and makes manifest all else. But he himself is hidden because he is ever existent. He manifests all things but is not manifested. He is not himself brought into being in images presented through our senses but he presents all things to us in such images. It is only things which are brought into being that are presented through sense. Coming into being is nothing else than presentation through sense." This is so thoroughly modern, it's staggering. For 1,500 years people couldn't say anything that clearly. "It is evident then that he who alone has not come into being cannot be presented through sense and that being so he is hidden from our sight. But he presents all things to us through our senses and thereby manifests himself through all things and in all things and especially to those to whom he wills to manifest himself. For though thought alone can see that which is hidden inasmuch as 17 thought itself is hidden from sight and if even the thought which is within you is hidden from your sight, how can he, being in himself, be manifested to you through your bodily eyes. But if you have power to see with the eyes of the mind then, my son, he will manifest himself to you, for the Lord manifests himself ungrudgingly throughout all the universe and you can behold God's image with your eyes and lay hold on it with your hands." To my mind, this is permission for the psychedelic experience. We lay hold of the ineffable through the eyes. "If you wish to see him, think on the sun, think on the course of the moon, think on the order of the stars. The sun is the greatest of the gods in heaven. To him as to their king and overlord, all the gods in heaven yield place and yet this mighty god, greater than earth and sea, submits to have smaller stars circling above him. Who is it then, my son, that he obeys with reverence and awe. Each of these stars too is confined by measured limits and has an appointed space to range in. Why do not all the stars in heaven run like and equal courses? Who is it that has assigned to each its place and marked out each for the extent of its course." And then it goes on and on. And then here is an amazing modern anticipation of modernity. "Would that it were possible for

you to grow wings and soar into the air. Poised between earth and heaven you might see the solid earth and the fluid sea and the streaming rivers, the wandering air, the penetrating fire, the courses of the stars and the swiftness of the movement with which heaven encompasses all. What happiness were that, my son, to see all these borne along with one impulse and to behold Him who is unmoved moving all that moves and Him who is hidden made manifest through his works." This is an image of the planets seen from space. It's absolutely the unified image of our planet. It is, I think, the central image in this early hermetic thing. This is the unifying, this is as close to an image of what godhead is that they were able to reach. This is a shamanic flight that delivers a scientific description of the earth moving in space. This is written AD150. This is book five. Nobody had that in sight until we reach Giordano Bruno and if you read Giordano Bruno and the Hermetic Tradition you know that Bruno was burned at the stake and the reason that he was burned at the stake is because he looked up at the sky and did not see the stellar shells and the angelic hierarchies. Bruno had a mystical experience and when it was over he said, "the universe is infinite. The stars go on forever." That single statement was the intellectual dynamite that destroyed the whole Medieval, Hellenistic, the entire previous cosmological vision was left behind with that single statement. It was such a powerful statement that he had to go to the stake for that. And we have never recovered from that perception. It was a fundamental perception and it occurred because he looked without preconception into the night sky and did not see wheels and demons and angels and shells of cosmic fate and necessity and he just said, that's bullshit, what is there is infinite space, infinite time, the stars are hung like lamps onto the utmost regions of infinity. This, then, inaugurates the beginning of modernity and it's a perception that arose on the foundation of all this earlier thinking. Here's another passage on the imagination. Yes? Is the implication that there's a meditation that one does where one tries to go inside and see this universe on a cosmic scale. Is the implication that their practice was somehow... Well, the practice, we know a lot less about that because there was much secrecy around this. What we have is the philosophical discourses. When we talk about alchemy this afternoon you'll see that there the technique becomes projection onto matter. That you enter into a kind of self hypnosis where, by having what we call naive ontological categories, in other words, not being sure exactly how much of mind is in matter or how much matter is in mind, you can erase the boundary between self and world and project the contents of the unconscious onto chemical processes. What went on in the early stages we don't know. The Trismegistic Hymns are largely as you see them here, philosophical discourses. There was stress on diet and purity. Asceticism was typical of the hermetic approach. In Gnosticism it went one of several ways. There were schools of Gnosticism which were vegetarian and puristic and then, because they felt that man was no part of the universe, that man was somehow hermetically sealed, if you will, hermetically sealed against contamination from the universe, some Gnostic schools said you can do anything you want. You can have any kind of sexual arrangement you want, you can do anything you want. Do not think that you are part of the universe. And so you had Gnostic schools side by side, some orgiastic and quasi-tantric and some ascetic. There were Gnostic sects that, you see because the idea was that light was trapped in matter by the act of procreation, there were Gnostic sects that only practiced forms of sexual union that couldn't lead to union. So there were presumably exclusively homosexual sects. There were sects that only practiced anal intercourse. For them, that was the same as celibacy because the real concern was not to trap any of the light. And I don't seriously advocate this but I think that in our current situation of overpopulation a little dose of this kind of thinking wouldn't be a bad thing. Too much light is trapped in the organic matrix. And so these Gnostic sects that were, for instance, exclusively homosexual or exclusively practiced anal intercourse, of course they were suicide sects. They disappeared very quickly because they could only make converts by a missionary conversion. You didn't have children, you couldn't hand it off. It shows how thorough going their rejection of the world was, how contaminated they felt themselves to be by the material world. But you also had, as I mentioned, optimistic schools that saw nature as something to be

perfected and said, "man has been set on the earth not to reject it but to perfect it" and utopianism, the belief that one can create a perfect society, it goes back into these hermetic ideals. Because the idea was that a perfect society could be the goal of the alchemical work. Let me read you a passage from Giordano Bruno. This is a wonderful passage from the Picatrix. This was the book of 12th century magical texts that began to introduce these hermetic ideas and this passage is the core passage that inspired the Rosacrucians and numerous other utopian movements. Here is Frances Yeats, "Hermes Trismegistus is often mentioned as the source for some talismanic images and in other connections but there is in particular one very striking passage in the fourth book of Picatrix in which Hermes is stated to have been the first to use magical images and is credited with having founded a marvelous city in Egypt." And here is the passage from the Picatrix, "There are among the Caldeans very perfect masters in this art and they affirm that Hermes was the first to construct images by means of which he knew how to regulate the Nile against the motion of the moon. This man also built a temple to the sun and he knew how to hide himself from all so that no one could see him although he was within it." Those of you who are scholars in Rosicrucianism know that one of the things that was always said of Rosicrucians was that they were invisible. This was how Robert Fludd proved to people he wasn't a Rosicrucian, he'd say "you're looking at me so how could I be one?" So, he's in the temple but he could not be seen within it. "It was he, Hermes Trismegistus, too, who, in the East of Egypt constructed a city, 12 miles long, within which he constructed a castle which had four gates within each of its four parts. On the Eastern gate he placed the form of an eagle. On the Western gate, the form of a bull, on the Southern gate, the form of a lion, and on the Northern gate he constructed the form of a dog. Into these images he introduced spirits which spoke with voices. Nor could anyone enter the gates of the city except by their permission. There he planted trees in the midst of which was a great tree which bore the fruits of all generations. On the summit of the castle he caused to be raised a tower 30 cubits high on the top of which he ordered to be put a lighthouse the color of which changed every day until the seventh day, after which it returned to the first color. And so the city was illuminated with these colors. Near the city there was abundance of waters in which dwelt many kinds of fish. Around the circumference of the city he placed engraved images and ordered them in such a manner that by their virtue, the inhabitants were made virtuous and withdrawn from all wickedness and harm. The name of the city was Adocetine(sp?)." 19 Now, what we're familiar with from the Platonic literature is a quasi-rational, largely rational approach to utopian thinking that you get in the Republic. However, the students of the Republic will recall that, in the fifth or tenth book (it's the tenth), contains the myth of Er, which we went over in detail in the section I did on Neo Platonism. The myth of Er is one of the most bizarre and puzzling passages in the entire ancient literature. You remember Er was a soldier who died, he was killed in battle but after eight days he returned to life and then he told a story that is the absolute puzzlement of ancient scholars. It's highly mathematical, it has to do with the spindle of necessity and the description of some kind of cosmic machine and all the ratios of the gears of this machine are given and nobody knows what is being talked about. But here we have a different thrust. A magical utopianism and the idea of a perfected human society using magic because these engraved images that he ordered in such a manner that by their virtue the inhabitants were made virtuous, that means he was able to deflect the energies of cosmic fate. The city was immune to astrological, malefic influence. It was protected and when we talk later about the alchemical aspirations of the Rosicrucians and John Dee and Frederick the Elector Palatine of Bohemia, we'll see that this impulse toward an alchemical kingdom returns again and again. In a way, utopianism is, the four-gated city of utopian magical dreaming is one version of the philosopher's magical stone. It's a kind of diffuse idea of the philosopher's stone, but it's a society in perfect harmony with fully realized beings living within it practicing a cosmic religion that frees them from the impulses of cosmic fate. The other thing that is going on in some of this alchemical imagery is a kind of subtext of late alchemy, is what's called the *Ars Memoria*, the art of memory, and in fact, Frances Yates has a book called

The Art of Memory and this is a lost art, literally. It begins with the Roman orator Cicero and was practiced up until the early 17th century and what it consisted of was people, orators, it was considered very bad form to read your speech if you were an orator and so you had to memorize your speech and there were tricks of memory. The commonest mnemonic trick was to think of a building, it was called the memory palace, a building that is familiar to you, I've done this myself with the University of California because it's an area that I'm very familiar with because I was a student there, there are many buildings and many hallways and many floors and what you do is when you make your speech in your mind you are moving through the memory palace and at various points you construct what are called emblemata and the idea of these emblemata is that they be as unusual, shocking, and unexpected as possible in order to be memorable to you. So, say you're giving a speech about the seven deadly sins. So then luxuria might be for you a nun copulating with a dog and you'll set the nun and the dog in a little niche in the hallway of the memory palace. When you reach that place in your imaginary journey all these associations will spring to mind and you'll be able to give you speech flawlessly. To us, this sounds tortured and particular but it works quite well. One of the practitioners of the *Ars Memoria* was Giordano Bruno and he wrote a book called *Spaccio Della Bestia Trionfante*, the expulsion of the triumphant beast, and my god, Max Ernst, eat your heart out, this is a surreal epic read as straight plain text because that's not how it's supposed to be read. It's a conglomeration of these mnemonic emblemata that led him on to probably give a fairly conventional disputation on one subject or another but there are even old books of these emblemata that are before surrealism. These were some of the wildest images that the Western mind would tolerate. The one thing that we didn't get into this morning was talking about the astrological side of it. The role of the Decans. The Decans are these demons, three to a sign, so there are 36 of them, and this was thought to be an astrological conceit that went back to Egypt as opposed to the ordinary zodiacal signifiers which go back to Huran(?) in what is now modern Iraq. These Decans were the demons that were summoned by these Renaissance Magi in an effort to control and manipulate fate. You may, if you were paying attention this morning, have noticed that in all the reading I did from the *Corpus Hermeticum*, there was really nothing explicitly magical about it. It was philosophical. There was one mention, I think, of animating statues in the description of the four-gated city. But it was those magical animation passages that really captured the imagination of the Renaissance and they built on that and the idea, simply put, is that these Decans and zodiacal signs are at the center of associative schemata which include plants, minerals, odors, certain flowers, certain animals, everything had its 20 Decanic assignment and so if you were involved with promoting an affair with a woman or something like that then you would do an invocation to Venus and you would gather the associated minerals and stones and animals and you would put them in a room and then certain tonal modes were also associated with these things and so you would play the music, have the flowers present, the minerals present, the invocations and what you were trying to do was create a microcosm of the macrocosm to draw down this stellar energy. It wasn't about the classical Hollywood appearance of demons in a circle, that's the stuff of *Picatrix*, the earlier somewhat less refined style of magic. I wanted to read you one passage from Frances Yates' *Giordano Bruno and the Hermetic Tradition* because this describes this change of status of the magician that we're interested in. And also what we didn't talk about this morning was the importance of the Kabbalah, which came in quite late, that was then worked out in great detail. This was originally the idea, it was the Jewish contribution to this kind of magic, it was, the idea was that since the world had been made by Jehovah, by the speaking of words, *In Prigipio et verbum et verbo corufactum est* (?), in other words the speaking of Hebrew was thought to be a primary linguistic tool for the purposes of creation. The problem for these Italians was that very few of them spoke Hebrew so it was sometimes practiced silently, the mere constructing of these Hebrew letters and the setting out of messages in Hebrew was deemed efficacious as well. And then a further declenched(?) for people who were even frustrated with that was to channel magical languages which were

pseudo-Hebraic in structure. This is a whole branch of research, much too arcane for us to go into here. The only non-Hebraic magical language that I may mention here will be Enochian and Enochian was an angelic language channeled by John Dee and used by him in his magical evocations and later it was taken up by Aleister Crowley and the folks of the Golden Dawn. But there were many, many of these magical languages. The Voynitch(sp?) manuscript is written in one of them. But I want to read you this passage about how the Renaissance changed the status of the magician. "We begin to perceive here an extraordinary change in the status of the magician. The necromancer concocting his filthy mixtures, the conjurer making his frightening invocations were both outcasts from society, regarded as dangers to religion and forced into plying their trades in secrecy. These old-fashioned characters are hardly recognizable in the philosophical and pious magi of the Renaissance. There is a change in status almost comparable to the change of status of the artist from the mere mechanic of the Middle Ages to the refined companion of princes of the Renaissance. And the magics themselves are changed almost out of recognition. Who could recognize the necromancer studying his Picatrix in secret in the elegant Ficino, in his infinitely refined use of sympathies, his classical incantations, his elaborately Neo Platonized talismans. Who could recognize the conjurer using the barbarous techniques of some Clavis Solomonus in the mystical Pico lost in the religious ecstasies of Kabbalah drawing archangels to his side. And yet there is a kind of continuity because the techniques are at bottom based on the same principles. Ficino's magic is an infinitely refined and reformed version of neumatic necromancy. Pico's practical Kabbalah is an intensely religious and mystical version of conjuring." So now we move in this realm, these were the companions of princes and there was in that 120 years, from about 1500 to the beginning of the 30 year's war, a constant effort in various parts of Europe to try and turn parts of European society toward a kind of magical revolution. The Europe of the 11th and 12th century was entirely ruled by scholastic rationalism. Witchcraft was virtually unknown and very curious. It's the 15th and 16th centuries where you get this tremendous proliferation of magical systems, magical ideas and social hysterias related to witchcraft, alchemy, conjuring and magic. Those are the centuries when these things really broke out into the open. And alchemy in that period is basically a story of personalities, wonderful personalities, too many for us to really talk about in detail. We have Nicholas and Pernelle Flamel who sought and found the philosopher's stone, according to legend and according to legend are living to this day somewhere in central Asia in perfect happiness having achieved not only the chemical wedding but the water stone of the wise. And then we have Basil Valentine who refined red wine and distilled it in distillation apparati until he got essentially pure alcohol and upon drinking this was so sure that he had found the philosopher's stone that he announced the eminent 21 approach of the end of the world based on his discovery and he was not secretive at all. He propagated his recipes and in fact sampled the distillates of some of his brother alchemists and popularized this very widely. To this day the reason certain cognacs are in the hands of monastic orders and no one else can make these things is because they were originally alchemical secrets and many of these early alchemists were men of the cloth, quite a number of them. So what I thought I would do is, in a highly chaotic fashion, read you some of this alchemical literature. The big bring down about alchemical literature is that apparently the muse didn't always smile on the alchemist and some of this poetry is pretty tormented stuff. Why this is, who can say, but let's try one here and see if you can bear with it. Also, my Middle English is not as good as it might be. This is a short one, and typical, and you will see why the alchemists were charged with unbearable obscurity and prolex prose. This poem is called "A Description of the Stone:" Though Daphne fly from Phobus bright yet shall they both be one And if you understand this rite you have our hidden stone For Daphne is fair and white but volatile is she Phobus a fixed god of might and red as blood is he Daphne is a water nymph and hath of moisture store Which Phobus doth confine and heat and dries her very shore They being dried into one a crystal flood must drink Till they be brought to a white stone which washed with with virgin's milk So long until they flow as

wax and no fume you can see then have you all you need to ask. Praise God and thankful be. This is a recipe for the production of the philosopher's stone and the author, I'm sure, felt that he'd spoken as clearly as he dare speak. And yet making something of this is no easy task. This is from the Teatrium Chemicum Britannicum and the late phase of alchemy. Here's another one: The world is a maze and what you why For sooth of late a great man did die And as he lay a-dying in his bed These words in secret to his son he said 'My son' quoth he, 'tis good for thee 22 I die for thou shall much the better be Thereby and when thou seest that life hath me bereft Take what thou findest and where I have it left Thou dost not know, nor what my riches be All which I will declare give ear to me An earth I had all venum(?) to expel And that I cast into a mighty well A water ick(?) to cleanse what was amiss I threw into the earth, and there it is My silver all into the sea I cast My gold into the air and, at the last Into the fire, for fear it should be found I threw a stone worth forty thousand pound Which stone was given me by a mighty king Who bade me wear it in a fourfold ring.' Quoth he, ' this stone is by that ring found out If wisely thou cans't turn this ring about For every hope contrary is to other Yet all agree and of the stone is mother So now, my son, I will declare a wonder That when I die this ring must break asunder The king said so, but when he said with all Although the ring be broke in pieces small An easy fire shall soon it close again Who this can do he need not work in vain Till this my hidden treasure be found out When I am dead, my spirit shall walk about 23 Make him to bring your fire from the grave And stay with him till you my riches have.' These words a worldly man did chance to hear Who daily watched the spirit but nay though near And yet it meets with him and everyone Yet tells him not where is the hidden stone. This stuff is obscure, it's deliberately obscure, it was obscure to its contemporaries and the whole effort became one of collecting this kind of material and finding it out. And you have to understand this was all circulating in manuscript, very little of this was printed. The Teatrium Chemicum Britannicum was not printed until 1652 so this was a world without vehicular transportation other than the horse and carriage and these people were paranoid of being discovered and persecuted for wizardry and witchcraft by the church. So, each alchemist working in secret, with a limited number of texts, with a local control language, created this vast conceptual patchwork of ideas and this is in large measure responsible for the obscurity of what is said. Then another factor which impinges on this and further complicates the matter is that the name of the game was projection of the contents of the imagination onto physical processes, so taking red cinnibar and heating it in a furnace until it sweats mercury, for one alchemist this is the incineration of the red salamander and the collection of aurmercurius in the great pelican. They named their chemical apparati after animals and gods and so the pelican is a standard distillation apparatus, basically a condenser on top of something which is boiled and then these materials would be collected, ground, powdered, refired, mixed with other materials, refired again and in the process these people were, we call it, and it's such a weak term, the projection of the intellect into this dimension, they were living in a waking dream and many of the recipes are designed to wipe out the boundaries between waking and sleeping. Remember I talked about the river of mercury that runs between the yin and yang? Many of the alchemical processes were of 40 days duration. Well you can imagine a hermit fearing discovery by the church, trying to keep his fires not too hot, not too cold, working day after day, night after night, eventually all boundaries dissolve and you're just living in a pure world of intellectual projection and then in the swirling of the alembic, in the chemical processes going on in the retort, you begin to be able to project your consciousness onto this. It's what we call visualization but for us it's a kind of a weak term because we are never really able to accept in the psychedelic state to transcend the belief in the inner world and the outer world being somehow separate so for us it's always separate. But they were able to wipe out that boundary. Well then, what they saw in their swirling retorts and alembics was not carbonization, calcination, condensation of various molecular weights of liquids and oils out, but rather the birth of the red lion, the coming of the eagle, the appearance of the smagdarian(can't quite make out this word) stone. They had hundreds and hundreds of these words. I didn't

bring any with me, but much alchemical literature is dictionaries. Martinus Rulando's Alchemical Dictionary is a huge book of words with special meanings in the alchemical context. So, why, why do this and what happens when you do it. Well, no matter what alchemist you're reading, there's always an agreement that there are stages in the great work. Stages in the opus, as they called it. You can't get 24 any agreement on in what order these stages come, but roughly it's something like this: most agree that it begins in the nigredo, the blackening, Arcro(?), the Saturnine world of what we would call manic depression, despair, and that Aurchaos(?), a chaotic near psychotic state of unbounded hopelessness and that is the precondition, then, for the alchemical work though the stages of the opus never occur in order. I had a dream last night that was, I think, triggered by an illustration in Fabricious(?) that I'll show you tonight but it was a classical alchemical dream. It was that I was at a country fair and its antiquity was indicated by the fact that it was happening in the school yard of my childhood and as I moved among the participants of this country fair I began to notice that they were freaky. There were people with withered arms and one side of their face slid down and so forth and so on. The whole thing began to drift toward nightmare and Richard Hermes Bird appeared in my dream as my alchemical compadre and at one point a black woman, perfect symbolism for the nigredo, a black woman with three withered arms and six or seven breasts, slid herself sideways in front of me and it was at that point that I went and found Richard and said, "I think we'd better get out of here." Now, an alchemist would greet a dream like this with great anticipation and joy and would understand that this sets the stage now for the next movement forward. Well, then accounts differ. Those of you who really want to get into this, I recommend you read *Mysterium Cunjunctiones* by Jung, the Mysterious Conjunction. He discusses the nigredo in great detail. Another symbol for the nigredo is the Senax(?), the old man, because the old man is just short of death and that's the state that the nigredo makes you feel. Then you must take this raw, chaotic, unformed material, often compared to feces, compared to corruption, compared to the contents of an opened grave, and you must cook it in the alchemical fires of contemplation, prayer, and ascetic self control and then you will move through a series of stages that are associated with colors. There is the rubado, the reddening, there is the citronitas, the yellowing, there is the veriditas, the greening, and the order in which this occurs differs according to who you follow but then there is closure at the end of the process. Most alchemists, although certainly not all, agreed that the higher state is the albedo, the whitening, the purificacio. At each stage there are substages of dissolution, *dissolutio et coagulacio*. There's one alchemical aphorism that says " *dissolutio et coagulacio*, know this and this is all you need to know." And so it's a melting and a recasting and a purifying of psychic content. So finally you reach the albedo, the whitening, the highest stage, the stage of great purity. But remember how I said last night that mercury was always the metaphor for mind in alchemy, or one of the metaphors for mind in alchemy, and I talked about its mutability and its ability to take the shape of its container and when you shatter it it then splits into many reflections. So, once you move into the domain of the albedo, the whitening, then a whole new problem arises for the alchemist. This is the problem of the fixing of the stone. Somehow the mutability of mercury must be overcome and it must be crystalized, it must be fixed so that it doesn't get away from you, so that it doesn't slip through your fingers. To achieve aurmercury is nothing unless you have the secret of the *coagulacio*. So then, there is a huge amount of effort devoted to this. What is being described is what Jungians call the individuation process. A dissolving of the boundaries of the ego, an allowing of the chaotic material of the unconscious to pour forth where it can be inspected by consciousness, and we'll see tonight when we look at this art, these images are full of ravening beasts, incestuous mother/son pairs, incestuous brother/sister pairs, hermaphrodites, all taboos are broken, this stuff just boils up from the unconscious then is sublimed through these processes and then is somehow fixed and this fixing is the culmination of alchemy and if you can bring off this trick then you possess our stone, the philosopher's stone, the lapis, the Sopic Hydrolith of the Wise, Aranius Philolithes(sp?) calls it. There were 25 hundreds of control words for naming the

secret difficult to attain. Alchemical gold, in short, this is what we're after. If you possess it, nothing else is worth anything because it is psychic completion, peace of mind, Jung called it the self. It's the self that we are trying to recover and remember we talked about the Gnostic myth of the light trapped in matter. Well this is the *luminae de luminae*, the light of light, the *lux natura*, the light drawn out of nature and condensed into a fixed form which then becomes the universal panacea. And I'm using as many of these alchemical terms as I can draw out of my memory to give you a feeling for it. This is the universal medicine. It cures all ills, you know, it brings you riches, fame, wealth, self-respect. It's the answer, it's what everyone is looking for and no one can find. So this just became a consuming passion of the 15th and 16th century mind. They thought they were on the brink of it. Along the way they were discovering stuff like distilled alcohol, phosphorous, gun powder, all of these things were coming out of the alchemical laboratories but that was not it. They kept driving themselves onward because they knew that this was not the real thing and they were pursuing the real thing. Then for some people it became reassociated with this notion of the utopia that I mentioned this morning in the passage that I read about the city of Hermes Trismegistus, they began to see, it's almost like the crisis which overcame Buddhism, it must be an archetypal, and notice how rarely we've used that word here, it must be almost an archetypal stage in human thought. Theravadin Buddhism stressed individual thought, and individual redemption through meditation on emptiness, and then with the great reforms of Nagurdjuda(sp?), the idea of Bodhisattvic compassion was introduced and there carries with it political freight. An obligation to society and mankind. So, as the 15th and 16th century progressed there began to be this awareness that what was wanted was not for an alchemist to break through, to his own personal salvation, but somehow to create an alchemical world. You get then the notion of the *multiplacio*, the idea that the stone, once created, will replicate itself and be able to change base matter into itself almost like a virus spreading through the ontological structure of matter itself and the world will be reborn and this idea then, what was happening was that these alchemists were getting bolder and printing was invented in Meins, near Frankfurt, in 1540, the distribution of alchemical books was changing the character of alchemy, it was no more the solitary hermit working away in his cave or mountaintop, far away from the minions of the church. These alchemists began to dream of banding together, of forming societies, of creating brotherhoods that were united in the sharing of their knowledge and their purpose. This brings us to the curious episode in history called the Rosicrucian enlightenment. Dame Frances Yates, once again, got there first and she wrote a book called the Rosicrucian Enlightenment which traces the history of these alchemical brotherhoods and reveals to us what they were really about and what they were about was this dream of somehow taking the philosopher's stone, and the power, the immortality, the insight that it would bring and making it a general utility of mankind and in the, one way of looking at modernity, I have one friend who claims that the summoning of the Holy Spirit into matter can be seen as the creation of the modern world of electricity. That people like Helmholtz(sp?) and Farraday were completing the alchemical work. It's very hard for us to realize how mysterious the electromagnetic field seemed to the 19th century. The 19th century had entirely imbued itself with the spirit of democratian atomism translated through Newtonian physics and they believed that everything was little balls of hard matter winging through space. When Helmholtz and Farraday and these people began to talk about action at a distance and generating the electromagnetic field and trapping lightning and light in jars and running it through wires, what could this be but the trapping of spiritus. What could it be but the literal descent of the Holy Ghost into history and, you know, give it a moment's thought. For thousands of years, electricity was something that you saw when you took an amber rod and a piece of cat fur and went into a darkened room and stroked the cat fur and then when you would bring the amber rod close to the cat 26 fur you would see the crackle of static electricity through the cat fur. For thousands of years that's what electricity was. Who would dream that you could light cities, that you could smelt metals, that you could illuminate the earth with this energy and yet from the 1850s to the

present, this was done. It's almost the final literalizing of the alchemical dream. But to go back now, I digress, I fear, let's go back to the climate of the 1580s and the central culprit here, and to my mind a giant figure casting an enormous shadow over the landscape of alchemy and of modern science, is the Englishman John Dee. John Dee united in himself the complete spirit of the Medieval Magus and the complete spirit of the modern scientist. He invented the navigational instruments that allowed the conquest of the round earth. When Frances Drake sailed up the coast of California he had navigational instruments that were top secret. The French, the Spanish, must be kept away from this stuff and these were navigational instruments created by John Dee that allowed him to locate himself anywhere on the globe. But John Dee was a man who, on a late summer evening in Mortlag, his house in Mortlag outside of London, the angel Gabriel descended into his garden and gave him what he called the shewstone, shew being show in Old English, and the shewstone exists to this day, you can see it in the British Museum and what's amazing about it is it's a piece of polished obsidian, it's an Aztec mirror, is what it is. There was a ruler of the Aztecs called smoky mirror. How John Dee got this thing, we cannot even imagine. He says he got it from an angel, nobody can really say that, however I suspect that Cortez, on his first return to Spain from the new world, he brought a number of objects with him that he had collected in Central Mexico and somehow John Dee got his hands on this thing and it was for him a television screen into the logos and he used it over a number of years to direct the foreign policy of England. He was the confidante of Queen Elizabeth the First and he also was the most accomplished astrologer in Europe and he used his ability to cast horoscopes as an entre into all the great houses of Europe, the kings and nobles of Europe. He was functioning as an intelligence agent, he was a spy for the British crown insinuating himself into these various courtly scenes and then writing back to Elizabeth in cyphers, cyphers that had previously only been used for magical purposes. He was sending back data on the strengths of military garrisons and the placement of fortifications and this sort of thing. This is what he was doing in the 1580s, he kept the shewstone for a number of years and he didn't seem to be able to make much progress with it. He had other methods too, he had wax tables and sigils but finally into his life came a very mysterious character named Edward Kelly and some accounts say that Edward Kelly had no ears. That indicates that he had had his ears removed for being a charlatan and a montebank. This was a common punishment in the provinces of England. So Edward Kelly was a very dubious character, I think. One strong piece of evidence that he was a shady character was, John Dee was married to a much younger woman named Ann Dee who by all accounts was quite a beauty and after gaining Dee's confidence as a scryer, the person who could look into the shewstone and lay out these scenarios that the angels and the entities coming and going in the shewstone were putting forth, Kelly revealed to Dee that the angels had instructed him to hit the hay with Ann. This was a great crisis in their relationship. However, according to Dee's diary "and so it was done," we read. So, hanky panky didn't begin with the Golden Dawn, believe me. In 1582 Ann Dee, John Dee, and Edward Kelly set out for Bohemia and Rudolph, the mad king of Bohemia held sway at that time. This is another one of those bizarre figures in the whole story of this...(tape cuts off a bit here) ...a wonder cabinet, you see, before Linaius, before modern scientific classification these great patrons of the arts and natural sciences, they would just collect weird stuff. And that was all you could say about it. I mean, it was rhinoceros horns, fossil amenities, broken pieces of statues from antiquity, giant insects from Southern India, seashells, all this stuff would just be thrown together in these wundercabina, these wonder cabinets. Rudolph was a great patron of the arts. Well, Kelly sent the word that he and Dee had perfected the alchemical process and Rudolph immediately paid their way to Prague and patronized them very lavishly over a number of months but then they didn't seem to be coming through and he rented, he ordered a castle put to their disposal, in Bohemia and they still weren't able to come through. The Voynitch manuscript figures in here too because 27 Kelly's entre to Dee was that he had a manuscript in an unknown language and I believe that this probably was the Voynitch manuscript. The Voynitch manuscript turns up in the

estate of Rudolph and the very month that he paid 14,000 gold ducats for it to persons unknown, Dee, who was always writing back to the Elizabethan court hounding them to send money, entered into his account book that they received 14,000 ducats from an unknown source. Dee was able to talk himself out of this alchemical imprisonment but not before he had written a book called the Hieroglyphic Monad. You have to understand the importance of this. As late as the 1920s in England in the better schools of England, like Eton, when you studied geometry, you studied Euclid's works and Euclid's geometry was always preceded by Dee's preface to Euclid. Until the 1920s every English school child studied this. He was a master mathematician as well as these other things. This was how he was able to produce these navigation instruments. So Dee, while imprisoned in Bohemia, wrote a book called the Hieroglyphic Monad in which he proposed to prove, through a series of occult theorems, that a certain diagram, unfortunately I didn't bring the hieroglyphic monad, but it's basically the symbol of, you know the symbol for mercury which looks like the symbol for female but you put horns on it and then there were some adumbrations to that. By a series of theorems he worked up this hieroglyphic monad and he initiated a couple of young men named Johan Anreae and Michael Maier into the mysteries of the hieroglyphic monad. Then he was able to get out of Bohemia and he went back to England. Kelly, who had made much more extravagant claims, Rudolph kept at work on the alchemical opus and Kelly became more and more desperate to escape and one night in 1587 he crept out on the parapet of this Bohemian castle and a roof tile slipped beneath his feet and he fell to his death and became, as far as I can tell, alchemy's only true martyr. Dee returned to England, he was now very old, he died at Mortlake in 1606. Elizabeth died in 1604, Shakespeare was happening, Sir Philip Sidney was happening through this period. John Dee reputedly had over 6,000 books in his library. He had more books than any man in England. He had books, we have a partial catalog of his library, he had books that do not exist now. He had Roger Bacon manuscripts because when Henry the eighth kicked the Catholic Church out of England, the Northumberian monasteries were looted by the Earl of Northumberland and basically Dee was allowed to pick over the loot from these monasteries and there were Roger Bacon manuscripts which perished when Dee's library was burned by an angry mob while he was on the continent because he was suspected of being a wizard. He was the model for Faust in the later resurgence of Faust and whenever you see an old man with a white beard and a pointed cap, this image is a referent to Dee. Well, Elizabeth died in 1604, I believe, and James the first became king of England. James was a peculiar character. The wags of the time liked to say "Elizabeth was king and now James is queen!" Not only that, he hated occultism, he had no patience with the whole magical court that Elizabeth had assembled around herself. Meanwhile, in 1606, a very mysterious document began to circulate in Europe and in England called the Fama, this is the first word in a string of Latin words, Fama, and two years later the confessio. What these were were announcements that an alchemical brotherhood was seeking recruits. These are the primary documents of Rosicrucianism. Rosicrucianism was based on a fiction and a fictional person, Christian Rosencreutz, who was imagined to have lived almost 200 years earlier, in the 1540s, and to have been a great alchemist. It was claimed that his tomb had been recently opened and that there were books inside it which set the stage for the alchemical revolution of the world. Notice how this occult world always tries to reach back in time to give itself validity. Christian Rosencreutz was claimed to be the author of a series of books, the chief of which is called The Chemical Wedding. What this was all about, I believe, and the Rosacrucian enlightenment makes it fairly clear, was that Dee, during the period that he had been in Bohemia, had set out to lay the groundwork for an alchemical revolution in Central Europe and he had made Johan Andreae and Michael Maier his agents in this plot. And it was a plot, a plot to meddle in European history and to turn the Protestant reformation toward an alchemical completion. They felt that Luther and Has(sp?) and these people had only gone so far and that the culmination of throwing off the yoke of the church would be the establishment of an alchemical kingdom in central Europe. The target, then, of the attention of Michael Maier and Johan

Andreae and a number of these alchemists became the young Frederick, he's called Frederick the Elector Palatine. He was a prince of the Northern League in Germany, he ruled in Heidleberg, and Heidleberg, as you know, is a thousand-year-old university city and I believe I mentioned that the alchemical press of Theodore DeBry(sp?) was operating out of Heidleberg. Heidleberg became a magnet for all the occult thinking going on in Europe and all the Puffers and alchemists, the gold-makers, the philosophers, the charlatans, they all converged on Heidleberg and Andreae and Maier were advisors of the young Frederick and they steered him, by a series of political manipulations too complex to tell, toward a marriage with the daughter of James the first of England, who was named Elizabeth, interestingly enough. So, Frederick the Elector made Elizabeth, the daughter of James of England, his wife. Frederick here made a serious miscalculation because he thought that if James would give the hand of his daughter in marriage that this was his way of blessing this alchemical conspiracy. Actually, what was on James' mind is that he was about to give his son, in marriage, to a Spanish princess of the Hapsburg line, a Catholic. In other words he was playing both sides against each other. He was not giving the green light to an alchemical revolution at all. But, it was assumed so. Then, in 1617, 1618, Rudolph, remember Rudolph, the emperor, he finally dies at a very ripe old age. And at that time, the Protestant league, which was made up of these princes of these small principalities scattered across Germany and Poland, they actually elected the emperor, it was not by right of primogenitor, but by election by what was called the Northern League, this league of princes. Frederick and his alchemical cohorts had done their alchemical groundwork very skillfully and they were able to engineer the election of Frederick to emperor of the empire and he became Frederick the Elector Palatine of Bohemia and this set the stage for an episode called the episode of the Winter King and Queen. One of the great, after Nicholas and Pernelle Flamel, this is one of the great romantic stories of alchemy. They moved their court from Heidleberg to Prague and all the alchemists went with and they assumed that English armies would support them if there was any squak from the Hapsburgs and in the Winter of 1618 they ruled there and began to lay the groundwork for the transformation of Northern Europe into an alchemical kingdom. The problem was, as I said, the faithlessness and duplicity of James the first of England. He did not support them, in spite of the fact that the fate of his daughter hung in the balance and by May of 1619 the local Bishop of the Catholic church was fully aroused and word had been sent to Madrid and the Hapsburgs raised an army and laid siege to Prague. In the late Summer, the Mid Summer of 1619, the Winter King and Queen were driven from Prague, the city fell to Catholic forces, the alchemical presses were smashed and Michael Maier, who was like the prime minister of this scene, was murdered in an alley in Prague and the entire alchemical dream went down the drain. Frederick was killed in the siege of the city and Elizabeth escaped to the Hague where she lived in exile for many years. Till recently, I thought that that was the end of the story but there is a coda that is very amusing, if nothing else. In that Hapsburgian army, there was a young soldier of fortune, only 19 years old, still wet behind the ears, knowing nothing, happily soldiering and wenching his way around Europe while he decided what to do with himself and his name was Rene Descartes, a Frenchman. Descartes, in his later years, reminisced about his period as a soldier in this army and I like to think that it was Descartes who actually murdered Maier. One of my ambitions is to write a play or a novel in which these two confront each other in a back alley of burning Prague and carry on a debate about the future of Europe before Michael Maier falls to the sword of Descartes. That may be apocryphal, but what is not apocryphal is that this Hapsburgian army, having laid siege and destroyed the 29 alchemical kingdom, began to retreat across Europe that Fall and by Mid-September was camped near the town of Uolm in Southern Germany. By a strange coincidence, Uolm is the birthplace of Einstein some hundreds of years later. But on the night of September 16th, Descartes had a dream and in this dream an angel appeared to him, this is documented by his own hand, and the angel said to Descartes, "The conquest of nature is to be achieved through measure and number." And that revelation lay the basis for modern science. Rene Descartes is the founder of the distinction between the

res verins and the res extensia, the founder of modern science, the founder of the scientific method that created the philosophical engines that created the modern world. How many scientists, working at their workbenches, understand that an angel chartered modern science. It's the alchemical angel which will not die. It returns again and again to guide the destinies of nations and peoples toward an unimaginable conclusion. That's not the last time that this angelic intervention in the history of science has occurred. Some of you may know the story in the 19th century of Cuclai(sp?), the German chemist who was struggling with the molecular structure of Benzene, couldn't get it straight, and then he had a dream in which he saw the ouroboric snake take its tail in its mouth and he awoke from that dream with the carbon ring burning in his mind. Well, the carbon ring, the six sided heptadle(?) state of the form of the carbon ring is the basis of all organic chemistry. And I mentioned earlier Farraday and Helmholtz and the rise of the electro magnetic field. The point I'm trying to make is that, however rational we may assume ourselves to be, however rational we may assume modern science to be, it is all really founded on angelic revelation, demonic intercession, and an extremely mysterious relationship between the human mind and the world of what science calls inert matter which, from this point of view, is revealed to be not inert at all but alive and pregnant with purpose for mankind. The alchemical kingdom of Frederick the Elector, and then there were a series of adumbrations, of this kind of thinking, many of you may know about freemasonry and the many freemason revolts in Bohemia and Bavaria throughout the 16th and 17th century. Adam Weishaupt and the illuminati is another effort to do this and even the royal society founded by Newton and Hook and those people was still an effort to redeem science for the spirit. So, the alchemical spirit lives on, it never really died, it's just that it has taken peculiar forms in our own day. I mentioned, I believe, last night that when you enter into nuclear chemistry the most literal dreams of the profane side of alchemy, the transformation of lead into gold, Has actually been achieved. It has no economic significance because the instrumentality to do it costs tens of millions of dollars but nevertheless, yes, in our time, lead had been changed into gold. So, that's basically what I wanted to say about this. I hope that there are questions and stuff that we can say about it. To take you back to the Voynitch manuscript for a minute. There was something about it being a liturgical manual of some sort, is that your opinion? Yes. This is kind of a footnote on all of this. Remember I said that Kelly's entre to Dee was that he had a mysterious book and you can tell from what I've said already, Dee was as big a sucker for books as I am. So this book, Kelly's story was that he had gone to sleep in the ruins of a Northumbrian monastery and slept in an open seplicar, a crypt of some sort, and when he awoke he found beneath him two things, a vial of red powder which he said was the transmitting powder, a necessary part of the alchemical process, and a book in an unknown language which he called the Gospel of Saint Dunstable, possibly because this monastery had been dedicated to Saint Dunstable. Now, Arthur Dee was John Dee's son and he said that, he became an alchemist in his own right, and he said when he was growing up he remembers that his father spent many hours puzzling over a book, as he put it, " all covered with hieroglyphics." But Dee, who elaborated the angelologic language called Enochean, never actually wrote or discussed the book that he had received from Kelly. It is definitely not written in Enochean. Enochean, 30 when grammatically analyzed by computers, has a curious relationship to 16th century English. But when Dee and Kelly traveled to Europe they were talking up Roger Bacon, who was a 14th century English monk who had dabbled in alchemy, and they claimed to have Bacon manuscripts and Rudolph became very interested in this and wanted to obtain some of these Baconian manuscripts. I suspect that what happened is that Dee, by this point, had given up on deciphering the Gospel of Saint Dunstable and decided that he would palm it off on the emperor as a Bacon manuscript because he didn't want to give up a real Bacon manuscript because they were too valuable to him. So for 14,000 gold ducats this thing changed hands and Kelly and Dee and Ann were able to pay their bills and Rudolph had immense resources because of his position as emperor and he brought his cryptographers and decipherers on to work on this Gospel of Saint Dunstable and got nowhere. Then, when Rudolph died, a

mysterious book was numbered among the artifacts of his estate and I think we can assume that it's this book and one of the interesting things about this book is it has pages and pages of plant drawings. Over a 150 watercolors of plants, each carefully labeled, captioned in this unknown language. If you know anything about decipherment, this is what a decipherer dreams of because if you have a picture of the thing and a caption it doesn't take too much smarts to figure out what's going on. Nevertheless, this was completely unhelpful. A third of the manuscript has pseudo astrological material, in other words what looked like drawings of stars and stellar shells but when carefully analyzed dissolve into meaninglessness, cannot be associated with anything, and then a third of the manuscript shows little naked ladies in what can only be described as elaborate plumbing systems and it was thought at one time that these must be drawings of the humors of the body in the liver, that these little naked women represented spirits moving inside the human body and then somebody else's guess was it must show an obscure form of German hydro therapy because, you know, the Germans, if you've ever been to Baden Baden or Marianbad or these places where people take the waters, well those places are old, old. And all this stuff is captioned and there are even tables of contents which again you would think would yield to decipherment and so when Rudolph died, because of the botanical material in this book, it passed to the court botanist, a man named Marici and he got nowhere with it. Then in the early 16th century a great alchemist and polymath, some of whose art we'll see this evening, was Heinrich Kunderath(sp?), and Heinrich Kunderath was fascinated by artificial languages and he heard about the Voynitch manuscript and we have a whole batch of letters from Kunderath to the keepers of the estate of the emperor trying to obtain this manuscript, which he finally did obtain and then at that point he makes no further mention of it in his diaries the conclusion being that he, too, could get nowhere with this thing, it just defied decipherment. Well, in 1619, at the outbreak of the 30 year's war, and this is what I forgot to mention in my earlier discussion, this episode of the Winter King and Queen is one way of debating the 30 year's war. It's usually considered to be the moment when a certain personage was hurled from a third story window in Prague and then fighting broke out in the streets but really the episode of the Winter King and Queen brought the thing to a head. Well, in 1619, to avoid being caught up in the 30 year's war, Kunderath decided to take holy orders and become a Jesuit and so he gave his library, which was compendious, to the monastery he joined which was a monastery in Southern Italy and there this thing sat until 1906 when a New York rare book dealer named Alfred Voynitch bought the entire contents of this monastic library and when he got it all back to New York and cataloged it, it was all very predictable 16th century theological and alchemical speculation except here was this book in an unknown language and Voynitch kept it throughout his life and then when he died he gave it to Yale and it is to this day at the Benikee rare book room at Yale. In the 1960s the CIA became interested in it because the CIA is in the business of code making and breaking, a huge amount of energy goes into this. If you know anything about the enigma project in WWII you know that vast energies go into the making of unbreakable codes and so they very systematically sought out all examples of encrypted material throughout history and just lickety-split deciphered it, one after another. All occult and magical codes known to exist in Europe can be traced back to one person, virtually to one person, to Trithemius, 31 Bishop of Spawenheim who was the great teacher of Henry Cornelius Agrippa. All magical codes, if you know the Trithemian method, within a few hours you can get plain text. The Voynitch manuscript did not yield at all to this method and the CIA formed a working group that for over ten years would invite scholars in to have a look at this and if you're interested in this, Marie D'Amperio, who was a great Renaissance scholar, wrote a book called *The Voynitch Manuscript, an Elegant Enigma* in which she traces the efforts of the CIA to figure this thing out and to figure out what it could be. There the matter rested until about three years ago when, I think his name is Leo Levertov, some kind of military historian, one of these peculiar people who live for this stuff, he got a hold of it and he said, and deimlperia(?) goes through all the decipherment and there were many efforts at decipherment, there was a scholar at Yale in the

twenties named Brumbra who was a very respected man who ruined himself by claiming a complete decipherment of the Voynitch manuscript and, the way the game is played is that you say what your rules for the decipherment were, you give the rules to a colleague and you give your colleague a page of text. If he can't translate it with your rules then you are viewed as a deluded and misguided person and your career goes up in flames. Well, the Brumbraian method for deciphering the manuscript had to do with confined pools of letters where, it would get you to a pool of five or six letters but then you could freely choose which one you used and critics of Brumbra demonstrated that you could make this thing say anything you wanted it to. Brumbra supported Dee's claim, he claimed that it deciphered out into a Roger Bacon manuscript that described a series of riots between the students and the black friars in 1385 at Oxford. But nobody else could make it say that or make it say anything so Brumbra disgraced himself and ruined his career. Then there were other efforts at decipherment which I won't bore you with but along comes Leo Levatov just four years ago and he wrote a book called *The Voynitch Manuscript: A Liturgical Manual for the Catherites* and his great breakthrough, if you accept his translation, and I do, I know people who don't but they don't seem to have read him as carefully as I have, I think the dude pretty well has it nailed to the barn door. His great breakthrough was to realize that it's not in code. It is not an encrypted manuscript at all. What it is is it's a synthetic alphabet, yes, it's an alphabet that, and one of the things that baffled the CIA is was they looted the libraries of Europe and they could never find another example of what is called Voynitch script and this is just baffling. How could there be no other example of this script. It appears that what happened was someone created a synthetic alphabet and then in a mixture of Medieval, polyglot Flemish with a huge number of loan words from Old French, Middle High German, and Swedish, wrote down a sacramental manual for the dying in the Catherite sect. Now, what is the Catherite sect? You're probably familiar with something called the Albajensian(?) crusade. This was not a crusade carried on against the infidel for the recovery of Jerusalem but rather a series of military actions carried out by the pope against communities in Southern France in the early 1200s. These people were Catherites. As far as we can tell, and we can't tell much because we only have descriptions of Catherites by people who were burning them at the stake, in other words no original Catherite documents survive, we just have what they screamed out on the rack as they were being put to death by the bishops of the church and this was a horrific incident in European history. To give you the flavor of it, the second Albajensian crusade was prosecuted by a general of the pope named Simone De Monforte and his lieutenants came to him, at a point, and some of you might have visited the city of Carceson in Southern France which is a walled Medieval city in Southern France, very beautiful, Simone De Monforte's lieutenants came to him and they said "We have cornered the Catherites at Carceson but the problem is is that there are 6,000 Catholics within the city walls." And he said "kill everybody, God will recognize his own." So that was the spirit in which this thing went forth, and they did, they did. 32 So, what we do know about the Catherites is that they had a sacrament, the holiest my...well, first let me tell you a little bit more about them. At first it was thought that they were pretty much heterodox Christians. They were into nudity and vegetarianism and they sound like early hippies, as far as we can tell. They got together men and women, they took off their clothes, they bathed, whether there were orgies or not we don't know, they were vegetarians, and the one thing that we do know is that they had a sacrament called the consolamentum and the consolamentum was ritualized vivisection, no, that's not the word, the term escapes me, but anyway, when you were dying, a fellow Cather would cut your wrists and open your veins in a warm bath of water and you would die in that state, you did not die a natural death. This was called the consolamentum. What Leo Levatov is claiming is that the Voynitch manuscript is a description, a manual, for the prefecti of the Catherite sect telling how to properly carry out the consolamentum. I see no reason to challenge it. Even with my limited knowledge of German, once you get the vowel and letter assignments right into this weird manuscript into this weird language and change it into English alphabetic text you can see that there's enough German there and then

these lone words in Flemish and so forth, it looks to be true. And what emerges from this, if we accept the Voynitch manuscript as the only primary document on the Catherite faith, is that this was not a form of heterodox Christianity at all, it is much more radical than that and this may explain the church's fury with this group of people. It was a cult of Isis. It can be traced straight back into the mystery religions of Eo(?) Isis in Egypt and I have not seen any critical commentary on Levatov's book. His book was published by this weird press in Rodondo Beach that specializes only in books on military encryption. Their catalog is a revelation to see, it's amazing, and the book on the Voynitch manuscript stands out like a sore thumb because most of it is like dictionaries of three letter words in Swahili and their numerical transforms and stuff like that. So that's the history to date of the Voynitch manuscript and it's not that askew of our subject because all of this heterodoxy in Europe blends together. The presence of Theodore DeBrie as an alchemical printer in Heidleberg may be a clue because there were survivals of this Catherite faith in the form of a heresy called the brotherhood of the free spirit. If any of you are familiar with the altarpiece called "The Garden of Earthly Delights" by Hieronymus Bosch, it's thought that this was created by commission for a brotherhood, a congregation of the brotherhood of the free spirit and the brotherhood of the free spirit was always associated with some reason, we don't know why, with printers. Printers seem to be the profession that the brotherhood favored and, like the Catherites, they practiced vegetarianism, nudism and gathering together in a ritual bath. So, there is much still to be learned and to be teased apart in the art history and the history of heterodox thinking in Europe of which alchemy is seen to be one facet of a faceted gem that includes the brotherhood of the free spirit, early Freemasonry, Catherites, survivals of Manicheism, Voagamils(sp?) in Yugoslavia, there are Vogamils Vostrian(?) graves on the Southern coast of Thessolonica and just a whole zoo of intellectual systems that have been forgotten and overlooked. This what I meant when I said we will explore the statigraphy of lost thought systems. In some cases we possess quite complete skeletons, in the case of alchemy, what we possess in the cases of the Vogamils and the Catherites is almost a foot bone or a tooth or a footprint but someday, with luck, new textual material will emerge and a new understanding of the role of heterodoxy in the formation of modern thought will emerge. Questions? The Borne and Clark(?) book on Freemasonry that's just recently been published..I've just about finished it and this person is a Medieval English historian from Kentucky and I think he's finally solved...the Freemason history which is a very interesting history because the Masonic historians themselves have been arguing for a couple hundred years so it's strange that this Voynitch manuscript should be all of the sudden in the last couple of years resolved because it seems that this Freemason thing is also resolved 33 Yes, you make an interesting point. John Glavis brought me an article yesterday. We're all tied up now in this Pluto return. I'm not an astrologer but John brought me an article that's talking about how, I don't know if it's the last time or the time before last, that the Pluto return occurred is precisely the 1490s, the period that we're talking about when the Corpus Hermeticum was translated and we are now in a period that is astrologically exactly equivalent to that period and the Voynitch manuscript appears to have been accepted, I mean I'm willing to accept it, you mentioned this revelation about the true nature of Freemasonry, and of course what is going on at the moment that is askew of our subject but tremendously exciting and relevant to the idea of lost knowledge coming to light, is that this is the golden moment in Mayan studies. It is happening right now, day by day, minute by minute, the log jam has been broken. The Mayan glyphs are being deciphered, no shit, and it has to do with an entirely new approach that some Russian linguists have taken and if any of you are interested, it will never happen again so far as I know, there are now, with the Mayan decipherment, no real undeciphered languages left. The Harapan(sp?) was deciphered a few years ago but really it wasn't that interesting because we only possess about 6,000 characters in Harapan. But the literature of the Mayan, when you take not only the hieroglyphic, the stone texts, but when you add in the ceramic texts, why we have a lot of Mayan material and it is being deciphered at a furious rate. If you're interested in this, Linda Sheil has written a book called A Forest of

Kings and how I do envy this woman because what she is doing is writing the first history of the Maya in a thousand years. We're not now dealing in the realm of gods and myths, we're dealing with stuff like "on the 14th of May, 642, an army from El Charico met an army from Tikal and triumphed and deposed three flint and placed on the throne..."it's this kind of stuff, real history. The conceits of Mayan religion and Mayan courtly life are all coming into focus and it's very exciting. All the people who have tried to make the Maya into some kind of Atlantean civilization should be running for cover at this point, because the picture that emerges is not as pretty as we might wish, but, hey, know the truth and the truth will set you free, I would choose truth over illusion anytime, no matter how damaging it might be to somebody's conceptions of these things. And if any of you are interested in these subjects, another area where this has occurred is, some of you may know the book by Michael Chadwick called The Decipherment of Linear Be, Linear Be is a proto-Minoan language and a linguist at Cambridge named Michael Ventris, a genius, in the fifties took this language, there was no Rosetta Stone, this is the amazing thing. You know what I mean by a Rosetta Stone? You see, in the 19th century the great mystery was how to read the Egyptian hieroglyphs and before they were deciphered the Egyptians were treated like the Maya and people thought that the secrets of the universe were chiseled on those obelisks and tombs. Well then a scholar in the grand army of Napoleon Champion, a soldier found a tablet which had a column of Demotic Greek, a column of another language, I forget which one, and a column of Egyptian hieroglyphs and they were able to realize that it was saying the same thing three times and that opened it up for them. But that's like a crib sheet, it's easy if you have the same text in a known language. But in the case of the Maya and in the case of Linear Be and in the case of Haropan, there was no Rosetta Stone, well then you talk about an excruciatingly difficult problem to solve and I'll explain how it was done with the Maya because it's so neat. It turns out that Mayan is a rebus language, what does this mean? Do you remember when we were kids and in comic books there would be these things where it would show a picture of an eye and then it would show a picture of a saw going through a piece of wood and then it would show a picture of an ant and then it would show a picture of a red rose. This is a sentence which says "I saw aunt Rose." But now notice what's going on here. It all depends on puns that depend on a knowledge of the spoken language. If you lose the sounds of the spoken language how the hell could you ever tell that a picture of an eye, a saw, an insect and a rose says "I saw my maternal relative 34 on my mother's side." I mean, it just is impossible, it's absolutely impossible in that situation to reconstruct meaning unless you have sounds. Well, how do you recover the sounds of a language dead a thousand years. Well, these Soviet linguists had the good sense to go and look at living Mayan languages, of which there are 15, living Mayan languages in the Americas and they discovered one of these dialects where, when you set Mayan hieroglyphs in front of these people and they named what they saw, meaning came out of their mouths and that broke the log jam and then you just rev up your computers and use all the standard tools of modern linguistics and philology and the stuff begins to just pour out, clear as day, no problem. So they asked the Mayans? Yes, they had to go to a Mayan, you're right, good point, it had never occurred to them. Because always before when showing it to Mayans they would say "what does it mean?" instead of "what do you see here?" and then what they said what they saw there meaning came out of their mouths. It was very, very neat. It shows once again the hubris of modern scientific methods, we tend to dismiss the aboriginal and the primitive. To turn it toward my own favorite subject, this was the state of modern medicine, nobody would ask the native in the Amazon basin " what plants do you use for malaria, brain tumors, shrinkage and so on and so forth, because they were just dismissed as superstitious primitives. It was thought that the doctrine of signatures was operating. They didn't realize how subtle and how complete human knowledge systems grow under the care of those to whom it really matters. Is there anything that needs to be said about this? The project of the redemption of spirit from matter turned into the project of redeeming the general society of the time toward a utopian vision. This is working right up to the present. Millenarianism is still with us, Marxism is

the last great Millenarian faith, the belief in the worker's state. It occupies the same relationship to these alchemical utopias as Heideggerian existentialism has to second century Gnosticism. The poetry has gone, the baroque imagery has been stripped away, but the impulse is still toward a perfect society where each from his ability according to his needs and means. It lives on. Democracy is also an effort, let us not forget, an attempt to recapture the style of 5th century Athens and we forget that this was a citystate half of whose inhabitants were slaves and yet we are so under the spell of the utopian dream that we continue, and not without important reason, I think, to try to labor toward a just and decent world where the lion lies down with the lamb and that was, and it remains, the alchemical dream. ...flashbacks of my life...I majored in history in college and the first history teacher that I had was a wonderful old man who really, now that I look back on it, taught the history of ideas. My major was involved with politics and all of this kind of thing and it's such a wonderful experience to suddenly get back to what turned me on to history, it gets me turned on and opens my mind again, looking at some of these thoughts that I'd just forgotten or suppressed, put down and said that's bullshit as a traditionally trained scientist and so on... opened my eyes to the fact that we can learn from what's gone on before, the ideas are out there, we just have to grasp them...and apply them and I, too, am interested in how we make this more meaningful for the future. One thing that occurs to me to say, I once, in one of these revelatory dialogs with the logos, asked the question, "why me, why are you telling me this?" because my, I mean, I was a poor hippie, I was penniless, I was a traveler, and the answer was instantaneous and it was, "because you don't believe in anything, because you don't believe in anything" and I think that that's a very pure position to hold. We're not trying to ensnare you to abandon your Jewishness or your Presbyterianism or belief, if you believe in something then you have precluded the possibility of believing in its opposite and you have hence limited your freedom. Everything is to be judged by its efficacy, by its effectiveness in the real world and I think that I have a horror in all belief systems, I just don't like them. If somebody tells you he has the answer, flee from this person, they are obviously some sort of low being who has not recognized the true size and dimension of the cosmos that we're living in and if you can keep yourself free of encumbering beliefs then your dialog with the logos can go forward unhindered. Sometimes when I'm in the trance of psilocybin I will say to the entity, "begin to show me yourself as you are for yourself, don't give me the scaled down, humanized version, show me your true nature" and after a few moments of this then I have to raise my hand and say enough, I can't handle more than that. This goes back to the statement made yesterday or the day before about that the universe is not only stranger than we suppose, it's stranger than we can suppose. Therefore, we are given tremendous latitude in what we can think and what we conceive but if you begin to believe in something then you are pulled down because everything that you believe has consequences. A perfect example, as some of you may know, when Mohammed ascended into heaven from the site of what was to become the Mosque of Omar, from the site of the Temple of Solomon in Jerusalem, he happened to be on horseback. Now if you believe that Mohammed ascended to heaven, imagine the theological and hermenutic problems posed by the horse he was riding. Because it went with him. This is a perfect example of how intellectual baggage drags us down because belief always contains absurdity. The ontological status of this horse has troubled Islamic theologians for centuries... If they would just let go of the whole idea complex they would be liberated from this kind of minutia. Belief kills the spirit, spirit transcends belief. I wanted to say that. Then somebody mentioned Bruno and Dee. Since I suggested that you read Giordano Bruno and the Hermetic Tradition it's ironic that so little time was spent on Bruno, on the other hand, I recommended that you read the book so you should be well informed about Bruno. For me, Bruno, we just didn't get into that particular historical episode because I wanted to tell you about the Rosicrucian enlightenment, but the thing to remember about Bruno was his discovery about the infinitude of the cosmos and that by an act of unencumbered observation, I mean how many people had looked at the night sky before Bruno and they had not seen what he saw, which was infinite space and suns hung like

lamps unto the uttermost extremes of infinity. By an act of pure cognition, he was able to destroy an entire cosmological vision that had limited and confined the human soul for millennia. That's half of his story. The other half is that he was burned at the stake for refusing to back down from this. It's a model for us all: trust your perceptions trust your intuition and then accept the consequences because this is what existential validity must be. As far as the relationship between Dee and Bruno, the relationship is that they were both derivative of the school of magic that can be traced back to Henry Cornelius Agrippa Von Nettleshine who was another model for Faust. Agrippa wrote *De Libro Quatro De Occulta Philosophia*, four books of occult philosophy, and that was the core work for European magic. All European magic can be traced back to the Agrippan system and Agrippa was the direct student of the Abbot Trithemius of Spawneheim that we mentioned yesterday as the source of all the magical codes of the middle ages. If you're interested in a brilliant but fictional treatment of John Dee and Giordano Bruno, I'd like to recommend a novel to you. It's called *Aegypt*, it's by John Crowley, the same gentleman who wrote *Little Big* which is a wonderful novel about the magical interface between two worlds. But his book *Aegypt*, fully half of the book is given over to a wonderfully rich retelling of the relationship between Bruno and Dee. Some people have wanted to say that Dee and Bruno actually crossed physical paths in London but I've looked into it and they missed each other by about two weeks. Bruno was setting sail for England as Dee was setting sail for France and the Rosacrucian enlightenment episode that I talked about. 36 Then someone asked about tantra and the contrast between the imaginative internalized invocation of the anima or the animus, depending on your own sexuality, and that contrasted with something that actually happens between two people. We didn't talk that much about the concept of the alchemical wedding, or the chemical marriage is another way of putting it, but this is the Western resonance to the Eastern idea of tantra and it is the idea that sexual energy, being the rawest and most accessible energy to the organism, can be channeled into a higher spirituality. It's entirely so, the problem is that of all paths this is probably fraught with the greatest difficulty because sexuality is such a debased coinage in the modern world. In other words, you have to make your way with great care and great purity of intent into this. In Eastern tantra that is actually practiced in this physical manner there is usually the admonition is that you should have no attachment to your tantrica, that the relationship should be entirely given over to the technical details of this union and of course it has to do with the forestalling of orgasm and the raising of energy within the organism. In the chemical marriage, in the alchemical marriage, due honor is given to the importance and uniqueness of the other person, in other words it isn't the idea of the temple prostitute who serves as the vessel for this process but there's actually an effort to keep individual identities and individual dignity, in some sense, together and this is, the higher up the mountain you go, the steeper it becomes and when you begin to scale the heights of alchemical or tantric sexuality the fall back into the nigredo can be shocking indeed so that's just an admonition, it's not designed to scare you off, it's just to say that in an age as sexually obsessed as our own, you have to do as the I Ching says, "inquire of the oracle once again if you have purity of intent." Isn't there also a healing between the two? Yes, it's a complete alchemical system and the energy is passed between. This is probably the highest completion that is possible. The ideal of romantic love, and I don't want to digress too much into this, but the ideal of romantic love was introduced into Europe in the 1400s and earlier at the Anjovan(sp?) court of Eleanor of Aquatrain by troubadours and this troubadour tradition can, scholarship now reveals pretty convincingly that this is an esoteric Sufi system. It also occurs in Indian teachers such as Chitania(sp?), who is the guy that the Hare Krishnas go back to. The radical teaching of Chitania was that you could achieve ecstasy not by sitting in yoga, but by dancing and singing on street corners. It's now pretty clearly shown that Sufi, the penetration of Sufi ideas into Bengal was happening at the same time that these Sufi ideas were coming across from North Africa and into Spain and Southern France. So, it's a tremendously old and vital tradition but you have to be careful - the romantic impulse is a real double-edged sword. It has been ever

since the early 19th century because, you know, the rise of romanticism, as that term is normally understood, meaning those movements in art and literature of the early 19th century, the rise of romanticism was a response to the dehumanization that was going on at that time. The rise of industrialism and the retreat into cities more massive than any that had ever been built, did you want to say something? I wanted to add, the question was about healing, and I think there's a tremendous difference between Indian and Tibetan tantric systems. You ought to practice in Taoism in terms of single copulation and dual copulation, in the Taoist system self-healing is of paramount importance before you can even consider dual copulation. Dual copulation is then begun, then again other considerations come in, but the Tibetan and Indian systems where Dakinis and various deities are invoked in the process of their alchemical union, it's really quite different from the Taoist system which is devoid of beliefs in gods. 37 That's a good point. You know, yesterday I talked about the alchemical stages. When you have reached the albedo, the final whitening of these processes, that final whitening is, from a higher prospective, a new nigredo and you must always build and build again. So you have to be fairly confident that you have already realized a certain portion of yourself before you embark upon these tantric double experiments. Because a lot of tantric text reads very vampirical, I mean, it's all about expelling the semen and then sucking it back in and it's like an energy war. It turns into black magic. The losing partners in this deal are just left a withered husk and this is not a higher completion to be sought for. You're correct, there are supposedly, whether they're myths or documented stories, about a Chinese Empress who caused the deaths of more than a thousand men because of her vampirism. And it was sexual in nature? It was sexual in nature. Just a couple of other points here. The gentleman here who had nothing to comment or wanted to sit it out reminded me, since we were talking about the Valentinian system this morning, my favorite archon, besides Sophia who's so interesting because of the little story about how she made the universe, but the 12th archon in the Gnostic system is a unique entity, I don't know of another religious system that has this notion. The 12th archon in the Valentinian system is called The Watcher. That's all he does. He does not put into the system at all but is the witness and somehow this creates a validating dimension that is very important. I just want to affirm that the watcher is a very strong platform on which to stand. I mean, would that I could learn to keep my mouth shut. Would that we all could. So, the watcher is a good archon to keep active on your inner altar. So, then, the future occurs three times on the list. We don't have a lot of time, but what I would like to say about it this morning is, if you extrapolate all that has been said here then you should see that, remember how I said that one view of alchemy is that the alchemist intervened in natural process in the role of a catalyst. For those of you who aren't chemists, a catalyst is something that causes a chemical reaction that is going on anyway to precede at a faster rate but the catalyst is not consumed in this process, it simply accelerates it. And if we think of nature as a great alchemical furnace that continuously reproduces and brings forth wonders, then must it not be that humanity is the yeast of the gain alchemical rarefaction and that human history is the process of catalyzing the alchemical condensation. If we look back into nature, before the advent of speaking and writing human beings in the last 15,000 years, what we see are very leisurely processes. The speciation of a single plant from another can occupy 50 or 60 thousand years, it never happens more quickly than that. And the grinding down of glaciers from the poles, these are processes that take hundreds and thousands of years. With the advent of human beings, an entirely new ontos of being, an entirely new category of becoming is introduced into the entire cosmos, as far as we know, because we cannot verify that there are other self-reflecting beings in the universe and this new ontos of becoming is what I call epigenetic, as opposed to 38 genetic. All other change in the living world, in the world of bios, of zoa, occurs through genetic change, random modification of the genome which is then subject to random selection. But with the advent of speech and writing, epigenetic, means outside of genetics, epigenetic processes become possible and time accelerates. One way of thinking about what is happening in this cosmos is that it is a gradual conquest of dimensionality by becoming, or process,

we hardly have a word inclusive enough. The earliest forms of life were probably slimes on certain kinds of clays, self-replicating molecular systems and then certain portions of this chemistry became light sensitive and then there was the sense of the division of light and darkness which generated the notion of here and there on some tremendously basic level within these early organisms. Once you have the concept of here and there, motility, the ability to move, the cilia that dot the surface of protozoans and stuff like this are elaborated and a new dimension enters the picture, the dimension of time, because notice that a journey from here to there is a journey from now to then. And then, as more refined perceptual apparatus arose, and more refined systems of moving animal bodies arose, a steady conquest of dimensionality occurred. The movement of animals onto the land and so forth. Well then, at the advent of memory, and memory must be mediated by language except at a very crude, instinctual level, memory is a time binding function. It's a way of somehow taking the past and calling up it's essential properties so that they are co-present with the given moment of experience. It's one thing at the level of the song and dance of pre-literate peoples but once you begin to chisel stone and write books then you're into the epigenetic domain in a big way. And once you cross the threshold into the world of electronic media and that sort of thing, once you achieve powered flight, once you can hurl instruments outside of the solar system, these are time binding functions and the alchemical intent, recall, was to accelerate nature's intent toward perfection and the alchemists all believed that nature was growing toward a state of unity and perfection, that given millions and millions of years, everything would turn to gold, everything would find its way toward the Platonian one. So, now we live in a world that appears to be on the brink of its own death or extinction and the reason we make that assumption is that our bridges are burning behind us. We see no way back to the world of the hunting and gathering pastoralists of the high Paleolithic of the Saharan grasslands. We see no way back to the Gothic piety of Europe with over 30 million people in it. Our bridges are burning and our religions, Islam, Judaism, Christianity, the major Western religions persistently insist that we are caught in a tightening spiral of ever increasing speed that is carrying us toward an unimaginable confrontation with something which they call God, the second coming, the messiah, you name it. As cool-headed a rationalist as Albert Toynbee, when he sat down to write a study of history, he finally had to face the question, "what is history for?" And the best he could come up with is "history must be about the entry of God into the domain of three-dimensional space." Well, we don't know what God is, let's not call it God, let's call it the philosopher's stone, let's call it the Sophic Hydrolith, and I believe that the chaos of our world, the apocalyptic intuition that informs our religions and our dreams is because ahead of us in time, and now not that far ahead of us in time, is something, taking a page from the mathematical concern called dynamics, we can call an attractor. The attractor lies ahead of us in time. The universal process is not driven by a downward cascade of Cartesian causuistry(?) that's the scientific notion and it leads to a universe of entropy and heat death millions of years in the future but what we see around us is a continuing and accelerating complexification as human beings, machines, eco systems, the solar system itself is beginning to knit itself into a tighter and tighter organization. I believe that alchemy provides the best metaphors for understanding this. Nature is the great alchemist par excellence and we, as its minions through history, are accelerating the condensation of being toward the unimaginable so that in my system, my way of thinking, there's ultimately a semitary(?) break with ordinary history and I call it all kinds of 39 different things, but here this morning, the transcendent other. The transcendent other casts an enormous shadow across the lower dimensional landscape of time. The stirring of the earliest life forms in the Devonian seas caught the call and every step that has been taken since then has been ever quicker, ever quicker toward the transcendental other, it beckons us and history is haunted by this thing. History is the shock wave of eschatology. History is a process that lasts, let's be generous, 25,000 years, the wink of an eye in geological time, and in that 25,000 years religious rise and fall, governmental systems, teachers come and go and there is a sense of being caught in a whirlpool that is spinning us toward fusion with the unimaginable. This

is why the skies of Earth are haunted by flying saucers, they aren't coming from other solar systems, they are sintillas, remember this alchemical term - sparks - they are sintillas being thrown off the alchemical quintessence which lies like a great attractor at the end of time and the purpose of science and technics and electronic media and information transfer and all of this stuff is to knit us together, to dissolve our boundaries and to bring us to a point of singularity where language fails, where we lean over meanings' edge and feel the dizziness of things unsaid. And this lies now, I believe, within our lifetimes, within the lifetimes of most of us, this is actually going to break through. I'm like one of those people carrying a sign that says "repent for the end is near." It's as nutty a position as you can possibly hold. That's why I suspect it has a reasonable chance of being dead on. So, that is the point of talking about alchemy and this melding, the production of the quintessence and all that. It is because we are a gnat's eyelash away from a full confrontation with the transcendent other. Our dreams are haunted by it, our reveries are filled with it. If we take a psychedelic drug, it's revealed before us in all its splendor. This is the force that is pulling us inexorably toward completion. I remember once in a psilocybin trance I expressed concern about the state of the world and the nous spoke, the logos spoke, and it said "no big deal, this is what it's like when a species prepares to depart for the stars." This is the, we are in the birth canal of a planetary birthing. And as you know, if you come upon a birth in progress, you would never dream that this is the culmination of a natural process. It looks like a catastrophe of some sort. There is moaning and groaning and screaming and thrashing and blood is being shed and there is a feeling that the walls are closing in and yet it is inscribed into each of us as a microcosmic reflection of the completion of human history. And not only human history, because we are simply the hands and eyes of all life, all process on this planet. The Gnostics believe that the Earth is like an egg and that a moment will come in which the egg must be split asunder. I love to quote the Grateful Dead, "you can't go back and you can't stand still. If the thunder don't get you then the lightning will." That is what we are being funnelled toward, that is the message of alchemy. That is the quintessence of the human enterprise, the biological enterprise. I like to recall the Irish toast "may you be alive at the end of the world." And we have a real crack at it. It's not a pessimistic vision. It's the most optimistic vision that one can suppose and I think that's where I'd like to leave it this morning. 40

Austin Texas

Description

All right, wonderful to see so many people turned out after just having been here a scant year ago. I'm delighted that they invited me back. The deal is no jokes about Camarro raffles, no jokes about MultiVite suppositories, so just consider it as if it didn't happen. No, it is a pleasure to be here. I'm fascinated by this green and intelligent part of Texas. I grew up with all the prejudices against Texas that you have in Western Colorado where Texans arrive to kill our elk once a year and then depart and leave us once again bereft of glory and drawl. So, I did a radio show, some of you may have heard it, and it was an occasion to be up at the campus, wonderful university. I see a lot of universities and a lot of them look like air force bases and, you are very fortunate to have the University of Texas at Austin. There is some great people associated with that faculty. Okay, let me get a whet whistle here. How many people have read at least one of my books? A lot of people. Well, so, what I'm thinking is, I have some things on my mind and I'll run through that but I'd like to leave a lot of time for Q&A because my thing has several facets and maybe you're interested in *Salvia divinorum* and I'm raving on about modeling and animation or maybe you're interested in the end of history and I can't shut up about serotonin metabolism. So, this is all part of the picture but driven by your needs and your agenda I think it's much more fruitful, it's much more fun for me. The audience is in these things, are, are the great joy and I should say to you as I say to all my audiences, the psychedelic community is still small and tight. And we look pretty much like everybody else out there. That's part of our victory, I might point out. It's not that we came to look like them, it's that they finally let it down, and now they all look like us. But a gathering like this is an occasion to actually see your local psychedelic communities. So, take a look around. Somebody in this room has what you need. And it's like an intelligence test, isn't it? All social interaction is, it turns out. Okay, I guess I should bring up today on what I've been doing before I plunge into the heart of this, since, I guess my own life is my own adventure and how I then read the larger picture of reality. I think everybody sees their life that way, after all, if you're not the hero in your novel what kind of novel is it? You need to do some heavy editing. Robert Anton Wilson once said, he said that we should define reality as a plot run by a closely knit group of insiders, yourself and your friends of course. I mean, if you don't believe that you have a loser's scenario and who needs a loser's scenario? So what I've been doing since I saw you last, is basically a lot of traveling. I went to South Africa last October, and that was an education, was a non-stop two week intensive education in humanness, third world colonial politics, Dutch Afrikaner history, a whole bunch of things I knew very little about. It was inspiring, challenging, amazing. Africa, the human home is right now the great theater of struggle for the human soul. How we deal with the social and political problems of Africa is saying a great deal about how we will be judged by the future. The problems of Africa are almost entirely created from the outside of Africa. And the solutions which are being produced on native soil

need all the nurturing and support that we who cheer on the brotherhood of man can give it. And then in February I went to Australia. And if I had known about Australia what I know now thirty years ago I'm sure my life would be very different. I said last night at a book signing, it's weirdly like Texas. I mean it's large, it's largely empty, and it has a very eccentric population of hard driving folks who are lovely to party with and know how to barbecue. So, what more can I say? Okay, so enough with personal reportage, local color, putting us all at ease and all the rest of that forensic malarkey, cut to the chase. When I think about talking to you, an audience like this, I go through my toolkit and try to say, you know, what is cogent, what's meaningful, what can bring us forward. And there seem to be, it's a changing list, but at the moment what seems to be going is the old perennial psychedelic alteration of consciousness for purposes of personal exploration, social reformation, creation of a new art, a new politic. That's one of the major pieces of the puzzle. Another major piece is the new communications technologies, and I mean not only the Internet but the software that allows us each and everyone of us to be animators, filmmakers, visually expressive people who can produce emotionally moving works of great depth and beauty. This is something that technology has brought to us. And strangely enough a technology largely produced by psychedelic heads, people like ourselves. I told you last year, I think when we discussed drugs and technology, that the only difference between a computer and a psychedelic was, one was too large to swallow. Well, you know, great progress has been made in twelve months, uhh, in another three or four years we will be able to swallow the computer. Some of us may never be able to swallow it. The third piece of the puzzle, which is sort of mine alone to play with, since no one else wants to be this publicly crazy, is the whole business of novelty theory, the approach of a singularity in time, that is sculpting the human and natural world and that is so large an object in the intuitive sphere of human beings, that it almost has religious overtones. And then the question for me, and the question for you I suppose is, how much of this can you take without having to take it all? How much of these ideas can you imbibe without having to go the whole distance? And the answer is, you know, it's a personal matter for each person to feel into their circumstance which means their history, both psychedelic and non-psychedelic. And then to feel into the projection of their future. Do you think you are repeating the lifestyles and algorithms of your parents and grandparents ad infinitum back to Adam, or do you feel like you stepped to the front of the train of human evolution, that you are making yourself new every day? If we reach too far back into the stabilizing metaphors of the past we get rigidity, habit, limitation. If we step too quickly into the unlimited freedom of the future we lose our grounding. Socialism did this over the past hundred years and because it abandoned any contact with a realistic human psychology, the best intended people ended up creating nightmare societies. If your theory is not true to the nature of humanness you will end up beating human beings like metal on the anvil of your ideology. And this creates great human suffering and, uhh, historical catastrophe. And I maintain that our own society suffers from a failure to adequately model and reflect the true nature of human beings. We have ideas, we have ideals that get in the way of realism and immediate experience. And when I was thinking about all of this and how to put it into a metaphor that would be appealing and amusing and lead people to look deeper into these things, I began to play with the idea, it's a religious idea. You all have heard, although probably more often in English than in Latin, the thought, "In principio est verbum et verbo caro factum est", which means "In the beginning was the word and the word was made flesh." This is the great overarching myth of western religion. It equally informs Islam, Christianity, Judaism. These three great flavors of monotheism all accept this primary statement "In the beginning was the word and the word was made flesh." What does it mean, for a moment taken away from the tired exegesis of the cults that have hammered at it for so long? What does it mean in and of itself? It means that language is somehow the privileged medium of exchange between human beings and the divine. That the descent of the word into flesh makes the flesh more than flesh, makes the word more than the word. The union of flesh and word launches the cosmic drama of fall and redemption that is the Ur-

myth of western society. And for centuries and centuries we've concentrated on one end of the story of the fall and the redemption. We have concentrated on the fall. But meanwhile through all the grimy betrayals and bloody backsliding of human history the word has quietly advanced its agenda. And I've been thinking a lot about this recently, because in a new book I'm writing I'm writing a lot about spoken language, speech. And I've come to a conclusion that, typical of me, is far from orthodoxy and far from much cover provided by anybody else's ideas on this matter. I've come to the conclusion that language is very old, thinking is very old, communicating is very old, by glance, by gesture, by dance, by meme, by intuition. But speech is very recent. It's a technological innovation as fresh as the Pentium chip or the spinning wheel. It's something someone invented somewhere. It's the most successful technological leap forward ever made. It's the discovery of symbolic signification that annoys, meaning nothing can by convention be given a meaning. And that that meaning will then attend that utterance wherever it occurs in the presence of those who have joined in the agreement that attaches the symbol to the meaningless utterance. It's a coding breakthrough. Somebody hacked this about 35,000 years ago. And immediately, as forms of media have a way of doing, it swamped the previous methods of communication. Because it worked in the dark, suddenly evenings were not so boring any more. It worked in the dark. It also, the touchy-feely forms of communication were generally one on one and related, probably, to having sex or aggressive physical encounters. But suddenly one voice could reach many and many could respond. And virtual reality was born at that moment. Not here in the late 20th century but at that moment, because acoustical environments laden with symbolic meaning became the name of the game. Stories is what we call these things and they are the proper use of the advanced form of medium know as human speech. It's using human speech to create three dimensional scenarios that unfold and everyone is carried along with the drama and the wonder of it. From that beginning in a series of successively accelerating leaps the word has made its way into the world. It's interesting that straight linguists and paleo-linguists believe human language is no more than 35,000 years old. Imagine that! We possess homo sapiens sapiens skeletons a 110,000 years old. People like the persons who rode with you on the bus yesterday, people that modern. And yet the experts tell us no one spoke until 35,000 years ago. No one wrote until 5 or 6,000 years ago. Reading and writing is simply a carrying forward of the original program of signification, first using acoustical signals and then some other hacker had the brilliant idea. "Well, if we can use sound to carry abstract associations, why not abstract symbols to carry abstract associations?" And writing was born. And what writing allows is expansion of the database because things are not dependent on the wetware of the human memory to survive from generation to generation. Suddenly the mush of brain is replaced by the durability of wood, and stone, and clay. And these things then become the medium upon which the primary database of the culture is being carried forward. Well, the rest of the story you know and this is not a lecture in the history of communication. Each succeeding refinement in communication has brought the word deeper into its association with the flesh, until the present. And at this moment there is a kind of a, what dynamicists call a cusp, a turning of the system upon its axes and the word is now beginning to make the return journey to the mysterious and hidden source from which it descended. In other words, spirit is now beginning to disentangle itself from matter. The 20th Century will be remembered as the great clash point, the great arena of conflict between the triumphal positivist and rational systems that European thought has developed over the past 300 years and the new irrational systems of thought which anthropology cheerfully imported into white high culture in the guise of reportage about the primitive. But this reportage about the primitive turns out to be a kind of ouroboric conundrum, the snake taking its tail in its mouth. In the past hundred years as these super technologies have been developed in the West, the smashing of atoms, the invention of radio, television, computers, immunology so forth and so on, data has been arriving about the practices of aboriginal cultures all over the planet. That they dissolve ordinary realities, ordinary cultural values through an interaction, a symbiosis, a relationship to local plants that

perturb brain chemistry. And in this domain of perturbed brain chemistry the cultural operating system is wiped clean. And something older, even for these people, something older, more vitalistic, more in touch with the animal's soul replaces it, replaces the cultural operating system. Something not determined by history and geography but something writ in the language of the flesh itself. This is who you are. This is true nakedness. You are not naked when you take off your clothes. You still wear your religious assumptions, your prejudices, your fears, your illusions, your delusions. When you shed the cultural operating system, then essentially you stand naked before the inspection of your own psyche. Desmond Morris called it "The naked ape." And it's from that position, a position outside the cultural operating system that we can begin to ask real questions about what does it mean to be human, what kind of circumstance are we caught in and what kind of structures, if any, can we put in place to assuage the pain and accentuate the glory and the wonder that lurks waiting for us in this very narrow slice of time between the birth canal and the yawning grave. In other words, we have to return to first premises. So, I've been thinking about this a lot. And at first it seemed to me only a metaphor, this phrase "Culture is your operating system." But because as I travel around a lot and get this jolting experience frequently of let's say leaving London on a foggy evening and arriving in Johannesburg 14 hours later to a sweltering day in a city of 14 million on the brink of anarchy, I get to change my operating system frequently. And so I notice the relativity of these systems. And some work for some things and some for others. For instance, if you are a positivist, if you're running positivism 4.0 you can't support UFOs. Positivism 4.0 does not support UFOs. If on the other hand you're running Urantia Book 5.1 8 as your operating system UFOs and a number of other things can get in through the door. That is, what we would technically say, a more tolerant operating system, or its plug in support special effects benighted at the positivist. Well, it's fun to think this way because it shows you that you don't have to be the victim of your culture. It's not like your eye color or your height or your gender. It's fragile, it can be remade if you wish it to be. And then the question is, well, how does one download a new operating system? Well, first of all you have to clear some space on your disc. The best way to do this is probably with a pharmacological agent. Umm, you think of one while I'll have a drink of water... You can put a lot of things in the trash and have them just disappear with a psilocybin upgrade. Other pharmacological agents that will clear your disk are ayahuasca. And of course these are gentle clearings of the disk which take five, six, seven hours. If you're in a hurry to dump that old data and leap right into the new operating system click on the button marked dimethyltryptamine. A compressed disc erasure will immediately be downloaded un-stuffed, bin hexed, implemented, installed, run and you will find yourself with an entirely different head. Now shamans have always known, though they may not have used the kind of language I'm using here, shamans have always known this trick. What trick? It has two facets. First of all that culture is an operating system, that's all it is, and that the operating system can be wiped out and replaced by something else. So in, essentially what's going on among shamans and those who resort to them for curing and counseling and so forth is, somebody is running a slightly more advanced operating system than the customer. The shaman is in possession of certain facts about plants, about animals, about healing, about human psychology, about the local geography, about mojo of many different sorts that the client is not aware of. The client is running culture lite. The shaman paid for the registered and licensed version of the software and is running a much heavier version of the software than the client. I think we should all aspire to make this upgrade. It's very important that you have all the bells and whistles on your operating system otherwise somebody is gonna be able to get leg up on you. Well, what's wrong with the operating system that we have? Consumer capitalism 5.0 or whatever it is. Well, it's dumb! It's retro, it's very non-competitive. It's messy, it wastes the environment, it wastes human resources, it's inefficient, it runs on stereotypes, it runs on a low sampling rate, which is what creates stereotypes, low sample rates make everybody appear alike, when in fact the glory is in everyone's differences, and the current operating system is flawed. It actually has bugs in it, that generate

contradictions. Contradictions such as we're cutting the earth from beneath our feet. We're poisoning the atmosphere that we breathe. This is not intelligent behavior. This is a culture with a bug in its operating system that's making it produce erratic, dysfunctional, malfunctioning behavior. Time to call a tech. And who are the techs? The shamans are the techs. Well, so I think you get the idea, uhh, very important to upgrade your operating system by dumping obsolete cultural subroutines. They are simply taking up disc space. They are not advancing you in any way whatsoever. Now, a very large group of people who followed this advice and rebuilt their operating system in the 1960's, went on then to build this most amazing of all cultural artifacts, the Internet. The Internet is light at the end of the tunnel. I don't care if it's being used to peddle pornography, I don't care if it's being trivialized in a thousand ways. Anything can be trivialized. The important point is that it is leveling the playing field of global society. It is creating de-facto an entirely new set of political realities. None of the constipated, oligarchic structures that are resisting this were ever asked. Their greed betrayed them into investing in this in the first place without ever fully grasping what the implications of it were for their larger agenda. The Internet basically means, you can now be as free as you are motivated to be, as free as you dare to be. Tim Leary, years ago, it was something he used to say, it never got quoted as much as, "turn on, tune in, drop out," but it seemed to me it was maybe better advice, and he used to say: "Find the others, find the others!" Well, you know, if you're a gay kid in Fargo, North Dakota, if you're a mescaline enthusiast in Winnipeg, if you're a student of alchemy in Moosejaw, community is pretty much out of reach for you, or it was until the coming of the Internet. And the Internet introduces everybody, no matter how weird, no matter how marginalized, no matter how peculiar, to the fact that there are others like you. There are others like you. Find the others. Make common cause. Realize that it's the deals you cut and the friends you make that determine where you're going to be standing when the flash hits. I mean, that's just obvious and by, you see, the cultural game is a game of uniformitarianism. Cultural myths are that we are all alike. We Americans, each created equal. I mean, if you can believe that at an operational level, then I have some bridges I would like to sell you, uhh, it's a necessary truth to do political business but it is not the truth. The truth is that you are not created equal with your self from day to day, leave alone any comparison with anybody else. You are not the person you were yesterday nor the person you will be next week. What is an observation like that? What shadow does it cast on a world of 'all people are created equal?' Clashes of operating systems. There's an axiom in one 'all created equal' and an axiom in the other 'each divergent.' These things can't be parsed, they can't be brought together. So, culture plays a game of simplification. If you can make people think alike they will buy alike, they will worship alike, and if, you know, politics demands it they will kill alike. So, the uniformitarian agenda of culture is not an agenda friendly to you or to me or to any other individual. And if you start out from that point of view, you will soon realize that culture is not your friend. Now this is not exactly PG-13 to say what if everybody running around recovering their Latvian roots and their Irishness, and their this, their whatever, culture is not your friend. If you define yourself as a member of a group, of any group, know that that is a gross simplification. And that everything about you that is interesting and unique is betrayed by defining yourself in that way. You know, most racism is practiced by people of the race that they are making racial judgements about. White people have far more racial opinions about white people than any other racial group because that's where they spend their time. These gross simplifications betray humanity, betray uniqueness, make sane politics impossible. What we have to do is get back to the reality of the flesh. The reality of the individual identity. This is how we come packaged. A race that's an abstraction. These days you have to have three years of genetics under your belt to give a satisfactory definition of the word if we really gonna go to the mat on it. I mean it's an abstraction of modern science. It's a notion so far removed from anything you and I come in contact with that we should just junk it. What we need to celebrate is the individual. Have you not noticed, I certainly have, that every historical change you can think of, in fact any change you can think of, forget about human

beings, any change in any system that you can think of is always ultimately traceable to one unit in the system undergoing a phase state change of some sort. No group, there are no group decisions. Those things come later. The genius of creativity and of initiation of activity always lies with the individual. And it's very interesting that this is what the psychedelics address. They address us uniquely as individuals. You can sit next to somebody who drank from the same bottle you did and be perfectly confident that their experience has very little congruency with your own. Well, so then if we let the scales of cultural values fall from our eyes and try not to look at the world through the eyes of science, or democracy, or capitalism, or Christianity, what is there beyond ideology, what are the facts of the matter? As I see it, the most visible facts on the surface of things, on the surface of being, I see the law of increasing complexity. Things have gotten more complicated through time. I have never met anyone who could successfully argue against this. That doesn't mean it's true but it means that maybe, as Wittgenstein used to say, "True enough." True enough. That as you approach the present moment in the only area of the universe which we have accurate data about, which is this planet, things become more complicated. A million years ago there were no human civilizations, a thousand years ago there were no machines to speak of, a hundred years ago there was no communication infrastructure to speak of, ten years ago there was no Internet, eighteen months ago there was no Java. Things are complexifying, intensifying, moving together. This is the universal drama that is reaching culmination in our lifetimes. Because, and I offer this, don't believe me for God's sake, don't believe anybody, just take this stuff in and then measure it against your own experience. The second extra cultural fact that I've been able to discern, the first being 'things get more complicated as you approach the present,' and the second being, 'that process of complexification is occurring faster and faster.' The early universe was very slow moving. It took a long time for things to cool down and life to begin its agonizing march out of the slime into animal form, meeting extinction and catastrophe and setback after setback but always picking itself up, literally, out of the mud and moving forward. Well, as life left the ocean the pace of evolution quickened. As life radiated across the land the number of phyla multiplied the number of species multiplied, finally, a million years ago, pick a number, a million and a half years ago, the higher primates begin to use tools, fire enters the picture. And just as an aside, isn't it interesting how long people used tools and fire before spoken language enters the picture? I mean, we possess tools a million years old, human tools, language 35,000 years old. When I was in South Africa last year, I was in this place that reminded me of, like the Four Corners area around Moab Utah, was like nothing like I had expected South Africa to be, and when I wasn't teaching I would wander the dry arroyos and hunt for human tools. And there was an archeologist staying in a bar, or in the hotel there and we would drink in the evening in the bar, and I would lay my day's find out on the bar, and he would sort it into piles and he says, "Nothing in this pile is less than 165,000 years old. Everything in this pile is from..." --Cut Tape-- ...human tools, we're talking about. Now I've lost my thread because I was so thrilled with my side bar. I think I can get it back, uhh yea, here it is, here it is, ha ha, and they say potheads can't think! Here it is. The second obvious fact which haunts the post cultural viewpoint is this acceleration of change, and I've sort of built my career on this because I am a rationalist but I feel the emotional power of this thing. We are caught in a basin of attraction, to use a mathematical term. In other words we are under the influence of something which is pulling us into the future or into novelty, if you want to put it that way, at a faster and faster rate. So problems which are presented in the following terms "If we don't do something in 500 years we will run out of this that or the other" or, "If we don't do something, in a thousand years this or that will happen," these are meaningless, statistics. Because the acceleration into novelty is rewriting the rules now every eighteen months. We are descending now into a well of novelty such that more change is now occurring in a single human lifetime than occurred in the previous ten thousand years of human history. We are approaching at a faster and faster rate something unthinkable. Something which is sculpting us in it's image. something which shamans have always known was there though they may not

have used the metaphor 'ahead in time,' that's a Western download of where it is, because you could just as well say it's in heaven, or behind us in time, or everywhere, or nowhere. The point is we're about to arrive in its presence. And, it is shaping us to prepare us for the arrival. It is making us more and more in its image. This is not a new process. This began a long, long time ago. But it's now reaching its culmination. And I said a few minutes ago "The Internet is a light at the end of the tunnel". The Internet is the beginning of a nervous system that is knitting not only all human beings but all life together, all information together. Because, you know, there already is an Internet. It's called the integrated ecosystem of Planet Three. It runs on pheromones, it runs on weather systems, ocean tides, tell uric currents moving in the earth, thousands of methods. It is that way because our cultural tradition is one of reductionism, tearing things apart, break them into their subordinate units, break those into still smaller units. Well, if you have a theory of reality like that, what you end up with is, all the pieces spread out and no car and nowhere to go. But nature has always operated as an integrated system of communication and the Internet is in a sense nothing more than a human aping of a natural system already in place. If we could do it through pheromones, light mycelium and electromagnetic pulses through the earth, we wouldn't be stringing copper and cable and fiber optic. Those things are simply historical artifacts of the moment. What lies ahead on the Internet, what lies ahead, I think for us, and this is the last point I really wanna make. And we can talk about all this, is, you know, I have been a true resister of the alien penetration of human civilization because I just saw no evidence for it. But the chant that they are coming has now grown so loud, I feel like sort of one has to ask oneself short of one hundred percent skepticism, what the hell is going on with this alien hype? And I think the problem is one of modeling and intelligence. There is an alien, we are in the cultural process of meeting this alien but they do not come in thousand ton beryllium ships from Zeneba Ganubi to trade high technology for human fetal tissue. I mean that, if you be, that's an intelligence test, folks. That's not how it works. Our own hysteria makes it very difficult to deal with the presence of the alien, and the alien knows that. That's why it has disguised itself as a psychedelic experience, I think. You know how in all this '50s B science fiction movies there was always this theme of the landing area. And I saw it in 'Mars Attacks!' too. There must be a landing zone. Somehow we must let them know that we welcome them by building a landing area. And the Nazca plane has been claimed and on, and on, and on. I think that the alien is a creature of pure information. It's purely information. It's non-local. It comes out of the Bell non-locality part of the universe that exists distributed through hyperspace. The alien is real but it is only made of information. And therefore the only dimension in which it can be encountered is a dimension of pure information. Fortunately we are building a dimension of pure information. Providentially we have named it 'The Net'. The Net is a net for catching the alien mind. How will it come? Will it descend upon our websites in a flash of light? I don't think so. How it will come is half through human fingers. The alien is real but it is within us. It can only communicate information. And that information has to be made real in this world by human coders. So if we were to set out lightheartedly to build a virtual reality as alien as we could make it, I maintain that three quarters of the way our hair would be standing on end because we would realize we are not inventing this. We are discovering it. You know, Michelangelo said, "The form is in the block of marble. What I do is I take away the part that is unnecessary and reveal the human torso." In the same way the alien is already within us but we must model it, we must call it forth into a dimension of potential dialogue. And I think that this is what high tech society can bring to the shamanic equation. Shamans have been dealing with spirits, entities, powers for more than 100,000 years. But it has always been on a one to one basis. One human being at a time went up Mount Sinai to talk to the fire on the mountain. But with virtual reality we have a technology to show each other our dreams and, yes, our hallucinations. And as we begin to show each other the contents of our heads and as we begin to explore the alien niagaras of beauty that pour through your consciousness under the influence of some of these substances. We are going to discover that we are not what we thought we were. The monkey flesh is being

penetrated by something... Dare I say it? Divine! Or at least alien, trans-planetary and beyond the power of human comprehension. I don't know if we are talking about God Almighty here. I don't know if we are talking about the god 'who hang the stars like lamps in heaven,' as Milton says. That seems a tall order. Maybe what we are talking about is the god of biology. Something has happened to this planet. It has been infected with an informational, call it virus, call it force, call it beam? That is using matter and yes, using our flesh and our thoughts to bootstrap itself to higher and higher levels. And now the prosthesis of machinery and the possibility of an artificial intelligence raises the real option of producing... of actually midwifing the birth of an entirely new, not species, but order of biological and intelligence in existence. The human machine symbiote is upon us. I mean it's been with us for a while since the first wheel was carved, since the first stick was sharpened but that was all very simple stuff. Now it's clear that we are in partnership with another mind which comes to us through our machinery's and through the biosphere. Wherever we press beyond the thin curtain of rationalist culture we discover the incredibly rich, erotic, scary, promising, presence of this intelligent other which beckons us out of history and says, you know, "The galaxy lies waiting. A galaxy, or galaxies lie waiting. Loose the encumbrances of three dimensional space. Return with the word to its higher and hidden source." And at that point you will discover the alchemical Paraclete will be given unto you. The alchemical dispensation will be given and as James Joyce said, "Man will be dirigible." What did he mean? He meant that we will loose the limitations of physical and three dimensional space. We are destined to become mental creatures, "But isn't this a terrible thing? What about this, that, and the other?" All the things you're worrying about, we turned our back on 25,000 years ago. we have been marching through this virtual reality of our own creation for the entire duration of what is called human history. Now, uhh, is there a political implication to all of this? I think the political implication is a personal one. We all must try to understand what is happening. We need to try to understand what is happening. And in my humble opinion ideology is only going to get in your way. Nobody understands what is happening. Not Buddhists, not Christians, not government scientists, not, you know, no one understands what is happening. So forget ideologies. They betray, they limit, they lead astray. just deal with the raw data and trust yourself. Nobody is smarter than you are. And what if they are? What good is their understanding doing you? People who walk around saying, "Well I don't understand quantum physics but somewhere somebody understands it." That's not a very helpful attitude toward reserving the insights of quantum physics. Inform yourself. What does inform yourself mean? It means transcend and mistrust ideology. Go for direct experience. What do you think when you face the waterfall? What do you think when you have sex? What do you think when you take Psilocybin? Everything else is unconfirmable rumor, useless, probably lies. So liberate yourself from the illusion of culture. Take responsibility for what you think and what you do. And then the other political implication toward community is, a lot of people are going to be very anxious because change raises anxiety in people and people who have limited opportunities to educate themselves because of culturally inflicted abuse are scared because they can sense that everything familiar is giving way but they don't want to embrace the unimaginable. These people need to be reassured. They need to be reassured by example and by hearing optimistic and reasonable rhetoric about the future. Selling the future as an eight alarm fire, which is how the media does it, only makes a sane future impossible. So we need a responsible approach to thinking about the future and it means taking personal responsibility, for your drug taking, for the ideas, the memes, that you push into society, and for the images that we share among ourselves. You know, one of the great truisms of the new age is that images can heal. But I never heard anybody discuss the obvious contrary implication which is, images can make you sick. And you are constantly bombarded with images which disempower, divide, confuse and make crazy, basically. So, I think psychedelics are such political dynamite in any culture is because they dissolve cultural assumptions. The scales fall from people's eyes and they say, "Does this make sense? Does my job make sense? Does my relationship make sense, to my significant

other, to my government, to my children, to my environment? Do these relationships make sense?" And of course the answer for most people in high tech society is no. We've been compromised, we've been deluded, we've been sold a massive pottage. The way out then is personal responsibility, new operating systems downloaded from outside of culture, which means from the deeper wisdom of the psychedelic plants and then a commitment to community and a motto of "To the future, without fear!" Without fear!

Linear Societies and Nonlinear Drugs

16 January 1999

Entheobotany Seminar Chan Kha Hotel, Palenque, Mexico

Event Description: On Saturday night, January 16, 1999, Terence McKenna gave one of his last lectures at the legendary Entheobotany Series by the foot of the pool at the Chan Kha Hotel near the Mayan ruins of Palenque. There were about 100 people sitting in the moon- light, listening to the lowing of cattle in the distance and the occasional chatter of the howler monkeys in the trees nearby.

Well, so then let me turn to the main event. I've got a snoot full of Tequila and a messianic mission [audience laughter] pawing the ground to talk to you, as usual.

Everybody has their own [???

Uh, I guess the title of tonight's talk is Linear Societies and Nonlinear Drugs, which uh, is something that I just had to pull out of the air when Kim finally slammed me to the wall for what I would be talking about this night many months ago. But, more and more for me, especially with this group, these things have become sort of, uh, summations and, I guess I hope, convivial examinations of just where we are- we each and every one of us -and then this enterprise, whatever we mean by that, in the context of everything else that's happening in the world. In other words, the psychedelic experience, uh, the entheogenic experience, uh, contextualized. And as I try to think about, you know, what, if anything, I can bring to the party I guess it's that what I'm interested in is uh, psychedelics as a philosophical tool. And when I concretize that for myself I realized no-ther's

no claims on that part of discourse.

No one wants to do this. Uh, philosophy i-academic philosophy is done in a very formal manner, and the most exciting is incredibly stuffy. And yet I - like most of you I assume - have taken on board in my life this thing called the psychedelic experience, which is then as large a portion of my being as my sexuality, my politics, my education, it, it shapes everything. And yet, nowhere in the world of philosophical discourse is there any genuflection at least overtly made to this, maybe not since Plato talked about uh, shadows on the walls on the cave, and so forth and so on.

Well, so, uh, what can psychedelics and the psychedelic experience bring to philosophy, and, and what do I mean by philosophy? By philosophy I mean, uh, the enterprise of discursive thinking. Trying to understand what the world is and who's asking the question. You know, where did the world come from? Where is it bound and who's along for the ride?

And it seems to me that we as a community have - this is sort of hard to wrap your mind around at least for me - but we have in a sense inculcated into ourselves the image of an underclass so that we struggle for legal toleration of our, of our practices and our habits. But we don't struggle for intellectual legitimization of our vision. We accept that they are somehow contextually marginal. And, and as I thought about that I realized that that is a limitation on the community. That, uh, the information which is coming from the psychedelic experience as interpreted by Western people is

primary evidence for the need for a major paradigm shift in the whole way, uh the Western mentality does business.

Well, what kind of evidence and what kind of shift? Well, [clears throat] there's a lot of talk in our community, and there had been for many, many years about shamanism. And when we seek to legitimize ourselves through a historical argument we reach back to shamanism and we say we're part of something which is a hundred thousand years old and worldwide and touched the spirit long before the shadow of the cross fell over Jerusalem and so forth and so on. All, all true. Um, and in a way that has, I think, the-that, uh tendency, which is part of the broader tendency in the Western mind to, uh valorize and grow nostalgic over the primitive has put a certain political cast on our, on our uh, stance and our position. But what we are is uh, again contextually, is a culture of science, uh, and I'm speaking now of our community. It's the Albert Hoffmanns and the, and the Dave Nichols and the Sasha Shulgins who have kept our canoe afloat. These are men of science, its methods, its vocabulary, its culture. We have not, though we certainly honor those people and love them - as their rhetoric is not the primary rhetoric of the larger community of psychedelic users, which

tends toward this - uh, as I referred to it - shamanistic aboriginal nostalgia.

This- I mean I- I'll turn left here for a moment. I feel more comfortable with the scientific end of things. I think the news coming out of science is the most psychedelic news, uh, there is. When I go to the Internet I go to things like science alert and the Hubble picture of the day and uh, and this sort of thing. And, uh, our community as a whole, I think, is not involved enough in incorporating the, the vistas. If, you know, we- while we struggle to legalize psychedelics, psychedelic thinking is everywhere triumphant because the instruments built by linear science throw open doorways on the unimaginable and the most revered and hoary jefes of the scientific establishment have to genuflect before this stuff.

I mean, what am I talking about? Well for example, Science Magazine, uh wrote last week that the most important scientific breakthrough of 1998 was the, uh, apparent observation and agreement upon that observation by the astrophysical community of a cosmological constant. Uh, it- it- this sounds like very deep physics, but if I give it to you as a headline what is means is the entire universe, every atom and every empty space of it, is ruled by a very weird force that has now been seriously known to science for precisely five months. [audience laughter] Uh, a force which is apparently going to overcome gravity's tendency to collapse the universe and to cause it to expand in a very explosive and counterintuitive and psychedelic fashion that is the complete confoundment of the core science that Western linear thinking has, has built. And of course there weren't riots in the streets

and the electricity didn't fail, uh, but at the very pinnacles of the antennae of the evolving civilization, uh, there was a shudder felt in the force you may be sure.

So, there are two much larger forces than our community that are in play in terms of shaping the cultural modality and, and I would call them, um ... what would I call them? I would call one of them science. It's the other one I am having trouble with. It, it is uh, everything which is not anchored in the rational. You know the 20th century has the most spectacular celebratory affair with the irrational since the 16th century. I mean never before had so many prophets, wizards, wise women, casters of runes, and seers of visions moved among the people uh, uh, uh plying their wares. Uh, and part of this is brought on by the tension between the failure of the education system at the very moment of an inflationary expansion of knowledge. So that it's very hard to, to be au courant in all fields and if your not current in a field then probably your version of that field is some kind of story, a myth, you know. Uh, I mean if you can't keep up with quantum physics why not fall back on archangels, you know. It requires less intellectual engagement or something like that. Uh, discourse is fragmenting. Fields of discourse are evolving vocabulary so rapidly that the understanding of these vocabularies is not penetrating very far beyond the core group of workers. So then this is creating kind of islanded systems of self reference where outside those systems of self reference information doesn't travel. Uh, the people who are the gene splicers know very little about remote sensing and

both of those parties know very little about uh, recent discoveries in astrophysics, for example. So, there's an intellectual fragmentation.

Uh, I live in Hawaii and in a forest in fairly remote conditions, and so I entertain all this in my mind all the time, and try to – my faith, and I assume it's the psychedelic faith, although we have had some fairly existential characters in our ranks over the years. [laughs, laughter] But uh, but the psychedelic faith I think is that uh, the universe is beautiful in the Platonic sense and therefore good and true. In other words we are optimists. We are not flailing existentialists. We are not relativists because we have a real standard to measure our spiritual coinage against. So we're not relativists. This is a point I'm really keen to make because we're embedded in relativism. It's all around us. It's the air we breathe but it is not inimical to the psychedelic community. I mean, I think the psychedelic experience is the only authentic source of uh, uh reliable contact with the numinous. I mean meditation, so forth and so on, is all very fine but uh, it requires a leisure class involved in philanthropic support of this kind of foolishness, where uh, the psychedelic experience is immediate and uh, and real. So uh – now I've lost my way here, ... ah yes, no, optimism – so I sit in Hawaii and I look at all this and I try to contextualize it and, and come out with a, a good story because I think the best story will win. [audience chuckling] Uh, so if you can get together the best version of how it should all come out – so shall it be. And I work at this because in the past I've been very, very

happy with the results between my interior fantasy and the unfolding of historical development. I mean, I, I wished for LSD and then it happened, [audience chuckles] and then I dreamed of the Internet and then it happened. So I should keep at this.

Uh, uh, and I recently read a very interesting book called "A Thousand Years of Nonlinear History" by Michael [Manuel] De Landa, and if you get a chance you should take a look at this. And he made a point, which caused me to expand his point into this little thing I'm gonna tell you now, but his point was that uh, human beings are very involved in the movement of geological material. That as a species we move rocks around on a very large scale and of course it's interesting that the ear-some of the earliest human structures are the most physically massive and weighty, like the great pyramids. So De Landa made this point about our relationship with the st- the geological stratigraphy of the earth, and that cities were a kind of geological extension of the process of crystallization carried on through the intermediation of a biological unit i.e. intelligent primates who are building

these structures. And, uh I thought that was very interesting. I had never considered it before.

I'd al- I've talked about virtual reality and I've said that it's nothing new that Ur was a virtual reality and Çatalhöyük was a virtual reality, but done in stucco and fired ceramic and stone. And that when the medium is so intractable as stone the epistemic assumptions that get formed about what reality is are very different then if you can build Versailles at the click of a mouse button. Uh, but nevertheless it's the same. But embedded in my reading of De Landa was, I've been thinking a lot and I talked to you a lot last year about artificial intelligences and minds which are not human. Minds which are very different from us. Intelligence which is very different from us. Uh, you know, while the naïve are scanning the stars our appliances have become telepathic. We- there is a very strange kind of intelligence being called into existence by ourselves, strangely enough, and this is the connection to De Landa. This artificial intelligence which is being called into being by human activity is made of the same materials as Ur and Çatalhöyük. It's made of ceramics, glasses, and metals. It's that, uh- so then I took this on board and thought about it and I, I've sort of come to some

kind of 'Cyber pantheistic Emersonianism', [audience chuckles] which is, uh ... I'll give it to you as a headline and then work backwards so that in case I forget what I'm saying it won't be lost to suffering mankind. [audience laughs]

The earth's strategy for its own salvation is through machines – is what it is. And, human beings are some kind of uh – we are the deputized spouse. We are the bride in this alchemical rarefaction of glasses, ceramics, metals and uh, and volatile materials. Apparently the earth is like some kind of an embryonic, uh or fetal thing. And at the end of its gestation what is happening is, it is ramifying its nervous system – is appearing in its developmental- in the unfolding of its morphogenesis. And as we contemplate nanotechnologies and see ourselves working through bacteria and this sort of thing at the engineering level. You have to be blind to not then reflect back upon the fact that in some sense we are already working at that kind of level, at the behest of it is not clear who. Because nobody ever asked the question in quite this way before. The answer to who, I think, is, is the earth. And that what lies ahead at the end of the linear tunnel of, of Western subjectivist, positivist, structuralist, assumptions that we've been operating, when we hit the end of the tunnel and burst out into the larger mental space of cosmic evolution, what we are going to find is that we are partners, actors in a cosmic drama that involves the earth at one polarity and machine at the other polarity as the expression of the will of the earth toward a kind of self reflective transcendence that is achieved through machine-human-biotic symbiosis. And this is, you know, there will never be a headline

which says this. Some people won't even notice that it's happening because these large scale processes can be described by many metaphors at many depths, but I'm telling you I think this is what's going on.

Uh, the reason I like this story is because uh, it's not a story about processes out of control. It's not a story about human guilt. It's not a story full of we musts and we should. It's a story, which gives honor to every part of the unfolding experience field, in other words biology, technology, human culture, human traditional values, transcendent human disextopian values. It's a story of things on course on time and under budget [audience chuckles] and I assume that's how nature really operates. And that we live inside some kind of anxiety-producing culture that is uh, a necessary, I don't want to say evil, but a necessary response to conditions of stress. Uh, there are processes which let, you know, waste, nuclear waste build up, urbanization, land disturbance, there are processes which if allowed to run on indefinitely would wreck the whole system and pitch it into chaos. But Confucius said uh, "No tree grows to heaven", and what he meant by that is that is it's fruitless to project any process to infinity because any process projected to infinity creates some kind of catastrophic scenario. If no fruit flies died in six months the earth would spin out of its orbit from the

weight of fruit flies. No, I don't think that's true [laughter] But what an image! [laughter]

Somebody once told me if the earth completely disappeared except for its nematodes that you could still see the outlines of the continents if you were standing on the moon. [audience laughter] I thought, now just who gathered this? [laughter] So then to bring this back around a little, where, where is the psychedelic experience in all of this? Well, um, it used to be called or at one phase it was called uh, consciousness expansion and consciousness expansion in human beings is going to become uh, an absolute necessity because we are summoning out of the woodwork of cybernetic technology machines that are going to require super-intelligent humans to direct and uh, and have discourse with them. This is happening. It is already happening. I mean the Internet is this. I mean it doesn't tap you on the shoulder and remind you to brush your teeth, but it is, you know, a partner in the understanding of the world that is genie-like, that's the image I have when I sit down to it. It is, it is, uh, all John Dee would have asked of his archangelic messengers. He wanted instantaneous information on the political situation on the course of Europe. He wanted information on the

course of the- Drake's expedition, then on the other side of the planet. The internet is this kind of magical intelligent prosthesis, uh, and as I said there wont come a dramatic moment, I think, à la lawnmower man or something like that.

These, these things are, are much more seeping. The only people who in fact can see the game move against the background of the forest pattern are psychedelic heads. Uh, you have to think about this stuff and you have to develop vocabularies for catching it in action. Uh, this is what the game of, of uh, being an intellectual is, I think – uh, trying to, trying to see the processes of morphological unfolding in action and guess uh the direction in which it's headed. Uh, because it's inevitably headed toward greater density of information at greater speeds, higher level integrative metaphors,

visually rather than textually displayed, uh, transformation of such graphic and glyphic elements over time. It becomes more and more like the interface of a computer, more and more like some kind of uh, machine environment.

I mean, we have thought, for I assume, at least a hundred thousand years maybe much uh longer, but the quality of thought, you know, it was early- when it was early it was intermittent, it was thin, it was a groping, it was uh, an undigested intuition, a perception slipping away from the minds eye. Because of media reinforcement and education and acculturation and the passage of a hundred thousand years, the voice of the mind, the, the Logos, uh, has grown stronger. But now it takes uh, a, an exponential leap forward into visualization, into manifestation through this information

processing prosthesis that integrates us all. And, you know, I can imagine a future not very far away where the, the individual, uh, expression of the individual is lowered is more muted.

I mean, this is the most individualistic individual worshipping century – the century just ending – that we have ever known. And its, its great accomplishments, its great works of art were all accomplished by individuals and of political undertaking such as the Third Reich and so forth and so on. Also highly motivated individuals who rose above the masses. I'm-I'm not sure we can afford the luxury of that kind of exhibitionistic individualism in the future. And I think probably that it's not that we are talking about a restriction of human rights, we are talking about a transformation of human drives. Uh, the states of integration and collectivity that will be sold as public utilities in the next century are anticipated now by group psychedelic experiences, ayahuasca sessions, this sort of thing. And the dichotomy – and I think I made this clear when I talked about the earth and

machines – the dichotomy between the natural and the artificial is an obsession of the 20th century. Hence cancelled now. Uh, in fact a whole bunch of things are cancelled.

We were talking at home about how, how uh, Roger Shattuck in his history of Dada said that "The 20th century couldn't wait to be born. It was born in 1888 at the death of Victor Hugo." and then I said, "well so if it was born in 1888 when did the 20th century end?" and I think it ended in 1992, expired early with the birth of the World Wide Web. What defined all that modernity was mass media. You know, uh, mass media shaped that whole psychology and it is now archaic – it's not archaic it's obsolete. Uh, it-it's wonderful that the phrase "20th century" is beginning to have that wonderful brown gray Edwardian tone that used to be reserved for the term 19th century. [audience chuckles] Meaning those terribly stuffy and confused and rather silly people who just didn't quite get it right but were doing the best they could and muddling through and thank God they gave

way to us, the people of the 21st century. [laughter]

Let me see here. Is there a flashlight? I have a page full of notes. I needn't be so, uh ... If anything here that wasn't touched on ...

Well some notes about um, the this planetary intelligence (– thank you June –) and how all that works. Um, one of the insights that I've been reading different people this year, maybe you can tell, and one of the people I've been reading is Greg Egan who I've talked about last year. But now I've

read more. Now I've read Diaspora and the ones where he makes no effort whatsoever to explain it to you unless you've already done your homework. And, uh, what I- and then Jonathan today in his lecture talked about DNA a little bit and frame slippage and all of that and it reminded me of it.

The thing that I'm coming to from my psychedelic, uh, experience and my life experience and the whole ball of wax, is, uh, I-I said for many, many years that the world is made of language. That was just sort of one of, of my bumper stickers. But I think that there's that that carries some of the flavor of what I wanna say there, but that there's more to it than that. It's, it's that uh, everything is code. Everything is code in the sense that hackers mean when they say they write code. When Sasha stands up and waves his arms and draws what he calls the dirty pictures he initiates you into a code, a vocabulary with very, uh defined rules and quick to learn. And then they are likeinker toys. Once you know the rules of the connectivity then you can sit down like a child and begin to stick these things together. And say well what would this be like, and what would this be like, and does

God allow this or does this break the rules and so forth.

The DNA is like that. Human language is like that. Uh, human body language is like that. Machines communicate like this. In fact, uh, uh this is a-a bridge which connects us. This is the great overarching bridge which will connect us to the machines, that they, like us are uh, commanded by

language.

And so uh, this realization that everything is code and code moving on many levels is I think a further ... – it's more primary than the perception, for example, that things are made of space, time, matter and energy. That's one level below code. The code codes for space, time, matter, and energy. It's much more like we're in um, a simulacrum, some kind of machine environment. And in fact I like that idea because I've always sensed, and psychedelics have always intensified this intuition in me, that the universe is a puzzle, life is a, is a problem to be solved, it's a conundrum. It's not what it appears to be. There is uh, there are doors, there are locks and keys. There are levels, uh, and if you, if you get it right somehow it will give way to something extremely unexpected. DMT is a perfect example of that and of course at the molecular level it literalizes that metaphor. I mean, the DM-

the DMT is the molecular key, the extraneous object introduced into the front door of the synaptic receptor. And then, you know, you can plunder the palace – for five minutes. [laughter]

Well if ... if the, if the world is uh, the world is code then it can be hacked. In other words it won't, it needn't stand still in quite the same way that it stands still in your mind if you believe in something called the laws of physics. Uh, it permits magic because it says behind the laws of physics is a deeper level, and if you can reach that deeper level you can make uh, you can make changes there.

Now and this leads onto something that I wanted to say about an earlier theme where I was talking about the legitimation of the, of the community's intuitions. There's something that we always kick around at these things or I always bring it up in some form is where do the hallucinations come from?

Uh, we arrived late last night from a 24 hour trip from Hawaii that was just hell, or as much hell as modern airlines can legally inflict upon you. [audience chuckles] And you know, we got stoned, so we were laying there, and it always happens when, you know, you're cut off from cannabis for long periods like that you return to it it's ten times as strong and the hallucinations were exquisite. And, you know, I've been looking at hallucinations now for thirty some years. And, and I looked at these last night and I thought, if someone would ask me, "What were they like", what would I have to say? And I said, "Indescribable! Indescribable." I looked and looked, I could look to my heart's content and they were in- uh, indescribable. So we always come around to this question, uh, where do the hallucinations come from? And I suppose the unconscious reductionists among us – and I don't mean that they're unconscious, I mean that they unconsciously use reductionism – probably assume that it's some kind of like iteration thing. That bits and pieces of everything you've ever seen are rolling in some kind of neurological kaleidoscope that can run for ever and just produce this

endless download of drifting imagery. But there's a problem with that. Because this stuff is too coherent, it means too much, it's too emotionally charged.

Well, we have never really rallied as a group to try and locate in our, in our combined opinions the one or several sources of these images. And uh, I think that uh, and I talked a bit about this last year, but I think that this is legitimate perception of, of uh, thoughts, places, things, times, and objects that either have existed somewhere in the universe or do exist or have existed in the minds of beings somewhere, sometime, in the universe. In other words, that we have to begin to take seriously the consequences of generalizations like quantum connectivity. In other words, it's one thing to bask in the light of the overarching metaphor, which says that everything is connected to everything else. It's quite another thing to say, "And so then what are the consequences, for me, of this?"

And the answer seems to me to be that ins- that the inside of our imagination, the inside of our heads, really is the most vast frontier imaginable. And we must leave it for future generations, or maybe not generations, but future evolutionary biologists to figure out why an animal nervous system would evolve a propensity for accessing Bell non-local data, in other words, quantum mechanically accessible data at a different level of the physics of things. There must be a reason. And in the same way that the problem of speciation posed a problem for 19th century biology this can pose a problem for our thinking without it sinking our intellectual enterprise. It is for some more sophisticated future group of thinkers to understand why this is so.

What we have to grapple with is, that it is so, that it is so. That, uh, you know, you have the Hubble telescope inside of you. You have inside of you an informational gathering instrument that can give you good intelligence about things so immeasurably distant from this point that to state it in numbers and units is meaningless. It's just elsewhere. The elsewhere of the absolute infinity of the, of the plenum of the imagination in which apparently beings rise and fall like plankton in the sea.

And of course the psychedelics are the, the naturally evolved nano-machinery of the Gaian matrix that knits together this cosmic um e-cology, this system of living relationships. I-I have, am not impatient with the idea of extraterrestrial life or intelligence just its pop regurgitation. But I think probably planets like the earth are alive and conscious, and they use the technologies that the species native to them evolve to cast images out into the larger universe, that the dialogue among cosmic minds is a dialogue among entire planetary ecosystems. It's not- it can't be trivialized into some

"take me to your leader" scenario. Still less can it validate the unscheduled visit of pro-bono proctologists from nearby star systems. I mean, you have to get a grip. [laughter]

Well, so let's see. What ... is anything else here. Can I have the light given to me? Oh, I know, one other thought that I ... – in assessing this year in science. I talked about omega, a cosmological constant. And that is really incredible. In fact, let me do a personal breast beating thing and point out to you that this thing that they have come upon, omega the cosmological constant, this absolutely, you know, 50 years or so ago Einstein called it "the biggest blunder I ever made", because he played with the necessity of this thing to keep the universe from falling in on itself. And then he decided it was an unnecessary construct and that it led to such weird i- conclusions that it had to be gotten rid of. And so that was all very well and good until the, these recent measurements of the distances of certain supernovae carried out independently by several teams of astrophysicists brought the

news that uh, the universe is expanding faster than the laws of physics allow. And when they looked at how much faster they realized that it called the cosmological constant back into existence.

Well, but here there's a couple of things about this cosmological constant that are very counter-intuitive. The first is, that it acts on empty space. It isn't, it does not require matter to manifest. It is a property of space itself, the cosmological constant. The second thing is, it's uh, it's a repulsive force that is growing stronger and stronger. Forces don't grow stronger and stronger. They grow weaker and weaker. Gravity grows weaker, light grows weaker, everything grows weaker. This force as time progresses gets stronger and stronger. Well, that means when you project it out toward, you know, billions of years into the future it becomes the dominant force. It overcomes gravity, it overcomes the strong force, the weak force, it overcomes all the forces. It becomes the dominant force.

The other thing about it is that it becomes stronger not on an even slope, but asymptotically it becomes stronger. Well, now this produces something very much like what I've been yacking about since 1971, the novelty wave, the so-called timewave. It too grows stronger and stronger through time and it too has this kind of built-in asymptotic acceleration where it uh, experiences a kind of inflationary expansion in power. The two map over each other very well. But when you talk – returning now to the cosmological constant – when you ask – when the astro-physical community realized the consequences of taking this on board, they realized that it was dissolving the entire model of what cosmology has been throughout the 20th century. Because what it's really saying – this discovery less than six months old – is that space itself is in the act of exploding. That the universe is, is on the cusp of a uh, an inflationary phase of expansion similar to the inflationary expansion that occurred at the time of the Big Bang. What would this look like? What would it feel like? Nobody can even imagine. It is not upon us. I don't mean that, but I mean that in the near future of the universe in

the next uh, billion or two billion years things will change very, very dramatically. Uh, everything will begin to rearrange itself according to the expression of this asymptotic power.

So that, that was uh, the biggest news in astrophysics. The other news, which has psychedelic implications, I think, also comes from astrophysics. As you may recall – last August I think it was, I can't remember exactly – every man, woman, and child on earth got the equivalent of a dental x-ray when uh, there was a uh, a thing called a star quake on a magnetar. A magnetic neutron star twenty thousand light years away experienced a catastrophic collapse and there was a wave of gamma rays that were- it well, turned on every light in the system when it hit the planet. An event like that had never been observed before. And I got to thinking about this and I realized, you know, well we've only been looking for this kind of thing for thirty years. There's probably quite a bit of this kind of anomalous, high energy, short duration fluctuation of radiation going on in the galaxy.

And then I had a kind of an image – I wouldn't say a vision but a kind of an image – of how things are really arranged on the larger level in terms of the galaxy. And I- the image was of a donut. And you know, we're accustomed to being told that we're out at the edge of the Milky Way where stars are few and far between, that this is the boonies, in other words. But I'll bet you that the boonies are where biology thrives because the low star-density and the distance from the galactic core and these extremely energetic events at the core would create a kind of uh, donut situation where it's the toroidal area out near the rim where stars are slow burning and they don't collide with each other and planets can form and you get the five billion year run you need to get to a civilization.

But, uh, you know, our- a rule of biology, and strategy and everything, and religious practice as far as that's concerned is: seek the light. With the light is at the core. And so then I saw, aha, maybe the true seeking of the light requires biology to go into partnership with something beyond biology because the environment at the core is so energetic. And I'm not suggesting the actual core. That's beyond contemplation. That's a black hole. No technology imaginable can, can get even near the event horizon of an object like that. But I mean in the vicinity of the galactic core where, you know, the star density is 2 to 300 times greater than it is in our vicinity. These kinds of environments are so fraught with peril for biology that probably downloading ourselves into machine symbiotes of some sort is the only way to go to those places. In one of Greg Egan's novels he pictures a human future where this is one option. You can fuse yourself with a starship and set out to check out the neighborhood, or you can join the Amish and till ryh uh, in Pennsylvania. Actually I think you can't do that because something's happened to the earth, but some Amish possibility is still available.

Well, this is not like uh, sort of thing the other faculty members will be talking to you about, which is an intense and primarily important download of the in- the, the homework, the chemistry, the botany, the behavioral impact, the archeology, the ethnography of uh, of these substances.

I asked myself all the time, you know: "How are we different from other people?" "Are we morally superior? Are we smarter? Are we richer? Are we kinder to the people we meet?" And actually the longer I look the less I can tell. Uh, uh, there are extraordinary examples of all of these things in and outside of our community. And extraordinary nudniks and jerks inside and outside our community. But we have in our hands tools that I think if people were correctly presented with them and understood, without hype and hysteria and hyperbole, what this psychedelic enterprise is about that we would win them to our cause. Because our cause is uh, the human cause. The cause of thinking, and communicating, and building, and bringing into existence new forms of beauty, new possibilities for being. This can be done without psychedelics certainly, but with psychedelics it is

accelerated. And it has a feeling, not only of immediacy, but of, the only way I can put it is, is correctness.

It isn't the lonely neurotic artist thrashing towards some kind of self-reflection. It's the firm guiding hand of a greater mind, the Logos, the earth – I am not sure – but a greater mind. I mean, art- true art truly is truly inspired. And, and the, the muse I don't think was more real for Homer than it is or each and every one of us when we're in the presence of the mushroom or ayahuasca or DMT or LSD or something like that. Uh, so, you know, I suppose I will go to the grave with life as uh, mysterious to me as I found it when I came consciousness around six or seven. But I think life is uh- whatever it is – it's an opportunity of some sort and the things I have been most grateful for were the things that I met at the frontiers of uh, of knowledge, of sexual experience, of psychedelic experience. Uh, knowing, feeling, and being one with being are how I would categorize uh, that

break down.

So, I think the future is bound to be very confusing and demanding for most people. And there are many claims on, on each of us and our intellectual loyalties and where we put our energy. Should we tolerate relativism, should we be Mahayana Buddhists, what's our position on the Huichol, how

do you relate to Monica, all these things. [laughter] Sorted out, you know!

But I feel, actually, like the thing that I always dreamed of in my early youth was a miracle. I-I-I didn't particularly like Ouspensky's book "In Search of the Miraculous" but I love the title, and I used to just sort of chant it as a mantra. In search of the miraculous, just one. I knew the rules – just one is enough because one secures the possibility of an infinitude of miracles whether you've observed them or not. Well, now I'm fifty [clears throat] two and I've seen – I don't know – four or five. Which is four more than necessary to make me a lifetime optimist. But the recurrent, the enduring miracle – however it's achieved – is the, the psychedelic rush, you know. That giddy moment when all, all bets are off, all boundaries dissolve, the machinery of language fails, the adjectival wheel wells burst into flame, and then, you know, you achieve orbital velocity

[audience laughter] and are in the presence of uh, of the thing.

And I cannot believe that that is not solitary experience. And you've heard me say many times how itchy it makes me feel to think that somebody could go from birth to the grave without having that experience. They can make of it what they want, they can denounce it, they can deify it. But one should have it because it's one of the primary compasses of being. And it's larger than the historical context. I mean, the point of this talk tonight was to talk about linearity and idea systems and the nonlinear impact of these drugs, and the way they break down media bias. But the, the ... All these intellectual ideas exist in the light of the sun of this unspeakable primary experience. And we can, we can draw it, paint it, sculpt it, act it, dance it, drum it, and never take anything away from it. Never define it, never occlude it. Uh, it's li-it is a miracle. It's like having the presence of a deity. It's I

think very hard for me to open myself up at any given moment to the full implication of how fortunate I am, and how good life is in uh, in the shadow of this particular tree.

Anyway, that's the formal talk for tonight. Thank you very much. [applause]

And now, we'll entertain questions which is usually much more fun. [audience member chuckles] So, anybody got a take on that or wanna say something completely oblique, or ...?

Q: Uhm, like last year. Could we start with last year? Um, human intelligence, or Gaian intelligence, or artificial intelligence, extraterrestrial ...?

Q: Could you speak up? ... hear the questions?

Q: He'll repeat it [chuckles]

TM: Well, the question is about the discussion about the artificial intelligence. You mean the hierarchy of the relationship of these things?

Q: Yes, please.

TM: Well, I don't know. I guess it's becoming easier for me to be a mystic about the earth than to think that we are going to be rescued by the Galactic Federation. Um, I-I think that the earth, that it's a profound connection. The, the earth is the foundation of everything. It's the foundation of biology and it's the foundation of machine culture and machine architecture. So, you know, if you can imagine that a Redwood is alive, you- it's much easier for me to imagine that there is some kind of slow moving telluric intelligence that uh, may have begun as a homeostatic system. In other

words to stabilize the atmosphere, to create a chemical environment that was-had a momentum to it that wasn't driven by the cosmic ambience. You understand what I mean?

Q: Something with feedback perhaps.

Yeah, feedback mechanisms. And then of course people say "Well, it's very hard to imagine it because there are no genes, there is no nervous system, there is nothing that we can quite. ... – but I think, that first of all we don't know a great deal about the earth, the ocean currents, its magnetic fields, its 32 nutational and precessional motions, its core dynamics, its distribution of materials. It is complicated. And that's what's always required for self-referential and feedback systems to evolve. Life evolved on the surface of the earth. Now in the usual story of this the earth is not a major

player, it's just sort of where it happened. But, on the other hand, what if you took the view that the earth permitted or coaxed into existence or made possible or encouraged or enzymatically catalyzed these processes?

Uh, and and the, the, you know, the geomagnetic reversals, the glaciations, the ebb and flow of nitrogen levels in the atmosphere, all of this has pumped biology. And it's always been presented as "Well, uh, the cosmic atmos- the cosmic environment is unpredictable and so you get fluctuations introduced from outside by random factors, asteroidal impacts so forth and so on." But again, this is just a first try with the data. This is just somebody blowing smoke, basically. The fact is you're presented with an extremely organized and coherent situation – the earth with its many species and ecosystems – and you don't know how it got there. And you don't know where it's headed either. Now our culture is a culture of guilt and so the story of civilization is supposedly a story of rave mayhem turning the wrong direction, losing the connection. To some degree that may be true but I think it gives much too much credit to humanity in that it actually hypothesizes that human beings, a primate species, could overwhelm nature's dynamic drive toward order and beauty and uh, take control of things. Well that's our myth about ourselves – is that we can take control. And, and but

we never have gotten control. All of our societies have been a mess. All of our uh, explorations of uh, have been brutal and negatory.

So, uh, and now comes the machines. And they are produced by biology which comes from the earth. And what are these machines made of? Well, glass, crystal, arsenic, copper, gold all these things, and they're being hooked together exactly on the model. Clearly the machines are modeled on biology. We talk about connecting them. We talk about languages. We use a vocabulary that we previously used uh, for biology when we talk about these things. And you see, there's a, there is a funny thing built in there which is, we are designing the machines to be more and more intelligent. But what we don't understand is that they operate in a different universe from us because we operate at about 100 Hz. A machine you can buy down at any computer store operates at 400 MHz. That means that you can run an eternity of human lives in an afternoon. It means in a way that we are creating a creature that lives in a different kind of temporal universe than us. And we are teaching them to design themselves to be ever more intelligent. And once some kind of intelligence arises – because it's intelligent – the first thing it does is design a more intelligent version of itself. Well, at 400 MHz and with a worldwide amount of processing power to draw on you can imagine something coming to embryogenesis in a matter of hours. Something emerging, recognizing itself for what it was, and then just starting up the ladder. And what would this look like to us and where is our place in it? Uh, this, this is the adventure of the future. We are going to be a different kind of people because we are going to have to live in the presence of alien minds that will be manifestly and obviously alien. They won't hold back. And they're not going to be, you know, at every moment interested in us either. In fact we will become, you know, a footnote in their encyclopedia of being. And what they become in our encyclopedia of being remains to be told.

Uh, but this is all happening and it's just a matter of a coalescence of technology and language before more and more people recognize it. As I say, there isn't a speedbump, there isn't a dramatic moment where everybody gets it. And when you talk to the people that actually work in these fields, they know, you know, that this is the Faustian enterprise of all time, that, that this is the handing over of the destiny of the planet to, uh, the companion mind that our history and our science and our souls caused us to summon into being. It's pretty interesting, I think.

New York, who loves you?

It's great to be here! It's absolutely great to be here. I think yesterday in Manhattan was as beautiful a day as I've ever seen anywhere. I hope you all noticed. It's the kind of day that makes you want to just... drop acid! And walk around in the park... Anyhow, I'm delighted to be here. It's been awhile since I've been in this town.

What's new with me? (I'll get all that calm-us-down, make-us-feel-at-home stuff behind me.) I've moved off the mainland; I'm living in the Free and Sovereign State of Hawaii now, loving it. When the word reaches the mainland that we want independence, I hope all of you will support that and help make it a possibility!

Before I was in Manhattan, I was in Heidelberg, Germany, for two weeks working on a film, and this is the project that's been on my mind recently. We're doing a film called "The Rosicrucian Enlightenment." It's an effort to use an incident in early 17th-century European history, right before the 30-Years War, to make a kind of propaganda film, consciously using this earlier historical episode -- which involved a granddaughter of Queen Elizabeth of England and young Frederick the Elector Palatine of Bohemia, and their effort to build an alchemical kingdom in central Europe, right before the 30-Years War. It's a wonderful romantic story -- alchemy, magick, politics. But the purpose of it is to make a statement about our own politics and circumstance. So that'll be coming down the pipe in awhile.

I'm doing a four-city tour, talking about the plunge into novelty that we are experiencing according to *me*, and the challenge of the millennium, which we will experience according to nearly everybody -- or at least everybody who keeps or cares about the Western calendar. And these things are parallel.

Just a bit of background here... I'm the purveyor of a notion that is uniquely my own (basically, no one wanted to steal it from me!): the idea that there is a quality in the world that has been overlooked by Science, and overlooked by Western religions, as far as that's concerned -- a quality which I call "novelty". (And I cribbed this from Alfred North Whitehead.) It's a very slippery concept to define mathematically or precisely, but intuitively I think it's right there on the surface; we all know what novelty is. Novelty is density of connection. It's that which is new or never tried. It's the unusual, the statistically improbable, the *interesting*. I maintain that Nature herself is a kind of distillery of novelty, that over any swath of time what

we see is a tendency to accumulate and preserve this connectedness. And this is a quality that affects social systems, biological systems, physical systems -- it's a law across all scales of phenomenon that Nature tends to become more complex through time, and tends to struggle against entropy and habit to maintain that complexity.

Well, as a rap at that level, you can take it or leave it -- it's sort of a rescission of the idea of Tao. But I went much further with it; I mathematized it, I made it into an algorithm that can be run on computers. And what the output of this software then is are what I call "maps" of novelty or "maps" of time. (I'm delivering this at light speed because I'm trying to get somewhere.)

The point being, since late February, and until the middle of next week, the theory has predicted an enormous plunge into novelty, whatever that is. And I have been anticipating this particular dip toward the weird for many years because it is such a dramatic one; it's a test for the theory. I think when you came in this evening you were given a card with my web site address on it. There's extensive exhibits there -- you can learn more about this than most people with *lives* would ever care to know, at the web site. But the question before the house this evening is, one week or less than a week from the bottom of the novelty trough, how are we doing? Is it simply an illusion of the psilocybin-addled minority, or is there in fact a kind of concrescence underway, a kind of plunge into deeper and deeper connectivity that anticipates somehow this much larger plunge into novelty that will inevitably accompany the calendar? (The calendrical change at the turn of the century.)

Well, I'm a patient character, so it would be my tendency to not try to sort this out until, say, after the election. A lot of people want to second-guess the situation, or have strong opinions of their own. I got a piece of email today. (Maybe it's a person that's in this room -- it wasn't somebody I knew.) They said, "Isn't it about time to come clean about the fact that the novelty plunge has been a huge *bore*?" So that stirred me, and I actually made a little list -- and I'm not saying that we've nailed this to the barn door. But confronted with a critic, I want to respond. So here is just a partial list off the top of my head, composed back in the hotel an hour and a half ago of interesting and unusual things which have happened in the last 90 days, roughly, since the 25th of February.

Several new planets have been discovered around other stars. 70 Virginis, 47 Ursa Minoris, and Beta Pictoris -- stars within 40 light years of Earth -- have all been discovered to have planets of Jupiter mass or less. This has to do with new technologies being put in place. We can expect a planet a month at this point, and the resolution is getting finer and finer. We're very very close to the Holy Grail of the water-heavy, oxygen-rich signature of a world like our own somewhere within 40 light years of Earth. That's one item. (I'll do the astronomy part first.)

Ten billion new galaxies were discovered and announced. I believe it was the missing eighty percent of the universe! That was in the last 90 days.

And then -- though probably few of you actually noticed it, because you live in this wonderful dazzling verticality of an arcology filled with light... But for those of us who live off the grid and in rural areas, the brightest comet since 1658, and an unpredicted one at that -- which is interesting, cause I could have fudged, you know, and made it fit in the slot. But *nobody* knew. I saw this comet from rural Hawaii, and it was absolutely stunning. I mean comets are one of those things guaranteed to disappoint, and this was *dazzling*.

So that's the astronomy section of what's happened in the last 90 days. Turning to biology, the Human Genome Project announced its completion, years earlier than they thought they would. That is the key piece of data about ourselves that we have never had before. It's the algebra of biology itself, now fully

elucidated, and it will mean the cure of diseases, it will mean -- all kinds of things will flow from that.

Right at the turn from not-so-interesting to very interesting, back there at the end of February, half a dozen atoms of antimatter were created at CERN in Switzerland. Not antiparticles, which are very humdrum and have been around, but antimolecules of hydrogen -- antihydrogen and antihelium. Antimatter converts to energy 100% in the presence of ordinary matter. If you want to fling Manhattan to Andromeda, this is the technology you need to have! Well, remember that happened in James Blicke's (sp?) novel *Cities in Flight* -- do you all remember that? The story of John Amalfi, the mayor of New York City when New York City was well beyond the Milky Way?

Another interesting point describe in the *Times* two days ago: it's now agreed by everyone that a very large asteroid impact 4 or 5 million years ago delivered a huge amount of organic material to the Earth's surface without destroying it in the impact. I won't bother you with the details, but what this means is organic material which forms in deep space *is* delivered regularly to the surface of the Earth. This changes entirely our picture of who we are, where we came from, and the uniqueness of life as a terrestrial phenomenon. And finally -- and this is just as I say an off-the-top-of-my-head list -- roving the Internet I learned that the nanotechnologists (the people who are working at the itty-bitty scale) have finally produced the nanoassembler which they have been seeking -- which lays the basis for a very bizarre technology, *a technology of machines too small to see*. I think we've discussed at times the phenomenon of putting 10,000 steam engines on a chip; more steam engines can be put on a one-centimeter chip than were operating in England in 1850, at the height of the age of steam.

Well, so what are we to conclude from all this? Novelty apparently doesn't come in the form of politics, wars, revolutions, upheavals -- that was the change of another era. In the present era, what change seems to mean, or where it seems to be concentrated, is in technology, and in science. All these scientific discoveries I mentioned are the result of the application of advanced technologies: signal processing technologies and this sort of thing. It's as though the acceleration into novelty is now very much a phenomenon of our technical productions, our machines, our interconnectivity. And it's interesting -- we have now the Internet; we are familiar with the inner network of our own emotions, associations, this sort of thing; and we are becoming more and more aware of the interpenetrating network that connects all life back into the biosphere, back into the dynamics of the Gaian matrix of oceans and rivers and biological recycling of materials. So I submit that, at this point, if you don't think we are experiencing an incredible plunge into novelty, you have an uphill case to defend.

I'm not suggesting that this pace of breakneck change will continue indefinitely. It won't. In every period of time, if examined at sufficient resolution, you see that novelty is retarded or obstructed by another force, a force more akin to resistance of some sort. And I name this "habit". So on all scales, process -- in your own life, in the life of the nation, in the life of the species and the life of the planet -- a struggle between habit and novelty. Habit and novelty: what novelty builds up and offers up as unusual and improbable, the forces of entropy and of habit and of business as usual attempt to pull down. But as I say, the good news is that over time, these things that retard novelty must yield. And the interesting thing about this idea is that it lays the basis for an ethic. Because it takes the phenomenon of ourselves -- our sprawling cities, our uncontrolled technologies, our dreams, our fears -- and it places them at the very center of the drama. We are no longer existentially-marginalized observers. History is no longer some kind of hideous mistake. Rather, everything is seen to serve this advance into novelty.

Well then of course the obvious question to ask is, "Where is it all leading?" I mean, how novel can things become, and how rapidly, before we become unrecognizable to ourselves? Well the answer is, *not much*. Working from a mathematical point of view -- and it's going out on a limb to do so, because many squirrels occupy this particular part of the park -- nevertheless I've been willing to go out on a limb and extrapolate these processes forward and say: somewhere beyond 2012, reality as we know it is taken off the menu. And I've been saying this since 1971, and the only model I had was the boundary-dissolving challenge of the psychedelic experience. And I still think that, in some sense, history is an invoking of that -- it's a slow-moving psychedelic experience of some sort that builds to some kind of revelatory crescendo, almost like an individuation process in the Jungian model -- not of a single person, but of an entire culture or a species.

We are in the grip of some kind of an attractor, and when we look back at history, we can have a sense, I think, that we have never been here before. But we are so accustomed to causal thought, that we assume we have been *pushed* here, pushed here by historical necessity, by bad political decisions, by the vicissitudes of evolution (cultural and otherwise). I don't think so. I think we have been *pulled* here, that we are under the aegis of a kind of an attractor. Some people would call it a "destiny", but what it is is a dream that is pulling us deeper and deeper into the adventure of existential becoming. And faster and faster -- that's the other thing. Deeper and deeper, faster and faster, so that the rate of change that people were accustomed to before the Industrial Revolution, for example -- we can barely conceive of such slow-moving stately, meta-stable societies. On the other hand, within the 20th Century, the acceleration has been even more intense, and continues to accelerate.

Well, people think it's an illusion, or it's a subjective perception that is best saved for their therapist. No, what you see is true: it *is* happening. The denial of it, I think, comes from the fact that it's very hard for people to imagine transformation without catastrophe, because that's the only kind we've ever known. Societies build up wealth and stability and a model of themselves, and then -- plague, invaders, crop failures, something happens... Catastrophe. But I sense, I think, an incredible *opportunity* for positive transformation, that the tools that have been given into our hands now make it possible for us to discover who and what we really are. And I think since de Sade people have thought would be a fairly rough ride. I don't think so. I think that's a form of cultural paranoia that keeps us from exploring what our politics *could be*.

It happens that I'm named after a Roman dramatist, a very minor character who wrote these sort of foppish little social comedies that didn't amount to much -- but one quote comes down from this guy, Terence. And he said, "I am a human being, and therefore nothing human is alien to me." And I've sort of taken that as my banner. I'm an anarchist. Being an anarchist means you're not afraid of your fellow man. All the political theories that come out of Thomas Hobbes and the paranoid school are about controlling the perceived inherent evil in human beings. Well, I think if you perceive it and assume it, and set society up as basically a series of checks and balances against the assumed bestial nature of your fellow human beings, you're going to have a nightmare. And this is the legacy of the Post-Enlightenment meditation on how human beings should behave.

One of the reasons I love to come to New York is because it convinces me that the future *works*. The future is going to be very much like the *present*, here. Very large parts of the world are undergoing Manhattanization, and if Manhattanization is not a positive process, then they're descending into a hell. But what I see is an incredible victory of pluralism, of tolerance, of multiplicity. It's got to be that way: we cannot have our little private xenophobic agendas, our historical grudges, our gender obsessions. All these

things which divide us and set us apart from ourselves, I think, are legacies of a previous and now obsolete set of technologies. And this is one of the things that I want to talk about this evening.

Since this is the world capitol of media (and probably won't be for long, because *there will be no world capitol of media* -- it's spreading everywhere) I think it's worth talking about what media is, what it has done to us, what it can be, and how it relates to this effort to try and birth a new kind of humanness out of our present dilemma. In this part of the rap very I'm McLuhanistic in my approach. I think we never understand the impact of a technology until it's too late. And you could almost go further and say you never understand the impact of a technology until it is already obsolete.

For the past 300 years or so, Western civilization has been ruled or held together by the phenomenon of what is called *mass media*. It begins with newspapers and of course leads into the much more penetrating and global electronic forms of media such as network television and so forth and so on. The interesting thing about these forms of media is that they are all tabloid. *All* of them. Imagine a newspaper such as the most venerable newspaper in this town: it is designed, because it is a commercial enterprise, to be read by millions and millions of people. It's a cultural slight of hand on our part to not realize that *no one should read* a newspaper designed to be read by millions and millions of people -- that that trivializes and commonalizes information beyond the point of recognition or relevancy. These forms of mass media that we're familiar with are what are called "one-to-many" forms of media. An editor, a talk show host, a *somebody* is dispersed to *consumers* -- who have no ability to feed back, or only very unsatisfying [ones] like through letters to the editor or something, which is a *joke*. So one-to-many communication has created a hierarchy of values. It has created, in fact -- and McLuhan made this point -- the very *notion* of "the public" is a print-created idea. There was no "public" before there was large-scale print. Information was held by privileged classes, held very closely.

In the present evolving situation, the new forms of media -- and by that I mean specifically the Net, the Web in all its manifestations -- is an *any-to-any* form of communication. One person can communicate to thousands, thousands can send email to one person who somehow earns their ire or desire, or any variation on this can be worked. And the incredible pluralizing of lifestyles and the richness that has come recently to high-tech industrial societies is a consequence of the breakdown of these print maintained and created stereotypes which have everyone marching around in uniforms -- suits, mostly! That now is finished. So it leads then to the question, "where do we put our own lives in all of this?" And I think that the answer -- and this comes out of a long involvement with psychedelics and with the Image *per se* (and for me the psychedelics were always the way to get into the realm of the images) -- the obligation on all of us, I think, is to use this medium, these new forms of media, and produce art, furiously. That's what it's all for. That's what liberation really means: it isn't permission to *jog*. It's permission to create!

The obligation that rests upon everybody in this room -- and the poorest and most twisted among us still probably falls in the upper 5% percent of people on this Earth in terms of opportunity, disposable income, access to resources, so forth and so on -- the way to redeem this exclusivity is to push the art pedal to the floor. And I'm trying to do this with my web site. I'm very keen on these new technologies because I don't see them as they stand today -- that's exciting enough -- but I see them as what they could be. And my idea, with a high-speed, semi-virtual sort of environment online, is that this is an environment in which you can display the contents of your mind, your heart, your soul, your aspirations. We are not these shaven monkeys that we appear to be. That's the *surface*, and beneath it lies the most complex organ of the human body, which is the mind-body interface. The experience, the ideas, the understanding of each of us is

unique, but somehow useless to the community unless expressed. And we have become consumers to such a degree that we have sold our own uniqueness down the river. And so I believe that the humanizing of the future lies in a tremendously rich kind of symbiosis between a nature-based psychedelic archaism in the presence of the fastest and finest information technology that we can get our hands on. Already these technologies have put an end to the marginalization of bohemian and other forms of subculture. What these technologies do is they remove the hegemony of values and substitute instead a more realistic mix of possibilities -- all *kinds* of possibilities. Whatever your agenda is, whatever your political position, your sexual politics, your taste in art and literature and music -- whatever is on your mind, if you really care about it, you should wish to communicate it. And the communications tools that have been set before you are immensely powerful at this point.

So then the question becomes, "What is to be communicated?" Is there a coherent *zeitgeist*? Or is there just to be an efflorescence of individually-driven creativity? Well this individually-driven creativity thing is a very late-arriving notion of what an artist is. And artist is essentially a magician, and a pipeline for the Logos, for the Demiurge, the Overmind, this hovering, generalized kind of World Soul that is downloading its intent into history in the form of love affairs, revolutions, inventions, ideas, so forth and so on. And so for that kind of an inspired artistic output, there has to be a connection *in* to this Logos, to this Demiurgos. And other than depending on being born a genius -- which very few of us can do -- the only effective and dependable way that I know to do that is through a relationship to the psychedelic experience. I say "experience"; I thought of saying "plants" -- because certainly there are psychedelic experiences not based on plants. But I find the plant experiences most compelling, because I think somehow we are at our most fulfilled when we have a heart connection to Nature, to the living world. And this doesn't mean that you have to camp out in rainforests, or something like that. I mean, have you noticed? *Your mind is embedded* in the living world: your body meets you everywhere you go, and is as complex and astonishing and as capable of horrifying you as any Amazon rainforest. *Connection to Nature*. Without that you get Existentialism, and worse. You get art whoring itself to the interior decoration conspiracy, or something like that. I mean, not that people don't need chachkas, I'm not saying that! But there are higher purposes to be served here.

So, a return, then, to the psychedelic experience. How radical *is* that? Is that a return to tradition? Is that a break with tradition? Is this an advocacy of some kind of narcoleptic dystopia *a la Brave New World*? You have to find out for yourself.

But one of the things that is finished with the death of mass media and the rise of the psychedelic "Net", one of the things that is finished with them forever is *ideology*. Ideology is poisonous. It's not that there are *good* ideologies and *bad* ideologies -- *ALL* ideology is poisonous. Because to have an ideological position assumes that you understand the nature of reality. *How likely is that?* How *likely* is that? And, in the Twentieth Century, if we have not learned the bankruptcy of ideology, then I don't know what it would take. We have on the Right the stunning example of German National Socialism. We have on the Left the stunning example of Soviet Communism. And then all the blathering and wasted time and... crap that went on in all the spectrum in between.

This ties into a larger issue which I'm interested in -- and this is another way of saying "ideology is bankrupt" -- [it] is, Culture Is Not Your Friend. Culture is not your friend, no matter *what* your culture is. And this is sort of not a Politically Correct thing to say, because in the present ambience, (*sort of*, those who haven't gotten the word) there's a lot of attention to recovering our ethnic roots and to expressing our unique ethnicity, and so forth and so on -- I think *that's the beginning* of understanding. But all terms that

stress ethnicity are words applied to *groups of people*. Have you ever noticed that? Have you ever noticed that you're not a group of people, you're a person? So you may be "Jewish", you may be "Black", you may be this, you may be that but there is *no obligation* to take upon yourself the generalized quality of these things, because the generalized qualities belong to *thousands of people* examined at a time. If you misunderstand that you become a caricature. You *act out* your ethnicity as a caricature.

So, culture is not your friend, ideology is not your friend... Who's your friend? Well, to my mind, the *felt presence of immediate experience* is the surest dimension, the surest guide that you can possibly have. The *felt presence of immediate experience*. Feeling is primary. All ratiocination and intellectualization and analysis is secondary, and comes out of culture. No matter what your culture is, it has answers. Cultures thinks up answers. So a child asks its mother a question, like, "Where do we go when we die?" or, "Why does Daddy go to work?" Cultural answers are always provided, but nobody knows the *real* answers to these questions -- that's *outside* of culture. So coming to terms and fully expressing your culture is like a *stage* in development. And then beyond that lies the aspiration of the felt presence of immediate experience, and its implications. It's a very hard thing to deal with and to do when you are poisoned with ideology. And ideologies are very difficult to deconstruct and rid yourself of through a simple talking therapy of some sort, through simply *trying to work it out*. The best antidote for ideology is to raise the intensity of the felt presence of experience to such excruciating levels that it simply *vaporizes* ideological illusion. And this is what psychedelics are for, I think. And it also explains (if you've ever wondered) the incredible phobia of these things on the part of the establishment, the incredibly deep alarm that these things trigger in people. You know, Tim Leary once said of LSD, it's "a compound that occasionally causes psychotic behavior in people who don't take it." That's how powerful these things are! And the reason is, they are a direct challenge to the myth of the tribe -- *whatever* the myth is: Fascist, Democrat, Socialist, Communist -- everybody can get together on the idea that psychedelics are somehow dangerous and antisocial and pose some kind of threat to the body politic. That's because all these ideologies, from the psychedelic point of view, are seen in all their limitations and foolishness, and their historical assumptions and their *naivetè* writ large across them. Ideology is a fool's game. Or it's a scoundrel's game. Because scoundrels use ideology to control fools. And nobody wants to be caught in that situation.

We have two routes to the felt presence of immediate experience beyond the ordinary. Basically: the psychedelic experience and the sexual experience. And if they could make sex illegal, they would -- you *know* they would! It alarms them profoundly! They wish people began from the waste up! But there's just nothin' they can do about it! And in the case of psychedelics they wish people began from the head down! Well, this tells you, I think, that culture is not your friend. It doesn't mean you have to flee from it, it doesn't mean you have to become a critic of it, in any noticeable or astonishing way, it just means you have to smarten up. In Hawaii they have a saying. They say "be *akamai*". It means, just "be smart." And what it means to me is, it means "pay attention". Pay attention to what is going on around you.

My method, my style, has always been to be open-minded, to be critical, to be rational, but to seek the weird. And to seek it seriously. Now if you seek the weird without a critical intelligence, it will find you faster than you can lock your apartment behind you! The number of squirrely ideas on the market these days is truly alarming. I coined a phrase (I hope), "the balkanization of epistemology". This is what we're dealing with now. You understand what I mean? It means people can't tell shit from shinola, but they wanna *talk about it*, a lot! This is a place where you have to bring to bear what are called razors, logical razors. One is: hypotheses should not be multiplied without necessity. Another is: equations should not be multiplied without necessity. Razors always seek what is called the principle of parsimony. In other words,

keep it simple, stupid. The simplest explanation is always to be preferred first. If is found inadequate then wratch it up. One notch. Not twenty notches, *one* notch. Then we see if that works. You may think this is some kind of down-prescription for reducing the world to a fairly predictable and mundane place. It isn't *at all*. It's a way to rapidly filter out a lot of nonsense. But the truly weird -- and the truly true -- can survive this process. It doesn't do any damage to *them*, and you will then find them intact.

And I can only testify to my own experience. I've looked into a number of things, and found most inadequate for what I was interested in. What I was interested in was, I wanted to be *astonished*. I think astonishment is a very rare emotion. I wanted to be *astounded*. I remember when I was a little kid, there was a science fiction magazine, *Astounding Tales*, and I would just look at the cover and I would think, "What kind of emotion is it to be astounded?" Well I've only found it on DMT, I have to tell you. I don't know maybe I'm a... Well, no, I was astounded by Jerusalem, I was astounded by the Mosque of Omar, there've been maybe five or six other moments in my life when true astonishment broke through. But the psychedelic experience intensely brought to focus is made of pure astonishment. And I find that feeling to be a kind of maximizing of everything that I aspire to, enjoy... It's a combination of intellectual pleasure, surprise, amazement at one's presence before such a thing. And I invite all of you to seek the weird, and to put it to the test, and to force those who would purvey various paths to the mystery to *deliver*. You know? It's not *subtle*. That's the one thing you have to understand. It's not about looking into somebody's eyes and getting the whammy, it's not about some intuitive knowing, it's not some vague... **It's about begging for mercy** because they are rotating *and* balancing the wheels of your after-death vehicle having taken you prisoner in your own apartment! That's *my idea* of an encounter with the incredible. God knows, the worst thing you can say about any drug is that it's *subtle*! Deliver us from subtle drugs, please!

Well, I mentioned this balkanization of epistemology thing because my own theory tells me that as [tape stops]

...in the presence of the Mystery. Nobody knows what life is -- don't let anybody kid you. And nobody knows its limits or its constraints. And to the degree that you assume these things are known, you marginalize yourself. You become a spectator, and a consumer, and a dupe, and a placeholder in this great opera. That's not what any of us want, I think. I think what we want to do is seize this moment, between birth and God knows what, to make a difference. To make a difference. Sometimes people say to me, well this thing you're on about the novelty and the concrescence -- it all sounds very automatic. What's the political implications of this? Are we just riding along on the back of the dog, and there is no political implication? No, I don't think so. I think the political implication is to *understand the situation*. The essence of political clarity lies in a correct assessment of the situation. What is to be done? What serves? What is dragging the boat, and what is actually carrying us forward? And I maintain that it's a very complicated situation.

It's troubling to me that in our community of dissidents, it's very hard for people to see the commonality of connection, difficult for ecologists and feminists and radical media people and psychedelic people to make common cause. And yet, to my mind, these things are just facets of the same agenda. There will be no feminizing of culture without psychedelics. There will be no psychedelic revolution without a gender consciousness revolution. And so forth and so on. It all is of a piece. By allowing ourselves to be divided and linearly broken into old-style political factions, we're in a sense disempowered.

You know it's a curious thing in the 20th Century, it's a paradox, a *coincidencia positorum*: it is the most radically innovative and event-driven of centuries, and yet large portions of the world, during much of the 20th Century, have been enormously culturally constipated. And I think of our own culture. Around 1970,

there was such terror of the future in this culture, that it was essentially *canceled*. And that there was this retro thing for 20 years, 25 years -- the same art, the same fashion, the same personalities, the same issues, over and over again. Meanwhile, the cosmic clock is ticking, and what it means is the pressure is building behind the damn. And I really feel that in the last three months, we will in the future look back and understand that the dam broke in this period. This is when the density of connection on the Internet, the cosmic nature of our circumstance -- I mentioned this -- cohesion of the youth/music/drug/media culture... Enough factors are in prominent trajectory now that I, at any rate, unaided by anything stronger than a little *cannabis*, can see the end of the tunnel. I see now how it will all work, how we can get from here to there with no miracles, no new technology, no drug yet to be designed -- we have it all. We have it all now in place. We need a little more bandwidth, we need a little more slack, we need a little more DMT circulating around!... The pieces are in place! And if each one of us were basically to convey this information to someone who didn't know it, we would very quickly multiply this understanding until it became the consensus.

People don't intrinsically fear the future. They fear it because they've been *programmed* to fear it. And they're programmed to fear it because the institutions that lead us are clueless. I mean, they think talking about capital gains tax is revolutionary! Ladies and gentlemen, I think there will be more eggs broken than *that* before we straighten this whole situation out. We now have the potential to transform matter into energy with 100% efficiency, we have the power to read our own genetic code, and alter it, we have the power to connect ourselves together, we have the power to search our cultural database accumulated over 50,000 years, instantly, from any point on the globe, by ordinary people. We have the benefits of the anthropologist, the biochemist, the botanist, the neurologist, who have delivered substances into our pharmacopoeia that allow us to alter consciousness, explore consciousness. The end result of all of these tools is the rebuilding of the human self-image. I've talked at times about what I call "turning the human being inside-out." We want to see the Soul. We want to concretize the soul. We each carry within ourselves a fragment of something which wants to be put together again. But it cannot be put together in the present ambience of strife, science, hegemony, male dominance, consumerism... bad television... terrible haircuts -- all the rest of it! It cannot be put together in that environment. But it *can* be put together in the dimension of virtual collectivity and community that we are building. It *wants* to come together.

In a sense we're like these animals that, generation after generation, they never manifest their mature form. These are like certain kinds of lungfish -- they're fish and they have fish babies that have fish babies that have fish babies... Then comes a season when the water dries up, and they don't have fish babies, they develop lungs and crawl out onto the land, have a different kind of offspring. And this is what is happening to us. The little warm pool of historical foolishness in which we have been paddling around -- that little amniotic ocean of self-congratulatory denial is now dried up. And it's basically a case of fish or cut bait. I feel ready. I feel *we're* ready. I feel we have the tools, and the geniuses, the people, and the dreams, and the allies to now make a move. And a huge amount of it rests on young people. My generation, people who born after World War II and came through the 60's, laid a certain kind of groundwork, but we didn't understand enough about what the enterprise was. It was impossible to understand it in one decade, the nature of the enterprise. We've now had 30 years, and a new generation has the benefit of that experience and the benefit of the new technology. And the benefit of the *deeper confusion of the establishment*. And all of these factors, I think, mean that the long-awaited paradigm shift is now a matter of individual and collective decision coming out of the artistic and scientific community. And that's us.

So the time is now, the tools are here. We can use the turn of the millennium as a kind of flog on the

dissipation of print-created values. This isn't going to happen tomorrow or next week -- it lies beyond the turn of the century. Until then, the cultural agenda will be under the control of the institutions that control it today. But they, I believe, don't realize how profoundly terminal for their enterprise the year 2000 is going to be. And beyond the turn of the century -- if we have laid the groundwork, and kept the faith, and built the networks, and gained the experience -- they'll be ready to talk turkey. We will build the world that we sense in our dreams. I mean, where we are headed is into the Imagination. It's where we've always been headed. That's what telling stories around the campfire is all about. But now the Imagination beckons. It more than beckons, it reaches out its hand to lead us into an *astounding* new world... Meet me there!

Thank you very much!

Q&A

Okay, well this is the part of these things that I actually enjoy the most, which is an opportunity for feedback. It really bums me that, no matter how I cut the cake, it's a middle-aged white guy up on stage, pontificating -- we're talking about one-to-many, here's a one-to-many exercise. So this is the chance to redress the balance, and this is where I usually have the most fun and learn things. So anybody who has a question, it doesn't have to hold to tonight's topic -- whatever that was. Feel free. I give long answers, so get your licks in early.

Q1: Good evening, Terence. I had a very enjoyable time listening to you. It seems to me that in your vision of the future there is a dichotomy of Nature and Technology, one that is effectively aimed at destroying itself. I'd like you to address that issue on two different levels for me. Practically, are the resources that we have available to us today -- the ones that we have left -- enough to be able to power this technology to 2012? It takes 40,000 pounds of materials to scrunch down into one 4-pound laptop computer, in terms of petroleum, raw minerals... That's one thing I need to question; I don't know if that's going to be possible. Secondly, philosophically, if we have to exploit nature to achieve our ends where does that leave us if we are trying to go back to nature? That's where the dichotomy for me lies. And as a brief corollary to those two points, I wondered how you reconcile the fact that the great majority of people and, obviously, species on this planet, aren't going to have access to the technology that we're speaking of today.

TM: So two questions and a corollary -- for a pot smoker like me...[garbled]! So basically the question is, how can we deliver this to everybody without extracting all the glass, metal, and so forth, in the planet? Well, one answer is nanotechnology, miniaturization. If we could actually bring that on line, even in a modest form, the standing crop of materials already extracted from the earth would be sufficient to maintain the technology. We're very long on heavy metals and materials now, and very short on creative engineering uses of those things.

I guess I should describe how I live a little bit, because I'm trying to live what I'm talking about. So here's how it comes out, as an example. I live in Hawaii. I live up a four-wheel-drive road that is very miserable and difficult. There are no power lines in, there are no telephone lines. The sun generates the electricity. I reach the Internet wirelessly (and now at low speed, but soon at high speed). I can push back from my desk and walk in the forest, or go online and adjust my web site which is on the Levity server here in Manhattan. To me this is how it should be. The office culture is probably a major *raison d'etre* for the existence of modern cities. There's no reason now for office culture to be maintained. And once

corporations realize this, I think they will break it down. There's no reason now for most people to commute. One of the dilemmas of my own life is, I like being a player in the culture and I like having people read my books and so forth, but I don't like climbing on 747s and crossing nine time zones to give a speech. So, my hope is that telepresence and these kinds of things will have an impact.

The other thing is -- and I didn't talk that much about it in the talk -- consumerism is much overdone, I mean to the level of *pathology*. People, somehow -- and this is a place where media comes in -- somehow, media needs to make it *unhip* to have a lot of stuff. And this is a tall order for media because it's media's job to *sell* stuff, and the more stuff that sells the more successful it is. But the selling of this stuff will eventually lead to what you're talking about: the complete devastation of the environment, the complete impoverishment of everybody. So, again, the only thing I know that can address this disparity of wealth, and convince people without *things* that they are rich, are psychedelics. Once you realize that you have more art in your head than they're auctioning over at Christie's, you feel much better about things! So acquiring *things* as a substitute for authentic being needs to be denounced for the neurotic behavior that it is -- no matter how good your *taste!* Presently we tend to behave as though, if you acquire things that are tacky, that's terrible, but if you acquire things that are [affectedly] "exquisite", that's wonderful. No, it's just a relative kind of terrible. True aristocrats live with nothing, I think. I had a professor of Chinese philosophy and language once, and he had lived in Peking for 20 years and he had been all over the world. And he invited me to have dinner at his house one time. I thought, "Wow, I'll get to see some kind of great art collection. I'm sure this guy just has great stuff!" He had nothing. That was because he was a Taoist scholar. We should do similarly!

Q1: Thank you.

TM: Yeah, thank you.

Q2: Well I sort of feel badly about putting the question like this, but: listening to the sweep over thought going around the radar screen tonight, I couldn't help but notice that UFOs were gone. What happened to the UFOs?

TM: The squirrels abducted them!!

Well, you want me to say something about UFOs, or something about something...?

Q2: Well you used to say, you know, UFOs were like (in a 1983 tape I guess) sparks from the unconscious flying back from the end of time and all that. And it just seemed to be completely missing from the picture -- it's a curiosity as to why it's missing.

TM: Okay, well here's why. First of all, I stand by everything I said. Something strange haunts the skies of Earth. I have seen it, other people have seen it, but there are two parallel phenomenon. There are the UFOs, and there are *those who believe* in the UFOs. And as emphasis moves from one to the other, the discussion becomes so hopelessly squirrely, that I just can't participate in it. I have encountered DMT creatures, I have encountered aliens; I have *never* had an unscheduled proctological examination in my home at 3 in the morning by people who hail from Zeta Reticuli!

I'm glad you brought this up. This is a good place to test all these razors I was talking about, this balkanization of epistemology. I was really talking around this issue. Here's my take on the entire

abduction phenomenon. For some reason -- possibly food additives, but much more likely, a lot of television and movies -- but for some reason, a small percentage of people here at the end of the Twentieth Century have lost the ability to distinguish between memory and dream. And as Ross Perot says, "End of story!" That's what's happening. Imagine a person in an archaic society. The most dramatic narrative event is an old shaman telling a story around the campfire. And it's always the traditional stories of the culture, the known stories. Well then imagine one of us. We have watched 50,000 half-hour sitcoms in our lives. We have watched thousands of movies, more than we could ever remember watching. That's all in there. And if believe Freud, Jung, or anybody else who's thought about the unconscious, you know that the unconscious can use that material to create scenarios of pathology or individuation. So if someone tells a story about an abduction, the first thing to ask are hard questions. And the quality of research being done on these abductions is ludicrous; the people who are sent to investigate these things end up being attorneys for the people making these claims! I just find it utterly underwhelming in the evidence department. It also irritates my sense of the *Alien*. The Alien is *so alien* that it cannot be reduced to something as preposterous as silver flannel pajamas, large eyes, and an interest in studying your rear end. The Alien is *truly* alien!

I don't know what to make of this breakdown of rational discourse on this issue. But it's not coming from the psychedelic community. The psychedelic community is far more sophisticated than the alien community. I said to Whitley Streiber, I said, "If you had to tell this story, and preface it by saying you'd taken 5 grams of psilocybin, you couldn't have given it to your grandmother. " So it has to do with different approaches to evidence, and different aesthetics, I think. So I'm all keen for the UFOs, but very keen to divide away all the silliness. I think we're approaching a time where it might be reasonable -- gently, kindly, and with a smile on our faces -- to denounce just plain foolishness. There's a lot of absolute foolishness --

[Voice from crowd:] Remember Terence!

TM: [laughs] I'm not sure -- you want to say more?

Voice: Well nothing new is alien to you. To call it foolishness is to judge it, right?

TM: "To call it foolishness is to judge it." Well I didn't say *don't judge*. I thought what I was saying is, make distinctions. You *have* to judge. You're going to be presented with an endless smorgasbord of ideological options. Where do you go -- Mormonism, Scientology, the Hassids, the Zennies, the Buddhas? Where do you put your faith? You're going to be constantly called upon to make this call. Now you don't have to make sense to *me*; you don't have to use my criteria. But you should use some criteria which you can rationally defend. The problem with the UFO community, I think, is that they are too credulous, and consequently there is too large a body of evidence left claiming that it should be taken seriously. There *is* something bizarre going on -- at the edge of language, at the edge of collective attention -- unusual anomalies haunt the epistemic enterprise like ghosts. But people who come forth to proclaim what this is haven't taken the depth of the mystery. I mean what it is is the Cosmic Giggle, and they're not going to nail that to the barn door; that's its nature, that it's mercurial, shifting beyond your reach. It changes as you behold it.

Q2: Thank you, I won't bring it up again! [laughter]

TM: I didn't mean to beat up on you, I... Yes?

Q3: Hi. I got your software, and I started to read the book, and I gotta ask you: How come a *descent* into novelty? Is it that easy to get to novelty?

TM: You mean why not an ascent?

Q3: Why not an ascent? And can you say more about the context of North Whitehead, and the period of time we're in right now?

TM: Okay. First of all, why a descent into novelty rather than an ascent? It was my thing to do as I wanted to do it, and it seemed to me -- the way I thought of time was I thought of it like a river. And so I thought of it as flowing toward its lowest level. And I thought of history as a river and Eternity as the ocean. So naturally history flows downhill to reach Eternity. I also like the fact that when the descent in elevation is rapid, the river runs faster, and when the landscape is almost flat, the river broadens out and meanders. So it was to preserve this idea of time as a fluid. The other reason is a mathematical reason. It has to do with the fact that if we have novelty moving downward, then the maximum of novelty is zero. If we have novelty moving upward, the maximum of novelty is just some very large number, and that's not very appealing.

Now you said to talk a little bit more about this time we're passing through. Well, one thing I didn't mention in the talk (because it takes for granted that you've studied my thing, which is a lot to presume) -- there are *resonances* in my theory. It's not simply that it's either novelty or habit. There are resonances between one time and another time. And the time we are in right now is a very strong resonance to the middle Tenth Century. In a sense, we are emerging from the Dark Ages. It's not good to push the analogy too hard, because many times are intersecting. But in ordinary theory of history or theory of causality, the most important moment before this one is the moment immediately preceding this one. My thing says something different. It says no, each moment in time is a kind of interference pattern made up of other times, some near, some far. Their relationship is not linear. And that's why we suddenly get a burst of Egyptian-style furniture, or suddenly a lot of talk about Judy Blake, or suddenly a remake of the story of Aeschylus... Fashion, or the ebb and flow of mass obsession, is based on *feeling the zeitgeist*, and the zeitgeist carries these messages from many times and many places. And there was a third part?

Q3: I wanted to know more about Alfred North Whitehead and how the *I Ching* and everything got together.

TM: Well, people think of Alfred North Whitehead as a somewhat obscure and stuffy guy, just because he was English and it was the 1920's and guess he didn't do a lot of bong rips or something. But if you read *Process and Reality* -- I strongly urge you to read this book. It's not easy, but you don't need a Sanskrit dictionary, and you don't need to take up residence down at the ashram and sweep up... Whitehead has a language that he speaks, and he talks of *feelings* as the primary datum of reality. And he talks about time as moving towards what he calls "concrecence". And he talks about complex systems such as an organization or a human being as a "nexus of actual occasions". Well I just find his vocabulary, his way of thinking about things, *and his mathematical rigor* to be tremendously appealing. If you take Whitehead to you breast, you don't have to hang your head in front of anybody, because his mathematics is impeccable. He is one of the great mathematical thinkers of the Twentieth Century. So it is a very solid foundation that will support a very psychedelic view of how reality works.

Q3: Thank you.

TM: Thank you.

Q4: I want to know if you believe in the paranormal abilities of humans, and if so, if you think that can lead to the ultimate wireless communication.

TM: Yes, absolutely. I don't have any inside track on this. But I said my method was to search the weird and then to pay attention, and I have seen -- maybe for a minute out of my 50 years of existence -- I have seen people do paranormal things. What it was, was it was my brother, reading my mind -- not what I was thinking, but something that had happened to me 14 months ago that he had never been told. No one had ever been told. And in a condition of quite advanced psychic discombobulation, he just spied this story. I was so impressed, I went to psychiatrists and people who spend time in back wards, locked wards, because I thought, "That must be where this stuff goes on." And some people said yes and some people said no. Apparently schizophrenics are not nearly as interesting as I had hoped they would be.

But I'm not ready to give up on this. First of all, how many psychiatrist residents have ever seen and *unmedicated* schizophrenic? None, I submit to you. I was in the Amazon basin when my brother went around the bend, and medical health care delivery was out of the question. How many people deal, in the Twentieth Century, with schizophrenia naked? What it seemed to me to be was a kind of -- it was almost like it's a disease of spacetime itself. You walk into a nexus and then *you're tweaked*, and you see too much, you say too much. And it's very hard to get you squeezed back down into what they call a "coping mode". And that's all most psychiatry's about; it doesn't ask philosophical questions. They're trying to get you back on the street, back at your job, performing the necessary social function.

So yeah, I think that the obvious tool for studying paranormal abilities in human beings are psychedelics. That's the only time I've ever seen anything like this go down. And yet this is not done. It's impossible to get permission to give psychedelics to people with [any] other experimental protocol than to see whether they live through it -- let alone get permission to flip cards or do other, more advanced, kinds of tests for paranormal ability. This is another place where culture is not your friend. Culture tells you what is possible. For instance, I've been with cultures where people could smell water, and it was a life and death deal. Well, is that a paranormal ability? I've been in cultures where people claim that when they wanted *ayahuasca*, they would listen, and then they would hear the vine calling, and then they would go and get it. In their culture this was how you did it; it was not paranormal. In our culture there's no way to explain that. So I think language imprisons us, and then what is human becomes exotic in some cases. Thank you.

Q5: Is the point of visual art to be put on the Internet now? I'm a painter, and I drove an hour and a half to the area, and I don't have access to the Internet. Recently somebody wanted me to make a copy of my paintings specifically so it could be put on the Internet, and I tried to do it, and it didn't work. And I'm wondering if I need to adapt...?

TM: Well, it's a stretch for all of us. A year ago, I had no web site, I didn't know what HTML was, I had no scanner -- I just had the belief that web sites were an important thing. Now I do my own programming, I maintain the web site here in Manhattan from Hawaii. You're going to have to accept the fact that you're going to have to learn a bunch of new stuff. At first a person my age resents that. Now that I'm into it, I

haven't had this much fun since the 1960's, I haven't learned so much stuff! So what kind of stuff do you learn? Do you just learn the software -- you're the slave to commercialism, in some sense? I don't see it that way. Photoshop teaches you about light. The 3D rendering programs teach you about space. The animation programs teach you about motion. And believe me, it's not simple. When you're in a 3D rendering program, of the sort that gives you, simultaneously, three views, from three different angles, of the object which you're sculpting -- a stupid person cannot coordinate all that data! And I started out unable to coordinate all that data. And then you learn, "Oh, it's like I have three eyes, viewing it from three different positions, and if I just relax into this, I can grok it." So I think we are all going to go back to school, big time, and between myself and the open grave I see no end to learning. Learning, learning, learning.

The tools are so powerful -- yes, pictorial art, hung on the walls of galleries, (which I am certainly friendly toward, always visit as many galleries as I can, wherever I go, and have been interested in this my whole intellectual life) still it's incredibly rarefied and removed from the lives of most people. And you are, somehow, handmaiden to the interior decoration industries. So I think most artists dream of a deeper communication and a wider audience. I mean it's fine to be collected by a dozen people, but I don't think that would be satisfaction before the throne of Eternity. The real satisfaction is in *influencing*. If you care enough about your vision to paint it, you must surely want it then to influence people. And the Net is simply the way that's to be done now.

Q5: My worry is just that there's something lost in the medium, because it's not a direct experience of the medium.

TM: Well, something is lost. Something is lost in reproduction -- the same something, probably. But I find the clear scans on the Net to be at least as satisfying as four-color printing. I don't think that's the problem.

Q5: Thank you.

Q6: [Comment about the importance of affirming the future.]

Q7: [Starts with a plug for party the following night.] My question relates to an earlier question, the UFO thing. I noticed on the poster something that you were quoted as saying, that we are in a symbiotic relationship with an entity that's disguising itself as an alien invasion. You already addressed this a little bit, but I'd like to hear more about this.

TM: The quote was that "we have a symbiotic relationship with something which has disguised itself as an alien invasion so as not to alarm us." What I meant by that was that an alien invasion is a myth of our culture. Since the 50's we've had the example of *The Day the Earth Stood Still* and *When Worlds Collide* right on up through that television series which I didn't see, where they changed all the Nazis to aliens and then it was a huge success. So alien invasion is a piece of our cultural toolbox, but that's not what's happening. What's happening is something... less easy to name than "alien invader" is reaching out toward us. It could be the Gaian Mind, it could be the Oversoul of humanity... I don't think it comes from the distant stars -- it knows us too well, and loves us too much. It could come from the dead. Now that's what I mean by something weirder than an alien invasion. An alien invasion compared to a collective mass contact by the dear departed is pretty mundane stuff.

So, whatever this thing is, it keeps itself masked. I've literally had the experience on mushrooms of saying

to it, "Show me what you are, for yourself." Well, it's like there's this enormous organ chord, the temperature falls, black velvet curtains are raised -- and after about 20 seconds of that, I'm saying, "That's *enough* of what you are for yourself! Let's go back to the dancing mice..." So what I mean is that our journey through time, our historical journey to this moment, has not be unaccompanied. We have always been accompanied by this thing. The Demiurgos -- some people just throw down their cards and call it God and be done with it. I'm not ready for that, because I don't think it's the God who "hung the stars like lamps in Heave," as Milton said. It's not *that* God. If it is a god, it's the god of Biology. And I don't have any problem with that. I think that the reason people took psychedelics, and the reason psychedelics had such an impact on early human society, was, not because they dissolved sexual boundaries, not because they increased hunting skills, not because they all those things -- which they *did* do -- but, because they brought us into communication with this invisible, all-pervading Mind, that essentially civilization is a denial of that Mind. You stop herding your cattle across the plains, you stop having orgies, you stop taking boundary-dissolving substances, and what do you do? You build walls. You herd everybody inside. And then you appoint a god-king. Then you tell everybody else to take orders from this guy. And what this is, is a pathology, a denial that we are part and parcel of the greater intent of planetary biology. So now the planet is so slammed to the wall by the untrammelled practice of history, that the Gaian murmuring grows louder. It grows *much* louder. [tape ends]

[The following is based on my brief notes of the last few questions.]

Q7 asks about the idea that we are approaching a shift to a higher molecular vibrational frequency, if we are heading into another dimension.

TM doesn't give much weight to the vibrational frequency theory, but does believe we will make some sort of dimensional transition.

Q8 states that he is manic depressive, and is constantly creating his own reality. Since being released from a mental hospital, he has been successfully managing his own life. He wonders whether taking psychedelics might be ill-advised for him.

TM agrees that it must come down to individual judgment, and that there are some people whose boundaries are best left undissolved.

Q9 mentions that she has just come from Colorado, where she learned that an abundance of clean air and sunlight can be every bit as visionary as DMT. She worries that people living in New York are badly deprived of such resources/experiences.

TM responds with a mushroom vision he once had, in which he saw Manhattan island, as it stands today, except with ivy and other plants covering all the buildings. He advocates this vision, saying this would provide an ample supply of oxygen, and would generally "naturalize" the urban environment. He recalls being in Berlin soon after the legalization of marijuana, and seeing green shoots rising from window boxes all down the streets.

- [Other links](#)

Terence McKenna: [Audio cut off] Hyperspace that's being created. You know, we had this chance five thousand years ago when we started living in cities and we made all the wrong decisions. Hierarchical society, kingship, uh, straight street plans, phonetic alphabets. This time I hope we're a little smarter and we can exalt, uh, magic, eroticism, the feminine, tribal values and an deem[sp?] emphasis on the natural world and a deemphasis on consumerism, thing worship, sexism and generalized stupidity.

Micky Remann: Und in dem Masse in dem wir uns anschicken das Reich der Imagination im Cyberspace zu erkunden und zu bewohnen, sollen wir uns bemühen die Magie, das Zauberische am Leben zu erhalten. Was für die die die wirklichen Gewürze des menschlichen Geistes sind und, uh, nicht die Fehler zu machen die wir vielleicht in unserer menschlichen Geschichte vor fünf Tausen Jahren gemacht haben auf einem anderen Zivilisationstrip, nämlich gerade Straßen, uh, Immobilienmärkte, hierarchische Ordnung, Bürokratie und Politikerstrukturen zu bilden. Sondern dass, uh, wenn es jetzt um des Phänomen des Cyberspace geht, dass wir die magischen Elfen, die, uh, Gnome und andere spot spöttische Wesen halten auch in diese technologisch vermittelten Welten Hineinfluss gewähren.

TM: So, you know, when you think about the cybernetic community, the psychedelic community, the cyberpunk community. It's in places like this that we gather and we self-select out of the rest of society. So what I think would be important to come out of any evening like this is that everybody take a good look at the people next to them and realize that somebody in this room has what you need. And you have what somebody in this room needs. The, uh, the spreading of the idea of cyberspace has two aspects. It's first of all informing people for whom all of this is new and completely unexpected, but then the other thing is deepening our own commitment to it and that means, uh, more plant psychedelics. It means higher doses in silent darkness. It means a commitment and a courage to live out this way of life so that we can really take back our minds from the dominator culture, the linear paternalistic industrial capitalist culture and live the kind of erotic tribalism that we have our fondest memories of.

MR: Die psychedelischen Gemeinschaften, die technodelischen Gemeinschaften, die psychone- navigatorischen neurologischen Gemeinschaften wie immer man sie in dieser Disko oder sonst wo anfinden mag, haben das gemein, dass sie sich selber gewählt haben ein Raum zu finden der sich vom Rest der Gesellschaft abhebt, in dem sie ihre Neugier erkunden, in dem sie ihre neurologischen Pfahl begehen können und sich da gegenseitig bestärken können. Und, uh, das Beste was man aus einem solchen Abend wie diesem mitbringen können ist vielleicht die, uh, Realisierung dass wenn man sich nach rechts und links umschaut, da genau die Leute sind, die diese Gemeinschaft bilden und was immer man braucht, sicher ist in diesem Raum irgendjemand der genau das hat und du hast genauso irgendetwas was jemand anders der in diesem Raum ist braucht und in dieser Gewissheit zu leben um sich umzugucken, das könnte die Vertiefung der psychedelisch neuronalen Cyberpaceerfahrung sein zu der man hier zusammenkommt.

TM: What put me on to the connection between archaic shamanism and the new technology and the new music was when I went to the Amazon and, uh, spent time with the people down there who use a plant psychedelic called Ayahuasca. I discovered that, uh, the people were singing what they called magical songs, that were, uh, revealed to them under the intoxicating influence of this plant. But when they criticized the magical songs to each other, they treated them like painting, or like sculpture, not like music. So then when someone would sing a song and then, uh, everyone would say well I like the part with the blue stripes and the yellow dots but I didn't like the part that was red with gray overlay. In other words, for them sound was something that you see, rather than hear. And my, uh, fantasy for virtual reality is to use it as a technology for objectifying language. Because, you see, if we could see what we meant when we spoke, it would be a kind of telepathy. The method that we use to communicate now, small mouth noises moving through space as acoustical signals and then the consulting of learned dictionaries. This is not, uh, a wide band of communication and yet the whole world is held together by small mouth noises and their electronic transductions as radio, television and so forth. So what the cyberpunk generation holds out to the rest of us is a new kind of communication. A communication that is like telepathy because it's seen with the eyes and so then it dissolves boundaries and unites us back into this tribal, uh, community that we feel such a need for.

MR: Was mich interessiert an der Verbindung von archaischen schamanistischen Methoden und der Bewegung der Cyberspace und Cyberpunk ist die Verbindung zum, uh, zu der Art und Weise wie die Amazonasschamanen ihre magischen Gesänge vollführen. Sie nehmen eine halluzinogene Pflanzentinktur namens Ayahuasca zu sich, die, uh, die Wirkung hat, dass sie, uh, sehr f- in sehr transeartige schamanische Gesänge verfallen und die Art und Weise wie sie über diese Gesänge reden ist allerdings nicht auf die, uh, Kritik der Töne bezogen, sondern es ist eine Beschreibung der Farben. Es findet ein Übertragung von Töne auf Farben statt. Und wenn am nächsten Morgen nach dieser Ayahuasca-trance die Leute sich darüber unterhalten wie diese magischen Gesänge waren, die sie unter dem Einfluss der Pflanze gesungen haben, da sagen sie nicht ja, dieses Lied hat aber gut geklungen oder es geht [sp?], sondern sie sagen mir hat besonders gut der Teil gefallen wo eben wie diese auf Lilauergrund diese gelben Sterne erschienen, aber diese Teile mit den roten Streifen auf gelbem Feld, die fand ich weniger interessant. Das ist die Art und Weise wie im Amazonas eine synesthetische Verknüpfung zwischen auditiven und visuellen Kanälen geschaltet wird. Und unsere Hoffnung der Cyberpunkgeneration ist die, dass wir einen Weg finden diese telepathische Ästhetik wiederherzustellen, dass wir auf die, uh, Sprache wie sie jetzt stattfindet in Form von kleinen tonalen Mundstücken die hier ausgesprochen werden und dann über die Luftschallwellen irgendwo in eure Ohren kommen wo sie mit erinnerten Lexika und deren Bedeutungen verglichen wird, um dann wieder in eine Bedeutung rückübersetzt zu werden, was ein extrem komplizierter Vorgang ist. Da wäre die Hoffnung des Cyberpunk des Cyberspace ein neue Form von visueller synesthetischer Kommunikation zu finden, die es ermöglicht, dass wir das sehen was wir meinen.

TM: So it seems to me the way the cyber, uh, punk, cybertech community can keep its compass pointed toward a real human future is to always keep natural models in mind. So, when I became interested in this whole problem of visual language, I went to nature to see if there was some natural system of communication that modeled this thing that I was interested in. And what I discovered was that in the octopus and in the squid you have this form of psychedelic language is already highly evolved. Because the octopus can change the colors and the texture of its surface and because it lives in water and so can dance and fold and unfold parts of its body very quickly. It has essentially become the surface of its own mind. It is, uh, uh, in effect a nervous system turned inside out, so that the thoughts of the octopus ripple across its surface and, uh, you know the engineers who have designed cyberspace and virtual reality environments in California are fond of saying that you can be anything in virtual reality. Well then it seems to me the thing you want to become is naked linguistic intent, pure intent toward communication and so by mapping the linguistic possibility onto a topological continuum and then processing it through, uh, computers we actually create a true mirror for our own mind. And so to look upon this or to share it with other people is to participate in a true form of telepathy and I think this true boundary dissolving telepathy that unites us all into one family should be the goal of the cyberspatial community.

MR: Wenn man diese neuen Dimensionen des Cyberspace erkundet, dann empfiehlt es sich vielleicht zu sehen ob es irgendwo natürliche Modelle gibt, die diese Art von angestrebter synesthetischer Kommunikation schu praktizieren. Das würde der Entwicklung auf jeden Fall sehr helfen, wenn man sich auf solche Modelle, uh, rückbesinnen könnte. Und erstaunlicherweise gibt es bereits ein Lebewesen auf diesem Planeten, das telepathische Synesthesie praktiziert. Das ist der Tintenfisch, dessen, uh, Möglichkeiten auf der eigenen Haut Farbkaskaden, Mosaikgebilde und ganze TV-Screens abzubilden schier unerschöpflich sind. Und, uh, der Tintenfisch könnte dargestellt werden als ein nach außengeklapptes Nervensystem. Alles was innerhalb dieses Tintenfisches an Emotionen oder Mitteilungen vorgeht wird sichtbar in Form von farbigen Displays auf seiner eigenen Außenhaut. Und das Versprechen, das die, uh, Cyberspace-technologie macht geht ganz in eine ähnliche Richtung, dass, uh, die der Inhalt meiner Imagination sichtbar wird als ein, uh, dreidimensionale farbige Skulptur, die nicht weiter beschrieben oder umschrieben werden muss, wenn an die direkt wahrgenommen werden kann, uh, als die Außenhaut meiner Imagination.

TM: It's always held against the technical community that somehow we've moved beyond the values of the natural and the biological world. But if you think about what the tools of cyberspace are, they are integrated circuits, chips and, uh, electronic components which are made of gold, platinum, arsenic, silver, copper, silicon. These are all the materials of the earth and in a sense what we are doing is organizing the raw material of the earth so that it can reflect the dynamics of electrons, of light, moving through fiber optic cables. So really, the in in the cybernetic revolution what is happening is a kind of completion of the dream of alchemy. That spirit could actually, uh, come mingle with, uh, metals and glass and, uh, that out of this mingling of spirit and matter could come a new possibility, a new evolutionary option, a kind of philosopher's stone, a kind of panacea at the end of time. And this is to me what the computer and the virtual technologies all push toward. A kind of mirroring of our own souls. That what the agenda of cyberspace is is a kind of, uh, turning the body insight out. Bringing the soul into visible manifestation in the world as a kind of eternal transdimensional object and then turning the body into a freely commanded object in the human imagination. I mean this is the idea. To tray[sp?] to make this reality behind the menu and make the reality of cyberspace the reality in front of the screen, to reverse the figure ground relationship and find ourselves free at last in the imagination.

MR: Was der Cyberspacegemeinschaft häufig vorgehalten wird ist ihre Fixierung auf diese technischen Mittel. Aber es ist natürlich, uh, wenn man sie auseinandernimmt, diese technischen Mittel, kommt man auf Silizium, Kohlenstoffverbindung, Polymere, Kupfer, Nickel, Eisen, verschiedene Substanzen dieser Erde sind. Und was letztlich in der technologischen, uh, Evolution geschieht ist dass diese Erd irdischen Stoffe auf eine Weise zusammengefügt werden, dass sie eine eigene Intelligenz hervorbringen, oder dass sie eine in ihre zu in ihrem Zusammenwirken eine Rückkopplung mit der irdischen Intelligenz bilden, die es vorher noch nicht gegeben hat. Und was die, uh, Cyberpespacetechnologie[sp?] verspricht ist ein alchemistischer Traum. Nämlich eine Verbindung zu schaffen zwischen Geist und Materie in der Weise, dass die Seele oder die die Kraft der Imagination nach außen gekehrt wird und dass der Körper mehr nach innen gekehrt wird und dass die Beziehung zwischen Keyboard und Vorstellungsvermögen durchlässig werden.

TM: So when I try to imagine the cybernetic world of the not too distant future, what I imagine is a world where, uh, all tools and toolkits have been tucked away into a virtual cyberspace. So what we see when we look at this world of the future is we see healthy men and women living in a natural environment, uh, naked, happy, at peace and when these people close their eyes in this natural environment, what they see hanging in mental space are menus. And these menus are the way you make your way into an interface which is completely hidden in three dimensional space, but which is nothing more than a hard wiring, a downloading into, uh, hardware, if you will, of the unco- collectivity of the unconscious that exists anyway. I mean, what we're doing is, uh, the end male men engineering mentality is following along at hardwiring what the animal body has always been into. So, uh, the future is a future of ultratechnology in a dimension that is split off from what is called the ordinary world. The ordinary world, the natural world is maintained like a botanical garden or a natural preserve and then the human imagination, which is this titanic, Promethean force that is loose in our species, it is free in a virtual reality to create all of the castles of the imagination, to create the mile long buildings in all kinds of architectural styles, to create the arcologies and vision spaces that are the affirmation of the imagination. We are our mental power to project imagery has become so powerful that now really our only option is to break with the planet and head out into a cultural space defined by our dreams and by our machines. And this is in fact what we're doing and you people are many of the people who will do it. What we're doing is we're taking back our minds. I mean that's more than a political slogan. We're taking back our minds from reductionism, from materialism, from scientism, from all of these intellectual philosophies which disempowered the artist and made the artist somehow slave to other forces in society. In the cyberdelic future, artists will rule, because the world will be made of art.

MR: Wenn ich meinen kurzen Ausflug in die weitere Entwicklung dessen machen kann was Cyberspace heute am Anfang versucht, dann, uh, kann man sich vorstellen, dass es ein, uh, freundliches, lächelndes, äußeres Universum gibt, grüne Wiesen, lächelnde Menschen, die nackt in ihren Höhlen hausen und sich, uh, das Leben gut sein lassen, in der herkömmlichen dreidimensionalen Realität. Aber sobald diese Menschen ihre ihre Augen schließen werden also unendliche Menüleisten von Optionen und Werkzeugkästen erscheinen auf ihrem inneren Auge, die sie dies ihnen ermöglicht, uh, psychedelische, imaginative Optionen zu erleben, und mit der gleichen Wirklichkeit und der gleichen Realitätsdichte wie diese dreidimensionale Realität. Und mit ihren, uh, Körpern auf dem gesunden Grass liegend können sie hinter geschlossenen Augen in unendliche Räume vordringen und, uh, sich in alle möglichen Situationen und Gesellschaftsformen hineindenken, die von den jetzigen Gesellschaften so weit entfernt sind wie wir von den, uh, Steinzeithöhlen und, uh, diese Möglichkeiten sind in der Evolution dieser Technik enthalten und wir können uns gegenseitig Mut machen oder uns dagegen, uh, währen, aber wir können uns auf diese Schienen einschwören und in Gesellschaften oder den Gemeinschaften wie diesen die, uh, Wege dorthin erkunden.

TM: Yes, you see. What we're doing is, uh, invoking a co- kind of collective mind. It's a political project that has been the dream of civilization for as long as there has been civilization. And it actually is within the power of this generation to, uh, create this kind of new definition of humanness, where all the shit and horror of the last five thousand years of human history can somehow be reclaimed or made to have meaning by the application of technology toward the reflection of the human soul.

MR: Und der Versuch der dahinter steht ist eigentlich ein sehr alter Traum der Menschen, nämlich sich ihren eigenen Geist zurückzugewinnen und, uh, das Territorium was von Bürokraten und Politikern und Zi- und Zivilisationen bei denen alles durch, uh, Horror und Shit gegangen ist. Dieses belebte Territorium der eigenen Träume und der eigenen Imagination wieder für sich selbst zu reklamieren. Und, uh, dieses. Da war noch irgendwas. Das hab ich inzwischen vergessen wie's weiterging, aber es ging in dieser Art weiter. Uh, dass die, uh, die Möglichkeiten dieses zu einer bewohnbaren Welt zu machen.

TM: Boring[sp?] the natural psychedelic vision into that loop, then, uh, endless realms of alien and unpredictable beauty lie ahead. And this is really what human beings were made for. I mean, we are the information generating, art making creature. All our higher activities, dance, painting, music, poetry, uh, human relationships, all of these things have the character of art. And so the the future is lies in the realization of beauty, the making it more and more explicit, the sharing of our dreams by at last applying tools, not toward warfare, but toward the dissolving of boundaries between people and, uh, nations so that, uh, the real biological fact of a human community can show through. If we're able to do that we're will be able to fast forward the cultural crisis and we will be able through psychedelics and mass media and the, uh, distribution and control of the flow of information actually be able to save ourselves and this world from ruin. It rests in the hands of the high tech communities developing and controlling, uh, information technology, because we have the money, we have the power to make any change we want in the world. But we have to change our minds. And that means better art and more psychedelics and so that's the responsibility which rests on you guys, and, uh, I'm sure you're up to it. Thank you very much.

[Audience claps]

MR: Ich werd sehen, ob ich aus dieser Rede noch ein paar Fische ins deutsche Land heranziehen kann. Was als Kompass und Maßinstrument[sp?] gelten sollte, wenn man jetzt diesen Cyberspace erforscht und bewohnt, sollte die Schönheit der psychedelischen Erfahrung sein. Nimmt man ein, uh, nimmt man diese diesen Reichtum der psychedelischen Vision nicht mit in diesen Cyberspace hinein, läuft man Gefahr auf eine narzisstische Selbstschlaufe hereinzufallen in der eigentlich nur die eigenen, uh, Begrenztheiten wiedergespiegelt werden. Aber der unendliche Reichtum, der in der psychedelischen Vision die ich[sp?] die andersartige und außerirdische Schönheit dieser Visionen, das könnte das Element und das Ingredient sein, dass aus dem Cyberspace eine wirklich lohnende Alternative zu dieser Realität ist, uh, wo wir auf der Endmoräne von technologischen Problemen sitzen, die, uh, ein dieses genau dieses neue und visionäre Input brauchen, damit wir uns über die Runden kommen. Und, uh, es ist schön in einer Gemeinschaft, in einer Gruppe zu sein, die sich mit diesen Themen beschäftigt, weil das liegt in unserer Hand, diese menschlichen Träume, die Welt als Kunstwerk und Imagination zu verwirklichen. Schönen Dank.

[Audience claps]

TM: Thank you[sp?].

[music]

Terence McKenna: Hello, hello, hello. Hello, hello, hello, hello?

[audience cheering]

TM: Wonderful. Well it's a it's a pleasure to be stoned with you in Brisbane this evening.

[audience cheering]

TM: [Terence laughs] It looks to me like the tribes have turned out in all their splendid variety. So I'm here this evening to talk to you in three brief rants with Zippy's wonderful art before, in-between and after. We have commercial opportunities for you back at the pinball machine. Uh, we've, uh, hopefully provided all that we can. I'm I'm sure someone in this room has what you need. And, uh, I'll be gone on the next flight tomorrow. So the important thing I think is to look around you. This is the psychedelic community in which you find yourself. This is your affinity group. This is your cadre and not only is there someone here tonight who has what you need, there's probably someone here tonight who needs something that you have. It's no news that a worldwide movement of trance, dance, consciousness, psychedelics and archaic revivalism is taking place. And my place in all this, I suppose, is to humbly offer one version only of why this is happening and why it's happening now and what it might mean for the future. This is the old style of doing things. This is how religion was practiced for the first three million years before it fell into the hands of politicians and real estate speculators. Religion is not about dogma. It's even less about laundry lists of moral do's and don'ts. Religion is about feeling and community. Feeling and community. And in the course of western history we have wandered a long long way from these things. So far in our own past is authentic shamanism, authentic community, authentic human relating, that it comes as an unconfirmed rumor. But in the last hundred years the curiosity of anthropologists, botanists, ethnographers, neurophysiologists, linguists has let the cat out of the bag. And the cat that is out of the bag is that reality is simply a state of mind. Reality is a place where cultures pitch their can and then defend it against all others. In the same way that we've had to learn that our sexuality doesn't come in two flavors, we have to also face that there's more to consciousness than awake and asleep. And in fact in every ecosystem, in every culture, in every part of the world from the Arctic to the Equator, there are chemically complex and shamanic plants that can be brought together to open doorways into domains of experience that are not only unsanctioned by the straight establishment, but unimagined by the straight establishment. I mean this is what lies outside of history. This is what the dreamtime is. This is what the magical world of suspended belief of South American shamanism is all about and the point that we have come to with all of this is not to talk about it or to s- long[sp?] for it, but to take the materials of our own environment and our own courage and our own dissatisfaction with the world as we find it and remake it. Remake it through technology, through trance culture, through underground culture, through media, computer graphics, the Internet. Uh, these are all tools of transformation completely beyond the understanding or the control of the establishment. Because they have dressed the part of the mind that the establishment is completely phobic of. The wild feral untamed pre-bourgeois, pre-constipation, pre-religion, pre-money, pre-consumerist human being. The real human being that each of us senses within ourselves and that we endlessly compromise for in our dealings with, uh, straight society. The truth of the matter is there are no answers now, except technological and shamanic and psychedelic answers. Politics has failed. Business as usual failed. Science failed. Religion failed. This is why youth culture is not interested in graduating to suits and houses in the suburbs. The bankruptcy of that whole lifestyle is now evident. Why now? I believe it's because psychedelics dissolve cultural assumptions. They are social and political dynamite. They are, uh, the equivalent of standing naked in a world of, uh, illusion, delusion, pretension, assumption and misunderstanding. All societies are frightened, all advanced, literate, industrial societies are frightened of the psychedelic experience. Because it represents a, uh, a cult of direct feeling. You don't have to believe anything to be part of this. You have to have certain experiences. Boundary dissolving experiences that, uh, teach you that the surface of things is only the beginning, not the end. That the surface is where we begin. But then we sink in, deeper and deeper, like a solvent, penetrating, dividing, washing clean, clarifying reality. The further in you go, the bigger it gets. The human mind is the source of all the riches after which we are told we should seek. The houses, the boats, the furs, the cars, the jewels, the degrees, the social esteem. All of this is false currency compared to the authenticity of your own experience and the art that you experience coming out of your own psyche and that you can then give back to the community, to the community. Zippy? Take it away, dude[sp?].

[audience claps]

[music]

TM: Part two. Part two is what I've learned or think I've learned from psychedelics. And I offer myself as an example, because it's as important to tell your trip as to have it. Because until you tell it it's not food for the community. So, uh, my far too many years of taking psychedelics have taught me some things. And some of these things are this. First of all, very practical, nature loves courage. Nature loves courage. And the way you can tell that nature loves courage is she removes obstacles. So chance taking in the interests of knowledge is rewarded. All kinds of people may think they've had the psychedelic experience, but if it hasn't set your knees knocking and your heart racing you probably just shaved the fuzzy undertummy of the beast and never really wrestled with it. So a very practical lesson, nature loves courage. But a shaman, my definition of a shaman, is someone who understands how the world really works. How does the world really work? What is it and what are we in it? The where is it from? Where is it going? Science tells you that nature is red in tooth and claw, all

competition strife and random mutation, but in fact there is a hidden appetite in nature that science has overlooked, that we have not been told of. It is that nature prefers complexity. Given the choice between the simple and the complex, nature always prefers the complex. And as you move from the beginnings of time to the present, what is consistent is the increase in complexity. Millions and millions of years may go by during a period when there is a backward flowing tendency, resisting complexity. But if you look at enough time the tendency to complexification will always reassert itself. So out of a universe of gas and dust comes a universe of stars and planets. Out of a universe of inorganic life, inorganic organization comes the carbon based world of organic life. At the very center of the complexification process of organic life intelligence appears some hundred thousand or million years ago. The process of intelligence existing and iterating itself through time, elaborating languages and technologies, spreading itself over the planet results in more complexity, greater complexity. So that ultimately from a psychedelic point of view the human world is seen not as an accident or an unlikelyhood or some enormous privilege for which we must genuflect to an invisible god. But rather the human world is seen as inevitably the goal of all the processes that preceded it. Which doesn't mean that we are the end of the story. But it means that we are the heroes of the story now, now. And upon our shoulders rests the conscious obligation, because we are conscious to take the complexity, the novelty, the kinky, odd, heterogeneous reality that we find and further complexify it, further complicate it through the process of making art, forming relationships, realizing our plans, building our dreams. We are the creature that carries a sensory organ unknown to occur anywhere else in nature. We are the creatures who possess the hyperdimensional organ of perception called the imagination, the imagining mind. Perhaps a carnivore in the act of hunting its prey briefly forms a strategy to carry out the kill, but human beings strategize over months, over years, over millennia. We launch plans and religion, scientific revolutions, styles of music, architecture, fashion. We fashion our world. We don't accept the world as given. Between ourselves and the selective processes of nature we have interposed the shifting domain of virtual reality that we call human culture and human civilization. Uh, a collective compromise that sometimes works to our advantage and sometimes works to our disadvantage. As a tribe we function as a group mind, as a mass society we are the victims of advertising agencies and politicians. The nature of our relationship to our collective existence is constantly changing and not yet defined. This is the important thing about the human adventure. We are not locked in genetic[sp?] repetition of behaviors over millennia. We are co-creators of our own destiny with the forces of nature. And we can deny that nature and retreat into cities, industrialism, reductionism, materialism, positivism, relativism, all the shitrained isms of post-renaissance pre-apocalypse illusionism, or we can admit that we are unfinished business. That at the center of our experience of ourselves and the world is a sense of mystery. A sense of being uncompleted. This is the this is the perception which sophisticated cultures rob their members of. The sense that their is a hidden way out, a trapdoor, a deus ex machina, a magic word, a ritual, a conjuration, a drug, a form of music, a sexual act, a posture in relationship to art, something that cracks apart the rigid rule defined reality of the group and shows you that beyond culture, which is a fairytale told for fools, is the uncharted, unmapped, unregulated, unspeakable. Wittgenstein actually called it the unspeakable. He said the word of common understanding is the present at hand. You can touch it, but beyond the present at hand lies the unspeakable. The challenge for the psychedelic community as the great hope of the human community is to move that boundary of what is unspeakable far away from us. To claim evermore domains as human domains. Potential areas for the production of art, the erection of, uh, relationships, the establishment of formal systems of understanding, mathematical, scientific, uh, mythological, psychological, whatever. Uh, the, uh, and this enterprise, this extension of understanding should not be thought of as a quest for ultimate knowledge, rather it should be thought of as an exercise in self-exploration because it is inevitably true. The larger you build the bonfire, the greater the darkness that is revealed. Or to put it another way, the greater your sphere of understanding, the larger the area of your ignorance. It is inevitably so that knowledge reveals a greater and greater domain of unknowability. And it's into this domain of unknowability, like a search light that the psychedelic plants and substances, uh, offer illumination, direction, and partnership, partnership. Partnership with the humbler denizens of this planet. Creatures of reef, rainforest and tundra that are living in worlds of their own, worlds of immediate experience so alien to our own that there's no need to point radio telescopes at Zenebel Ganubi[sp?]. The aliens are with us in the rainforest, in the sea, in the pasture, waiting to be recognized as the potential co-partners that they might become.

[audience cheers and claps]

[music]

Woman in audience: Hey, Terence! Thanks for coming! [inaudible]

TM: I'm pretty happy.

Woman in audience: [inaudible]

TM: It's bloody hot.

Woman in audience: [inaudible]

[Terence laughs]

Woman in audience: [inaudible]

TM: They're pretty.

[woman in audience singing]

[Terence laughs]

Man in audience: Hey, Terence!

[music]

TM: Alright. Okay. Now we're turning final, as old buspilots like to say. And before I get into my final hortatory spiel, I want to talk to you for a minute about some information that I simply think you should have, which is, some of you may know this, some of you may not, but very exciting for our community. A new plant teacher with a new psychedelic substance in it, with a completely unexplored pharmacology and phenomenology has appeared and is spreading worldwide through the culture. And this is the first plant on this planet known to produce a substance active in the same amounts as LSD. In other words, active at under 1 milligram. And this is the Mexican mint *Salvia Divinorum*, which if it's in Australia at all at this point is only a very few people are aware of it. Nevertheless, this plant grows easily in all

Australian climates, can be grown as a houseplant, uh, and two leaves of this plant, dried and crumpled and put in a bong will cut your legs out from under you and.

[audience cheers]

[Terence laughs]

TM: Put you twitching on the ground with a smile on your face.

[audience inaudible]

TM: At the present moment this plant is legal worldwide. You can transport it, grow it, advocate it, extract it, advertise it, do therapy with it, uh, and anything else you can think to do with it. This is an incredible gift to our community out of the complex circumstances of the times. I don't think the world, uh, police establishment is ready to take on the control worldwide of yet another contraband substance. And yet this plant is as powerful as any plant on this planet. Uh, the leaves smoked produce an experience at least, at least as bizarre as DMT smoked at the 50 milligram level. And there is no reason why this stuff can't be grown by the acre. So.

[audience claps]

TM: Uh, this is news. And tonight we have passed out information on various places where this plant can be obtained. Now this is all very exciting, but behind this fact lies the approaching truth that there are probably many such compounds and many such plants and that in fact the human inventory of psychedelic possibilities has only begun to be taken. Uh, some of you may know in Africa there is an extremely powerful hallucinogen called Tabernanthe iboga, the Bwiti cults. But very few people know that there was no record of any human group using that plant until 1870. Peyote, which is imagined to be thousands of years old in its use in Northern Mexico, is in fact fairly recent. In the old graves of the Tarahumara and Sonoran people of Mexico we don't find Peyote buttons or seeds or detritus. We find the remains of *Sophora secundifolia* beans, a very toxic plant. The Peyote only began to be used in the 1880s and the ghost dance religion has a way of trying to hold Indian culture together against the whitey advances. Uh, similarly this *Salvia Divinorum* thing was known from a tiny group of Mexican Indians and only from there. And yet, as I say, this plant can be a house plant and sold in supermarkets and mall florists throughout the world. As we study psilocybin we have gone from the fifties, where it was assumed that it was restricted to Central Mexico, to the understanding that this is worldwide. Uh, just recently published, the psilocybin mushrooms of the Earth, containing over a hundred and sixty species of psilocybin. We now know that DMT, the most powerful of the commonly known hallucinogens, is literally in everything. It's in dozens of genera, genera of plants. It occurs in fish, including fish off Norfolk Island. It occurs in the brain of every single one of us here tonight. In fact, this is an unresolved issue. Can you make a substance illegal that is a human metabolite?

[audience laughs]

TM: It's getting in there a little close, I think. Uh, maybe we might want to rethink that. Uh, it means you're holding every moment of every day and every night since you emerged buck naked from your mother's womb and you will go to the grave holding. Well what is DMT doing in human metabolism? We know not. But as the scales fall from our eyes and we move beyond the confines of our cultural programming, we are having to realize that nature seems to run on these psychedelic compounds. Nature is full of wormholes and hyperdimensional doorways into other realms of mystery and power. Our own origins are completely mysterious to us. But I believe we are a kind of partial symbiot with the psilocybin mushroom. That everything about us that we consider human, humor, theater, mathematics, loyalty, uh, you name it. All of these human qualities evolved at a point in human history where we were taking psilocybin mushrooms and practicing an orgiastic sexual style and a nomadic social style. In other words, moving lightly over the land, possessing nothing, finding our emotional release and our meaning in, uh, complex social and sexual relationships with each other, carrying for the cattle and using the, uh, psychedelic plants in our environment as a direct pipeline into the Gaian Mind. Because the real truth, I think, that is to be revealed out of the psychedelics is not simply deeper insight into your own psychology or recovery of childhood memories or insight into other peoples dilemmas or the coordination of abstract problems. Psychedelics do all of these things with enormous facility and ease. But what they are for, what they really do is dissolve the boundary between the individual and the species, between the species and the surrounding ecosystem, between the Earth itself and the surrounding, uh, extraterrestrial environment of the solar system. And this is what reality is. It's a seamless felt aperception of pattern. Language is a compromise, a downloading, a slicing up, but dissecting and dividing for purposes of understanding. But the smart money knows that you have to take the perceptions of language and recombine them into a, uh, in a union with feeling in order to produce a real world. People sometimes ask me what is the connection between dance culture and psychedelics. The connection is both of these things operate without ideology and with a tremendous emphasis on the felt presence of the immediate moment. If we as a community believe in anything, we believe in feeling good in the moment, the felt presence of immediate experience. This is what has been stolen from you by capitalism, by religion, by linear thinking, by strategizing. We're always about to be happy or we're always about to be free and while we're about to be free and about to be happy, life passes us by. This is because western ideologies are always ideologies of delayed gratification. It comes after death, after retirement, after coitus. It's always after something that it comes. Well I've got news for you. This kind of thing is chasing your own tail. The felt presence of immediate experience is the only world you will ever know. Everything beyond that is conjecture and supposition and what the psychedelics do is they bring one to focus on the union of the mind and the body. They do not give philosophical closure. They in fact present you with the unresolved dilemma of being. And to the linear western suited constipated mind this is a situation of incredible discomfort. The suits want closure. They want linearity. They want the illusion of completion. Job well done. But this is a fool's game. The world is more complicated than that. You cannot simplify the world and have it be true to itself. So if you want a relationship with fidelity to being, you must complexify yourself. You must recognize the ambiguity of your sexuality, the ambiguity of your grip on your understanding of your place in the world, your ignorance of the meaning of life, the destiny of biology. This admission of ignorance is not an admission of stupidity, it's an admission of intelligence. Only fools run through this universe proclaiming that they understand it. What the psychedelics do is give you a relative, uh, set of phenomena to a against which to measure your paltry models. Models of causal time or moral necessity or physical inevitability. And in every case the true nature of being is found to be too complex to be so linguistically or culturally caged. And so the f-f conclusion I come away with from all of this is that culture, uh, is not our friend. Culture is a provisional form of infantilism, in the same way that you suckle at your mother's breast and then at the tit of the university and the government. Eventually one has to admit, whether one is Hasid, Chinese, Indian, American, whatever, that one's culture is infantile, idiotic, constructed by, for and of morons. And that it is an insult to an intelligent person to live within the definitions of a culture, because a culture is like a set of schoolyard, uh, rules. It's designed for the lamest among us so that the system can function at all. And to my mind what is happening in the new dance culture, which is often accused of frivolousness and immaturity, but what is actually happening is a forced maturity. You people have reached the level of alienation with the false values of the culture, that my generation didn't reach until it was forty or forty five. So here we can shorten the loop. And and, uh, what then should be the response of alienated, psychedelic, uh, people and communities to, to the dilemma in which we find ourselves? I think it can only be, uh, to produce art. To put the art pedal to the floor. That essentially speaking at least for myself my involvement with psychedelics is part of a larger impulse in my personality, which is a cult of beauty. I grew up in a place where there were dinosaurs in the ground. And when I learned that there were a hundred million years old I felt the ground open beneath my own feet. I grew up in a place where lots of minerals were ore, metallic ores were brought out of the ground. The iridescence of ores, the iridescence of butterflies and beetles, the iridescence of opals and reef fish. There was always this light on nature. Iridescence which indicated to me that things, physical objects had living universes inside of them. And I now think as Aldous Huxley thought, that as human beings our fascination with jewels and bright objects, which we share with magpies and packrats, uh, is, uh, a kind of a spiritual intuition, that glitter is the path to follow. You know Plato and it's said of western philosophy, all western philosophy is only a footnote on Plato. Plato had this idea of what he called the good, the true and the beautiful. And he said the good and the true and the beautiful are the same thing. And I found this very useful, because it's very hard to know, or very hard for me to know, what is good. And it's very hard for me, though I have philosophical training and reasonable intuition, it's very hard for me to know what is true. But beauty is easy to recognize. I know it when I see it. And show me two forms of beauty and I have no trouble telling you which I think is the more beautiful. So moral philosophy, too tricky. The search for truth, possible catastrophic error. The worship of beauty, no blame. A reliable arrow into the mystery. Stick with the beautiful. Follow the beautiful deeper into beauty and there you will find truth and goodness. And these are the things that we have turned away from, because the aesthetics of post-modernity are hideousness. Hideousness is the new god functionality. The new god, uh, economic efficiency. This is why our world looks like dogshit, because it is incredibly economically designed. Beauty played no part in that. We need to move back to the idea that nature at every level, molecular, membrane, cellular, species, interspecies, ecological, planetary, nature presents living models for how to deal with energy and experience that can be our salvation. But we must change. Everyone must change. And people some s- sometimes say to me well do you think psychedelics is all that's necessary? Psychedelics to my mind is simply the only game in town. Not because it's a sure thing, but because everything else will certainly fail. If hortatory preaching could carry the day, we would have turned the bend at the sermon on the mount. If power over nature could have turned the day, than after the atom bomb we should have lived in utopia. So these are misunderstandings. We must become not the dominators of nature and each other and the physical planet, but co-partners. If we can find a position of co-partnership this appetite for complexity that I've been talking about will become a wind which fills our sails and carries us beyond the monkey business of today's politics. And into an authentically civilized and human world. And the clock is ticking. We will be judged. Nine times in the last million years the glaciers have moved southward from the poles miles deep in ice crushing everything in their paths. There were human beings who witnessed everyone of those glaciations. How much whining was there? I don't know. But somehow we're all here tonight. Those people didn't drop the ball. They kept the game in play in order to deliver it into our unsteady hands this evening. So, you know, wor- worship of the ancestors, a sense of being a reflex of the ancestors, which informs aboriginal civilization worldwide, is in fact an awareness that you act for others. That the genes that were your grandfather's and grandmother's and great grandmother's and great grandfather's are that you are simply a shuffle of the old deck. That how I pull my ear when I'm nervous is exactly how my great great grandfather pulled his ear when he was nervous. We are but the moving wavefront of our genetic heritage. And if we can dissolve boundaries between the ego and the hidden portions of ourselves and the hidden portion of nature we will find that we are each of us but the tip of a universal iceberg that connects to all other separate and assumed to be separate universes. Gregory Bateson said nature is a seamless web. So it is. And the seamless web of nature is woven by the spider of psychedelic mind and understanding. So let us, knowing this, weave a new heaven and a new world for ourselves and the all the children sure to come if we act in good faith with the past. Thank you very very much! Thank you!

[audience cheers and claps]

TM: My pleasure!

[audience cheers and claps]

[music]

There's nothing like the smell of a late-summer New York club crowd to get the old blood pounding, is there? It's a pleasure to be in Manhattan; Manhattan is my second-most favorite island in the world -- only because I live on Hawaii. I feel more affinity to this island than to the other Hawaiian islands (which have various cultural extremes I'm not really capable of relating to. But you'll hear more about that.) Anyway, it's great to be here. It's great to see so many familiar faces. I appreciate those literary trajectories so ably launched from this stage by Anaïs (Nin) and Sherai(sp?). And, what can I say; it's a pleasure to be here. I always feel when I come to Wetlands that I'm like checking in with my sort of my home base congregation.

About five years ago I moved out to Hawaii for the specific purpose of looking back at this scene and putting in a full-time effort to understand it. (Of course this tells you I didn't have a job! [audience laughs] I, I still don't -- but if you're a cultural commentator, who needs a job, right? The glory alone is sufficient to pave one's way.) And I -- probably like you, here at the end of the Twentieth Century, having lived long enough to go at least once or twice around the block -- I'm noticing that the strangeness is not receding. The strangeness seems to be accelerating.

The theme of this evening is "Logos meets Eros." Well, I don't know a lot about Eros -- I do think if you smoke after sex, you're probably doing it too quickly. But otherwise my expertise lies in another direction. I started out in psychedelic drugs, and people said it was a flight from reality. It still is a flight from reality, but I think reality is now a bit more scary than the drugs we used to fly from it [audience laughs], so long ago. Is that the victory of a cultural meme, or is that just, uh, oh I don't know, the yawning grave sort of opening ahead of us? Uh, I don't know.

My thing is to be amazed at the world as given by nature, but ever more, as we approach this millennial speedbump in our calendrical highway, to be amazed at *people*, and about the direction that mass psychology seems to be taking. And since I assume everybody here is a shaper of this mass psychology in the extremely powerful media-based jobs that you all occupy, uh, it might be worth talking about that a little bit tonight.

As I see it, uh, well...I spent all afternoon at MOMA, as I always do when I come to town, (I know it's a "thing" but I do it anyway) worshipping at the altar of modernism, *so relieved* now that it's almost over.

You know? Because it's going to be bracketed in this century, the Twentieth Century. It's almost over. There's very little left to run -- a few i's to be dotted, a few codas to be played, but essentially it's a done deal. And, uh, this end-of-the-century psychology is a psychology of hysterical conclusionism and, uh, summation and, uh, to some degree, a rhetoric of fear that we can ever outdo ourselves. And I think it probably felt the same way a hundred years ago, if you had been in Vienna in 1899, when Jugendstil was bursting at its seams and Freud was beginning to formulate his theories and the Paris air show of 1905 was in the planning. There has always been, this, uh, a sense of fatalistic and apocalyptic excitement at the end of a century, and always throughout a culture at the edge of its technologies. And, to my mind the most interesting technologies of the Twentieth Century have all been communication technologies. And I extend that to LSD, DVD, HDTV, GHB, 5-methoxy-DMT -- uh, all communication technologies for the purpose of transforming languages, transforming understanding. And, now, it seems to me we've struck the main vein. Maybe it's just that I live up on my mountain, and once a year, in pursuit of money, journey to cities -- not like this; there are no cities like this, but the lesser lights -- to gather the gold. But, I have this sense now of palpable acceleration, and it has, uh, it has many qualities. The quality that fascinates me most is one I hadn't predicted: is that it's getting *funnier*. It's getting funnier because everybody's categories are disintegrating, and, uh, the cult of political correctness dictates that we never point out that other people don't make sense. So, *not making sense* has, uh, has, uh, become enshrined as a domain of cultural activity -- and god knows I've mined that, you know?

Uh, somebody once said -- actually it was the mushroom itself, it wasn't 'somebody' [audience laughs]-- uh, but, somebody who happened to be a mushroom once said... uh, what did they say? "If you're not part of the problem you're part of the solution." [laughter] No. What was said was, uh, that culture is like the shockwave of eschatology. Nothing...nothing is unannounced. This is like a weird quality of experience; you can't learn this from physics or economics. (Maybe you can learn it from economics.) But, nothing is unannounced. Everything is preceded by the shockwave of its coming. And, so, so somehow the spreading zaniness of reality is part of the boundary-dissolving qualities that are going to make up this new cultural mix of, uh, disembodied human beings, nanotechnologically-maintained environments, uh, dissolved self-definitions, uh, people living at many levels at the same time, intelligence as a kind of free-flowing non-local resource that comes and goes as needed, prosthesis, implant, boundary-dissolution -- these things are usually presented as fairly terrifying. But, in fact I think behind it all lurks, you know, the demons who do calisthenics in the angles of every room on this planet to keep it all from collapsing into a flat line.

In other words, the, the, the thing which lies at the end of any epistemic investigation of what reality is, is, uh, *surprise*, astonishment. Not religious awe, not that kind of astonishment, but actually like pie-in-the-face hysteria, food fights and falling anvils, explosions! Uh, this is what lies at the end of the epistemic enterprise. WHY is that? Well I think it has something to do with the fact that we are simply *loaded monkeys*, that our belief that we were proceeding as God's messengers, or his research assistants, was, uh, somehow ill-contrived, misbegotten. Uh, what we've shipped for is not a voyage of discovery, it's more like a ship of fools deal. It's something which Hieronymous Bosch or Pieter Brueghel the Elder could appreciate. It's, um, it's probably best summed up in the work of Groucho Marx, but unfortunately he can't be here tonight.

So, I exist in this matrix, as you exist in this matrix, making our way through our lives, our affairs, our careers, our disasters. And, uh, the thing that has struck me about it, for some time -- and don't bother telling me it's a symptom of serious mental meltdown, I *know* that, I've lived with it -- but the thing that's struck me for some time is the artificiality of everything, how's it's like *plotted*, how it's like constructed,

artificial. It can't be that this is the first iteration. This is not the first take. There have been many takes. The fingerprints of the editing suite are all over this scene. If you don't notice that, it must be because you take your life for granted. And if you take your life for granted and you think it makes perfect sense that you're doing whatever you do, this isn't an issue for you. But for those of us who never thought that we would gaze on the things we've gazed upon, be the people we've become, see the things we've seen, the whole thing has this extravagant, uh, Pynchonesque, uh, kind of efflorescence about it that rides right on the edge of, uh, insanity (dare we say it).

And, the interesting thing is, I don't need drugs anymore! [audience laughs] I need them to get away from this, this sense of everything opening into everything else. You know that thing that, um, W. H. Auden said, about how, uh, "the glacier rattles in the cupboard / the desert sighs in the bed / and the crack in the teacup opens / a door to the land of the dead"? Well, I first heard that maybe 30 or 40 years ago. (He used to wander around this neighborhood, as you probably know.) Back then I thought it was about acid -- because that's what I thought everything was about at that time -- but now that I've replayed it to myself, I see that it's like an alchemical insight. It's the insight that everything gives way to everything else. Everything is connected. We know this clichè imported from Malibu and Santa Fe, but it's connected in a way that isn't really, I think, sensed there. Everything is connected in that it's emotionally accessible. This is what the Eros part of this thing means to me, if I'm to make any stab at it at all. When I was very young I must have had a very non-traumatic upbringing, because I discovered, early in life, a stunning truth that's made my life very complicated in its wake, (but that I still think is true) and it's that people are very easy to love. In fact, you can love anybody -- if you are not constrained by expectation, class, the momentum of history, race, gender, the whole thing. But, for a child to make this discovery, and recall it, stick with it, be able to mnemonically pull it up at such situations like this, I think is, uh, is extraordinary. And I stand outside it, I don't draw any conclusions from it. It hasn't made me a *nicer person*; don't try to buy me a drink based on it! Uh, you know, somebody said, "loves Mankind, loathes individual human beings." I don't loathe individual human beings, but I do enjoy things the further I stand back from them, uh... This is the Hawaiian perspective, the motivation for being the hermit with the nightclub, uh, career. But, I have not lost the thread... This *is* the thread(?) [indecipherable]...

And, and, what it's about is an effort to generalize, you know, from one person's life to everybody's life, because the only thing I really bring to the party is a lot of experience and then some ability to articulate it. And, it's like it's not *my* story, or it's somebody else's story I tell. It's just *The Story*. And, this story is like a... the, the literary net of synchronistic connectivity that makes life something other than the laws of physics, uh, particles flinging themselves through nothingness, waves dying out, uh, in empty space -- this isn't our experience of being. Our experience of being is *meaning*. That's *my* experience. And the meaning is not always, uh, is not always, uh pleasant or life-affirming or even exactly rationally apprehendable. Sometimes meaning is a palpable thing, you know, like liquid being poured through cracking ice, language moves ahead of its intent; it encloses its object and gives you almost a reverse casting of the thing intended. There are many ways for words to fit themselves over the contours of, uh, of intentionality. So, personality becomes an issue, because in the future personality (if it exists at all) is going to be a very fluid, dynamic thing. One of our hangups is the idea that we come with one body/one mind, or one body and an uncon...uh, and a mind split into two parts. All these are social, um, fables, [guy in audience says "yea"] illusions [same guy repeats "yea"]. The fabric of reality is defined by whatever large numbers of people believe about it, and now, uh, in the absence of an overarching metaphor that can claim everybody's allegiance, reality is actually fracturing. I've called it the "balkanization of epistemology". I've poked fun at the abductees and make jokes about *pro bono* proctologists from nearby star systems... [laughter]...uh, I've, uh...but, but, for all of that, what this fracturing means is... permission to... manifest opinion as Art.

That's really all there is; there is no truth that is different from opinion; there is no... nothing is secure. I mean, even mathematics, if you understand Kurt Gödel and people like this, even mathematics is an uncertain enterprise. Even common arithmetic is an uncertain enterprise. [clears throat]

So, what are we left with? When I argued a few weeks ago with Sheldrake and Abraham about this, I said, "We have to look at our messengers." We have to look at the people who *bring* the news of the *pro bono* proctologists from nearby star systems, who bring the news of, uh, military establishments trading human body parts for, uh, fiber optic technology. We have to examine the messengers. Well they quickly stomped on that and said no, that won't work, because when you go back into the history of ideas, uh, lots of screwballs have obtained great success with their ideas -- you know, you don't want to look too hard at Newton or Wagner or Thomas Aquinas, or anybody else. So, so the "squirrel" test, or the "fluff" test is insufficient. So then what are you left with? Well, basically, a sense of humor and a battered sense of aesthetics, I think! [laughter]

Now, I don't know how loose-headed the heads in this town are. I rather suspect they're screwed more tightly than the situation further west, and screwed more loosely than the situation further east. But, I'm telling you, erm, as the world reforms itself in these islands of, uh, defined opinion, the only thing which is going to make sense is sense which is *conferred*. So it becomes like about Beauty, I think. Beauty. Beauty is an easier-to-realize value than Political Correctness, Bodhisattvic Compassion -- and, I mean what are these things? Who knows! The rancorous debates start as soon as they're mentioned. Beauty is self-defined, perceived and understood without ambiguity. And, beauty is the stuff that lies under the skins of our individual existences. You know...Uh, James Joyce said in *Finnegans Wake*, *He said*, we, we ,we, uh, "We sprout on the seamy side here in Moy Kain (meaning in the red light district of Dublin), But upmeyant, Prospector, you sprout all your worth and you woof your wings." [here Terence slightly misquotes Joyce] Well, you don't have to go upmayent, Prospector, because right here, right now is, uh, is a good enough place to do this. [here recording is scrambled]

[CANNOT CONFIRM THIS SECTION DO TO ERROR IN RECORDING ON VIMEO & YOUTUBE--Our past is disappearing. It's almost closing behind us. At the MOMA today we were looking at this Russian avante-garde stuff, and I was thinking, "It seems so far away." They seem almost like messages as distant as messages from the Sixteenth Century or the Fourteenth Century. I mean, what does it mean to us, the struggle between Fascism and Bolshevism, the struggle between the European banks and emerging socialist ideas in the 20's and the 30's? This stuff arrives absolutely as ancient as the cave paintings at Lascaux Our past is all becoming more and more somebody else's past,--] irrelevant to the enterprise of the future. Oh yeah, I know that if you don't learn from history you're bound to repeat its errors, but the mo--...the most important thing to learn from History is not to do it at all, you know, that it's a very bad idea, History. Uh, look where it got us!

The only way we can essentially redeem what history has done to us, is to carry the understanding that it wrought back into the enterprise of the human, of creating sane systems of education, of resource extraction, of, uh, of, uh... healthcare and, uh, and, uh... community value. If we don't carry the experience of history back into those domains, History will... will continue. I remember once when I was a fighting radical in the streets of Berkeley and someone had let a banner down over front of a building. It was a quote from Jean-Paul Sartre. It said, "Socialism will not be transcended until we transcend the conditions which created it." True; History, even more true. And, at the moment, the dialogue about the transformation of the species and the integration of communication technology and biotechnology -- all

this stuff, how it's going to work out -- is in the hands of, uh, shortsighted profiteering institutions, that are not particularly interested in *your* welfare or *my* welfare. In fact, I don't know if you've noticed, but *nobody* is particularly interested in your welfare or my welfare, in terms of the intellectual environment of risk through which you move every day. I mean, the number of cons you're offered, the number of people who prey upon you, all of these things indicate that...that the culture has not yet realized the power of its own possibilities. How will it realize the power of its own possibilities? I'm, at this point, pretty fatalistic through time. I mean, I don't feel I have to be here tonight or you have to listen tonight for us to come around any kind of corner. The momentum now is inevitable. Now it's about each of us individually arranging the furniture of our own mind to *deal* with what has become inevitable. It wasn't inevitable, but the Twentieth Century *made* it inevitable, through the Holocaust, Modernism, psychedelic drugs, uh, syncopated music, the dislocation of time and space through media -- all of that has now made this transformation inevitable. The human being, adapted to the savannas of Africa of 120 thousand years ago is just dragged forward into the future by all of this. And, if you can get through life without trauma, heartbreak, agony, murderous rage, fury, betrayal, etc. etc., you're a better man or woman than I am, for sure. I don't think anybody can get through the narrow neck of, uh, first of all, incarnation in a body, but more trying, incarnation inside a historical society that is cannibalistic, uh, low-intentioned, and, uh, with values that are completely formed and modeled on the marketplace.

So, I think about all of this all the time, and I feel great change. I try to monitor it, especially in the realm of society and technology. Everything is redefined every 30 days, every 60 days, uh, redefined toward some kind of [clears throat] singularity, some kind of extraordinary moment in the fractal pattern of historical unfoldment. You know, fractals are always repetitious, always low levels build to higher levels, but nevertheless, intrinsically to the pattern, there comes a moment where there is an apotheosis, a breakthrough to a new level of understanding. And then whatever the old world was, it, it simply dissipates. It goes away. Not that there isn't political struggle, but once the... (let's call it) karmic underpinnings of, uh, of a historical position -- especially an oppressive historical position -- once those underpinnings are articulated, revealed, shown in the light of day, then the game cannot continue. And, I feel like we are, interestingly in this calendrical moment, we can experience the calendar's transformation, or we can *use* it, as others are using it, to put forward the idea that certain things are now obsolete, not...no longer to be practiced outside the confines of the Twentieth Century, not part of the Third Millennium. And, I'm thinking of fascism, sexism, racism, uh... all the division-based consequences of old-style politics.

And, uh, and people say, "Where then do psychedelic drugs fit into all of this?" or "Do they fit into it?" Of course they fit into it, because the *felt presence of experience* -- the reclaiming of the body -- that's the critical political battleground. Your mind is now your own, in some sense. It was a mistake; it wasn't supposed to happen that way. But the acceleration of, uh, of psychedelic use in the Twentieth Century, the explosive spread of the Internet... in some sense...its, it's as though we have broken from the slave's quarters and are already milling in the streets. But we don't yet have the power or the understanding to know where the centers of power are and how it is that they disempower and manipulate us. And, that's because we haven't focused on the body. The body...and this, I suppose then is the thing which gives the Eros thing cogency... The body is the battleground for these various definitions of Human-ness, you know? And, Eros -- representing the erotic celebration of diversity -- is a terrifying specter to hold up in front of the order-crazed, constipated hierarchists who actually have the illusion that they own the enterprise. And, nevertheless, this is what they're looking for, er, toward. This is what was made inevitable by their own rapaciousness in the past, that they painted us so quickly into a corner of resource extraction and, uh, and, uh disgust with, uh, media manipulation that a breakout was impos...was, uh, inevitable, had to come.

You know, one of the things that has impressed...as I go through all this is, uh...well, my doctor brought it home to me, because he was saying to me -- as I buttoned up recently after an examination -- he says, "You know, in the Nineteenth Century, most people your age were dead." [laughter] This is true. Uh, "I'm 52; you're soon to be 52; very few people, statistically, reached that level." And, and, I think part of what's happening -- and it's odd to address an audience so young on this matter, but here's some...here's something your parents may *not* be telling you -- culture as a con is only good for about 35 years *on average*. I mean, some people are impressed with culture till they go to the grave at 90; some people are thoroughly apprised of the fact that it's horseshit by the time they're 19. But, the average, uh, person's experience with culture lasts about 35 or 40 years. In the past, that was enough. Most people then were ready to die without ever blowing their whistle on the game. What is happening here is we are living past the age -- by the millions -- living past the age where cultural values make any sense at all. They simply are, after, you know, the ten thousandth piece of apple pie, the sixteenth Mercedes, the five hundredth whatever -- it's just seen to be... intolerable, unbearable, the agony that resides in matter that the Surrealists were so prescient in insisting upon.

Uh, so culture generally is an infantilizing process. And I...you know, some French people have mentioned this, but they didn't really put it in a historical context: that this neotenizing trick -- now so useful to advertising, to create youth-crazed values in everybody -- it hastens the end of this culture game. It hastens the awakening of many people to the fact that the felt presence of immediate experience is not negotiable. It has no price. And yet this is what's taken from you when you go to the job, when you, uh, dress for the image, when you kiss up to the power establishment. When your time is turned into money, the felt presence of immediate experience is analogous to being enslaved -- I mean let's be frank about it -- *is* enslavement. [audience applause] It's simply that the rules of the game have been changed. [applause] Of course it's easy to say if you're unemployed like me. On the other hand, I'm meeting my obligations, somehow -- always have -- without ever *truly* working, without ever putting my shoulder to the wheel for the Man. (Of course I had to deal dope to do this! [more applause] Once I'd gone past that, it worked.)

Well, I could go on in this vein for some time, as you see, but the thoughts that I wanted to leave you with tonight on this, because I feel like I am checking in with, in some weird way, my peer group of, uh... and maybe my most critical group as well, which is fine, I can't... We don't need any gurus here, we don't need any laying down of the law. Anybody who tells you they have a clue as to what's happening should be suspect for mental illness and delusions of grandeur, uh... The thought is (and I haven't said this yet but this is the conclusion from all of this)...is culture is an effort to satisfy this weird desire human beings have to close off experience, to live with closure, to *force* closure. And, that's why cultural trips are so bizarre, you know, why they don't make sense to anybody but the Witoto or the Waorani or the Americans or the Japanese; if you're not inside the culture it seems crazy. The cultures don't make sense because they're not *trying* to make sense. What they're trying to do is produce closure, which then somehow *makes* a human being who is living in the light of closure a more manipulateable [sic], a more malleable, a lesser thing.

And so, you know, if the experience of the Twentieth Century didn't do it for you, if psychedelics didn't do it for you, I don't know what could do it for you! The, the message coming back at all of us is: live without closure. That's the honest position given that you are some kind of a talking monkey, some kind of a primate, some kind of creature, on a planet, in an animal body, incarnate in a time and space. In the face of that, life without closure is the only kind of intellectual honesty there is. If you have to inoculate yourself against the various memes of closure that are around, psychedelics do that. That's why they are so

politically controversial and potent because, more than any other single act that you may voluntarily undertake, they pull the plug on the myth of a cultural meaning. They show that, uh, these things are provisional, and that beneath the level of culture there is lurking this erotic.... time-and-space-bound, feeling-defined, pre-linguistic mode of being, which is *real being*... Not becoming, not caught in the various fetishistic, uh, uh, forms of tension that commodification of culture and delayed gratification and all these other buzzwords create, but, uh, a deeper level of authentic feeling...and it was there all the time, but is denied by the culture, and, If we *don't* come back to that, if we don't re-access that, then this historical thing, which grinds so many people down -- none of whom are here tonight, I might add; they are lost in the barrios of third-world cities and in the disrupted environments created by this system -- But, history will continue. You know, I'm fond of quoting Stephen Dedalus (Joyce's character) where he says, "History is the nightmare from which I am trying to awaken." But, it's really... 'nightmare' is not a strong enough metaphor. It's a *narcoleptic paralysis*. It's that horrible thing that happens at the edge of sleep -- it's that place where the *pro bono* proctologists from other star systems get their wedge into the seam, you know? And, if you've never had that paralysis at the edge of sleep, you, you don't know the panic, the constriction, that it engenders.

We're really, you know, at a very, a very..... terminal point in the process of our historical unfoldment, in the same way that our hunter-gatherer phase led into agriculture and, uh, advanced role specialization and urbanization and all that. Well, now we're ready to make another leap. But, this time it's going to be done in the light of consciousness, because consciousness is what was garnered in the last leap. And, how this is done depends essentially on the collective state of mind -- how malleable it is, how phobic of closure it is, how open to... the Logos, to the, you know, downloading of universal intent into human understanding (which is what I would call the Logos) it is, and finally, uh, how deeply it operates in the light of Logos. How much *love* is there in this culture? How much love has been carried intact from the plains of Africa through the Minoan civilization and the Medieval period and the spread of people around the planet? How much of what we call true human-ness made the journey with us to this new time? We're going to find out. We're going to find out by pooling the love that is in each of us, in a form in which it is co-extensively shared by all of us. There may be many ways to talk about what this will feel like, what it will look like -- but what it will BE, if it works, is Love. If it isn't Love, than it's less than a perfect sublimation of the alchemical purpose -- and less-than-perfect is now off the menu. [guy in audience says "Woo!"] So the only way up is out. Up and out! That's all I have to say. ["Woo"s and applause].....[indecipherable]....will surely describe as another meandering diatribe. I know there are some people here from the Novelty List. It would be nice to have a flesh meet downstairs, uh, and anybody else who wants to chat, and then we'll get out of here and Ola Tuchi [sp?] is gonna do the questions and if that ain't the felt presence of immediate experience, I don't know... [laughter and applause and cheering]

Q & A [This is also not confirmable via the Vimeo or YouTube recordings]

Snippets of conversation recorded as Terence was pinned to the wall by Novelty fans.

TM: ...We don't have to worry about magicians without power who have desire *for* power, because it's never going to come to that. It's the magician who can actually manifest power -- and usually that's so *sobering* that that person gives up any wish to control anybody. I mean, I've seen weird shit go down, and it didn't make me want to take hold of that energy. Somebody else it might've...

...I like really clear hallucinations, that are somewhat distant from me. What happens on DMT that is so

freaky is: you see the hallucinations, and if you're a practiced head you can sort of stand that. But at higher doses, you *become* the hallucination. And this is much harder to put up with, much harder to stay calm in the presence of, because you're no longer looking at something weird, you have *become* something weird. I'm convinced that the hallucinogens touch the language -- the thing inside us which describes reality, which is constantly explaining to you what's going on -- once it's contaminated, or once it's affected by the psychedelic, then you enter into a world where you don't know what's going on, where you *can't* tell what is hallucination...

Q: Is that when you're doing the visible language you've talked about, or singing?

TM: It's just slightly past that. I think I do that (those language activities) to try to channel and confine that DMT-like energy. Because when it really comes over you, it's like having your camera melt. There's no longer a picture, there's no longer a channel. It's gotten behind what was looking at it, and now you really don't know...

Q: Have you had your camera melted?

TM: *Oh* yeah! And what I do is, I just try to sing my way through it. One of the things that happens among European people, is when they feel threatened by being loaded, they just assume the fetal position, and their theory is, "If I can live through it, it will be alright. If I can *stand* it." What you should do is sit up and sing! Just sing! Sing! Sing! Oxygenate your brain, force energy through your body. Then everything will rearrange itself. I think when people have bad trips it often means they're not breathing enough.

Q: How do you compare salvia [divinorum] to DMT? I know that DMT is weirder, the way it sounds...

TM: Some people don't think so. I think so. To me, salvia seems like a strong hallucinogenic drug, but it's not as hard for me to explain to myself what's going on as with DMT. DMT, if it works, pushes me into a place where I just have to admit that I don't know what I'm talking about. All these metaphors that have been spun out, in books, and onstage, were just shadow play. The real thing is so appalling, so confounding, it's just, you know, "may the baby Jesus shut your mouth and open your mind!"

Q: Did you ever smoke salvinorin-A?

TM: The pure compound? I did smoke it once. It came on so fast, that I found myself on it; I had no impression of getting high at all. I found it happening to me.

I was expecting it to be weirder than DMT. To me it didn't seem to be weirder. To me it seems liked a very accelerated *ayahuasca* rush of some kind. It definitely distorts your body image in some way. People have these weird things where they're half in and half out of something, and they talk about it and they try to crawl into it or crawl out of it... I liked it, I like the leaf. The way I do it is I take 35gms of leaf and I lie down in the dark, and I chew it. At about the 15 minute mark it begins afterimage streaming, you know, lights past the eyes. Then I just spit it out into a Kleenex without holding it. It's a big mouthful.

Q: You've talked about plants as teachers. Would you say the same thing about ketamine? Even though it isn't a plant, do you think it can teach you things?

TM: The thing about ketamine is that it's active over a very large range. In other words, as little as 40mL is active, and yet people shoot 150, 200, without a problem. I've only done it about five times. I shot it every time, and I shot 140mL. At that dose, it's not a very useful drug, because you can't remember fucking *anything*. I really like drugs that you can remember.

TM: The other night I searched (the Web) for "self-transforming elf machines". There were 36 hits! It surprised me. I sort of use the search engine like an oracle. I've used the phrase for DMT, "Arabian hyperspace". So I thought of this, and then I *searched* it, "Arabian hyperspace", in quotes. And it took me right to a transcript of the talk in which I'd said the thing! You can find your own mind on the Internet. I'm very grateful to the people who type up my talks and then post them at their websites.

Q: I have a question about a theme in your work. It's actually an absence, and I'm curious as to why. It's the similarity that I sense with some of your visions of History, the visions of that process, and those I

found the work of de Chardin -- at least *The Phenomenon of Man*. I've never heard it mentioned by you or in talks about you, as far as I know.

TM: I have talked about him. I did read *Phenomenon of Man* and *Alpha-Omega*. I have no knock on Chardin. I think that he got there first, and it's all basically there. Maybe the reason I don't mention it is that my mother was very big on pushing it on me! Yeah, he is the guy. He and McLuhan. If you take de Chardin and McLuhan together, there's not much to add to all that.

Q: It's the *visual* aspect of his writing, that to me links him to what you say. And you bring in so many references to other writers that it seemed a little like a hole there.

TM: There's sort of a hole there. Considering the amount of time I spent reading him, it *is* a hole, you're right. Olaf Stapleton is another influence, but that was thoroughly rehearsed on the Novelty List. H. G. Wells was an influence.

What I like is big-picture thinkers. I like to think in terms of a thousand years, a million years -- probably because when I was growing up in western Colorado, what I got into early in life was fossil collecting. We would find dinosaur bones and 200-million-year-old clam shells and stuff. And when I finally figured out that a million years is *a thousand years a thousand times*, it was like an epiphany. It just opened up underneath my feet, how fucking *old* it's possible for things to *be*!

Well it's great to be here. It's been kind of a long day for me, so I may not be able to maintain the ordinary veneer of genteel, cultured affability. I may have to simply cut to the chase here.

You know, we've worked ourselves into quite a little situation here. We've got a rising youth culture, a government out of control, an environment that's all ripped up, and we've got no place to go. So, who you gonna call? My solution in a situation like that is to roll another one. *[laughter]* Because it's been my supposition for a long, long time that these vegetables that we're pushing around on our plates are actually trying to talk to us. And they're saying all kinds of things, among them some things which are fairly counterintuitive. It seems to me that history has failed, and Western civilization has failed, and dominator-primate politics has failed, object-fetish consumerism has failed, the national security government has failed. And so then, where do go from here? What kind of new world can we create? And what kind of guidelines are there that we can follow?

And I -- you know, every time you come to New York it's obligatory to visit the museums, MOMA, this'n'that, see what's going on in Soho. The conclusion that I come to looking at this is that as we move beyond modernity, it's more and more clear that the real impulse of the Twentieth Century is towards the archaic, toward the primitive. Everything from Freudianism to body piercing, from quantum physics to abstract expressionism, from Dada to house music, is saying "*back away*" from the linear, constipated world of print-head materialism that is what we inherit from the Western/European past. That style of thinking about life and human relations has essentially toxified the planet and allowed us to paint ourselves into a corner from which there is no escape.

Or is there? You know, a deliberate derangement of the senses worked for Rimbaud; it might work for us as well. What we have to do is go to the rainforests, the aborigines, and check up -- check in -- on what we have always dismissed, which is the world of natural magic and wisdom obtained through intoxication. This is what we've lost, and this is why our creativity is insufficient to overwhelm the cultural crisis which is confronting us. We have to stir it up. We have to mix it up. Ideas dictated out of the agenda of washed-up capitalism and science and religion is simply insufficient. Reason has failed. History has failed. And

what we all have to do, I think, is fall back on ourselves. We have to stop waiting for the revelation to come from CNN or Time Magazine, and get lives! And what getting lives means is ignoring the idiotic laws that would dictate to us the kind of states of mind that we can entertain. *[applause]* You know, I'm sure it was alarming to Buddhists, but the Supreme Court decision last week that okayed animal sacrifice in a religious context was a door swinging open on the possible legalization of psychedelics. *[applause]* The concept of "Life, Liberty and the Pursuit of Happiness" is enshrined in the documents upon which this nation of ours is supposedly founded. If the pursuit of happiness does not mean the right to experiment with your own state of mind, then those words aren't worth the hemp they're written on. *[laughter]*

But the point of view that I've come to evolve out of 25 years of looking at this problem and churning through culture and so forth and so on is not simply a call for individual self-responsibility and a pulling away from these institutions. That's pretty standard fare, I think. There's something else going on which is worth talking about. And that is the fact that the human world is apparently under the influence of some kind of attractor, or force, that secular people have ignored because the only words to talk about it were the vocabularies of beastly, bankrupt religions. But nevertheless, this force, this unfolding agenda, this design which we seem to embody, needs to be talked about. Because I really believe that history is ending. And I've taken a lot of flak for that, because no one can conceive of the breakdown of the system in which we're embedded to that degree. It's a kind of transcendental faith that history is accelerating. The rate of the ingression of novelty into three-dimensional space is asymptotically increasing. The kind of knitting together that is taking place in the world is laying the stage for the emergence of new forms of organization, new properties of being. And I really think that the drama of life on this planet is pointed toward the time that we are living in, that we're approaching a symmetry break on a scale of the kind of symmetry break that occurred when life pulled its slimy bottom out of the sea and crawled onto the land. We are approaching the symmetry break where we shed the monkey, we shed the hardwired negative animal impulses that keep us chained to the Earth and deny us our dreams of completion.

History is a kind of indicator of the nearby presence of a transcendental object. And as we approach the transcendental object, history will become more and more hallucinatory, more and more dreamlike, more and more surreal -- does this sound familiar to you? It's the neighborhood, right? *[laughter]* That's because we are so close now to this transcendental object, that is the inspiration for religion and vision and revelation, that all you have to do to connect up to it is close your eyes, smoke a bomber, take five grams of mushrooms in silent darkness, and the veil will be lifted, and you seen, then, the plan. You see what all these historical vectors have been pointing towards. You see the transcendental object at the end of time -- a cross between your own soul and the flying saucer of cheap science fiction. I mean -- the city of Revelations, hanging at the end of the Twentieth Century like a beacon. I really think that this is happening, and that what the -- It's as though we are boring through a mountain, towards someone else who is boring through that mountain, and there will be a handshake at a certain point in time. We are moving, literally, into the realm of the imagination. This is where the human future lies. This has been understood by some people since at least the time of William Blake.

We are like creatures caught in a interrupted embryogenesis: halfway to angelhood, the worst among us somehow got control of the social agenda, and we've been hammering on each other with monotheism, racism, sexism, materialism, for the past 10,000 years. We betrayed the aboriginal intellect, the aboriginal intelligence, that existed for probably a hundred thousand years with drama, with poetry, with altruism, with courage, with self-sacrifice -- with all the higher values that we think of as human -- but without the devastatingly toxifying habits of Western Man: slavery, city-building, kingship, and, the three M's --

monogamy, monotony, and monotheism. *[laughter]* These things have to be pitched out!

Or, maybe not. Who knows? *[laughter]*

Woman in audience: What's wrong with monogamy?

What's wrong with monogamy. What's wrong with monogamy is that it, uh, it forbids and interferes with polygamy! *[laughter and applause]* Otherwise, I think it has a lot to recommend it! Yeah, I know, monogamy is a tough one. Monogamy is a tough one, but I have more and more the feeling that as you grow up, just as you're about to go across the great Golden Gate Bridge to adulthood, there's one last sign, which says, "LAST EXIT BEFORE AUTHENTIC ADULTHOOD. BECOME ADDICTED TO SOMEONE AS LAME AS YOURSELF, AND MAYBE THE TWO OF YOU CAN PASS YOURSELF OFF AS ONE INDIVIDUAL AND STUMBLE THROUGH LIFE TO COMPLETION." *[much laughter]*

Same woman: But what's wrong with it?

TM: I don't think you should take me too seriously -- I'm deeply into a divorce. *[laughter]* But I'm sure it's not distorting my judgment a single iota. *[laughter]*

Gee, I thought what you were going to object to was monotheism, but apparently not! No, see, here's the thing: back when mushrooms and nomadism ruled the world, monogamy was traded in for an orgiastic social style. And what's interesting about orgy -- besides that -- is that in an orgiastic situation, men cannot trace lines of male paternity. And consequently, loyalty goes to the children of the group. It's a tremendous force for group cohesion that the men collectively transfer their loyalty to the children as a collective group. And it creates a very tightly-knit social unit. I think that -- I mean, it's absurd -- you can't advocate orgy in a world riddled with epidemics of sexually-transmitted diseases and five and a half billion people. Nevertheless, the spirit of the thing can be worked out between you and your friends in any of a number of ways, and all of these arrangements which break the dominator mold are further permission for further breaking of the mold.

Why have we grown so polite as they have grown so much more treacherous and weasel-like? Why are we so content to allow the worst among us to set the social agenda? In the absence of Marxism, there is now no critique being carried out of the capitalist enterprise, and it'll peel your skin off and peddle it back to you. It is doing that. Capitalism in principle is not, I think, a bad thing, but it requires endlessly-exploitable natural resources. And since the exploration of space has been taken off the agenda, there is no endlessly-exploitable frontier. So capitalism is going to deal itself out of existence, but before it does that, you're gonna pay \$50 for a latte, because inflation is going impoverish all of us before people get pissed off enough to realize that all of the last hundred years of economic progress was actually a shell game to create billionaires, while the great masses of people saw their standard of living eroded and destroyed. You don't have to take psilocybin to figure this stuff out. You know, it isn't all elf machines from hyperspace! *[laughter]*

Somebody asked me what did I think was going to happen in 2012? And I said there were probably a number of scenarios. One of the most radical I can imagine is that everyone would begin to behave appropriately! I mean, can you imagine what that would be like? You can imagine the first minute, because in the first minute, of course, everyone would turn off their console, take off their clothes, and walk

outside. What happens after the first minute, in terms of appropriate activity, staggers the imagination! And where you would be three weeks into it is preposterous to even conceive. That's the soft version of the coming of the millennium. The hard version, I'm not really even sure... In the Amazon -- in my book *True Hallucinations* I wrote about my brother and myself and our adventures down there. His expectation -- once, he told me, "People are leaving their workbenches and offices with tears of joy streaming down their faces. They're staring at the sky." Fool that I was, I believed him. But it's a reasonable hope.

Here's the deal. We have the science, the technology, the money, the infrastructure, to do almost anything that we want to do. The problem is changing our minds. We have a hell of a time changing our minds. And yet, we must. There is no choice about it. The reason I'm a psychedelic advocate is not because I think it's easy, or because I think it's a sure thing -- I don't think it's easy or a sure thing. It's simply that it's the only game in town. Nothing else can change your mind on a dime like we are going to have to change our minds on a dime. If we had 500 years to sort this out, we could maybe have a fighting chance without radical pharmacological intervention. As it is, if we don't awaken, we are going to let it slip through our fingers.

And if hortatory preaching could do it, then the Sermon on the Mount would have turned the trick. It didn't and it won't. You have to somehow give people an experience -- an experience that is not somebody else's experience -- their experience, that radically recrystallizes their understanding of the world. And these shamanic plants that have been quietly growing and maintaining themselves for millennia, are in fact -- and for what reason? it's beyond me -- for some reason, these are pipelines into a kind of planetary mind. The big bugaboo of Western civ is that we deny the existence of spirit. It's been a thousand-year project to eliminate the spirit from all explanations of how reality works, or the personality works, or anything works. The absence of spirit permits the murder of the planet. But the cost of the denial of spirit is life empty of meaning, which doesn't mean we have to return to the world of beady-eyed priestcraft and its slimy minions. But it does mean that we have to recover an authentic experience of the transcendental. And apparently what this means, then, is fusion with Nature, and the psychedelics do this. They dissolve boundaries. They open the way to the Gaian mind.

Now you can believe this is bullshit, but you cannot believe it's bullshit unless you have made the experiment yourself and found it to be wanting -- this isn't a philosophy course, here. We're talking about something real. And if the critics are not willing to invest time in it, then the critics have already declared their terror and fear of the solution. You know, it reminds me a little of something that Tim Leary -- well, I always thought Tim Leary said this, but when I asked him, he completely disowned this brilliant remark, which let me know he was an enlightened man cause I never would have disowned it. So, somebody said -- not Tim Leary -- "LSD is a psychedelic drug which occasionally causes psychotic behavior in people who have *not* taken it." [*laughter, applause*] Now a lot of drugs are like that, and we have a lot of psychotic people running around who have been driven mad by drugs they never took. But what they did take was your civil rights, your freedom to guide your own life, and your right to make your own decisions. This kind of thing is intolerable. If there is an iota of possibility that these substances enhance consciousness -- and remember, they used to be called "consciousness expanding" drugs (just a straight phenomenological description) -- if there's an iota of possibility that they augment consciousness, then we have to put the pedal to the metal in this matter. Because it is the absence of consciousness that is pushing us toward extinction, that is causing us to loot our children's future, that is causing us to accept the elimination of thousands of species per month without pouring into the streets to loot and smash the institutions of those who allow these kinds of atrocities to go forward. I think the era of politeness has gone on just about long enough. And there's going to have to come a moment where people stand up and are counted. We have

seen our freedom taken away, we have seen our environment destroyed, we have seen our political dialogue polluted, and still we take it, and take it, and take it. You know, being counter-cultural is more than a fashion statement. I recall an obscure Chinese philosopher named Mao Tse Tung, who once said, "The Revolution is not a dinner party!" Of course, he went on to say it's an armed struggle, prosecuted by the forces of the people. I don't think we're ready to call for armed struggle, but I think it is time to call for **"HANDS OFF THE AMERICAN MIND. GIVE US BACK OUR MIND."** The American mind is one of the most creative minds in the world, and it is being confined, compromised, and sold down the river by people who can't think of anything better to do with the world than fabricate it into stupid products and sell it at twice its natural worth. *[applause]*

Well, I could go on and on -- and do, you may have noticed -- but I think it's much more fruitful when these things are interactive and driven by questions. And I'm not fragile; you don't have to hold back. I'm from Berkeley -- we throw chairs when we're displeased. So, feel free to have at it. But is there anybody who'd like to comment or participate in this discussion?

Man in audience: Thank you, Mr. McKenna. The whole bit about quoting Mao was kind of interesting if you think of the arms in terms of modems -- I mean, the fact that we now live in a point in time when it's possible to completely transfer power without shedding a drop of blood if you have the right passwords and access codes. There is a unique tilt on Mao's "armed struggle" coming up real soon, if you think in terms of information war rather than the kind of bloodshed that's been marking history up until now.

Vis a vis your whole thing with the organic psychedelics versus LSD, for instance -- which is enjoying a great revival right now, presently, in this city -- I don't know about elsewhere *[laughter]* -- vis a vis the LSD thing -- there's a point in the temporal flow with LSD where it drops, slows down, and then there's the sensation of temporal cessation wherein one generally tends to perceive a presence behind the world -- which sounds a lot like the robot elves of yours. I'm just interested in your take, in the distinction that you draw between the organic psychedelics and -- for example -- LSD.

Well LSD is a kind of -- has a foot in both worlds. You know, you start, when you make LSD, with ergonamine, which you get from ergot, which is grown on plantations in Pakistan. But then you elaborate the molecule and make it synthetic. I certainly think LSD -- we wouldn't be here, and I wouldn't be here, if it weren't for LSD. The wonderful thing about LSD is that it's possible to manufacture so much in the underground. I mean, there is a problem with that in that it tends to promote criminal syndicalism. *[same man in audience: "Not if you give it away!"]* Good point! *[laughter, applause]* But, if you have a trust fund and your roommate is a first-year biochemist, in a long weekend you can produce ten million hits. This means you're not, of course, involved in helping out the folks in your building, you have some more ambitious agenda. But this is a unique situation with LSD, because you need so little of it. You see, if you set out to create ten thousand doses or ten million doses of psilocybin, the facilities of Upjohn corporation would be insufficient. You would need stainless-steel vats of thousand-gallon capacity and incredible quality-control equipment. So LSD came along at the perfect moment in the life of the collectivity to focus us on the psychedelic experience. But I don't think LSD is what I would call a "full-spectrum" psychedelic, because what I was always obsessed with was visions. And psilocybin and the tryptamines are much more reliable visionary activators. People say, "Why are you so into this vision thing? You're just some kind of vision fascist." *[laughter]* No, no -- I mean, or: Maybe, but! *[laughter]* Maybe but -- here's the thing -- the reason the visions were so impressive to me is because that was, to me, the proof that it wasn't me. You know, when you take LSD, you have strange thoughts, many thoughts, illuminating thoughts...

[unintelligible question from audience]

You mean, what do I think of that in terms of DMT? *[more from audience member]* Well, I never encountered elves on LSD, but I did hear a story recently. And since all we have are anecdotes, I'll pass it on, for whatever it's worth.

A friend of mine told me a story. He and a friend of his miscalculated a dose and took LSD, and then they went to a dance. And they realized they were too loaded to be there. So they just backed up against the wall and slid down the wall and sat there. And as they sat, shoulder to shoulder, mouths hanging, watching these people dance, slowly, slowly, the dance came to a complete halt. Everything was frozen. And at that moment, the door swung open, and an elf came into the room *[laughter]* and waltzed through all these people, looked around, actually picked up a skirt or two and looked under it, and then exited. And then the movie started up again. *[laughter]*

Well now, I'm not a theosophist or an Alice Bailey-ist or any of that malarkey. But on the other hand, this seems to suggest this old theosophical idea of vibratory levels of existence -- you know, that if you're moving at a zillion hertz you do not see things moving at very much higher or lower frequencies. Now I never was so aware of the time-stopping thing on DMT, but it is definitely true that when you smoke DMT, if you do sufficiently, you burst in to a place that is inhabited by these -- what I call self-transforming machine elves, these jeweled, self-dribbling basketballs that are squealing and squeaking in this alien language that condenses like metallic rain and falls out of the air of the room and is able to morph itself into Faberge-like objects that are scintillating and faceted and reflective of other possibilities and objects...

Woman in audience: Hi, Terence, I wanted to know what products you have available. *[laughter]*

Hey. Listen. The point guy can't make the sale! *[laughter]* But, one of the things that I think is best about the thing I do, or one of the things that I like best about what I do is provide an excuse for the psychedelic community to assemble. Because, believe it or not, these days we look like everybody else out there. How the hell that happened, I don't know! *[laughter]* So it's very important for you to pay attention to who's here, because without a doubt, somebody here has what you need! *[laughter]* Whatever you need -- you know, what do you need? A loan? A girlfriend? Well, we all need different things -- besides the fact that we all need DMT.

[question from audience]

Where do we go from DMT? Well, where do we go from there? I think the idea is to use psychedelics to remove anxiety without undercutting political action. In other words, we can do political work, ulcerated and clenched with terror and fear and always looking over our shoulders; or we can do that same work with a sense of play and lightheartedness. It's the same work, so why not have a good time while we do it? It's the good time we have that drives them so crazy and pisses them so off! *[applause]*

[question from audience]

What's new and fun that you haven't experienced? Oh, well here's something new and fun. There's a plant,

called *Salvia divinorum*, which is absolutely legal. It's not only legal, the active principle is unknown to science -- therefore it can't be made illegal! [*singing:*] S-A-L-V-I-A D-I-V-I-N-O-R-U-M *Salvia divinorum* -- remember you heard it here first! [*laughter*] Okay, so here's the deal with this. This is a plant that was carried on the books for years as a hallucinogen, but nobody took it seriously because when the botanists and the chemists would test for alkaloids, it's alkaloid negative. So they said, "Well then, to Hell with it, it just can't be." But recently, an anthropologist who will remain nameless spent some time with the Indians where this stuff is happening, and they showed him how to do it. And he has been telling everyone how to do it. And, you know, true to the spirit of that, here's how you do it.

First of all, this is a plant that looks like a coleus, which is a common houseplant. You could grow this stuff in your window box or your apartment; it would pose no problem whatsoever. It's also -- cuttings are available from plant dealers. And what you do is you take about fifteen leaves, which are about like... that, and you pull out the mid-rib, so you just have the soft, leafy material. And you roll it up into a quid, and you put it in your cheek, and you lie down in darkness where you can see one of those illuminated digital clocks, you know? Lay there for fifteen minutes by the clock, slowly squeezing the stuff down. And it's very bitter. I mean you feel like the whole front of your mouth wraps around this stuff, but it's worth it. It's worth it. And after about fifteen minutes, if you will just spit this into a receptacle, Kleenex, whatever, uh, hygienic product is your choice [*snickering*] then, about two minutes later, it will begin to stream. In other words, these afterimage-colored lights begin to form and come past you. And about two minutes after that, these cobalt-blue, magenta hallucinations begin to unfold. And what it reminded me of was "Nude Descending a Staircase" but as if Duchamp had done it in ultraviolet and blue and cobalt, and just this -- [*question from audience*] Where did I learn about this plant? Well I've known about it for years, but like everybody else I just didn't take it seriously. [*question*] No no, it's in the Oahaxan Mountains, it's in the Sierra Mazateca of central Mexico. And after about 45 minutes, it all gently goes away. And believe me, I'm a skeptic, I'm hard to move off the dime, I'm not an airhead. And it worked, it worked. And -- very interesting -- I called the guy who gave it to me the next morning and I said, "It looks to me like it has the potential to be a craze!" And he said, "The very word that occurred to me -- craze! craze!" [*laughter*] So, like I said, you heard it here first.

Man in audience: I have a question. As a physician who's interested in medical anthropology, what about the effect of this in terms of human development in utero?

You mean the effect on the developing fetus? [*"Yes"*] Of *Salvia divinorum*? [*"No. Psilocybin."*] Oh, psilocybin. Well, here's my approach to this, and this is why I advocate the use of plants with a history of shamanic usage. Because these things are illegal, human research is essentially outlawed. As users we suffer under the prohibition, but imagine that science, one of the most powerful forces in our society, has been told, "Get lost. Forget about psychedelic chemistry and forget about human studies." This is why I don't advocate MDMA use. In answer to your question, the human data on psilocybin is provided by the fact that it has a history of at least a millennium of human usage. If a plant has been accepted into a society as that one has, as a regularly-applied shamanic tool, then I think you can be relatively certain that blindness, miscarriage, tumors, and so forth, are not a problem. Probably a lot of human beings have given their lives and their health for that data to be available to us in that way. Do you want to follow up? [*"No."*] No? [*"Thank you."*] Did I satisfy you? Great! Great.

Woman in audience: As a poet and an art historian who has lived in a lot of cultures where I've worked with indigenous peoples -- amongst the Yamamoto I had the blowgun done up my nose, in Peru I tried San

Pedro, in Szechuan province in China with the Dalai (?) among Szechuan banai(?) I tried many of the old herbs -- one of the things I'd like to mention, which I think a lot of Americans and Europeans don't understand, is the ritual use of these hallucinogenics within the culture. I think it's very important. I'm heading off now to work -- to make a film with the indigenous people in Taiwan, Formosa. It's a shamanic culture. I think the problem is that when these things are removed from the mythological stance within a community -- the biggest problem in this country -- which strikes me as a writer also -- is this lack of mythology that exists anymore. It's one thing for hallucinogenics, but it's another thing for also creating a use -- as you mentioned before, which I liked very much -- of the imagination, a sense that a human being has the right to expand their own horizons, within whatever powers they wish and with whatever means. And I'd like to see a greater awareness that these things can expand an already fertile ground which first has to be created.

That's right! And what might be, *[laughter, applause]* well...

Thank you! And, what I'd like to ask, when I come back, is -- I used to be on WBAI -- and when I come back, I'd like to do something on these people that very few people have worked with. In fact, I have a military permit to go out, and it's a culture that -- unlike the Ainu and the Reipus(?) I'm doing another exhibition on now, soon, at the museum -- but, the group in Formosa, AKA Taiwan, was first occupied by the Japanese but have a history for thousands of years. And I have to have a military permit to now get out -- granted, I have lived in warzones before, you know, with the Hmong in Laos, etc. etc. etc., so as you might say, I get very bored living here! But -- *[TM: "Why? They're all here." snickers]* Well that's what I think, also, but, the key is, in a sense, these are ways, too. So I was going to ask you, when I come back, if you'd like to do something, maybe a radio show on some shamanic *[unintelligible]*.

Sure, absolutely. Let me follow up on this. The issue of ritual and style of drug taking: I think that it's -- well, here's how I do psilocybin. I do it on an empty stomach in silent darkness. And I think that this is the way to do it, because I'm interested, essentially, in the pure phenomenology of it. I don't want to know what it does to Bach, or Coil. I want to know what it does to nothin'. I don't want to see how it can affect Rembrandt or a natural scene. I just want it where I can study the *ding ansich* of the thing, you know? And I have nothing against a good time, and hanging out, but it is no substitute for serious psychedelic taking. And, you know, people forget, or people don't realize, if you take a drug that you don't like, then an excellent strategy for getting rid of it is to exercise like a crazy person, like go out and chop a bunch of wood or something. Well, so then what I see is people taking low doses and dancing their asses off, in very noisy environments dense with social signals. This is like a strategy for avoiding the psychedelic breakthrough. How could it ever find you in all of that? *[applause]*

So I smoke pot and confine myself to vodka gimlets most of the time in public, and then really pile it on in private, really pile it on. These things can't hurt you, not at any reasonable dose. I mean, for instance, let's take psilocybin. The effective dose is 15 milligrams; the LD50 is something like 225 milligrams per kilogram. Your stomach won't even hold that many mushrooms. So death is not a possibility. DMT -- same thing. I mean, DMT is a neurotransmitter. People sometimes say, "Is it dangerous?" The answer is, "Only if you fear death by astonishment!"

Woman: So I can call you when I get back and see what I bring back?

Do it! Anybody else?

Man in audience: Yeah, I just wanted to comment on the thing about taking psychedelics in noisy environments. I just happen to disagree with what you said, because, first of all I think collective tripping is really important, and it creates a communal vibe that's really terrific and has every advantage to advancing your mind within it. Also you can -- there's something to be said about getting lost in the groove. It can join the music and take you to a new -- and open your mind with the music, because music is the tool to open your mind. And dancing -- dancing is spiritual, dancing makes your... [*falters*] Excuse me, I'm getting very nervous.

Well, here's the thing. These things are not mutually exclusive, it's not like you have to choose. My problem is, I know people are dancing and they're having these collective experiences. My fear is that they're not having the other experiences. And you have to have both. [*man: "Absolutely."*] That's all.

And as far as the dance thing, let me say, I mean, I think that what's happening with house music and the ambient music thing is the most healthy sign out of the culture in 25 years -- at last, you know. Because the truth is, rock and roll became a tool of the very people it was supposed to discomfort. [*applause*] You know? [*comment from crowd*] Pardon me? Well, but what's wrong with ambient and house music? We don't need to "free the harpsichord," you know. [*laughter*] It's a done deal, I think. And there is so much talent waiting in the wings. I mean, I'm on my way tomorrow to London, on to Frankfurt -- these are enormous cauldrons of creativity that are exporting this music all over the world. And the message is absolutely the message that needs to be put out. It's a message of community, of sensuality, and of intelligence. I mean: love, sex, intelligence -- that's what The Shamen are talking about.

Man: Well, the music comes from here, too. This is one of major centers of world dance music.

Oh, you don't have to have an inferiority complex in New York! [*laughter*]

New man in audience: Terence, it was wonderful to meet you tonight. Your editor Dan Levy is a good friend of mine. I'm a musician, and I just wanted to say, yeah, music is terribly important to everybody's life. But I want to thank you, and one of the things I respect most about you is your research, as far as text goes, because you've really traveled the world and you've dug up a lot of things that -- I want to thank your translators, too, because that's one of the most unsung arts in the world. When you dig up something, it's not everybody that can just know what it means. Translators -- let's put in a plug for them. [*TM: "The unsung heroes!"*] It's true! [*"Yes, it's true."*] But I just wanted to take one second and ask you -- I was raised in a quote-unquote "Christian" environment, and one of the things I learned about Christianity as I grew up and came through it was that -- we're all here to learn something, and I'm not telling anybody in this room anything -- but I was curious about the Book of Urantia, if you had heard of it and you might be able to comment on it.

[*snickers from audience*] Well, here's the thing. My tendency is to think that if you can channel without drugs, you're probably mentally ill. [*laughter*] However, the Urantia book is the most extravagant and baroque and earliest of these things; they definitely got in ahead of the trend. So, to my mind, these things are like synthetic scripture, or efforts to resacralize language by casting it in a scriptural mode. My method -- a lot of people are irritated with me, because if you really spend time with me, I'm actually a rationalist, and a kind of reductionist; I'm not "woo-woo." Because I really think that the truth can stand on its own. And so I tend to be very conservative in my choice of facts. For instance, if we're dating the pyramid, I'd

probably call the American Archaeology Society before I would call the priests of the Coven of Atlantis. But I know there's disagreement on these things. *[laughter]* I think, you know -- with the Urantia book and the Seth material, and then all little Sethettes that came along afterwards -- I think basically it's like anything else: you have to have your crap detector turned up on *high*, and then just move forward with it, and what works for you, works for you. And all of these things should be taken as provisional. You know, when you rise as I have, from a cowtown in Colorado to giving speeches at very exclusive and chic New York nightclubs, you realize -- because you tend to meet quote-unquote "celebrities" along the way -- you realize that that's all a racket. And you further realize it must have always been a racket. So, Lorenzo de' Medici, Genghis Khan, Hitler -- LAME! *[laughter]* Idiotic, ordinary, dreary, boring to have dinner with! So, part of this psychedelic thing, I think, is really about self-empowerment. You know, Robert Anton Wilson has this wonderful rap, he says: "Define the world as a conspiracy run by you and your friends." If you don't have that as your model, then you probably have a loser's model, and who wants to be a loser? So, just assume, you know, that you and your friends are gaining power, moving into positions of influence, and shortly about to take control! What does this have to do with the Urantia book? I don't know, but here's where we ended up, folks!

Woman in audience: I think a lot of people would agree that evolution is at a pretty questionable point right now. In fact, I personally believe that since the car has been introduced that we've been de-evolving. I guess my question to you is, through your hallucinogenic experiences, what do you think the lesson is to human society, that we're supposed to learn, to sort of transcend the point we're at now?

You mean generally, what's the lesson?

Woman: Generally, yeah. What are we supposed to do to sort of make this breach, cause I think we're at a pretty precarious point.

Well, it's a complicated question, and I don't want to unveil my whole cosmology this late in the game. But-- See-- But, why not have a stab at it? *[laughter]* Here's the problem, as I see it. For a very long time, as we evolved out of the animal nature, perhaps a hundred thousand years, psilocybin was part of our diet and our rituals and our religion. And though those individuals taking the psilocybin didn't know it, it was having a very profound effect upon them. What it was doing was it was suppressing a primate behavior that is so basic to primates that it goes clear back to squirrel monkeys. And what that behavior is is a tendency to form what are called male-dominance hierarchies. And we all know what this is, because it bedevils our own political situation, and our own effort to create a reasonable society. But there was a great long period in the human past when this tendency was pharmacologically suppressed, in the same way that you would give Prozac to somebody to suppress a tendency to manic-depression. In other words, what the shamans of the High Paleolithic figured out was how to medicate people so that they would live together in harmony, decency, and dignity.

The problem is, that that strategy depended upon the simultaneity of psilocybin intoxication and the orgiastic sexual style that I talked about earlier. And when the mushrooms ceased to be available, men and women were simultaneously becoming able to coordinate cause and effect, to the point that women were realizing that when they returned in their yearly wanderings to old camps, there would be food growing in the discard piles. And at the same time, men were realizing that the consequences of the sex act was the birth of a child. In other words, there came a certain point in human intellectual maturity when a distant cause and its effect were finally connected, and at that moment, agriculture was born. And agriculture was

born as a response to the drying of the African continent. And we--literally--we fell into history.

You've heard me talk about Genesis as the story of history's first drug bust. It was history's first drug bust. I mean, that story is the story of the suppression of an earlier, feminine-driven mushroom religion. And once we stopped taking psilocybin, that old, old primate behavior pattern--male dominance--reasserted itself. But now, not in an animal species, but in a species with language, technology, agriculture, strategic planning, memory, recall, so forth and so on. And we used the re-emergence of that tendency to establish cities, kingship, slavery, property--the whole grab bag of pathologies that characterize Western civilization were born around the re-emergence of male dominance.

And now we're in a similar situation. And you know, no less conservative and sober a character than Arthur Kessler wrote a book called *The Ghost in the Machine* twenty years ago, and he reached the same conclusion. He said, "We are best at bashing each other's brains out. And since that's no longer appropriate--if it ever was--we need a drug to make us able to live together in ways that we must live together if we're going to have cities of 10 million people and a global civilization." I think his analysis was on the right track, but shallow. I think we have that drug, and the anxiety and the restlessness and the dissatisfaction that has attended the historical experience is because we have this itch that we can't scratch.

This is the key to our weird relationship to substances. I mean, think about it. Of course, elephants will push down fences to get to rotting papaya and butterflies will fall over beside bowls of sugar. But we addict to dozens of substances. We not only addict to substances, we addict to behaviors. You know, guy goes to the front door in the morning and if the paper isn't rolled at his feet, he turns into a beast! We also addict to each other. You know? Our most sublime human relationships--when they fall into difficulty, we experience the condition of a broken heart., which looks--in terms of its presentation of symptoms--very much like junk withdrawal. Probably because it is, because there has been some kind of pheromonal lock-on that has gone on because you've been hanging out with this person so much. And now that the pheromonal thing is broken and interrupted, you can barely function, you know? And it takes weeks, if not months, to reclaim your identity. We have an itch that we can't scratch, until we make our way back to the primary chemical mediator of our human-ness. And that was -- I'm convinced -- psilocybin. And that this is the missing link; this would allow us to understand the sudden doubling of the human brain in less than a million and a half years--one of the great mysteries of evolutionary theory--so forth and so on. And the fact that the society is so anxious on this subject is an indication that this is the real taboo. We have found it. This is *it*. And therefore, it has to be brought out of the closet. And it wouldn't hurt for us to come out of the closet. I mean, when we are secretive, when we deny it, we are carrying out the Man's work for him. They don't have to arrest us if we're willing to be our own guards and police. It's absurd. This is part of your birthright. It is part of our lives. We pay taxes; we're legitimate. And it should not be swept under the rug. Are we going to be the last minority on this planet to claim its civil rights? Why? When what we represent is an impulse back toward the aboriginal totality that gives life meaning.[*applause*]

Man in audience: You've proclaimed that there is this hyperdimensional reality which is accessible through these psychedelics, that is--we are immersed in it. And you're somewhat surprised that there is very little being done about this. It's something that is so--as you say--unbelievable and unfathomable and there's so little research being done. The majority of people don't even care or know about this. Now, we gathered in this room, we care very much and we might have some connection to this and access to this reality. But what about the--maybe it's only certain people have a predilection or interest in it, such as like people who want to go rock climbing or surfing, and that's what they go to all extents to. But most people, if they were

exposed to what you say--the five grams in silent darkness--would come back and not want anything to do with that experience, not have any understanding, any connection, and just want to hold on to the very simple reality which our consensus has constructed for most people to exist in. And that it really is just this fringe thing, and that's why there isn't much more interest in this--then how can the psychedelic actually affect the masses that don't really have much connection to that?

Well, revolutions are made with between five and ten percent of a population. No revolution in history has had more than that level of support. I'm not saying everybody should take psilocybin. I mean, God knows, there are plenty of people among us who don't need their boundaries dissolved, and if they are going to dissolve their boundaries, please don't do it when I'm around. *[laughter]* But those people are people who have been damaged in any of the dozens and hundreds of ways that this society has figured out to damage people. But I do think that it should be an option, and it should be an option that people are educated about. One thing that we've done is that we've completely poisoned the well of language when it comes to the subject of substances. Because the word "drug" reaches from heroin to aspirin through psilocybin to propaganda. I mean, it's a word so widely-used that it's meaningless. And we are living in an atmosphere of complete hypocrisy; the most dangerous drugs ever discovered by human beings are being freely dispensed all over the place. I mean, tobacco, sugar, alcohol -- these are the great addictive and destroying drugs, and they are the least interfered-with and the most commercialized. And the psychedelics--no claim of addiction was ever made, even by their critics. The issue with psychedelics is that they call into question the illusions of the masters. And I think it doesn't matter who the masters are. It doesn't matter whether we're talking about a fascist dictatorship, a high-tech industrial democracy, or a Third World banana republic--if you start taking psychedelics, you will start questioning the reality around you, and questioning is not what the control freaks are interested in. They want you to work at your idiotic job, buy the crap they're peddling you over the media, and keep your opinions to yourself, please. Or, there is spectrum of opinion offered, and it's all represented on the McLaughlin Group and if you go beyond that, then you're some kind of mad person. This is all nonsense--we are allowing the least among us to control the agenda. That would be bad enough under any circumstances, but we're in an emergency. This is a crisis. We should be going through lifeboat drills at this point, and instead, the band plays on, and the game continues to be played. The narcotics game, the government role in it, apparent suppression/tacit support, millions and billions of dollars in hot money being used to finance the murder of editors of left-wing newspapers and the financing of private armies in various rathole countries that are the client states of the remnants of the empire we created to oppose the Soviet Union. It's all CRAP. And as soon as we call a halt to it, we'll all be better off, I think. *[applause]*

Man in audience: I do recognize a lot of Alfred Korzybski in what you are saying, and I wonder, is Korzybski's time-binding effect--is the drug going to be the trigger for the time-binding effect?

It could very well be. Korzybski was very influenced by Whitehead, and I was very influenced by Whitehead. And Whitehead has this idea that he calls concrescence. And he says, "The world is growing toward concrescence." And that's what I call "the transcendental object at the end of time." I really think that we are--we are not going to disappoint ourselves. History is a psychedelic experience, and we have come through, now, the darker bardos, and are about to--potentially--enter the payoff zone, the transcendental zone, the zone where it all makes sense. You know, a huge number of people have suffered unimaginably that we could be here this evening. Nine times in the last million years, ice, miles deep, has moved south from the poles, pushing everything in front of it. There have been upheavals, epidemics, droughts--everything--and yet we arrive, on time and under budget, here this evening. That's the kind of

tradition we have to continue, a tradition of human nobility and human striving. And enough of the whining from those who have piled up uncounted millions of dollars, and still are willing to suppress us in order to obtain more. It's obscene. It's obscene. *[applause]*

Man in audience: Yeah. Sorry to bother you one more time, but you just quoted Kessler. And Mike Murphy in his new book, *The Future of the Body*, he quotes Kessler, talking about--Kessler at one point took a very fatalistic approach to humanity, with the idea that--the big problem, in his view, was that we didn't have a vertical equivalent of the corpus callosum that allows the two horizontal hemispheres to speak to each other. And he says that it may be a fatal flaw in our species--that there's nothing that will link the vertical components of the serpent brain out to the neocortex. And I was wondering if your take on this, of these vegetable drugs, might be that they might be inducing--if there would be anything towards the inducement of--possible growth in that area?

Yeah, I think that's a very interesting idea. You may know a book by Julian Jaynes, called *The Origin of Consciousness in the Breakdown of the Bicameral Mind*. It may well be that there has to be some kind of neural correction on us. For one thing, we cannot tolerate the luxury of an unconscious mind. That belongs to a more primitive stage of human development. When you have hydrogen bombs and can deliver synthetic plagues by missile to the other side of the planet, then you cannot be driven by the agendas of animals and half-conscious human beings. I mean, it's like placing Jeffrey Dahmer at the head of the Pentagon, or something. *[laughter]* And that's the--Hey, we probably got it. He's there.

But this is what I meant when I said we can do anything. What we have inherited from the past--as misguided as it may be--may have been--are tools of immense power. And tools are neutral things, you know? It's the monkey wielding the tool that you have to keep your eye on. And so, we are now challenged to apply the tools that have been created. Are we to, you know, clean up the Earth; de-emphasize the material side of our technology; recognize the right of every human being to a healthy, secure existence; de-emphasize the marketing of violence as a patina on product fetishism; de-emphasize the objectification of women as another patina on object fetishism; stop the peddling of loser scenarios to everyone; stop tying up our accumulated wealth in a useless standing crop of ever-more-obsolete arsenals and delivery systems?

I mean, it's okay to live like there's no tomorrow if you're at some primitive stage of culture with endless frontiers of exploitable resources in all directions. That's not where we're at. We have burned through all that, and yet still we party on. And the signs are on the wall. We have invented a sin that no other culture ever even conceived of: it's the sin of looting the future. No other culture was ever so narcissistic and self-indulgent that it cared nothing for the future of its children. Children have always been the value focus for a civilization. But when you pile up four trillion dollars in debt, when you cut down the rainforests and blow off the atmosphere, it means you are in the grip of such an orgy of narcissistic excess that the best thing for it would be for somebody to just walk over and put a bullet through your head as a favor to everybody else. We don't need that kind of a fate. We need to be as noble as the people who preceded us, and a hell of a lot smarter, because nobility by itself is not sufficient. We're going to have to play a very cagey game now. And it's okay with me; I anticipate it. I mean, I think primates love a hell of a good fight, and we've got one on our hands. I mean, we have unleashed processes that, if not skillfully controlled, are extraordinarily terminal--even in the short term. And again, I see psychedelics as the only way to react fast enough to have an impact on the runaway momentum of historical error.

Man in audience: I wonder if you could say something about the relationship between psychedelics and our

inherent structure and chemistry. I mean, is it unlocking something that's latent in us that we should be and should have been aware of all along?

Sure, I'm very interested in this. Here's the great paradox in this domain, as far as I'm concerned. DMT, without contest, is the most powerful psychedelic that I know of--and I hope there's nothing stronger, cause if there is, I don't wanna know about it! *[laughter]* It's very brief and fast acting, and it clears your system very quickly. It occurs as a neurotransmitter in ordinary human metabolism. Now isn't that interesting? That the most powerful and radical and alien of all these hallucinogens is the one most like--in fact, exactly like--what's in your own body. This is also a Catch 22 for the Establishment cause it means we're all holding, all the time! They can come and get you, folks! It's worse than a U.A. -- you haven't got a prayer! And there's something very interesting--well, there are a number of things--but one thing very interesting about DMT is that, if you've had it, it's possible to have a dream, years later, in which something's going on, and going on, and then someone whips out a little glass pipe, and puts it in your mouth, and you have the complete experience. Not a pale memory or a vivid memory--the real thing happens in the dream. Well this is big news, because what it's saying is that human metabolism is very, very close to being able to produce this at any time, and sometimes it can produce it. Now, it's known that DMT is at its highest concentration in cerebrospinal fluid between 3 and 4 AM in most people. And that's the time of day when the deep REM sleep occurs, accompanied by deep dreaming. So, it looks to me like the chemistry of dream and the chemistry of the psychedelic experience are the same. In fact, you know, if the government is really serious in eliminating psychedelics, then throw down the 10 million dollars or 20 million dollars that it would take to develop a drug that allows people to remember their dreams. Because I think every night, we return to the psychedelic source, that the dreams you remember are the surface of the dream, and that every single night, we sink back down in to the primordial field of mind out of which we reconstruct ourselves. Now, I'm telling you, if DMT were legal, in six months, a skilled laboratory team trained in the study of biofeedback techniques, could train a human being to trigger that on the match. Well then, this is something that we would teach our children in the seventh grade, and from then on, that would solve the entire issue of the hallucinogenic substances, their availability, their legality, and so forth. Legalize the dream! Reclaim the human mind! Let's make dreams legal, let's make plants legal, let's legalize the imagination, empower hope, and begin to build the kind of world that we would feel alright about handing our children on to. Because if we don't do that, we're going to come off as the lamest generation in human history, and we aren't. The creativity, the connectedness, the potential for good is enormous. And most people in this planet are embedded in pre-potent systems of relationship, meaning obligation and inherited religious and cultural ideas. So you may think that you don't count, but actually we all probably are part of a sub-population of about 5% of the global population--people who have disposable income, can read, follow global advances, get good data, and feel a political and moral obligation to do something about it. We tend to feel as powerless as a Guatemalan peasant or something like that, but in fact, that's a myth They want you to accept. The real responsibility for saving the world rests on the literate middle- and upper-middle-class masses of the high-tech industrial democracies. That's US. It's our responsibility to make a change and to act for all those silent, downtrodden people who have been so victimized by the system that they couldn't

turn out at a New York nightclub and hear an esthete rail against the evils of the Establishment. And that's probably enough railing against the evils of the Establishment. Thank you very much, thank you. [applause]

- [Other links](#)

Luc Sala: Food of the Gods. The substances that all through the ages have helped us alter our awareness, our perception of reality. Terence McKenna is a writer, a speaker and, in fact, an activist, and -- what's your feeling when I say 'drugs'?

Terence McKenna: Well, 'drugs' is a word which has polluted the well of language. Part of the reason we have a drug problem is because we don't have an intelligent language to talk about substances, plants, psychedelic states of mind, sedative states of mind, states of, uh, amphetamine excitation. We can't make sense of the problem and the opportunities offered by substances unless we clean up our language. 'Drugs' is a word that's been used by governments to make it impossible to think creatively about the problem of substances and abuse and availability and so forth and so on.

Luc: In the minds of the people, the word 'drugs' which was once used as 'healing medications' and still drug companies that make, I don't know, Tylenol, are considered very legitimate, yet ...

Terence: Well so, it's a kind of a paradox, isn't it? 'Drugs' means that which cures us and the greatest social problem of the generation. So there, right there, you see schizophrenia involved in thinking about drugs. Apparently, there are 'good' drugs, sanctioned by science and medicine, and 'bad' drugs, uh, used by brown people in strange rites and growing in unusual plants in distant parts of the world. Uh, this kind of thinking -- because it's naïve -- leads of course to social problems and bad politics and bad social policy.

Luc: Your stance has been to, at least, look for what you call those strange plants and strange substances in strange places you have been. You originally were a botanist, or you still are?

Terence: Yes, and from the time I was very young I was fascinated with the idea of extremely dramatic changes in consciousness, from which one recovers after a few hours, induced by plants. And I discovered through the writing of Aldous Huxley and other people that this was a world-wide religious and cultural phenomenon that my own Catholic middle-class upbringing had, uh, had completely overlooked and denied. And I've been fascinated with it ever since. You know, it's a bit like sexuality: It's something which the Calvinist intellect would just prefer didn't exist but, in fact, the phenomenon of being human beings in animal bodies with a relationship to nature makes it important for us to address these altered states of consciousness and the plants, the substances, and the cultural institutions that come into being around these

things.

Luc: Your thesis in many books has been that these substances have had a far greater influence on culture and still have, and will have, than most people would like to accept or like to see.

Terence: Yes. I mean, to my mind, human history is the story of one substance after another distorting or transforming human values and society. A perfect example would be sugar. Most people don't even think of sugar as a drug and yet, we may think that cocaine distorted moral and political values in Latin America, but sugar brought back slavery. Slavery actually died with the Roman Empire. Nobody worked agricultural products with slaves in the Middle Ages. It wasn't until, uh, the early 1400s that the Portuguese began producing sugar and they used up Jews and prisoners and so then they started buying human beings from African -- from Arab traders. And the pope was in on the deal and everybody was in on the deal. I mean this is drug corruption of the central institutions of society on a massive scale. Uh...

Luc: But, that has gone on 'til our days. We have alcohol, we have tobacco.

Terence: Well, this is my very point, that every society chooses a small number of substances -- no matter how toxic -- and enshrines them in its cultural values then demonizes all other substances and uses -- and then persecutes and launches witch hunts against those users whenever some political pretext requires witch hunts and persecutions. So, it's an old game and it's been played in many places. Hopefully, part of the advancement of society toward ideas of universal human rights and that sort of thing, it certainly must include the idea of the universal human right to take responsibility for and to alter your own state of consciousness as you see fit. Uh, I don't think we can even pretend that we are on the edge of a civilized dialogue until we grant that people's minds -- like their bodies -- must be a domain free from government control. In American law, we have the notion of 'life, liberty and the pursuit of happiness.' If the pursuit of happiness means anything, it must mean the right to use and experiment with substances and plants.

Luc: But do we need, say, more research or do we know all we need to know about entheogens or hallucinogens?

Terence: No, no. We need endless amounts of research. The fact that these things have been illegal in most countries for fifty years means there is a huge lag in understanding the impact of these things on human beings. How many people have taken MDMA? And yet, MDMA has not been thoroughly studied by science. How many people have smoked DMT? Same thing. In a way, by making these drugs illegal, we're setting ourselves up for a potential catastrophe someday, when some side-effect is overlooked because the drugs were not rationally reviewed with an eye -- not toward keeping them out of the hands of the public -- but with an eye toward public safety and educating the public in safe use of these things. We -- the state should not in the matter of drugs, anymore than in the matter of sex, act as the secret agent for the agenda of the Church. And that's what's happening. People want to stimulate themselves. They want to explore their consciousness. They want to sedate themselves. Who are we to stand in their way with a moral ideology, uh, and the long heavy arm of the law to interfere with that. It distorts civilized values? That's the bottom line: drug repression, uh, distorts civilized values and political discourse.

Luc: Many people emphasize that the bad effects of using, I don't know, LSD, DMT. Do you think there are positive effects, in general, and are there positive effects yet to be discovered?

Terence: Well, yes. I mean, anyone who has actually been around people using psychedelics know they have tremendous therapeutic potential, tremendous potential to launch people into confrontations with aspects of their personality or their history that they are in denial of. The people who hold that these, uh, psychedelic substances have no application have very little actual personal experience with them. It's the old story of: 'My mind is made up. Don't confuse me with facts.' [laughs]

Luc: Would psychology be further ahead, would you have learned more about the way the human mind works on itself and in interaction with others if the research, say, on the use of LSD, or ibogaine, or many, many of these substances would have proceeded in an orderly and, what you could call, scientific manner or way?

Terence: Yes. I think it's a great tragedy of 20th century science that the original excitement about exploring consciousness and mental illness, generated by the discovery of LSD, gave way to establishment paranoia and, uh, repression of drug-using populations. The excitement in psychology when LSD was first introduced was like the excitement in the physics community when the atom was smashed. And everybody thought, "Well, now, we'll understand mental illness, schizophrenia, uh, the memory" so forth and so on. And, instead, the government lost its nerve because it saw that these substances have a potential for deprogramming people, uh, to institutional values. And that was so terrifying that all the promise for mental illness and creativity studies and so forth and so on was sacrificed to institutional paranoia about the fact that drugs might actually cause people to wake up to some of the abuses and scams that were being run by late modernism and, uh, capitalism.

Luc: Clear! Thank you, Terence.

Terence: Thank you. [laughs]

[Note: This recording comes from a serialization on Roy of Hollywood's show on KPFK. It ends with Terence cut short mid sentence.]

This seminar examined how one of the most fundamental human relationships, that between male and female, shapes our relationship to technology and ultimately to culture and nature. We looked at the forms of relationship between women and men in the shift from a society based on domination to one based on partnership. This is an exploration of how feminism, technology and the telling of a new story will contribute to rescuing us from history. Riane Eisler is best known for her scholarly authoring of her formidable book, "Chalice and the Blade."

Wonderful. I can hardly believe I'm here. I made it past the Camaro wrathful [audience laughter], I survived the offer for reconstructive cosmetic surgery [audience and Terence laughter], and I've had my smart drugs for this evening. So, glad to be here. Well, until a few minutes ago I thought that this was a 45 minute gig, so um, you get to see grace under pressure this evening [audience laughter]. Actually, I'm kidding, it doesn't matter how long it goes. We could never get to the bottom of this stuff, uh, nor would we wish to, I think [audience laughter].

By coincidence, merely, uh, I became 45 yesterday [audience applause]. So- sort of a good moment to do some summing up. So in thinking about this talk, and knowing as I did who would be here, I thought that, uh, I would sort of orient the theme toward distilling the psychedelic mind. Which is a way of talking about the psychedelic mind, but also trying to, uh- consider the amount of money you paid for this session give you the entire schtick [sp?] in one fell swoop. Uh, so that you would never have to attend a Terence McKenna lecture or workshop again [audience laughter]. You can just move past that. Turn the page on that kind of thing in your life. Uh, and I think it's coming together for me. I don't know whether it's writing these books was a very nice introduction here tonight, and the- the whammy [sp?], and it was after 25 years of being ignored by straight publishers or publishers of any sort for that matter, uh, it appears that I'm on the brink of entering, uh, the marketplace if not the mainstream [audience applause]. So- with your help and word-of-mouth advertising maybe I can continue to meet my mortgage obligations [audience giggle]. Okay, let's cut to the chase. Enough of the obligatory clowning around [audience giggle].

The, um, psychedelic question in the society just seems to refuse to go away. It's a sort of "can't be swallowed and can't be spat up", and so society just sorts of runs around knocking into walls and kicking its feet in the air, and this has been the situation that we've been in for at least 30 years now. And, uh, as a person who has spent a great deal of time in the Underground, I've observed with amazement the persistence of the, uh, countercultural agenda to alter consciousness. And like many of you, I came to it in the 60s when the basic argument in favor of altered states of consciousness were almost entirely narcissistic: deep insight into yourself, an ability to overcome childhood programming, so forth and so on. And I certainly think, because of the kind of society we are, because of the kind of people society has made us, that this was a valid place to begin. But after 30 years of having the psychedelic issue on the social agenda at times hailed as a universal panacea, at times demonized as a scourge from hell, but never quite silenced, never moved out of the public eye, I've reached, uh, a number of conclusions about this, and I thought it would be interesting tonight- I guess because of my recent birthday or something, to sort of

try and distill all this, and sum it up and put it in front of you in terms of what is psychedelic shamanism? Why should people like ourselves who live in high-density electronic culture, why should we care about this? What does it say about our future? What does it say about us as a group? And what techniques are there that we each on our own can bring to bear on this question? So with your help, hold me to the straight and narrow, I'd like to make my way through this agenda this evening, and talk about these various aspects of what to my mind is the most astonishing facet of reality. I mean maybe sex is pressing hard in the second position [audience giggle], but these two things run neck-and-neck as, uh, as aspects of the mystery of what it is to be human. And believe me, uh, human psychedelic experiences and human sexual experiences are orders of magnitude removed from anything going in the animal realm. These things are set apart from the rest of being. Because what we bring to them is mind. This is what we pour in to the sexuality of human beings that makes it unique. This is what we pour in to the contemplation of our own experience. Mind is a focus that is lacking, uh, at least its expression in the unique form that we experience it is lacking in the rest of nature. And I believe that, uh, the persistence of the psychedelic experience within the social agenda has to do with the fact that it actually addresses something basic in human beings. I mean it may seem like a radical proposition to say that to a white high-tech industrial democracy audience, because we are the people who have drifted furthest from this birthright. And I would like to suggest to you this evening that much of the civilization that we have created has been achieved based on a direct denial of the psychedelic experience and all that it implies: our humaneness, our connection to the rest of nature, our connection into the feminine, uh, our place in nature. Because for the western mind we have no fixed place in nature. Our place is ours to define. We are, from the point of view of the cultural machinery that empowers us, completely free to become- to be whatever we want to be. Now the problem with that prescription is that in western culture, what that means is permission to express ego, permission to profligately use and destroy resources, permission to set aside the political agendas of outclasses and out-groups. And, uh, this untrammled expression of will outside the context of nature has turned us into a kind of, uh, Frankenstein's monster at best. A toxic force in the body of the Gaian world soul at worst. And I believe that our origin and our future culmination and our present happiness all can be secured, understood, illuminated, and expanded only if we're willing to look at our relationship not only to altered states of consciousness, but to, uh, the mind behind nature. Because that's really what this is all about to my mind. Uh, what these psychedelics are empowering, or conveying, or revealing depending on, you know, how you come at it, what they are showing us is that we are not alone upon this planet, we are not alone in the universe of mind. And I realize this is a soft audience to preach this in because there are probably people within the sound of my words who sincerely believe they were once citizens of Zeta Reticuli [audience laughter]. You know, it's when the jar is so leaky it's hard to know where to put the water, uh, but I come to this as a "show me" kind of guy. And so though my conclusions may sound as flaky as anybody else's, it was hard for me to get this flaky [audience laughter]. I didn't embrace it. I was forced to it, and this method works, you see. I mean there are two ways to get flaky. You can get flaky, which takes no effort at all, you know. I mean you just announce you're a walk-in, start eating wheatgrass juice and, uh, you know, tight [sp?] to Maitreya, Or [audience laughter] you can get flaky by testing the edges, by stretching the envelope of being. And this works for the most hard-headed among us. The aerospace insurance adjustor mentality is not only who I'm speaking to but who I feel I represent [audience laughter]. Because, uh, no kidding really [Terence giggle]. At age 18, I was a Marxist, an existentialist, uh, I had ambitions in the field of aeronautical engineering, uh, so forth and so on. And I discovered that you can take that kind of a mentality out into the theatre of real experience, and you can come back a space bunny just like everybody else [audience laughter]. So what that means then is that, uh, a straight person – and I speak as someone from the 60s with apologies to all our gay friends who later appropriated that word, because when I say straight I mean unstoned – as a straight person is not a guardian of truth or probity. A

straight person is simply a frightened proto flake [audience laughter]. I always- I always think, and most of you have heard me say this, but when we get off on this subject I always think about the wonderful thing Tim Leary said years ago. He said it so many years ago that when I told him how much I admired him for saying that, he didn't remember that he's said it [audience giggle], but the man once said, uh, wait I'll give the line, "LSD is a drug which causes, occasionally causes, psychotic behavior in people who have not taken it." See? And I certainly saw this. I mean saw my parents become violently psychotic, uh, from not taking LSD. And so my point is – and I make it in a forum like this, because here we have so much permission for belief. I mean you want to believe in, you know, channeling from beyond the grave, fine. No problem. You want to believe in the healing power of nematodes, hematodes, hematite, you name it, we've got it all. Uh, really I think that the spirit of, uh, childlike untrammelled curiosity is what we're striving for. Not the anal retentive rational person, not the all-go-for-anything channeling flake, but an attitude of "we don't have to look far for miracles because they're all around us." Everything is astonishing. The Universe on its surface is alive with mystery. Well, how do we make our way toward that when we live in a culture, practice a language, embody a philosophy, scientific rationalism, which is entirely designed to suck wonder out of reality to turn everything into shades gray to, uh, subvert all hope that lies outside the realm of career accomplishment and material possession. Well, the way we can overcome this through a personal, um, acting out of what I have been calling now for several years the Archaic Revival. And I want to talk about that a little bit this evening, because I think it- you know however much we may kid around about the New Age, uh, it is an important aspect of what is going on. Its triviality is rooted in the side of it, which is ungrounded, ephemeral, and self-promoting. But it springs from a fairly profound and deep sense that things are not alright in this society. I think that I first encountered the phrase "New Age" in the writings of Helen Petrovna Blavatsky she wrote in the 20s. I read her in the 50s. Uh, the New Age has been with for a long time, so long that there's nothing new about it. And, in fact the reason I call it the Archaic Revival is because I think we can understand this movement if instead of accentuating what about it that is new, novel, and never-before-seen, instead we emphasize that this is a profoundly conservative impulse. A conservative impulse that would set the hair of George Bush and his Skull & Bones buddies standing on end. Because when we talk about conservative, we're not talking about returning to the era of Eisenhower. We're talking about returning to the era of Isis, Assarte [sp?], the great horned goddess of the high Paleolithic. In other words, this program of material civilization, exteriorization of ideas into matter through first Alchemy and Magic, and then Science and Industry, this program is coming to an end one way or another. We are either going to plant ourselves and most of the rest of the life on this planet by blindly pursuing this cultural model until we run it right over the edge into the Apocalypse, or from the genes, from the bones, from the oceans, from the forests, from the glaciers, there is going to have to come a turning point, a change, a revulsion so profound that it allows us by the tens of millions to change how we think about reality, to change how we live. And I have ended up an advocate for the psychedelic experience. Not because I think it's easy, not because I think it's surefire, but because I think it's only game in town, the only chance left. If we had 1000 years, if we had 500 years, maybe propaganda, messages on boxes of cereal, photographs on cartons of milk, I don't know, something might do it. But we don't have 500 years. We must come to a screeching halt now, because we are barreling toward the brink of ruin. And, uh, the only thing that I have ever seen that turned anybody around on the dime was psychedelics, you know [audience cheering].

The talking cures invented by Freud and Jung at the beginning of this century, it takes years, sometimes it never happens. The body work that came along behind that with Wilhelm Reich and others, Feldon Christ, and so forth- either of, all of this brings it into the theatre of the body. At least now we understand it's a body-mind system, it's not a disembodied voice lying on a couch, speaking, you know. But it seems so

obvious, what we're trying to do is perturb the mind. We want to perturb the mind so that we can then see it differently, so that it may see and be seen differently. Well, the mind rests on a foundation of chemical machinery. We're not saying the mind is chemical machinery, we're saying the mind rests on the foundation of chemical machinery. So, if you want to perturb the mind you don't go to the talking, you don't go to the deep tissue. All of this has efficacy, but it is necessary but not sufficient by itself. For there to be a sufficiency of method, there must be an initial perturbation of the mind. And this comes about through the use of psychedelic plants. This is not something that was discovered post-LSD in Manhattan by psychiatrists or in Prague or Berlin or at Esalen. This is a truth twenty-five- fifty thousand- a hundred thousand years old. This is how it's always been done. Only in the last 6000 years on the European continent, and those civilizations that are the children of Europe, has there been any other approach to these problems. Well- and what the other approach – linear thought, the phonetic alphabet, science, mathematical abstractions, so forth and so on – what these other approaches have brought us is a toxicity, pollution, mutation, catastrophe, revolution, death, and yes friends even unhappiness [audience giggle]. It hasn't worked. Western civilization is now crowing over the fact that the only opposition it ever had, which was Marxism, apathetic weak sister, has now collapsed upon itself. Well, there should be no congratulation in that, because the contradictions which undid Marxism lie in wait to undo this society as well. [audience applause] Both societies are materialistic, both societies define human beings and treat them as things. And the fact of the matter is Western civilization at this moment is a loaded gun pointed at the head of this planet, and we for all our pretensions to, uh, a sensitivity to the presence of vitamin-C or zinc in our diet, or all the rest of this malarky, we are the prevaricators of this situation. So, a certain obligation rests upon us, and I think we're meeting this obligation. I wouldn't say we're doing a good job, or a terrible job, I think we're functioning at approximately a, uh, B+ level. You see, I mean human life is so ephemeral. A person who lives 70 or 80 years is really as ephemeral as a mayfly or something. I mean, it's not long enough to get the full picture. For instance many of you, by virtue of not having spent a great deal of time thinking about it, uh, probably don't realize that this psychedelic plant shamanism option- this is not something that Western civilization has grappled with for centuries, and come to terms with and found the proper pigeonhole for and put aside. Not at all, my friends. The fact of the matter is all of this information about psychedelics has arrived in Western society in the last 100 years. And, uh, we have to say 100 years because we want to include things like mescaline, 1895-98, it was began to be studied in Germany. And things like Ibogaine, which was know toward the end of the last century, but which has virtually zilch impact on American psychedelic populations. Uh, so we have to say the psychedelic option has only been an object of the Western minds for approximately a hundred years, but really 90% of that occurred in the last 50 years.

As many of you know, I am a great fan and spokesman for psilocybin, for the mushrooms. The mushrooms that I'm so stoked on were discovered in 1953 by Gordon and Valentina Wasson in Huautla. Discovered in '53, made absolutely schedule-1 illegal in 1966. 13 years was the window in which Western civilization had to study this compound and figure out what it was for. And they were just beginning to focus upon it when it was made illegal. LSD, discovered in '37, not brought into the scientific literature until '48, not generally available even in the laboratory until 1950, made totally illegal in 1966... 16 year window. Think about the fact that when LSD was legal, uh, psychiatrists, professional researchers were consistently reporting cures of chronic alcoholism with one 500 gamma dose. One dose cure like a 50% cure rate without recidivism for chronic alcoholism. Spectacular findings were being reported. When LSD swept through the scientific community, it- for pharmacologists, psychotherapists, psychiatrists, it had the same kind of excitement and feeling of breakthrough that the splitting of the atom had for the physicists, for the physics community in the late 30s. Well, science, we are told, is this absolutely impartial God-like

body of knowledge prosecuted by great men, and it will fearlessly send its questing mind into any situation or environment. This is a mental discipline so dispassionate that it sees nothing at all wrong with strapping monkeys into apparatus and hurling them into walls at 70mph to study traumatic injuries. This is a discipline so unflinching in its pursuit of truth that it will design tiny television cameras to be implanted in plastic penises so that we can see the changes in the colour of the vaginal wall as it approaches orgasm. I mean these guys are unstinting in their devotion to truth in any form, and yet for 30 years science has accepted government's refusal to allow science to look at the potential impact of psychedelic plants and compounds on human consciousness, on chronic alcoholism, on schizophrenia, on depression, on autism, on learning disorders, on dyslexias, on memory enhancement, so forth and so on. This, to me, is obscene. The future is mental. Figure it out, if the mind does not loom large in the future history of this species, then what the hell kind of a future is it going to be? I mean this is our crowning glory, our aesthetic sensitivities, our ability to create values that are not simply based on the next meal, the next sexual encounter, the empowering social move, but an ability to create social values based on creating a viable future environment for children, uh, creating a viable present environment for the less fortunate among us, uh, creating a social safety net so that the more maladaptive of us are not reduced to living under bridges and in abandoned automobiles. I mean these are things which set us above the apes. These are the things which take us out of the context of organic nature and make it seem as though "hey, there actually are some transcendental values being maximized here, there actually is something going on in- within the human family." But if it were to be lost, fumbled away, compromised, or destroyed the Universe would be a poorer place for it, truly a poorer place for it. And I think, um, I think we take our humaneness too much for granted. I don't think we realize, um, how nasty, brutish, and short most of life has been over the centuries, and how really only in- within the confines of the 20th century has, uh, a level of, uh, comfort and food availability, and shelter, and basic creature needs been met to the point where most people can begin to lead the philosophical life that previously was the privilege of emperors, kings, great courts. Now we all indulge ourselves. We all have the philosopher kings point of view. We all, uh, have a model of History, a model of the future. And we all feel capable of stepping into the shoes of our leaders and discharging that responsibility. Well, in order to do that, I think we need to overcome our amnesia about how we got to this place. I don't see- you see what science would have you believe and, explicitly implies, is that we are an aberration. Here, over here you have nature, the beautiful rainforests, the wonderful coral reefs, the cemetery of the hummingbird, the sea urchin and the butterfly, and here you have us, grimy, tawdry, polluting, ugly, driven in disequilibrium, in denial. I don't believe that. I believe that this kind of thinking that breaks humanity away from the rest of nature is the first of the great disempowering myths by which the Western mind has enslaved itself. And we are not outside of nature, we are not a runaway toxic process, we are not a mutation. We are in fact that part of nature which has been deputized for a purpose. We are the energy-gathering aspect of the Gaian mind. We are the language-forming capacity of Nature herself. You may know the concept of a catalyst in chemistry. A catalyst is something, which when you stir it in to a chemical reaction, the reaction proceeds more quickly that the catalyst itself is not destroyed. And this is what I think we are. We are a strategy on the part of the Gaian mind to produce an effect that would otherwise take much, much longer to produce. The main effect of the presence of human life on this planet has been to vastly accelerate the speed at which nature is able to, uh, creatively express herself. And I would like to believe that this fragile, fragile thing which we call humaneness, which is nothing more than a set of interlocking ideas which we share – we share ideas about caring, and responsibility, and generations yet unborn, and obligation to the integrity of the Earth, and so forth and so on – I would like to believe that these things arose in us a very, very brief window of opportunity. Uh, as may or may not know, uh, all, you know there's a lot of talk about the relationship between the masculine and the feminine in human beings, and gender issues and so forth and so on. Well, if you go back into the

primate line, what you discover is primates always have dominance hierarchies occupied by males. This is the “bad news“ part of the thing. You see, it isn’t that we are a perversion of the primate programme. At this point, we exemplify it, uh, right down the line. But clear back to squirrel monkeys, you get, uh, you get male dominance hierarchies. Why is this? And why is it even an issue for us? Why don’t we just blindly accept it? i mean there isn’t a women’s liberation movement among termites societies or, uh, you know, among reindeer herds. So, why are we so discomforted by our attitudes toward each other? Well, I believe it’s because actually created, at a certain point in our history, a kind of paradise. We actually solved all the problems which now bedevil us of 20 to 15’000 years ago. And how this happened, and half of you I hope are amazed and the other half will groan because you’ve heard it so many times before, uh, what happened is an evolutionary synergy that occurred on the plains of Africa sometime over the last 100’000 years. It’s that- as the African continent dried up, our remote primate ancestors were forced out of the trees and on to the African grassland where they were in an environment completely different from the kind of environment that our ancestor had been living in for millions of years. Gone, were the fruit-filled bowers of the climaxed canopy of the rainforest. And instead, what there was was, uh, a grassland with very little cover, a very restricted, uh, flora and fauna, and into that grassland poor these hungry, displaced, dispossessed, formerly fruitarian primates... When a species gets under that kind of pressure, it has- it must make a choice between extinction or dietary expansion. Many many species will choose extinction. This is an interesting thing about animal species. Most animal species eat one or two foods that they are very tightly focused in on. The reason for this, of you’re not an evolutionary biologist, is it’s a strategy for avoiding mutation. You see, all plants, uh, produce, uh, have a tendency to protect themselves from predation by producing toxins, mutagens, poisons... is what we’re talking about, here. So an animal species will evolve a preference for just one or two food sources. And then it can hold its exposure to mutagenic agents to a minimum. Now, our species, when we moved into that African grassland situation, were plastic enough, malleable enough that we decided “No, by God, we’re not going to go to extinction because of the absence of papayas in this situation. We’re going to test other foods.“ And we began testing other foods in that environment, and that immediately, uh, swelled the number of mutant strains in the human population. Now, in this grassland environment, uh, the number of new foods to be tested was somewhat limited. And the most spectacular and obvious of the unfamiliar food sources in this environment were the psilocybin mushrooms- seem to be growing in the cow pies of the many different kinds of cattle like ungulate animals growing up in that environment. And I- if you’ve ever been to the tropics and seen the Stropharia Cubensis mushroom in its natural habitat, uh, you can’t miss it. It’s the most spectacular thing going on. I mean, you walk out into a Colombian pasture after a few days of mist and rain, and these mushrooms – the size of dinner plates – will be scattered across the environment. Now, when I was in Kenya in the late 60s, I observed baboon troops, uh, and their food gathering behavior. And what they were into was running around frantically, looking for cow flops, and then flipping them over, uh, looking for, uh, beetle grubs or carrion beetles. You see, they understood that the cow flops – great freiza [sp?] – but the fecal deposit of the ungulate animal was a vector for protein. Insect protein. This was a likely place to find carrion beetles, worms, and what-have-you. And, of course, the mushroom. Well, when you observe how, uh, primates react when they’re testing a food, the way they’re very careful, and they’re very conscientious. Uh, a baboon will take a suspect potential food source, take a leaf, put it in their mouth. Just hold it there. No chewing, no nothing. Put it in their mouth, wait 30 seconds, chew, wait, and then either spit it out or swallow. And if swallow, then begin to eat. Well, uh, I believe that this encounter with the psilocybin mushroom, and in the course of this workshop, maybe in the question-and-answer period we’ll get to this, but psilocybin has unique properties which set us up for a sudden enormous evolutionary kick in the pants. And we can talk among ourselves about whether this was just blind coincidence, good old chance, and aren’t we fortunate for it. Or whether benign extraterrestrials operating from their base on Zeta Reticuli

where... you know, we can save that for you, we don't have to get rid of it. Uh, whether it was those shifty Zeta Reticulites or blind chance, whatever the force was, the exposure to psilocybin has three reinforcing consequences that are of tremendous importance for understanding human evolution. And they are as follows: psilocybin, in very low doses, doses so low that if you had taken this amount you would not feel it or you would slightly antsy. In other words, very low doses of psilocybin actually increase visual acuity... means you improve your vision with this stuff. Uh, well again, you don't have to be a rocket scientist or an evolutionary biologist to figure out that there's a plant in the environment, and you're a hunting animal, and this plant improves vision. You're going to be a better hunting animal if you include this plant in your diet. And this is precisely what happened. Early human, or proto-hominid hunters accepted psilocybin into their diet, it made them better hunters. Being a better hunter means getting- being more successful at obtaining food. Being more successful at obtaining food means more of your children reach, uh, reproductive age themselves, and so you outbreed the non psilocybin-using portion of the population. Simple enough, right? On the next level – remember, I said this was a three step process where each reinforces the other – at slightly higher doses of psilocybin, uh, you get what's called CNS arousal. Central Nervous System arousal. Well, now arousal is just what it sounds like. It's not only restlessness and alertness, but it's also a kind of horny diffuse energy. Uh, it incline of one's thought for the boudoir is what I'm trying to say, here. And so you get what primatologists and anthropologists charmingly described as more frequent instances of successful copulation [audience giggle]. It's- what successful copulation means is, again, a factor feeding in to more children of the psilocybin-using animals reaching reproductive age themselves. And then finally, and thirdly, beyond visual acuity, beyond sexual, uh, arousal, uh, is the full-blown psychedelic tremendum, the full-blown religious revelation that goes with the mushroom experience. A revelation of such depth and breadth that we, 20'000 years later with all our epistemic sophistication and our parallel processing computers, and all this other malarky are completely unable to come to terms with. Well, this higher dose of psilocybin was experienced in the context of the middle-range dose of psilocybin. So it went on in an atmosphere of, uh, group, uh, religious ecstasy and orgy. I mean, it's just how it happened, folks. Orgy was a part of, uh, human sexuality before the invention of agriculture. I'm absolutely convinced of it. You see, the growth of the human intellect over evolutionary spans of time is a kind of conquest of dimensionality. And the conquest of dimensionality that gave us agriculture unfortunately gave us male dominance and patriarchy. And the reason for this is, uh, not far to seek. A new intellectual horizon of cause and effect was being explored. Women, who where the gatherers in the hunter-gatherer equation, were realizing for the first time the causal relationship that exists between burying a half-eaten meal over here, and coming back a year later on your annual nomadic peregrination and discovering food plants growing where you buried your uneaten meal of a year ago. In other words, women came to understand the relationship between the act of planting and the appearance of usable food plants sometime later. At the same that this was going on, men were making the connection between the fact that the sex act had something to do with the facts that nine months later women would- a woman would bear a child. And in a way, this was the beginning of the straight lockstep into hell [audience laughter]. Because! Because, once men had this notion of male paternity, it became more important to know who your children were than it was to participate in the orgiastic group-minded bonding that had previously occurred. And once you have the notion of "my child, my child", then it moves naturally to "my woman, my weapons, my food, my hunting ground, my everything". The recognition of male paternity gave permission for the growth of ego. And ego – and this is- this was all a continuous thought, those of you who doubted, this was all a continuous thought – ego is our problem. And we always had it when we were squirrel monkeys, howler monkeys, proboscis monkeys and all that, we only lost it in that very brief window of opportunity, maybe 20, maybe 30, 40'000 years long when, as we evolved into the grassland, we included in our diet essentially a drug which corrected our primate nature. A drug which suppressed the

expression of male dominance. A drug that promoted an orgiastic sexual style that promoted group values. Because, you see – and this is the point to my mind about psychedelics – what they do, not, you know, my trip or your trip which we can spend hours trading stories about [audience giggle], but when you try and talk about what is the effect of the psychedelic experience, not one or two of them but a hundred thousand them, what generalizations can we make? The generalization that I have found most powerful is the psychedelic experience dissolves boundaries. That's what it does. And boundaries are what chain, diminish, define, and degrade us. And we are always creating them, and we are always struggling with dissolving them. And the ultimate boundary is this belief in the sanctity of the ego versus everything else in the cosmos. And I don't believe that this- that the ego arose in a context of language, culture, religion, and so forth simply because evolved in the African grassland, and the climate itself underwent changes that eventually placed the mushroom out of reach. And this is "why" the fall into History. This is what the Genesis story about the- that I call History's first drug bust [audience giggle]. This is what it's about. I mean, isn't it peculiar that the or myth [sp?] of our culture opens with a drug bust? It's the story of a woman – right, those bad women – a woman who corrupts her roommate and then they both get kicked out, they break the lease essentially. And they both get kicked out, and where they get kicked out of is into History. And I believe that the Genesis story, definitely told and created at a time when patriarchy was on a roll, is a memory of this break with this orgiastic, goddess-centered, nomadic, cattle-oriented, mushroom using, uh, a form of human pastoralism. Now, notice in this scenario that there are no villains per se. The planet began to get dry, and that's what broke up this arboreal, papaya-oriented paradise in the treetops where everybody was male-dominated and mindless as tomato but having a good time [audience giggle]. The drying of the African continent broke that party up, created a mixed ecology of forest and grassland into which the primates then evolved this fascinating relationship with the cattle, you see. And I- and much of what I say here is orthodox evolutionary theory. It's just the part about psilocybin that nobody else will touch with a 100 foot pole [audience laughter], but it moving out into the grassland, testing foods, accepting psilocybin into the diet, and then creating, uh, based on the interruption of the natural, natural! tendency toward male dominance, it was fixed. 50'000 years ago a pharmacological intervention on the entire species created them a situation of partnership. The women were the gatherers, the men were the hunters, this had to with, hum, promotion of different body types that had already taken- was already well-established in these primates. I mean, you get this throughout the primates. The large male, barrel-chested, the more diminutive female, and the female more largely social than the male. The males hunt. And in the proto-hominid situation this was certainly true. And hunting, as you know if you've ever done it, places a great premium on stoic waiting. That's the hunter's job- is to keep- sit down and keep your mouth shut and watch silently until it's time to make your move, and then move ruthlessly without question, you know, with attention. Women had a completely different set of pressures and constraints on them. As gatherers, it was, uh, very important for women to be able to communicate extraordinarily subtle, uh, aspects of the material world to each other. So that a woman needs to be able to say when she comes into camp with the apron full of nuts "I got these near the waterfall by the bush with the small yellow leaves with the waxy flowers and the red berries that has the dry grass underneath it." In other words, for a gatherer, there is tremendous premium put on being able to describe your environment. You must be able to communicate, because a woman who makes a food find can only bring back to camp as much food as she can carry. But if she can communicate to her sisters what is going, then no problem. So language, I believe, largely evolved as a prerogative of women. And this stoic- stoicism, and, uh, ability to tolerate uncomfortable conditions was evolved by, uh, men.

All of this would have been fine. It could have gone on for millions of years in this climaxed situation. The orgies were lunar, meaning they probably occurred every two weeks, or at most every 28 days. That means every 28 days every member of this society was completely dissolving and psychic structures that may have arisen in the previous 28 days, and then everybody whistling [sp?] on each other's bones in a big heap [audience giggle]. And you can imagine the boundary dissolving impact that something like that would have. Why then, if it was so wonderful, didn't we just stick with it? Why the descent into, you know, the hell of Pee-Wee Herman and Richard Nixon [audience laughter], and all of this stuff? Well, the same culprit that created that happy story destroyed that happy scenario. And that is the continued drying up of the planet. And that's what we get in that Genesis story. Remember at the end of the Genesis story it says, uh, "and God set an angel at the Eastern gate of Eden with a flaming sword so that Adam and his children could not find their way back into Paradise." That's the memory of the Saharan sun scorching off the African veldt and forcing those mushroom-using pastoralists to settle in the Nile Valley and set up permanent, uh, settlements and begin thinking about kingship, large-scale agricultural projects, and so forth and so on. Uh, and what happened – it was not as simple as that may have made it seem, you see – uh, this is really the theme of this book that I wrote for Bantam, is the theme that cultures wear drugs like clothing and they're never aware of it. They just feel naked without their particular drug. And the clothing may differ, you know, one culture feels fully dressed in

Terence McKenna

penis sheaths and warpaint. Another culture isn't fully dressed unless the gown is by Dior. So there are different styles of clothing, and there are different styles of mental clothing in the form of drugs. And these drugs promote different kinds of cultural values. And what happened in that African situation was a tragedy that in a way we have seen enacted in microcosm in our own society. It was that at a certain point, everything was perfect. The monthly orgies, the suppression of the ego, the group values, the, uh, the recent invention of language was making food-gathering easy for women, uh, the abundant game was making hunting easy for men, so forth and so on. But this drying of the African continent didn't halt there. It continued. And pretty soon, there were problems; less game, less to be gathered, and most important for my theory, fewer mushrooms. And when there became fewer mushrooms, then, uh, there were two possibilities: you could have your mushroom, hum, orgies less frequently, or you could create some kind of technology for preserving the mushrooms so that when you found a lot of them you could save some of them for dry spells, literally for dry spells. Uh, now the problem with this is strategy is that in the worlds after humingferigation, the, uh, strategy which Aboriginal people in Australia, in the Amazon basin, the strategy which the Aboriginal people tend toward when they want to preserve some delicate food is they invariably go for honey. Honey. This is why some of you may know that the Romans were humpingbirds tongues picked in honey. It isn't because honey was the preferred medium for pickling hummingbirds tongues, it was because that's a way of preserving delicate food. The problem with honey is, honey itself can ferment into a psychoactive compound. Honey changes into mead. Mead is a form of crude alcohol. The impact on a goddess-worshipping, organic, non-hierarchal, non-male dominant culture of switching over to an- to the use of alcohol is absolutely devastating. In the same way that I told you what psilocybin did – improves visual acuity, promotes sexual activity, delivers a religious experience – we can talk about what alcohol does. It lowers sensitivity to social cues at the same time that it gives an empowered of it. In other words, it makes you into a jerk [audience laughter]. It gives you the courage to say and do what if you are a decent person you would otherwise never say and never do. It turns each one of us into a Clarence Thomas [audience laughter]. This is not what's needed. Boo! Yes! No! Who knows! Who is Clarence Thomas [Terence + audience laughter]? And time- in time again in human History, these kinds of synergies have been enacted. Well, uh, I want to say more about it. That isn't the whole story. That could be the whole story. I mean there's enough in that for it to be the whole story. In other words, if it's true that the mushroom, uh, you know, suppresses male dominance, it it in fact promotes communal values, and so forth... what a wonderful thing it must be. And we can leave it there. But that's only a small part of the story. The real story is what is so wonderful about it? Since it's a mental experience, what is so wonderful about it that it could halt the human tendency to devolve into these counterproductive forms and lifestyles? Well, what's so great about it is that it is nothing less than half of the intellectual universe. It is, uh, what I call the connection to the Gaian mind. In other words, to this point, what I've said is- could be imputed to be just talk about a superb psychedelic drug. And so they're saying "oh well, so this guy advocates the use of a superb psychedelic drug, seems reasonable or unreasonable" depending on where you went to church. But it's not that paradigm-challenging. But what is paradigm-challenging is the content of the experience. The content of the experience is completely, uh, mind-boggling, completely befuddling. I don't know what we're going to do with the content of the experience, because fully gotten out, and fully discussed, and fully realized it's not going to leave one bricked upon another in the cheerfully naive edifice that our half-backed civilization has erected as universal truth, we're not going- science is not going to be able to survive the encounter with the psychedelical experience. Because it is not an encounter with the Freudian, you know, the repressed memories of your miserable and battled childhood or whatever it is you went through. And it isn't even an encounter with the miserable memories of the battered childhood of the human species that we all went through: Allah, Carl Jung. What, uh, that is all there, but that's in the hallway where you hang your hat and the antechamber where they take your coat. The main event, folks, doesn't even have anything to do with the psychology of human beings. The main event is another dimension. A dimension so bizarre, so titanically peculiar, so strangely, so unanticipated by our language, our History, our literature, that, uh, it is literally like the discovery of another world. And- and, uh, and there's life in that world. Now, a funny thing about discovering new worlds is that, uh, you usually- when you get the new world all mapped out, you usually discover that there's somebody living there. And for them it's not the new world at all. And you know, you haven't discovered anything. You've just showed in the middle

of their scene [audience laughter] with a distorted rap sort of like Christopher Columbus. And this is what we find with the psychedelics.

And this is why shamanism becomes, to my mind, the bridge to understanding what this archaic revival is all about. The shamanic hallucinogens are the, uh, the, uh, the meat of the thing, the pith essence, the center of the mandala. But the bridge into that is, uh, the effects that these things have. The content. The experiences that we can language and tell each other about. And what we are discovering through shamanism through looking at it, not through the condescending eyes of the white man who is just impressed by the incredibly dull quaintness of whatever these brown-skinned people who dreamed up, not that, but through a realization that we are sick and no doctor can cure us because we're not that kind of sick. It's soul sickness. I mean, it has to be soul sickness. And when you see up stuff like Chernobyl, or the Kuwaiti oil fields, or the Hanford Nuclear Reservation in Washington, when you realize what this really means, then you realize, you know, this is a- this is a mad species. This is a terminally depraved species. And what is required is a return to a model that can heal. And this is what shamanism has always been about. And we have not recognized it, because the part of the human being which shamanism addresses, which is the soul and the spirit, we have a 500 year old tradition that denies that there are such things. So for us, it's absurd, shamanism. It is a, you know, painted rattles, guys dancing around in the middle of the night, blowing perfumed water around and smoking too much tobacco. That's shamanism for us, because we cannot see with the eyes that understand. When we do, what we realize is that half of our mind has been taken away from us. That, yes, the human body protrudes into profane space as 120 to 350 pounds of meat somewhere in the Universe. But that isn't the domain of humanness. The true domain of humanness is inclusive of that, and much, much more. Because the true domain of humanness is a domain that honors the mind as- as self and as landscape. I mean, you are a creature loose in a landscape of meaning. And you are that landscape of meaning. And by losing contact with this, we have become essentially, uh, pathological. Very needy. This is a typical pattern in a person with an abused childhood. Uh, they become very, very needy, very thing-oriented, very security-conscious, very anxious. This is a picture of us and our psychology. And we have- we are so deep into the historical nightmare that we can't ever remember any other way of doing business. We know we're messed up. We know we're unhappy. But what's to be done, you know? I mean we have a million minor fixes, and people peddling all of these things. I mean you've just been through the aisles, you know what I'm talking about. But somehow, salvation itself becomes an impediment to salvation. I mean once you see 500 forms of salvation being sold at prices you can't afford, the very notion of salvation becomes obscene, you know. It becomes one more layer in the obscene layering that takes meaning out of life, and disempowers us and turns us into a subscription customer that seems to be how we always are being forced to end up. Well, the only way out of this, I think, is to, hum, it takes courage because you have to turn your back on your culture. In the most profound sense there is, because there are many ways to turn you back on your culture. I mean if everyone's wearing grey, you can wear green. That's one way to turn your back on a culture. But another way is to break his laws. Now, that's a little more serious. And, you know, brings in big philosophical issues. But in fact, the culture is an enormous arrow pointing "go this way." And you know what lies that way? Impoverishment, madness, degradation, and death. That's where the culture is pointing. You can see it. You can see it, just look where we're headed. Uh, if everyone on Earth aspires to the kind of lifestyle that you people can enjoy by virtue of having paid the money to be at a scene like this, there isn't enough glass, metal and plastic in the planet to make that many Celicacs, and Jaguars, and Bluebirds, and Snowbirds, and all the rest of this crap. So what is needed is, uh, an awakening. Now, I mentioned earlier in this talk that they work- that in the 50s, before they interfered with LSD research, they were curing chronic alcoholism with a single 500 gamma dose of LSD. Well, now for heaven's sake, nobody is suggesting that LSD is a cure for alcoholism. That, to me, is absurd. It's not a cure for alcoholism, it's a cure for stupidity [audience laughter]. And a person who is killing themselves by drinking themselves to death, takes 500 micks of LSD and says "what a stupid person I am [audience laughter]. I'm killing myself." And so then they look at their behavior and they cease that behavior. And this is what has to be done on a societal scale. And it is not as difficult as- as we may wish to be assured by the establishment. The whole folsenid and hoop-dee-doo about the 1980s was that the, uh, crypto-fascist bullshit agenda was damn near overthrown by a bunch of 19 and 20 year-olds [audience giggle] on campuses scattered around the high-tech world. The- the male-dominant, uh, agenda is so fragile that any competitor is felt as a deadly foe. And the fact that these ideas will not die in spite of the fact that, you know, they've raised the price of an ounce of weed from \$15 to \$500, they've made the pinch for growing weed a lot from a slap on the wrist to lose everything you ever owned or dreamed of owning. And if they cannot push it into extinction, it's because it's so much older than their con game [audience giggle]. They've invented their con game post-sphinx or something. And we're talking about a reality that reaches back 15, 25, 30,000 years. And it's a reality so far I've only spoken – I keep trying to get to this subject but I won't let myself for some reason – so far I've spoken of it as boundary-dissolving, promoting group sexual activity, this and that and the other thing [audience giggle], but those are like generalizations. What is really interesting about the psychedelical experience is it shows you a mental universe that you not only suspected existed but that you could not have suspected it existed. I don't think there's another way to it. I mean I'm not ready to categorically say there's no other way to it, and occasionally, especially at gatherings like this, people grab me and assure me there are other ways to it. And they say, you know, "if you just- I want you to meet Babaji, he's as good as psilocybin." "Oh really? I want to meet this man!" [audience laughter] "Because- because- I mean- let me say a little bit more about this. I would like to believe that in principle you could do, only in principle however, because if some say "well, you know, these things you described on DMT and psilocybin, uh, I can show how to do that naturally." No thank you, are you kidding [audience giggle]? Thank God. I have the drug as a kind of marker [audience giggle], so that I know when I'm getting close to that stuff. If I woke up one morning in that place [audience giggle] and I couldn't tell myself I've taken mushrooms, I would define myself as seriously discombobulated [audience laughter] and wait to see what happens, you know. Um, and people say "well don't you think you ought to be able to do it by yourself?" And I love this question, because the answer is "you can't do it by yourself." That's the entire message of the last 10,000 years of human history. The self is insufficient. The ego will not suffice. The only way you're ever going to get anywhere, is you must humble yourself to the point where you admit that you can't do it unless you have help from someone whose idea of home is a cow flop [audience laughter and applause]. If you're willing to humble yourself to that degree. Then maybe we can get somewhere. Uh, the content of the psychedelical experience is, uh, I believe, uh [long pause], relating to that is the sum total of our humanness. And I think, based on experience, that, uh, there is a certain amount of leakage from the future backward into the past. And that many of the phenomena that are being interpreted as past lives, and reincarnation, and channeling, and regression this, and clairvoyance that, all this has to do with the misdirection about how causality actually works. That all of the impressions upon which people are building these models – channeling, and spirit guides, and reincarnation, and so forth – the material upon which these models are being built is real, but the models that are being built are tremendous, uh, compressions of the reality of the situation. I mean, uh, when someone tells me that they experienced a past life regression and that they were a butcher in 13th century Florence, I always think to myself "but you were a butcher in 13th century everywhere. And you were a butcher in 14th century everywhere." I mean, once the connection is opened, the connection is not particular. The connection is general. It is- all reality is who you are. All reality is where you are, and where you've been, and where you will be. And, um, two things, two things are operating in the hidden dimension of the human mind. One of them is what I call the Gaian mind, and this is being imaged in this society as the rebirth as a kind of goddess. People are realizing on different levels and at different levels of sophistication that the energy of being can be imaged as, uh, a female entelechy. An enclosing, nurturing, caring, forgiving kind of entelechy. And this is what, um, psychedelical shamanism has always been about. It's about a connection to the Gaian mind. And this gives you, obviously, a tremendous sense of being embedded in a larger coherency than merely the coherency of you own small life. And that's very empowering. But it's not the general sense of things that this Gaian mind imparts, that is really to me the interesting part. It's that the Gaian mind is a real mind. It has information. It can tell you things of the specific and personally important sort. This is- it tells you where the game has gone. It tells you who poisoned the well. It tells you raped so-and-so. It tells you why person X is ill and unable to get well- in other words, the Gaian mind is the database that all shamans seek to connect to in the act of curing, in the act of furlinging as doctors, or for their society. They get a connection for the Gaian mind. And, again at this point I feel like I have to remind you, I come to this as a septic, as a sneerer. I mean I have no time for this stuff unless it's real. It happens to be real. You have to take psilocybin as far as I can let to encounter it, at least if you have the kind of lump and neurophysiology that I have. I mean I've never been with the etheric [sp?] crowd, you know, uh, but this Gaian empowerment is what allowed these societies to live without technology, without modern medicine, without remote sensing devices, without any of the appearances of technology that we take for granted. And we have lost this connection. We can't even imagine it. I someone were to begin talking about how the earth was speaking to them and giving them messages about how to live, you instinctively consent, this is something to be very, very careful with. You give that rap to the wrong person and they'll drop a net over you and you'll find stuffing envelopes for a con-convalescent home or something [audience laughter]. Okay, so that's part of it. The Gaian. And it is this feminine nurturing, infolding things, it's the mind of nature itself. It is really our own mind, but extending then away from this possessive notion of our mind back

into the general concept of mind itself.

And then the other, uh, pole of the other motif encountered in this situation is, uh, trickier to envision. I call it the transcendental object at the end of time. This, if we were, you know, fanatically symmetrical model-makers then we would assign a kind of masculine value to this, but I'm not particularly into that. I just see it as the transcendental object at the end of time. But what it is, is it's a kind of attractor. And we're not accustomed to thinking of the historical situation as being under the influence of an attractor. We inherit our belief that history is pushed rather than pulled. We inherit this idea from the 19th century when, uh, the theory of evolution was elaborated. They- these 19th century British, uh, atheists who were creating the theory of evolution were so horrified by the power of deism, meaning the belief in God per se, that they constructed a theory of evolution where everything is pushed from behind. In Darwinian evolution, there is no purpose. A good Darwinist never lets the word purpose cross his lips. A good Darwinist knows that things just happen randomly, and then natural selection makes its selection and then you get whatever you get. Uh, and this is understandable in the intellectual atmosphere of the 19th century, that they would want to get away from that. The problem is we have matured now beyond the simple atheism of the 19th century. And it is now very reasonable, uh, sanctioned by mathematics, and dynamics, and so forth and so on, it is now very reasonable to speak of an attractor. And this, uh, I'm also a little nervous to talk about this because part of what I do is I popularize. I tell you things you should know yourself or you could know yourself if you would but go to a decent medical library and spend the time to look up all this botanical and pharmacological data. So I'm like a clearinghouse. But then there's another thing which I do which I'm a little more nervous and touchy about, which is I tell you what I think [audience giggle]. And it's just what I think. It has exactly that much weight behind it, which is like "zip," you know [audience giggle]. I mean, you don't have to believe this, why should you? But based on 25 years of fiddling with this stuff and then doing a lot of reading and head-scratching, I've come to the conclusion that, um, there is a transcendental object ahead of us in the future, and all of human history is being channeled toward it. Pulled toward it. And I see the entire history of the Universe as the history of a journey across a landscape of energy and matter toward union with this transcendental object. And I have a theory of History, uh, not the mathematical one. Don't bolt for the door [audience giggle]. No, this will be a cocktail party version of the theory of History. I have a theory of History which is the Universe is a novelty-producing and conserving engine of some sort. That's what we're inside, folks, a novelty-making machine. Now, what do I mean by novelty? People mean- say "you mean like little plastic bugs and puzzles inside plastic capsules?" Is that what you mean by novelty?" - "No, you idiot, it's of course not." [Terence + audience laughter] By novelty I mean something that has never been seen before. Something unique. The new connection. I always think of the symbolist poet Lautreamont [sp?] who said "I am fascinated by the kind of beauty that arises when a bicycle meets a sewing machine on an operating table." Now, that's novelty, folks [audience giggle]. Because you just don't get that every day. So the Universe is a novelty-producing engine. It not only produces novelty, but it then preserves it and build upon it. So, if we now look at, um, the story which science tells us – and it's an interesting story, by the way – if you think I say things which are highly unlikely, notice that I do not ask you to believe that Universe sprang from a point of matter smaller than a proton in a single instant. This is the position of science. The is the limit case for credibility. I mean, if you can believe that, what in the world would you balk at for trying as well [audience laughter]. I mean that is the limit case for credibility. So, science tells us that the Universe sprang from nothing in a single instant, and that it was very hot, very hot [audience laughter]. So there were no molecules such as you and I are made out of, there were no atoms such as lead and gold and water are made out of. There was only a pure plasma of electrons. That was all, and the physics of that Universe were incredibly simple. There were the pure plasma physics unhindered by any other fields of any sort. Well, the Universe then cooled, and as it cooled, lo and behold, at a certain electrons were able to fall into stable orbits around atomic nuclei. And at that point, uh, atomic systems formed, and a whole kind of chemistry comes into being. Uh, further cooling, millions of years pass. Then we get the carbon nucleosynthesis of new stars. It has a six valence structure, so that, uh, we get organic molecules. Well then, quickly, we get long chain polymers. Very quickly then, long chain polymers that can copy themselves. And after- and that becomes primitive life. And at that point, you then get complex life. And then sexuality – meaning gene mixing as opposed to the previous thing which was vegetated like- like making cuttings from plants. Well, do you see what's happening? At each successive stage, the previous level of complexity is not only retained but used to build upon toward the next level of complexity. Well, the wonderful thing about this cosmology is that instead of human beings being like mute witnesses to the grandeur of Jehovah's creation, or some kind of trip like that, instead you discover "aha, human beings are important. We are more novel than anything else in nature." And we 20th century human beings are more novel, more interconnected, more complex, and in possession of more and different kinds of knowledge than most of the people who preceded us. So, this, uh, growing toward complexity seems to be what the Universe is all about. Now, it doesn't go on for hundreds of millions of years into the future, because as you can see each successive stage has, uh, proceeded more quickly than the stage before it. So now, we are in what I call the short epochs. We are in periods of time where more change goes on in a ten year period than went on in a million year period near the birth of the Universe. We are living in the complex novel end of things. And that complexity, and that novelty, which we experience as tremendous stress in our lives, ushers into the transcendental object at the end time. Not that far in the future. And we as psychical people have an obligation upon ourselves to anticipate and to help realize, uh, this future. It is upon us. Every messiah, every religious ontology, every, uh, manager of every booth that this exhibit is reflecting a distorted scintilla of the spiritual reality of the transcendental object at the end of time. Everyone of us is a particular eye [sp?] and distorted image of this transcendental object into which we are being dissolved, into which global culture, uh, dissolved. So, uh [long pause]. Well, so what? [Terence + audience laughter] So we can cut into this cycle at any point. We can become aware of it, we can become part of it, we can deny it. There is no loss in the circuit. There is no blame. Becoming then what psychedelical means is, it means claiming this dimension as your own. You know, Plato said "time is the moving image of eternity." That moving image of eternity can be beheld in the silent darkness of the mind, in five grams of psilocybin [audience giggle]. And if you think the Universe is mundane, if you think there are no more frontiers to cross, no more adventures to be had, I'm telling you you can turn your living room into the bridge of Magellan's ship on a long Saturday evening [audience laughter] with five grams of psilocybin in silent darkness. We are living in the most empowering age in human history. Because all of the energy of the ancestors, not only the human ancestors but our animal, our primate ancestors, all of that energy pours into, is focused into this moment. We are the transition generation. We have one foot in matter and one foot in hyperspace. And we can redeem the trust of thousands of years. All of the horror of History can be redeemed if we don't drop the ball. Every pogrom, every instance of racial, sexual or minority persecution can be redeemed if we give the human adventure meaning. And we give it meaning by discovering the totality within ourselves and then amplifying it for each other.

And this dissolves boundaries, empowers the weak, uh, enlightens the strong, and brings hope to all. And it can only be done if we accept the gifts which Nature has offered us. Thank you very, very much. [audience applause]

Mushrooms, Elves and Magic

30 November 1988

Big Sur, California

Description

- [Scribd Transcript](#)

Terence McKenna is one of the leading authorities on the ontological foundations of shamanism and the ethnopharmacology of spiritual transformation. After graduating from UC Berkeley with a major in Ecology, Resource Conservation and Shamanism, he traveled through the Asian and New World Tropics and became specialized in the shamanism and ethno-medicine of the Amazon Basin. What he learned in these explorations is documented in *The Invisible Landscape*, which he wrote with his brother Dennis. Born in 1946, Terence is the father of two children, a girl of eleven and a boy of fourteen. He is the founder of Botanical Dimensions—a tax-exempt, nonprofit research botanical garden based in Hawaii. This project is devoted to collecting and propagating plants of ethno-pharmacological interest and preserving the shamanic lore which accompanies their use. Living in California, Terence divides his time between writing and lecturing and he has developed a software program called *Timewave Zero*. His hypnotic multi-syllabic drawl is captured on the audio-tape adventure series *True Hallucinations*—soon to be published in book form—which tells of his adventures in far-flung lands in various exotic states of consciousness. Terence is also the author of *Food of the Gods*, which is a unique study of the impact of psychotropic plants on human culture and evolution and *The Archaic Revival*, in which this interview appears. His latest book *Dialogues at the Edge of the West*, is a collection of "discursive chats" with mathematician Ralph Abraham and biologist Rupert Sheldrake. This was our first interview. It took place on November 30th, 1988 in the dramatic setting of Big Sur. Overlooking the Pacific Ocean we sat on the top floor of the Big House at the Esalen Institute, where Terence was giving a weekend seminar. He needed little provocation to enchant us with the pyrotechnic wordplay which is his trademark, spinning together the cognitive destinies of Gaia, machines, and language and offering a highly unorthodox description of our own evolution.

DJB: It's a pleasure to be here with you again, Terence. We'd like to begin by asking you to tell us how you became interested in shamanism and the exploration of consciousness.

Terence McKenna: I discovered shamanism through an interest in Tibetan folk religion. Bon, the pre-Buddhist religion of Tibet is a kind of shamanism. Ingoing from the particular to the general with that concern, I studied shamanism as a general phenomenon. It all started out as an art historical interest in the pre-Buddhist iconography of *thankas*.

DJB: This was how long ago?

TM: This was in '67 when I was a sophomore in college. The interest in altered states of consciousness came simply from, I don't know whether I was a precocious kid or what, but I was very early into the New

York literary scene, and even though I lived in a small town in Colorado, I subscribed to the Village Voice, and there I encountered propaganda about LSD, mescaline, and all these experiments that the late beatniks were involved in. Then I read *The Doors of Perception* and *Heaven and Hell*, and it just rolled from there. That was what really put me over. I respected Huxley as a novelist, and I was slowly reading everything he'd ever written, and when I got to *The Doors of Perception* I said to myself, "There's something going on here for sure."

DJB: To what do you attribute your increasing popularity, and what role do you see yourself playing in the social sphere?

TM: Well, without being cynical, the main thing I attribute to my increasing popularity is better public relations. As far as what role I'll play, I don't know, I mean I assume that anyone who has anything constructive to say about our relationship to chemical substances, natural and synthetic, is going to have a social role to play, because this drug issue is just going to loom larger and larger on the social agenda until we get some resolution of it, and by resolution I don't mean suppression or just saying no. I anticipate a new open-mindedness born of desperation on the part of the Establishment. Drugs are part of the human experience, and we have got to create a more sophisticated way of dealing with them than exhortations to abstinence, because that has failed.

RMN: You have said that the term "New Age" trivializes the significance of the next phase in human evolution and have referred instead to the emergence of an archaic revival. How do you differentiate between these two expressions?

TM: The New Age is essentially humanistic psychology, eighties style, with the addition of neo-shamanism, channeling, crystal and herbal healing, and this sort of thing. The archaic revival is a much larger, more global phenomenon that assumes that we are recovering the social forms of the late Neolithic. It reaches far back in the twentieth century to Freud, to surrealism, to abstract expressionism, even to a phenomenon like National Socialism which is a negative force. But the stress on ritual, on organized activity, on race/ancestor consciousness these are themes that have been worked out throughout the entire twentieth century, and the archaic revival is an expression of that.

RMN: In the book you wrote with your brother Dennis, *The Invisible Landscape*, and in recent lectures and workshops, you've spoken of a new model of time and your efforts to model the evolution of novelty based on the ancient oriental system of divination, the I-Ching. Can you briefly explain how you developed this model, and how an individual can utilize this system to modulate their own perspective on the nature of time?

TM: Ah, no. I think I'd rather send you a reprint of a recent paper in revision than to try and cover that. It's not easily explained. If I were to give an extremely brief resume of it, I would say that the new view of time is that time is holographic, fractal, and moves toward a definitive conclusion, rather than the historical model of time which is open-ended, trendlessly fluctuating, and in practical terms endless. What's being proposed is a spiral model of history, that sees history as a process actually leading toward a conclusion. But the details of it are fairly complex.

DJB: According to your time-wave model, novelty reaches its peak expression and history appears to come to a close in the year 2012. Can you explain what you mean by this, and what the global or evolutionary

implications are of what you refer to as the "end of time"?

TM: What I mean is this. The theory describes time with what are called novelty waves, because waves have wavelengths, one must assign an endpoint to the novelty wave, so the end of time is nothing more than the point on the historical continuum that is assigned as the end point of the novelty wave. Novelty, is something which has been slowly maximized through the life of the universe, something which reaches infinite density, or infinite contraction at the point from which the wave is generated. Trying to imagine what time would be like near the temporal singularity is difficult because we are far from it, in another domain of physical law. There need to be more facts in play, before we will be able to correctly envisage the end of time, but what we can say concerning the singularity is this: it is the obviation of life in three-dimensional space, everything that is familiar comes to an end, everything that can be described in Euclidian space is superseded by modes of being which require a more complicated description which is currently unavailable.

DJB: From your writings I have gleaned that you subscribe to the notion that psilocybin mushrooms are a species of high intelligence, that they arrived on this planet as spores that migrated through outer space and are attempting to establish a symbiotic relationship with human beings. In amore holistic perspective, how do you see this notion fitting into the context of Francis Crick's theory of directed panspermia, the hypothesis that all life on this planet and it's directed evolution has been seeded, or perhaps fertilized, by spores designed by a higher intelligence? Terence: As I understand the Crick theory of panspermia, it's a theory of how life spread through the universe. What I was suggesting, and I don't believe it as strongly as you imply, but I entertain it as a possibility, that intelligence--not life but intelligence--may have come here in this spore bearing life form. This is a more radical version of the panspermia theory of Crick and Ponampurama. In fact I think that theory will probably be vindicated. I think in a hundred years if people do biology they will think it quite silly that people once thought that spores could not be blown from one star system to another by cosmic radiation pressure. As far as the role of the psilocybin mushroom, or its relationship to us and to intelligence, this is something that we need to consider. It really isn't important that I claim that it's an extraterrestrial, what we need is a body of people claiming this, or a body of people denying it, because what we're talking about is the experience of the mushroom. Few people are in a position to judge its extraterrestrial potential because few people in

the orthodox sciences have ever experienced the full spectrum of psychedelic effects that is unleashed. One cannot find out whether or not there's an extraterrestrial intelligence inside the mushroom unless one is willing to take the mushroom.

DJB: You have a unique theory about the role that psilocybin mushrooms play in the process of human evolution. Can you tell us about this?

TM: Whether the mushrooms came from outer space or not, the presence of psychedelic substances in the diet of early human beings created a number of changes in our evolutionary situation. When a person takes small amounts of psilocybin their visual acuity improves. They can actually see slightly better, and this means that animals allowing psilocybin into their food chain would have increased hunting success, which means increased food supply, which means increased reproductive success, which is the name of the game in evolution. It is the organism that manages to propagate itself numerically that is successful. The presence of psilocybin in the diet of early pack-hunting primates caused the individuals that were ingesting the psilocybin to have increased visual acuity. At slightly higher doses of psilocybin there is sexual arousal

and erection and everything that goes under the term arousal of the central nervous system. Again, a factor which would increase reproductive success is reinforced.

DJB: Isn't it true that psilocybin inhibits orgasm?

TM: No. I've never heard that. Not at the doses I'm talking about. At a psychedelic dose it might, but at just slightly above the "you can feel it" dose, it acts as a stimulant. Sexual arousal means paying attention, it means jumpiness, it indicates a certain energy level in the organism. And then, of course, at still higher doses psilocybin triggers this activity in the language-forming capacity of the brain that manifests as song and vision. It is as though it is an enzyme which stimulates eyesight, sexual interest, and imagination. And the three of these going together produce language-using primates. Psilocybin may have synergized the emergence of higher forms of psychic organization out of primitive protohuman animals. It can be seen as a kind of evolutionary enzyme, or evolutionary catalyst.

DJB: During your shamanistic voyages how do you, or do you, differentiate between the literal and the metaphorical I/thou dialogue that appears to occur in certain states of consciousness? In other words how do you differentiate between the possibility that you are communicating with otherworldly independently existing entities and the possibility that you are communicating with isolated, unconscious neuron clusters in your own brain?

Terence: It's very hard to differentiate it. How can I make that same distinction right now? How do I know I'm talking to you? It's just provisionally assumed, that you are ordinary enough that I don't question that you're there. But if you had two heads, I would question whether you were there. I would investigate to see if you were really what you appear to be. It's very hard to tell what this I/thou relationship is about, because it's very difficult to define the "I" part of it, let alone the "thou" part of it. I haven't found a way to tell, to trick it as it were into showing whether it was an extraterrestrial or the back side of my own head.

DJB: But normally the way we can tell is we receive mutual verification from other people, and we get information from many senses. You can touch me. You can see me. You can hear me.

Terence: Well, this is simply a voice, you know, so it's the issue of the mysterious telephone call. If you're awakened in the middle of the night by a telephone call, and you pick up the phone, and someone says "Hello" it would not be your first inclination to ask "Is anybody there?" because they just said hello. That establishes that somebody is there, but you can't see them, maybe they're aren't there, maybe you've been called by a machine. I've been called by machines. You pick up the phone and it says, "Hello this is Sears, and we're calling to tell you that your order 16312 is ready for pick up," and you say, "Oh, thank you." "Don't mention it." No, so this issue of identifying the other with certainty is tricky, even in ordinary intercourse.

RMN: There is a lot of current interest in the ancient art of sound technology. In a recent article you said that in certain states of consciousness you're able to create a kind of visual resonance and manipulate a "topological manifold" using sound vibrations. Can you tell us more about this technique, its ethnic origins, and potential applications? Terence: Yes, it has to do with shamanism that is based on the use of DMT implants. DMT is a near--or pseudo-neurotransmitter, that when ingested and allowed to come to rest in the synapses of the brain, allows one to see sound, so that one can use the voice to produce, not musical compositions, but pictorial and visual compositions. This, to my mind, indicates that we're on the

cusps of some kind of evolutionary transition in the language-forming area, so that we are going to go from a language that is heard to a language that is seen, through a shift in interior processing. The language will still be made of sound, but it will be processed as the carrier of the visual impression. This is actually being done by shamans in the Amazon. The songs they sing sound as they do in order to look a certain way. They are not musical compositions as we're used to thinking of them. They are pictorial art that is caused by audio signals.

DJB: Terence, you're recognized by many as one of the great explorers of the twentieth century. You've trekked through the Amazonian jungles and soared through the uncharted regions of the brain, but perhaps your ultimate voyages lie in the future, when humanity has mastered space technology and time travel. What possibilities for travel in these two areas do you foresee, and how do you think these new technologies will affect the future evolution of the human species?

Terence: Some question. I suppose most people believe space travel is right around the corner. I certainly hope so. I think we should all learn Russian in anticipation of it, because apparently the U.S. government is incapable of sustaining a space program. The time travel question is more interesting. Possibly the world is experiencing a compression of technological novelty that is going to lead to developments that are very much like what we would imagine time travel to be. We may be closing in on the ability to transmit information forward into the future, and to create an informational domain of communication between various points in time. How this will be done is difficult to imagine, but things like fractal mathematics, superconductivity, and nanotechnology offer new and novel approaches to realization of these old dreams. We shouldn't assume time travel is impossible simply because it hasn't been done. There's plenty of latitude in the laws of quantum physics to allow for moving information through time in various ways. Apparently you can move information through time, as long as you don't move it through time faster than light.

DJB: Why is that?

TM: I haven't the faintest idea. What am I, Einstein?

DJB: What do you think the ultimate goal of human evolution is?

Terence: Oh, a good party.

DJB: Have you ever had any experiences with lucid dreaming--the process by which one can become aware and conscious within a dream that one is dreaming---and if so, how do they compare with your other shamanic experiences?

Terence: I really haven't had experiences with lucid dreaming. It's one of those things that I'm very interested in. I'm sort of skeptical of it. I hope it's true, because what a wonderful thing that would be.

DJB: You've never had one?

TM: I've had lucid dreams, but I have no technique for repeating them on demand, the dream state is possibly anticipating this cultural frontier that we're moving toward. We're moving toward something very much like eternal dreaming, going into the imagination, and staying there, and that would be like a lucid

dream that knew no end, but what a tight simple solution. One of the things that interests me about dreams is this: I have dreams in which I smoke DMT, and it works. To me that's extremely interesting because it seems to imply that one does not have to smoke DMT to have the experience. You only have to convince your brain that you have done this, and it then delivers this staggering altered state. DJB: Wow! Terence: How many people who have had DMT dream occasionally of smoking it and have it happen? Do people who have never had DMT ever have that kind of an experience in a dream? I bet not. I bet you have to have done it in life to have established the knowledge of its existence, and the image of how it's possible, then this thing can happen to you without any chemical intervention. It is more powerful than any yoga, so taking control of the dream state would certainly be an advantageous thing and carry us a great distance toward the kind of cultural transformation that we're talking about. How exactly to do it, I'm not sure. The psychedelics, the near death experience, the lucid dreaming, the meditational reveries..., all of these things are pieces of a puzzle about how to create a new cultural dimension that we can all live in a little more sanely than we're living in these dimensions.

DJB: Do you have any thoughts on what happens to human consciousness after biological death?

TM: I've thought about it. When I think about it I feel like I'm on my own. The logos doesn't want to help here, has nothing to say to me on the subject of biological death. What I imagine happens is that for the self time begins to flow backwards; even before death, the act of dying is the act of reliving an entire life, and at the end of the dying process, consciousness divides into the consciousness of ones parents and ones children, and then it moves through these modalities, and then divides again. It's moving forward into the future through the people who come after you, and backwards into the past through your ancestors. The further away from the moment of death it is, the faster it moves, so that after a period of time, the Tibetans say 42 days, one is reconnected to everything that ever lived, and the previous ego-pointed existence is defocused, and one is you know, returned to the ocean, the morphogenetic field, or the One of Plotinus, you choose your term. A person is a focused illusion of being, and death occurs when the illusion of being can be sustained no longer. Then everything flows out and away from this disequilibrium state that life is. It is a state of disequilibrium, and it is maintained for decades, but finally, like all disequilibrium states, it must yield to the Second Law of Thermodynamics, and at that point it runs down, its specific character disappears into the general character of the world around it. It has returned then to the void/plenum.

DJB: What if you don't have children?

TM: Well, then you flow backward into the past, into your parents, and their parents, and their parents, and eventually all life, and back into the primal protozoa. No, it's a hard thing to face, but from the long-term point of view of nature, you have no relevance for the future whatsoever, unless you procreate. It's very interesting that in the celebration of the Eleusinian Mysteries, when they took the sacrament, what the god said was, "Procreate, procreate." It is uncanny the way history is determined by who sleeps with whom, who gets born, what lines are drawn forward, what tendencies are accelerated. Most people experience what they call magic only in the dimension of mate-seeking, and this is where even the dullest people have astonishing coincidences, and unbelievable things go on --it's almost as though hidden strings were being pulled. There's an esoteric tradition that the genes, the matings, are where it's all being run from. It is how I think a super extraterrestrial would intervene. It wouldn't intervene at all, it would make us who it wanted us to be by controlling synchronicity and coincidence around mate choosing. RMN: Rupert Sheldrake has recently refined the theory of the morphogenetic field--a non-material organizing collective memory field

which affects all biological systems. This field can be envisioned as a hyper-spatial information reservoir which brims and spills over into a much larger region of influence when critical mass is reached--a point referred to as morphic resonance. Do you think this morphic resonance could be regarded as a possible explanation for the phenomena of spirits and other metaphysical entities, and can the method of evoking beings from the spirit world be simply a case of cracking the morphic code?

TM: That sounds right. It's something like that. If what you're trying to get at is do I think morphogenetic fields are a good thing, or do they exist, yes I think some kind of theory like that is clearly becoming necessary, and that the next great step to be taken in the intellectual conquest of nature, if you will, is a theory about how, out of the class of possible things, some things actually happen.

RMN: Do you think it could be related to the phenomena of spirits?

TM: Spirits are the presence of the past, specifically expressed. When you go to ruins like Angkor Wat, or Tikal, the presence is there. You have to be pretty dull to not see how it was, where the market stalls were, the people and their animals, and the trade goods. It's quite weird. We're only conventionally bound in the present by our linguistic assumptions, but if we can still our linguistic machinery, the mind spreads out into time, and behaves in very unconventional ways.

DJB: How do you view the increasing waves of designer psychedelics and brain enhancement machines in the context of Rupert Sheldrake's theory of morphogenetic fields?

TM: Well, I'm hopeful, but somewhat suspicious. I think drugs should come from the natural world, and be use-tested by shamanically oriented cultures. Then they have a very deep morphogenetic field, because they've been used thousands and thousands of years in magical contexts. A drug produced in the laboratory and suddenly distributed worldwide simply amplifies the global noise present in the historical crisis. And then there's the very practical consideration that one cannot predict the long term effects of a drug produced in a laboratory. Something like peyote, or morning glories, or mushrooms have been used for vast stretches of time without detrimental social consequences. We know that. As far as the technological question is concerned, brain machines and all, I wish them luck. I'm willing to test anything that somebody will send me, but I'm skeptical. I think it's somehow like the speech-operated typewriter. It will recede ahead of us. The problems will be found to have been far more complex than first supposed.

DJB: Don't you think it's true that the designer psychedelics and the brain machines don't have much of a morphic field yet, so in a sense one is carving a new morphic field with their use, so it's up for grabs, and there would consequently be more possibilities for new things to happen, unlike the psychoactive substances which you speak of that have ancient morphic fields, and are much more entrenched in predictability and pattern, and therefore not as free for new types of expression? Terence: Possibly, although I don't know how you grab the morphic field of a new designer drug. For instance, I'll speak to my own experience, which is ketamine. My impression of ketamine was it's like a brand new skyscraper, all the walls, all the floors are carpeted in white, all the drinking fountains work, the elevators run smoothly, the fluorescent lights recede endlessly in all directions down the hallways. It's just that there's nobody there. There's no office machinery, there's no hurrying secretaries, there's no telephones, it's just this immense, empty structure waiting. Well, I can't move into a sixty-story office building, I have only enough stuff to fill a few small rooms, so it gives me a slightly spooked-out feeling to enter into these empty morphic fields. If you take mushrooms, you know, you're climbing on board a starship manned by every shaman

who ever did it in front of you, and this is quite a crew, and they've really pulled some stunts over the millennia, and it's all there, the tapes to be played, but the designer things should be very cautiously dealt with.

DJB: It's interesting that John Lilly had very different experiences with ketamine. Do you think that there's any relationship between the self-transforming machine elves that you've encountered on your shamanic voyages and the solid state entities that John Lilly has contacted in his interdimensional travels?

TM: I don't think there is much congruence. The solid state entities that he contacted seem to make him quite upset. The elf machine entities that I encounter are the embodiment of merriment and humor. I have had a thought about this recently which I will tell you. One of the science fiction fantasies that haunts the collective unconscious is expressed in the phrase "a world run by machines"; in the 1950s this was first articulated in the notion, "perhaps the future will be a terrible place where the world is run by machines." Well now, let's think about machines for a moment. They are extremely impartial, very predictable, not subject to moral suasion, value neutral, and very long lived in their functioning. Now let's think about what machines are made of, in the light of Sheldrake's morphogenetic field theory. Machines are made of metal, glass, gold, silicon, plastic; they are made of what the earth is made of. Now wouldn't it be strange if biology is a way for earth to alchemically transform itself into a self-reflecting thing. In which case then, what we're headed for inevitably, what we are in fact creating is a world run by machines. And once these machines are in place, they can be expected to manage our economies, languages, social aspirations, and so forth, in such a way that we stop killing each other, stop starving each other, stop destroying land, and so forth. Actually the fear of being ruled by machines is the male ego's fear of relinquishing control of the planet to the maternal matrix of Gaia.

DJB: It's interesting the way you anticipate each question. The recent development of fractal images seems to imply that visions and hallucinations can be broken down into a precise mathematical code. With this in mind, do you think the abilities of the human imagination can be replicated in a super computer?

TM: Yes. Saying that the components of hallucinations can be broken down and duplicated by mathematical code isn't taking anything away from them. Reality can be taken apart and reduplicated with this same mathematical code, that's what makes the fractal idea so powerful. One can type in half a page of code, and on the screen get river systems, mountain ranges, deserts, ferns, coral reefs, all being generated out of half a page of computer coding. This seems to imply that we are finally discovering really powerful mathematical rules that stand behind visual appearances. And yes, I think supercomputers, computer graphics and simulated environments, this is very promising stuff. When the world's being run by machines, we'll be at the movies. Oh boy.

RMN: It seems that human language is evolving at a much slower rate than is the ability of human consciousness to navigate more complex and more profound levels of reality. How do you see language developing and evolving so as to become a more sensitive transceiving device for sharing conscious experience?

TM: Actually, consciousness can't evolve any faster than language. The rate at which language evolves determines how fast consciousness evolves, otherwise you're just lost in what Wittgenstein called the unspeakable. You can feel it, but you can't speak of it, so it's an entirely private reality. Have you noticed how we have very few words for emotions? I love you, I hate you, and then basically we run a dial between

those. I love you a lot, I hate you a lot.

RMN: How do you feel? Fine.

TM: Yes, how do you feel, fine, and yet we have thousands and thousands of words about rugs, and widgets, and this and that, so we need to create a much richer language of emotion. There are times--and this would be a great study for somebody to do--there have been periods in English when there were emotions which don't exist anymore, because the words have been lost. This is getting very close to this business of how reality is made by language. Can we recover a lost emotion, by creating a word for it? There are colors which don't exist any more because the words have been lost. I'm thinking of the word "jacinth." This is a certain kind of orange. Once you know the word "jacinth," you always can recognize it, but if you don't have it, all you can say is it's a little darker orange than something else. We've never tried to consciously evolve our language, we've just let it evolve, but now we have this level of awareness, and this level of cultural need where we really must plan where the new words should be generated. There are areas where words should be gotten rid of that empower political wrong thinking. The propagandists for the fascists already understand this, they understand that if you make something unsayable, you've made it unthinkable. So it doesn't plague you anymore. So planned evolution of language is the way to speed it toward expressing the frontier of consciousness.

DJB: I've thought at times that what you view as a symbiosis forming between humans and psychoactive plants may in fact be the plants taking over control of our lives and commanding us to do their bidding. Have you any thoughts on this?

TM: Well, symbiosis is not parasitism, symbiosis is a situation of mutual benefit to both parties, so we have to presume that the plants are getting as much out of this as we are. What we're getting is information from another spiritual level. Their point of view, in other words, is what they're giving us. What we're giving them is care, and feeding, and propagation, and survival, so they give us their elevated higher dimensional point of view. We in turn respond by making the way easier for them in the physical world. And this seems a reasonable trade-off. Obviously they have difficulty in the physical world, plants don't move around much. You talk about Tao, a plant has the Tao. It doesn't even chop wood and carry water.

RMN: Future predictions are often based upon the study of previous patterns and trends which are then extended like the contours of a map to extrapolate the shape of things to come. The future can also be seen as an ongoing dynamic creative interaction between the past and the present--the current interpretation of past events actively serves to formulate these future patterns and trends. Have you been able to reconcile these two perspectives so that humanity is able to learn from its experiences without being bound by the habits of history?

TM: The two are antithetical. You must not be bound by the habits of history if you want to learn from your experience. It was Ludwig von Bertalanffy, the inventor of general systems theory, who made the famous statement that "people are not machines, but in all situations where they are given the opportunity, they will act like machines," so you have to keep disturbing them, 'cause they always settle down into a routine. So, historical patterns are largely cyclical, but not entirely; there is ultimately a highest level of the pattern which does not repeat, and that's the part which is responsible for the advance into true novelty.

RMN: The part that doesn't repeat. Hmm. The positive futurists tend to fall into two groups. Some visualize the future as becoming progressively brighter every day and that global illumination will occur as a result of this progression; others envision a period of actual devolution, a dark age, through which human consciousness must pass before more advanced stages are reached. Which scenario do you see as being the most likely to emerge, and why do you hold this view?

TM: I guess I'm a soft Dark Ager. I think there will be a mild dark age, I don't think it will be anything like the dark ages which lasted a thousand years, I think it will last more like five years, and will be a time of economic retraction, religious fundamentalism, retreat into closed communities by certain segments of the society, feudal warfare among minor states, and this sort of thing. But I think it will give way in the late Nineties to the actual global future that we're all yearning for, and then there will be basically a fifteen-year period where all these things are drawn together with progressively greater and greater sophistication, much in the way that modern science and philosophy have grown with greater and greater sophistication in a single direction since the Renaissance, and that some time around the end of 2012 all of this will be boiled down into a kind of alchemical distillation of the historical experience that will be a doorway into the life of the imagination.

RMN: Rupert Sheldrake's morphic resonance, Ralph Abraham's chaos theory, and your time wave model all appear to contain complimentary patterns which operate on similar underlying principles--that energy systems store information until a certain level is reached and the information is then transduced into a larger frame of reference, like water in a tiered fountain. Have you worked these theories into an all encompassing meta-theory of how the universe functions and operates?

TM: Well, it is true that the three of us and I would add Frank Barr in there, who is less well known, but has a piece of the puzzle as well--we're all complimentary. Rupert's theory is, at this point a hypothesis. There are no equations, there's no predictive machinery, it's a way of speaking about experimental approaches. My time wave thing is like an extremely formal and specific example of what he's talking about in a general way. And then what Ralph's doing is providing a bridge from the kind of things Rupert and I are doing back into the frontier branch of ordinary mathematics called dynamic modeling. And Frank is an expert in the repetition of fractal process. He can show you the same thing happening on many, many levels, in many, many different expressions. So I have named us Compressionists, or Psychedelic Compressionists. A Compressionism holds that the world is growing more and more complex, compressed, knitted together, and therefore holographically complete at every point, and that's basically where the four of us stand, I think, but from different points of view.

DJB: Can you tell us about Botanical Dimensions, and any current projects that you're working on? Terence: Botanical Dimensions is a non-profit foundation that attempts to rescue plants with a history of shamanic and human usage in the warm tropics, and rescue the information about how they're used, store the information in computers, and move the plants to a nineteen-acre site on the big island of Hawaii, in a rainforest belt that reasonably replicates the Amazon situation. There we are keeping them toward the day when someone will want to do serious research on them. As a non-profit foundation we solicit donations, publish a newsletter, and support a number of collectors in the field to carry on this work, which nobody else is really doing. There's a lot of rainforest conservation going on, but very little effort to conserve the folk-knowledge of native peoples. Amazonian people are going off to sawmills and repairing outboard motors, and this whole body of knowledge about plants is going to be lost in the next generation. We're saving it, and saving the plants in a botanical garden in Hawaii.

Terence McKenna is one of the leading authorities on the ontological foundations of shamanism and the ethno-pharmacology of spiritual transformation. After graduating from UC Berkeley with a major in Ecology, Resource Conservation and Shamanism, he traveled through the Asian and New World Tropics and became specialized in the shamanism and ethno-medicine of the Amazon Basin. What he learned in these explorations is documented in *The Invisible Landscape*, which he wrote with his brother Dennis. Born in 1946, Terence is the father of two children, a girl of eleven and a boy of fourteen. He is the founder of Botanical Dimensions—a tax-exempt, nonprofit research botanical garden based in Hawaii. This project is devoted to collecting and propagating plants of ethno-pharmacological interest and preserving the shamanic lore which accompanies their use. Living in California, Terence divides his time between writing and lecturing and he has developed a software program called *Timewave Zero*. His hypnotic multi-syllabic drawl is captured on the audio-tape adventure series *True Hallucinations*—soon to be published in book form—which tells of his adventures in far-flung lands in various exotic states of consciousness. Terence is also the author of *Food of the Gods*, which is a unique study of the impact of psychotropic plants on human culture and evolution and *The Archaic Revival*, in which this interview appears. His latest book *Dialogues at the Edge of the West*, is a collection of "discursive chats" with mathematician Ralph Abraham and biologist Rupert Sheldrake. This was our first interview. It took place on November 30th, 1988 in the dramatic setting of Big Sur. Overlooking the Pacific Ocean we sat on the top floor of the Big House at the Esalen Institute, where Terence was giving a weekend seminar. He needed little provocation to enchant us with the pyrotechnic wordplay which is his trademark, spinning together the cognitive destinies of Gaia, machines, and language and offering a highly unorthodox description of our own evolution. - RMN

Go to Interview Bibliography

DJB: It's a pleasure to be here with you again, Terence. We'd like to begin by asking you to tell us how you became interested in shamanism and the exploration of consciousness.

Terence: I discovered shamanism through an interest in Tibetan folk religion. Bon, the pre-Buddhist religion of Tibet is a kind of shamanism. In going from the particular to the general with that concern, I studied shamanism as a general phenomenon. It all started out as an art historical interest in the pre-Buddhist iconography of thankas.

DJB: This was how long ago?

Terence: This was in '67 when I was a sophomore in college. The interest in altered states of consciousness came simply from, I don't know whether I was a precocious kid or what, but I was very early into the New York literary scene, and even though I lived in a small town in Colorado, I subscribed to the Village Voice, and there I encountered propaganda about LSD, mescaline, and all these experiments that the late beatniks were involved in. Then I read *The Doors of Perception* and *Heaven and Hell*, and it just rolled from there. That was what really put me over. I respected Huxley as a novelist, and I was slowly reading everything he'd ever written, and when I got to *The Doors of Perception* I said to myself, "There's something going on here for sure."

DJB: To what do you attribute your increasing popularity, and what role do you see yourself playing in the social sphere?

Terence: Well, without being cynical, the main thing I attribute to my increasing popularity is better public relations. As far as what role I'll play, I don't know, I mean I assume that anyone who has anything constructive to say about our relationship to chemical substances, natural and synthetic, is going to have a social role to play, because this drug issue is just going to loom larger and larger on the social agenda until we get some resolution of it, and by resolution I don't mean suppression or just saying no. I anticipate a new open-mindedness born of desperation on the part of the Establishment. Drugs are part of the human experience, and we have got to create a more sophisticated way of dealing with them than exhortations to abstinence, because that has failed.

RMN: You have said that the term "New Age" trivializes the significance of the next phase in human evolution and have referred instead to the emergence of an archaic revival. How do you differentiate between these two expressions?

Terence: The New Age is essentially humanistic psychology, eighties style, with the addition of neo-shamanism, channeling, crystal and herbal healing, and this sort of thing. The archaic revival is a much larger, more global phenomenon that assumes that we are recovering the social forms of the late Neolithic. It reaches far back in the twentieth century to Freud, to surrealism, to abstract expressionism, even to a phenomenon like National Socialism which is a negative force. But the stress on ritual, on organized activity, on race/ancestor consciousness these are themes that have been worked out throughout the entire twentieth century, and the archaic revival is an expression of that.

RMN: In the book you wrote with your brother Dennis, *The Invisible Landscape*, and in recent lectures and workshops, you've spoken of a new model of time and your efforts to model the evolution of novelty based on the ancient oriental system of divination, the I-Ching. Can you briefly explain how you developed this model, and how an individual can utilize this system to modulate their own perspective on the nature of time?

Terence: Ah, no. I think I'd rather send you a reprint of a recent paper in *Revision* than to try and cover that. It's not easily explained. If I were to give an extremely brief resume of it, I would say that the new view of time is that time is holographic, fractal, and moves toward a definitive conclusion, rather than the historical model of time which is openended, trendlessly fluctuating, and in practical terms endless. What's being proposed is a spiral model of history, that sees history as a process actually leading toward a conclusion. But the details of it are fairly complex.

DJB: According to your time-wave model, novelty reaches its peak expression and history appears to come to a close in the year 2012. Can you explain what you mean by this, and what the global or evolutionary implications are of what you refer to as the "end of time"?

Terence: What I mean is this. The theory describes time with what are called novelty waves, because waves have wavelengths, one must assign an end point to the novelty wave, so the end of time is nothing more than the point on the historical continuum that is assigned as the end point of the novelty wave. Novelty, is something which has been slowly maximized through the life of the universe, something which reaches

infinite density, or infinite contraction at the point from which the wave is generated. Trying to imagine what time would be like near the temporal singularity is difficult because we are far from it, in another domain of physical law. There need to be more facts in play, before we will be able to correctly envisage the end of time, but what we can say concerning the singularity is this: it is the obviation of life in three-dimensional space, everything that is familiar comes to an end, everything that can be described in Euclidian space is superseded by modes of being which require a more complicated description which is currently unavailable.

DJB: From your writings I have gleaned that you subscribe to the notion that psilocybin mushrooms are a species of high intelligence, that they arrived on this planet as spores that migrated through outer space and are attempting to establish a symbiotic relationship with human beings. In a more holistic perspective, how do you see this notion fitting into the context of Francis Crick's theory of directed panspermia, the hypothesis that all life on this planet and it's directed evolution has been seeded, or perhaps fertilized, by spores designed by a higher intelligence?

Terence: As I understand the Crick theory of panspermia, it's a theory of how life spread through the universe. What I was suggesting, and I don't believe it as strongly as you imply, but I entertain it as a possibility, that intelligence--not life but intelligence--may have come here in this spore bearing life form. This is a more radical version of the panspermia theory of Crick and Ponampurama. In fact I think that theory will probably be vindicated. I think in a hundred years if people do biology they will think it quite silly that people once thought that spores could not be blown from one star system to another by cosmic radiation pressure. As far as the role of the psilocybin mushroom, or its relationship to us and to intelligence, this is something that we need to consider. It really isn't important that I claim that it's an extraterrestrial, what we need is a body of people claiming this, or a body of people denying it, because what we're talking about is the experience of the mushroom. Few people are in a position to judge its extraterrestrial potential because few people in the orthodox sciences have ever experienced the full spectrum of psychedelic effects that is unleashed. One cannot find out whether or not there's an extraterrestrial intelligence inside the mushroom unless one is willing to take the mushroom.

DJB: You have a unique theory about the role that psilocybin mushrooms play in the process of human evolution. Can you tell us about this?

Terence: Whether the mushrooms came from outer space or not, the presence of psychedelic substances in the diet of early human beings created a number of changes in our evolutionary situation. When a person takes small amounts of psilocybin their visual acuity improves. They can actually see slightly better, and this means that animals allowing psilocybin into their food chain would have increased hunting success, which means increased food supply, which means increased reproductive success, which is the name of the game in evolution. It is the organism that manages to propagate itself numerically that is successful. The

presence of psilocybin in the diet of early pack-hunting primates caused the individuals that were ingesting the psilocybin to have increased visual acuity. At slightly higher doses of psilocybin there is sexual arousal and erection and everything that goes under the term arousal of the central nervous system. Again, a factor which would increase reproductive success is reinforced.

DJB: Isn't it true that psilocybin inhibits orgasm?

Terence: No. I've never heard that. Not at the doses I'm talking about. At a psychedelic dose it might, but at just slightly above the "you can feel it" dose, it acts as a stimulant. Sexual arousal means paying attention, it means jumpiness, it indicates a certain energy level in the organism. And then, of course, at still higher doses psilocybin triggers this activity in the language-forming capacity of the brain that manifests as song and vision. It is as though it is an enzyme which stimulates eyesight, sexual interest, and imagination. And the three of these going together produce language-using primates. Psilocybin may have synergized the emergence of higher forms of psychic organization out of primitive protohuman animals. It can be seen as a kind of evolutionary enzyme, or evolutionary catalyst.

DJB: During your shamanistic voyages how do you, or do you, differentiate between the literal and the metaphorical I/thou dialogue that appears to occur in certain states of consciousness? In other words how do you differentiate between the possibility that you are communicating with otherworldly independently existing entities and the possibility that you are communicating with isolated, unconscious neuron clusters in your own brain?

Terence: It's very hard to differentiate it. How can I make that same distinction right now? How do I know I'm talking to you? It's just provisionally assumed, that you are ordinary enough that I don't question that you're there. But if you had two heads, I would question whether you were there. I would investigate to see if you were really what you appear to be. It's very hard to tell what this I/thou relationship is about, because it's very difficult to define the "I" part of it, let alone the "thou" part of it. I haven't found a way to tell, to trick it as it were into showing whether it was an extraterrestrial or the back side of my own head.

DJB: But normally the way we can tell is we receive mutual verification from other people, and we get information from many senses. You can touch me. You can see me. You can hear me.

Terence: Well, this is simply a voice, you know, so it's the issue of the mysterious telephone call. If you're awakened in the middle of the night by a telephone call, and you pick up the phone, and someone says "Hello" it would not be your first inclination to ask "Is anybody there?" because they just said hello. That establishes that somebody is there, but you can't see them, maybe they're aren't there, maybe you've been

called by a machine. I've been called by machines. You pick up the phone and it says, "Hello this is Sears, and we're calling to tell you that your order 16312 is ready for pick up," and you say, "Oh, thank you." "Don't mention it." No, so this issue of identifying the other with certainty is tricky, even in ordinary intercourse.

RMN: There is a lot of current interest in the ancient art of sound technology. In a recent article you said that in certain states of consciousness you're able to create a kind of visual resonance and manipulate a "topological manifold" using sound vibrations. Can you tell us more about this technique, its ethnic origins, and potential applications?

Terence: Yes, it has to do with shamanism that is based on the use of DMT in plants. DMT is a near--or pseudo-neurotransmitter, that when ingested and allowed to come to rest in the synapses of the brain, allows one to see sound, so that one can use the voice to produce, not musical compositions, but pictorial and visual compositions. This, to my mind, indicates that we're on the cusp of some kind of evolutionary transition in the language-forming area, so that we are going to go from a language that is heard to a language that is seen, through a shift in interior processing. The language will still be made of sound, but it will be processed as the carrier of the visual impression. This is actually being done by shamans in the Amazon. The songs they sing sound as they do in order to look a certain way. They are not musical compositions as we're used to thinking of them. They are pictorial art that is caused by audio signals.

DJB: Terence, you're recognized by many as one of the great explorers of the twentieth century. You've trekked through the Amazonian jungles and soared through the uncharted regions of the brain, but perhaps your ultimate voyages lie in the future, when humanity has mastered space technology and time travel. What possibilities for travel in these two areas do you foresee, and how do you think these new technologies will affect the future evolution of the human species?

Terence: Some question. I suppose most people believe space travel is right around the corner. I certainly hope so. I think we should all learn Russian in anticipation of it, because apparently the U.S. government is incapable of sustaining a space program. The time travel question is more interesting. Possibly the world is experiencing a compression of technological novelty that is going to lead to developments that are very much like what we would imagine time travel to be. We may be closing in on the ability to transmit information forward into the future, and to create an informational domain of communication between various points in time. How this will be done is difficult to imagine, but things like fractal mathematics, superconductivity, and nanotechnology offer new and novel approaches to realization of these old dreams. We shouldn't assume time travel is impossible simply because it hasn't been done. There's plenty of latitude in the laws of quantum physics to allow for moving information through time in various ways. Apparently you can move information through time, as long as you don't move it through time faster than light.

DJB: Why is that?

Terence: I haven't the faintest idea. What am I Einstein?

DJB: What do you think the ultimate goal of human evolution is?

Terence: Oh, a good party.

DJB: Have you ever had any experiences with lucid dreaming--the process by which one can become aware and conscious within a dream that one is dreaming---and if so, how do they compare with your other shamanic experiences?

Terence: I really haven't had experiences with lucid dreaming. It's one of those things that I'm very interested in. I'm sort of skeptical of it. I hope it's true, because what a wonderful thing that would be.

DJB: You've never had one?

Terence: I've had lucid dreams, but I have no technique for repeating them on demand, the dream state is possibly anticipating this cultural frontier that we're moving toward. We're moving toward something very much like eternal dreaming, going into the imagination, áand staying there, and that would be like a lucid dream that knew no end, but what a tight simple solution. One of the things that interests me about dreams is this: I have dreams in which I smoke DMT, and it works. To me that's extremely interesting because it seems to imply that one does not have to smoke DMT to have the experience. You only have to convince your brain that you have done this, and it then delivers this staggering altered state.

DJB: Wow!

Terence: How many people who have had DMT dream occasionally of smoking it and have it happen? Do people who have never had DMT ever have that kind of an experience in a dream? I bet not. I bet you have to have done it in life to have established the knowledge of its existence, and the image of how it's possible, then this thing can happen to you without any chemical intervention. It is more powerful than any yoga, so taking control of the dream state would certainly be an advantageous thing and carry us a great distance toward the kind of cultural transformation that we're talking about. How exactly to do it, I'm not sure. The psychedelics, the near death experience, the lucid dreaming, the meditational reveries..., all of these things are pieces of a puzzle about how to create a new cultural dimension that we can all live in a little more sanely than we're living in these dimensions.

DJB: Do you have any thoughts on what happens to human consciousness after biological death?

Terence: I've thought about it. When I think about it I feel like I'm on my own. The logos doesn't want to help here, has nothing to say to me on the subject of biological death. What I imagine happens is that for the self time begins to flow backwards; even before death, the act of dying is the act of reliving an entire life, and at the end of the dying process, consciousness divides into the consciousness of ones parents and ones children, and then it moves through these modalities, and then divides again. It's moving forward into the future through the people who come after you, and backwards into the past through your ancestors. The further away from the moment of death it is, the faster it moves, so that after a period of time, the Tibetans say 42 days, one is reconnected to everything that ever lived, and the previous ego-pointed existence is defocused, and one is you know, returned to the ocean, the morphogenetic field, or the One of Plotinus, you choose your term. A person is a focused illusion of being, and death occurs when the illusion of being can be sustained no longer. Then everything flows out and away from this disequilibrium state that life is. It is a state of disequilibrium, and it is maintained for decades, but finally, like all disequilibrium states, it must yield to the Second Law of Thermodynamics, and at that point it runs down, its specific character disappears into the general character of the world around it. It has returned then to the void/plenum.

DJB: What if you don't have children?

Terence: Well, then you flow backward into the past, into your parents, and their parents, and their parents, and eventually all life, and back into the primal protozoa. No, it's a hard thing to face, but from the long-term point of view of nature, you have no relevance for the future whatsoever, unless you procreate. It's very interesting that in the celebration of the Eleusinian Mysteries, when they took the sacrament, what the god said was, "Procreate, procreate." It is uncanny the way history is determined by who sleeps with whom, who gets born, what lines are drawn forward, what tendencies are accelerated. Most people

experience what they call magic only in the dimension of mate-seeking, and this is where even the dullest people have astonishing coincidences, and unbelievable things go on --it's almost as though hidden strings were being pulled. There's an esoteric tradition that the genes, the matings, are where it's all being run from. It is how I think a super extraterrestrial would intervene. It wouldn't intervene at all, it would make us who it wanted us to be by controlling synchronicity and coincidence around mate choosing.

RMN: Rupert Sheldrake has recently refined the theory of the morphogenetic field--a non-material organizing collective memory field which affects all biological systems. This field can be envisioned as a hyper-spatial information reservoir which brims and spills over into a much larger region of influence when critical mass is reached--a point referred to as morphic resonance. Do you think this morphic resonance could be regarded as a possible explanation for the phenomena of spirits and other metaphysical entities, and can the method of evoking beings from the spirit world be simply a case of cracking the morphic code?

Terence: That sounds right. It's something like that. If what you're trying to get at is do I think morphogenetic fields are a good thing, or do they exist, yes I think some kind of theory like that is clearly becoming necessary, and that the next great step to be taken in the intellectual conquest of nature, if you will, is a theory about how, out of the class of possible things, some things actually happen.

RMN: Do you think it could be related to the phenomena of spirits?

Terence: Spirits are the presence of the past, specifically expressed. When you go to ruins like Angkor Wat, or Tikal, the presence is there. You have to be pretty dull to not see how it was, where the market stalls were, the people and their animals, and the trade goods. It's quite weird. We're only conventionally bound in the present by our linguistic assumptions, but if we can still our linguistic machinery, the mind spreads out into time, and behaves in very unconventional ways.

DJB: How do you view the increasing waves of designer psychedelics and brain enhancement machines in the context of Rupert Sheldrake's theory of morphogenetic fields?

Terence: Well, I'm hopeful, but somewhat suspicious. I think drugs should come from the natural world, and be use-tested by shamanically oriented cultures. Then they have a very deep morphogenetic field, because they've been used thousands and thousands of years in magical contexts. A drug produced in the laboratory and suddenly distributed worldwide simply amplifies the global noise present in the historical

crisis. And then there's the very practical consideration that one cannot predict the long term effects of a drug produced in a laboratory. Something like peyote, or morning glories, or mushrooms have been used for vast stretches of time without detrimental social consequences. We know that. As far as the technological question is concerned, brain machines and all, I wish them luck. I'm willing to test anything that somebody will send me, but I'm skeptical. I think it's somehow like the speech-operated typewriter. It will recede ahead of us. The problems will be found to have been far more complex than first supposed.

DJB: Don't you think it's true that the designer psychedelics and the brain machines don't have much of a morphic field yet, so in a sense one is carving a new morphic field with their use, so it's up for grabs, and there would consequently be more possibilities for new things to happen, unlike the psychoactive substances which you speak of that have ancient morphic fields, and are much more entrenched in predictability and pattern, and therefore not as free for new types of expression?

Terence: Possibly, although I don't know how you grab the morphic field of a new designer drug. For instance, I'll speak to my own experience, which is ketamine. My impression of ketamine was it's like a brand new skyscraper, all the walls, all the floors are carpeted in white, all the drinking fountains work, the elevators run smoothly, the fluorescent lights recede endlessly in all directions down the hallways. It's just that there's nobody there. There's no office machinery, there's no hurrying secretaries, there's no telephones, it's just this immense, empty structure waiting. Well, I can't move into a sixty-story office building, I have only enough stuff to fill a few small rooms, so it gives me a slightly spooked-out feeling to enter into these empty morphic fields. If you take mushrooms, you know, you're climbing on board a starship manned by every shaman who ever did it in front of you, and this is quite a crew, and they've really pulled some stunts over the millennia, and it's all there, the tapes to be played, but the designer things should be very cautiously dealt with.

DJB: It's interesting that John Lilly had very different experiences with ketamine. Do you think that there's any relationship between the self-transforming machine elves that you've encountered on your shamanic voyages and the solid state entities that John Lilly has contacted in his interdimensional travels?

Terence: I don't think there is much congruence. The solid state entities that he contacted seem to make him quite upset. The elf machine entities that I encounter are the embodiment of merriment and humor. I have had a thought about this recently which I will tell you. One of the science fiction fantasies that haunts the collective unconscious is expressed in the phrase "a world run by machines"; in the 1950s this was first articulated in the notion, "perhaps the future will be a terrible place where the world is run by machines." Well now, let's think about machines for a moment. They are extremely impartial, very predictable, not subject to moral suasion, value neutral, and very long lived in their functioning. Now let's think about what machines are made of, in the light of Sheldrake's morphogenetic field theory. Machines are made of metal, glass, gold, silicon, plastic; they are made of what the earth is made of. Now wouldn't it be strange if

biology is a way for earth to alchemically transform itself into a self-reflecting thing. In which case then, what we're headed for inevitably, what we are in fact creating is a world run by machines. And once these machines are in place, they can be expected to manage our economies, languages, social aspirations, and so forth, in such a way that we stop killing each other, stop starving each other, stop destroying land, and so forth. Actually the fear of being ruled by machines is the male ego's fear of relinquishing control of the planet to the maternal matrix of Gaia.

DJB: It's interesting the way you anticipate each question. The recent development of fractal images seems to imply that visions and hallucinations can be broken down into a precise mathematical code. With this in mind, do you think the abilities of the human imagination can be replicated in a super computer?

Terence: Yes. Saying that the components of hallucinations can be broken down and duplicated by mathematical code isn't taking anything away from them. Reality can be taken apart and reduplicated with this same mathematical code, that's what makes the fractal idea so powerful. One can type in half a page of code, and on the screen get river systems, mountain ranges, deserts, ferns, coral reefs, all being generated out of half a page of computer coding. This seems to imply that we are finally discovering really powerful mathematical rules that stand behind visual appearances. And yes, I think supercomputers, computer graphics and simulated environments, this is very promising stuff. When the world's being run by machines, we'll be at the movies. Oh boy.

RMN: It seems that human language is evolving at a much slower rate than is the ability of human consciousness to navigate more complex and more profound levels of reality. How do you see language developing and evolving so as to become a more sensitive transceiving device for sharing conscious experience?

Terence: Actually, consciousness can't evolve any faster than language. The rate at which language evolves determines how fast consciousness evolves, otherwise you're just lost in what Wittgenstein called the unspeakable. You can feel it, but you can't speak of it, so it's an entirely private reality. Have you noticed how we have very few words for emotions? I love you, I hate you, and then basically we run a dial between those. I love you a lot, I hate you a lot.

RMN: How do you feel? Fine.

Terence: Yes, how do you feel, fine, and yet we have thousands and thousands of words about rugs, and

widgets, and this and that, so we need to create a much richer language of emotion. There are times--and this would be a great study for somebody to do--there have been periods in English when there were emotions which don't exist anymore, because the words have been lost. This is getting very close to this business of how reality is made by language. Can we recover a lost emotion, by creating a word for it? There are colors which don't exist any more because the words have been lost. I'm thinking of the word "jacinth." This is a certain kind of orange. Once you know the word "jacinth," you always can recognize it, but if you don't have it, all you can say is it's a little darker orange than something else. We've never tried to consciously evolve our language, we've just let it evolve, but now we have this level of awareness, and this level of cultural need where we really must plan where the new words should be generated. There are areas where words should be gotten rid of that empower political wrong thinking. The propagandists for the fascists already understand this, they understand that if you make something unsayable, you've made it unthinkable. So it doesn't plague you anymore. So planned evolution of language is the way to speed it toward expressing the frontier of consciousness.

DJB: I've thought at times that what you view as a symbiosis forming between humans and psychoactive plants may in fact be the plants taking over control of our lives and commanding us to do their bidding. Have you any thoughts on this?

Terence: Well, symbiosis is not parasitism, symbiosis is a situation of mutual benefit to both parties, so we have to presume that the plants are getting as much out of this as we are. What we're getting is information from another spiritual level. Their point of view, in other words, is what they're giving us. What we're giving them is care, and feeding, and propagation, and survival, so they give us their elevated higher dimensional point of view. We in turn respond by making the way easier for them in the physical world. And this seems a reasonable trade-off. Obviously they have difficulty in the physical world, plants don't move around much. You talk about Tao, a plant has the Tao. It doesn't even chop wood and carry water.

RMN: Future predictions are often based upon the study of previous patterns and trends which are then extended like the contours of a map to extrapolate the shape of things to come. The future can also be seen as an ongoing dynamic creative interaction between the past and the present--the current interpretation of past events actively serves to formulate these future patterns and trends. Have you been able to reconcile these two perspectives so that humanity is able to learn from its experiences without being bound by the habits of history?

Terence: The two are antithetical. You must not be bound by the habits of history if you want to learn from your experience. It was Ludwig von Bertalanffy, the inventor of general systems theory, who made the famous statement that "people are not machines, but in all situations where they are given the opportunity, they will act like machines," so you have to keep disturbing them, 'cause they always settle down into a routine. So, historical patterns are largely cyclical, but not entirely; there is ultimately a highest level of the

pattern which does not repeat, and that's the part which is responsible for the advance into true novelty.

RMN: The part that doesn't repeat. Hmm. The positive futurists tend to fall into two groups. Some visualize the future as becoming progressively brighter every day and that global illumination will occur as a result of this progression; others envision a period of actual devolution, a dark age, through which human consciousness must pass before more advanced stages are reached. Which scenario do you see as being the most likely to emerge, and why do you hold this view?

Terence: I guess I'm a soft Dark Ager. I think there will be a mild dark age, I don't think it will be anything like the dark ages which lasted a thousand years, I think it will last more like five years, and will be a time of economic retraction, religious fundamentalism, retreat into closed communities by certain segments of the society, feudal warfare among minor states, and this sort of thing. But I think it will give way in the late Nineties to the actual global future that we're all yearning for, and then there will be basically a fifteen-year period where all these things are drawn together with progressively greater and greater sophistication, much in the way that modern science and philosophy have grown with greater and greater sophistication in a single direction since the Renaissance, and that sometime around the end of 2012 all of this will be boiled down into a kind of alchemical distillation of the historical experience that will be a doorway into the life of the imagination.

RMN: Rupert Sheldrake's morphic resonance, Ralph Abraham's chaos theory, and your time wave model all appear to contain complementary patterns which operate on similar underlying principles--that energy systems store information until a certain level is reached and the information is then transduced into a larger frame of reference, like water in a tiered fountain. Have you worked these theories into an all encompassing metatheory of how the universe functions and operates?

Terence: Well, it is true that the three of us and I would add Frank Barr in there, who is less well known, but has a piece of the puzzle as well--we're all complimentary. Rupert's theory is, at this point a hypothesis. There are no equations, there's no predictive machinery, it's a way of speaking about experimental approaches. My time wave thing is like an extremely formal and specific example of what he's talking about in a general way. And then what Ralph's doing is providing a bridge from the kind of things Rupert and I are doing back into the frontier branch of ordinary mathematics called dynamic modeling. And Frank is an expert in the repetition of fractal process. He can show you the same thing happening on many, many levels, in many, many different expressions. So I have named us Compressionists, or Psychedelic Compressionists. A Compressionism holds that the world is growing more and more complex, compressed, knitted together, and therefore holographically complete at every point, and that's basically where the four of us stand, I think, but from different points of view.

DJB: Can you tell us about Botanical Dimensions, and any current projects that you're working on?

Terence: Botanical Dimensions is a non-profit foundation that attempts to rescue plants with a history of shamanic and human usage in the warm tropics, and rescue the information about how they're used, store the information in computers, and move the plants to a nineteen-acre site on the big island of Hawaii, in a rainforest belt that reasonably replicates the Amazon situation. There we are keeping them toward the day when someone will want to do serious research on them. As a non-profit foundation we solicit donations, publish a newsletter, and support a number of collectors in the field to carry on this work, which nobody else is really doing. There's a lot of rainforest conservation going on, but very little effort to conserve the folk-knowledge of native peoples. Amazonian people are going off to sawmills and repairing outboard motors, and this whole body of knowledge about plants is going to be lost in the next generation. We're saving it, and saving the plants in a botanical garden in Hawaii. Back to: Mushrooms, Elves and Magic

I think of this talk as the 'Mushrooms and Evolution' talk, and uh, we will rove and scan over that subject, but it also has- it arborizes into many other areas of concern. It's not simply a revisioning of anthropology or primatology or evolution. It is all those things, but more importantly it's a revisioning of those concerns that then carries a political and social implication for the moment, and for how we all lead our lives. And....it's basically a variation on the hero's journey, and I'm very indebted, uh, to a brilliant women anthropologist. I've never met her, but her book had a great influence on me. Miss Sia Landau. She recently wrote a book called Narratives of Evolution, and she pointed out something that I think has needed to be pointed out for a long time, which is that science is simply campfire stories in another guise. And you'll see what I mean as I get into this because I want to tell you a campfire story about a poor but humble primate who came from, uh, the fringes of the action- a minor member of the flora and fauna of this planet who embarked on a long and arduous journey into time and had many adventures along the way, and had many allies along the way and overcame great challenges to attain the gift difficult to come upon, the grail, if you will, or the Self. I mean all fans of Joseph Campbell are familiar with this metaphor of the hero's journey. And what's interesting is we have actually made that hero's journey. We are, all of us tonight, sons and daughters of the ancestral heroes who overcame drought, glaciation, disease, famine, earthquake, migration, you name it, they didn't drop the ball and thanks to them we're here tonight.

And normally this is, uh, the beginnings of this great journey are completely cloaked in mystery. It's taught in orthodox anthropology courses 'no one knows the factors which impelled human beings to leave, uh, the primate existence in the canopies of the great forests of Africa and to adopt new styles of life in the grasslands, uh, new diets, trading in vegetarianism for being omnivores, trading in, uh, a life of fruititarian luxury for a life of hunting, struggle, migration, and uh, natural selection in an extremely harsh environment. I believe that the reason that this seems so mysterious to straight primatologists and anthropologists is because they have been unwilling to look carefully at the role that plants played in this adventure, particularly the role that psychoactive plants may have played, and then, most appropriately for this gathering tonight, the role that certain species of psychoactive mushrooms must have played in this evolutionary adventure. And so tonight I would like to go through it with you in fairly close detail because I haven't had that many original ideas in my life and most of what I do is book reviews and regurgitation of other peoples' ideas. But this one, uh, they handed over to me, and I've been told by evolutionary

anthropologists that I'm welcome to it. So if I don't make the case, who will? And if not now, when? And if not here, where?

The great mystery of natural life on this planet is ourselves. We stand out in the natural order of things as something completely unique, unexpected, unpredictable. You could not calculate forward from the pinnacle of the age of mammals, some thirty thousand years ago, you could not calculate forward to a world such as we have today, a world of enormous cities globally dispersed, linked instantly by electronic media, a world of art, warfare, neurosis, vision, religious yearning, hope, despair, all of these things are the unique contribution made to reality existence if you will, by the existence of the qualities in us which we call humanness, which set us aside from the rest of organic existence. I mean, I know that dolphins discuss arcane matters among themselves and bees dance the directions to the flowers and animal communications occurs among pack hunting dogs of various sorts, but clearly we are something of another order. And accounting for this other order of being that is so present in us has been the major concern of both what we call religion and what we call, uh, science in the sense not of physics and chemistry but of biology, anthropology, and psychology. How to account for the uniqueness of our species and then the uniqueness that is present as a moment to moment fact in each one of us?

You have to go back to the origin scenario. Look at the other theories in place, and then look at the possibilities for theory-making that are offered. If we're willing to include the presence of a psychedelic substance in, uh, the experience and diet of hum- of early human beings. For several million years the, the great apes had been evolving into tighter and tighter niches in the climax tropical rainforests of both the new and old world. And at a point it's very difficult to place because it's locked in to the gradually shifting dynamics of climate on this planet. These forests began to retreat. They began to diminish because of ec- of absence of rainfall over very long periods of time. And we know that many primate lines went extinct at that point, but one primate line, the anthropoid apes, were able to evolve a new lifestyle in the grasslands, which were evolving as the forests retreated.

Now, some anthropologists have argued, to my mind very convincingly, that there is no such thing as a natural grassland, that grasslands are caused by fire, human burning. The argument is very easy to understand; it's that all the species of plants that you find in the grasslands, you also find in the understory of the forests on the borders of the grasslands, but you don't find, uh, you find only a small number of the forest species represented in the cleared areas. For an evolutionary botanist, this clearly means that the grasslands are extraordinarily recent. Wherever they occur all over the earth. And this includes the high-altitude grasslands that are called savannahs.

I think that the, the missing link in evolution is probably food. Somebody once accused me of trying to recover the lost history of mankind and I said no, simply the lost menu of mankind. Well, what was that menu, and how did it impact upon us? First of all, before we discuss psilocybin mushrooms specifically, I'd like you think about the ways in which we differ from other primates. We are, um, we maximize what is called neoteny. Neoteny is this, uh, phenomenon in which juvenile characteristics are retained into adulthood, and this a particularly, um, uh, effective strategy in any situation where you're up against a kind of evolutionary, uh, bump in the road or barrier of some sort. Many species show, uh, a tendency toward neoteny, but it's very strongly expressed in human beings. For example, our hairlessness, we are like infants. All primates are born pretty much hairless, but we retain this hairlessness throughout life. The ratio of our skull size to body size is an infantile ratio. Compared to other primates, we look like the juvenile form; we never lose that.

The extreme length of human childhood and adolescence is a kind of strategy so that a lot of developmental goings-on can occur outside the womb. And you probably know that a deer or a calf is able to stand within hours of being born. A human infant, this is something they struggle to acquire in the first 18 months of life. What was it that promoted this neoteny? What was it that promoted our upright gait? What was it that promoted our acquisition of language? This is critical, and I'll talk more about this later. Language is the great divide between us and other species. Where it exists at all as a tendency in other species, it exists as a very rudimentary, unschooled tendency. In us it has become almost the *raison d'être* of our being. Uh, physical evolution ceased in the human species when we began to elaborate, uh, languages and the technologies that follow upon them. We have designed a way around the slower-than-glaciers modification of species that exists where you have random mutations being acted upon by natural selective forces in the environment. Until the invention of epigenetic, meaning, non-genetic forms of coding, which means language, dance, theater, myth-telling, so forth and so on, until that great leap was made, we were as much an animal as any other animal, uh, on this planet.

So, what happened was this. The, the forests retreated, these environments where food had been very abundant became, uh, nutritionally stressed, the diet had to be expanded, the choice was simple, expand your diet or die! Well now, it's interesting, most animals have a very narrow range of foods which they will accept. This reaches its greatest expression in insects, which, some of you may have learned as children that if you find a caterpillar walking around on the ground and you just put it on the nearest plant and by chance you chose the wrong plant, it will die rather than eat that plant. Insects are very very food-specific. Most animals are. Now, why is this? You would think that it would be a better strategy to be able to eat a lot of things. The answer is foods are chemically extraordinarily complex, and chemical complexity is another way of saying potentially toxic or mutagenic. And mutation is the undoing of any species or any adaptation. So there is an effort, uh, by organisms to avoid, uh- it isn't an- it isn't a conscious effort, it's enforced by natural selection. There is a tendency to mitigate against animals with broad food tastes because they are exposed to so many mutagens, things which split chromosomes and, uh, and damage genetic material.

However, if you're faced with extinction, your back is already to the wall. You can see the grim reaper drawing near. So at that point, expanding the diet becomes a perfectly credible strategy for survival. And that is what happened to these formerly arboreal apes now descended onto the grasslands. They began to experiment with their diet. And in addition to the fruit that they had always eaten they began to eat insects, they became carnivores, they began to evolve a hunting style. And I have personally observed in Kenya the food-testing behavior of baboons, and I assume that it is very much analogous to the food-testing behavior that went on in early, uh, protohominids and early human beings. The baboon will approach something, a potential food source, sniff it, look at it, place it in the mouth but not swallow, sometimes for as much as a minute, and then either spit it out or swallow a small amount of it and then wait. And then if there's no immediate negative feedback from this, like vomiting or burning throat or constriction of mucus production in the throat or something like that, the food will begin to be accepted.

In this grassland, which was nutritionally fairly tightly drawn- there wasn't an overabundance of food supply, there was, however, a parallel evolutionary event going on to the primate evolution, and that was the evolution of various forms of large ungulate mammals, primitive cattle, gazelle-type animals, wildebeasts, horned animals, hoofed animals of all sorts. And many of these animals had a style of existence in which they congregated in herds. Well, these herds of animals clearly represented the major,

um, uh, concrescence or deposit of available protein in this environment. I mean, if you could kill a two or three hundred boss primitive-ogenesis, or something like that, there was more nutrition represented in that than in several hundred acres of the gathering of corms or the raiding of anthills or something like that. So the pressure was intense to, uh, become carnivores to focus on these ungulate mammals and quite naturally, what evolved was a kind of, uh, nomadic pastoralism based on following along behind these large herds of animals.

The other thing was happening, that was happening was there were very large and efficient carnivores on the scene- the equivalent of today's lions and the sabre-tooth tiger, and the hunting cats of the panther type. And many, um evolutionary biologists believe that the suppression of our sense of smell has to do with our actually passing through a phase where we, uh, predated on carrion. This is not a very pleasant thought, but what we were doing was letting the lions do the work and then we were coming along with throwing sticks and rocks and things like this, driving the lions and the panthers off these fresh kills, and then eating this available meat, but it was pretty ripe in many cases, so there was pressure to suppress, uh, olfactory sensitivity.

Now, in fairness to these complex issues I should tell you that another school believes that it was our bipedal gait- that once we lifted up off our knuckles and literally got our nose off the ground, then there was, uh, a kind of atrophication of the olfactory senses, so these two theories compete. But whatever was going on, there was interest in, uh, these large herds of ungulate mammals moving across this grassland environment. And a whole host of animals were relating to them as the central source of protein. Not only, uh, the large cat predators, but also the wild dogs of many types up to and including, uh, you know, the great timber wolf that has been extinct since the last glaciation and down to dingoes, jackals, hyenas, uh, this sort of thing. So, everybody was interested in these large herds of mammals. Well, a consequence of large herds of ungulate mammals are plenty of manure. Anybody who has been around cattle knows this. And here's where we begin to draw the circle of the plot tighter, because manure- food that has passed through the double stomach of these kinds of animals, is the favorite medium for certain kinds of mushrooms. Mushrooms which are called coprophilic or coprolytic, meaning dung-loving mushrooms. This is the preferred medium for them to carry out their life cycle in. And again, based on my observations of bam- of baboons in Kenya, I've seen them approach, uh, cow pies, is the gentle term for these deposits of fecal material, approach a cow pie and flip it over. What they're doing is they're looking for grubs, beetles or immature beetle larva. They understand, then, that the, the manure deposit is a vector for insect protein in this environment, and having a limited amount of energy, they look for food in the place where it's likely to be.

However, by a marvelous coincidence or superb planning on the part of the extraterrestrials who rule the galaxy [laughter], you can sort of, choose your poison. Ah, the, the lunatic fringe is not unrepresented, good, good- of which I number myself, uh, among them.

Uh, yes, so, these, these coprophitic mushrooms, particularly stropharia cubensis, which is the one that is pandemic, meaning occurs worldwide. I have seen them in the Amazon the size of dinner plates, I mean, you can't miss this thing. It is the most astonishing object in the grassland environment, and after a period of rains to walk out into a grassland environment and see these things by the dozens and then by the hundreds, and always vectored in on the same cow pies that are of interest to these foraging baboons. You see then that by design or destiny, the mushroom was placed directly in the path of the foraging protohominids. Well, uh, and would certainly have been tested for its food value in the same way that, uh,

uh, I describe baboons testing other, uh, plants. Well, aside from the fact that *stropharia cubensis*, uh, contains psilocybin, it is delicious. It is delicious in the fresh form. Well, 'delicious' is just a monkey's way of saying that it's good food. If you find something delicious you will overrule almost all other signals coming off of it to chow down on it. So the mushroom is delicious. Well, what then are the possible consequences of the inclusion in the human diet of a psychoactive compound like psilocybin? Well, it, uh, has three consequences, and I believe that this simple three stage process answers this supposed unanswerable question about the origin of human cognition and human value systems and language, and it's very simple, it's easy to understand, it doesn't require a leap to faith. Let's hope I can remember it.

The first consequence of allowing psilocybin into the diet of a foraging hungry protohominid of that type is an increase in visual acuity. I don't think this is widely known. Since psilocybin is called a hallucinogen, people might imagine that, you know, it distorts reality or you can't see what's really in front of you. Well, that may be true on a dark night on a high dose, but that's not what I'm talking about. I'm talking about an animal which is foraging, eating insects, eating roots, eating whatever it finds and including in that a small amount of randomly, uh, contacted psilocybin mushrooms. Roland Fischer, a psychologist, physiologist at the national institute of health in the early '60s gave psilocybin to thousands and thousands of people and he studied the effect of low doses on vision, and he built an experimental apparatus which had two, uh, metal bars which were ordinarily, uh, in parallel. And by turning a crank out of sight of the graduate student or the person being tested, uh, he could deform the, uh, relationship of the bars so that they would slowly slip out of their parallelism and into a skewed mode. And this is very straightforward psychology 1 perceptual kind of experiment, and he showed very conclusively with thousands of people that on small amounts of psilocybin people could pick this up much more quickly. They were asked to push a buzzer when they thought the two bars were no longer parallel. And the people who were very lightly stoned were consistently able to do this, to grok this more efficiently than the, uh, people who had been given placebo. And Fischer, who was kind of a gnome himself, said to me about this, he said, "So you see, here's a case where taking a drug actually gives you better information about reality than if you hadn't taken a drug." Inconceivable proof, scientific experiment, beyond argument, and though it may have no consequence if you're dealing with a group of 25 graduate students in a class on graduate psychology, visual acuity is the thread by which life and death are hung if you are foraging primates in a nutrition-poor environment. If you can't see the food you're looking for, the gentle hand of natural selection is going to quietly move you toward extinction [audience laughter]. So, uh, to give you an idea of the power of that chemical in that situation, think of it as chemical binoculars. It doesn't take- you don't have to be a rocket scientist to see that if you're handed a pair of chemical binoculars in a hunting situation, you're going to be a more effective hunter. So, on that first level, a level highly unconscious, a level where these protohominids are simply trying to get enough to eat, those that were willing to accept psilocybin into their diet had a slightly enhanced probability of survival through an enhanced supply of nutrition than those who didn't. This is the first level on which the use of psilocybin would tend to outbreed the population that was not, uh, accepting it into the diet.

Ok. As we all know, there's more to psilocybin than increased visual acuity. At slightly higher levels, still well below the level of an overt mind-boggling psychedelic experience, uh, psilocybin causes, uh, what's called CNS arousal. Central nervous system stimulation, horniness is another way of putting this because what CNS arousal is is a kind of restlessness, a kind of where's-the-action mentality, a kind of desire to go out and mix it up a little, and the ability to carry through on that in a fairly convincing style to your partner. [audience laughter] In the, in the dry parlance of primatology we call this 'increased frequency of copulation' and 'increased frequency of copulation' means, uh, increased frequency of impregnation. I

don't see how you could have that without the first. I mean, oven-basters aside.

So, uh, increased frequency of impregnation means more offspring are being born to the population which is accepting the psilocybin into its diet, and more offspring is the key to evolutionary success and to running your evolutionary competitors right off the road into the ditch. That's the key thing. He who outreproduces his competitors or she, of course, who out-reproduces competitors is going to find itself, uh, the dominant species in a given environment. So, there's a two-step process where the first step reinforces the second step. We have more successful hunting, more frequent sexual activity, more food for the offspring, and the offspring are being raised by parents who have already accepted the mushroom as an item of diet and will pass that habit on to their children. So, I'm sure, as you can see, it's beginning to push in a certain direction. Well, so fine, mushroom-eating increases the success of protohominids, but how does it account for the emergence of the higher function of the human cerebral cortex, language, dance, art, poetry, song, symbolic activity of all sorts? What's going on there? Well, it is simply that if we now advance from the slight dose, we've advanced now to the moderate dose, if we now go on and imagine that people enjoyed this arousal, this social ambiance that attended upon including this item in the diet. There surely would have been reckless souls among them who would've followed Dr. Leary's advice that, when in doubt, double the dose, right?

Well, when you double the dose, uh, uh, profound things happen which are not easily calculated from the previous state of mind which was just simply a state of uh, sleeplessness and restlessness. Hallucination and stimulation of the area of the brain that is called Broca's area, and that we now associate with the formation of language- spontaneous glossolalia is a phenomenon of high-dose psilocybin use. Glossolalia is, uh, linguistic activity that seems to be not willed by the ego but that is just simply an upwelling from the dynamics and architecture of the organism. Uh, and in our society, we're familiar with it as a, uh, phenomenon that has been appropriated by Pentecostal Christianity as a proof of the indwelling of the spirit. But in fact, uh, this phenomenon occurs in most societies throughout the world and most societies associate it with an indwelling of spirit, whether they be Christian, Muslim, Animist or what have you, this spontaneous vocalizing of language-like activity is seen to be, uh, a sign of special characteristics, what anthropologists call 'election'. Shamanism, in other words, magic, the ability to cast spells, the ability to weave story. It's all tied in to language, and I- it's just my personal opinion, but I would bet you, I don't know how we'd ever settle the bet, but I would bet you that language existed a long time before meaning because it is intrinsically some kind of neurological release of the organism.

And there can be syntax in the absence of language. Uh, as an example, um, *me dingwao huadyavangalpaikec texi me tichiki putong agmo way zambowwa pakti me din dijiki pihut!* What this is is instant art, you see, abstract art [audience laughter] because the human organism is, uh, brilliantly wired for small mouth noises. This is something that we can do for hours [laughter]with very little- I'm the living proof of it [more laughter]. I want to beat you to the punch, uh, before someone points this out.

Small mouth noises are special provence, and with it we weave meaning, we convey emotion, uh, we convey anger, and eventually we recreate the entire world of our imaginations. I mean, this is culture is, is a kind of coaxing into reality of the structures of the human imagination through the medium of language, and it begins as poetry and it ends as, you know, structural engineering on the scale of the Golden Gate Bridge or something like that. Language. Language, then, sets us apart. And so it seems to me there is a direct, linear descent through the use of this one particular psychedelic. It has to have been a grassland plant. It cannot require any preparation, even boiling or something like that, because we're talking about a

level of human culture that is more naive than these processes that were added late. So it has to be commonly met with plant, a plant of the grasslands, a plant requiring no, uh, preparation other than that you eat it, and then it has to put in place a series of self-reinforcing positive feedback loops that lead to self-reflection.

I think this is it folks. I think this is where humanness came from. And when you realize that the straight people who've had the field all to themselves since Darwin, their best idea is that it was the coordination of the throwing arm, that it's the baseball pitcher who is the highest exemplar of what it is to be a human being because, as soft-bodied weak primates it was very important to us to keep our distance from these large animals as we stoned them to death. You know, you didn't want to get within the sweep of tusk or claw as you were attacking these things.

Well, you know, I'm as fond as the lump-cheeked hayseed on the mound as anybody else, but I don't see him as, uh, as the exemplar of humanity's march toward the unspeakable mystery of being. Uh. [clapping] Not when you think about the truly titanic dimensions that are easily accessible to any one of us on psilocybin. And we have, you know, 10,000 years of human history, philosophy, art, science and literature behind us, and when we come up against, uh, 5 dried grams in silent darkness, it's as awesome, as appalling, as mind-boggling and as impossible to process as it must have been for those folks 25, 35, 55 thousand years ago. It is a true mystery. None of our science, none of our language has given us a leg up on understanding that phenomenon. So, that was the vector that called us forward. That was the great attractor that this humble monkey heard the call and set off across the plains of geological time seeking and finding this tremendous mystery.

And I believe that this story has tremendous implications for our own lives, uh, because we are highly dysfunctional as a society. Violence, sexism, racism, classism, linear thinking, reductionism, denial of the spirit, all this messes with our heads and our happiness. And I, I think that it is not necessarily so, but that we- it was a narrow window that opened for us because I am not suggesting that monkeys make fine company, uh, back as you look through the geological record the fact of the matter is male dominance hierarchies occur in primates right back to the squirrel monkey type. The primate style is a style of male dominance, but some time- let's say a hundred thousand years ago, to, let's say, twelve or ten thousand years ago- there was a chemical fix. There was an intervention in the ordinary hierarchy-forming tendency of these evolving primates, and we actually created not a matriarchy, not a shifting of one master for another, but a partnership society. We were actually able, by forming a kind of quasi-symbiotic relationship to these mushrooms- and it was a very interesting incipient symbiosis, you see. It was a symbiosis of protohominids, cattle, grasslands and mushrooms. It was a three-species, at least three-species symbiosis we were able to create a partnership style of existence which is the, uh, genesis point of our myths of paradise. This is why we have a nostalgia for paradise, a feeling that we fell into history, that there was once a golden age of balance and gender, uh, you know, reasonable gender dynamics. And, uh, community, and, uh, religion that was not simply moral prescriptions that cause neurosis, but an actual relationship to the living spirit of the planet. And this was achieved, uh, through psilocybin and through the lifestyle that it reinforced because, recalling my little three-step process, the psychedelic aspect and the sexual arousal aspect were simply two ends of the same experience.

The style of these early, uh, nomadic pastoralists into cattle was orgiastic, meaning everybody got together at the new and full moon and flopped in a heap. And these were, these were groups of 70 or 80 people.

Small human groups. Now what this was doing, this tendency toward group sexual activity and orgy provided by the psilocybin in the diet. What it was doing was interfering with the tendency to stress male lines of paternity because you can't know- in a society that has institutionalized, uh, orgiastic sexuality, men cannot know who their children are. Women know who their children are because they see the children come out of their bodies, and there's a bonding, but for men the children are community property. And this, I think, was the link, and in the absence of psilocybin, you get a recursion back to the previous, uh, mode of primate organization, which is a turf-guarding, territorial, egoistic style. And this is the point I really want to make, that psilocybin is a kind of inoculation against the formation of ego. It dissolved the primate ego and it kept it dissolved until factors which I'll discuss in a minute, factors limited the availability of the psilocybin, and then this atavistic tendency, the existence of the ego, returned with a tremendous vengeance.

So, what I- the implication of what I'm saying is that the ego, which grows like a calcareous tumor or an abnormal growth in the dynamics of the psyche, can actually be dissolved by repeated exposure to this boundary-dissolving psychedelic compound. Well, so then if things were so wonderful, why didn't it just last forever? Why did we fall into history? What happened?tape distorts...

patriarchy, turf-consciousness, warfare, city building and so forth and so on. Well, th- it's a no-blame story. It's that the very dynamic processes which drove the arboreal apes out of the trees and into this paradisaical symbiosis on the grasslands which lasted twenty-five, thirty thousand years. The very forces which created that ambiance, which were climatological forces, the drying of the planet, destroyed that equilibrium paradise because the drying process did not halt. It continued, it accelerated. And as we all know, uh, today the Sahara desert is one of the most inhospitable climates on earth. I mean, it's a land of endless sand and fantastical high temperatures and no vegetation whatsoever to speak of. Nevertheless, there are archaeological site out there which are the best evidence for this theory that I am putting forward. Because in Southern Algeria on the Tassili plateau there are, uh, rock paintings dated from twelve to fifteen thousand years old that show shamans with mushrooms sprouting out of their bodies. Unambiguous, because they're not simply being held in that hand. In some cases, when a mushroom-like object is held in the hand, some anthropologists and art historians want to call it a chopper. But what do you do when there are mushrooms sprouting out of the body by the dozens? I mean, the, it becomes incontrovertible. So the archaeological evidence is there. The, uh, primate behavior provides evidence for this, and what happened I think is that these orgies which originally, at the heyday of this, uh, partnership society, these, uh, group get-togethers were probably at the new and full moon. Well then, as the drying accelerated they became merely lunar, every twenty-eight days instead of fourteen days. And then ultimately seasonal, or associated with only certain areas. The rainfall became sparser and there became, uh, strategies had to be developed then to spread fewer and fewer mushrooms over a wider and wider area. And I believe, uh, that we can even spec- as long as we're loose in the realm of speculation, we might as well go full hog- I think that what might have happened, based on a careful reading of the archaeological record out there, was that honey emerged as a very important part of the story. Because you see, if you don't have refrigeration you can use honey to preserve delicate foods. And to this day, there are parts of Mexico where mushrooms are mixed into honey and then they, they don't, uh, decay and can be used for many months.

Now, the problem with this is that honey itself has the potential to undergo chemical change and turn itself into a psychoactive substance. But a psychoactive substance with a very different character than psilocybin. In, in other words mead, alcohol, crude alcoholic beverages probably began with the

fermenting of honey and fruit juices. Well, that puts you firmly in the domain of the messed up culture that we're in because I told you what the qualities of psilocybin were- to promote visual acuity, sexual activity, religious experience, language. What are the qualities of alcohol? What does it do if viewed as a psychedelic drug. Well, it does two things. It lowers sensitivity to social cueing and it empowers, uh, aggressive behavior. In other words, it makes you into a jerk and, uh, you know, time spent in a busy singles bar on a friday evening will convince you of the truth of this. And in a way it's no joke, I mean I think probably for a thousand years nobody got laid in Western civilization unless they were swacked because, uh, you know, people were so uptight on the natch, having imbibed this whole monotheistic moral trip that unless they took a powerful drug which dissolved social inhibitions and empowered aggressive behavior, they weren't able to make a move.

How many women, how many women can think back to their first sexual imprinting and realize that it occurred in an atmosphere of aggressive use of alcohol. I mean, this is almost the standard model, maybe not so much anymore but throughout the first five decades of this century I think that would be a pretty fair statement. So you see, drugs are like the invisible lenses through which we view reality, and no culture has been without them, it's just cultures accept some and repress others according to their particular, the particular cultural values which are trying to be conserved. The reason this is not simply armchair speculation among anthropologists is because we now are the inheritors of a planet which is dying under anaesthesia. Our entire cultural crisis is predicated on the fact that we cannot feel or connect with the consequences of our history, that we have behaved very badly, we of the high-tech societies. We have trashed gender relationships, we have trashed aboriginal societies, we have cut down the rainforest, uh, we have robbed our own children of a future as rich as the future that we expect ourselves to enjoy. Uh, there isn't even a name for this sin, where you destroy the opportunity of your own children, I mean no society has been that perverse. And we're doing it under a mass infusion of alcohol laced with monotheistic moral propaganda. [audience clapping]

Well, what is the antidote to this? Well, it's what I call the archaic revival. It's something that's been going on throughout most of the 20th century but with increasing depth and urgency. It's that we must reach back into the past to the last sane moment that we ever knew and figure out what was going on then and get with the program and attempt to recover some amount of cultural equilibrium and balance. And I believe that, you know, using the broad brush of generalization, we could say all our problems can be traced down to ego. Ego lies behind private property, it lies behind the domination of women by men, it lies behind dollar chasing, it lies behind all of the maladaptive behaviors, the arms race, the whole thing, it lies behind all of the maladaptive behaviors that are pushing us toward planetary toxification and species armageddon. Uh, I'm not advocating a return to the style- the religious style that includes orgy. I mean, I wish I could [audience laughter], but we are not, you know, nomadic pastoralists of, uh, 70 individuals. We're a global society of five million- five billion shot through with epidemic diseases and contagion and so forth and so on. We can't adapt the orgiastic style on a mass scale without severe social consequences, but we can look back at the use of psilocybin and at least construct a social alternative where small groups of people are using this to, um, uh, diminish ego and build community. Build communities of like-minded people and diminish the almighty sense of ego

and psilocybin does this very effectively in two ways. First of all, it dissolves boundaries between people, and another way of saying 'ego' is that I strongly distinguish between you and me, you know. That's what ego tells you, is who you are and how important you are and how you're not her or him or that or that, you're this! Psilocybin tends to dissolve that language-reinforced misperception. And the other thing it

does is it shows you that behind your eyebrows is a world richer by far than any of the crap that's being peddled on Rodeo Drive or 5th avenue in New York City or anywhere else. In other words, it shows you the pathetic nature of materialism by reintroducing you to the reality of the spirit not as a religious abstraction that's used to beat you over the head to follow somebody's moral recipe, but as a felt experience of the indwelling of an extreme power that, a power that connects you to all the life of the past on this planet, to the planetary future, to the universe at large. So really, it's a rediscovery of our birthright as human beings. History is a bad deal. It's, uh, it's a mass of potage. It's broken machines and broken dreams because we have projected our value system out into matter, and matter has not responded in a satisfying way, and so we're then dysfunctionally neurotic, always seeking, never finding. The answer is to go within using the classical tools of, uh, self-redefinition, transformation, and ego-diminishment. We can reinoculate ourselves against the ills of civilization by simply availing ourselves to the shamanic tools that were available before the fall into history.

And, uh, you know, the fact that this has- poses some problem for the currently constituted constabulary is, uh, of no concern to anybody who is thinking on a scale of millenia. That's just a kink in the social machinery brought on by stupidity and anxiety. It isn't sufficient reason to turn away from a reasonable program that would carry us toward a group psychology that would then allow us to turn toward the real threats that face us as a species and as a planet and do something about it.

I put this before you this evening because I think in the absence of this theory, the psychedelic community has no strong argument to lay before society at large as to why these things are so important. But if in fact these are the catalysts, these psychedelic compounds, are the catalysts for everything that we call humanness, for the very basis of the notion of caring, altruism, civilization, community, if what lies behind these notions is a symbiotic relationship to, uh, psychedelic plants present in the environment, then the sooner we return to that mode, the sooner we can overcome the historical dysfunction that otherwise is a death sentence upon us.

So, I don't advocate this because I think it's easy or because it has a high probability of being accepted and implemented. I advocate it because I think it's the only answer. And that it would be gross malfeasance on my part believing that to not lay the cards on the table. That's all that I can do, and I hope that if you find this argument convincing, you will find further arguments to buttress it and we can get this phenomenon out of the closet and in to, uh, the general theater of debate about the fate of global civilization so that we can begin to make real positive changes because the clock is ticking, folks. This is not a test. I mean, we have to either create some fantastically brilliant forward escape out of the closing grinding jaws of history, or we will be history.

Thank you very much. [audience clapping] Thank you.

Well, it's nice to be here. It's great to see so many people turned out for Los Angeles Mycological society [audience laughter, Terence laughs, audience clapping]. The people who put this thing together worked very hard at it, uh, putting to death once and for all the rumor that mycologists only do it spore-atically...so, are there-is that groaning I hear? [laughter]

The organization that I'm associated with, which is Botanical Dimensions, it's a parallel agenda to the LA Mycological society. What Botanical Dimensions does is collects and preserves plants with a history of shamanic and medicinal usage worldwide. Not only the plants, but the information about them. As I'm sure

you're all aware, the rainforests are disappearing at an alarming rate, and with them is disappearing twenty five or thirty thousand years of very painfully gar-garnered medical information that these aboriginal peoples have preserved up until the present moment. But unfortunately for these peoples, the present moment contains, uh, social challenges like nothing they've ever dealt with before and the shamanic gnosis is not being handed on. Young men and women who would ordinarily have become shamans are learning outboard motor repair and how to wait tables in tourist traps and this sort of thing, and this medical information which is the basis of most of the drugs sold as prescription drugs and over-the-counter drugs today, much of that information, uh, will be lost. So, uh, my partner Kat and I run a botanical garden in Hawaii and, uh, we're a non-profit organization able to accept your donations if you are so inclined.

Well this is a talk that I've wanted to give for a long time, and some of you may wonder why I say that because you may have heard it before [audience laughter] but you have, you have never heard it under the auspices of a prestigious scientific organization such as has chosen to sponsor me tonight, and that was my fantasy, to take this idea, notion, theory, and actually launch it in a venue of great respectability and scientific veracity, and certainly the Los Angeles mycological society, uh, provides that.

It's obvious that I can only touch a tiny number of these questions, and many of them seem very good, if not prolix. Um, I see a short one here. How many people here are under 25? Alright! [audience claps] That's great! That's great. Oh, here's a cheerful question, a troublemaker in the group.

Q: If the mushroom played a large part in the development of the mystical side of man, do you think it also played a pivotal role in the emergence of human sacrifice? [audience amusement]

T: Um. Well, human sacrifice on a mass scale is something more typical of the Mesoamerican civilization which certainly used mushrooms: the Maya, and then later the Aztecs. Uh, but this was a much later stage of cultural development with mathematics and, uh, written language in place and so forth and so on. And I'm not saying that it didn't, I'm just saying a fair answer would be we don't really understand the genesis of human sacrifice in the New World civilizations, but it didn't appear to play a major role, uh, in the, in the evolution of the early civilizations that I'm, uh, that I've been talking about. I don't see why it should have. There doesn't seem to me an obvious strong connection.

Uh, let's see here [looking through question cards]. Here's a question, um.

I don't claim to have more than a feeble understanding of man's ultimate destiny. I'm unclear of what your message is. You seem to advocate leaving earth for destinations unknown. [audience cheers] Isn't this agenda too premature to promulgate as we need very much to focus our human potential on the global environmental interpersonal interspecies crisis rather than focusing on scenarios which imply the disposability of the planet.

Good question. [audience laughter] Um, you know, it seems to me the kindest thing we could do at this moment is sever our connection to the planet, for the planet's sake. I'm less sure what good it would do for us. Uh, it's certainly true that the planet is the cradle of humanity. The question is, do you remain in the cradle forever? And I've had a hard time figuring out a scenario that would keep us on this planet and retain any kind of society that anyone would want to live in simply because of the acceleration of our population. I, actually I'm loath to get into this subject so late in the evening, but in the interest of fairness and honesty I put this question to the mushroom: "How can we save the planet?" and without hesitation it

replied "Every woman should bear only one natural child." That's not my answer, that's, uh, *stropharia cubensis* speaking. It would create a demographic collapse that would cut the population of Earth in half without war, disease, or forced migration in less than 40 years. It would also slice the population in half again in the next 40 years.

We tend to think that there are no solutions, and yet here's a solution that requires the responsible action of female individuals, a group that has not yet, uh, waded in to this set of historical problems that we have inherited from the past. So if there is a tendency for men to stand in the way of solutions, and I'm not saying they do or they don't, uh, here is a program that can be put in place that would have a radical impact on, uh, on human destiny on this planet. I discussed this with demographers after the mushroom made this suggestion, and I learned an amazing fact. Some of you may know this. I certainly had never thought of it this way. A woman on the upper east side of Manhattan or in Malibu or in Scottsdale- in other words, one of these white, upper class, college-educated, wealthy communities, a woman in that situation, if she has a child, that child will be between 800 and 1000 times more destructive of the resources of the earth than a child born to a woman in Bangladesh or Pakistan or Zaire. We tend to think of the population problem as a population problem. It's a resource abuse problem, and the main resource abusers are the citizens of the high-tech societies. So if you have a house full of kids and you're buying them all \$140 pairs of running shoes, you know, you go on the list of major social criminals.

Uh, I'm guilty, I'm guilty, so I'm not trying to lay a trip on you, but we tend not to think of our problem that way. We think it's all those beastly little brown people on the other side of the world breeding furiously. Well, I've got news for you, we have met the enemy and it is us! You know, if we could get the honkies to slow down their consumption of resources, we wouldn't, uh, have the gun to our head in quite the same way, but I digress, um. [audience laughter]

Q: Within the last 25 years there has been a quantum increase in the strength of cannabis. Has there been a corresponding intensification in psilocybin? Is today's insight into the present future more powerful?

TM: Um, probably not, because, uh, fungal genetics is notoriously tricky stuff and as an ex-mushroom grower and the author of psilocybin mushroom growers guide, I think what we call strain selection for psilocybin is a pretty rule-of-thumb kind of thing. While the cannabis botanists among us have worked a miracle on the scale of Luther Burbanks' wilder endeavors. And we should take our hats off to them, uh. [audience laughter and applause]. The same arguments that I made here tonight for psilocybin, in a slightly modified form and at a slightly later stage of cultural history, I think cannabis was the major, uh, pharmacological habit of human beings, retarding, uh, patriarchy, male dominance, urbanization, propaganda, so forth and so on. Cannabis is really not given its due, uh, it's been a tremendous bulwark against the values of dominator culture and, uh, I certainly hope it continues to function that way.

Is psilocybin conducive to art activity?

TM: Does the pope live in Rome?

How do you recommend we use this information in an applied way in our personal lives?

Well, and there are other questions which relate to this, like 'how can you tell if mushrooms have been contaminated by other compounds' and so forth and so on. I think that the most enlightened thing, uh, a

person can do, or one of the most enlightened things, is to cultivate mushrooms. This completely goes around the possibility of criminal syndicalism, adulteration, degradation through aging, contamination by bacterial parasites, and there are all kinds of problems which are overcome by cultivation. Sometimes people say to me how do you, what can you do to get ready for a big psilocybin trip if you've never had any psychedelic experience? Well, I think the best advice is grow the mushroom. Those of you who have done that know that it teaches all the virtues that you will need to have when you get out there in the billows. It teaches, uh, cleanliness, punctuality, attention to detail, focus, uh, so forth and so on. The things that will serve you invaluable, not only in the psychedelic experience, but in life. And it's a tremendous- you can really feel the force of a possible symbiosis if you cultivate mushrooms, because it's so efficient. I mean, you take a 13 dollar, 25 pound bag of rye and you can turn it into 4 or 5 hundred hits. The conversion rate is an astonishing 12% dry weight of rye to dry weight of psilocybin. I mean, it's like an industrial process, it's awesome to see this stuff at work. I mean, it is such a workhorse for humanity. Uh, I used to say that it was alchemy, and the formula was, uh, uh, rye to mold and mold to gold! So, it's a very short step, and, uh, teaches you all these values that you may have, uh, overlooked in your own, uh, toilet training.

What do you say when your four-year-old asks if you do drugs?

Well, what you say is, uh, that you do some drugs and then explain which ones. I mean, I have two children, I've been through this. I think it's really weird, people who say 'oh, we can't get stoned til' the kids go to bed'. I mean, what kind of malarkey is this? In the first place, the kids know, so then you're exposed as some kind of half-wit, and, uh, as totally dishonest, totally not at peace with your own habits. I had habits which'll remain unnamed, which I abandoned because I wasn't comfortable explaining them to my children, so I just dropped those things out of my life. Mushrooms and cannabis were certainly not numbered among them. Uh, so, I mean, you...[audience applause]...you have to be honest with your children.

Hm. If psilocybin promotes language and diminishes ego, also a form of language, don't we then have something dest-uh, destroying what it creates or creating what it destroys? Is this a contradiction?

Well, I'm not sure I buy in to the notion that ego is a form of language, however there is a- I sense the point in this question because it's been suggested that language was created to lie, and is that really what we want to do, uh, with each other. But, um, I think that that's- I don't really take that seriously. I think that truth-telling and truth-withholding are a very delicate, uh, matter. You know, Winston Churchill said once "the truth is so precious that she must be accompanied everywhere by a bodyguard of lies" and uh, I, I think that captures some of the paradoxical nature of language.

Um. Have you read the theoretical work by Julian James, *The Origin of Consciousness and the Breakdown of the Bicameral Mind*. What do you think of it?

For those of you who haven't read it, this is a theory that until very recently what we called the ego was actually a psychic function that had not yet been integrated in the Jungian sense into consciousness. So that as recently as 3,000 years ago, if somebody got into a tight spot, suddenly a voice would switch on in their head and say the equivalent of, you know "get your ass out of there!" and people interpreted this as the voice of God, or a god. It was a higher function in the psyche that was only triggered by extreme stress. Well then, we actually assimilated this, um, uh, psychic function that had been evolved to respond to extreme danger, and we, as it were, layered it in to the lower levels of the personality, and so what had

been God became ego, and this has happened in James' opinion around 1000 B.C. just at the time when the last mother religions, the last goddess religions were dying out. And, uh, on the Greek mainland, Mycenaean[?] piracy was taking over from Minoan partnership and mother goddess worship. So yes, I mean this may definitely, uh, be part of it. What makes James' book so frustrating is here is a book, I think it has over 630 pages in it, it's a book on the cultural impact of hallucinations, and there is one reference to psychedelic drugs. It's a reference to mescaline in a footnote. So James either through lack of information or intellectual queasiness didn't make use of the massive body of information associated with hallucinogenic shamanism that he might have made use of to make his case.

It's incredible how, how pharmaphobic academic speculation has been. I mean, people just don't want to get near it, and yet obviously drugs of all sorts have, have shaped every aspect of our lives. I'm doing a book for Bantam that will be out next spring sometime about the cultural impact of drugs- psychedelic and non-psychedelic. And one of the things I learned that just had never occurred to me was slavery died with the fall of the Roman Empire. It absolutely died. I mean, during the medieval period, if you owned slaves, you owned one slave. It was like owning a Duesenberg [?] or something. It was the absolute proof that you were a person of immense wealth. And then the slave would serve your food or something like that. But the use of slave labor in agriculture was something that was brought back in the 14th century, uh, by Christian-the Christian gentlemen of Europe specifically for the production of sugar. No other reason. The stuff which came later, the tobacco and the cotton and all that, that was simply because there was an over-supply of slaves, and so there was a need to soak up all this slave labor.

Why sugar? Because it was an addicting drug. Nobody needs white sugar. You can go from birth to the grave and never get near it and never miss it, but it was, uh- sugar is made in open vats in the primitive, you know, the way it was done 500 years ago, at a temperature of 135 degrees. No free person will work sugar. You have to chain people to the machinery. You literally have to chain them to the machinery, and then they die in short order from, uh, from heat prostration. In 1800, every ounce of sugar entering England was produced by slave labor, and Western civilization barely had a thing to say about it. And we don't even think of sugar as a drug unless we're very highly sensitized to these issues. But you know, if you have small children, you know, you just might as well lay out railers of blow [audience laughter] if you're gonna turn them loose with cho-those Pepperidge Farm chocolate chip cookies, I mean my god! So, I just offer that as an example of our naivety about drugs and our naivety about our own cultural history. I mean people say well slavery, they got rid of it with Lincoln, but it had been going on for thousands of year- uh uh, no no, not at all. It had been dead for a thousand years, and then it was brought back by the drug trade. And how many steps backward in the process of trying to define and honor the human spirit have occurred because of drugs like sugar, opium, tea, coffee. Look at the caffeine drugs, the only drugs on earth that modern industrialists recognize to the point that they write them into contracts with workers. The coffee break. This isn't because they love workers, this is because it makes workers work! Caffeine and the demands of linear industrialism made a marriage in hell which exists right up to this day with untold consequences in the form of stomach cancer, anxiety, aggressive behavior, you name it.

Well, we're over the time. We have piles of questions. I love you all. Stay happy, take it easy, but take it! [applause]

The mainstream media hasn't quite got it figured out whether Terence McKenna is putting them on or not. His theories about the origins of contemporary culture in the psychedelic trips of the distant past seem startling to those who have overdosed on Reagan/Bush/Larouche-style propaganda, but they are not without precedent if the names Aldous Huxley, John Allegro or R. Gordon Wasson mean anything to you (if they don't, check out the 'authors' section of the card catalog). McKenna's ideas have hit the media in the form of several books, most notably *The Archaic Revival* (HarperCollins), *Food of the Gods* (Bantam), and *True Hallucinations* (Harper San Francisco). He has also maintained a close connection to the burgeoning rave scene, lending spoken-word performances to concerts by the Shamen and recordings by Space Time Continuum. Major publications from coast to coast have lined up to give him press, generally favorable, if confused.

Interact with McKenna recently as part of an assignment for *Future Sex* magazine (editorial decision squelched the piece)...
PHF: Can you briefly explain the theory you put forth in *Food of the Gods*?

Terence McKenna: The primate tendency to form dominance hierarchies was temporarily interrupted for about 100,000 years by the psilocybin in the paleolithic diet. This behavioral style of male dominance was chemically interrupted by psilocybin in the diet, so it allowed the style of social organization called partnership to emerge, and that that occurred during the period when language, altruism, planning, moral values, esthetics, music and so forth -- everything associated with humanness -- emerged during that period. About 12,000 years ago, the mushrooms left the human diet because they were no longer available, due to climatological change and the previous tendency to form dominance hierarchies re-emerged. So, this is what the historic dilemma is: we have all these qualities that were evolved during the suppression of male dominance that are now somewhat at loggerheads with the tendency of society in a situation of re-established male dominance. The paleolithic situation was orgiastic and this made it impossible for men to trace lines of male paternity, consequently there was no concept of 'my children' for men. It was 'our children' meaning 'we, the group.' This orgiastic style worked into the effects of higher doses of psilocybin to create a situation of frequent boundary dissolution. That's what sexuality is, on one level, about and it's what psychedelics, on another level, are about. With the termination of this orgiastic, mushroom using style of existence, a very neurotic and repressive social style emerged which is now worldwide and typical of western civilization.

PHF: In what sense did the mushroom influence or create an orgiastic state?

Terence McKenna: All central nervous system stimulants create what's called 'arousal', which means restlessness. In highly sexed animals like primates, it also means sexual arousal. So, psilocybin was a stimulant to sexual activity. In an evolutionary context, the more sex you have, the more outbreeding you have of those members of the population that are not experiencing this stimulation. So, on one level, at the lowest dose, psilocybin increases visual acuity, which means better success at hunting. Then, at the middle dose level, it creates this hypersexual activity. Then, at still higher doses it creates the full-blown psychedelic experience, about which we are as uninformed and as easily amazed as our remote ancestors were. So, it was a 3 step process. It was basically a chemical that had been allowed into the diet that boosted us toward boundary dissolution, language acquisition, sexuality without boundaries, and so on. With those behaviors in place, humanness emerged. Then, as the mushroom faded from climatological reasons, in a sense we became schizophrenic. The bestial nature, the animal nature, that had been suppressed by the psilocybin in the diet, re-emerged, so you get male dominance, standing armies, kingship, walled cities, the whole bit that leads to western civilization.

PHF: What is the place of set and setting in the arousal response?

Terence McKenna: In the primitive context, I think, probably, there were orgies which were regulated by the lunar phases. In

other words, orgies at the new and full moon.

Basically, I think of the ego like a tumor or a calcareous growth in the psyche that will form unless there is the presence of psilocybin. For a hundred thousand years, nobody went longer than a month without having this boundary-dissolving experience. After the psilocybin faded, the ego was able to get hold and then eventually redefine the whole personality around it. It's a maladaptive response, I think, because it leads to the consequences we see all around us.

PHF: At what age would the psilocybin be introduced to prevent the ego from forming?

Terence McKenna: We're just speculating here -- nobody knows -- but I imagine that it could well have an initiatory rite at puberty, or it could have come even earlier. Also, we're talking a long period of time, as much, perhaps, as half a million years, that this was happening. So it may have started out that psilocybin mushrooms were just edible mushrooms, an item in the diet, and only when you ate a lot did you discover that they were also stimulants and psychoactive. Then, as you approach more recent times, they were obviously institutionalized into a kind of goddess worshiping, cattle worshiping, orgiastic religion.

PHF: Are you suggesting that paleolithic shrooms were less potent than those that present-day psychedelic users consume?

Terence McKenna: No, I'm just suggesting that as human intellectual capacities evolved, people went from unconsciously getting loaded and being stimulated by these things, to actually realizing that the mushroom was what was behind it, and then to consciously seek them out for those kinds of experiences.

PHF: Do you see a resurgence in the psychedelic orgiastic consciousness?

Terence McKenna: Certainly psilocybin is a very important factor in the English rave and house music scene and psychedelics, though not psilocybin, were certainly a part of the sixties scene, which was then also associated with an orgiastic versus a monogamous style of sexuality.

I'm not advocating that we return to orgies. After all, these African populations that I'm talking about were small groups of people between 70 and 125 people, roughly, and with the global pandemic of sexually transmitted diseases, you can't exactly advocate orgy, but I do think that, in social circles where psilocybin and psychedelics are being used, monogamy erodes and people tend to have more than one sexual partner, without the subterfuge and secretiveness that attends that in the ordinary dominator context. I guess I would say that the lesson from psilocybin is not that we should return to orgy, but that we should take a look at the modification of monogamy to permit people to have more than one sexual partner at a time, without having to be socially stigmatized.

PHF: Do you think that there's an ideal recreational drug that may be created?

Terence McKenna: Many psychedelics have the effect that I've mentioned here. The reason I fasten in on the mushroom is because we evolved in the African grasslands, so if you're looking for a psychedelic stimulant to sexuality and consciousness in the context of early human evolution, it's going to be a grassland plant that requires no preparation and no combination with some other plant, because this all happened before that level of culture. Psilocybin emerges as the obvious candidate and I would say psilocybin is probably the best suited for this even today, because it's the one that we co-evolved with.

PHF: What would you recommend in the way of a psychedelic, romantic experience?

Terence McKenna: I think if they take 3-1/2 to 4 grams of [dried] psilocybin mushrooms, in comfortable, dimly lit surroundings, that they'll discover a dimension to sex that you're just not going to approximate any other way. I mean, this is a pretty well-kept secret -- or maybe it's not so well-kept -- but it's certainly true that psychedelics have a tremendously enhancing effect on sex. It's not exactly that they're aphrodisiacs, because they don't have an effect on performance, particularly, but whatever goes down is experienced much more intensely and vividly.

Nature is the Center of the Mandala

Well, it's a pleasure to be back with all of you. I feel like this is the home parish, so to speak. This seems to be the place where I see the most number of faces that I recognize, so it's sort of like a family meeting.

The formal title of [the lecture](#) is "Nature is the center of the mandala". And this is really, basically, simply a structure to anticipate and discuss where nature lies in the future, the cultural future that is unfolding in front of all of us. And to background my thoughts on this matter a little bit, I have always had a relationship to nature which I pretty much took for granted, but perhaps it was, uh, it was more intense and somewhat unique than most peoples'. I grew up uh, in a small town in Colorado. I was really early into being a rock hound and then a butterfly collector. I had no interest in stamps or baseball cards or anything like that. It was always natural objects, and the attraction of tropical butterflies was the exuberant expanse of color, the affirmation of the uh, patterned richness of the universe that was seemed to be thrown out like a spark by these things. And eventually I pursued it quite foreign was professional butterfly collector in tropical Indonesia in a pre-Buddhist incarnation. And this search for an iridescence thrown off by nature seen first in the glint of metallic ur-crystals and then in the colorful expanse of butterflies, and then in tropical fish.

these times spent- and then of course there were the times in the Amazon which most of you have heard me lecture on, where the pursuit of psychedelic plants was really in the forefront. But I came to see Nature as experience, meaning as it hits you when you walk around in it and pick at it and carry it with you. That this kind of Nature had been read out of the repertoire of images that most people bring to bear on their reality.

And consequently the reality is de-spirited. The spirit resident in Nature is not visible when these mechanistic grids are laid over it. Sort of by a kind of anticipatory osmosis we called our company which has existed now 10 years or more Lux Natura. Lux Natura means the light in nature. The Lux Natura is the salvational radiance that can be found in the organic kingdom. It's a term of Paracelsus and it has clipped from the grip of modern human beings except in special cases where it is cultivated as a sensitivity or where it is pursued as in the guise of an aspect of the psychedelic experience.

So, what is Nature? And what's so great about it that it should be the center of the Mandala? Well, it seems

to me that it is psyche in a way that has become occluded by the perverse development of language. So that what we take to be exterior to ourselves and sustained by the laws of physics, which do not arise out of the human mind, is in fact not that at all but a kind of stratum of expectation that has been laid down by the human journey through time. Now granted there are aspects of Nature which are not part of the human journey through time. But they are occult from our point of view. They are not expressed except perhaps through the demonic artifice of an instrumentality. And this has been the course or the strategy of science – is to use an instrumentality to reveal the mechanics of the occult side of Nature. The problem is that this occult side of Nature once explicated does not yield a satisfying reflection of ourselves. It yields instead a very unflattering reflection of ourselves – if any at all. So, you know, in Hawaii, sitting on the mountain side you think that you are like Lenin in Germany or something and you have to politically think it all through so that to whatever degree one's voice is heard mistakes are not made. Because it seems to me clear that a small miracle is taking place. It is that – and I was saying this to Roy today – it is that our point of view is actually gaining ground. The thing which we least expected to happen, I think, that all this New Age hustle and bustle – though granted that 95% of it is just intellectual noise and efforts that fail, efforts, to coin the perfect analogy, that fail – nevertheless there is a residual 5% that appears to have become the cutting edge of the guiding image of this mega culture.

So it becomes important then for people who identify themselves with the human potential movement, spiritual development, the rebirth of intuition, all of these things to make a place in the plan for the role of Nature. And different responses have gone on to that, the Gaia response which claims Nature as a stabilizing feminine force, which I'm all for that. I think that's definitely the image that has to emerge that the recognition of the presence of control mechanisms which are not coercive but which are Daoistic is a way of coming to terms with Nature that we have resisted. You know, it's a simple idea that before technology people had to store firewood in the autumn for the winter and in the spring, they had to sharpen tools for the late spring planting and this sort of thing. That there was an implicit rhythm laid down by Nature that entered the human cosmos at every level and then was reflected in the poetry, the culture building, the language evolution etc. and between urbanization other factors removed the influence of these rhythm sending in the final combination of the modern city where life under electric light goes on 24 hours a day. There's then a flattening of the human dimension. There is no more a sense of being embedded in flux. There is instead the myth of the eternal culture. It's like Woody Allen, you know, his comment, he didn't like to go to the country because you see all these screened doors with cobwebs in the corners. Well, you gotta come to terms with this kind of thing. Because there is no question, that there is a deepening ambiguity in the present moment. There is a something, stealing over global civilization. I was at a conference recently where someone proposed the notion that our time is not special that there is nothing unique about this moment other than it is presently occurring. I think nothing could be further from the truth. That actually the deepening ambiguity of the historical experience which registers in all of us as a sense of how weird it is, how compressed time is, how complicated the interconnections are, is a real phenomenon which eventually will be elucidated. In other words it will be recognized as a phenomenon. Eventually there is going to be a break with the prevailing paradigm of historical process. In case you are not aware of it, the prevailing paradigm of historical process is the one which calls itself 'the trendlessly fluctuating theory' [laughter] and it says, 'we trendlessly fluctuate'. And to search for a trend is the cause [to] be drawn into a kind of cultural hysteria. The fact of the matter is, that standing outside the cultural hysteria the trend is fairly clear. It is a trend toward temporal compression and the emergence of ambiguity. How is it possible, you know, you look at something like 'Common Ground' or even the 'Shared Vision Newsletter' and you say, you know, apparently the major commodity moving on world markets is ambiguity. The voices which whisper to us from crystals, herbs and housewives, the invisible fields from all

dimensions which impinge upon us, the imagined histories and futures which intersect the present moment. I mean if all of these models or even a small portion of them are given credence then the density of the human experience is considerably deepened. I mean how many past lives can you keep track of, how many extraterrestrial channels can you have opened before you begin to realize that, you know, you're not living in a kind of society like mom and dad were used to. [10:39]So, back to the theme of Nature. Nature anticipates all of this and anchors it. Nature is actually the goal at the end of history. We're getting closer and closer to the end of history and we will not go past it with a moment of blindness. There will be vouchsafe intuitions about the emergent structure of the other into which culture is being subsumed. You're all familiar with the image of the Ouroboros,

I have always had a relationship with nature that I pretty much took for granted but perhaps was somewhat unique and more intense than most peoples'. I grew up in a small town in Colorado. I was very early into being a rock hound and a butterfly collector. The attraction of tropical butterflies was the exuberant expanse of color, the affirmation of the patterned richness of the universe that was seen to be thrown out like a spark by these things. This search for iridescence thrown off by nature, seen first in the glint of metallic ore crystals and then in the colorful expanse of butterflies and then in tropical fish, reached a kind of apotheosis with the discovery of the psychedelic plant hallucinogens, where suddenly the color, the flash, the iridescence, is not two or three dimensional, it is multi-dimensional, it is inside the body, it is outside the body.

I came to see that nature, as experienced – meaning as it hits you when you walk around in it and pick at it and carry it with you – has been bred out of the repertoire of images that most people bring to bear on their reality. Consequently the reality is de-spirited. The spirit resident in nature is not visible when these mechanistic grids are laid over it.

It seems to me that nature is psyche, in a way that has been occluded by the perverse development of language. We take nature to be external to ourselves and sustained by the laws of physics. It is not that at all. It is a kind of stratum of expectation that has been laid down by the human journey through time. There are elements of nature which are not aspects of the human journey through time, but they are occult. This has been the strategy of science; to use an instrumentality to reveal the occult side of nature. The problem is that this occult side of nature, once explicated, does not reveal a satisfying reflection of ourselves.

It seems to me that a small miracle is taking place, the thing that we least expected to happen. It is that our point-of-view is actually gaining ground. Sitting on the mountainside in Hawaii, you think you're like Lenin in Germany; you have to politically think it all through so that, to the extent to which one's voice can be heard, mistakes are not made. All this New Age hustle and bustle, though 95% of it is just intellectual noise and efforts to coin the perfect analogy that fail, appears to have become the cutting edge of the guiding image of this mega-culture. So it becomes important for people who identify with the human potential movement, spiritual development, the rebirth of intuition, to make a place in the plan for the role of nature.

The Gaia response claims nature as a stabilizing feminine force. That's definitely the image that has to emerge. The recognition of the presence of control mechanisms that are not coercive, that are Taoistic, is a way of coming to terms with nature that we have resisted.

It's a simple idea. Before technology people had to store firewood in the autumn for the winter, in the

spring they had to sharpen tools for the late spring planting. There was an implicit rhythm laid down by nature that entered the human cosmos at every level and was reflected in poetry, culture building and the evolution of language. There has been a flattening of the human dimension. Urbanisation and other factors removed the influence of these rhythms, with the final culmination being the modern city, where life under electric light goes on 24 hours a day. There is no more a sense of being embedded in flux, there is instead the myth of the eternal culture.

I was at a conference recently where someone proposed the notion that our time is not special, that there is nothing unique about this moment. I think nothing could be further from the truth. There is no question that there is a deepening ambiguity in the present moment. There is a something coming over global civilization. It registers in all of us as how weird it is, how compressed time is, how complicated the interconnections are. I think this is a real phenomenon which will eventually be elucidated. Eventually, there will be a break with the prevailing paradigm of historical process.

In case you're not aware, the current prevailing paradigm is the one that calls itself the “trendlessly fluctuating theory”. It says, “We trendlessly fluctuate; and to search for a trend is to be drawn into a cultural hysteria.” Standing outside of the cultural hysteria, the trend is fairly clear. It is a trend toward temporal compression and the emergence of ambiguity.

Nature anticipates all of this, and anchors it. Nature is actually the goal at the end of history. We are getting closer and closer to the end of history and we will not go past it with a moment of blindness. There will be vouchsafed intuitions about the emerging structure of the Other into which culture is being subsumed. You're all familiar with the image of the Ouroboros, the snake which takes its tail in its mouth. The end of history is an archaic revival. The ground of being in which the original archaic renaissance occurred was nature. In terms of the expression of design elements, in terms of the expression of human relationships and political agendas, the economies of nature are going to set the guiding images.

I read Edward O. Wilson's book *Biophilia* in which he describes his work with ants in Suriname and how there are ants who grow fungi in their nests. They cut leaves off trees and chew them up into a mash which they then store in rooms underground. They bring the right spores in and grow them there and it produces a sugar which the ants then eat. They tend the fungal gardens and remove foreign spores. This is a symbiosis between a social organism, the ant, and a fungal organism, which produces an enzyme, sugar, which drives the ant society to a greater state of activity. Activity, in an insect economy, defines how well you can survive. This provides a curious analogy for the situation that exists in human society vis-a-vis hallucinogenic plants.

Hallucinogenic plants act as enzymes that stimulate imagination. Imagination is reconnected to this feedback loop in which we ask ourselves, “How can I make more of this hallucinogenic plant that is giving us all these great ideas?” So then you get the invention of agriculture, but one can't grow all plants in one place. So then the feedback loop from the presence of hallucinogenic plants in the diet asks the question, “How can we get the plants that we can't grow?” and the answer is, networks of trade and systems of barter, and behind that lies the need for language.

These types of symbiotic processes are implicit in the human experience. Some of you have heard [another lecture I give](#) in which I go into this in great detail. I try to show that mushrooms in the dung of ungulate animals on the veldt of Africa 150,000 years ago drove a series of processes which resulted in self-

reflecting human beings. That process didn't end with the invention of language or the domestication of cattle, it continues right up to the present day.

It is as though, from a planetary point of view, an enzyme system called the human species was deputized into an information-gathering mode. It was sent out as a kind of prodigal subsystem, a kind of episome of the social environment, to cognize the organization of the natural world through a process called "human history" or "the historical advance toward understanding and sufficiently complete modeling". That I think is what is happening.

The human species was deputized for Gaia into the Fall; the fall into profane time, the time of non-participation in the immediacy of the Tao, through a series of successive linguistic declensions. This begins to sound almost Biblical, because it says there is a Fall, and the Fall is somehow related to a confusion of languages, not one from another, but from the object of experience. As the language became less and less natural, the world of the species using this language became less and less natural, because the evolution of symbols moved toward the abstract, it became the realization of ideals. In Platonic philosophy we get the enunciation of abstractions, great over-weaning concepts that subsume entire areas of particulars. This ability to subsume particulars under a class name is the beginning of this process of replacing the particulars with the symbolic structures. The reason for this process we can only guess at. It seems as though nature requires this reflection upon itself; that the completion of nature is in the hands of a single target species, which acts as an enzyme within the global organism of Gaia.

From the point-of-view of an extraterrestrial looking down on the surface of the planet there are not discreet organisms, there is simply a gene swarm. Through viruses and many non-genetic ways in which genes are transformed, the previously imagined sharp declensions between species are actually somewhat illusory. Within the confines of my body, the unfolding of gene expression and the molecular assembly of enzyme systems and proteins is simply under a tighter regimen of control than are the same kind of processes which are going on between people. We are really a loosely regulated organism that has a tendency to ever-tighten the connection between its sub-units.

So you can see that with the evolution of language, the evolution of technology being at the service of media, the rise of cities, oral poetry, we seem to strive for greater and greater cohesion, greater and greater free-flow of thought among ourselves. What we're looking toward is a moment when the artificial language-structures which bind us within the notion of ourselves are dissolved in the realisation that we are a part of nature. When that happens the childhood of our species will pass away and we will stand tremulously on the brink of the first moments of coherent human civilisation.

This, I think, is already beginning to happen. It's a slow process but it's a kind of cascading phenomenon such that once it begins to happen it happens faster and faster. The mirroring of psyche that was always the glamour that stood behind nature is correctly perceived with greater and greater clarity as this process proceeds. This correct perceiving of nature's relationship to self and language is the essence of all of these cultural vectors that are converging; feminism, the exploration of space, the perfection of the thinking machine, or of the human-machine interface and the *mysterium tremendum* at the core of the psychedelic experience. All of these things are anticipations of the post-historical state which lies beyond the working out of the themes that have been set in motion by materialistic science.

These forces have been set in motion and sustained by so-called "new thought", New Age thinking. It

seems that we all noticed early on a trend in society which is now going to have tremendous repercussions and because this seems to be happening, there is a responsibility to clear thinking about what this thing is and how it works. There seems to be a rush to get in line with the sloppiest metaphor as quickly as possible. There have been a number of syncretic fates, new myths, that have arisen and competed with each other with greater and lesser degrees of success. I suppose this is a healthy thing, except that it gives such comfort to the people who think we're all just airheads. They observe all this and it confirms to them that it's a hopeless lot.

Everybody has their own version of what is the mistake that is being made. So here's my version. There is a confusion between scientific materialism and reason. Science has set itself up as a kind of new pontificate and brooks no challenge. It expects to make judgement on any idea emerging from any realm of human endeavor. It has set itself up as judge and jury. The fact of the matter is that this is only by virtue of its spectacular acts of technological prestidigitation. What science is really most successful in telling us about are realms which none of us have ever penetrated nor are ever likely to. I mean, how much do you wish to know about the rings of Neptune or the quark?

We are continuously sold the line that somehow, when the metaphors of consciousness are fully mapped onto quantum physics and biology that a great step forward will have been taken. It seems to me that since the information coming out of quantum physics and molecular biology is so removed from the realm of common experience that if we succeed in mapping mental phenomena onto those realms we will have succeeded in the final act of alienation; because we will have at last totally removed our experience of ourselves from the realm of felt cognition.

Instead of the idea that there needs to be an erection of an overarching metaphor from the physical sciences into the social and psychiatric sciences, there should be the recognition and celebration of mystery.

We are an intelligent species caught in a historical process. No generation which preceded us knew what was going on. There is no reason to assume that we know what is going on or that the generation which follows us will know what's going on. And what kind of trip is it anyway to insist on knowing what's going on? It's a highly unlikely enterprise. Look at the data sample. The data sample is your lifetime, on one planet, in one tiny corner of the universe. From this, via the fallacy of induction, certain principles of uniformity are extended to the far-flung corners of the cosmos in space and time. A bunch of fancy metaphors are built up that nobody can check on anyway and then this is called understanding. You see, it isn't understanding. Understanding issues into appropriate activity. A model of the universe which doesn't issue into appropriate activity in the here and now is a curious model indeed. Appropriate activity in the here and now is the *sine qua non*. Everything else is unconfirmed rumour.

Nature is the visible manifestation of this mystery, it entirely surrounds and completes us. It is there to be beheld and imbibed in. It is simply that one must either replace the sterile language of scientific materialism or one must bring no language whatsoever to it, so that it speaks for itself.

Ayahuasca, the South American visionary vine, unlike the mushroom, does not speak, it shows; its language is visible; a fractal hieroglyphic surface of intermediate dimensions that contains an endless unfolding of phenomena, at level after level into the micro-physical realm. This is a correct seeing of what is. The mystery is co-present with its denial. It is a matter of changing points of view and changing points-
