I think that it's because, uh, the world is made of language, and that if the Eastern conception that the universe is mind has any operational impact in the world, it will be through conceiving of mind as, uh, the underlying, self-aware....ssss-self-active, world-forming, grammar of being. So that the, what Freud called the superego, what I call the Overmind--there have been different ways of talking about it--has to be seen not as a passive homeostatic controlling device, but actually, as the most intelligent....organization on this planet, and we are all only components of this, believing ourselves to be the highest expression of freedom, but it is actually at the species level that organization is controlled, and that's why the emergence of ideas like the calculus or the invention of LSD or the steam engine, why these things have the curious property of being regulated from above; it's because the world is not nearly as chaotic and random as we suppose. We are actually trapped inside a giant organism. And it is not Gaia...that's a much larger organism. We are trapped inside a large organism, which is the human collectivity, and that's why we are such different monkeys. Because, there is this, uh, group mind which none of us is aware of or has ever perceived but is actually mediating, uh, the human experience. And it is no more apprehendable to us than the group mind of an anthill is apprehendable to us. It can't be seen. What it is is it's an interlocking set of conventions, linguistic directions, uh....genetic components, assumptions, and, uh, what for lack of a better word you would call innate tendencies. And, these things which we wear as, uh, as the clothing of our specieshood are actually the constraints directing us first one way and then another. And, if we want to take control of our destiny, we're going to have to rise into empathy with this Overmind, this superego. And, there's no reason to think this can't be done. I'm sure you're all familiar with Julian Jaynes' theory that, until very recently, in fact, until Homeric times, everyone heard voices....in moments of crisis. If you were in a moment of crisis, suddenly and quite naturally, a voice spoke in your head and said, you know, 'get the hell out of there!' or 'Do something!', and everyone understood that this was 'God' or 'the king' or 'the dead king'. It depended on where you located in the Middle East.

But, uh, there were people who traded between these various locations, and the first cynics is what they were, because they noticed that, uh, over at Ur, god spoke to everybody, but down at Nineveh, it was the dead king, who everybody l--heard in their head [audience laughter]. And, this logical discrepancy cast doubt, and they became the first people to not hear the voice but to assimilate it, and this is what we call the ego. It is what we experience as the self. Something which 2,000 years ago was a god, which only intervened in human affairs to save lives and give, uh, heavy advice, has become for each of us, the, uh, the central focus through which we mediate our sensorium and project models of the world. So, it is not, uh....we are far more plastic than we realize. And, I think what Stan was saying tonight about how the goal

is to be in the, uh, I forget the term--the hylolytic [sp?]-the matter oriented side of it--but to have this awareness, a complete awareness of the other side, so that you are simultaneously locked in Newtonian spacetime and the parameters of the situation, and you are simultaneously, uh...liberated into a complete awareness of the other potential. And, the way I recognize that state, and this may be idiosyncratic, but, I can tell I'm in that state when, no matter what I'm doing and no matter where I go, I can see the Earth hanging in space by simply referencing that image and discovering it present in my head in a way that is not like a thought or, uh, or-or something, uh, artificially induced. It's a real modality that is present and accessible. And, I think that means, you know, that you have enough of yourself committed to the Overmind that you're operating in the light of it, and then many consequences flow from that that are, um...efficacious at the personal level. For instance, there is something which has been called the 'Tao of the ancestors'.

What that means, I think, is simply that for each one of us, there is a way to do the things we must do that is the most, uh, energy-efficient way to do it. And I'm talking about opening a door, picking up a fork...the best way to do it is to follow the creode that is the 'Tao of the ancestors', to recognize that you are a genetic expression, a partial genetic expression, of a gene pool which has received genetic expression at each generation in your family for thousands and thousands of generations, and that you are just the latest recinsion...recension of this gene pool, then you release the ego, and you act with this awareness. These are psychedelically-induced states of being that, I think, make it easier to live in the world, and how many of them are there. Who knows? For instance, uh, under the influence of psilocybin in the Amazon, I notice what I am completely convinced is an atrophied human ability. It's a very simple ability, but we have lost it. It's the ability to know how to walk from point A to point B, not following the shortest distance, but following, automatically, the, the, uh, path of least resistance, so that, you don't go down into valleys and then climb hills. You automatically stay on ridges, even though you take more circuitous paths to your goal. And, I could feel this sense working; it was just like a part of the dashboard that had previously be covered up with sun cover. Here was a human sense, which we don't particularly need, because we've erected linear cities, where the most, uh, the path of least resistance usually is a straight line, but you can imagine, people in rugged country, this is a sense, which would confer great survival adaptability and be tremendously important.

So, I think that the...what we need to do is tease these human abilities out of the psychedelic experience, that really the psychedelic experience is like an intimation of immortality. And, at varying distances in time from the point you occupy, it shows you ever more vague intimations of the future, but they are there nevertheless. Uh, language is probably somehow....related to the endogenous hallucinogens in the human brain. The evolution of culture is probably related to these things. It's been suggested that DMT in the brain is mediating what we experience as attention that when you...look and look hard, something is happening in the brain having to do with DMT, that it mediates awareness in a very moment to moment way. Um....the future evolution of mankind is going to be based on these states, but the, the last point I want to make is..one about how evolution occurs. It isn't that..a mutation happens and it is...confers greater adaptability upon an individual and therefore that individual and his offspring numerically gain over competitor, uh, individuals of the same species. This is not how it works. The way it works is you have constant mutating of the gene pool from the influx of cosmic radiation and other factors. There is always a, uh, low-level of mutagens, uh, of mutants in a population. But, they are of no consequence, as long as the selective parameters remain the same. But when the selective parameters change suddenly, these individuals who were previously masked in the general population, the selective, uh, eh, advantage that they have now, comes immediately to the fore, and they act very quickly and critically to send the

evolution of a given species off in a different direction. This is why, uh, the fossil record progresses in fits and starts, because sudden shifts of environment caused the apparent emergence of new types. It isn't that they cause it. It's that the new types were always there but not with any advantage. It's that the new situation has conferred a sudden advantage on them and they are moving, then, into positions of, uh, dominance in the population, or the society, if we're talking about human beings.

I think that the psychedelic experience is like that at the present level. It has conferred, uh---there is a population of different people in the general population, and as conditions change, these people will be seen to have, uh, adaptive advantages, uh. Without being metaphysical about it, an obvious advantage is, uh.....what I call the deconditioning effect. That we live in a jungle of propaganda. You know, 'buy this', 'believe this', 'wear this'. If, uh...if you have a symbiotic relationship with a deconditioning agent, you're much more likely, uh, to thread your way through that with your soul and your bank account intact. So, uh, [audience laughter], this is, this is one way of thinking of it, that, what the psychedelics really do, I think, is release us from cultural machinery and put you right up against the human essence, and say you no longer have to pretend that you're Scotch-Irish or Witoto or Jewish. You can actually explore the human modality independent of the inertia of these exterior labels, and so it places responsibility, it, uh, raises questions of validity, existential, uh, uh, uh....honesty with oneself. And, I think it promotes, uh, the moral life which I don't think happens if you buy deeply into myths of the tribe, if you're a devoted practitioner of Marxism, fascism, capitalism; I don't think these things will lead you to the moral life, because they are not, uh, they don't arise out of experience. Experience is everything. These are drugs of experience. Uh....eh, it's very important to take the moment seriously, uh. Reincarnation and all these things aside, what if this were your unique opportunity to unravel it all and not, uh, be caught in disillusion, because I think that there is, there is a potential for immortality, but it isn't assured. It is something which comes to the courageous, and, uh, somehow in the historical experience, we've gotten the idea through orthodox religions that salvation comes to the subservient, and this is totally wrong. It is, uh, eh...more like the Greek ideal of the hero, that if you are heroic enough, once you're dead, you'll be a god, and I think this is what these things summon us all to, and the thing to look at are the things which don't fit any paradigm, the anomalies, the paranormal things, the self-transforming elf machines, the UFOs, all of these things.

[audience member says something--"...tell a story] What?! [audience member: "you didn't tell a story, the UFO story"] Oh, which UFO story [audience commotion].....Well.....I don't know. It has to do with this whole thing. You see, the alien is an archetype, as well as whatever else it may be. I mean, if aliens didn't exist or don't exist, we would still invent them, because it's, it's the other. You know, I've, I've made the metaphor that we have arrived at some kind of, uh, collective puberty, where we now are fascinated by, uh, the notion of a non-human partner. We're obsessed, as an adolescent is obsessed with sex, we're obsessed with the notion of alien love. We want this, and yet we have all the feelings about it that an adolescent brings to the early sexual experiences; it seems like an abyss, a devouring, a kind of a giving up, impossible, and yet, our, our historical development, has led us to the place where we now realized this was possible, it's like finding out the facts of life. The facts of life are that there could be a girl next door.....and now [audience member: "who's an alien"]...Who's an alien. Of course! What other kind of girl next door could it be [audience laughter]. So, then, hmmm, there's a girl next door....a-a-and, so, it's not--all the talk about the wonderful technical benefits that we would reap, and all this, and obviously it isn't that. It's an erotic fascination with the notion of the other that drives us and that perhaps this is why, in the psychedelic experience, the alien emerges so fully and completely, because it is a repressed notion. Although, I've noticed that in the...in the history of the, the phenomenology of the UFO contacts, the theme....it was first a light in the sky, then we had all these exotic abductions, and then the last four or five

years there are more and more persistent stories of, uh, sexual relations, pregnancies, this kind of thing. Well, this obviously means that, you know, we're growing up, we're getting older [audience laughter], the pressure is on to come to terms with how this thing is going to present itself.... Yes. [Terence laughs]

So, you know, it's hardly respectable to say these things anywhere. I mean, fortunately, I am--I work for a living, so I can [starts laughing] say these things.....but, uh, the amount of anecdotal material that would come pouring forth if these things were stressed, I think, would shock everyone. And, somehow it has to be taken out, and this is a really sensitive issue that I--it's very hard to talk about--how can such a screwy notion be taken out of the hands of squirrels? [audience laughter] In other words, we have no shortage of people assuring us that aliens of all sorts are channeling left, channeling right, this, that, the other thing.....how....the problem is the reverse of the problem in radio-telescopy, where they search the skies and get nothing. Our problem is just a cacophony of hysterical claim-making. Where do you begin, you know? The Urantia Book, you've got 'the nine', you've got...all kinds, and this is, uh, not a new phenomenon, uh. It's, uh....well, you could choose your point, but certainly since the onset of Theosophy and Alice Bailey's school and there's been a lot of channeling in the 20th century. So, the problem is one of, uh, filters. Which aliens do you believe and, uh, how do you tell, uhh....garbage from the real thing. And, I think this is a problem for information theorists. It's a poker-playing problem, essentially, and shouldn't be difficult to solve if we apply ourselves to it. It's just that for us, the notion of a dialog with an interior other is, uh, psychopathy. So, we're very leery of that, or we're very, uh, [audience laughter at connection with "Leary"] of that...[audience member: "Albert or Metzner"].

Anyway, I noticed that Sasha [Shulgin], when he described the phenomenology of psilocybin, didn't say a thing about self-transformation elf machines or whispered messages from gods and demons...he did mention demons. So, uh, you're free to believe that this is the raving of an unhinged mind, but, uh....you know, being a Jeremiah figure is a great tradition, and they usually have the last laugh [audience laughter].

Are there any question, uh....[more laughter and applause]
[audience member: that's the story man!]

Q & A

Terence McKenna: Please

Question: Uh...sort of, psilocybin glossolalia....that's, that's not any words that are in any cultures right, but that has meaning for you [Terence: "Yes"]...Have you ever heard of, or have you ever, communicated with any other person in this language.

TM: You mean, while I was loaded and they were loaded?

Q: Yea.

TM: Yes, its...

Q: And both of you have this experience of shared meaning?

TM: Yes, but...see, it's very...how can we check since English won't flow back and forth.

Q: No, I just, I mean, I'll take your word, if you both experienced shared meaning and confirmed it, that's about as far you can go...

TM: I think so, but when I listen to recordings of this glossolalia, uh, "down", uh, it makes me very uncomfortable, and I wonder what could possibly be the matter with me that I place so much emphasis on this...and I've noticed, uh, you know, it'll clear most rooms in a hurry [audience laughter]. I mean, I mean, it's, it's allll...people are with it, you know, and they say 'ah, it's far out' and all this stuff, and then you play it and they say 'well, you know....er.....I've gotta go do something'. I mean, they draw back. It seems too [audience member: "too weird?"] quirky, too quirky.

Q: So, it's like you, you do some and they do some back and forth...and it's totally unintelligible to the English ear.

TM: Yea, it's totally unintelligible to the English ear. It's sound---what it sounds like, eh, when I listen to it "down" is it sounds like a language, a human language very, very far removed from English.

Q: What, w-you know, what you're talking about, really could be the language before we were trying to build the tower of Babel. We all shared the same language [can't decipher] because we...

TM: the Ursprach...this is the term for that...Ursprach, the first language. Yes, uh, it may, uh---that's what I mean by an assembly language, but the things that happen on psychedelics with language just defy rational apprehension. For instance, uh...I...there's a Celtic saying that 'poetry is made at the edge of running water', and I've noticed on psilocybin, at times, that as you approach running water, like a river or a waterfall, you know, you--there is--you're--you begin to think in rhyme, it sprung verse, and it seems preposterous, and you say, you know, 'this is too crazy to mention to anyone', and you're right [audience laughter], but nevertheless, it's happening you know. I mean, I, uh---and as you leave the river, thought becomes perfectly normal, and, uh, now, well, people say, you know, white noise is doing this.....that's an explanation? [audience laughter] ...oh, and, uh, you know....or, you look at historical phenomenon....Mohammad, it turns out, spoke in verse. And, it was considered a sign of election. Glossolalia with shaman is not that, uh, not that rare....spirit voices.

Q: I mean, it happens without drugs all the time.

TM: Yes, although, I don't know if you know this book by Sylvia Goodman called 'Speaking in Tongues', which is, as far as I know, the major work in English. It's done strictly from the sociological approach, but there is some physiological data, the most interesting being that, on the floor of these Costa Rican churches, where she did her research, after these sessions, they would measure pools of saliva 18-inches across, deposited by single individuals. Also, [audience laughter] what was going on was, there was a lot of hyped-up, you know, Hallelujah type of stuff, and then, someone would fall into the glossolalia, and utter a burst of it, and then be like almost like a post-epileptic, uh, situation, and they would turn to the people around them and say 'Did I do it? Did I really speak in tongues?' This is not what the DMT glossolalia is like. What it is...and I, I'll take a minute and describe it, because [audience: "do you have it recorded?"]. Uh, not with me, but, but I'll describe how it comes, because, I-I think people often say to me 'well, I took mushrooms, and nothing like that ever happened'. Well, the first time it happened to me, was the first time I smoked DMT, and I'm not sure that it would happen on psilocybin if you didn't have a lead into it. You

have to invoke it. In other words, it isn't that psilocybin causes it, and this is interesting; it's that psilocybin carries you to a place where...it is possible, given several other things which seem to be necessary. So, psilocybin is necessary but not sufficient for this phenomenon. What else is required is a thing which is sort of hard to describe, but it's an attitude of expectation. It's an attitude of, uh, being on the verge of communication even though nobody else is present. In other words, you have to invoke it. And, that word, strangely enough, has a history related to demonic, uh, summoning, and that sort of thing, but that's what you do, you invoke it. You feel the load of the psilocybin and you say 'aha, it's enough now'....and then you, um, test a religious...you try it, and you do this by consciously speaking gibberish. In other words, what seems to be happening is that you have to release your brain's expectation that sound will have meaning. Because, when we all speak, we...eh, always the words have a meaning attached them, or else there's something wrong with you. But, if you will speak gibberish for a moment, just for a moment, it's like priming the pump. And, the break, then, is made with whatever connects language to meaning, and language begins...it begins to flower..and to take off..and to develop these abstract modalities that are free of association but that are obviously highly ordered and grammatical. And, going through complicated s...s--it's s-like a sonata. And, in fact, it's led me to suggest, uh, that probably language existed..thousands and thousands of years before meaning--that this is what..monkeys, these evolving monkeys on the brink of self-reflection did for each other as a form of entertainment. It's not as much of an energy drain as chanting and singing. It's..you just carry it on at a conversational level [audience member chuckles], but you, you know....it's word music..that..c--very very fine nuances of..the stuff it's manipulating, which is not meaning, but whatever it is, this topological manifold, very fine nuances can be imparted to it by these small mouth noises, and...

Q: So is it anything like what babies who are about to learn to speak to use to carry on these things, and sounds like a language that you just don't understand...there's all this inflection, and, it sounds very intelligent if you could just kinda catch it [Terence: "It's, it's like that..."--several people talking at once]...well, a lot of it was to actual language.

TM: It's like that only more so [Q: only more complex] Like, one of the things that seems to be going on is there seems to be more phonemes than are actually in any human language. I mean isn't that there are 52 phonemes and no language known has more than 41 or something like that. But, eh, i--because if you do this for a while, and it's so much fun, it's a kind of ecstasy to do it that there's no reason to stop if you're alone....after you've done it for an hour or so....you're face, your mouth, is just hanging down to your waist...[audience laughter]...I mean, it's like you've just done something to the whole front of your head, and all the musculature has dissolved, because you've been making all these sounds that you never make. And, the whole front of your face feels different, So, uh, every language has a set of coded mouth positions which are expected, and, uh, easily facilitated through use.

Q: Is it easier if there's somebody else there to hear it?

TM: No, there's rarely somebody there to hear it when I do it [some audience laughter and talk]...I sometimes wish.

Q: Is it easier, in other words....And, uh, I got the impression that there was something about the attention, the listening to somebody else, that facilitated it, a channeling through...

TM: Oh, I don't know. I mean, for instance, I'm very shy about it. I feel like it's a very personal thing to do,

so that I...it's hard for me to do it in the presence of other people, but, this is just perhaps my personality, or my association with it.

Q: Do you think you're a better speaker in English since having these experiences?

TM: Yes, well, this is something...

Q: Is there more fluidity that there are, you know, you have developed, you know, in your face, in your expression, and..?

TM: Well, here's what I think it is, it's... And Henry Munn made this point in his, uh, in his, uh...article. And, I said earlier, you know that what..we need is the evolution of language, and it's all about the evolution of language. Yes. It's a very...it's a continuum. And, as I, I guess I was here, or somewhere recently, I said, 'it begins as a clear thought, it moves into eloquence. It then becomes charismatic. At that point, if it goes any further, it will be called demonic possession [audience laughter], because it's too, it's happening too much; you're not supposed to be that compelling; you're not supposed to be that powerful a speaker. And, if you stick with it past 'demonic possession', it actually becomes the, it becomes these objects; it actually crosses over and becomes the topological modality..that, that I mentioned. Um..Jill and I were talking in the baths the other night because she made her sounds down there, and I caught it at a certain angle visually, and I could see these things coming out of her mouth which looked like, uh, blue smoke, and I've seen this before. It looks like heatwaves off a highway, and perhaps it's nothing more than heated air that's been in the lungs, heated by the body, has a different refractive index than the exterior air, it's probably expelled in a series of waves, and so if you have the light just right, what you see is a, is a, is a, uh, a displacement of light and a flickering in the vicinity of the mouth, but I think, I've also, in a stoned state, watched that condense into this more visible language. And it's as though, you know, there are finer and finer levels of vibration. The whole notion of the word becoming flesh, which occurs in cosmogonic, uh, myths as diverse as the Judaeo-Christian and the Australian aborigine. It's always about a word, uh...a word was uttered, and this word was somehow more than a word; it adumbrated through dimensions, and caused the phenomenon of being. And, uh, uh, uh, th-this is, uh, the sort of thing that is happening.

But, to answer your question, yes, I think that I, uh, have verbal facility because I've taken so much of this drug, and maybe I had a tendency toward it at the beginning, being Irish and, uh, not given to hard work [audience laughter] but, uh...but, nevertheless, it definitely does this and it does it temporarily. Like, when you take psilocybin, if you actually try to do what we call 'raving', which is, uh, you know, a..f-a-a high speed soliloquy, but the raving can just go anywhere, and is, uh, and if it's true that what we are are creatures of information then this is very interesting, that it synergizes this ability. Everything that we are doing is informational deployment. I mean, we take in raw materials, and we excrete manufactured objects which are essentially ideas. We take in air, and we expel words. Everything that we do is about stamping higher orders of information on unorganized lower forms of raw material, and it's, uh, it's moving out of us, moving out of our bodies, this technical engine that we have created of computer and scientific institutions and rapacious, uh, government agencies and commercial concerns [audience member: "it has a life of its own"]. It has a life of its own; it's defining what humanity will be for itself. It's a war about language, about, uh, you know, Joseph Goebbels was the...the great 20th century thinker who understood this more clearly than anyone else, and set the tone...uh, set the rules of the game, so that the deconditioning effect of the drugs, the introduction to alien modalities, the glossolalia, the accessing of the vision state, all of these things have to do with information and it--the life its own that it is taking on, and

we are like the privileged observers of this. It's as though...well, no less a, uh, psychedelic voyager, researcher, and, uh, bon vivante than William Burroughs said, uh, "English is a virus from outer space," and that's what I've been trying to say...and now I'm finished [Terence laughs]...yea...

Q: You see that, the first thing that comes to mind when you talk about the creative power of sound, err...or language, uh...um...for me, is the experience that I've had with the holophonic sound, where you have this sense, you know, that, that qualities in other senses are created through sound [Terence: "right"] and, uh, I wonder what would happen if you record this holophonically, and then people listen to that.

TM: Now that's an idea. That's a very interesting idea.

Q: I heard a lot of things, you know, with transmits qualities, emotions for people in unusual states and so, um...but there I came as close as I've ever been to understand that there is something special about the creative power of sound...

TM: Of sound, yes...I think sound..

Q: You know, I was always saw it as a metaphor that, what science has discovered about vibrations and so that when they talk about sound, they really mean vibrations and not sound literally.

TM: Well, they talk too much about sound, I think, and not enough about language. W--Most people, when they think about the creative power of sound, they think about the, the mantric approach--syllables, sustained tones, and what I'm more interested in is the, the self-transforming power of grammar. That, that there is really something, uh, going on there.

Q: Yea, but there's just...you know, there's just, it's just the next stage.

TM: Right, well, these things...it's all gradations. This is all of a piece somehow. And, how the visual cortex and the voice relate to each other is not well understood. One thing I want to mention; I just thought of it, but, because there may be experimentalists in the room. This was...uh, appeared three months ago in Scientific American, and to me, just seems astonishing. It is that anyone who can sustain 100 hertz hum, that's 100 cycle per second hum, can, uh, look at an electric fan, and if you can sustain this 100-cycle hum, you can slow the fan down, make it appear to stop, make it go backwards. You can do this to a phonograph record, you can do it to a spinning wheel. This is not stoned...this is simply using the voice. Well, uh, it sounds like pure magic. How can such a thing happen? The explanation of the Scientific American was...that, uh, actually the resonant voice cavity is imparting vibration to the eyeballs, and that it's actually this subtle vibration [audience laughter] is breaking up the, er, photonic input, and you're actually getting a stroboscopic effect. Well, the guy who wrote the article said that he has no training in music and he was tone deaf, so to test the theory that it was vibration of the eyes, he built a little machine where he strapped his chin onto a box, and by manipulating a dial could make the box, uh, vibrate [muffled thumping sound as Terence demonstrates] and impart the vibration to his chin, so then, [clears throat] and he was using, he also using--you can make TV pictures appear to roll, or you can fix rolling without getting out of your chair [audience laughter] by... And, and, uh, and he attached his chin to the box, and ran it up to 100 hertz and, low and behold, this effect was happening. Well, imagine, an Amazonian shaman being able to approach a waterfall, or something like that, and make the water stop, or flow uphill, things like this, with no technology except the human voice. How many things are there like that, you know? How many human

abilities are there that we, we, are just unaware of or have masked, and what could you do with it? I mean, I suggest stopping a waterfall, because I've just given it five seconds thought. But, what if you've given a millennium of thought to social institutions and little tricks and party games that could be used if you could stop time with your voice. And, we bring orthodox physics to bear and say, well, acoustical vibration, stroboscopic effect, etc., blah, blah. But, what is experientially happening is, here's a man who uses sound to control the speed of passing time. If that's not a magical ability, what is? And, yet, it's all nuts and bolts, and we--and he hasn't even taken his first hit of ayahuasca; this is just on the 'natch [audience laughter]. Right?

So, what happens when you add in, you know, the exotic psycho-dynamics of these compounds?

Q: Well, that's like, what I...two things come to mind. One is, I understand that Hitler's generals would go into him, you know, and they're gonna talk him out of this next invasion, cause he's totally off the wall, and they come out glassy-eyed and convinced they're gonna go and invade some more.

TM: Well, they'd probably been chatting with Joseph Goebbels before they walked in..

Q: Well, the other thing is, uh...the other thing is to, uh...is, uh, Milton Erickson, who, just with his voice, uh, does all sorts of things with people that are, you know totally [other audience member]: he can't even speak their language; he can do it to people that he doesn't even understand them and they don't understand him... [first audience member]: totally with sound and he moves his head around in real unusual ways even when you stop talking and who knows what that does

TM: Ayahuasqueros are interesting, because, uh, when you meet a few of them, they all have a bunch of mannerisms which have to do with their voice, and a certain sound that they make, who, the only, uh, 'honky' I've ever met who came even close to this was, uh, Ralph Metzner, had a curious, uh, speech habit, which is this, it's a kind of, uh, purrr, at the back of your throat. But, these ayahuasqueros do it very noticeably, and when they're listening to you, you hear them purring, and they have very smooth, liquid, invasive voices, and, of course, ayahuasca, the, the way in which it's taken it's very interesting; there's no drumming, no...I've never seen a musical instrument at an ayahuasca session; everything is voice, voice, voice...and, uh, that's what they're into.

Q: Don Fidel

TM: Don Fidel is a good example. Many of you have probably heard his tape, but there are many such practitioners. Also, uh, in the curing process, eh...use very sharp sounds, and, in fact, when you talk to Don Fidel, he has a very animated style that is not the macho Spanish style at all. His speech is punctuated with [makes high, sharp, noises]--all these aspirations, sharp..sounds, and he obviously has a relationship to sound that's very different than we do.

Q: We have the tape down here...

TM: We can play it sometime, or in an intermission sometime, and it's wonderful to trip to. It's very good....

So, that's how the boar ate the cabbage. [audience laughter]

Thank you very much. [Audience: Thank you, Terence] Thank you.....for your tolerance.

Here is a true enough myth of our world. It begins with the notion of a soliton of improbability. Let us imagine that these are events which only happen once, and since they only happen once they are not legitimate objects for scientific inquiry, because objects of scientific inquiry must happen at least twice; but this is a phenomenon which happens only once, and we can visualize it as a kind of particle. These solitons of the utterly improbable crisscross the universe, occasionally colliding with an existing event system. When they collide with an existing event system, that event system bifurcates into two event systems in order to preserve a kind of parity of probability — a term I invented that need not be taken seriously — but in the pursuit of the preservation of the parity of probability, the soliton creates a temporal bifurcation.

We have reached the top of the steep learning curve in this concept system. Now here's the good news: the soliton of improbability which interacted with our world occurred 2,000 years ago in the phenomenon of the Immaculate Conception: an event that I think you and I can agree is highly improbable! But let us take it at face value and see if we can work with it. When the Immaculate Conception occurred through the collision of the soliton of improbability with this Galilean village girl called Marian or Mary, in one world she became impregnated with a figure destined for a great religious and political future: our world, the world in which Christ was born, became a young man, taught his message, and went to his execution around 27 A.D. Another world sprang into existence at the moment of the Immaculate Conception, and in that world nothing whatsoever happened to this young Galilean girl. She continued to live with Joseph. He continued to make fine furniture. Eventually they were able to move to the better side of Nazareth, and that was their story. It's the claim of Christian theologians that Christ comes in the center of history. They speak this same language: before Christ no souls were entering heaven. He freed the valve and now it's possible to enter into heaven. Before his intercession that was impossible.

So, you see, I'm suggesting that at the time of Christ a parallel world came into existence that knew nothing of Christ, and consequently the forces which shattered Roman civilization never came into existence in that parallel world. Instead, Greek science and mathematics continued to enrich Roman engineering, government and theories of civil polity. The wonderful female mathematical genius Hypatia was able to complete her career. She was stoned to death by Christians in our world, yet in the parallel world she lived to old age and was able to elaborate the calculus some thousand years before Newton. This meant that by the 6th century or so this Greco-Roman world had shipbuilding and navigational techniques that were

possessed in our world only by Elizabethan times. Roman navigators, inspired by the perfection of their science, set sail to explore the world, and in that parallel continuum they discovered the Maya just as they were reaching their classic climax in the jungles of Central America.

Approximately 900 years after the bifurcation into the two timestreams, a Greco-Roman-Mayan civilization came into being in the parallel continuum. The great influence on the Greco-Roman psychology from this cultural adventure was the sophisticated use of psychedelic drugs for the purposes of religion and self-exploration. In the vision in which this idea was shown to me by the powers of the other side, I actually saw the Roman emperor Cosmodorus the Fifth and his retinue arriving at Tikal in the ninth century for the coronation of Three-Flint-Knife at the end of that Baktun 8; a great confluence of imperial majesty as the greatest king of the Mayan cultural climax received his European counterpart, and documents, codices, mathematicians, instruments of navigation and pharmacy were traded.

The genius of the Mayans in mathematics and astronomy and their extremely sophisticated psychopharmacopoeia and shamanism mated with Neoplatonism and Hermeticism, so that rather than science developing as it developed in our world, a kind of magical, psychopharmacological technology of thought and understanding developed over the centuries. In later centuries — centuries before it happened in our world — they contacted the Orient, and the dynastic influence of the Song poured itself into the creation of a global civilization such that by around 1200 A.D. they were able to land on the moon and create a cybernetic global civilization similar to the kind we have now. They continued evolving with all this psychotronic and shamanically-derived technology, and by this time you can imagine that it was an unbelievably exotic and alien civilization compared to our own.

The fruit of their psychedelic and psychoanalytic investigations into higher space was the discovery of our world. By studying the dreams of psychotics in their world, they slowly became aware of our existence. They found out what had happened. They figured it out by studying dreams, and by making deep journeys into the psychedelic space they were able to discover our sleeping unconscious, with its repository of the legacy of the Christian centuries under the reign of this demiurgic ideology, and they conceived of the notion of saving us.

Further, by extension of their more advanced understanding of atomic and particle physics, by around the year 1900 in our continuum they came to the hypothesis that major releases of hard radiation would penetrate across the energy barrier of the two timestreams. They conducted an experiment to test this hypothesis: they decided to set off a small atomic device in their continuum and to monitor the dreams of sensitive people in our continuum to see if there was evidence of an awareness of this explosion. The experiment was actually carried out in 1906 by our time reckoning. This is what we call the Tunguska blast that occurred in Siberia. After the blast in the parallel continuum, those who had conducted the test were able to monitor the dreams of Siberian shamans, and they saw hundreds of square miles of trees smashed flat by a mighty explosion. Hence they realized that their theoretical assumption that explosions in one continuum would affect life in the other were in fact true, and they became quite alarmed, because as they continued to monitor the dreams of human beings in the parallel continuum they came to slowly understand that, primitive though we may be, in our world we were coming to a grasp of atomic chemistry and thermonuclear fission and fusion.

Fearing for the destruction of their own world they began, and have in fact carried out through this century, a massive scientific research project to attempt to reach us to communicate to us the true situation

and to depotentiate our nuclear arsenals in order to save their own world, which is now in fact the administrative center of some 16 integrated star systems in this part of the galaxy. In other words, they are some 1,200 years in advance of us technologically and in the use of psychedelic substances, because they never experienced the history- freezing eschatology that the rise of Christianity created in our world.

Psychedelic compounds amplify the very slight leakage of information from this other dimension. In the same way that they found us, we can find them by taking psychedelic mushrooms and opening ourselves to the information pouring through from the alternative timestream. The other side is actually the manifestation of this bizarre Greco-Roman-Mayan, postmodern, starfaring civilization trying to reach across the dimensions to save us from the momentum of our history by making us aware, first of all of their existence, and also of their technology.

It's not unlike the situation with East Germany and East Berlin. All we're saying is that this advanced civilization is about to pull down the wall and invite us to leave the benighted world bequeathed to us by rampant monotheism and participate in the higher life of the great stellar civilization created by the Greco-Roman-Mayanists, who avoided the rather tawdry ideological path of development that we were victim of; and UFOs are aspects of this technological effort to reach us. In other words, they are experimental vehicles attempting to penetrate the time barrier to reach us with this news. I believe that in 2012 this technology will be perfected and they will no longer need to send unmanned probes or experimental devices: rather they will actually be able to open a domain, perhaps as much as several thousand kilometers in diameter, which will be coexistent both in our timestream and in their timestream.

If any of you have read the late works of Philip K. Dick, he was probing in these areas. He was a genius; his book *Valis* is pure exegesis of the internal unravelment of what was going on. His take on it was that he believed that from A.D. 69 until 1948 no time had actually passed; that we were living in apostolic time and that the crucifixion lay only 75 years in the past, and that the demiurge had inserted a false history. The Nag Hammadi manuscripts, he believed, were actually the Logos as printed letters, and when the Nag Hammadi manuscripts were deciphered it was like this information creature would come alive and again be present on the earth, like the Logos in 1948 was beginning to infuse everything and that shortly it would dissolve the illusion of the intervening 1,860 years and then we would realize that the prophecy would be fulfilled and that the last days were upon us.

He didn't get around to the Antichrist, to his credit probably. You have to distinguish between Christ the person, the teacher, and this thing called the Christos, which is the archetype of such power and force that immediately people of ill-intent could get lined up behind it and impose their will. The Christos is the thing history is ruled by, the archetypes which the people can generate. Most people are very ordinary, I mean, your Mick Jagers and your Henry Kissingers are very ordinary people, but they are able to project an archetype and that is the thing which sets them apart. When that reaches the kind of super intense focus that you get in a Mohammed or a Christ, then you know that history is just putty in the hands of the force, not the person. The person is usually martyred in some horrible way, but the archetype draws energy to itself, and we don't understand how this process works.

If there ever is developed by benevolent or malevolent forces a science of social control, it will be a science of knowing how to project archetypes. Different archetypes, apparently, are suitable to different times; you can almost pause at an astrological theory of archetypes, but what's appropriate for the 1st century A.D. is not appropriate for the 15th. When the archetype is appropriate, nothing can stop it. The

modern term for archetype is paradigm. We expect it not to be a person, not a messiah, but an idea which will save us all, which then gives us certain affinities with mystical Judaism, where the messiah was expected in the form of an idea. This is sort of our faith; we are messianic ideologues, or something like that.

The Human Future (On 'Thinking Allowed' w/ Jeffrey Mishlove)

Day Month 1988

Location, City, State

Event Description:

Description

- [Audio Link](#)
- [Transcription](#)
- [Other links](#)

JEFFREY MISHLOVE, Ph.D.: Hello and welcome. I'm Jeffrey Mishlove. Today we're going to examine "The Human Future." As we approach the year 2000, what are some of the novel features of our contemporary culture that are likely to become dominant in a future society? With me is Terence McKenna, a specialist in shamanistic cultures and hallucinogenic plants and drugs. Terence is the coauthor with his brother Dennis of *The Invisible Landscape: Mind, Hallucinogens, and the I Ching*, also *Psilocybin: The Magic Mushroom Grower's Guide*.

In addition he is a founder of Botanical Dimensions, a nonprofit organization devoted to preserving hallucinogenic plants as used by native peoples throughout the world, and he's also the author of *Timewave Zero*, a computer software package. Welcome, Terence.

TM: It's a pleasure to be here, Jeffrey.

MISHLOVE: You know, you're a specialist really in the past -- the ancient past, the prehistoric past of shamanistic cultures; and of course ancient peoples, shamans and other ancient peoples, have always attempted to look at the future. Today there are many, many scenarios about the future, and the one thing that seems to be certain is that the future will contain surprises -- that no matter how much we attempt to predict what the future will be, there will always be unexpected things. I think you have a unique perspective on the future, since your studies take you so deeply into the past. I wonder what some of the major features that you delineate in our present and our past society are that may tend to surprise us, or surprise conventional theorists about the future.

TM: Well, first let me say you make a valid point. My ordinary concern is shamanism, which is usually thought of as an archaic or an historical phenomenon. However, in my looking at the shamanistic phenomenon, I've discovered that shamans themselves, as you also mentioned, have a deep concern with seeing into the future, with having a feeling for the course of development of the society in which they are embedded. And strangely enough, my own career somewhat paralleled that model, as I was a student of Erich Jantsch, who was one of the great forecasters of the last ten years.

MISHLOVE: Systems theorist, as I recall.

TM: Systems theorist, exactly. And he was very concerned to model the future with a degree of realism that had previously not been possible, and he taught me that the way to do this is to concentrate on the novel and the unexpected. As you point out, much of the future will be in fact characterized by factors that are presently unpredictable. How then, by stretching our own definition of what is currently at the cutting edge of society, can we anticipate these future event systems? My own approach to this has been to try to concretize or locate areas of influence that seem to me, while very seminal in the present situation, probably fated to grow and flower over the next twenty-five years.

MISHLOVE: You know, I think it's interesting that you mention Erich Jantsch. He wrote a book, I believe it was called Design for Evolution.

TM: Exactly.

MISHLOVE: In that book I was very interested in how a man of his scientific credentials as a systems theorist took a close look at the new age movement, and things such as Kundalini yoga, and examined how we might begin as a society to look at developing Kundalini to develop our own evolution biologically and as a species.

TM: Yes, well, he was an extremely broad thinker, not only a fine scientist but music critic, philosopher, what have you. A point that he was always very much concerned to make to me about the future was that much of the future is in place in the present. A typical residential street of today will look pretty much as it looks today thirty years from now, barring major catastrophic changes in society. A curious thing about history is how much momentum it does have. Nevertheless it is possible to isolate forces which are creating change. Four major forces which I will enumerate and discuss for you, the four that I think are probably among the most important, are first of all feminism. Feminism is a tremendously underestimated force, viewed in the present context primarily as a woman's concern. The understanding has not yet percolated throughout society that the advancement of women is a program vitally connected to the survival of human beings as a species. The reason for this is simply that institutions take on the character of the atoms which compose them, and what we are most menaced by -in the twentieth century- are dehumanized institutions. If women played a major role in policy formation and execution on the part of these institutions, I think they would have a far more benign and ecologically sensitive kind of character. So I see feminism not as a kind of war between the sexes or any of these stereotypic images, but as actually a kind of effort to shift the ratios of our emphasis that is expressed through our institutions.

MISHLOVE: In other words, you're not looking so much at whether women get more voting rights, or whether they get more women placed in high positions in government, but rather whether institutions have more of a nurturing quality.

MCKENNA: That's right. It isn't even really about women, it's about femininity -- injecting femininity into our decision-making process and our social policy. Naturally the most obvious way to do this is to bring women into the process, but that isn't necessarily how it should be done.

MISHLOVE: Well, there's a catch phrase now that's going around a lot in business circles -- "High tech, high touch." That seems to embody this notion of paying attention to human feelings and to caring about people as we develop a more technologically oriented society.

MCKENNA: Yes, although I'm suspicious of that, having seen several American revolutions turned into advertising slogans. I'm afraid this may be an effort to co-opt the really volcanic energy that feminism could bring to the social restructuring effort. But feminism is only one of these novel areas that are injecting change into our lives.

MISHLOVE: Why don't we list the others, and then perhaps we can look at how they interrelate with each other?

MCKENNA: Well, for example cybernetics is certainly a major area where we could spend some time. Space flight -- I don't think you would get a lot of argument from people that that is going to have a major impact on our lives. Then perhaps in a more controversial vein, and along the lines of my own special interests, I think hallucinogenic plants and the pushing back of the frontiers of the mind, the cataloging of ever more exotic states of experience through the use of hallucinogenic drugs, aerobic exercise, vitamin therapy, what have you, is going to be very, very important. Seen as an amalgam, what these things seem to imply is that we are really sweeping toward the climax of a thousand-year-old civilization -- a civilization that began, I suppose you could say, with the rise of medieval scholasticism, which then transformed itself into proto-modern science, which then became modern science, and then modern philosophy. We are really sweeping toward the culmination of the western contribution to the story of mankind, and what will that contribution be? It could well be a devastating species-extminating thermonuclear war. Or it could be the culmination and completion of the ideals that we inherited from the Greeks. How we balance historical forces against the need to evolve consciousness is going to decide how the tale is told, and if you look at the things that I named -- feminism, cybernetics, consciousness expansion, space flight -- these are all different approaches toward the notion of expanding our frontiers, organizationally, geographically, informationally, consciously. The expansion of frontiers is the very essence of a continuing human future, a humane human future.

MISHLOVE: You used the word balance a little earlier in a pivotal way, and the four elements that you mentioned strike me as being rather balanced. Space flight and cybernetics seem to be expanding the frontiers of science and technology, and yet when we look at the inner exploration suggested by the rise of feminism and the return or revival or re-energizing of hallucinogenic drugs and other features of the consciousness movement, that suggests an expansion of the inner frontiers. It seems to me ultimately that if we are to survive the threats that now stand poised above our planet, that balance has to be essential, that we can't go too far either internally or externally without some balancing features.

MCKENNA: No, I think that's a very good point. In fact the entire lethal dimension to our cultural dilemma can be laid at the feet of a burgeoning scientific capability that developed at the expense of a concomitant ethical capacity. I think that we are not going to go to the stars as Republicans and Democrats, communists and free marketeers; we are not going to go to the stars as male chauvinists; nor are we going to go to the stars as uninformed clods. All of these various characteristics and ways of being are dross that the historical experience of the twentieth century is going to either burn away from us or burn us with. We have actually created a self-limiting situation for ourselves. We are the ones who have boxed ourselves into this dilemma, and we must now be the ones who have the cultural and intellectual wherewithal to take command of the situation and to navigate out of this cul-de-sac without wrecking the planet, without betraying our ethical heritage of some several thousand years. Balance is going to be essential to this -- a sense of openness to possibility, a sense of the true strangeness of the situation in which we find ourselves.

MISHLOVE: It strikes me that as we move into the future, as we move into the next millennium, perhaps the really novel feature that might emerge is that as a culture, as a global culture, we will be forced, I think, to take responsibility for ourselves on this planet in a way that we haven't previously been forced to do because we've always had room to expand, room to exploit the environment and ourselves. We're running out of room for that, so we must be responsible.

MCKENNA: Yes. Well, this is the century in which the chickens come home to roost. All the profligate processes of metal extraction and subjugation of native populations and land clearing in the tropics, that pot latch mentality must now give way to a more resource conserving state of mind, or we will be quite simply doomed. And I'm very much up on humanity, but I'm very concerned about the role that the United States is to play in this future. Certainly if resource management is going to be an important factor in the future, then the Japanese are out in front of all of us. Now, if not having committed resources to an obsolete infrastructure is going to have an impact, then certainly the Chinese have a leg up on all of us. Did you know that there are less than a thousand private automobiles in China? Can you conceive of the leap forward that can be made if you could go from the wooden cart to the spaceship without committing yourself to fifty years of highway building and gas stations and petroleum extraction and this sort of thing?

MISHLOVE: You have a remarkable talent here for seeing the positive side of a nation of a billion people living in what we would think of as destitute poverty. They don't have cars because the per capita income in China is about two hundred and fifty U.S. dollars a year.

MCKENNA: Well, I think Marshall McLuhan pointed out that any technology put in place is extremely difficult to dislodge, and that is our problem. We went for the automobile so completely that it will now be a major effort at cultural restructuring to leave it behind. The Chinese have no such problem. I think it was Freeman Dyson, or perhaps Gerrard O'Neill, who said, "No technology should be put in place that has a foreseeable obsolescence." This was his argument against nuclear power. And I think that's an excellent point. We should not commit ourselves to any course of action whose end state can be foreseen. This is why we have to commit ourselves to this kind of conscious, open-system, non-equilibrium future that futurists like Jantsch, and West Churchman and others have so eloquently described in their work.

MISHLOVE: Let's talk for a bit about the role of hallucinogens in the future. I think most people would agree that the marvelous decade of the 1960s, which seem to have awakened so many people to possibilities, was inextricably linked with the use of LSD and other hallucinogens at that period. It's interesting to me that today this is not talked about very much; you're one of the few people who are willing to look at the role that hallucinogens may have played at that time. How do you see hallucinogens? Do you imagine, for example, that a billion Chinese will return to...

MCKENNA: Using LSD? No, it isn't quite like that. I think that whatever we may say about the way hallucinogens were introduced into American society in the sixties, I think that that has now become a dead horse, and that we are looking at a much different sort of problem. The problem is that psychology is the science whose perfection we are most in need of, because our whole problem is that we do not communicate with each other. We do not understand our own motivations. We are waiting on psychology literally to save our necks, and governments are repressing the major tools that promise major advances in psychology. I may represent only a faction of opinion, but it is my opinion that the hallucinogenic plants and drugs are to psychology what Galileo's telescope was to astronomy. The difference is that the church

was unable to suppress the telescope, but the state has had immense success in suppressing hallucinogens. I'm not speaking of keeping it out of the hands of high schoolers and college students; I'm talking about keeping it out of the hands of research pharmacologists. Science feels free to investigate any area that concerns it -- areas of our interpersonal relating, our sexuality, the effects of automobile crashes on human bodies studied through using monkeys. Nothing is sacred. However, when it comes to allowing scientists to study the effect of hallucinogenic compounds on brain function and psychology, a great wall, a great barrier, is raised, and I think it signifies the fear really, that the establishment has of unleashing the creativity and vitality that it senses to be tied up in these things. The very decade that you mentioned was the last decade, I think, when Americans had this feeling of an open-ended, hopeful, transcendent future. Ever since the 1960s we've been given shortages, limited resources, voluntary simplicity, and a host of other notions that boil down to repression.

MISHLOVE: So you're suggesting that the legal restrictions are perhaps a temporary aberration, and that the exploration of the human mind through hallucinogens or other means might get us in touch with a vast resource within ourselves that we seem to have lost touch with a little bit as a culture.

MCKENNA: Yes. Well, if you contrast the state of modern astrophysics with astronomy as it was practiced in 1530, I think you can feel the kind of paradigm shift that I'm suggesting. We know nothing about the mind. There are a few theories -- Freud, Jung, Reich, so forth and so on -- but these are just guesses tossed into the unknown. And yet in principle the mind need not be a mystery; it's simply that the more complex objects in nature yield their secrets last. We understood falling lead balls long before we understood drops of water; we understood drops of water long before plastic polymers. The brain will yield, but it will yield to a different set of tools than the ones we have been applying.

MISHLOVE: As a philosopher, or at least a person who asks a lot of questions, I wonder if the ultimate nature of the mind is really knowable, any more than the ultimate nature of matter. It seems as if in some sense, as physicists today probe the ultimate nature of matter, they begin asking questions that sound more and more theological. And we get that way too with people who look at the mind, particularly people who explore hallucinogens.

MCKENNA: I think we can do a great deal, though, without having ultimate knowledge of something. As you yourself said, we have no ultimate knowledge of what matter is, or electricity, and yet we light our cities with electricity; we transform matter any way we wish. So I agree with you; the mind is inherently mysterious. If nothing else, Goedel's theorem will protect it from being understood -- that mind cannot understand mind. But I think brain, which is the receiver of mind, the stage upon which mind acts, the magic marionette, if you will, there's much to be learned there. That is in fact the great frontier of materialism, strangely enough.

MISHLOVE: As you look at the future, Terence, with your special lenses that really are unique to yourself, where do you see the realm of religion evolving?

MCKENNA: Well, I think we are rapidly growing into what I call a religion of the imagination, where we transcend individual archetypes and begin instead to realize that the mystery can take any form, and that a higher religion is a religion then which dispenses with the symbolic forms, the presentational modes of the mystery, and concentrates on the mystery itself as a kind of ineffable center of being that constellates everything around it to have meaning.

MISHLOVE: This would require obviously a dropping away, then, of dogma.

MCKENNA: Yes, well, I think dogma has served us ill. How ill is hard to say, but I think, for instance, the case could be made that it got us to this point. I think it was H.G. Wells who said, "History is a race between education and disaster," and I think we are in the homestretch, we are neck and neck, it is too close to call, and we must not take our eye off the ball. It is going to take the best effort of all of us to bring to birth the kind of transcendental human future that we all sense so pregnantly near the surface of things. It is not far away. It is here, it is now, if we could but invoke it, if we could but find the means to communicate to the deeper parts of ourselves and to each other, to bring that kind of perfected future into being. It's fallen out of fashion recently in a lot of existential whining and carping, but I think this is only a fad of the times. The future is endlessly bright and full of transcendental promise for those who are not afraid of it.

MISHLOVE: The future that you described was a fourfold future, in effect -- feminism, space flight, cybernetics, and hallucinogens. It reminds me of Jung's image of the mandala, the fourfold mandala, that we move into.

MCKENNA: Yes, well, these things could be imagined as the four quarters of a mandala that taken together create the totality of a free and caring world -- well fed, well governed, well intentioned, and pointed toward the exploration of the mystery of being, which is, I think, really the higher calling of human beings. We are naturally called to the mystery, we are naturally its acolytes, and in all other roles we perform rather badly, I think.

MISHLOVE: So there's a sense in which if we look at the future, we might ask ourselves, why have a future at all? What is the meaning, what is the purpose of being here? And you seem to be saying to study, to appreciate the mystery of it all.

MCKENNA: Well, I think that history is a kind of message from the ineffable -- that in the rise of dynastic families and the fall of empires and the migrations of peoples there is a vast tale being told; that we are caged within art, and that the great satisfaction of contemplating this spectacle is to know where in the tale you are.

MISHLOVE: Terence McKenna, thank you very much for being with me. It's been such a pleasure.

MCKENNA: It's always a pleasure to talk with you.

Description

- [Youtube Audio Link](#)

I believe that what these psychedelic states are are actually a sense to a higher order of information. And by a sense, I mean the word in a dimensional context, as a mathematical idea that here we are deployed in a three dimensional matrix. The past fades into unknowability. The future fades into unknowability, and only the crudest and least interesting of processes like the rising of the sun and falling of the tides can be propagated into the future with confidence.

What shamans see in contrast to this is a hyper-dimensional universe of information. They see the past the origin and they see the goal, the culmination, the place where the ouroboric snake takes its tail in its mouth. We who are locked in linear history don't have this perspective, and what we have in its stead is immense anxiety, immense anxiety about the future. We map the unknowable future onto the presumed experience of our own death, and vice versa, and we build up a universe that is characterized by exsistential abysses. The unknown future, the inevitability of death, and the impossibility of intellectually assimilating what that means. Shamanism isn't like this. Shamanism is a fractal point of view. What fractals are are structures that have their subsets embedded in them. Subsets embedded in them. So the course of the history of an entire people can be known by looking at the history of an individual, or a family. Il subsets refer to levels above and below them. This is entirely different from the kind of linear history that we get in a hierarchical, scientific society. It is more characteristic of experience, and this is a very important point because the two phenomena that I tried to call your attention to, that argue for hope, are the self-evident accumulation of novelty, and the self-evident acceleration of that accumulation of novelty. Well, now notice the phrase 'self-evident'. These are not things that you have to study advanced mathematics to perceive. These are not things revealed to the holders of advanced degrees. This is stuff that one can tell by feeling into the world. The structure of linear society has disempowered the individual. We are all now- we have bought the Habesian notion that we are social atoms in a vaster machine than ourselves with a greater purpose than we can know. This is actually hogwash. If we move away from the human individual, the human individual, the consciousness about what is happening becomes more and more low grade and amoeba-like. You have the consciousness of the Giuliani administration, the consciousness of the American government. You see, as you widen the ven [???], it becomes more and more primitive, more and more simply a matter of stimulus and response. But you, the supposed irrelevant atom at the center of this process, make very subtle judgements, take in information of all sorts, compare, contrast, weight, understand, seek evidence. This is the subtlest thinking that's going on, but we don't reclaim our own minds, we look for institutional guidance, and yet it was institutions that guided us to this moment. So the character, then, of this next advance into novelty is from my point of view now easily discerned, it is boundary dissolution. This is what is happening. This is why great wealth and great poverty must come to

terms with each other, it's why the first world and the third world must come to terms with each other. It's why gays and straights must come to terms with each other. Boundary dissolution is what is happening, and this has been going on for a long time, but it affected our peripheral technologies first. Almost without us noticing it we've gone from a world where information moved at the speed of the horse's gallop, to a world where all information is co-tangent. Space is only an illusion of the plebs. Everyone else, with their computer networks and their connections, knows that the world has become a kind of virtual point. And yet still we maintain the most toxic of all the fictions to come out of the dominator experience. The fiction of the individual ego. This maintenance of the fiction of the ego is what is exacerbating a smooth transition into a new world order because people have one foot in the dematerialized connectivist, feeling-tone experience based future, but they also have one foot in the consumer fetish, objectified, constipated, linear, acquisitive, class conscious, sex conscious, race conscious past, and each one of us is a union of these opposites. Each one of us is trying to make some kind of an alloy of our hideously dysfunctional cultural past, and the incredibly compelling yet frightening, dimensionless, boundariless, polyamorous polymorphous future.

[Introduction on recording: "This is first of three tapes of Terence McKenna at the Ojai Foundation, under the Teaching Tree, in April 1985]

Terence McKenna: I don't think of myself as a teacher, primarily or at all. I think of myself as a researcher, who, because of the unorthodox nature of the research has to submit to this kind of situation for peer review. That's what this is. This is peer review of my rap, not teaching in any sense of the word. So, before I get into it I'll say a little bit about my attitude toward epistemology and system making generally. Um, this is one of the slightly uncomfortable moments because I have to make distance, uh, between myself and large numbers of other people and say I do not believe in the wars of Atlantis. I do not believe in reincarnation. I do not believe in the healing power of crystals, and a whole string of alienating "I do not believes". Fact of the matter is; I don't believe in belief. I think belief is a tremendously stultifying force. What I'm interested in is freedom, and I noticed very early that a belief absolutely precludes the possibility of holding to its opposite, and therefore if you believe something you have signed away its opposite and, uh, limited yourself. This comes close to the ideal but not the fact of how science is supposed to be waged. So I'm , uh, impression and fact-collector and I will propound a number of ideas that are very controversial, I guess, and I want you to understand they appear controversial to me, and the controversy over their applicability to reality rages in me at least as strongly as it will rage in any dialogue that I have with any of you.

The area that we're working in at the fringe of science, at the frontier of psychology is too chaotic and disorganized to be called a science at this point. We're in the Baconian phase of it where you merely collect facts, catalogue facts and wait for emergent patterns to, uh, be visible. And, uh, this is what I've done and I did it, I began as a skeptic, fairly confident that this kind of examination of reality and collection of facts would support the rationalist reduction- reductionist minimalist mapping of reality, and I discovered, to my delight and amazement that the world is quite a complex place, quite a large percentage of it goes on outside the descriptive power of any metaphor that we presently have a handle on and, uh, so I just want to put that out, that my attitude is, uh, is one of a kind of skepticism that allows and I am well-known as the proponent of the notion that there is an extra-terrestrial or trans-human intelligence accessible through certain psychedelic drugs. I have that experience often, but I am not a believer in it. I am very puzzled by it. I return again and again to reason as the measure against which all these things have to be played, so peer-review is very important I think because we're moving in an area where very little is known. It- we're somewhat in the analogous position to the early explorers of the Amazon who would sail up the main flow of the Amazon and note in their logs 'passed a river mouth that ?? two miles wide. Origin, unknown.' This is what we are charting. Enormous unknown flows of which we are only able to chart the, uh, the most gross, uh, expression of these things.

Ok, so that's enough about method. The, um, as I understand it, the- the matter around which this counsel is spun is the journey beyond history and the notion in that implicit is that there is an end to history. So, what I want to talk about this morning, and it's the most difficult lecture that I give because it is- the goal is not to convey a feeling or an impression, but to actually convey an idea, and ideas, you either get or don't get. It isn't like you can halfway get how to factor a quadratic equation. You either know how to do it and it's trivial or you don't know how to do it and it's inconceivable.

What happened to me was a series of, um, channelings, although I hate that word [audience laughter, Terence laughs]. It's so obnoxious -- I prefer maybe the word 'psychosis'. [laughter] Anyway, a series of self-amplifying revelations springing from an interior source that appeared from my best judgement not to be me, right? [laughter] And it was, uh, an unusual example of this sort of thing, although I do not immerse myself, I have never read a word of what Seth? has to say or any of that. But I gather these things are largely, um, urging people, they're moral teachings is what they are, urging people to straighten themselves out and fly right and care for the earth and be aware and be decent, and. the thing which I received was more in the character of an unravelling of a mystery. Somewhat analogous if any of you are familiar with Robert Graves book "The White Goddess" wherein a series of continuing revelation he gains, gains great insight, uh, into early Celtic and Goidelic poetic alphabets and encryption methods. The object of my uh experience was I Ching and I noticed, discovered, uh, a number of things about the I Ching which lead me to the conclusion that what we possess in the King Wen sequence is in fact a fragment, an archeological chunk of a piece of broken cosmic machinery. I concentrated entirely on the I Ching as a prehistorical artifact. I unburdened myself completely of the necess, of the necessity to be a sinologist by concentrating on the I Ching as it existed in the pre-han period, that is before 400 B.C., 200 B.C. All the commentary on the I Ching, all the exegesis is han or post han, so I didn't deal with that at all, I dealt with what is called the King Wen sequence. How many of you are well familiar with the I Ching? Good. The rest of you, good luck. [Laughter].

The King Wen sequence is the oldest uh, if you give up Atlantis, Lemuria, etcetera, the oldest ordered human abstraction. It is uhh, we find fragments of it on shoulder bones that are four to five thousand years old, so it's a human generated abstraction that has been preserved through the millennia. Now the question is: Is it an ordered sequence? And this was the first koan that the interior voice posed to me. "What is the order of the King Wen sequence?" As you know the human sequence [clears throat] begins with the creative and which is all solid lines, then the receptive which is all broken lines, and then umm whatever it is, uhh I noticed immediately that it was obviously organized in pairs. In other words, each hexagram the subsequent hexagram can be generated by turning the first one upside down. That's all that's happening. Now there are 8 cases where turning a hexagram upside effects no change in it. In those 8 cases a second rule has been applied which is if turning the hexagram upside down causes no change, then all lines change. You meet the first exception in the first two hexagrams. Clearly, when you invert the created six solid lines, you obtain the created again. Therefore, all lines change, and you get the recepted?. So then that solved a problem of partial ordering, that showed that uhm, we were dealing not with 64 hexagrams but with 32 pairs of hexagrams, and the next question was "What is the order of the 32 pairs?". Now this is a deeper question, and not so easily solved. But it was easily

solved for this interior voice that had my attention. It said “look at the first order of difference”. Now this is a very fancy way of saying “Look at how many lines change as you move from one hexagram to the next.” Obviously as you move from the first hexagram to the second, six lines change. As you move from the second to the third – I forget how many it is – four I believe, and so on. So that you can make a linear graph of the first order of difference as you move through the King Wen sequence and I rushed out and bought graph paper and did this, and looked at it. And it’s a saw tooth, all of these figures by the way are in the book “The Invisible Landscape”. It’s a double challenge to give this lecture without visual aids let me tell you. But as you all are probably expert visualizers, why uh, you should have no problem.

So when you graph the first order of difference in this way, an anomaly just jumps out at you. This is clearly not a random, uh, stochastic process that you’re graphing. If it were a stochastic process you would expect the possible values which are 1, 2, 3, 4, 5, 6, to occur in more or less, uhh, similar proportions. However, you notice immediately there are no values of 5, there are no first order of different changes in the King Wen sequence of 5. Now what is the prohibition against 5 about? I don’t know but its worldwide and Neolithic. Astragali are the knucklebones of sheep that have been used since the late Neolithic inter-roman times to gamble with by burning dots into the knucklebones, and in fact playing dice is called throwing the knucklebone. There are no Neolithic astragali with 5 dots burned into them, it’s a number which is just strictly avoided. So there is some curious, uh, thing going on with the number 5, knowing that Timaeus as people are coming in and sitting down for dinner, Plato turns to Timaeus and he says “The one generates the two, and the two the three, but where oh where is the fourth my dear Timaeus.” And this the first four numbers seem to lie in a much more archetypically intense relation than the number 5. 5 has been called the first human number. In any case, uh, that was not the anomaly which leaped out at my eye when I graphed this thing. What I noticed was that, uh, there was a saw tooth stroke at the beginning and at the end. Such that if a reflection or to use the technical term if the stereo-isometric reflection were rotated 180 degrees the two ends would fit together perfectly. They would dovetail like the joint of a cabinet maker. And it would not fall into this kind of parallelism or congruence at any other point. Only at the beginning and the end, and only I then noticed, if the hexagrams were paired across from each other in such a way that they always added to 64. In other words, 64 is across from 64, that’s the exception. 63 is across from one, 62 is across from 2, 63 is across, and so forth okay so the sums in all directions to 64.

And umm, so I looked at that for a long long time, and then I saw that what I had done, that though there were parall- these congruencies at the beginning and the end, there were also approaches to parellism – parallelism at 6 points in this figure, rather evenly spaced. And I realized then that what I had done if I had taken the entire King Wen sequence, run it

forward, run it backward against itself and created a kind of macro hexagram. A super hexagram which contained the entire sequence twice, running backward and forward, and at that point I had insight into a curious passage in the Confucian commentaries, where it says, of the I Ching, the backward running numbers refer to the future, the forward running numbers refer to the past. This was a, a, an anagram which makes no sense whatsoever, unless you posit the kind of structure that I am talking about. So then I wondered, what could this thing possibly be for? And I experimented with, uh, I said okay, this thing I have built in accordance with the principal of hierarchy construction, which is completely expressed at every point in Chinese history, and is therefore be assumed to antedate Chinese history and be prehistoric. This hierarchical principal can be used to manipulate this strange figure. Now the lines of a hexagram are called yao, and there are 384 yao in the 64 the hexagrams, obviously, 6 times 64 is 384. So I said I will take my figure and I will treat it as the yao of a hexagram. And so I made 6 of them, end to end and then I said okay now I have the 6 lines of a hexagram, some kind of hyper or macro hexagram. But a hexagram is composed of more than 6 lines, it is composed of 2 trigrams. So I took my figure and I multiplied it by a value of 3, and I laid those two, over the 6, generating everything from a common point of origin. So then I said okay, now I have everything that is in a hexagram, except the hexagramatic wholeness, but it is embodied by the thing as a gestalt as a holonomic entity. So I laid a big one over the 6 little ones and the two medium sized ones, generating everything from a common origin point and having everything return to a common origin point, so it looks and its figured in the invisible landscape, like a, uhm, an oscilloscope tracing, a mult- a three level tracing of lines, a tremendous mish-mash. And this was a problem. The voice then was by this time saying "this is the map, the fractal map of all space and all time. It is existing on many levels of resonance, and I personally could feel that. And I spent literally months and it was madness, much of this was generated in the amazon jungle. You have to picture a man in a thatch house on stilts, with the amazon flowing by, the Indians, the drugs, everything raging outside, and me with my slowly deteriorating pad of graph paper just drawing these lines, hours and hours a day, and looking at them and finally realizing convincing myself that it did in fact map time in a certain way. But realizing that it had the quality of a mystical doctrine. The interpretation of these slashing paralleling intersecting lines was impossible to convey to another person. I had to have a method of reducing this compound complex wave to a single wave, moving in a single direction on a single level.

Fortunately for you I am going to skip over the mathematical details of how this was accomplished, but I assure you that it was accomplished and to me it was, it was like a series of revelations. I didn't even care about the I Ching. And the notion that out of myself I could extract the techniques to collapse this wave and to produce something coherent out of it, it was like a revelation. And I don't even today know that much about the

mathematical ways of handling waves. Im sure that I reinvented the wheel in some sense. But the point is that I didn't reinvent it all by myself. And when it was over, I had something which I could show to people. I had the notion that there is a factor in reality, which we have previously missed, which is called novelty. Right and novelty is something which comes and gos, dowism is talking about this. Tao Te Ching it says the way that can be told of is not an unvarying way." Way is clearly a mistranslation for wave, and [Laughter] and uhm, so then okay you have this thing you've reduced it to one level, and it is now an object of reasonable research but what are the periods, what are the frequencies, what are the harmonic uh, uhm resonances by which this thing expresses itself in time.

In other words, what I had generated up to this point was a wave unscaled against the world. And the teaching voice said "now we will show you how to scale this against the world" If, remember that there are 384 yao in the complete sequence. 384, is a number that has not be well regarded by calendar makers, its 19 days longer than a solar year. However there have been lunar calendars at various times among the pre exzealot jews and other people where 384 day lunar calendars were used. I found out all this after the fact but the voice proposed was that I looked at lunations and I discovered what seemed to me an astonishing fact which is a lunation is 29.53 days long, 29.53×13 is 383.89. So it it comes very close to being exactly 13 lunations so I looked at that and then I said well I constructed this wave through affrication of these principals of hierarchical ordering that are inimical to Chinese thinking. I will now using the same periodicities apply the thing to time and see if I get astrological correlations at higher levels. So I took the 384 days and I multiplied it times 64, that's the obvious uhh multiplicon. And you get 67 years 104.25 days, now if we think of that as a hexagram, it should have 6 lines embedded within it, if you decide 67 years 104.25 days by six you get a number which is very very close to the average duration of a sun spot cycle, 11 plus years. However people who study the sun know that there isn't only the famous 11 year sun spot cycle. There is also a larger cycle of 33 years, where the peak reaches a greater height. Well that then would be the trigramatic? level of this hexagram. So what I seemed to have was a lunar calendar which was also capable of keeping track of sun spot cycles. Now the earliest observation of sun spots occurs in China, and is a naked eye observation from around 12 A.D. So obviously and we don't know whether there was part of a tradition of observing these things or not. So then I was very pleased with that, well that's interesting. So what happens if you take 67 years 104.25 days and multiply it by 64. The same multiplicon used before. And it uh the answer is 4306 years s-something like that. Uhm and I thought that was very interesting because that is uh, exactly 2 zodiacal ages. It takes approximately 2200 years – and there's argument about the length of zodiacal ages because theres argument about the width of the sign the number of degress to be assigned to each sign. So but it was remarkably good correlation. . And then the voice said "now multiply that not by 64", the previous multiplicand used, but

by 6 the number of lines in a hexagram. When you do this you get 25,800 years, within 1% of the value accepted for the processional great year, in which the zodiacal signs move around, uh, the earth in a twenty-six, roughly twenty-six thousand year cycle.

Well, you know, great thrills for the person who discovered it. But so far all we have is a Neolithic calendar, constructed out of the I Ching. The notions that then began to be put forth were, that the ancient Chinese had assimilated this notion through their early development of what are called stilling of the heart techniques, which are this particular stripe of yoga that aims for complete suppression of bodily functions in order to contemplate the mind in its nakedness, you now, uncontaminated by the gross uh, attributes that are being reflected upon it by the body. And uh, the notion was that they were actually observing a fact in nature. That this is not simply a calendar, it is THE calendar. It is some kind of previously unnoticed thing present in the world, which is mitigating change. The e-recall that I said that uh what we had was a figure which was together at the beginning flowed apart in a series of interference patterns and then flowed together at the end and restored the value of 0. In other words, if you think of 0 as parity, parity is conserved by this wave. So the notion was that this hierarchical calendar is not an eternal calendar. It's a calendar with a built in closure, and this is hard to visualize so I wont spend too much time on it but.. The last 3 values in the wave are 0. Consequently, as you approach the last 3 positions on the wave, in any of these duration schemes I've mentioned – 384 days, 67 plus years, 400 and three hund.. –

As you approach the last 3 positions the higher level in the hierarchy is given a value of 0 and it ceases to contribute its valuation to the lower levels. So you get a sudden drop in the in the mathematical value of the wave. And these things, for a long time I called them passages and I called them necks and I called them different things. José calls them harmonic convergence – something like that. And I saw them as places where novelty rushed into the world at a much faster rate than it had done before. And, yes. And then I Saw the entire career being in space time is effected by this curious property of intensification of novelty and acceleration of time. And we have tended to -because we view the universe as fragmented we have tended not to connect this up to the universe. We believe that human history is an abomination unrelated to biology and modern times an abomination unrelated to sacral and mythical civilizations and uh so forth. But what this notion was suggesting was that matter, I don't know how far back you care to go, but the something is in the process of becoming and that this process of becoming is not gradual but proceeds in a series of telescoping leaps into density of connectedness and that uh, if

you look at the history of the universe it was very active the first 10 high sixteen (10^{16}) nanoseconds. But then things settled down for a long long time and there was just cooling until finally a point was passed in the cooling process where uh, electrons could maintain orbits around atomic nuclei so that we were no longer in the era of free particles but we entered into the era of nuclear chemistry. Further cooling of the universe allowed a much more intensified form of novelty to come into being through the molecular bond which then allows a fantastic variety of structures and possible combinations. You no longer now have free atoms winging around in the void. You have uh, the complete cornucopia of molecular structure that we're familiar with. Physical chemistry I'm talking about, life has not yet appeared. But then further levels of order, further inclusions of novelty into the becomingness of being, and you begin to get self-replicating molecules. Then you get life in the sea, THEN life on the land. Now each one of these phases of novelty is taking less time than the previous phases. Finally you get land animals, finally then you get higher mammals, then the "ponzi deradiation"? of the primates.

[30:00]

Suddenly, 50,000 years ago you arrive at the threshold of self-reflecting consciousness. Instantly, you have thermonuclear weapons, parallel processing in computer, super-conducting colliding waves and all of the accoutrements of modern uh, modernity. This is a continuous process that has been going on since the moment the universe was born. Now, what is so interesting about it and what boggles my imagination and what causes me to wonder if I wasn't in fact losing my marbles and heading by some dark path toward Christianity it was the notion that this process that we have no entered what I call the short epochs. The epochs now do not last a billion years or 18 million years or 275 thousand years the short epoch is history. The first short epoch is history and we entered it around 2300 B.C. See I - this is why I'm not fond of "pushing-backism". The amazing thing to me about humanity is not how there are cities in the Bermuda triangle that are 50,000 years old but how man emerged almost instantly out of the background of a planet covered by forests and populated by animals. Something happened. I mean it IS the thumbprint of God, it DOES push you almost to the notion of a deus ex machine intervention in the course of nature. Uhm.. We have entered the short epochs. We entered the 4,306 epoch as I say around 2300 B.C. arou- You know there is a hiatus, pre-dynastic Egypt is the Egypt which built the pyramids. It- That all closed down around 2400 B.C. then there's a period of about 350 years where we have very little information. I'm talking Egypt. Then suddenly you get the rise of the dynasties, and the thing we are familiar with as the Egyptian stereotype. So I believe there was a significant cultural change at that point. It may be Julian Janes *Bicameral Mind*; it may be the ability to epigenetically code information through writing;

To no longer depend simply on the genetic machinery to carry information. I see this whole process I am describing as the career of information. It is information that is loose on this planet. When people say DNA they mean information. DNA is the vehicle of the information god, and all nature is the vehicle of the information God, and so is all culture and all individuality. Okay.

Dividing 4,306 years by 64 you see the need for 67-year epoch. The next short epoch, and this occupied me for a long long time trying to figure out where it began. And then finally it hit me where it began. It began about 8:30 in the morning on August the 6th 1945 over the Japanese city of Hiroshima. And at that moment the big bang - Its tiny parallelism. It's little self in the world of history was born, as a thermos-nuclear expl- er- not a thermo-nuclear, but a nuclear explosion. Uhhh, and we are now living out that last epoch. Now why did this push me toward uh, Christianity? Because the next short epoch will only be 384 days in duration. And the one after that will only be 6 days in duration. And the one after that will only be an hour and a half in duration. And the one after that, two and a half minutes. So what I have done is I had constructed a cosmology that 5 hours before its complete dissolution it was only half way to completion. You see? Because these rapid closures mean that half of the novelty that the universal being will express in its career of becoming will occur in the last 384 days of time, of time.

And uh, and so this explains to me the chaos at the end of history, which is what we are living through, and the mushroom has said you know, many times, "no big deal". This is what it's like when a species prepares to depart for the stars. There is nothing wrong, nothing wrong with H-Bombs and super colliding. This is all part of the narrowing neck. You know, monkeys don't go to the stars, and you must go through the monkey net to find yourself on the other side. But what I'm not, I'm not talking about uhm, a historical transformation in quite the same way that I think Jose and perhaps Peter were indicating. I am talking about a change in physics, not a change in the human heart or the human political structure. I'm talking about a collapse of the entire space time continuum, and a necessary consequence of the laws under which IT operates. And so we are not responsible and we have no choice and it's not a question of who wants it and who doesn't, any more than death is open to that kind of fiddling. And in fact, death is the reflection in the macrocosm of every individual experience of the wave running down to zero into the ultimate novelty, which you can call a zero or you can call the concrescent essence of everything. Depending on your ontological bent. Uhm. Now, there's a funny thing about this which is and to talk about it requires introducing the notion of fractals. Fractals are

curves of a peculiar variety because they seem to have fractional dimensions. M- C- They are one and a half dimensions, two and a half dimensions, three and a half dimensions, and the reason for this is that when you take a portion of a fractal and blow it up, it looks exactly like it looked before. Now this is easy to visualize in the simplest version of a fractal, which is a circle. I mean think of a segment of a circle. If you blow it up, it looks just like it, and then take a piece of it and blow it up – TAPE GOES BLANK FOR UNDETERMINED TIME –

There are given themes, and this is what the hexagrams are about. This was the genius of the Chinese to realize that time has elements. The orthodox uh, or, let me put it this way. Western science had to go through a whole conceptual reformulation to realize that space is not simply where you put things, that's how space is treated in Newtonian dynamics and up until Einstein. It's just the necessary dimension for three dimensional description. But then Einstein said "well no no, space is a thing affected by magnetic fields. Torqued in the nearby vicinity of a star." And, and so then this notion that it was a thing and that it could have various properties of curvature because allowable. Now what I am suggesting is that time has elements – 64 of them as a matter of fact. And the formulators of the I-Ching simply by stilling the heart, by eliminating noise from the body, were able to see these states which we could call quantum mechanical, but since they are not material we don't need to invoke the holy god of quantum mechanics to bless this effort. Anyway whatever these things are and whatever dimension they exist you could think of them more, I think of them more like platonic archetypes. They – the way in which they inner penetrate three dimensional being is what gives three dimensional being its primary qualities. The qualities of color, of tone, of emotion, of feeling. All of the descriptive qualities that science has left out, and has called epiphenomenal and uh, and uh, subjective but which are the things we all experience, you know, what science has achieved is a tremendous devaluation of primary experience. And what this notion is trying to say is that there is possible physics of experience, and understanding of history that will make it coherent. So that the coherency which we know must be resident in the universe is no longer a value dark dimension to us. The order becomes visible.

Now how does this work? I always use this rather idiotic example but it amuses me. Its that if you find yourself in Hadrian's Hamurger Joint having a burger, there is a direct causal relationship between your doing that and the campaign of the roman emperor Hadrian; You are in fact passing through the Hadrian analogic moment. Now, I think the only person who has really understood this to bedrock, is probably James Joyce. Who realized that a walk to

the store IS the Trojan War. It IS the Trojan War. You cannot pass through a gate without passing through the gates of Thermopylae. You cannot, uh, we and so, a notion like reincarnation or past lives is seen in a whole different light. What we are are harmonic adumbrations of events in the past. Now this comes fairly close to Rupert Sheldrake's notion, and we've talked a lot about this. The, what is absent in Rupert's scheme is an explanation of novelty. What he is saying is that the past has a tremendous influence on the future that the very fact that something has happened, sets up all uh, following time for a more.. a higher likelihood of this thing happening. What I'm suggesting is that that's true but then the mystery of why there is novelty is solved by realizing that the way in which the morphogenetic field impinges upon reality is through a fractal expression. And there would be nothing surprising about this, uh, fractal- the electromagnetic waves described by Maxwell's equation. That is essentially a fractal transformed. It is how waves work.

So uh, another way of thinking about this notion that we are adumbrations of larger historical epochs is the aphorism "Rome falls 9 times an hour". This is the idea- and it does! I mean I always notice it. Its.. its just there. We are very state bounded in our self-observation and we only tend to value what is relevant to profane existence and communication. So, the fact that as you sweep the house you notice Rome falling nine times an hour, there's not much to say about it. It's just I think weird things; I wonder if everybody thinks weird things. I think the answer is yes and not only does Rome fall nine times an hour but the Celts move out of Spain and into England nine times an hour and so forth. That really the present is a, an interference pattern caused by epochs in the past uhm, coming together to create a certain particular situation. So what has been happening since 1945, since the dawn moment over Hiroshima is that the entire history of the universe is being recapitulated uhh. Now it has many cycle levels of cyclic expression. On one level the first land animals have yet to appear. We are truly in the inchoate darkness. On the level of the 4,306-year cycle, we are deep in the dark ages. And on the basis of that, and the barbarians, the time when the barbarian hoards poured into Europe. The sacking of Eleusis and all that. I see uh, punk culture as the harmonic response to the fact of this happening. On the basis of it I would predict that in the late 80's the uh, new wave punk phenomenon will give way to an almost gothic, religious sensibility. Which will be in fact a recapitulation of the early middle ages and uh,. - Well No no.. [laughter] in the mariological cults that found their expression at Sharpe and places like that in the early 90's. We will have a, a, uh, a feminist revival which will be slightly longheaded because it will make those same mistakes that those gothic people made. We will not even reach the threshold of the industrial revolution until about 23.., two-zero-zero-three.

So you see the notion of us sitting around making sense of things is quite preposterous. I mean, we are still waiting for Newton, let alone for Maxwell and Einstein. We are not-prehistory except on the highest level. Uhm, so this intensification will occur. Now uh, what is it leading to? This is the part that, you know, Christianity insists that the world will end. And that it will just roll up like a scroll and uhh, the triumphant Christ will come to judge the living and the dead. Now, why do they believe that? Obviously, apocalypse haunts history like a ghost, in the kind of cosmology I'm defining. There MUST be anticipations of it. The death of every human being is an anticipation of the apocalypse. The collapse of every empire, the uh- ANY sensation is a part of THE sensation. It is the archetype of the ending. So this knitting together, this compactification of novelty and connectedness which is emanating out from the most densely compactified and connected thing in nature which is the human cortex. This is an interesting thing, we've worked so hard to move ourselves out of the center of the mandala, but the fact of the matter is the most complex object nature is the human brain. Curious... Uhhh.

[49:15]

This knitting together that is emanating from the human brain is accelerating at such a rate that we are rapidly going to become unrecognizable to ourselves. [49:35] The- The end point which I have come to feel is correct is the endpoint 67 years 104.5 days after the Hiroshima blast, and that would be dawn of the 16th day of November in 2012. Now I have worked all this out and the thin thread on which I am here in a conference devoted to the Mayans is that after I had worked all this out I discovered that the long count of the Mayans, the calendar of which you have heard so much, contains thirteen baktuns. Now the emergence of uh, of uh, Mayan civilization as we currently understand it is around bak- late in baktun 6, and the complete collapse of the Mayan is in around the middle of baktun 11. But their whole calendar was generated from the end of baktun 13; There is no baktun 14. They said "that's it. That's the end." The end of baktun 13 is the winter solstice of 2012. 34 days later than the date I reached through this series of involvements with the I-Ching.

But then I discovered there's what's called the Thompson Correction. The Thompson Correction is a different reading on certain calendrical material which would locate the end of baktun 13 only 4 days after the date that I had chosen. So the question seemed to me then, "What is it about psilocybin mushrooms that a civilization in Mesoamerica in the 11- in the 8th and 9th century and an individual in California in the 20th century would both, through an elaborate series of mathematical contortions, different mathematical contortions, reach the same point in time?" What is happening there?

And uh, we were talking last night about how um, how the uh, my, my little story about what happened to the Mayans, to the Maya. And Peter pretty much agreed was around 970 and probably at Copan, which was the Alexandria of the Mayan world. Its where the mathematics and this and these things were you know, brought to their peak. They figured it out. They figured it out. And they ended the long count. It was obviously ended as a uh, an order. It took about 20 years to emanate out from Copan and to reach the most remote Mayan centers, Paraguay and Palenque and so forth. But within 30 years the long count had been ended. The stele had been pushed over face down in the grass. The cities emptied and the Maya returned to being primitive agricultural pastoralists.

I think it was because they figured it out. They saw what was coming, and one you have figured it out the curious thing about this notion I'm propounding is that it carries no obligation. It is a way of making you free by admitting you are more deterministically bound than you ever dreamed, you know. You HAD to go into Hadrian's Hamburger Joint, it was settled when Hadrian invaded Scotland, that you had to go into that hamburger joint. And so we are, we are bearing an unnecessary burden of guilt and responsibility. We are living in a cosmos, not a chaos. The universe IS doing what it wants to do. It is calling forth the kind of novelty that it wants to call forth. The fact that we cannot understand it's purpose is our problem. You know? And we are not its victims. The- In these short epochs, what is happening is something that I think can only be understood by uhm, having recourse to the metaphors of alchemy. Alchemy and modern science; These are anticipations of taking control of energy. Of binding as James Joyce says, "All space in a nutshell." Its where- what the concrescence is, is the flowing together of everything in a higher spatial dimension.

We mentioned last night the saying in the I Ching – if this sacrifice is cor- the person who correctly understands this sacrifice can hold the universe in the palm of their hand like a spinning marble. 54:46 This is absolutely true. It's a statement of physics. It is not a metaphor, and analogy or anything else. It is that reality is being knitted together, into a spinning marble. Everything but that spinning marble is an illusion. Uhm, it has many reflections in linear history, which is like the shadow cast into three dimensional space time, by this higher dimensional reality. It is the telos at the end of time. Uhh, its modern manifestation is the flying saucer. The flying saucer haunts time like a ghost. It only exists at the end of the historical process, yet it is somehow co-present spread throughout the

historical process. It is uhm, the proof that the apocalyptic moment exists.

Another metaphor for this is concrecence, this spinning marble is uh, the holy grail, or the philosophers stone. The philosophers stone is an object which is made out of mind. It has, [it's called the] one gloss on it was it was called the sophic hydrolith. The uhh, the water thought stone. It is something which has the quality of mind and matter. And this is what the human function is, I think, is through technos to eliminate the distinction between mind and matter, to free us into the imagination. That's where we're going when the novelty wave runs to zero and we are released into this trans-historical space. It is the imagination and it will not be miraculous. It will be created by us, through us, through a number of uh, disciplines, technologies, ideas, and innate abilities that we cannot currently hope to do more than glimpse, because we are so far back in the historical continuum from where this thing is going to happen in 2012. So basically, uh, this is a funny explanation of almost everything.

They say when you create a funny explanation of almost everything, you have to be careful that you don't unexplain a whole bunch of things, and I don't think this unexplains too much because it is uhm, it is not an extension of a current paradigm. In other words it is not physics, it says nothing about particle physics or quantum mechanics or anything that- it talks about time, which is not matter. We have been obsessed with matter for millennia, and thought of time as, just as something passing by, couldn't really get a handle on it. But uh, maturity will mean getting a handle on it. And everything I've said about the historical process and how puzzling it is is true in our own lives. For instance, you may have noticed that every day is sort of like every other day and yet every day is different. This is this fractal nature of things working, and there are days of great advance but they are embedded in this larger matrix of a pretty state situation. I studied with West Churchman who was a futurist, and he used to like to say that most of the future is already present in the present. And uh, its this kind of idea so uhm..

What I was able to do with this I-Ching wave and what I offer as the uh proof or at least the uhm the place where pressure should be put on the theory if we want to falsify it is uh- We wrote a computer program which very rapidly sorts through the wave on many levels, and will draw the graph of novelty for any point in time, and it will draw it on different scales,

like uh- Say you were interested in the French Revolution, 1789. We can throw a picture up on the screen which shows you 1788, 89, and 90. And you can then ask yourself “Does this line fulfill MY intuition of how a novelty curve descriptive of the French Revolution should look?” Suppose you’re a specialist, you’re interested only in the assignation of Marat, okay.. Then we can look at the 19 days in 1789 surrounding his assassination on the 20th of July, and so forth. But where it is really interesting is in application to our own lives. And there then, you have a personal body of information that you can try against the wave, to see if in fact it fits your intuition of how your life should work.

There are a couple of people here who have counselled with me one on one, where we’ve actually looked at their life and then on into the future. It goes right on into the future to 2012, and of course 2012 is just my choice after a lot of reflection I chose that as the apocalyptic zero date. The program is set up so early in the program you can enter any apocalyptic zero date. And then you search the best fit. And the way I use it is I like to go to the scale where there is 19 years on the screen or I mean 3 years on the screen or even 200 years on the screen, and then I’ll go way back and then it has a continue function and I just fly over the mountains of time. And when I see a steep valley I dive into it, and blow up the fractal landscape and then the program has a function called “Near” which is a historical data file and you can just hit a button and it will tell you uh- Ascension of Artaxerxes, 514 B.C.

There it is, look! His son was an idiot but then he came on and the wave it fits, it works, it fits! It’s all clear! So it’s a way of modeling history, and If I could contort it into a video game my life would be much easier. [Laughter].

1:01:30s – 2:05:15 is peer review questions and dialogue.

Self-maintaining, over quite a long period of time until then its overcome and it is in this period that I mentioned this morning that all of these things happen. Now let me demonstrate some of the commands within the program. These are the position numbers of the wave here, and as I mentioned to Francis, we could take those position numbers, and if you have a copy of the invisible landscape you could look at the drawing of the wave in there and derive this set of hexagrams that would give you feeling toned rather than mathematical information about what’s going on. Anyway, here are some of the commands.

Question mark and one of these numbers, such as, for instance 157, gives you the absolute value is 308 right there. So this trough is riding along at about the 300 level. Okay now, if

we query D 157 we're asking a different question about this point and the answer is the 11th day of the 3rd month of 533 B.C. Is right there so- and I through long experience happen to know that these blips are 11 years long so I'll just save us the trouble and tell you that that flat area there runs then, uh, from the 11th day of the third month from early in 533 B.C. to uh, let's see, we subtract.. to 511 B.C. Right in here. Now when I query 158 which is in there, with the command "n" which stands for near, "n1-5-7", lets make it 1-5-7, it now goes to the history file and it searches.

(Female Peer) – “And you programmed all this?”

Terence – Yes that's just a chore to enter a huge bunch of historical data. I used the uh, London – Tape cuts off.

2:07:55

-works of art, political acyivity, migrations, religions, artistic motifs, all that stuff.

Kay, what have we got. Okay, if minus 540 was the restoration of cestatus? Deuteronomy is being worked uh, 539 is the fall of the Babylonian empire. Here at 532 Pythagoras flourishes according to Apollodorus, uhm- And in that same period all these other things were happening. C is the continue function, it gives you more data. What it does is it blots out the nearest date. It prints in reverse the nearest date and then it prints all the other stuff around it. Now it's scrolling up more okay.

Pythagoras, Persian conquest of Egypt, birth of Aeschylus, uhh Buddha, Lao Tzu uhm- Ezekiel will scroll up next and so forth. So it is uh, or is it, confirming that this deep trough is in fact reflective of an incident of novelty? Now if we hit uhm, quit, we just go back to the beginning and we can look something else. Not rub 0, run zero.

Although rubbing 0 might be more interesting. Okay and again the default date, and what I want to show you now is uhm, the waves version of the 20th century. Essentially, let's just start with uh, well lets enter the Hiroshime date which is the 5th day of the 8th month of the 1945. And let's look at this situation on the 200-year level. I promise you this will end at three o'clock. And, yeah I don't know where's the sun coming from. Is that better?

[Chatter]

Is that good? Okay. Now.

The entirety of time from 1945, in other words, the 67 year period in which all of the historical themes will be recapitulated is contained in this center section and as you see its

almost a flat line. All that's there is like a tiny pimple, all that lies between us and this completion that we are so hot for, is portrayed at this scale, as just the tiniest uh, energy barrier. That's why I think we can feel it so eminently. But remember that because the wave is fractal also lying, that this is the same picture if we think of this as 4,000- as the 4,306 years preceding the apocalypse, er- preceding the whatchamacallit. So uh, all of that time period since 2300 B.C. has been imbued with this sense of the eminence of the transcendence, the transcendent. And that is what has given this period of time its peculiar character.

The bomb is uh, right there. The top of the pimple is early January 1967, and that is where if you'll recall what was going on at the time, that's where the concatenation of the struggle of the opposites reached its most intense point. That's where LSD was a mass phenomenon, when the hippie phenomenon was in the quintessence of the 60's is spring-summer 1967, that's the summer of love. 12 months later we were in the streets fighting the police and so forth. So it was a brief, brief moment. We have no come off that uh, that uh, high point and we're moving along now a kind of uh, prenylated surface, where there are many dips and many rises but the sum total of what's happening is that we're oscillating around a mean. And I certainly, that for me describes the 1970's. It was much oscillation around a mean and many people found that very ideological corrosive because they expected the continuous deep descent of ever faster into novelty that they had experience in the 60's, and the fact of the matter is it just isn't happening. Now –

Male Peer - Was not 67 also the year that Mao released the red guard?

Terence – That's right, the whole red guard phenomenon in China, all of these things were global phenomenon.

Male Peer – sort of the opposite to the summer of love.

Terence – Right, although these things uh, certainly represented chaos forces each in the society in which they were happening. Now, the my reading of it is is that at 2012 the wave disappears, the reason the graph is shown as ascending rapidly into entropy is because the computer is stupid and it wraps it around, and connects it to the beginning of the wave. But you should view this last one as simply the blank unknown, okay? We know not about that. Now I want to change the date of interest and uh, let's look at 1-1-1-9-8-5. In other words, the 1st of January this year, and let's look at it at a level which will give us uh, 3- approximately 3 years on the screen. I say approximately because what is really being given on the screen are harmonic resonant increments of the other calendrical system that I have lined- the one that uses the 384 day year, not the 365 and ¼ day year.

So what we're really seeing is 3 of these lunar years, these thirteen month lunar years on the screen. So we'll see this will be '84 into '85 here. It will pass into the future approximately mid-screen. Oh yeah, I remember this.

This is uh, here is the campaign, here is the election, here is the inauguration, and here are we. Well, if you, we are down on, we are in a deeper more novel situation. This definitely was a long period in which everything was held in stasis, and then the, the uh, uh, party of the right uh gained ascendancy at least on this continent, and you see this happening.

Now let's see, you see this line here at 228 is uh, 16-7, the 16th of July 1985 is right there. So we are in this small period here coming down off this peak, I can get it up in more detail, let's see, change the date of interest, no. Yes, change the date of interest to the present, what is today? The 14th. The 14th day, January- February- March- April- of the fourth month.

After years of doing this..

And I'm going to show it al- So that we only have 19 days on the screen.

So this is like a uh, my notion of a preview of the next 6 weeks or so, we can just look 'til we're bored.

[Chatter]

Well that period before the election was long, it was more than a year in length, uh.

Yes, like, remember how I said we were moving through, that we had just moved through the period of the dark ages and the barbarian invasions when learning died out in Europe and they thought that the circumference of a circle was twice its diameter and all this stuff. Well, that is that is that same plateau and we are now slightly beyond it, but only at the beginning of the proto-mediaeval period. I mean we've reached approximately A.D. 800 which is of course the coronation of Charlemagne, and the inauguration of the Carolingian Kingdoms, which really do end the dark ages, although where this is happening I'm not sure, maybe in Brazil. Oh, now what have got, oh yes! The 10th, 289 or 288. It was the 11th, that was uh, did I fly in from Hawaii? Was it the 11th? Well we're all in it together, how was the 11th for you? Judging by this see, its giving a very clear indication that in all of those 19 days unambiguously the 11th was uh, the clincher. Thursday.

So you know it's not doing sleight of hand, if you didn't have a big 11th then this is wrong for you. Well its lunar so it tends to keep track of that kind of thing. Now, is a deep decent in to novelty. Now we're moving along this thing. We are in this trough right here, and I might say that because I have assumed the end date to be in 2012 even uh, small drops in

novelty like that carry the entire planet into a new level. We are now every day there is we are going more and more into it. There are very few backwashes, enough to wipe out the impression that just every day novelty is intensifying and we're thinking it to it.

Let's see if that was the 11th, 12th, 13th, 14th... must be 291.. [2:20:00]

Yes, had we given it at the very beginning of the program when it asked "End date:" we could give it any date. We could give it José's date, uhmm..

Do you want to see José's date with my end date setting?

Oh okay, uhmm.

Let's see José's end date it the 16th of August 19-

No, but the date you're interested in is? Yes, It's the 16th day of the 8th month, no '87, '87.

[Peer] Whats curious to me Terence, is does this also take into account uh, like the southern hemisphere?

[Terence] Yes, I believe so. I think its hyper-dimensional. Its uh, you mean because of the international date line and all that?

[Peer] The history you'll have stashed in there will be northern ... history

[Terence] Oh yeah, although so much of the southern hemisphere is ocean, and so recently colonized that there is an absence of historical uh.. It's the blank end of the wave you see. It's the blank...

But we've no record, we can only work with the data we have. That's a data dark dimension, for example these African empires and stuff.

[Peer] So we still have northern hemisphere chauvinism. [Laughter]

[Terence] Well we need to recover the secret history of kiwi land. [Laughter]

Oh no I know! I am sympathetic. The marsupials where do they fall into all this. [Laughter]

Okay, level 5. Okay now we'll see José's date embedded in the three years, the three lunar years of time, around it. There'll be 3 lunar years of 13 months portrayed on the screen. His date will fall somewhere on the second year, as close as the computer can look at it. Okay now see this does not support his contention, because what we have here is this situation of

oscillation around a mean. It goes up, it goes down, it goes up, it goes down, but after three years of this, it is in fact exactly where it started out from. Now let's get the dates on this.

Which means nothing as far as the theory is concerned. What this screen is saying is that from uh, the 16th of July 1985 until uh the 10th of September 1988 you might as well go fishing. Because it's all uhh, it all amounts to very little you see.

If we put, if we enter José's date as the end date and then look at another date. Oh okay, uhhh.. Now I think that requires a cue ... here. Okay now it asks zero date, we're going to enter José's date, 16th day, the 8th month 1-9-8-7.

Now what date should we look at to test José's theories. The bomb. I think the bomb is the good concentrated clearly major event that we can all agree is some kind of a water shed.

Enter the day you wish to look at it. What is it uh, 5, August, 1-9-4-5. Okay, now we'll, let's look at it uhh, if we look at it on the 200 year scale it will just say it'll close to the end because this date is even earlier than the previous date. Let's look at it on the 3 year scale, 3 lunar years. It always tells you you are 15,351 days from the end. A nice little touch there. Yeah, shopping days.

[Peer] How much will you consume.

[Terence] Whooa, now where is it? It's at position 144, okay look! Look whats happening a long flat totally steady state at this level of clarification, and then bingo, and a long, long slide. That we could by well- well- before i change the screen does everyone understand the interpretation. That that moment clearly initiated a long plunge into novelty. Oh you mean where is the date? It says it's at 144, 5-8-45 is at position 144. Right at the falling. Now I'm going to shift the screen by using the command continue and we'll see how long this descent into novelty went on before it was overwhelmed by the uh, entropic backwash.

Okay, there it is. It's this thing here. D-157. Until uh, early November 1947, now my guess would be that's an election day. 6-11-47, wouldn't someone have been inaugurated in January '48.

[Peer] Elected in '48, Inaugurated in January '49

[2:26:40]

[Terence] Oh I see so it's not an election date. It's something, by this version, and this long trough it's like this long flow into novelty, which ends in a wide trough and then is mitigated and slides off. So if we use José's end date we get pretty good agreement with

that particular piece of data, now let's see. We have two minutes shall we test him on the whole history thing? How can we do that, Oh I know, now let's see.

[Peer] You should ... continue with this cause it sounds like everybody's interested.

[Terence] January 1 minus 6 minus eight hundred, let's give ourselves some room here, minus 800, yes, yes, at the two hundred year level. Well I just want to get way back in B.C. I just want to get way in front of that trough, then we'll cruise forward in the wave until we find the trough, then we'll get the date then we'll...

With my setting. Well there will only be uhh, yes, whatever the difference between '87 and 2012 is. So he'll hit the trough too.

[Laughter] about surviving the timewave.

The continue function pushes it up one shingle, these things are called. Pushes it up on shingle. We're looking for the trough, I hope we didn't miss it. There it is, okay now by José's applying mine to his there's the most, the moment of greatest creative advance, concentrated creative advance in human history was from, yes, from uhhhh, December 559 B.C. until December 547 so what would right in the middle of that be about 553. So let's query near with his date on 158, and 158, and it goes to the history file and.. this really seems like magic to people who don't know how computers .. they say, "Is all of human history in the computer? What?" All we typed in, friends.

Sure, we... From Hildegard Von Bingen to Judy Chicago, it's all...

Okay Cyrus the 2nd of Persia defeats Eumenides. The Persian empire, oh he establishes the Persian empire, the great counter-foil to roman power which held Zoroastrianism is made the official religion, in 545 Persia conquered Assyria, restoration of Cestada? So here we come then into my thing, oh look he got Zoroastor, although my typist apparently didn't know who Zoroastor was, uhmm...

Anyway, I think that's enough of that...It's 3:00. I'll briefly entertain questions, you, I'm sure now I hope get more of the jist of some of what was said this morning. Because I think, the program really makes it accessible to people. And you can spend hours cruising these hills and valleys and dipping into the thing, if that's the kind of thing that interests you. I'm a real bug about history, I think that people who don't know history are amnesiac. And that uh, you know, we would all, there's nothing more important, really in all these forms of self-cultivation and development, than to read history. You know it's not cliché that those that don't know it are doomed to repeat it. It's true in individual lives as well, and it's the story of who you are, and how you got here, and if you don't know it, it's kind of a

strange lacuna, in your uh, in your knowledge.

[Peer] ... correlate I-Ching with the DNA codings?

Well, no, I did that, that's not very interesting to me, it's been done by a number of people and I had a scheme for doing it and uh it just didn't tell me anything. Once I knew what hexagram was lysine and what hexagram was L-alanine, I didn't know enough about lysine and L-alanine to know really what to do with that information. Uhm, this session will go I believe until about 5:00. Are there any questions about this morning or is anyone burning to take up any of that again? If not I'll go on to uh, something related but different. Related but different.

Okay well, I guess what I'll talk about is uhh, uhh.... Just trains of thought that I see present in the world, that I think will eventually be seen to flow together and to provide facets of this question "What is the nature of the transformation and what are the factors that go into it?" I mean obviously all fronts of human knowledge are developing at a tremendous rate but uh, certain strains of thought claim for themselves a kind of primacy, and I know the new age, whatever that nebulous term means, it has a connotation sometimes of an elite with an answer that is only- all that's holding back the world is that this answer is frustrated in making its appearance, and I don't really hold with that I think that by and large the new age is a fairly minor phenomenon. It's basically the search for a way to get high without drugs, a way to uh advance yourself without putting yourself on the line, you know, just anything is better than facing 25mg of psilocybin and uh, while all these things have merit, they don't seem to have transformative merit; In the sense that the great decade of new age thinking which was the 1970's is certainly one of the most stagnant decades that we've seen in a long long time.

However, there are strains and things going on and I sort of wanted to construct a mandala, not very seriously... But a mandala of four human concerns that lead to what I will, in my short hand, call the flying saucer, which is this concrescent alchemical union of humanness and otherness and humanness and technology that is uh, to come, I think, and inevitable I think we all are articulating the inevitability of something. And this game we play of prophesying the moment..

You know William Blake said there is only one moment in all eternity, and Satan's Watch-Fiends search through all eternity which is the way into God's Creation, but they can never find it, it is, the secret of the moment is well kept. Uhm..

These fields, or these endeavors I'm going to called Psychedelics, Cybernetics, Space and

Feminism. But each one of them over-flows it's label, and becomes many other things. I mean, in other words if someone said but "What about politics?" I would say well, that's a subset of feminism, and what about something else that goes somewhere else...

So let me, there's no particular order in which to take them... I think maybe first I'll talk about cybernetics because that's a good transition from this little beast.

Cybernetics is this epigenetic transformation of information going wild. It begins with uh, the notion of writing and number and develops up to the point where now 9 million computers a month are being connected into the global information grid, and uh, there are only 9 billion neurons in the human brain. There is a school of self-organizational theory which holds that new properties simply emerge through the connecting up of large numbers of elements, and that once you pass a critical level whole new properties begin to emerge from what were before fairly well understood matrices and arrays.

The cybernetic thing is viewed as uh, invasive, and masculine and technological, but I think that's only because we're seeing it in its most raw emergent phase, we're actually seeing adding machines changed into these cybernetic devices. All the computers in the world are digital analyzers. We have yet to have an analytical machine, and this is coming. And what we have so far are large adding machines, and when we get the so called "thinking machine" and its coming, it's going to have an enormous impact on our self-image and our society. You can imagine the impact that Darwinism had on the 19th century conception of man where, you know, the notion that man was descended from the primate line was just intolerable. Well, the notion that machines can think, and you've noticed it used to be very fashionable for cyberneticians to write articles saying "The thinking machine is a complete misunderstanding of cybernetics. Utterly impossible. Machines don't think," That voice has grown quiet in the light of what has been learned about cybernetics and linguistics in the last 5 years, particularly in the last 18 months. And it now seems very reasonable that this goal is within reach, an actual simulacrum of the human mind and what that will mean is very hard to gauge. I had a mushroom trip recently in which the aphorisms arose "To design computers is to be designed by computers." And I saw very clearly that the keyboard is entirely an illusion, a convenience, and that the keyboard could be made to disappear very quickly and then you would not truly and clearly perceive where the interface stopped.

And people who spend hours and hours working on computers admit that this happens, and there's a meshing and you're part of the circuitry. I think what holds this back from becoming any even more noticeable phenomenon is just our willingness to materialize these cybernetics objects as furniture. But the day is coming you know, when you will be able to reach the library of congress by tapping a certain tooth with your tongue. And that is simply what the masculine engineering mentality is thinking about. Obviously the feminine matrix

which supports these kinds of imaginative constructs exists already, and it's simply that the engineers are catching up to these notions of integrated intuition and field perception and that sort of thing.

To me the computer not the computer so much as the cybernetic network is actually a feminizing force, it's like hardwiring the unconscious so that these oceans of information that beat against the human uh mind are not abstracted, not contained in libraries but made ubiquitous throughout , you know, consciousness and actually that we are beginning to create a, an extra genetic foundation of human understanding which will always be there in the form of these large data banks. And as we learn to swim in this sea of information, the character of our understanding is going to change radically. We are all confined by ignorance of all sorts, basically ignorance of simply the facts of the matter. Leave alone what theories might organize the facts of the matter. The other thing is the human machine interface is becoming more and more subtle and miniaturized away. And its, it's possible you know, to imagine a world where you wander naked through Eden, and there appears to be no technology on the planet, because the technology is all in a particular grain of sand lying on a particular beach uhh, in Madagascar. We'll put it in the southern hemispheres to uh..

[Peer] That's where it is now!

[Terence] You're right! The key is to actualize this thing you know.. William Blake said "To see what eternity in a grain of sand, and to put it in there if need be in order for that to happen." So that is cybernetics.. The transformation of cybernetics into something really exciting I think is going to happen through psychedelics, which is the next of these quadrants of the mandala that I would mention. Psychedlics is uh, totally discounted as a transformative force by the powers that be. It isn't even, it doesn't even rate much of a budgeting in the DEA budget. It's just a dead issue, and yet I believe, perhaps many of you believe that it is some kind of overlooked factor. Almost of the character of a taboo because it is totally corrosive to all paradigms. It is, it cannot be encompassed. The measure of it cannot be taken, science it useless because it is a phenomenon of individual experience, and uh there is no way that science can get a hold on that, any more than it can get a hold on falling in love. The problem is falling in love has not yet been shown to be completely dependent on a chemical substance, a material molecule, an atomic arrangement in space and time. And uh, the psychedelic thing is the path to the origins, The transformation that we want to see talk place is essentially an ouroboric transformation. A taking of its tail in its mouth, by the snake of time, and this cannot happen unless we're in contact with our origins.

This is why I think the shamanic uh, strain of the new age mentality is the probably the most enduring, because there is something to be learned from primitive so called primitive pre-literate people who are living in the dream time, who are living in the imagination, and never saw any need for technological constructs, because the constructs of the imagination were so wonderfully satisfying. We glimpsed these constructs uh, with psychedelic drugs and even upon our society with all of its rationalism and all of its reductionism they have a tremendous impact which we respond to with prohibition and coercion and propaganda. I don't think that they are uh, static in spite of the importance of shamanism. I don't believe that it is always had the character that it has today. Because the psychedelic experience works with the cultural overlay, works with the contents of your mind, I could never have created the theory I created if I had not known about the I-Ching and DNA and all of these things. And yet the psychedelic intelligence was able to take that information and whip it together into something which was astonishing even to me and yet I had been the source of the information. Psychedelics show the relativity of these various mental dimensions and constructs that we inhabit, and uh to this point I've been basically speaking of drugs like mescaline, LSD, that sort of thing ...

Possibly although it's not really a psychedelic, it is a synthetic for sure. What I'm more interested in, and I think that Rupert Sheldrake's ideas open a way to understand the difference is plant hallucinogens which have existed in living systems for millions, in some cases hundreds of millions of years, and have been taken by human societies for untold millennia. When a person takes a drug the drug takes the person, and so a drug like psilocybin that has been used for thousands and thousands of years has a tremendous morphogenetic field about it, garnered from the experiences of all the people that have taken it that have flowed into it. Uh, these things point the way toward engineering states of mind that we can hardly imagine. The interesting drugs to me are the ones which uhm, occur in plants, have a history of shamanic usage, and mimic brain chemistry in some way. In other words, you're not interested in a massive disequilibrating intrusion into your brain chemistry... you want something which is almost like what is present but which gives you a massive shift in cognitive apperception without any shift in the perception of how your body is operating. You know, you don't want it to cause muscle tension, kidney.. all of these things. You want it to touch the mind and all else very lightly. The curious thing about the mushrooms is of course that they seem to have this logos like entity, locked up inside them. A speaking voice, a teaching entelechy, that is somehow concerned to involve you in a personal exchange of information and that point when you reach that level you have totally cast of from uh any of the metaphors that your society has prepared for you to understand that kind of things. It just appears to be delusion and yet it has a very healing and uh, integrating quality for the person who is experiencing it. Perhaps there is a lifeform, long resident on the Earth and so different from us the main problem is one of recognition.

I mean I vacillate between whether the mushroom is you know, whether we really can split off portions of our psyche so completely that we cannot recognize them as parts of ourselves and then they can approach us to teach and torment us. Or whether that's an unnecessarily breast beating attitude and that it would be much more reasonable to just say there's no reason to be in awe of the pronouncements of modern science. Modern science knows nothing about the density of life in the universe or the constitution of consciousness or its probability of occurring in any planetary or physical regime other than the one we're acquainted with. We have no idea how densely life and intelligence is spread through the universe and what the strategies are that have evolved. What I said this morning about uh, taking control of the human form by the act of understanding DNA which got a ripple from people, I'm sure that this is inevitable and I'm sure it is inevitable for every species which passes through that narrow neck, because knowledge is used and applied. I mean there may be Zen like cultures that find out these things and turn and move away from them. Perhaps that's what the Maya were about, but pastoral and romantic as the vision of the Maya turning away from technocratic civilization is still if you take evolution seriously the goal of evolution is to keep the options open. Many- most (creatures?) preachers –Tape cuts out 2:40:34-:44 –scended to the tropical veldt and grass lands, we migrated across the deserts of a near and middle east which were not so desertous at that time but we also were able to cross the Himalayas, we exist in the arctic, in the rainforest, we exist at the level of the Witoto or the modern new Yorker. We are adaptable and this is what's kept our options open, and this is what I think we have to uh, recognize and conserve, and the psychedelics do that. The psychedelics are to my mind, although people have actually argued this with me, although it seemed really incontrovertible to me, that they are deconditioning agents, that they make you question what Marxist Mormon, whatever you are, if you take psychedelics you will ask questions that cannot be answered in the paradigm in which you were brought up. And that's important because all of these social systems are only means to the next level of ascent. What we see in the Soviet Union today is a hang-up, they have an ideology which allows no means to the next level of ascent. They are caught forever in the Hegelian dialectic, there's no escape its uh, its hopeless and uh, so they have occupied an evolutionary niche very successfully but now what are they going to do. And every society is confronted with this because every society erects institutions which try to freeze the historical process. It's almost as though we are continuously calcifying and yet we must not let that happen. I think it was Ludwig Von Bertalanffy who said "Human beings are not machines, but in every situation given their own will they will behave like machines, falling to routines and just cease to examine what is in front of them."

So I think that the psychedelic thing is very important. I'm sorry to see its ... clouded it's a murky picture. I don't see, I think people should do more of it, and reflect and that there should be much less missionary work. That the goal is not to get as many people stoned as

possible. The goal is to make sure that everybody who gets stoned gets really stoned. So that we don't have a bunch of confusion about just exactly what we're talking about. I mean I meet people who the only drug they have ever taken is MDMA. [2:54:34]

And we're trying to have a conversation about the nature of psychedelic cosmology? It's weird sledding, you know.

Okay, cybernetics, psychedelics, space is the other one. And I see all of these things as just completely one thing, and I, as I said this morning, I think the difference between José and I, one difference is that he is interested in creating a planetary consciousness, out of the surrender of the ego, of individuals to this higher vision of what should happen. I think that there already is this tra- super-human organism, and that our freedom is largely illusory. We are all moving to the tune of what Freud called the super-ego, and I what I call the overmind because I don't like the notion of superego, is a little torch light parade and that sort of thing. But the overmind, the notion of simply a control mechanism, which is uh, almost cybernetic, but which is leading everything forward and actually is orchestrating what is happening, so that all of these human groups, which aspire to hegemony, you know wall street, the communist party, the Zionist, you name it. They are all frustrated, because there seems to be an invisible, impeding force against their machinations, and their vision of how things should be. And no matter how many guns they pile up, no matter how much propaganda they churn out the historical continuum has a way of stabbing them in the back, and surprising them endlessly, because they are fools, playing with a master which is the super-ego.

And uh until this en- what we as individuals can do, is help that process by not participating of the projections of anxiety that these various factions are pushing, that arise out of their frustration with their inability to get a handle on things. I don't want them to run things, Wall street or the communist party or anybody. I think that it works very nicely that it is run invisibly from the unconscious. I think it was Charles fort who said uh, there comes steam engine time, and then there will be steam engines. And uh, and that is what is happening with modern technology, even to the point of the atomic bomb, I am willing to explore the notion that the atomic bomb has been a wonderful force for cohering people's minds around the question of planetary survival. That if we had come out of World War II with aerial bombing and mustard gas but nothing quite horrifying enough to shock people awake. I think it's remarkable that we have lived in such a stable world since 1945. That it has never- only once used against a human population. And my god think of the hatred and the loathing that is loose on this planet, and yet the bomb has sobered people, and every political movement for social cohesion and enlightenment that is post 1945 has built its rhetoric around the bomb. The peace movement to some degree, the hippies, the existential response of the beat generation. All of these rich cultural phenomena have been reflections on the bomb. So the bomb is good, the thing that is important is not to use it. Then, then it

becomes a problem.

I think that this thing that has broken about nuclear winter is very interesting. But uh, capitalism is very interested in making money. A decimated earth is not good real estate. And I think that the nuclear winter issue is the beginning of the end of the nuclear uh, log jam, that because the soviet academy of science has conducted an independent study, they reached the same conclusion. The people that were skeptical of Sagan and the others they researched it, they reached the same conclusion. War is obsolete, and this is actually understood by the people who frighten us the most. I really think that they have come to see it as a bad deal, and no money maker. And in that case, uh, there will be change. The novelty wave is effecting all of these institutions. The strategies are changing at the very topmost level, because it's no good to have a no-win situation.

So, and as far as the space travel thing is concerned, I really think that inner and outer space are the same thing, and that we will come to understand this through research on the psychedelics. That when the Ayahuacero in the Peruvians amazon tells you he goes to the milky way, he is not really kidding. You see no matter how radical we are in our assumptions, it's very hard to not assume that we don't at least have 95% of the picture. I mean for instance, we believe in things like elementary particles and all- well these things may be no closer to the mark than the notion that the world was created when the Ant King got out of his canoe at the second waterfall to take a leak. You know?

These may be preposterous notions. The polite approach that is usually taken is to say well "everybody has a bit of the piece. The Mayans had a bit of the piece, the Buddhists they know something, those Sufis they're pretty sharp." The mushroom suggested that nobody has a piece of the action. That it's all wrong, that it's all completely 100 percent bullshit. You see? And that's a very cleansing notion to begin to explore. To return to ground zero. And start out with- how radical a deconstruction can we carry on with this world. What is the real nature of language? This is what all of these fine theories leave out. It's what mine leaves out, it's what José's leaves out. It's that you know, what is this phenomenon called language? Where by making little mouth noises, we coax roughly congruent into each other's brains, and then gabble joyfully over this achievement, you know? Reality is not made of electrons or quarks or any of these things. It is clearly made of language. And all of these abstractions, the faithless myths we mentioned this morning, are totally naïve about language. They just view it like a fish views water. You know? It's good to speak clearly, that's important., but other than that they haven't a word to say about the epistemic basis of language. Science is most guilty of this because science is a very old institution.

Consequently, its most fundamental assumptions are, were carried out in the atmosphere of greatest epistemological naïveté. [3:03:15] You know, things like that the universe is knowable at all. Things like that induction is a good way to think. Induction is when you say well if it happened ten times it'll probably happen the eleventh time. Probably. There's a

loaded word, that science is very big on.

So the real revolution is to come, I think, in language and the way in which psychedelics and feminism and cybernetics all come together is that we each need to carry out a very basic analysis of what we think about language and what we think it is and what we think it does. For instance, I've noticed and uhm, this may be because I'm male, but I've noticed that there are all these things flying around which can't be discussed. And I finally realized that they're emotions, is what they are. And that we have a very very limited vocabulary of emotions. We experience an amazingly rich interior gradient of shifting modalities, of which we never can say- I mean we say "I like you", "I don't like you", "I'm uncomfortable", "I really feel weird". I mean this is just like, y'know, petroglyphs about emotion. Ralph Metzner and I have have been playing with the idea that there is a- and certainly Robert Graves and other people have preceded us in this but that there is hardwired into the human brain a kind of "urrrr" language, that is older than agreed upon dictionaries, that is in fact to hear it is to understand it. The problem is that the only thing it can convey are emotions. But the emotions that it can convey are so finely graded and so rich in their adumbrations and resonances that it's like a form of magic, and we call this glossolalia and classify it is as a sub-psychotic or near-psychotic phenomenon, brain origin-uncertain, cultural use-uncertain, so forth and so on.

Ralph and I have even toyed with the notion of holding weekends where we would insist that every rationally apprehendable utterance be followed by an utterance which was not rationally apprehendable. The non-rationally apprehendable utterance would uh, anchor you in the emotional gestalt of the moment. And that would be like the carrier wave- Do it? I thought you'd never ask!

Terence McKenna glossolializes.
As does peer member.

[Audience member] I've had a conversation like this with a Sufi in the Sudan, and it was amazing to me because there was a third person there who could translate exactly what he said"

[Terence] What is being conveyed once you get used to it is the anchoring and the gestaltum of the emotional moment.

[Peer member] And this man was reading my emotions to a finer level, the one who was translating. I mean I recognized what he was saying but it was accurate, the mood that? The Sufi made.

[Terence] That's right. You discover these things on psychedelics, but the are clearly

subject to creodization, in other words to being learned. That you can lay down these pathways in the brain and its marvelous that-

[Peer] I think there's some mental language learning anyway. This is how the child learns and how you learn when you're in a foreign country and you don't study from a book. You understand long before you can speak and you don't know what's being said but you can come to understand. And the child is always spoken to in turn about anything? Of its verbal comprehension.

[Terence] So we need to learn to be able to create these linguistic constructs, which are not meaning-tied but which communicate. One of the most interesting things about psilocybin is that on high doses, a synesthesia takes place, where, when you articulate in this emotional glossolalia you actually can condense objects which are beheld, in other words you take control of the mechanism of the hallucinations and you create these hyper-these toy-like, jewel-like self-transforming grammatical complexes. You're speaking some kind of translinguistic language which is beheld, rather than heard. And you know Philo Judeus talked about the more perfect logos. And he said the more perfect logos will be beheld, rather than heard, but it will pass from being heard to being beheld without ever crossing a discernable barrier of transition. And I've experienced this, and I think other people have, where you hear the glossolalia like wave, and it comes closer and closer and then at a certain point it is manifest as a topology and I think many of the psychedelics communicate in these visual languages, after taking ayahuasca you know, and sitting with these people in darkened huts in the amazon, after hours and hours of it, your eyes are just bugging out of your head. You just have spent hours looking and looking and looking and drinking in this visual data, and uh, this is how really dense information is conveyed. Not a linear of string of little mouth noises where the brain rushes to the conventionalized dictionary and then grimly reconstructs the intention provided nothing too finely sculpted was intended.

And I think what's happening with the monitoring of brain states- Ralph Abraham who was here this morning is the director of the visual mathematics project at Santa Cruz.

Glossolalia, language, drugs, cybernetics, all of these things are the means to transforming the human self-image. It's almost impossible to imagine what a society would be like where this glossolalia held sway equal with speech. I think the pre-celtic- or I mean the Celts of Ireland may have been into this, because they rarely spoke without punning, and you were expected to pun on multiple levels. And the pun, far from being trivial, is a step toward this hyper-dimensional linguistic construct. It's almost like a fractal. A pun is a word with one and a half dimensions, or more, in it. And uh, it resonates. This historical, this vision that I conveyed this morning of the co-presence of resonant epochs in time, could only be conveyed if someone could transform their language in such a way that it was implicit that

this was happening and we were all noticing it and experiencing it the way we are noticing and experience the greenness of this tree, the fall of the sunlight through the leaves. We could also also be experiencing the ebb and flow of mid- Mesopotamian empires and Hellenistic religions and so forth and so on.

The fourth quadrant of the mandala, and then I will open it up for questions, which I hope there are many, is feminism, and I feel very trepidatious, wading into this, but never the less, I really feel in some ways it is the most important of all of these, because it is uh, going to work the change that is going to go on between us as individuals. What is happening I think is nothing less than an awareness that the most appropriate way to talk about the entelechy of this, on this planet is to call it her, and to admit that the goddess worship which was repressed by the rise of the patriarchal religions is now, its return is necessary. I don't want to say that the patriarchal interlude which lasted two-three thousand years was not necessary, I think it was necessary, but the fear will go out of the bomb when the hand that rocks the cradle holds the bomb, essentially. And all the bad little boys of the 19th and the 20th century who have been fiddling with their chemistry sets, now need to recognize that this all has to be handed over, to cooler heads who have not been scarred by the historical experience, in the way that I think masculine intelligence has been.

And uhm, psychedelics I count as a feminizing force, because they introduce you to the unconscious. Cybernetics I count as a feminizing force because it hardwires that same unconsciousness and raises it into inaccessibility. No longer are these things the theoretical constructs of psychologists, they become, you know, living realities in our lives. And uh, the transformation of the species into a, into a space-faring, whether interior or exterior or something else kind of space is only going to happen if this feminizing influence can now take the heat off the technological processes which were necessary to move us here. And feminism really, it has nothing to do with gender, it's just an attitude toward being in the world that is open I think basically to the translinguistic. If you had to stirp it of all biological notions of what feminism is, feminism is a kind of mentality which operates exterior to language. And there's no, it's like, the Nohual and the Tonal, theres no unifying those two things, or encompassing one with the other, it just is not like that. These things are uhm, alchemical opposites and as such the only way they can be unified is in a kind of coincidentia oppositorum. A union of opposites where the identity of each element is still fully expressed. This is not a rational concept, its like being in two places at once time. Nevertheless, it is a concept that is psychologically and experientially very, very valuable. And I see, as I say, all of these forms of self-exploration and technological expansion and even space, I mean if the earth is our mother then certainly outer space is our dark-blue great grandmother.

So I sort of give this as a background on what was said this morning, because I, I wanted to

convey the one thing I have to convey which is uniquely mine which is this strange wave, and that's mine. That its difficult to understand and its importance is open to debate. It may be trivial in the extreme. This afternoon, I sort of wanted to speak as a member of the culture who is trying to figure it out like everybody else using the same data banks that everybody else is using, and I- it was in Hawaii that I thought about this a lot, and I think these are the four pillars or the four quadrants of the mandala that lead into the coincidentia oppositorum which is the flying saucer, the exteriorized soul of the human race and the end of time, the transcendent object that will carry us all completely out of these concerns and into an entirely different set of concerns of which we have not the faintest inkling. So are there questions, or debates? In the back, Don.

[Roy Tuckman Introduction]:

Roy Tuckman: So, I guess that's the end of my introduction, here's Terence McKenna!

[Audience Clapping]

Terence McKenna: Can you all hear me? Can you hear in the back? Yeah? Not very well? Make them hear in the back.

[Audience Laughter]

TM: Ok. Ah. That's much better isn't it? Is it better in the back? Good, good. Well I would like to, uh, join with Roy in thanking all of the people who made this possible. Mary Fowler, uh, worked long and hard to make this happen. Eric Ali did the wonderful graphics for the poster. Pam here, has controlled and managed traffic flow here this evening. Diane and Roy are, uh, incomparable treasures in the LA community. I was talking to someone today who said they had listened to KPFK very carefully in the month that Diane and Roy were away and it just ain't the same thing. [audience murmurs] It's terrifying to think that two human beings in a city of what, 11 million, are what's holding up the hip, uh.

[Audience applause, whooping]

TM: The hip end of things. As Roy said, this is, uh, a benefit for KPFK, and, uh, in a larger sense for Botanical Dimensions. Botanical Dimensions is the non-profit that, uh, uh, Kat and I and Rupert

Sheldrake, and Ralph Metzner, Ralph Abraham, Frank Barr, a number of people have organized to carry out plant rescue operations for medicinal plants and plants with a history of shamanic usage and we uh have a botanical farm in Hawaii, 20 acres, maintain collectors in South America and occasionally support collecting in Africa. And, uh, this is our real-world political work, beyond the communicating and the publishing and that sort of thing, where we actually try to impact, uh, some of the more- some of the negative, so called, progressive changes that are taking place in the third world and disrupting rainforest culture and causing this shamanic and folk pharmacopeia to be lost. So I appreciate, uh, your being here tonight in support of that. It's very important work, far more expensive than I thought it was when I organized the foundation, and, uh, it's ongoing so we never really seem to be ahead. So I want to thank you for your support of that.

In line with that, I've been living, uh, with Kat and our 2 children in the h- in Hawaii on the big island for the past year and not really doing any public speaking because there is none to be done there, and, uh, it was a very good opportunity to get out from under the electronic umbrella, of the sprawl of North American culture, and to sort of look at it and assess it. As this practice of speaking with groups of people has become more and more a part of my life it has sort of changed in my mind, from the addressing of certain topics and the building of a talk around a theme, to more, uh, just pointing and looking and saying "well, here we are, here's where we've arrived tonight. What is the situation? What is the state of the world? What is the state of the union?" Um.

I think psychedelics had a very large impact, I'm sure there's no argument on this in the 1960's. but in a way it was not ever anchored in anything. It was never explained to anybody by anybody how it fit into the historical context of what had preceded it. Perhaps because no one actually knew at that time. For instance, there was no, uh, the- the invoking of shamanism as an explanation for how plant hallucinogens work on psyche is completely alien to the literature of the 1960's. it just isn't there. And, speaking of aliens, the theme of alien intelligence or of hyper-dimensional, uh, organized entelechy contacted in the psychedelic state. That also was an absent theme. It was basically presented, it, the psychedelic experience, was basically presented - it, the psychedelic experience was basically presented as an exploration of the contents of the personality with a little bit of overflow into aesthetic issues. So I remember in the early days we would stack our Abrams books on Hieronymous Bosch and Pierra de la Francesca and Giotto, and the idea following Ald Hux that you would, uh, you would imbibe the meaning of these great works of art, uh, behind the kind of psychic freedom that the psychedelic substance was going to graft on to your ordinary consciousness.

While I think all those kinds of metaphors were useful, but it's been now, uh, 20, 25 years of looking at that phenomenon, and also of having the future continue to overtake us with ever more demands upon our cultural resourcefulness and our, uh, ability to cognize the cultural situation. And, uh, I think now it can be seen, uh, somewhat differently. And so these two nights in Los Angeles, uh, which are called Understanding and Imagination in the Light of Nature, are a kind of effort to take several telescoping steps backward, and place the, uh, adventure of psychedelic self-exploration in context. To frame it in a number of different ways, because I think it's very important for us to know, uh, as the hermetic mysteries urge us to know, wither we have come, where we are, who we are, and whence we are going. All issues that the psychedelic experience, especially to my mind the plant hallucinogens, uh, bring into close focus. Here is an opportunity for a theater of cultural growth that is, uh, uh, unparalleled.

How did we find ourselves in this situation? What is, exactly, the nature of the cultural situation in which,

then, the psychedelic response is called forth as part of a spectrum of cultural responses? Basically what's been going on in western civilization for about 500 years is the exploration of the metaphor of materialism, which began as a simple, limiting case. Since we're at the philosophical research society it behooves us to talk philosophy for a moment and remind you that there is what's called Occam's Razor. William of Occam was, um a late medieval philosopher and his razor was the hypothesis should not be multiplied without necessity, without necessity. In other words, the simplest explanation should be preferred in all cases. The fewest number of elements should be put forward as necessary for an explanation. And following William of Occam's, uh, uh, statement of this notion as a, uh, logical way of proceeding, um, the assumption was made, then, a provisional assumption, at the beginning, that matter could be, uh, separated from the notion of soul and spirit. That it could be divided into its simplest units. And out of the activity of those simple units, a model could be built up that would explain more complex phenomena in the world. Cartesian Materialism, which, uh, was applied very successfully to, uh, physical matter, to the chemical elements, and so successfully, in fact, that the provisional nature of the assumption was soon forgotten in the explanatory zeal of the people who had latched onto this method. And so it was then applied, uh, out of the chemical realm and it moved into the biological realm, and the search was on for the biologically irreducible unit, which, uh, in the 17th century was the cell, and great excitement about the cell. And then in the 20th century, of course, first the nucleus of the cell and ultimately DNA, that, as the constituent of the nucleus which was, uh, controlling protein synthesis.

But strangely enough, the elucidation of the mechanics of the gene, through this program of reductionism, did not, uh, issue into the same kind of control over the products of the gene that the same program had, uh, the same kind of fruit that had been born of the analysis of physical matter. And in the early years of this century when the effort was made to extend the metaphor into, uh, psychology, the true inadequacy of it became clearly seen, so that, the effort to break the personality down into types, or complexes, or archetypes, or behavioral, uh, uh, strategies all failed. and at the same time that this process that this confirmation was happening in the social sciences, physics, which had been old reliable, in the matter of supporting this particulate, pointillistic, materialistic, school of explanation began, in fact, to betray it. Because the analysis of matter was pushed to deeper and deeper levels, until finally phenomena began to be elucidated which seemed, uh, incomprehensible in the mechanical model. It seemed as though what had been thought of as points of matter we in fact spread through time, and the notion of simple location began to give way to clouds of probability and this sort of thing. All of this reaching, uh, a culmination in 1923 with the Copenhagen conference on quantum physics, where basically a new vision of matter was elucidated.

And strangely enough, the new view of matter seemed to have a very mentalist sort of aura about it. It no longer was a theory of simple location, calculable energies, and specific predictions. It was probabilistic. Now this reemergence of a need for a wave-mechanical description of matter, can I think, now be seen from the vantage point of 55 years, as, uh, the first stirrings, or among the first stirrings of the reemergence of the spirit. and I think that, uh, what understanding and imagination in the light of nature argues for is the presence and re-emergence of the awareness of spirit in the world. This is what, uh, the so called and long heralded paradigm shift is all about. It is a vast turning over of the intellectual universe, which will eclipse many idea systems, and support many more. It- it is the idea of fields. Spirit need not be defined or even conceived in any sort of 19th century, or mentalist, or animist way. What spirit is, is, uh, a field of deployed energy that is somehow co-present at more than one point in space and time. It is, uh, it is the shadow that haunts the particularized world of Newtonian matter. And it is, strangely enough, the commonest object of experience. In other words, as we move through our lives, as we project our hopes,

as we plan our days, as we execute our jobs, we move in this realm of spirit. The problem is that we have been very slowly, but very, uh, efficiently, corralled inside an intellectual system which gives no credence to spirit, and therefore has had a curious effect on the validation that we give our own lives.

For instance if you look at, uh, uh, positivist philosophy, which is the dominant philosophical paradigm in academic philosophy, there you learn that there are primary and secondary qualities to the world, and the primary qualities are charge, spin, angular momentum, velocity, this sort of thing. Things which nowhere come tangential to the felt world of the individual. Well then there are also, so called, secondary qualities: Color, taste, tone, feeling. All the things that make up the world that you and I experience. So somehow we are not traveling in first class on this metaphysical airliner. No we're back there with the secondary qualities, and the good stuff is all up front and it is described and manipulated by incomprehensible equations, uh, and uh, you have to enter into a priesthood to become part of it.

Well, uh, it's to our credit, I think, that we are waking up, and one of the reasons that we are waking up is because into the objects of common experience, by an exhaustive search of the objects of common experience, uh, diligent, clear thinking, seekers after understanding; people who are practicing, uh, who took seriously the Constitution's assurance of, uh, the pursuit of happiness, have, Robert Bork notwithstanding, [audience chuckles] have found more than the right of privacy in the Constitution, but have actually found the right to alter your own consciousness for purposes of personal growth. Well, consciousness is like a still pool. If it is unperturbed it returns a clear image of the world, in the same way that the unperturbed surface of a pond will become a mirror to the environment around it. But if consciousness is perturbed by being shifted from its ordinary modalities, then the extraordinarily tenuous and provisional nature of what we call reality, swims into our can. And we see, you know, that what we take to be solid objects, what we take to be here and now, what we take to be personal identity versus, uh, Other in the form of other personalities. That all of these things hang by the most tenuous of linguistic threads and cultural conventions. And that beneath the surface of those conventions is utter *terra incognita*; a no man's land. The unexplored territory behind cultural assumption suddenly starkly totally incontrovertibly illuminated to the inspection of the individual. Well, this is, uh, feeding, indeed to my mind it is the major factor responsible for the reemergence of the awareness of the spirit. It holds out the possibility that we can create a new definition of our own humanness. That it was fine, for purposes of disentangling from the medieval church, to take the materialist rout, and to follow it into, uh, Darwinian evolution, to recognize our ascent from previous primate forms, and to, sort of, claim a dimension of existential freedom.

But that is not the whole story; that essentially is the legacy or the achievement of modernism, which was fully worked out by 1927 or 8, I would say. I mean those people: the pataphysicians, the quantum physicists, the Dadaists, the surrealists, [???] it was all worked out. And those of us who were born after that time and have come into this sort of pseudo-eschaton of regurgitation of modern values in art, fashion, and literature, have been living in this kind of a goldfish bowl ever since. I mean, really, it's astonishing the degree to which, in the most progressive and fast-moving century in the last 10 or, a- or, 20 for that matter, there has also been an extraordinary backward current. A very strong recidivism that has held at bay the true exfoliation of what modernity was supposed to mean. That's why, within the 20th century, the further back you go the more utopian the projection of the future becomes, and the further into the 20th century you go, the more like a dystopia it becomes, as we get not elevated railways, immortality, and, uh, hot pants, but, you know, bread lines, and germ warfare, and double speak, and all of these things. So, into this situation, of retrenchment and cultural recidivism, and the working out of modern values, which are

materialist values, comes then, the beginning of the post modern era. I don't- I prefer a different term, which I call compressionism, the compressionist era, which follows the modern era, and its theme is the reemergence of the presence of the spirit, and its major, uh, cultural exhibit, or the major cultural force driving it, is the discovery of relativism, with regard to consciousness. Which does not only mean, uh, psychedelic drugs and hallucinogenic plants per se. It also means media, it also means literary expectation, reorientation of the senses through design, urban planning, the entire spectrum of effects which feeds consciousness back into itself is, uh, enunciating this theme of the emergent spirit, and it is not necessarily a welcome theme. Because, uh, all institutions attain a certain momentum toward the preservation of their own vested interest. And science, and the handmaiden of science which is modern technocratic government, uh, have, uh, created a number of cultural institutions that, uh, have a friction with the reemergence of the spirit.

First and foremost is the notion of the public. The public is this weird idea that was generated in the wake of the printing press that there were vast numbers of people who could be treated atomistically. They didn't have to be thought of as individuals, they could be thought of as various, uh, classes. Masses of people to be manipulated, and if you could sell these, the public, on the idea of democracy, which is another one of these atomistic notions, the notion of democracy is for us all to get together and have it work, we have to assume that we're all alike, see, so we each have a vote and you may be tall, you may be short, you may be rich, you may be poor, you may be black, you may be white, but that doesn't matter, we'll give everybody this charge, one vote, and then we'll see how these populations work themselves out. What they don't tell you is, that at the same time that you build this definition of the citizen, you also build the institutions which subvert the the citizen. So the citizen is not free to act out and express the wishes of the citizen. The citizen is a consumer of ideological models that are sold to the citizen through agencies of mass propaganda. So there's this peculiar playing off of one against the other. In the meantime what has also been happening is, the institutions of language, which previously were pretty much left to develop on their own, and, and that was the situation well into the 19th century. The, through the power of the printing press, the evolution of language also became, uh, something under the control of these institutions and they very quickly have replaced whatever reality may have been impinging into the lives of the citizens with concepts.

Concepts replace reality. You come into the world with a blank slate, and everything is what William James called "a blooming buzzing confusion". Well then, one by one you isolate phenomena in this confusion, and you name it. Once a sector of reality has been named, it stays still. It ceases to behave the way it would behave for itself. It begins to behave syntactically, because it has been changed into a linguistic object. When things behave syntactically they are either subjects or objects or the syntactical machinery which relates these two together. In that case, materialism, dualism, projection of authenticity beyond the self are all reinforced. So these are the factors which have, uh, impeded the spirit. Into this comes the psychedelic experience. It has a tremendous force to revivify the spirit, particularly because it is not an ideology. It is not something someone figured out. It is an experience and this is important to bare in mind. It horrifies me, I'm sure you've heard me say it, uh, to think of someone going to birth to the grave without ever coming tangential to the psychedelic experience. It's like going from the birth to the grave without ever discovering sex. It means that you died as an adol- as a pre-adolescent, you know; you never really came into your birthright. and we have been infantilized by our cultural institution to accept the notion of ourselves as citizens consuming this regurgitated, these regurgitated scientific models which are then hashed through by Madison Avenue, and then handed down to us by the organs of mass culture, and this is supposed to be what we anchor our lives on. It's no wonder that, uh, drug abuse, child abuse, self

abuse is rampant in this society, because it all has been taken away from us. You may read 1984 and think "well, thank God it isn't that bad yet!" Well, the only difference between us and 1984 is we dress better!

[audience laughter, applause]

So I think that, uh, little gatherings like this, and I feel like this is definitely a family gathering, uh, this, this meeting was sold out, uh, before there was any promo, uh, other than Roy's show and a small mailing we did. So you are people who have passed through a very narrow filter. You stay up late [audience laughter] you listen to KPFK, and you tolerate Terence McKenna, so you are either thrice blessed or thrice cursed [audience laughter] I- I don't know which it is, but anyway, it feels to me like a family gathering. It feels to me like we are figuring this out, and there aren't that many of us, I think. But what we understand as a group, or what I imagine that, that we understand, is, that there is this twilight of reductionism. There is this end of the old model and yet we're not ready to proclaim the twilight of reductionism to simultaneously be the funeral of reason. You see, there are a lot of people, a much larger group than we represent who are prepared to bury reason along with reductionism and I think reason, uh may have been caught in bed with reductionism, but it may have been set up [audience laughter], is the the take that I have on it, and , and as they used to say in Watergate: "linked but not tainted" [audience laughter] so.

I am a very, uh, uh, some people even, someone said I was narrow min- I was accused of being narrow minded the other night [chuckles] because, uh, I come to this very honestly through the sciences, through trying to really find out what was going on, and not just accept everything that came down the pipe. I mean, I will believe anything if there's evidence, if it's self consistent, if the case is well made. I mean I think that the first thing that the truth will be is, uh, a pleasure to hear. You know, and not some turgid and tormented thing where you have to go to six meetings and not talk to anybody who doesn't believe it, and all of this sort of thing. So I think, uh, it's important as the, what I call the archaic revival, gets rolling, it is important for us to clarify where we're coming from. When we- when we were simply the lunatic fringe of the lunatic fringe it hardly mattered, but responsibility will devolve on us to say what we mean, and to have a position which is, uh, not only convincing to the converted, but convincing to the skeptics. That's who I'm after, you know, because I think that a great, uh, instance of cultural blindness is what we're confronted with on the issue of psychedelics. Psychedelics are to the science of psychology what the telescope was to astronomy in Galileo's time. And we are in a situation of increasing global pressure on our species, increasing outbreaks of neurosis, unhappiness, psychic epidemics, and we are leaving our best tools behind because of fairly preposterous cultural prohibitions. Cultural prohibitions which deny us our best weapons for overcoming, uh, the situation that we are in. And this is really an intolerable situation because, uh, the fates, nothing less than the fate of the human species probably hangs in the balance. We cannot afford the luxury of an unconscious. We cannot afford, uh, stupidity, closed mindedness, racism, sexism, uh, consumer materialism, selfishness, an absence of globalism. These things are not necessary for us, for our moral edification so we can feel like well bred ladies and gentlemen. These things are necessary for us so that we don't destroy ourselves. And the fact that, uh, this message is so slow coming out is a strong argument for activism on the part of anybody who thinks they have even the faintest glimmer of what is going on. You know, the future will not wait, uh. I see the most, uh, cryptofacist and intransigent of institutions slowly waking up to fairly basic facts, such as that a nuclear war is probably a bad investment

[audience laughter]

You know, so that even, uh, so that even a neanderthal a type as President Pinocchio is willing- isn't that a cruel thing for me to say?

[Audience laughter]

Is, is waking up to the fact that, uh, [clears throat] it just don't pay. But you know we have a lot of problems, it isn't going to be the millennium even if we achieve a massive cutback in strategic weapons, there's still going to be propaganda, sexism, starvation, uh, inability to correctly manage resources. These things will plague us, uh, unto, uh, the last syllable of recorded time unless we begin to undergo this kind of intellectual cohesion, the compression of our intent, the recognition of our group mindedness as a feeling, as a will, that can act in the historical context, and, uh, to my mind the psychedelics have always existed in the plants to promote precisely this. There were not language-using tool-making tribes of human beings in the absence of hallucinogenic plants. The hallucinogenic plants create the context for integrated organizational activity. This has been going on for at least 15- 20,000 years. The problem is that through a series of factors which we needn't go into in depth here, but factors which impinged on European civilization particularly, civilizations were able to evolve outside of the noetic input from Gaia, outside of the biological radio which envelops the planet and inputs into balanced tribal societies with functioning shamanic institutions. In Europe somehow the chain was broken. The link back to the elder Gods and Goddesses and to the biological organization of human society before history was lost. And this curious kind of ungoverned intellectual development occurred. Ungoverned in the literal sense of a machine which slips from the control of its, uh, of its governor. And uh, uh, it's, uh, in that situation materialism, which is an insupportable philosophy actually, if you have an openness, a sensitivity, any kind of cultivated feminine response to nature, it is utterly impossible.

Recall that the Cartesian, the point of view of Cartesian materialism pushed Descartes to actually claiming public debate that, m- that animals are machines. He said they feel nothing. The apparent display of pain is simply a, a, something which we project onto them. because we alone have a soul and, and Descartes you see had himself had not gone over completely to materialism, he believed there was a human soul but it came tangential at only one point to, uh, to the human body. Somewhere in the Pineal gland there was a switch and the, and the soul was running things like a telephone switch board operator from there. Well, uh, very shortly after Descartes his followers just said well we don't need this soul concept is just a thing to stay on the right side of the church and we don't need it and they cut it loose. An- Well once you cut that loose, then you have all kinds of permissions. You have permission to rape and exploit nature. Permission which had already been reinforced for Western man by the New Testament, but now raised to the nth degree by the assumption that nature is utterly without soul and this philosophy persisted well into the 1950's.

The essence of, s-, of Jean Paul Sartre's existentialism was, can be summed up in the na- in the statement "Nature is Mute" that was Sartre's position on nature. How many people thinking themselves existentialist and hanging out in coffee houses actually ever found, worked through what the consequences of the existential point of view was. Nature is not mute, you really have to have worked yourself in a weird place to believe that, you know. In fact, nature is entirely the something else. Nature is communication, because nature is psyche. This is what we haven't understood. We have somehow talked ourselves into the belief that into the natural world of Eden, God came and made man and from man, woman, and that men and women are of so ontologically a different level than the rest of nature that no conclusion about us can be drawn from an examination of nature. Nothing could a- I mean I, eeh, it's impossible for me to understand

how this idea persists and has such momentum in the 20th century, where hierarchy theory has very very clearly, uh, explicated the notion of the linkage of higher-order systems to subsystems that are physically more simple. So you see really what we have is a kind of fractal universe. I- In fact it's not greatly different from the alchemical view of the 16th century where people said, uh, "as above so below" the microcosm is a reflection of the macrocosm. What this is really saying is that at the level of a planet you get a certain level of organization and spectrum of peripheral effects. The same thing, such as self reflection, self regulation, intent, goal projection, steering toward perceived goal. You get the same kind of thing on the level of society, can be a beehive or a herd of antelope or whatever, and you get it in the human individual and the human society. So really, what is to be seen is the, we are the cutting edge of becoming. We are not a thing apart, we a unique level of a multilevel organism and we have been called forth out of nature, by nature, for a purpose, and what is our cast as individuals, I think, is to discover what that purpose is and then to align ourselves with it in a way which allows the plan, whatever it is, to most smoothly unfold.

Well what it seems to be is a progressive invocation of spirit. The theme with which I began the evening. That through language, through abstraction, through magical invocation, the formulation of religion, the projection of art, the field phenomena, the phenomena which are diffuse in space and time and not easily located are forcing, or intruding their way, into three dimensional space and time. If you were an extra terrestrial in a starship in orbit around this planet, what you would see looking down is a gene swarm. The species that seem to us to be animal forms extremely stable in time are actually highly permeable membranes over millennia and tens of millennia with genes crossing over, moving around, and being basically obedient to the expression of some kind of teleological form. And it was the concern of 19th century biology to eliminate teleology, to eliminate purpose and directedness, but it's very hard to avoid the impression of some kind of, of, uh, attractor, ahead of this planet, embedded in its history, and somehow channeling everything toward it. So that the progressive acceleration of human society, of information production, of communication, the proliferation of languages, natural and synthetic. All of these things are, uh, not something going on in the human domain and somehow sealed from the general state of nature, but are, in fact, part of the general state of nature. And the human experience, or the human animal as the carrier of this catalytic process, this speeding up and accelerating of process on the surface of the planet is not sealed from nature, but the leading edge; the leading edge of a process on this planet.

Now teleology was so antithetical to 19th century science because they were trying to pull away from the *telos* of, uh, medieval philosophy. They didn't want God, these 19th century English atheists: Darwin and Lyle and, uh, and uh that crowd. However, uh, we have come through the de- the so called death of God, and the elimination of, uh, of a theological *raison detre* for the Universe. And now we're looking more at a *telos* we would operationally define. Rather than define, for- it based on ancient revelation, which was the pre- you know, the previous the method was: the older the book the truer it must be, and the Bible is the oldest book and therefore it must be true. This is, uh, what Mercea Eliade called the nostalgia for paradise paradigm of time. We are overcoming that, it can now be seen that there is, in fact, some kind of transcendental object, and it's best to try and describe it phenomenologically. We don't know what it is, but we do know that it's an enormous attractor of some sort, and we are in the field of attraction, and by we I mean all life on the planet is being drawn in to this noble point. And it is possible to anticipate it through the psychedelic experience, because apparently the natural and the linguistic worlds are, uh, worlds which are organized along the principle of fractal curves.

Fractal curves are recently discovered mathematical objects- not all of them are recently discovered, some of them are known as late as the late 19th century, but most have been discovered using computers in the

last 10 or 15 years, and they are self-similar curves such that, when you take a subset of one of these mathematical objects, it is found to have a whole pattern embedded in it. The Fourier transforms that describe holograms are these kinds of things, coastlines, mountain ranges, uh, data of all sorts, when analyzed in a certain way is found to be fractal. Apparently the world is a kind of vast spiral fractal that is achieving greater and greater closure with itself, and we experience this density of closure and this compressionism, uh, as the spectrum of effects which we call human evolution, human history, emergence of high technology, the present moment, the rush towards apocalypse. The most intense moments that the Universe have ever known are the next 15 seconds, and beyond that lies still more intense moments. Novelty, as a kind of generalized paradigm of the compression of connectedness throughout the cosmos is accelerating moment by moment, in the rocks, in the trees, in the stars, and in us. And so what we call history, which is not as modern- the modern theory of history is what they call "trendlessly fluctuating" that is their model of the world. You get order at the atomic level, order at the biological level, order, order, order, suddenly you reach human beings trendlessly fluctuating.

[Audience Laughter]

It's as though, you know we were brownian, effected by the brownian movement of random particles and yet we, somehow out of all this ordering we're to believe that then emerges the trendless fluctuation of human history. Actually, this is nonsense simply that there has never been a thoroughgoing theory of history. However, now we are ready for them because these wave-mechanical ideas that notions of closure, Shelldrake's idea about the presence of a past, the way in which a past drives the present, all of these things lay us open for an understanding of the compression and densification of time, and this is what is experienced in the psychedelic experience. Really, you know, Whitehead said of dove grey that it haunts time like a ghost. Well, I think that the compression of the three dimensional universe at the end of time haunts time like a ghost. It's the cosmic giggle. Here a messiah, there a shaman, there an ecstatic poet, and there the tiny ripple that is simply a congruent coincidence in the life of a single individual. Robert Anton Wilson called this the cosmic giggle. It's when something protrudes through the flor- the forward flowing momentum of rational causuistry and causes it to flow around it, and eddy and churn, and then you like you see through for a moment and you're like What is it? and there's a plottedness for a moment, there was, uh, the hand of the maker there but now I don't see it anymore. That is the going behind the veil. That is the seeing into the structure of being that lies beh- behind the conventionalized languages. That's why, uh, coincidence is so often reported as an accompanying phenomenon for the psychedelic experience, because really syntax is dissolved, and syntax is a filter for this sense of, uh, eminent connectedness. And when the syntax goes, the eminent connectedness flows in. Then it's a question of what you do with this. If it causes you to believe that you are going to save the world, then you haven't gotten the message right, that's inflation, and, uh, inflation is very bad, it drives up interest rates. So if you get that kind of a take on it, you are misusing it, nevertheless, the most advanced yogic techniques that are known are the techniques of the so called AYTIT and the tantric yoga techniques, and there the prescription is, it says in Herbert Nothers Treasures of the Tibetan middle way "You should think of your house as a resplendent palace. Think of your utensils as made of beaten gold. and think of yourself as having a body made of living mercury." What this is in western psychological terms is an invitation to inflation, but if it is a, if it is approached with the right analysis of mind, basically that it is, that there is nothing but Bodhi Mind and there is no particularization in time and space, then there is no fee- inflationary feedback into the ego.

And this is, um, this is the kind of opportunity that the psychedelic opens up. It is, uh, I've said many times quoting plato, time is the moving image of eternity. Time is the moving image of eternity. What the

shaman does is he or she leaves the mundane plane and in Mircea Eliade's phrase is able to trigger a rupture of planes. And a rupture of plane carries the shamanizing person into another dimension. Literally, another dimension. And in that other dimension, all of time and space is beheld, as James Joyce said, in a nutshell, and in the nutshell of time and space everything is, uh, seen to be a part and a, a, a, uh aesthetically pleasing integral, necessary part of the transcendental object. In fact, what this universe is is a lower dimensional slice of that same transcendental object. Well, I guess what impells my career and what I really can't get over is that what I'm saying to you is true.

[Audience murmuring]

You know, that we, we sit here and we gather here, and even though we're talking about this extremely far out thing, still all the forms are in place. I'm here, you're there, everybody sits on their ass, nobody sits on their head. It all, uh, it all appears fairly mundane. How can it be that what we are talking about is the nearby presence of an impossibly alien dimension. Now if that alien dimension had been reported back to us by a robot probe dropped into the methane oceans of Europa we would be all hot to go there, to organize a 20 billion dollar expedition and a 15 year plan and go out there and found out what is happening. The amazing this is, that you know, each one of us in our own living room can be this Magellan, can penetrate into these dimensions. It really seems quite freaky to me. Freaky to me that such a thing is possible, and yet that we are such monkeys or so culturally constrained, or so blind that this is not what we're all talking about all the time, and by we all, I mean all 5 billion of us on this planet. Because we appear to be being pushed down a featureless corridor toward a furnace, and yet if you notice there are all these doors along the side of the so-called featureless corridor, and nobody seems to have cognized that you can just open these doors and walk through and short circuit the inevitability of planetary disaster. Amazing! Amazing! because we pride ourselves on, uh, our commitment that science allows us to look anywhere, inspect any possibility, our models are not dictated to us by the church, or by government, or by industry, when in fact they are dictated to us by the church, government, industry, mammalian organization and so we are no better off than all those benighted people in those previous ages where we look back upon them and say "well, they must have been so limited by their world views because they didn't know about quantum physics and ketamine and Michael Jackson and cable TV and all of these things" but the fact of the matter is that unless we push through culture to nature we, too, are dupes; we too are somehow being sold a line.

And, uh, and yet nature is there, outside of the cities, you know you drive an hour and a half from where we're sitting you're in the high desert and it is demon-haunted, paleolithic space. It is, uh, it holds the same promise for us as moderns that it held for the [?] indians who were initiated in to- into their shamanic institutions before the conquest, before history. So, nature is the final arbiter of cultural forms. This is what Taoism understood, and this is what, I believe, the psychedelic plant thing is pushing us toward. It was not immediately apparent that this was so, because as I said at the beginning of this talk, in the 60's uh th- the psychedelics came out of a laboratory, and only the most scholarly of the trippers bothered to study the natural origins and the anthro- and ethnographic context in which these things were coming from like the Eleusinian mysteries or the Mexican morning glory mysteries or the Wasson-discovered mushroom mysteries. but if we can somehow link a respect to nature, a sensitivity to Gaia. A valuing of ourselves, a, a, uh, complete placing of our own feelings and our own perceptions in the forefront of, uh, trustworthy sources and the psychedelics integrated into our lives, then there will be a tremendous cultural impact, a tremendous reorientation. Because the, the message that nature is trying to give, the steering signal on the human species comes through the accessing of this shamanic dimension outside of history. Revolutions are made by tiny percentages of the populations in which they are- in which those revolutions are wrought.

The important thing is clarity and connectedness, and, uh, a, uh clear understanding of who one's antecedents are, what the source antecedents are and what the target goal is.

'New Age' is a pale label for what is going on. New Age sounds too much like new Nixon, new Reagan, new re-treaded everything. What is happening is an archaic revival. A parking back to cultural models 10 to 25,000 years old because the profane fall into history is actually ending. The way the fall into history ends is with the progeny of Adam, the human race, recovering the control of the human form. The control of the human soul. The ability to turn ourselves into whatever we wish to be. This comes through the union of imagination through understanding, into nature. The invocation of the dream, this is what the Australian aboriginal society is talking about, this is what the dream time is. Finnegans Wake says "up neent prospector you warp your woof and spread your wings. sprout all your worth." This upneent this end of time, this birth into angelhood lies ahead of us, but it is really part of the archaic return to the paradisaical mode before history. The psychedelic hallucinogens are the catalyst. The minds that they touch become the catalysts within the society in general and from there the fashions, the social forms, the kinds of consciensousness, the innate decency that is, uh, that is called forth by the authenticity of the experience is what will transform us.

I mean in the same way that, uh, an affair can become a love affair if there is mutual authenticity of behavior, rather than simply a kind of flirting flirtation. In the s- in that same way our affair with Gaia can be a love affair if we can summon to ourselves the vision to make it so. And it means really being aware of the vastness of the options, of the precipice that late 20th century historical human beings stand on. We are about to leave for the stars. This is what is happening on this planet. The species prepares to depart for the stars. To do that, energy has to be marshaled. The lessons of the long march out of the trees and to this moment have to be collated, sifted, refined, concentrated, that is the alchemical goal. The historical process of the story of the prodigal son, of a wandering and a return. The return is meaningless without the wandering. The wandering has no meaning unless its fruits are given, uh, birth after the return. And I think that, uh the last thousand years has been the prodigal journey into matter, and it ends finally with modern pharmacology, modern ethnobotany discovering in the jungles of the Amazon, in the mountains of Mexico the body of Eros. Osiris, you know, fallen since the time of the flood, but awaiting the reemergence of the cognizant human connection. That is what the archaic revival holds out. It's actually our salvation

I mean I think I'm fairly hard nosed. I don't see any hope for us, I don't see any hope for institutional transformation unless it is done with an awareness of the transcendental object. And the religions that we inherit from the past are so screwed up that the only way to validate and empower the transcendental object is by self experience, and by direct accessing, and people say "Well can't it be done on the natch?" No it can't be done on the natch, generally speaking, because if it could be, it would have been done. I mean, we- there are plenty of elder societies on this planet that have the rap down, you know, but look at the kind of societies that they erect. I mean, horrifyingly dehumanized societies seem to be the breeding place of the most sublime religions there are! So, no, I think it has to be, there has to be a humbling. We have to bow our heads and abandon the dualism that we inherit out of our, out of Christianity and science and the whole judeo-christian-islamic schtick. We have to realize that it requires a symbiotic partner: It's a hand in hand effort. And if we're willing to take the hand which nature offers in, in the strange form of the alien vegetation spirit from the stars that seems to infuse us on plant hallucinogens then we will go forward into a bright new world. It's a partnership, it's a challenge, it's uh, the only game in the planetary village, and, uh, I appreciate your letting me share with you my notion of it this evening, thank you.

[Audience applause]

TM: We're gonna take about, uh, 10 or 15 minute break and then do question and answers. There are a bunch of, uh, handouts, catalogs, events coming up, stuff on tables at the back of the room which I urge you to take a look at.

[Tape Splice]

TM: Yeah?

[Audience Noises]

TM: We're going to start very quickly, because, uh, the philosophical society has asked that we, uh, wind ourselves down. I wanted to call your attention to a couple of things before I take questions. "Psilocybin: The Magic Mushroom Growers Guide" [audience begins to cheer] is back in print by popular demand.

[audience applause]

At health food stores, you buy agar.

[Audience Laughter]

But, uh, I do technical consulting at a hefty hourly fee. This, this can be gotten at Bodhi Tree, it's longer, it's on better paper, it has more drawings, it's as state of the art as, uh, as we can make it. It has brought freedom, prosperity and enlightenment to tens of thousands.

[Audience Laughter]

We have, uh- not to be outdone by Tim Leary, we have a piece of software [scattered applause] so if, if you own a 2E, 2C, or 2GS machine from apple, why you can run this Timewave software which, in my opinion, is actually my best trick, and I will be writing and talking more and more about, uh, about the wave of time because in Hawaii, finally developing this software gave me a real grip on it. Eventually we will market this for Macintosh and IBM-compatible machinery, but right now it's in the uh, 2e, 2c line. Um, also I'd like to mention that, uh, Kat and I will be at Esalen next weekend so if any of you are true gluttons for punishment why you can join us up there for 2 and a half days, and uh, it should be lots of fun. That will wind this all up.

And before I take questions I want to again remind you of botanical dimensions. It is a tax exempt non-profit, we do need donations, so, every- all the money that is given goes very directly into visibly manifesting, uh, the botanical garden in Hawaii, collecting the plants, in, uh, building a computer database, and basically support-, not even supporting but, uh, keeping a Peruvian collector in the field. Since I'm most familiar with Amazonian botany why that's where we've concentrated.

Well, usually questions are the most interesting, uh, how is this to be done? Are you going to have a microphone? Will people come up? Stand up? Stand up and speak loudly. In the middle in the back, yes.

Q: Yes, Terence. I was wondering if you could share with us your ideas about what the spirit is?

TM: Well, I think it, it's uh, my notion of it is it's an info- the way we experience it, it's an informing understanding. It's, on one level, it's simply appropriate activity, you know, knowing how to do everything because it is the Tao of the ancestors. In other words, you can sort of see yourself as the, as the most recent version of your family's genes, and in all traditional activities there's millions of years of morphogenetic fields stored up for how you pick something up. How you sit something down, so, in the immediate sense, the manifestation of spirit is appropriate activity.

What it really is, I think, is some kind of hidden how-ness that makes everything be as it is. And that's what the spirit is. In other words, science describes the possible things that can happen. Science is the study of possibilities, and what nobody has ever answered is how is it that out of the entire class of possibilities, certain things actually undergo the formality of occurring? Somehow they are selected out of the class of the possible and they become the actual. Well, the thing which mediates the coming into being of the actual out of the class of the possible is what I think the spirit is. It is the, the invisible hand, if you will. It is the guiding force. It is the invisible landscape over which becoming flows like a river. It defines, it creates, it is this telos that I mentioned, this attractor at the end of time. Other q-? Yes, back there.

Q: Uh, yes, Terence, uh, has there been any research you, uh, know of, uh, in in relation to electron spin resonance recently since the Invisible Landscape? And secondly can tryptamine act as a mechanism for the release of genetically stored material, uh, through that DSR or direct spin resonance with an interpolation [??] substances into the neural DNA, isn't it, uh, subset of genetic mechanisms for uh, racial?

TM: Well, in The Invisible Landscape, that's what we were suggesting, and The Invisible Landscape was published in 1975, uh, since then there's been a lot of work with MMR and ESR, none of it which overthrows this idea. It's a real question about the, uh, the where is the epigenetic data stored? In other words, all the memories that you accumulate during your life die with you. Your genetic material you can pass on at least half to your children, and, and so during the life of the individual this epigenetic material: experience, anecdotes, memories, anticipations. How- where is it molecularly stored, and is it molecularly stored? In The Invisible Landscape we were suggesting that, uh, thought is actually a naturally occurring ESR readout of portions of the DNA which were not associated with genetic expression but which were somehow like, uh, um, write- writable memory in a computer. The epigenetic stuff was being stored there. There's no data to overthrow that notion that I'm aware of, I'm not, I don't cling to it, um, as strongly as I once did. I- I look more and more, I, see I didn't realize that this was a fundamental break, this, uh, allowing of spirit into the scientific model of the world, and, uh, uh. I now think of the, the brain as a receiver of the phenomenon of consciousness. That- I don't believe that, that consciousness is generated in the brain anymore than that television programs are made inside my TV. You know, the box is too small.

[Audience laughter]

You know, that, I mean it just obviously is too small. I, I mean, it might not be if you didn't have the psychedelic experience, but once you spike that then well you say, well it's taking you know 10 high 16 megabytes of memory to store this database so, it just doesn't, I just don't think it would be done like that. I think there is, a- some how this field phenomenon that I keep returning to. This is another slice on what the spirit is, it is this field of some sort of energy that organisms, as they evolve, discover. Right? Already somehow present in the environment it is that, the apatition for being that drives organic, uh, evolution into

this kind of dance of relatedness to this other thing which is transduced from another dimension. That's why, you know if you take "consciousness expansion" as a phrase, or consciousness enhancement seriously it must be very important because consciousness is after all what it's all made out of. That's the name of the game.

So, uh, this transducing of, uh, higher states of consciousness then seems, uh, uh, very important even at that it would be, uh, necessary to elucidate the physical mechanisms whether it's ESR, MMR, or what it is. An interesting, um, sort of opportunity for psychedelic research, you see, the amazing thing about psychedelics is not only that they are illegal and restricted from the so-called ordinary person, but they are restricted to scientific research. Nobody can do research on psychedelics. I mean, it is professionally and practically impossible to do it.

Well there's no other area where this is true, I mean science probes obscenely into the pri- the most private areas of our sex lives, our social lives, our dream lives, monkeys are smashed against walls to study- There's no limit to it, and yet there's this total hands off attitude to the psychedelics. So an interesting break in this front is the sudden need, because of, uh, computer assisted tomography, CAT scanning, the need for compounds which locate in certain highly defined parts of the brain. If you could trivariate these drug compounds, uh, and make them radioactive you could make very nice pictures of various parts of the brain. So now suddenly there is an interest in all this old psychedelic research about receptor sites and location densities of molecules in the brain so we may be on break of an era where, to have a psilocybin trip in the evening you must have signed on for a CAT scan, uh, at general hospital in the morning. Someone else.

Q: I, I forgot my question I about the space of these plants that you need new rescue them from the Amazon and bring them to Hawaii, how many types of plants there are, that type of thing.

TM: Well, um, the, every time I have gone to the Amazon plant collecting I've observed that the cultures, the indigenous rainforest cultures are more and more disrupted, and there's a lot of, uh, conservation and big organizations raising money to preserve the rainforest and to get large tracts of rainforest set aside. But, there is no awareness or social, uh, conscience about the fact that the presence of capitalism in the Amazon is totally disrupting tribal human culture. So these people who have been tribal for thousands of years, uh, the men are just totally walking out on the traditional lifestyle and taking their canoe 100 miles down river and signing on at saw mills and on oil drilling crews and this sort of thing. And, so the consequences of this is, that far more rapidly than the rainforest itself is being destroyed, uh, the human cultural interaction with the rain forest is being lost, and thousands and thousands of species of medicinal plants, antibiotics, immune stimulators, hallucinogens, analgesics, uh. All these different kinds of plants, this data, this lore is being lost and when you realize that, you know, 80% of the drugs sold in the United States are, in fact, traceable to plant sources, and in spite of the vaunted success of so called strategic pharmacology, where you just think up the drug you think you need and make it in a laboratory it really- it's still a lot of what drug companies do is screen for plants, uh, and cash in on folk lore, basically.

So, it's important to preserve these plants and, uh, the lore about them because, you see, I mean like, it's really hard to explain how some of these plants have been discovered, for instance in the case of Ayahuasca. Ayahuasca is a visionary shamanic brew that happens to be made of two- two different plants *Banisteriopsis caapi* supplies an MAO inhibitor and *P. Viridis* supplies DMT. Either plant by itself is inert and you have to know to brew the wood and bark of one with the leaves of the other, and you have to know

that it's in a certain proportion, and you have to know to concentrate it to a certain degree. Well, when you realize that in a square mile of Amazonian rain forest can have 120,000 species of plants on it, I mean, that's in contrast to when you go into the Sierras a square mile of forest may have 150 species. So, it's an ultra complex environment and human beings, who knows by what means, I mean, it is to my mind, that the vegetable spirits lead them to it, have sussed out all this knowledge that is, uh, you know, un, a seamless web of understanding about nature, and, uh, so this is what we're trying to preserve in Hawaii.

I think ayahuasca is a good example, it has tremendous potential for psychiatry. It is a purgative, it kills intestinal parasites, it, uh, appears in agar, in slant cultures, to kill the tramazone of malaria. Well, instead of delivering high priced drugs made in Germany and the United States to the outback of Indonesia where malaria is raging, you could simply send in thousands of cuttings of this plant. People could grow it as a door yard plant, take it as a tea on a weekly basis, and uh, malaria would be held at bay. There are over 200 plants, uh, in a recent review article that I saw, known from Africa that appear to be immune stimulative plants. Well, God, this should have everybody on the edge of their seat. the breakdown of the immune system and the whole aids related complex and all of that. It turns out that adaptations to plants in traditional cultures have conferred, or have stimulated the immune system and conferred certain kinds of immunity. Well then, this could be the basis for a drug strategy of some sort, and so on. So this is the kind of preservational work that we're doing there. Yes

Q: Yes Terence, um, a few days ago you were on KPFK with Roy and you mentioned briefly san pedro, that what you said right? you were talking about that, that, plant san pedro cactus that people can you just, can you just a background maybe a parallel or your experience with san pedro that to that of, um, psilocybin mushrooms. When I tried san pedro cactus mixing it with vanilla ice cream.

[Audience Laughter]

TM: I don't know what ... means but it must have startled your stomach

[Audience Laughter]

Q: ...

---1:29 REVIEW IN PROGRESS ----

TM well I am, I don't really know that much about San Pedro, I've never gotten around to it, I know a person who swears by it, that they have an elaborate way of cooking it up in a pressure cooker. Mescaline, which, and and hallamin, anhallomine, n methy mescaline, all of these things are occurring in that plant. Uh, it's an amphetamine related thing it tends to be pretty rough. of, uh og the natural hallucinogens that really the big ones as I think of them, mescaline is the harshest. An operating dose is considered to be actually close to a gram, 700 milligrams. One way that pharmacologists judge the toxicity of a drug is by how much it takes to get you off, and the less it takes then the more benign the drug is thought to be, so on that scale mescaline doesn't do too well, but my experience with mescaline is with peyote, which I gather is somewhat similar, but. It's been interesting, it's hard to take enough to really reach the deep water without it really acting on your stomach. It's not the cleanest way to go. I think that, having looked at these things in south Americana and in many places, in my experience the mushrooms just is it. I mean, other things have

other aspects to it and bring it in, but, um, the mushroom is an extraordinary organism, it's like it's engineered for that purpose, and I've spoken about how it's almost strewn in the past of developing primitive man in Africa, because, uh, it was associated with the manure of cattle, and on the, in the ungulate herds of Africa, evolving on the veldt at the same time that the Human animal was evolving a complex, uh, pack signaling language and so forth.

This set the stage, it seems to me, it was the catalyst, I really believe that we are in a symbiotic relationship with these plants and that the mushroom, by virtue of being global in its distribution, is probably a major slice relationally of that kind. And in other in other words the peculiar turn that evolution took in our species, the reinforcing of self reflective consciousness and the reinforcing of linguistic signaling has to do with the present in the human diet in that early stage of these mushroom, uh it's known that the mushroom, that low amounts of psilocybin, sub-threshold doses of psilocybin increase visual acuity. Well, it isn't hard to think of, then, that if evolutionary pressure is operating on a hunting species, a pack hunting species, that visual acuity is going to be, uh, uh, uh, at a premium, and if, uh, small amounts of psilocybin the food chain increase visual acuity those animals will be selected and survive. Well, then their habit of using, as accepting the mushroom as a food makes them open for this linguistic synergy, this symbol forming capacity, then, and then, the, the deeper more ecstatic experiences with psilocybin which are then projected onto the mushroom onto the cattle become the basis for a kind of cattle goddess mushroom, uh, a cycle of a heirophany. The discovery of the tremendum. I mean almost as though in the scene in 2001 where the apes encounter the monolith, was precisely that except that the monolith was a mushroom, it was a superbly genetically engineer omnivorous, uh, uh, organism that could insert itself into the ecosystem of a planet and begin to coax an effect out of a mammal that it had a relationship to, and this effect coaxed out of the mammal is this relationship to this higher dimensional wave form which we call the spirit or mind, which is, apparently, sigh, you know that's what it's all about. Why this is happening is not clear,. I mean in the mushroom book I suggested that it was because there is some awareness of planetary finitude. That the mushroom actually thinks on so large a scale that it is using us, uh, to make machines for it to perpetuate it, uh, throughout, uh, the nearby galaxy. That it is aware of the finite nature of our start. We don't know, we don't plan, yet, on those kind of scales; we're an infant race. Very obstreperous and, uh, the mushroom said to me once: "if you don't have a plan you become part of somebody else's plan!" one of it's slightly more paranoid, [Terence breaks into laughter] but it is good, I think, to have a plan, and to have allies, and uh, the mushroom is very contemptuous of the notion of, of humans having human allies. It says, you know, for one human being to think it could gain enlightenment from another is like for one grain of sand to think it could gain enlightenment from another. So, really believes in, uh, hierarchical levels and trickle down gnosis, which I'm not sure how I view that,. I believe all secrets should be told and that we should just lay our cards on the table, but maybe I don't have as many cards as they do, so we play by their rules.

On the Isle.

Audience Member: uh, uh, if you're a wonderful convincing speaker... ceremony what your saying. Um, it's absolutely true that there's this intelligence that wants to connect... it's extremely informative, and uh, your saying, um that one way we can do this is through psychedelic experiences, I agree with this, but uh I'd like you to talk a little bit about the western traditions of the mystery, which involves ritual. And using ritual in order to maintain, uh, to uh uh, to maintain contact with the nature spirit, which, uh, I might add, is, uh, is a spirit which is bursting at the seams right now to connect...

TM: Yes, well, um. Mircea Eliade talked about the difference between sacral and profane time. And he said the way you leave history is you sacralize a space, and you sacralize a space through ritual. You, you abolish profane constraints of space and time, the here and now, and you imagine that you are what he, what he called *innilio tempora*, in the time before, in the paradisaical time before the fall. This goes back to what I said about the AMTYT, the imagining of these titanic God-like states of mind as a ground for being. Yes! I would never have thought, I mean I've been pushed to my position by my experience. I mean, I'm amazed at what I have to say based on what I've experienced, because I never thought it could be this way. You know, I came up a whole different way, I was a Marxist, and an Existentialist, and all of these things, and it was, as you testified: it's the pure evidence of it. I mean, you can, uh, you can convince yourself intellectually that something is true, but it's only in the, uh, in the, uh, embrace of the tremendous that it just sweeps over you how true it is, and uh, as far as the difference between establishing these connections through psychedelics and through ritual, I think deep psychedelic tripping, uh, is something that you don't do very often, simply because each time it's so rich. It takes a long time to process, uh, it's much better to go deeper, seldom, than, uh, than to diddle with it in the other ways as people do. I mean it often seems to me it's not even so much a matter of, uh, of spreading the good word, and turning it into a mass movement. It might be much more interesting if simply the people who were already in on the secret did it more conscientiously and did it more deeply, although, uh, I hasten to add that you shouldn't do too much. You should never do more than about 6 or 7 grams of mushrooms. I say that because I keep hearing stories about people who think going deeply means doing a lot, and they do amounts that stand my hair on end. I mean, in the past month traveling around I've heard stories ... and people are crazy, you know, they say I couldn't remember whether you said five grams or five ounces-

[Audience Laughter]

So to be safe I did an ounce and a half!

[Audience Laughter][Terence clears throat]

You know, I mean, it- it's important, to, uh hahaha, ha, it is important to get there, granted, but it's [Terence chortles] important to come back. [Terence laughs more]

Oh lord yes.

Audience Member: In your talk you, um, the transcendental object, you go into more about that.

TM: The way I imagine that history works is- well, first of all let me say how the way the people I disagree with think it works. [apparently the tape skips for a second] Then you have cooling, development of molec- atomic and molecular and organics and ultimately cultural, and systems, and ultimately technological systems, and, uh, this will go on indefinitely down until the heat death of the Universe, and the development of life and the culture has nothing to do with the physical, astrophysical level of things; it's sort of ancillary and a mistake. My view is somewhat different. It's that, if we have to have a singularity in our cosmology, in other words, it's so hard to figure out how you get from nothing to something. No philosophical school has ever been able to do it without some kind of singularity. So if we are going to have a singularity in our system, let us try to make it as logically palatable as possible. So how to do that? It's not logically palatable to me to believe that the Universe sprang from nothing in a single instant. It seems to me if you believe that you're set up to believe anything! Right, I mean isn't that it "Well if you'll believe that,

what wouldn't you believe!?" So, how about this instead? That the Universe, uh, its origins are a mystery, and cannot be determined, but as we look at its history, the history of it that is available to our inspection, what we see is increasing complexity, ending in ourselves and our civilization so far as we know. Well, then if you're going to have a singularity, I think that the singularity as a kind of phase transition. You know, Illia Pregosian talks about, uh, a chemical system will suddenly and spontaneously migrate to a higher state of order. Well that's sort of how I think of this thing. It is capable of migrating to a higher state of order. So, uh, If we're going to have a singularity, isn't it more likely that it will emerge out of a situation of vast complexity, than a situation of utter metaphysical nothingness? I think so. So I think that what the transcendental object is, is it is, uh, the cause of the Universe, if you will, except that this cause is at what we would conventionally refer to as the end. It's what everything flows towards. It isn't, uh, something which wound up that runs down. It's something diffuse, which is gathered in to something. And th-, and this gathering in takes the form not only of a progressive densification of a physical level, but of a progressive complexification at the organizational level. It also is a kind of a spiral; it has a temporal closure, so that each epoch, of uh, of closure happens more quickly than the ones which preceded it. What I mean by that is, it took the, you know, the universe of 20 billion years old, it took the first 5 billion years it, well, no. The first 10 billion years it was all about star formation, and nuclear put down of heavier elements out of lighter elements. And then you get molecules, which signify a higher level of organization which can only go on at a lower temperature, so as temperature leaves the universe more complex systems become possible, and ultimately polymers of great lengths become possible. So, this complexification is occurring and it is, uh, at each stage more rapid than the last. Now, the emergence of self reflection, of self reflection in our own species is part of this. It isn't a fluke, it isn't an accident, it, it is obedient to the same natural law which created these other systems. And, the emergence of our own curiously alienated and at odds with itself culture is also, uh, a part of this phenomenon. We ,eh, are initiating a kind of crisis with the planet. It is in the same way that a foetus will become septic if it is carried too far beyond term. There is a crisis now in the Gaia-Human system. The two must be parted, and the transcendental object is this knitting together of the organic intent of the planet to somehow expell us from the planetary environment. In some way, which is very hard for us to foresee and anticipate, because it is infact the transcendental object. I mean by appointing a committee to look into this weare not going to find out what it is. It is the- it is the face fo the abyss, it is the transcendental object, it cannot entirely be known, it is the living embodiment of Goedels incompleteness theorem. You know, science has taught us there are no mysteries only unsolved problems. this is a mystery not an unsolved problem. Nevertheless, it is, the- the narrowing vector of our timeline, and as some of your probably know, my, in my opinion, uh, around 2012 AD we will cross into, cross through novel epochs of concrescence, and, the transcendental object will be manifest. It's a very curious thing, it's something which is coming toward us from the future, that we are creating out of our intillectual and technological anticipation of diety. Really, I mean at tiome s I have spoken of it as the flying saucer. It is the flying saucer, a nd ti does enter history at a certain moemnt, and it is going towards us, and as we go toward it we are becoming what we behold. In effect I am saying the entirety of human history is a kind of psychedelic apotheosis where we are involved in a heiroschomos, a kind of alchemical marriage, and what th- you know what the next 25 years are about is advancing to meet the bride, and the bride is the unimaginable and un-, uh, un- um, -anticipitable, uh, fulfillment of our hearts desire. You know, we are becoming what we behold. Our metaphysical hypothitization of diety is becoming a cultural program for our completion and that's why communication is so important, because what we are trying to do is articulate this vision of the oversoul of our species. We are going into a kind fo swarm-state, or, there is a, uh, pheramonal transformation of our cultural modality. Our pheramonones are infomation systems, and now information systems, ideologies, are being released into the mass psyche that are, uh, set us up to undergo this cultural compression, uh, and concrescence that the experience that

transcendental object is.

If you haven't read William Gibson you might give him a go. His anticipation of a cybernetic future is part of the anticipation of the transcendental object, and what Gibson is saying, *Neuromancer* and *Count Zero*, is that data storage in hyperspace will become conventionalized the way the grids of cities are conventionalized in three-dimensional space, so that when you jack into cyberspace, you will find, you know, you will see the Bank of America database like an enormous red neon obelisk glowing off to your left, and over the horizon the transworld Airline database. In other words, the dimension of culture which, for fifteen thousand years or so has been, uh, for purposes of comparison let's say as thin as a thick sheet of paper, what has culture been ... a few mud huts, some brick streets, a cathedral here and there more recently, and then more recently a lot of knitted together electrified cheap construction. Suddenly the dimension of culture is about to be, which is orthogonal to ordinary reality, is about to be expanded a hundred, a thousand fold, into a complete mind space. The cyberspace that Gibson is talking about, the psychedelic space that shamans have always known about, is about to be, uh, uh activated as a cultural artifact in high tech, uh, high tech society. Where we will become whatever we imagine, you know, you will move off into this electronically sustained realm of mind. At least that's how I imagine it. I imagine that passage through the transcendental object leads into the imagination and that the imagination is really our true home, and that all of this electronics and culture and art and grubs and magic and ritual is about the prodigal return to the imagination as a cultural norm, and, uh, and, uh, the transcendental object represents a narrow neck, the narrowest place, the place where the phase transition occurs. At least that's what I hope, that's what I feel the symbiosis with the hallucinogens is coaxing out of us. Because we cannot go to the stars in the ape mindset, you know, with ape politics, and, uh, it's just impossible, and very clearly we are on the brink of taking control of our own self image. This is what the long cultural march has been. This is the justification, if there is one, for science, is that it does give us a certain measure of control over stuff, and it's out of, it is the mirror of our minds that we will make out of stuff that we will eventually perform this magical evocation in front of and walk through into the time outside of history, the place before history.

Another Question. Somebody over here. Yes.

Audience Member: ... I just wanna say you really.... [applause] anyway, I something Mexico to the little village of Tijuahaca and my companion said... while you're looking around you might find some federales or something. So I decided to grow the mushrooms and that just ... but I was always of the fantasy that going to this place in Mexico there was something magical... and I wanted to know if there was a more p... wouldn't that be in the negative time space frame. So my question is, ... and, um,

TM: that's the question.

AM: yeah.

TM: well, um my, one of the best people one of the very best people that I've found in the so called new age is Rupert, Rupert Shell Drake, and he and I are tight. And we've spent a lot of time just pushing these ideas around, um, ultimately I think probably he's very much onto something. It's interesting that it's such a, considered such a radical idea because think about what it says. It says that things are as they are because they were as they were. One can hardly imagine a more conservative philosophy. In fact, the, the problem for this philosophy is to therefore explain how anything ever manages to be different. How any kind of

novelty could emerge out of the situation where the past is so present that it configures everything. So, uh, Rupert's idea and my idea, which I discussed except by implication tonight, I have this notion which is embodied in the software of a wave of novelty, a way of quantifying the flux of the toa, and, uh, a wave of novelty would be necessary to, uh, for Shelldrake's idea to support, uh, the coming into being of new forms. Uh, I mentioned this evening in the main body of my talk the term compressionism. I've just sort of begun to think about this. I like it because I like impressionism, abstract realism, I like it because it's an art movement, not a science, but I would number the compressionists that come to mind to be Rupert Shelldrake, Ralph Abraham, Frank Bar, and myself bringing up the rear, and, uh, we all four of us have a slice on it. Each different but each leading to the same set of conclusions: that there is a set of hidden variables which we all describe differently, but that these hidden variables are channeling the development of events, and what this signifies is a new way of thinking about time. And it's all very much in flux. Rupert is a true, a truly great scientist and gentleman. If the theory of morphic resonance can be overthrown it will be and he will lead the charge. Our efforts when we get together, much of our effort is experimental design, we try to think of experiments that will disprove the notion, because it is a notion that will assert very firmly certain strange things about reality should be measurable and discernable, so, uh, morphic resonance, my novelty wave, the dynamic attractors of Ralph Abraham and, the, uh, fractal hierarchies of Frank Bar are all embryonic efforts. There's this feeling in the air, a sense of an idea to be, uh, nailed down. And I'm convinced, you know, that in the next 10 or 15 years one of us or somebody we know, or somebody sitting at the table near by will, uh, work it out. It's really the great intellectual adventure of our time, and it carries us all along with it. When this thing is figured out, it's going to be understandable to all of us. It's going to end the era of the professional abstraction. You know, for the new paradigm to work it's going to have to transform the lives of hundreds of millions of people, and, uh, that's the point that's been diminished, uh, by the proponents of some of the more narrow versions of what the new paradigm is. The new paradigm will be an understandable explanation of the world. Understandable to whom? to you, to me, not an abstraction sanctioned by a professional elite and handed down by Adam.

Audience Member: translated into numbers in order to demonstrate the,.

TM: well that's the beauty and the wonder and the delight of Time Wave theorem. Absolutely! I mean this, this was produced to convince scientists. What this thing does is it draws graphs of the ingression of novelty into time. I advance novelty as a new primary quality of the space time continuum, on a par with charge, spin, angular momentum, novelty. This is the realm of the hidden variables, and this program makes thousands of experimentally testable assertions. This is not smoke and mirrors stuff, you give it an end date, you give it a date of interest, and it draws a mathematically defined graph of its opinion as to where the flux of novelty and habituation, these are the two opposed quantities, novelty and habituation, where they fall vis a vis this event system. So every time you activate the program it fills the monitor with a screen full of precise predictions about, about known historical phenomena. It seems to be that if there were a body of informed give or take on the matter we could quickly settle on whether, you know, I smoke too many little brown cigarettes, or that this kind of thinking is in fact going to underlie and restructure science. It's alright! I mean, why should we assume that the basic qualities of the Universe have been defined as of 1965 by modern physics. After all modern physics doesn't explain, uh, uh, the unicorn or the flower, so there must be more work in the universal mix than we have perceived. Well I think I'll do one more question.

Audience Member: historical biographical..

TM: Yes, that's exactly what it is. It's, uh, a way of looking at the life of an individual or society and asking a quest- see, the way I think this it will be this is good because. It, the spirit, to eastern philosophy, is the Tao, and the Tao is the howness of the way things happen. Well, we are so accustomed to allowing these eastern forms of thought to remain largely formally undefined that we never ask obvious questions about the Tao for existence, for example. Uh, in the Tao Te Ching, uh, the opening words in the Wailly translation are: "The way this can be told of is not an unvarying way." ok it's a double negative it's not an unvarying way, it's a varying way. So anything which varies is modulated. That's a mathematical term that has precise meaning. So if the way that can be told of is not an unvarying way then it can be mathematically described as a set of integers in flux. The problem, then, becomes what integers? well that's a long story, but, uh, it's all in here. huh huh huh huh huh

And it's, uh, and I'm, you know, not mad enough to claim that this particular take, this particular set of integers is correct. I'm very impressed by it's, uh, successes, but I am convinced that a theory of this class will eventually explicate, uh, time. Time is the spirit, not the time of flat duration in the newtonian universe, or the very slightly curved time of einsteins universe, but time as lived, from moment to moment it flows like a river, it runs here quickly, there slow and deep. Here there are cataracts, here there are vast lakes form, and all sense of direction is momentarily lost. Time i- is, uh, the continuum upon which our entire experience of being is deployed, and yet up until very recently the only model we've had of it is this flat or slightly curved surface. That didn't explain the viscissitudes and synchronicities and the mystery of our own lives. Now, if we take a fractal model of time, the kind of fractals that we see in the psychedelic experience and the kind of fractals that we see whenw e unleash computers in the realm of pure mathematics, thenw e begin to see the time of pure experience, where every day is like every other but different. Every year is like every other but different. We grow, but we cha- but we stay the same. We move forward at the same time that we move backwards. All of these kinds of feelings... about movement and time are handled very well int eh fractal., So the Tao, what the psychedelic experience has done for me, above and beyond the heart opening and what it's done for me as a person, what it's done for me as a seeker after truth has, uh, given me, you know, this total description of reality and I think our senses and our minds and our hearts are always trying to give us a total math, a total mandala, it's always trying to emerge out of the chaos of, uh, out of perception, but it appears to me that it can happen to any depth, and if you still your mind with psychedelics and with disciplin and you look into the black rivers that flow in our hearts and in our minds eventually you see not only the truth of yourself, not only the truth of ourselves, but formal truths. The truth of mathematics, and then you have sort of made a kind of closure. So this is what, this is my personal meditation in Time WAVE Zero. I urge you to take a look at it, because, uh, its the most original thing that I have done, the rest is the descriptive diaries of an explorer well footnoted which I share with you gladly, but this other thing was actually, um, the logos from on high. That was what my particular relationship to the spirit was based arund. the revelation of this particular idea, because I had no interest in the i ching still elss in mathematics and all of the disciplins which impinged on this notion, but somehow, you know, I was chosen virtually because I was standing around whent he descision was made. You know I really beleive that. And, uh, and these things only mean somkething as their communicated. Well you see we have great anxiety about the pas- about the future, and if there were in fact fractal maps of the future, then that anxiety would lead us- would leave us and would leave us free. And in one sense I think thats the transcendental objkect, it's the manifestation of the spirit. The spirit is with us throughout historical time and space, but it is, uh, concretized at histories end. Well that's all I have to say, we're five minutes over, I appreciate you're being here very very much. Thank

you!

Audience applause.

DAY 2:

I want to mention this is a benefit for Botanical Dimensions and KPFK. Botanical Dimensions is the real world kind of real politick response to all the issues that Kat and I hammered out over the last 11 years. And what it boils down to is a plant rescue project built around a 20-acre botanical garden in Hawaii. What we're doing there is trying to bring in plants that are threatened in the warm tropics; either the extinction of the species is threatened, or the knowledge of its medicinal or herbal or shamanic use is in danger of being lost. There are a lot of fancy organizations, World Wildlife Fund, Earthwatch, Earth First!, that are saving the rain forest or at least fighting that battle, legally and by getting huge tracts of forests in the tropics made into reserves. But nobody really even cognizes or is focused on saving ethno-botanical lore, data that concerns the very subtle relationship between aboriginal people and botanical resources in their environment. So that's something we're doing.

A theme was touched on last night which is one of the centerpiece themes of aboriginal shamanism; the felt presence of some kind of alien intelligence. An intelligence that is somehow co-present with the human sense of self, for different people, in different ways, with varying degrees of intensity in different times and places. At the bedrock of shamanism is the notion that life is really finally a mystery wrapped in an enigma, but without resolution. Nevertheless as you close distance with this mystery there are a series of analogical metaphors that don't really suggest themselves but that are communicated *to* you by the other. One of these analogical metaphors is the presence of an alien intellect, an organized *other* that is folklorically present in tradition as fairies, gnomes, elves, jinns, afreets, sprites, tree spirits -- that sort of thing -- and anecdotally present in rural cultures throughout the world as the poltergeist and the milk-souring fairy -- these things seem to reside in a curious area that is not epistemically clearly defined for the culture.

Among aficionados of these domains the question of, "is it real or not?" is thought to be mildly tasteless. You would intuitively sense if you were drinking in an Irish pub and people began to spin leprechaun stories, that the question "is it real?" is a real bring down. It isn't *really* like that because the question "is it real?" can ultimately be shown to be infantile in any situation. I mean is the Bank of America real? Immediately we realize that ordinary experience is simply assumption skating over the mystery.

But I choose to talk so much about the felt presence of the other because it was for me such an astonishing personal surprise. I was raised Roman-Catholic and indulged in the kind of theological fiddle-faddle that involves. And then grew out of that into atheism, into agnosticism; by the time I got to college I was reading Jean Paul Sartre and Husserl. My intellectual ontogeny had followed historical phylogeny and I had arrived in the 20th century. And then having thought I had absorbed the lessons of LSD, which seemed to me to be to reinforce and confirm the theories of Freud concerning the dynamics of the psyche: that it *was* about repressed memory, repressed desire, sexual neurosis, parental foul-ups and the imprinting of traumatic behavior experienced in infancy.

And then someone came to me one rainy February evening, in 1967, really a mad person, a kind of a social menace and intellectual criminal. A person who had said to me only months before, "we must live as if the apocalypse has already happened." Here he was on my doorstep, he wore little black suits that he buttoned up to the throat. He came in and he said "here's something that you might be interested in." And he brought out a sample of di-methyltryptamine that he had somehow come into contact with. And I said,

"well what is it?" And he said, "well, it's short acting -- it's a flash." And I said, "how *long* does it last?" -- that was my first mistake. He said, "oh it doesn't last long." So I said, "OK, we'll do it." And we did it. And I discovered, I had, I guess it's called a peak experience, or a core revelation, or being born again, or having your third eye opened, or something, which was a revelation of an alien dimension; a brightly lit, inhabited, non three-dimensional, self-contorting, sustained, organic, linguistically intending modality that couldn't be stopped or held back or denied. I sank to the floor -- I couldn't move. I had become a disystolic hallucination of tumbling forward into fractal geometric spaces made of light, and then I found myself in the sort of auric equivalent of the Pope's private chapel, and there were insect elf machines proffering strange little tablets with strange writing on them. And I was aghast, completely -- appalled -- because the transition had been a matter of seconds and my entire expectation of the nature of the world was being shredded in front of me. I've never gotten over it.

And it all went on, they were speaking in some kind of -- there were these self-transforming machine-elf creatures -- were speaking in some kind of colored language which condensed into rotating machines that were like Faberge eggs, but crafted out of luminescent super-conducting ceramics, and liquid crystal gels, and all this stuff was *so weird*, and *so alien*, and so "un-english-able" that it was a complete shock. I experienced the literal turning inside-out of the intellectual universe and I had come to this -- I thought -- fairly intellectually prepared: A *kid*, but nevertheless double-Scorpio, art history major, Hieronymus Bosch fan, Moby Dick, William Burroughs.

And as I came down -- this went on for two or three minutes, this situation of disincarnate dimensions orthogonal to reality engulfing me -- and then as I came out of it, and the room re-assembled itself, I said "I can't believe it. It's impossible. It's im-possible." That to call that a "drug" is ridiculous. It means that you just don't know, you don't have a word for it and so you putter around and you come upon this very sloppy concept of something which goes into your body and there's a change -- it's not like that, it's like being struck by noetic lightning.

The other thing about it, which astonished me, was there is no clue in this world -- in the carpets of Central Asia, in the myths of the Maya, in the visions of an Archembolo or a Fra Angelico or a Bosch -- there is not a hint, not a clue, not an *atom* of the presence of this thing. When you look at the religious hierophanies of the human species they don't have the same vibe, don't have the same charge. Religion is all about dissolving into unitary states of love and trans-linguistic oceanic unity and this sort of thing. This was not like that. This was more multiplistic than the universe that we share with each other. It was almost like the victory of neo-Platonic metaphysics -- everything had become made out of a fourth-dimensional tesseractual mosaic of energy.

I was quite knocked off my feet. And set myself the goal of understanding this. There was really no choice you see. I don't know how it hits other people. There are many things that can be said about introducing a chemical into your body. They've shown that certain people are 50,000 times more sensitive to the odor of certain compounds than other people. And part of the unique genetic heritage of each of us are our complement of synaptic receptors for psycho-active alkaloids. So that there may be something to the notion that the Celts tend to be poets, that certain peoples tend to be expressive in certain artistic modes, or certain senses seem to be accentuated for certain human sub-groups.

But whatever the explanation for how it hit me, I felt it like a call -- there was no turning back from trying to understand, because there is no place for it in our world, and yet it is overwhelmingly, existentially real. You see? And easily accessed. I'm not telling you that you have to go some place in India with poor sanitation and put yourself at somebody's feet for a dozen years or something like that. The enunciation of the presence of this dimension should inspire some kind of coming to terms with it. It's preposterous that we can entertain in our popular journalism the titillation of the search for extra-terrestrial intelligence and prop up all reductionist personalities, and trot them out to give the statistics on the distribution of G-type

stars, and this sort of thing. Because the fact is, what blinds us to the presence of alien intelligence is linguistic and cultural bias operating on ourselves. The world which we *perceive* is a tiny fraction of the world which we *can* perceive, which is a tiny fraction of the *perceivable* world, you see.

We operate on a very narrow slice based on cultural conventions. So the important thing, if synergizing progress is the notion to be maximized (and I think it's the notion to be maximized), is to try and locate the blind spot in the culture -- the place where the culture isn't looking, because it dare not -- because if it were to look there, its previous values would dissolve, you see. For Western Civilization that place is the psychedelic experience as it emerges out of nature.

As human societies interact with the psychedelic experience in nature, they inevitably secrete the institution of shamanism. Like a pearl around a sand grain, a nexus point, a loci of inter-dimensional data-flow, which is really what it is. Under certain conditions, which have to do with molecules that have evolved in these species which have a weirdly quasi-symbiotic relationship to our species, you strike through the veil. Melville said, "if you would strike, strike through the mask." And that's what's done, you strike through the mask of the coordinates of apparent reality. And then, something is there which to me is a miracle.

It transcended any miracle I could ever ask for because it not only had the quality of a miracle as I imagined it, it had the quality of a miracle as I could *not* have imagined it. It was entirely charged with the energy of the other. It had the ambiguity of a pun: A kind of zany, impossible, improbable, hysterical revelation of the joke, the self-contradiction, the provisional nature of it all -- that it really is a Marx Brothers movie in some sense.

So I pursued it. First to Nepal, and involvement with pre-Buddhist shamanism in Tibet. The thing that puzzled me most, I guess because I was an art historian, was the absence of the theme in the artistic productions of human kind. I felt that maybe there was a trace of it in the artistic conceptions of the old pantheon of Tibetan shamanism. And that Central Asian Tibetan shamanism *had* actually created astronauts of inner space that had gotten good recon on this same area. The Dharmapalas -- the guardians of the Dharma -- are not Buddhist deities *per se*, they are autochthonous Tibetan folk demons that protect the Dharma by virtue of the fact of having been overcome in magical battles by great Buddhist saints who came to Tibet. In fact, there are, or were before the Chinese occupation, monasteries in Tibet where the vow of fealty to the Dharma, on the part of the Dharmapala, had to be renewed by the monks every 24 hours or the thing would run amok and be on its own and bust up the countryside. (I'm just telling you what they told me.)

It seemed to me that the raw sense of the shamanically accessed demonic realm was there. I also saw traces in Hellenistic gnosticism, and alchemy. But such thin traces. So I went to Nepal, immersed myself in those studies, and decided ultimately that it was inaccessible -- I wasn't sure whether it was there or not. Then I placed myself in the context of nature by moving my sphere of operations to eastern Indonesia. To the climaxed, continental rain forests of the ancient continent of Sundaland. You see Indonesia was a continent until as recently as 120,000 years ago. And then with the melting of the glaciers and the subsidence of the land, it became a vast group of islands. It was my good fortune, or fate -- because it was prudent for me at that time in the late sixties to remain outside the United States -- to become the hero I had pretended to my friends that I was. Which I wasn't. I had an around-the-world air ticket and was entirely a preppie poseur. But suddenly return was not a possibility. So I became, and my apologies to Buddhists in the audience, a professional butterfly collector.

I pursued this blood sport for many months in these remote montane jungles of eastern Indonesia. And it was there that the missing link in the quest for the resolution of the meaning of DMT and spirit fell into place. Because I *saw* what most of us only see on National Geographic specials; the real fact of the rain forest; the real fact of organic nature. And how nature *is* communication. Not only are the species that

comprise the biota linked by pheromones and acoustical signals and color signals and other various methods by which communication is seeping around.

In fact, nature ultimately resolves itself into a self-reflecting, syntactical metasystem, right down to the DNA. DNA working as it does, with nucleotide sequences that code -- that means arbitrarily assign association -- code for certain amino acids. It means that organic objects are essentially utterances in three dimensional space and express of some kind of universally distributed linguistic intent. This is what it means when it says, "In the beginning was the word." Nature is that word. This infinitely self-adumbrating, fractal, syntactical hallucination with an infinite number of facets for potential regarding and self-regarding.

And having said all of this, I might invoke here Godel's Incompleteness Theorem, which as I'm sure many of you know was Kurt Godel's brilliant contribution to theoretical mathematics where he showed that the possible set of true formal statements generated by any formal system exceeded the possible set of true formal statements which the *rules* of that system allowed. He showed this for simple arithmetic. And what this means, friends, is that what was called truth up until the beginning of the twentieth century, is absolutely impossible. That's what Godel's Incompleteness Theorem secures. It shows that there is no ultimate closure in an effort to describe a formal system.

And so in a way, my take on nature, and culture, and man, is that human language is a meta-linguistic system, generated out of the necessary formal incompleteness of nature. Nature is a self-describing genetic language and yet out of it arises something which is not formally predicted by its constraints and rules. There's a symmetry break there, and a so-called emergent property comes into view. This emergent property is our unique ability to *provisionally* code sound to meaning so that we then can freely command and reconstruct the world. We *imagine* that we do this for our own purposes of communication. The analysis that I'm suggesting would seem to indicate that actually we do it because we are complicated enzyme systems that are moving linguistic charge around inside some kind of metasystem. A metasystem that is very important for the emergence of new order out of nature.

The fact that it is contrived, provisional, is very interesting. It doesn't arise out of the gene structure. Rather it is agreed upon by individuals who are living at the time that the linguistic structure, whatever it is, emerges into consciousness. Since individuals are replaced, the language is much more in flux than the genome. The genetic component of an organism is a physical structure stabilized by atomic bonds -- possibly stabilized by a phenomenon like room-temperature's superconductivity. In that the way nature works is to conserve the genes. Molecular machinery has evolved to do that. But there is no mechanism in nature with the same kind of binding force that conserves meaning. Meaning is some kind of freely-commanded, open-ended, self-evolving system. The rules are that there are no rules.

Meaning consequently addresses itself to a much larger potential modality of expression than the genes. The genes basically repeat themselves, over and over. Almost like Homeric poetry, where the idea is that it be memorized and repeated. And that's what sexuality is about: memorizing and repeating gene structures, handing on parts of the story. But the epigenetic domain is different, the creation of linguistic systems, where meaning can be freely commanded, allows very rapid evolution of cultural forms.

I suggested last night, and want to say more about it tonight, that this process is mediated by plants. It is synergized in human beings by plants, of all sorts. We are obsessed with drugs, and short-term spectacular effects, but think about the effect on a culture of the presence or absence of say, sugar; or the presence or absence of coffee. Human culture can essentially be seen to be a series of plant-established developmental creodes for a higher mammal. The fact that we are omnivorous lays us open for the formation of weird relationships to things in our food chain. Everybody is taught in school that the Renaissance, the close of the Middle Ages, the rise of urban culture all had to do with the search for spices. Bringing spices back to Europe. Why was it so important that a drive to simply broaden the palate of Europe is given credit for the

re-defining of post-medieval civilization? Very strange.

Hofmann and Ruck and Wasson, showed that the Eleusinian Mysteries, which were the philosophical and experiential linchpin of the ancient world's cosmology -- the Hellenistic cosmology -- was a cult of ergotized beer. Every September at Eleusis, this Mystery was carried out, and everyone who was anyone participated in it. The rule was that you only got to do it once in your life so you had only one opportunity to understand it.

The point is clear: in human culture in all times and places, the way in which our cultural institutions have been molded by these so-called tertiary compounds in plants is very suggestive. It seems to me that the felt presence of the other, the alien intelligence felt as being from outer space, is actually co-present with us on this earth. And that the problem is not the *finding* of it, but the *recognizing* of it when it is seen. In the same way that in the present cultural crisis everyone is crying 'answers, answers, we have to have answers,' the fact is we *have* the answers. The question is to *face* the answers.

The answer to self-empowerment lies in the psychedelic experience. The answer to dissolving the hierarchically-imposed set of mythical conventions that *disempower* us, lies in the psychedelic experience. Because what is really happening is a return to the primacy of feeling. And feeling is not something you convey to people the way you convey facts to them. Facts can be handed down every week through *Time* magazine, and the latest issue of *Science News* and *Nature*. But feelings will not lend themselves to that marketable, hierarchically-distributed system. Consequently feelings represent a backwash against that. Yet feeling is the modality in which we all operate. So as long as we are under the umbrella of the print-created, linear, post-medieval institutions that promote the myth of the public, the notion of the atomic individual, the notion that we are all basically *alike* then we are going to be unempowered.

The amazing thing to me about the psychedelic experience, is that it can be kept under wraps; that people don't insist; that somehow we're leaving it to experts to figure it out. But did you know that the experts are not *allowed* to work it out? That in this particular area, the entire human race has been relegated to an infantile status. It is not really professionally possible, to do work with these things.

Nevertheless, our cultural crisis is deepening. Deepening mainly because we have very poor connections among our fragmented and autonomous psychic structures -- within ourselves as individuals and within ourselves as a society. Our whole problem is that we can't communicate with each other, we can't express intention. Yet the psychedelics are sitting there waiting to unify us, to introduce us to the trans-linguistic intention. To carry us forward into a realm of appropriate cultural activity, which is to my mind, the realm beyond history. Beyond history lies effortless and appropriate cultural activity. And nature has proceeded us, as it always does, by laying out models that can be followed to realize this.

As an example, I'll point out that the 19th century had a titular animal. Its titular animal was the horse, idealized as the steam engine, the Iron Horse. Marx talked about the locomotive of history, and there was a whole focusing on the horse archetype. Which in the 20th century, gave way to the titular animal, the raptor, the bird of prey, as exemplified by high-performance fighter aircraft, as the kind of ultimate union of man and machine in some kind of glorification of the completion of a certain set of cultural ideals.

In thinking about this and in thinking about how language is the cultural frontier of our species, I went to nature looking for models of how we might move beyond the bird of prey, which when you think about it, is the American symbol. It was also the symbol of the Third Reich. A lot of creepy scenes have actually been into birds of prey, when Alleric the Visigoth burned Eleusis, it was the crow that fluttered on his battle standard as the greasy smoke swept by. These dark birds have been ever with us.

In looking for a new titular animal and drawing the conclusion of what it would mean, I was drawn to look, strangely enough, at cephalopods, octopi. Because I felt, first of all, they are extremely alien. The break between our line of development in the phylogenetic tree, and the mollusca, which is what a cephalopod is, is about 700 million years ago. Nevertheless, and many of you who are students of evolution

know, that when evolutionists talk about parallel evolution, they always bring out the example of the optical system of the octopi. Because, isn't this astonishing? -- it's very much like the human eye, and yet it developed entirely independently. This shows how the same set of external factors impinging on a raw gene pool will inevitably sculpt the same organs or attain the same end, and so forth and so on.

Well, the optical capacity of octopi is one thing. What interested me was their linguistic organization. They are virtually entirely nervous system. First of all, they have eight arms in the case of the octopods, and ten arms in the case of the squid, the decapods. So coordinating all these organs of manipulation has given them a very capable nervous system as well as a highly evolved ocular system.

But what is really interesting about them is that they communicate with each other by changing the color and texture of their skin and their physical shape. You may know that octopi could change colors, but you may have thought it was camouflage or something very passive like that. It isn't that at all. They have a vast repertoire of traveling bars, dots, blushes, merging pastels, herringbone patterns, tweeds, mottled this-and-thats, can blush from apricot through teal into dove gray and on to olive -- do all of these things communicating to each other. That is what their large optical system is for. It is to be able to see each other.

The other thing which octopi can do -- besides having these chromatophores on the surface of their skin -- they can change the texture of the skin surface: can make it rugose, papillaed, smooth, lobed, rubbery, runneled, so forth and so on. And then, of course, being shell-less molluscs, they can hide arms, and display certain parts of themselves and carry on a dance.

When you analyze what is going on here, what at first seems like merely fascinating facts from natural history, begins to take on a more profound aspect. Because it is an ontological transformation of language that is going on in front of you. Note that by being able to communicate *visually*, they have no need of a conventionalized culturally reinforced dictionary. Rather, they experience pure intent of each other without ambiguity because each octopus can *see* what is meant -- this is very important -- can *see* what is meant. And I think that this heralds, or could be made to herald, a transformation in our own definitions of language and communication.

What we need is to see what we mean. It's not without consequence or implication, that when we try to communicate the notion of clarity of speech, we always shift into *visual* metaphors: I *see* what you mean, he *painted a picture*, his description was very *colorful*. It means that when we intend to indicate a lack of ambiguity and communication, we shift to visual analogies. This can in fact be actualized. And in fact, this is what is happening in the psychedelic experience. There we discover, just under the surface of human *biological* organization, the next level in the organization of language: the ability to generate some kind of acoustical hologram that is manipulated by linguistic intent.

Now don't ask me *how* this happens, because nobody knows how it happens. At this point it's magic. Nevertheless, the fact is it *does* happen -- you can *have* this experience. It represents a synesthesia in the presence of ongoing communication. It is, in fact, telepathy. It is not what we *thought* telepathy would be, which I suppose if you're like me, you imagine telepathy would be hearing what other people think. It isn't that. It's *seeing* what other people *mean*. And then also seeing what they mean. So that once something has been communicated, both parties can walk around it and look at it, the way you study a Brancusi, or a Henry Moore in an art gallery.

By eliminating the ambiguity of the audio signal, and substituting the concreteness of the visual image, the membrane of separation, that allows the fiction of our individuality, can be temporarily overcome. And the temporary overcoming of the illusion of individuality is a much richer notion of ego-death than the kind of white-light, null-states that it has imagined to be. Because the overcoming of the illusion of individuality has political consequences. The political consequences are that one can love one's neighbor, because the commonalty of being is *felt*. Not reasoned toward, or propagandized into, or reinforced, but felt.

This is why there is a persistent notion, which accompanies these psychedelic compounds, of a new political order based on love. This was a hard thing to say in the panhandle in 1965, it's not easy to say in heavy-metal LA.. in 1987. But it seems to be the fact of the matter. That love, which poets have celebrated for eons as ineffable, may in fact have certain ineffable dimensions attached *to* it, but it may in fact be more affable than we had previously cared to imagine. And the invoking of the effability of love has to do with discovering the shared birthright, the atemporal dimension that is co-present with this reality, a dimension that is a vast reservoir of anchoring -- existential anchoring -- for each and all of us in our lives. So my response to feeling the political pull of this, feeling the power to transform language, that resided in these things, was to go to the people who I thought would know most about it: the shamans for whom hallucinogenic shamanism has never been an issue; for whom the notion that you're supposed to do it on the 'natch, is a patent absurdity. If you're serious about doing it on the 'natch I suggest you eliminate all food. Because this notion of the pristine self somehow riding above the muck of the world, carrying on a spiritual evolution is absolute foolishness. We are made of the stuff of the world.

People who do not confront the presence of the hallucinogenic possibility, are turning their back on their birthright. In the same way that if you do not experience sex throughout your life you are turning your back on your birthright. After all we could argue that to allow another person to touch you, is to not do it on the 'natch, right? But, dear friends, we're slicing too close to the bone here to take that approach. It's much better, I think, to *open* to the world.

The world *is* communication. Nature *is* the great teacher. All human gurus are simply distillations of the wave of nature that is coming at you. So you can just short-circuit the whole human boil-down, and go straight to the executive suite by putting yourself under a tree in the wilderness. The Great Ones all have said this but they need to be taken more seriously on the subject of their own expendability. *Me too.*

Going to the Amazon with these kinds of notions, and looking at what had been achieved there, I came to have a vision then, of the future that could be. That we are hurling ourselves into a new stone age, where the fruits of the prodigal wandering, that I discussed in such detail last night, can be used to infuse new meaning into that paradise. That the imagination of man and woman is so incomparably rich, and exerts such an attraction on us as the builder-monkey, that we have to honor that. We cannot demonize that and preach a kind of naturalism that if actually put in place would cause the starvation of tens of millions of people.

We have passed the point where some kind of Luddite reform can save us. Only self-indulgent elites can preach voluntary simplicity, because a lot of people are experiencing *involuntary* simplicity. And, unless you're one of them it rings rather hollow to be told that Zen values are best.

Re-inserting ourselves into nature is inspiration for cultural design. That's what it is -- it's not flight from the design process but a re-invigoration of it. Some of you may be aware of the concept of nanotechnology in which everything is built at the molecular level. By studying the mechanisms of the cell, and the immune system, and DNA, we begin to have a picture of how molecules and atoms are the machine parts of a microcosmic world that if we were elf chemists we could make our way into and create anything that we could imagine. I can foresee a world where *all* machines will be made by DNA-like polymers that will code base materials into larger and larger aggregates.

The minaturization of our world is a great frontier. As culture becomes more enveloping, its physical manifestation should become less material. So the ultimate notion is of the world turned back to the form it held, let's say 35,000 years ago, in which people lived in an environment of entirely climaxed natural perfection. However behind their eyelids would lie a culturally and consensually validated data phase space that is culture, civilization. Turn each of us into a telepathic aquarium, that has a direct pipeline to the general ocean of mind and being. This is possible. In fact, its not only possible, it may be the only decent solution: to down-load ourselves into another dimension. (And I want to note in passing the collapse of

Max Headroom. What a tragedy I think it is that his last show was tonight. This was a weird force for cultural transformation, but to be applauded. If anybody here tonight has anything to do with it, I wish them luck.)

But this sort of notion -- the Max Headroom people and the William Gibson people have a very high-tech take on this, because they are interested in accentuating this tight blue-jean, cyber-punk kind of notion. But in fact the worlds that they describe will have many many different social sub-groups and social ecosystems forming in them. What the future *really* means is choice to become who we are, to flower out, to find our own way.

McLuhan saw all this 20 years ago: he said that the rise of global electronic feudalism would create an atomistic fragmentation of culture. It may well be that within 50 years the largest organizational entity on the planet will be corporations with a few million loyal employees, and all larger social institutions will have disappeared because they were unable to command loyalty in a social environment where direct experience has become empowered. And this empowering of direct experience, this return to the feminine, this legitimizing of the presence of the vaster regions of the unconscious -- these are all aspects of this emerging paradigm of the spirit. Understanding and the imagination in the light of nature, which is what this two-night party has been called, is a *definition* of the spirit.

In other words, true understanding, poetic imagination, standing as a mirror before nature as object, will cause the hologrammatic presence of the spirit to magically appear. It will be then seen to be a kind of emergent quality of the situation that was previously masked, simply because the elements had not fallen into the correct arrangement. As we move forward through time over the next 25 years there will be many prophets of the transcendental object at the end of time, many takes.

The important thing is to recall Godel's Incompleteness Theorem, and to always recognize the provisional nature of the metaphysical goods that you're going to be sold. Nobody has the faintest notion of what's going on. It's important to keep that in mind. If you have that in mind, then the game proceeds much more cleanly.

What is ahead of us is true high adventure. The essence of it is its unknowability. Its promise is transformation. Its theater of occurrence is the here and now. We are not waiting for it to begin, it has already happened for us, and our job is to understand how that can be so.

Plato said time is the moving image of eternity. My notion of shamanism is, it is that state of mind which accrues to those who have seen the end. By cultivating this notion of closure with hyper-space, imaged as the archaic return to the world of the pre-cultural ambiance, we can have an anticipation of the transcendental object. It is still in Eden. It is *we* who have undergone the fall and the ricorso. And now the laden prodigal son returns to beat at the doors of the manorial home, the birthright. And within lies the beginnings of true civilization.

We are the forerunners of a truly moral and ethical human society. The deepest aspirations, however badly mangled and mishandled by our traditions, nevertheless still have the potential for archetypal fruition within them. The torch that has been passed from generation to generation, ad infinitum back into the distant past, is alive. And by some strange quirk of the metaphysical machinery it's our great privilege to live through this symmetry break, this revelation of the next level of the open-ended mystery. I think that the real thrill lies in relating to our world with an open mind, a sense of caring, a sense of wonder, and a sense of real, grounded, intellectually firm hope. So that's all I want to say this evening. I think we'll break for about 15 minutes and then we'll have questions. Thank you very much.

Question and Response

Now comes my favorite part of these things which is the period where there's interaction because I think this is really a group process. Every one of you to some degree has taken upon yourself the role of the Magellan-in-the-living-room, and probably every one in this room has at some time or another gazed upon things no other human eye has ever beheld. The psychedelic dimension is not *yet* a science. We're more like explorers comparing our crudely drawn maps, and hastily scrawled journal notes, trying together to get a picture of this new continent in the imagination. So, I'm yours. Sir -

Question: You have said in your book that the mushroom was genetically engineered for producing psilocybin by an alien intelligence. What do you think now about the possibility of us using psilocybin genes within other kinds of organisms like fungi or plants, or, I don't know about animals.

Response: Well, interesting question. The question was I've described the mushroom as genetically engineered by some other agency for the production of psilocybin, what do I think about the possibility of human beings being able to genetically manipulate organisms to produce psychedelic compounds? I think that the technology and theory has reached the stage where, if there's an enterprising graduate student within the sound of my voice, the way to go is to locate the gene for psilocybin in the mushroom genome, and to translate it via standard techniques to *E. coli*, to *Escherichia coli*. Then you would have an easily grown bacterium which would be a chemical factory for pouring our psilocybin. So if any of you are aspiring genetic pharmacologists, this would be a fine project.

I might elaborate on the answer for some of you who are not familiar with the premise. The reason I suggested that the mushroom might have been engineered and be in fact an artifact of an alien intelligence was number one, of course, the informational content of the trip, but number two, the fact that psilocybin is one of the few four-phosphoralated indoles known to occur in nature. Out of thousands and thousands of compounds and organisms, only a few four-phosphoralated compounds are known. This suggests that such compounds are artificial, or at least highly unusual.

Every week the science magazines are full of talk of strategies for locating and identifying extraterrestrial life. Well a very obvious practical and scientifically reasonable way to proceed would be to look at the DNA of various life-forms on earth, and see if there *are* any in which there is a wild statistical departure from the norm. Whenever you get an organism which is producing, or has genes that no other organism has, this is highly suggestive. Because species evolve incrementally out of each other. So you would expect that there would be a relative smoothness in the expression of chemical taxa. That one fungus would be rather like its taxonomic near relatives. One member of a genus would be chemically similar to another. In fact, of course, we do find subtle chemical variations, but the presence of a four-phosphoralated indole in a fungus like that is very suggestive.

There's an interesting book by Cyril Punampurama called *Perspectives on the Problem of Extraterrestrial Communication*. In it he outlines what he believes would be a general strategy for extraterrestrial contact that *any* kind of species would have to operate with if it were to seriously conduct a search through space. And the model posits a ship, which at a certain distance from its origin planet, must replicate itself. And then at a certain distance, replicate again. And then again, in order to keep the density of ships constant as the sphere of the area being explored expands. These ships could be as small as an animal cell. They don't have to be thought of as Star Trek-type ships.

But the point is this ship contains instructions that you must read and follow in order to call in. There are so many planets and star systems to be surveyed that the only way such a survey could be conducted is if there were a message in the ship-qua organism, such that in the gene swarm of an alien planet it would eventually be read by an organism on the planet that would act to do the things necessary to call the central switchboard. Then the folks who made the ship would say: 'ah-ha, we have contact in sector alpha sub-N 362,' and they would concentrate all their attention there.

Q: Yes would you speak on the time-line a little?

R: Oh what a kind questioner, to lead me to my favorite subject. Well, it has to do with why (people do this for different reasons), why people take psychedelic plants and what lies behind it always. And what always lay behind it for me, from that very first DMT trip that I described to you at the beginning, was the notion, 'My god, this stuff has historical significance. Nobody *knows* about this,' carrying with it the notion, 'we are discovering it.'

If we could bring it back, somehow, it would change the world. Perhaps people *are* bringing it back, by designing buildings and creating fashions or fashioning mathematical descriptions of reality. I never had that aspiration. I just simply defined myself, more humbly than that, as a *consumer* of ideology, as an intellectual who would learn what has been said and done and proposed.

But after the DMT experience I realized that there is unclaimed stuff out in those dimensions. James Joyce says in *Finnegan's Wake*, "Up-nee-ent prospector you sprout all your worth and woof your wings." Well, the key word is prospector. A prospector is a rock hunter. I wanted to prospect for the alchemical stone, for the lapis philosophorum. And I conceived it as an idea: the timewave -- I think it would come differently for each of us -- for me it was an incredibly formal, aesthetically symmetrical, and therefore satisfying idea about what time is.

That the Tao is something which could be mathematically described as a flux of a quality in time. A quality that I named Novelty. And once I had enunciated it for myself I saw that it was the part of the world that we have no description for. Science gives us descriptions for what is possible. But we have no descriptions for what, out of the set of the possible, undergoes the actual formality of occurring. Why are certain things selected to come to be? And I saw then the notion of the Tao, which is generally presented as a kind of intuitive notion -- you're not supposed to demand too much hard-edged clarity. You say, 'just flow with it man, flow with it.' Well when someone says flow to me, I think of equations which would describe flow. Flow as a dynamical system which therefore can be mathematically modeled.

What the timewave is, is a seeing that the very largest patterns which describe the whole birth, evolution and death of the universe, are repeated at successively shorter and shorter spans of time, down into the quantum-mechanically and micro-electronically cognizable realms of time. The realm of nano and pico seconds. I saw the *I Ching*, which as a kind of phenomenological description of time, produced by the oriental mind completely unencumbered by *our* particular set of cultural conventions. Certainly it has its own set of peculiar conventions -- but not ours -- that there is a pattern in nature, not in three dimensional space, but in time, a pattern in time on many levels that reproduces itself and can be known, can be formally described. And once known, can be seen to control the ebb and flow of connectedness. Or the forward and backward surge of novelty. I thought that this was a great insight -- since it was the only one I had, I could hardly sell it short. And what pleased me most about it was that a rap is only as good as the rapper. But here was a mathematically formal idea, that could stand on its own; be examined in the absence of the rapper; be examined by critics who were as hostile as they cared to be.

It's simply a tool. It's in a long line of tools that stretches back toward the first chipped flint, and stretches forward toward the soul made manifest as starship and alchemical transformation. But it was the tool that I came upon and what is always put against the psychedelic experience is they say, 'well, big deal, what's ever come out of it?' So I was pleased that here was a concrete notion that came out of it. Richard -

Q: Along the line of this timewave, can you give us a reading of our current time in the not-too-distant future?

R: I would be only too happy to. The question is would I care to prophesy based on this timeline? Yes, one of the assumptions built into the theory is that time is a series of nested resonances. And that each time is composed of resonance with previous and future times on varying levels. The time we are living through, I call the Roman Twilight. Simply because we are living through a period that is in resonance with the time

of the last Roman emperors. And I think that if you look at it carefully, you can begin to see the way this theory proposes to be analogical and yet formal at the same time.

What was happening in the decades immediately preceding the fall of Rome? A progressively weakened series of self-indulgent propagandists ruled the greatest empire on earth with a more and more shaky hand as they succumbed to gonorrhea, mercuric poisoning, various occult pursuits, millenarian obsessions and so forth. Meanwhile in the east, in Byzantium, a new civilization was unleashing itself, and if you think of those events, which unfolded over a few hundred years, as telescoped into a few years in our own era, you see that with the rise of Gorbachev and the continued mis-management of the American empire under the crypto-fascist series of rotating bimbos and buffoons that *we* have suffered through; that what is happening is an empire is being betrayed into eclipse by self-indulgence, stupidity and bad management, and its cultural adversary is in ascendancy.

Now Byzantium never conquered Rome -- it doesn't happen like that -- but what ended was the Roman world of indulgent, cohesive imperialism. And what it was replaced with was a rise in religious fundamentalism, a stricter and more puritan kind of morality, the rise of epidemic diseases, and a vast economic retrenchment which initiated what we call the Dark Ages.

Now, in the present situation of the 20th century these themes are being recapitulated at an extremely rapid rate. So their Dark Age is for us, a tough three or four years, fortunately. It's said history occurs first as tragedy, then as farce. We are the heirs of the vast tragedy of extended history who live through the curiously mediaized and dehumanized farce of the recapitulation of these same themes. Because the very notion that the last ten Roman emperors could be symbolized by someone like the present American chief executive cannot fail to bring a small smile to any open mind.

So what I see happening over the next twenty-four years really, is first this retrenchment which, hell, it may be upon us judging by the market's performance Thursday and Friday, I may not be doing prophesy at all, this may be recap at this point. But whether that is a technical move, or the actual beginning of the unraveling of the over-bought western capitalistic system, one can't say. But I will say that by mid-1989, by the time the next presidential ritual has been enacted, it will be clear I think, that we have entered into a whole new kind of temporal domain. A kind of temporal domain that will appear superficially to be fairly bleak. Because the situation will be highly chaotic, highly novel, and tending to oscillate wildly around a mean. So in other words there will be no clear trend visible. There will appear to be progressive surges, and then losing of ground, and then progressive surges, and losing of ground. And this will go on through until the mid-nineties.

Around 2000 the resonance pattern will have shifted, and we will be occupying a relationship to the late high Middle Ages, and the emergence of the new social forms created by the emergence of the mercantile class and the bourgeois. In other words private wealth, cities, end of cultural insularity, a re-starting of the economic machinery, and a kind of new flowering. But still under the shadow of these fundamentalist forces that will have come into ascendancy in the previous dark age.

Then in 2004 we come into that area which is in resonance with the period of the discovery of the new world. 1492 in other words. And the exploration of the New World and its subjugation over about a hundred and fifty years will be going on as we open the millennium.

What the discovery of the new world will mean, in terms of our reenactment of these great themes, is anybody's guess. It could be the vindication of my style of rap: a nearby inhabited dimension filled with alien intelligence. Or it may be the vindication of a more orthodox sort of expectation of extraterrestrial contact. Or perhaps, ultimately, the launching of large telescopes into orbit which will confirm for us the existence of oxygen-rich water-heavy worlds around nearby stars. That alone would make an intellectual revolution that would leave our world unrecognizable to itself.

We have to recall that as recently as 500 years ago the continent that we are inhabiting was unknown, it

was something talked of by wild-eyed dreamers. It was an impossibility, a psychedelic dimension. Everyone knew that when you sailed west far enough there be monsters and that was the end of it. It was, literally, the unconscious. Now we deal in the real estate of *that*unconscious. And there is no reason why our children should not deal in the real estate of the psychedelic dimension that we are discovering and confirming over the next ten years or so. Let me carry this through to the end because the good part comes at the end.

After the turn of the century, the acceleration of the unfolding of these resonances becomes more and more intense and eventually we reach the super-compression of modern times. This is why I proposed to you last night, the term "compressionist" for this school of thought that myself, and Sheldrake, and Frank Barr, and Ralph Abraham represent. Because we all are talking about the dense nesting of concrescent systems. And ultimately, in my own point of view, the emergence of a transcendental object at the end of time. And the end of time is not far off. As Joyce says in *The Wake* -- it may not be as far off as you wish to be congealed. It is, I think within the lifetimes of all of us, that there will be an ontological transformation of the human mode. The transcendental object is emerging.

Once it has emerged there will be no big deal about it. In the same way that we look back at the emergence of language. And nobody gets excited about it, or only a few philosophers do. And yet the fact that we *possess* language is the thumbprint of God upon our species. It's an impossible break with previous animal organization. You can talk all you want about Coco the talking gorilla, this and that, but then you turn to a poem by Andrew Marvel you realize there is an ontological break here -- there is *not* an even progression. So as we anticipate this thing, it could be anything. It could be the visible language that I indicated as a possibility earlier this evening. It could be emergence in an extraterrestrial mind. It could be the transcendental emergence of all and everything -- the Tao made flesh, the actual collapse of the state vector into some kind of mysterious completion. It's much more rational to place this kind of singularity at the *end* of a complex evolutionary process, like the life of the universe, than at the beginning which is the scientific approach. To just say everything sprang from nothing, for no reason, in a single instant, and please don't ask questions about that because our map begins one ten-trillionth of a pico second *after* that happened. We don't talk about that. Well isn't this somewhat begging the question, for an intellectual enterprise that purports to offer an explanation of how things came to be?

The transcendental object, suggests to me a *negative* casuistry -- a purpose in the universe that is focusing and drawing everything toward it. And in fact I've said, history is the shock-wave of eschatology. History, which lasts 10,000 years, is a microsecond of ultra-complex experience, where the penetration of the natural world by the transcendental object occurs, each exists co-temporaneous with the other for a historical or geological microsecond and then the two terms are merged and all opposites are dissolved and somehow the gift is claimed, the pearl is restored and the project is ended.

We are living through that moment. A 10,000 year rush, from chipping of stone flint, to walking through the violet doorway of a self-generated, hyper-dimensional vehicle that carries us to our true home. No *wonder* it leaves an explosive set of eddies in its wake. This is what happens when a culture prepares to depart for the stars. This is *not* business as usual, this is something else entirely. And it's the intellectual adventure and challenge of our time for each of us to understand this in terms relevant to ourselves and the people immediately around us.

So this is the inspiration for TimeWave Zero. This is what it maps. The odd thing is that when the time-map came through, it wasn't only a map of historical process, but there was the transcendental object mapped into it, and all of its sub-reflections could be seen. This is what Christ was about. This is what Buddha was about. This is what *your* most enlightened moment was about. You, each of you, and me. It is the hyper-dimensional, particulate reflection of God-head scattered back through the flatter plane of this lower-dimensional slice of experience. It's hard to say it any clearer than that...

Terence McKenna: Well, the parachute never looked more like a mushroom than it does right now. [Terence chuckles]

I couldn't really see you all in the firelight last night so this is like seeing you for the first time. Welcome, and, uh, I hope you feel free to interrupt what's going on at any time and ask questions, or if something needs clarification please, uh, don't hesitate.

My hope for these kinds of retreats is that it will quickly become so interesting to everyone that the, uh, presentational form will transform itself into a dialogue among many people. It seems to me that's when it happens best. And I don't think people would be here if they didn't have strong opinions and ideas about probably everything which is said. So, that's the way the group mind is generated, by everyone opening up and, uh, expressing how they relate to these things that we're going to discuss.

I guess the place to start is sort of with looking at the notion that, uh, the dawning paradigm of post-modern consciousness seems to be the growing awareness that we don't know what is happening at all. That all of the models whose implications have been worked out over the past 500 years or so have come to a place where they are now recursive and they no longer can be pushed forward as models of explanation. In other words, they are completed, and ontological analysis of how they work now shows us the limitations of their application to reality. They just simply cannot -m- there is not more blood to be squeezed from the stone of science. There may be further discoveries, but further growth and understanding along those lines now seems unlikely, what with the complementarity principle, Bells theorem, the primacy of language with the formation of ontology. All these things show the relative power of science to account for reality where before it was assumed that science would ultimately give a good account of reality.

So, postmodern living is living in the light of the fact that that faith has dissolved away, and that we're now living in some kind of intellectual free space, or fire-free zone where everything is up for grabs. And the, uh, the 20th century's fascination with the archaic, with shamanism and, uh, breakdown of perception through modern art, exploration of the unconscious through psychoanalysis, mass political movements, all of these things relate to this fascination with the archaic which is an effort on the part of the culture to stabilize itself because we really have- having seen the limitations of science, we have discovered we are in a small rowboat in a dark ocean and we're being swept we know not where. So all past tradition is searched: magical traditions, alchemical traditions, lost philosophical traditions, pre-literate tribal traditions, everything is frantically searched for a key.

And while there are consoling perceptions that arise out of this search through all this other extended human knowledge, there haven't yet emerged certain answers about what is going on. This is why several people last night referred to how weird the time is, how hopeful we are with so little reason, uh, on the surface to be hopeful. And, uh, it's because the gelling out of this historical problem is happening right now, and it's not clear, uh, what it will become. Meetings like this are efforts to uh, build an understanding of it. It doesn't appear that it's going to filter down through the transformation of institutions of control. It appears more like it's going to be some kind of proletarian, uh, upwelling of a shift of point of view.

Now, the shorthand way of saying what I just said is that we now know that we don't know anything. And things like uh, the psychedelic experience and the use of psychedelic plants throws open doorways that science was able to successfully keep closed during its heyday because they were areas where the number of variables exceeded science's power of description and therefore they said "Well we'll just keep driving straight ahead, and we'll go up those rivers later." But now that is all changed and the exploration of, uh, the existential dimension of not-knowingness which psychedelics makes possible is what is forming modern people, I think. I mean, people who will be seen to have lead lives that were relevant 50 years from now, or 100 years from now, people who had actually figured out the context of the world they were living in and tried to come to terms with it.

And, uh, this morning I think we want to talk about uh, plants and how they relate to the planet, but before we do that I want to paint a picture for you of a, of a mandala which then I will discuss later in other meetings. But my notion of, of what the post modern person's mandalic projection on to the world should be in terms of a map of understanding is a, uh, a quadrated circle in which psychedelics, and feminism, and cybernetics, and space travel are the four parts of the circle. And in the center of the circle, looking backwards in time, there is a category that I would call conservation. Which means conservation of the planet, conservation of traditional and historical knowledge, conservation of values, conservation in the sense of intelligence husbanding the planet.

And when the mandala is flipped over and you look through it into the future, conservation has been replaced by art. Art is the ultimate expression of this transformation of, uh, unorganized matter into ideas, which human beings carry on. And we carry it on in a technical mode of necessity, but in the artistic mode, out of a kind of upwelling of ecstatic self-expression about the universe. So conservation is the way we relate to the past and human history is seen as an object of collective artifice-making in the future culminating in the notion of, uh, of the flying-saucer.

To do this, we have to completely re-design our understanding of reality which in terms of practical experience will mean that reality itself will appear to be redesigned. And I touched on this for a moment last night when I mentioned plants and said how admiring I was of them because they subs- they exist on sunlight, air, and earth, and that this is what we have to learn to do in order to release spirit out of the ape matrix that we're bound in. And strangely enough the way this is to be done apparently is by a redefining of the nature of the biological world in relationship to this other kingdom of being which we call plants. Plants represent some kind of entire other dimension of existence of which we view the topological manifestation of the form, but are completely occluded as to the network or energy and information that this represents.

And like the zoological kingdom which has uh, thousands of forms of expression and progressively more complex forms which culminate in self-reflecting primates the vegetable kingdom seems to have intelligent species and gradations of awareness in the world so that we are opening a dialogue at the end of history with this other form in the biosphere which we are just beginning to cognize as our own understanding about what the world is really about falls into focus. And certainly a hundred years ago no one would have thought that this was in the direct line of historical development of the high tech civilizations, that they would have to explore the mind of the vegetable plant goddess who was the only force contending with them for control of the planet. That's what it's come down to.

So, with that kind of idea in mind, the idea of "plant and planet", which is a phrase of Anthony Huxley's which is wonderful. Uh, Kath maybe you would want to talk about this, this is a good...

Kat McKenna: Um, yeah. I was thinking uh, last night and this morning about plants particularly [clears throat], um, because of our talks that I anticipated and back at the tent a little while ago I had a gnawing feeling that I was ignoring the animals too much and then I, um, arrived here and they all began to gnaw on me. I just got about 14 ant bites just sitting here, you see the scratching on it, so I feel grounded again. [Kat chuckles] Uh, I don't know about having a dialogue with the end of history through plants [laughter], I don't know about that, but um, I do think they are this obviously great and ever-present mystery which we ingest all day long, um, without thinking of those as plants, without thinking of them as sacred plants in the way we do the sacred ones. Their chemistry- their input is influencing us all the time. Whether we eat meat or not we eat plenty of plants, and we breathe from them, and we soothe our nerves by seeing them and being near them, and we go out into places like this and see kinds we've never seen before and marvel at how they can survive. They're real models of graceful survival, I think.

Um, the jungle where we spent a fair bit of time, the competition it seems is for light and for protein, I guess, for, for organic matter, the animals competing. Here it's obviously for water. They have a kind of, uh, a deal. If you look around under the bushes you see wonderful wildflowers right now, the rains have just held on, the moisture has held on long enough that many things are going- and the short life cycle plants are going through their intense short life cycle and they often need to shade to do it. So you can see- we found something that we were sure was an African violet bush yesterday, you know? You can see wonderful things if you look carefully and don't bother anybody else that might be under there.

Um, the question I've been asking of myself recently, and of a few other people- now I have many of you to ask it I hope I get some answers, is, um, how can a plant be a teacher?

Um, I asked this of someone the other day who was deeply involved in neuro-linguistic programming and he got way off on a tangent about "What does this question mean?" you know [laughter] just broke down every part and phrase and it was wonderful, we never got to anything like what he thought about the answer but [Kat chuckles] uh, it does assume all sorts of things. You have to have an image of what you think of as a plant, which although we have sort of a language-verified easy answer it doesn't really touch on the reality and, uh, and then of course you have to think what you mean by 'teacher'.

Well, I know there's at least one biologist, serious biologist in the group here so I'm hesitant to define a plant. I guess from my point of view as an observer, I, I've done botanical illustration and I really value the opportunity I had to learn to really look and them. And then when you think you've really looked, look closer. You can just keep on learning from them just visually, that way. But they are, uh, organisms like us that that draw in all the elements: fire in the form of sunlight, and water and air and earth and, uh, go through this transformation of energy into, uh, something else, in the same way that we do. Um, this moment right now is when they are doing that most energetically for the year. They are taking that moisture in their... you can look at each one- the leaf tips are new, and the tissue is soft, and the colors are bright as well as the blossoming and all that.

Um, they are also laying out the structure as I understand it for that growth to become more permanent, or woody, the perennials anyway, so during the year they will fill that out, and next year they will come from that place doing this envisioning the future, what they'll have to deal with, how to move to make their interface with it, and then how to reproduce. And, uh, and their little messages are going into the, uh, the seeds coming from the pollination of other plants. So it's always like with us, you choose a mate it's your choice for how you'd like the future to be, right? My genes, your genes, here it goes down the line.

Um, really all I have about this is questions. I hope you don't mind if I just throw questions up, if anyone wants to say anything, please do. Uh, one thing I wonder is, we regard ourselves as such individuals, we don't think of ourselves a species much. Terence talks about that a fair bit. But in our daily life we really identify ourselves as individuals, as, uh, some of us having more power, more clarity, more energy, more talent, whatever. We divide that way. With plants we tend to think of each plant on a species basis, you know. I wonder if, um, how much that's true. plants that we're familiar with like ayahuasca, *banisteriopsis caapi* in the South American jungle, if you want to make this visionary drink you go and find uh, a member of that species but different members have different potencies and different takes on the same kind of message. This gets to the teacher part.

The, the, um- a friend of ours, Eduardo Luna, interviewed a number of shamans in the uh, jungle. They use this term "plant teacher" in Spanish as we've come to use it too and uh, he asked them, do you think that all plants have a, a plant teacher in them, or do you think that some do? And they were divided on this question, some people think that only the sacred plants do, right? Other shamans said "no all plants do, just some of the spirits; they call them 'the mothers', the mother of the plant, or the spirit or the teacher. Some are stronger." So that implies that anytime we eat any plant we're taking in that, that teacher. They um, they mix these plants with ayahuasca which already provides the vision. Then they take a new plant that they don't know so well, or that they want some particular aspect of and they mix it in with that and take it and feel that they are radiating what is that plant, what is the personality, whatever you want to call it, of that plant. And that they take on the qualities of that plant.

So um, I think the Indians in this area as I understand did that too with their plants, they wanted to take on the quality of the- peyote is a good one, you know. I mean, it's- it lasts a very long time in a very subtle way doing who knows what all that time when it's not being eaten by something which is metabolizing the teacher in it. Is the teacher in it, when it's just sitting there all that time? Is it experiencing the, the visions that come with, uh, that come into the, the animal organism that ingests it? I don't know

I guess on the species and individual thing I wonder as a, an adjunct that, you know when you grow your own plants- anyone who gardens you know when you grow your own plants and vegetables how they taste different than the ones obviously at the store whom are probably grown, certainly with the same kind of physical care, but certainly not the same kind of attention.

TM: It's the question for me, or what always astonishes me about it is where does the information come from? I mean, the peyote plant or the ayahuasca vine, or the mushroom growing there in the jungle or in the desert, how did it manage to tap in and become filled with a, a universe of alien Platonic beauty? Why is that there? All the rules of orthodox evolutionary theory conserve- only what is necessary is conserved. So it's very hard to understand how- why a plant needs a uh, library card at the intergalactic library, uh, because it's just sitting there in the desert of some planet alive and living. S-

KM: But each plant is different too, their library cards don't take them to the same libraries even you know? Each one of these visionary plants provides something distinct. And sometimes you can see how it's a cousin of that one and sometimes you can't see that they are related at all.

Terence: Well isn't it that mind is, somehow at the reflexive level, chemical? And that when you change the chemistry of the engine which is giving the pictures, the pictures change. There- sometimes it seems almost like a biological radio that you tune in to very strongly broadcasting stations, some of which are, uh, you know, alien high-tech insectoid science-fiction places, others are jungle worlds or things that you can't even English.

KM: Giant human teachers, I met one who was 40 feet tall, you know, and he took me by the finger like a little child and let me through, what was that doing in the plant?

TM: Yeah what is it for?

Q: [???

TM: Sure.

KM: Yes.

TM: When you take a longer slice, you realize that the individual existence is like an illusion, and that really the planet is involved in some kind of chemical process which is like a gene swarming, and it's been going on for a billion years with more and more- and, and animals and plants, as species and as individuals, are just, uh, aggregates of genes of varying degrees of permanence. The individual is a very impermanent aggregate of genes. The species has a slightly longer duration. But what's really happening is these information transferring molecules are just swarming on the surface of the planet, and controlling, as you mentioned, the weather, the chemistry of the soils, the rate of heat transfer. They've discovered now that plankton control weather in the oceans by controlling the surface reflectivity that- the question I think is the peculiar dualism in the world of information. Why does it seem that reality is not reality? Why are there co-present- actually two worlds are co-present in our experience. This is the taboo subject that we're here to talk about: the weird fact that there are two worlds, one of which our culture doesn't acknowledge but we all experience. That's a very schizophrenic situation to be in. We all exist in both of these worlds, but our language, our culture, our institutions tell us "No there's only one world."

We have gotten into this lethal cul-de-sac where, by not acknowledging the second world we have, uh, have veered off on a tangent which is uh, threatens our extinction now, this obsession with control of world one, matter, energy, and the complete ignoring of the world of consciousness which stood in front of it and manipulated it, but just taking that as a given has created this fantastically imbalanced culture.

Q: I think that gets back to the plants as teachers because uh, since we do, as in your words, play with fire as human beings, perhaps the question you were asking as to the plants as being teachers, my feeling at the time was they are in communication with us as we are in communication with them, we're all transparent beings, and you're talking of gene swarming on the planet. There's no, um, safe in which we lock our own human knowledge. It's, we're transparent to all around us and if you get into intelligent plants which is what we were talking about earlier, perhaps, I mean if you follow that logically out, why not have teachers as chemicals? That's how they can manifest within this particular body and do the library cards as you said.

Q2: They realize that we are doers and shakers.

Q1: Well I think there is only one life on the planet though, and to say that we're separate from the plants or from this or from the air is a fallacy.

TM: So that's a great image, the growing transparency. That's, that's a good idea for what the end of history is, it's that everything becomes clearer, and clearer, and clearer, and as it becomes clearer boundaries disintegrate and everything is seen to be of the same, uh, of the same stuff.

KM: I think for much of the world, and still for instance in the Amazon and other cultures who are tuned into nature, it was very transparent for very, very long. Progress was the losing of that transparency and the you know forging ahead of certain parts of it and, and almost the point of either just eliminating to extinction or to the extinction memory, the, the lessons.

One day, I was just- I think it was during bookkeeping or something very much mundane, the little voice that interrupts every once in a while said that "A plant teacher is a teacher who has taken the form of a plant" and that raised all these questions for me you know, does that mean there are teachers floating around looking for places to land, right? And ways to interface with the other species? Or- and you know I've always thought of rocks, big rocks, many places in the world you can just sit on them and you can just hear them you know and feel them, really.

TM: I'm sure you're- you know Rupert Sheldrake's theory, well it's basically the idea of like kind resonate together, and, when- I've thought about this problem before, about LSD and where does it fit in to all of this. LSD is in, uh, is in the morning glories of central Mexico and the far Pacific. And what I think that makes a plant teacher complex is how many people it's taken. And that a plant that has been used 100,000 years is filled with all of the contents of the minds of the people who took it over that time.

But I want to introduce the notion that life, the plants and the animals, are intrusions into 3-dimensional space of some kind of topological manifold of a higher order. You see, the way in which a chair differs from a giraffe is that if you, if you slice through the chair and then come back and examine it twelve hours later it will be the same, but the giraffe will have changed radically. This is because by cutting into the giraffe you will have intruded into the temporal dimension of its existence. It is more like a musical note than an object. It must be born, grow, mature, and die. I- it- and that process, growth maturity and death, is how 3-dimensional beings like ourselves describe the intrusion of these hyper-dimensional vortices into our world. That's the mystery of life. Cannot be encompassed in 3 dimensions. Life is a hyper-dimensional object. All hyper-dimensional objects are organisms whether they be societies or animals. So the question of "What is the plant." You know, when you ask yourself "What am I?" What you immediately concentrate on is what philosophers call your internal horizon of transcendence. You look into yourself to understand yourself. When we try to describe a plant, we inevitably give a topological mapping of it, how it appears to us: its uptake of minerals, its surface reflectivity, its weight. But the plant obviously experiences itself very differently. All life has an internal horizon of transcendence toward which it aims. Its, um, Whitehead called it "appetition," its inclusion of sensory data out of which it maps being. But what the nature of this higher dimension is, that these vortices are intruding into our dimension from, is absolutely anybody's guess. I mean you can call it a mathematical conundrum or a religious mystery, but it's what's making the world happen. It's what- how the mystery of our being will eventually be shed one more level of uh, veil to let us understand it.

You see an organism is a chemical system which does not run down. The, the second law of thermodynamics says that the whole universe tends towards the dissipation of structure and the release of energy in heat and then everything, all structure and all energy is dissipated. But, the, uh, life has achieved the miracle of, by being an open system and taking material into it, and extracting energy from it, and getting rid of waste, uh, life has been able to leave the main stream of thermodynamic degradation and establish itself at an equilibrium point off that graph and maintain itself there for, at least on this planet alone, four billion years. Now the average life of a star in this galaxy is on the order of 2.5 billion years, some last longer. But that means that biology is no epiphenomenon, no iridescence off the surface of matter as the 19th century physicalists wanted to describe it. It means that life is, uh, indicative of a physics of higher dimensions which intrudes into this otherwise thermodynamically degrading system which we call the physical universe.

And, uh, information, there seems to be an informational ghost of this universe which is somehow co-present at all points within the matrix, perhaps a-la Bell's Theorem, or something like that. And that's what the psychedelic experience shows you. It shows you a holographic space of information where, by sitting still in your room and ascending the mind, you can cross the universe in an instant, you know, and return. And the question of "Is this real?" is in bad taste. [audience laughter] It violates the two ontological categories you see. I, I mean, uh, it just isn't done.

But- you're right, and the plants seem to be the things which shake us out of these cultural conventions. We have this very bad habit of when we encounter a new experience we describe it, and as we describe it we erase its reality and replace it with a map. And forever after when we encounter that input, we access the map and overlay it over the things and say "Aha I know what this is" and so by the time a child is five years old they have completely entered into a symbolic construct which hides the real world from them. And, uh, fortunately, uh, these plant teachers seem to have the unique ability of showing you the relativity of language which for us is the relativity of being. And then you are freed because you have seen something incontrovertible, there's no going back. You know, you are- that is the great first gateway on the path, to realize the relativity of language and the malleability of, of, of the world.

And for instance, coming out in to the desert is typical of people seeking visions, the first thing you have to do is leave the polis. Culture is this effort to hold back the mystery and replace it with a mythology which is then in the control of those who recite that mythology whether they be shamans or priests. This holding back of reality is this strange- is what Christian theologians call "The Fall", our strange alienation from nature that causes us to crowd into cities and mint money, and uh, put a price on everything.

This is why it's so important to go back to the Amazon and Eastern Indonesia, and these places and try and understand what spark it was that those people kept, you know, over the millennia while we became the prodigal son and wandered into matter and, uh, you know, horde on the cities on the plain. We have now come full circle and returned at the end of history with the dilemma that we have made such a mess of things that there's nothing we can do now but lay...

36:05 [audio seems to cut out for a second here]

Each stage is a greater distancing from the wellspring of being, and it's brought us, you know, to the valley of dry bones, to the valley of the apocalypse. And, uh, now the fat is in the fire. Now we'll find out what stuff man is made of as, uh, the chickens come home to roost.

But, uh, well no, I- I'm very optimistic!

Q: The metaphors!

TM: Well is it my metaphors or my pessimism? Oh the horrible metaphors... Yes well the rhetorical hyperbole unbridled...

Q: Asking about the multiple worlds "It interests me greatly, do you think there's two worlds, or do you think there's many, many worlds?"

TM: Yes well I think you're right, but there are different orders of different worlds. I mean, I guess it was the physicist Wheeler who thought that every time there was a choice, the universe took both paths and had always done this, so that the number uh, and kinds of universes was, uh, you know, staggering.

Q: [unintelligible]

Right.

Q: [unintelligible]

I don't- I find that cumbersome [laughter], but there certainly seem to be a number of universes and there seems to be different kinds of universes, for instance, uh, you can tune from channel to channel, but some of them you can't make heads nor tails out of, you know. It's just too far away from your conceptual schema for you to be- so it's sort of like watching, uh, ideological mandalas or something. You can't say much about it afterwards, but it certainly was compelling while it was... [audience laughter] And, uh, well, I don't know, Robin.

You've, you're such a skillful questioner, you've brought yourself to the doorway of my most recent mania. Maybe I should unburden myself briefly about it. [audience laughter]

One of the weird things about, about growth, or trying to make your ideas always become new is that you always assume you're going to, uh, to, uh, know what the next step is, that even though you're going to become more and more enlightened, there won't be any surprises. In, and- uh, so, a few weeks ago I was meditating in my usual fashion and uh, I began to get this new idea which was so weird that I immediately shifted into "Aha this is, this is not the truth, this is not a transmission about the nature of reality. This is a plot for a science

fiction novel that I, that I should write" and try to hold that as the defense. That was my shield against the onslaught of this thing.

And I've never been one for Atlantis, or Lemuria, or all these invisible pre-historic lands and places that people enjoy so much, but I was told a very funny thing which I will share with you. It's, uh, a funny idea. Now let's see, how does it go. It has two versions, one of which speaks a scientific language, the other speaks a mythological language. Ok, so the scientific language goes like this: There's something in the universe called a fractal soliton of improbability. This means it's a unicate event, it only happens once in the lifetime of a universe. You can think of it as a wavelength with one wave. That's why it's called a soliton. And if, if one of the- and these things move not in ordinary 3-dimensional space but, but in some kind of much higher spatial manifold, and when they collide with a planet, or when one collides with a planet in a universe the time stream of that planet is divided and two copies of the entire planet spring into existence without either having any knowledge of it, it just is something which happens. So this voice was telling me that, uh, this had happened to the earth, and

that this was the secret that we were all striving to understand, was that an event in the past had actually divided our time stream, and that a twin of this planet had come into being in another dimension.

Ok, so that's the scientific explanation of it. So the mythological explanation was that the universe is Gnostic, that the creation of a demiurge, not the highest expression of divinity, but a kind of demon, a fallen creature, and that this demiurge was able to coax itself into being and actually incarnate into history as a human being. And that when this happened this was then the mythological expression of the fractal soliton of improbability. And when it happened the time stream split.

KM: The universe was the creation of the demiurge, and the demiurge impelled itself in in the form of an individual?

TM: Right.

KM: It waited a long time!

TM: When you're a demiurge, who can hurry! [laughter]

KM: Ok, go ahead.

TM: Ok so, so the time splitting event had to do with the career of Christ who was an extraordinary manifestation of energy in the historical time stream, not to be confused with a Buddha, or a Mohammed, or a Zoroaster, who were great saints. And, uh, it was something else. It was in some sense what it claimed to be, but in some sense. Ok? So now at the moment of, and you can choose either the immaculate conception or the resurrection depending on which side of the bed you got up on today. But at that moment the time stream split and this

other place came into being without having any awareness that- and they were identical at that moment, these two worlds.

Now, Christ had no children, so- oh, what I forgot to say was that the event, the fractal soliton of improbability, has this quantum mechanical half-charge so that in one of the universes it happens, in the other universe it doesn't happen. And so everything about these two worlds was the same, except that in one of them the immaculate conception had not taken place, or the resurrection had not taken place. Now because Christ had no children, the world in which he was absent, it was not a genetic line which was missing, it was an ideological line which never received expression. And consequently, as time passed, first decades and then centuries, the absence of this particular intellectual influence in the world changed the world radically in the following way: Greek science did not suffer the suppression that

occurred with the conversion of Constantine. The academies were not closed. The hermetic knowledge was not repressed.

--Audio cuts off here and starts again at "Greek science did not suffer the suppression..."

Conversely, the Empire was stronger and was able to repel the barbarian invasions of the second to the fifth century, and, and mathematics, which had halted in our world at Diaphantus, proceeded through his disciple Hypatia to develop a calculus by AD 370 so that the millennium of Christian stasis that occurred in our world did not occur in that world. And as time passed and engineering advances occurred by around 850 they had ships which were able to cross the Atlantic ocean and they encountered the Mayan civilization reaching its fullest flower on- in Guatemala and on the Yucatan peninsula. And in fact in this vision I saw the Roman Emperor Cosmodorus the Fifth make a pilgrimage to Tikal in 920 to be present at the coronation of a king at the end of that Baktun 8.

Anyway, this Greco-Roman imperial culture immediately recognized the genius of the Mayans in mathematics and astronomy and, and Europe was transformed into an- an amalgamation, a Greco-Mayan civilization with, uh, [clears throat] [laughter] So let me see, and, and this civilization continued to develop. Now one of the influences around the year 950 was their extremely sophisticated psychopharmacopaia and shamanism. And this mated with Neo-Platonism and Hermeticism, so that rather than science developing as it developed in our world, a kind of magical, psychopharmacologic technology of thought and understanding was what was developed over the centuries. And then in later centuries, centuries before it happened our world, they contacted the orient and the Sung- the dynastic influence of the Sung poured itself into the creation of the global civilization such that by around 1200 AD they were able to land on the moon and create a cybernetic global civilization similar to the kind we have now. They continued evolving with all this psychotronic and shamanically derived,

and now by this time you can imagine it was an unbelievably exotic and alien, uh, civilization compared to our own.

The fruits of their psychedelic and psychoanalytic investigations into higher space was the discovery of our world. [laughter] They found out what had happened. They figured it out by studying dreams and by making deep journeys into the psychedelic space they were able to discover our sleeping unconscious with its repository of the legacy of the Christian centuries under the reign of this demiurgic ideology. And they conceived of the notion of saving us.

And it, it has to do with this whole thing about the UFO's, and influencing dreams, and astral traveling, and the other side, is actually the manifestation of this bizarre Greco-Mayan, postmodern, star-faring civilization trying to reach across the dimensions to save us from the momentum of our history by making us aware of, first of all, their existence, and also their technology which is evolving towards a point where, I think around the Mayan millennium, around 2012 the time island will be f- we will flow past the time island and the two time streams will be rejoined, and we will make peace with this civilization which is now 1,000 years more advanced than us with this totally different cultural history and this completely different take on reality. So this came to me in the space of about 15 seconds [audience laughter] and uh, more details have flowed in, I use it mostly as a meditational device because it's so interesting ask to be told about how this other civilization developed.

Its amazing exoticism, you know, its Neo-Platonism, its Daoism, its Mayan influences melded into a completely different kind of civilization than the one that we inherited. I've always thought, you know, that the, that Christianity, without making any judgement about Christ himself, that Christianity is hands-down the single most reactionary force in all of human history, and where would we be had that 1,200 years not been given over to this peculiar meditation, you know? All the pieces were in place for the kind of civilization that I've outlined, it was just, uh coincidence. Kat does not endorse this idea, [laughs] or even encourage it...

KM: He only told it to me a couple of days ago in Apache Junction at a truck stop or something, and he didn't tell me it's the plot for a science fiction novel he said 'this is the truth!' and I said 'let's get back to it being a good science fiction novel.'

Q: Well the thing is that it, it would on our level explain perhaps the questions you were asking earlier. Why the teaching plants?

TM: Ye- sure.

KM: Yeah.

Q: Another thing I was curious when you were talking, the physics nowadays you can have an electron on one side of the universe and split it into two and separate them on two sides of the universe and they are still in communication with each other so is that why, logically, you can bring the time island back together again?

TM: Yeah, this would be a quantum-mechanical super macro-physical Bell's Theorem event, a kind of, a kind of hyper dimensional vacuum fluctuation where the two worlds spring apart, sail along for a period then parity is conserved and they're rejoined.

Q: Well this is interesting. I've had dreams that are parallel, and it's very interesting that you bring this up, I've not heard of it before.

TM: It's a-

Q: It, it- another thing I was curious is that this takes place, uh, this would be on a human experience level, uh, what you're speaking of. Now the plant kingdom, would they remain in, uh, connection between the species?

KM: Interesting question.

Q: Uh...

TM: We're free to have it any way we like. [chuckles]

KM: So it- how has Christianity possibly affected the evolution of plant species in this time stream as opposed to the other. Have they gone on..

Q: How did our lack of say 100,000 or one million species in the last 200 years that the other planet has- how does that affect the parity between the two? Uh..

TM: You mean how does our destruction and contort... Well, the part of the myth which I didn't tell you which I will now tell you [audience laughter] was, uh, that, uh, naturally, well, they were developing and exploring technical options many hundreds of years ago and they, uh, theoretic- they discovered the theoretics for nuclear fusion and fission but they never used it, until a few hundred years later one of their great theoreticians- this was after they had discovered our time stream -made the prediction that the physics of atomic explosions were such that they would cross the time stream, and so they performed an experiment by detonating an atomic device in what is our year 1907 and this was the Tungusca-

KM: ...yes sir, can anyone guess?

TM: ...the Tungusca, the Tungusca event. And then by monitoring the dreams of Siberian shaman which they had in clear focus, they saw aha, this explosion which we actually set off did occur in both time streams and at that point they became very interested in monitoring our, uh, time stream because they were picking up the dreams of a Swiss telegraph worker [audience chuckles] who seemed to be pushing toward an unimaginable conclusion. So now there is a certain amount of urgency because if we explode our atomic stockpiles it will wreck the place that they call "Home world".

Q: [unintelligible]

TM: Yes, yes. Not self-preservation because they now have star flight and encompass many systems, but preservation of Home World which on the other side is a vast botanical and ecological preserve from pole to pole, I mean it's a sacred site of pilgrimage, it's, uh-

KM: ...the earth

TM: ...the home of the species, it's the Earth. And the notion that suddenly great parts of it will be blown apart by leakage from hyperspace of one of our atomic wars is impelling them now to attempt to open the doorway and rejoin the time streams, and we'll be allowed a few years inside the botanical park to acclimate and then most people will ship off for the stars, I imagine.

The British science fiction writer, Ian Watson, has a wonderful book called "Chekov's Journey" in which he talks about the Tungusca event, and his theory is that it was a catastrophic failure of a Soviet time-travel experiment conducted shortly after the turn of the next century. [audience laughter]

KM: Tough one to prove, right? [chuckles]

TM: Obviously! Why didn't I think of that! [laughter] Well, I mean, I'm not sure, I've thought of that before, you know, it's the claim of Christian theologians that Christ comes in the center of history, they speak this same language. Before Christ no souls were entering Heaven. He freed the valve and now it's possible to enter into heaven. Before his intercession that was impossible.

Q: [unintelligible from the audience]

TM: You're....

[audio splits here 56:20]

So I thought that the millenium had come, that forever after we would - **BREAK**

All trash... Muzare Sharif

[this seems to repeat?]

----REVIEW IN PROGRESS----

efore I had this idea, I had another which I'll tell you (laughter) which was a completely different kind of idea and it's the idea that there is an overmind, this doesn't involve other dimensions.

There is an over-mind co-present on this planet and when technology, when the development of technology exceeds the development of ethics then this over-mind can work miracles. Because the over-mind is plugged into each of the individual minds that compose it, this miracle always has this unbelievably creepy quality of being exactly the thing which can convince you to change your mind.

In other words it like it reads you so perfectly that it's able to present the one situation which you can not refuse, so in the case of Rome, you know Rome was a pigsty, Pasterna called it 'a bargain basement that ran on two floors' it ran on slavery and it ran on brutality and captive populations and outrageous garrisoning of military power in foreign lands.

People like Diophantus, this mathematician I mentioned and hero of Alexandria, these people were on the brink of the calculus and the steam engine. So the over-mind is seeing that and seeing their appalling ethical state sent their miraculous personage of Christ who in a world where information could not move faster than a horses gallop, this religion within 60 years was beating at the gates of Rome itself, it was like a fire you know just burned through the empire, and changed everything, and halted technical advance.

Everything stopped, now I created this idea in an effort to explain the UFOs because the new theory of UFOs or the new school of UFOs says "we've been wrong to ask what are they, that has not been fruitful, what we should be doing is asking what are they doing?"

What are they doing?

And we can analyze what are they doing in the same way that we can analyze what anybody is doing through sociological polling of human populations we can find out what the flying saucers are doing.

So they polled human populations and what they discovered is that what the flying saucers are doing is that they are sowing disbelief in science.

They cause people to not believe in scientists, because scientists come off so lame when asked to explain flying saucers.

It's like, the flying saucer is a confounding of science in the same way that the resurrection was the complete confounding of Greek stoicism, and democracy, and materialism in the Roman world. It's conceivable that the flying saucer, the statistics are now something like 12 or 11 percent of the American population have seen a flying saucers 52 percent believe flying saucers are real.

And so forth. It is a faith which is percolating up from the lower levels, its people who live in trailer courts and read Fate magazine who are the believers in this thing.

What it may be is an intercession on the part of the over-mind, which it can do anything, it can do ANYTHING from our point of view.

In the most extreme version of this idea I said "What if enormous space-crafts were to fall into orbit around this planet?" and "What if television images of this craft were to be beamed into every home on the planet?"

Then a teaching revealed some completely mind boggling thing which you could have thought of it yourself but you never did, which is always how these things are.

Then suddenly, then after 30 days of melting the nuclear arsenals and causing all cancers to disappear and curing all infectious diseases and delivering this message the enormous spacecraft disappears, 30 days...

Then everybody says "My god, we have been abandoned, we have abandoned again into time."

And you know...history would halt, everybody would do nothing but study the teachings of the saucer and try to figure out how we can get right with them, how we can figure out how to get them to come back. Dogmatism, theories of communication, priestcraft, the whole thing.

Though I am fascinated with the flying saucer, and what it says about the malleability of mind and matter, I think mature civilizations should not be haunted by Messiahs or Flying Saucers. That these things are like metaphysical spankings imposed from on high that are saying it's a boot in the tail, wake up! Stop repressing.

K: Lets take your two ideas, because neither one of them is that old, what does the over-mind have to do with, or think of the double time stream?

Terence: Now that's a question I never would have asked. You mean if that's true? I sort of think of these as mutually exclusive. I think the demiurge is a negative expression of the over-mind. I think of the over-mind as the logos, you know, it's the understanding and self-existence which permeates everything and the demiurge is the force of matter and time and cosmic destiny which is always trying to lock in the logos and condition it and make it subject to the rules of the physical universe of space and time. The logos is like something from like, this is all Gnostic theology by the way this is just straight from the book. The logos is trying to struggle through the labyrinth of the material universe to escape, to rejoin the real source of itself which is outside of matter. Matter is viewed as an entrapment.

If any of you have read the late works of Phillip K Dick, he was probing in these areas, he was a genius, his book Veilus is pure exegesis of internal, unravelment of what was going on.

His take on it was that he believed from AD 69 until 1948, no time had actually passed and that we were living in apostolic time, and that the crucifixion lay only 75 years in the past, and that the demiurge had inserted a false history, and the Nag Hammadi manuscripts, he believed, were actually the logos as printed letters and when the Nag Hammadi manuscripts were deciphered it was like this information creature would come alive and again be present on the earth.

Like the Logos in 1948 was beginning to infuse everything and that shortly it would dissolve the illusion of the intervening 1,860 years or whatever it was and then we would realize that the prophecy would be fulfilled and that the last days were upon us.

He didn't get around to the anti-Christ, to his credit probably.

You have to distinguish between Christ the person, the teacher, and this thing called the Christos, which is the archetype of such power and force that immediately people of ill-intent could get lined up behind it and impose their will. Yeah sell love, and sell forgiveness, what a scam.

The Christos is the thing history is ruled by the archetypes which the people can generate, I mean most people are very ordinary, I mean your Mick Jagers and your Henry Kissingers are very ordinary people but they are able to project an archetype and that is the thing which sets them apart.

And when that reaches the kind of super intense focus that you get in a Mohammed or a Christ, then you know history is just putty in the hands of the force, not the person, the person is usually martyred in some horrible way. But the archetype draws energy to itself, and we don't understand how this process works.

If there ever is developed by benevolent or malevolent forces a science of social control, it will be a science of knowing how to project archetypes.

Different archetypes apparently are suitable to different times, I mean you can almost pause at an astrological theory of archetypes, but its something about how...what's appropriate for the 1st century AD is not appropriate for the 15th.

When the archetype is appropriate, nothing can stop it.

The modern term for archetypes is paradigm.

We expect it not to be a person, not a messiah, but an idea which will save us all which will then give us certain affinities with Mystical Judaism where the Messiah was expected in the form of an idea, and this is sort of our faith. We are Messianic ideologues or something like that.

(brief commentary, inaudible)

Oh I agree with you I think dualisms have to be dissolved in the notion that there is one thing, you know that's the Platonic faith. The problem is all these secondary and tertiary operational levels and you know we're actually trying to operate in a universe of scarcity and a body which requires energy and all these things. This is really the central problem in Western thinking, I think.

The tension between dualism and unity and matter and spirit, and how do you do it?

I think we are spiritualizing matter, this is what technology is. The spiritualizing of matter is the highest expression of our technological output and that this will become more and more of what this is about, so that in the next century the difference between mind and brain and cell and machine will all have been subsumed under a new vocabulary.

Because we are hard wiring our minds and we are making the artifacts of our culture intelligent, and we are breaking down the barriers between ourselves and larger databases, and this kind of thing so that the old "I am an ego inside a skin" definition gives way to a much more malleable and plastic thing.

(Commentary) "In astrology, something I like is that the symbol for Pisces is a symbol with 2 lines and a line going through it, it's the definition of relationship quality by opposition, it's polarity, it's right and wrong, good-bad, male-female, Russians-Americans.

The Aquarian one which is 2 lines of waves over each other is one of resonance, it's one of dolphins jumping in the water together, it's one of people coming together and realizing how I resonate with you and what I have to give you and what you have to give me, but you'll have something to give me that other people can't and so on, and we need to swim together.

That breaks down all the of the dualistic bonds, and I think we're right at the crux right at the moment, the place between Pisces and Aquarius where we're kind of 2 worlds again, flipping from one side of opposition, being torn from life and death and seeing, as the Christ I feel was that prototype, that template, of light and spirit and matter coming together and saying "I can dance in this, I can leave it, and I can come back into it, I have this power it's my conscious compassionate love that is just so unbounded that it give me the opportunity to play in clay, if I so choose"

Much of what I say is Alfred North Whitehead, his philosophy and believe me if you're looking around for a serious ontological foundation you don't have to read Sanskrit, ANW will serve very admirably, science in the modern world, process and reality. He was and remains the great psychedelic philosopher of the 20th century and the heir of Burson. You had another question?

Yeah I'm going to be 84 in the year 2012 and I'm wondering how to manage my life so I'll be ready for the conrescence.

Well I don't know, I think that the canyons of the creode down which we as individuals are moving, those walls are getting higher and higher too.

A lot of times when I had this intense contacts with the teaching entity I would have an anxiety about "What should I do? What is it for me to do?"

And it always said "Nothing, relax"

Your function is to just...you'll be present where you're necessary, and this isn't a fatalism, this is a kind of recognition of the dynamics of time that the thing is trying to teach you see.

It's trying to say that, if you understand how process works you will always understand where you are in any given process, and then you won't have anxiety about not occupying some other point in that process, you know.

When I began having these ideas, the only way I could previously relate to the notion of the end of the world was that I had a head full of cartoons of bearded men in sandals carrying signs on street corners saying "Repent! Repent!" and here was I, former Marxist, former this former that espousing these unimaginable things.

It's always good to do your homework, and I discovered there's this wonderful book called Pursuit of the Millennium by Norman Comb in which he details the history of Milinarianism, that's what this phenomenon is, belief by a person or a group of people that the end of the world is about to occur.

It existed among the Jews in the Exilic period, it's part of the phenomenon, or part of the social expectation that gave Christ his entre.

The early Patristic Christians lived in the imminent expectation of the end of the world, and then during the Medieval period the most utopian prophetic Milenarian movement before Marxism was Floraism, or the people who followed the teachings of Wakiin of Flora who was a wandering monk who predicted the end of the world, I think for 1244 and he died in 1222, but his followed carried on and the Pope had to send out armies to quell uprisings as people wanted to distribute the wealth because they felt the end of the world was upon them and why should anybody go to work you know this sort of thing.

Similarly in the year 1,000 there was great expectation of Christ's imminent return.

This is the thing which the human mind, at least in its Western expression seems to seek to do. Islam too has its apocalypses, 1967 isn't bad, I thought it was happening, I thought we were months away from a new secular order for the ages.

My theory of history views these things not as evidence against such a thing occurring, but as evidence that it will occur.

That these uprisings, that these outbreaks of irrational expectations of the millennium are in fact temporal reflections, they are catching the light on the temporal prisons from the object at the end of history contains the apocalyptic scenario.

It's very important to manage the apocalypse in the millennium.

It's very important that people not confuse the cleansing flames of transcendence against the ability to use thermonuclear weapons against your ideological enemies.

It's a very delicate matter because our mythologies and our fears run so deeply, but I think that its an awareness of this potential of the existence of this law of temporal compression.

And of course institutions don't promote Millenarianism because institutions want people to invest their money at low interest and long term, and have the expectation that everything will carry on pretty much as it has.

An examination of the last 500 or 1,000 years of human history would lead anyone I think to the conclusion that everything is going to be swept away, and that everything that replaces it is going to be swept away, and we are just moving into an era of change that might as well be called apocalyptic and it must be made Millenarian, otherwise it will just end in some kind of Götterdämmerung and the worst Bogey men will emerge and destroy it.

(Commentary) I know how the wave accelerates and comes towards this transition point, I never call it the end because then the beginning of a new series of many (muddled?) waves is there I guess I believe in flux so the whole process is one wave and at that moment we begin another process. At that point we discuss being the end of the universe as you did a little while ago and sometimes I feel like when everything is accelerated like it seems to have recently and when you're close to a moment of transformation of some sort as it seems to be you see great strides forward being made and great slips backward being made all at the same time right. It seems possible that the transformation will be so fantastically physical as the end of the universe or turning inside out of the, whatever this is. But actually as we sweep through world wide peace of mind, what if that occurred?

That's large enough to qualify, it seems to me for the change-over in the wave.

Terence: Yeah I think the hardest thing to know is the nature of what this ultimate compression is. What it means. Like one way I imagine it, and that's why I love to quote Joyce about "Man becomes dirigible" I imagine it as "The day when your mind becomes your home" and all over the world people just realize that their mind is their home.

(Question) "But do you feel free to describe that as the end of history or the end of the universe?"

Not the end of the universe, the end of history because I think history is some kind of involvement with matter, it's a wrestling with the angel of matter and the end of history is when you pin the angel of matter to the mat. Then you stand up and you say "I am the ademic human being made of light" and you leave the realm of matter and you return to some previously hidden dimension.

Whitehead called these things epochs, these long periods of time. He called transition from one to the other "a shift of epochs" well we've only been doing things like measuring the speed of light since 1910, all the so-called constants of our physics are based on miniscule periods of actually monitoring these things to see if they are constants.

So I can imagine it as a shift in the laws of the universe that somehow cause consciousness to perceive itself more as it must truly be. I am always trying to find physical models for these transcendental hallucinations, the one which fits this is a few years ago this Scandinavian astronomer called Hans Alden wrote a book called Worlds and Anti-worlds and in it he talked about what's called a vacuum fluctuation.

A vacuum fluctuation is where suddenly out of nothingness there emerge a stream of particles and they are equally particles and anti-particles. And they sail along for a period of time and then they collide again and each particle is destroyed by its anti-particle.

What is called parity is conserved, meaning that when you add up all the charges positive and negative you get zero. So it's ok that this matter came from nothing, and returned to nothing, it violates no laws as long as parity is conserved.

The interesting thing about this phenomenon called a vacuum fluctuation there seems in quantum mechanics no rule which would limit the size of such a phenomenon as this.

It's conceivable that our entire universe is an enormous vacuum fluctuation and its just you know 10^{72} particles that emerged from nothingness and are hurtling through space and in another parallel dimension the anti-dimension which is the twin of this universe is also hurtling through space and at some point in future time, completely unpredictable from the state given within each universe, the two will collide and parity will be conserved, and all particles and anti-particles will be conserved. However the interesting thing is that photons, which is what light is composed of, do not have anti-particles.

They are this one weird exception. So that when the universe collided with its anti-matter twin what would be left would be a universe made only of photons, and those photons would be in the configuration they were in in the moment when the cosmic collapse of the state vector occurred.

Well we have no idea what the physics of a photonic universe would be about, a limiting case or a good try would be that it is just nothing, no life, no self reflection, but why posit that?

There is such a persistence in the perennial philosophy of the notion that spiritual development is somehow related to light, and to the cultivation of inner light, and to the creation of light bodies, and to the stabilizing of light.

It's possible to suggest that the world of the imagination is simply the world of internal light, that it's a world where light is manipulated by thought in the way that in this world physical organism manipulates matter. You live in the radiant castles of the imagination after a shift of epochs in which the photonic mode predominated. That's just one way of imagining it.

It's one of the richest meditations there is, to try to imagine the millennium, again it's this thing, what would you have if you could have anything? Sometimes I imagine it, Hieronymus Bosche's great trip to the garden of earthly delights where men and women of all races mingle among giant reeds and strawberries and feed each other pomegranates under autumnal sun in an endless rolling park-like world of exotic vegetables and sexual excess hard stuff to (base?)

You can really take a readout on yourself by seeing how would you like things to be. I have sometimes my fantasy is "I would like to be alone on a star ship 10,000 light years from home with all the books in the universe and I would dress like captain Ahab and I would stride around the catwalks inside this echoing star ship and faithful robot slaves would bring me crumbling volumes of ancient lore which I would say..." no this is a little too Vincent Price. If any of you are into science-fiction the science-fiction of Cordwainer Smith is really wonderful, and one of his stories The Starship is really George Washington's estate Mount Vernon in New York. And it's all exactly like Mount Vernon in Washington's time except that in the library of the big plantation house there is one room from which the thing is controlled and its actually a starship in mid-flight.

(Question) Yes I had a question, you mentioned how the now is flooded with future perception and I have, its really part of the Tibetan practices, it's always something which captures my imagination, how come it's now, now?

The fact that these future perceptions are so tremendously tangible to us, especially while sitting in meditation, while taking a meal even or something, and how come it's not yet today? And how come it's not tomorrow? How come I am here now when I just have to flick my mind and I'm in yesterday, and equally easy in tomorrow. I wonder if you have anything to say on that?

Well I think that life precedes through time, it's an effort by organism to map something one-dimension larger than itself, so it takes a whole life to do it, a life is an effort to map a something, and the now is the moving edge of the mapping process. You cannot map it instantly, or you would be it.

So what being in time is, is experiencing the incremental mapping of this higher order object, and that's why hopefully a long life would give wisdom, because a person would begin to get the whole picture.

What did Plato say? The present is the moving image of eternity. That's pure good Platonism.

You can think of the now as a kind of laser which is moving over a larger surface and illuminating it, you know scanning it. It's scanning something and it takes it a while to scan it, and in the end all the data is in place and you say "Oh yes I see now what the object of cognition was" and our faith is, and there's no reason to doubt it, that this is a great transcendent experience.

This is the peace that passeth all understanding as you sink into death.

It's just that we like to think that the psychedelic experience gives us preview, no one escapes the final realization, it's just that some people do postpone it to their last act.

But there's no reason for that

Because it is the mystery, the culmination, it is the depalm and the wellspring.

(Commentary) I'd like to...I'm always interested in pursuing things from the Mayan days and I'd like to ask about how this theory of time relates to the individual, somewhat related to BJ's question, there's some sense I have that in their techniques and certainly you've experienced this, and other people have experienced this with the mushroom at high doses of traveling through time and actually seeing the future or seeing the past. I was wondering if you could say more about that, and some framework for understanding how that is possible.

Yes will I think psilocybin seems to be the great teacher of history and part of its teaching is...it views a person without a history as a person with amnesia, a person with a diminished capacity because your history gives you your power of convictions.

The way I use the wave, or the way I've been using it recently is I've been trying to study the time immediately ahead of us so we don't misjudge what is going on, and you know it's a mathematical process, there's no indeterminacy about it, if we anchor the whole wave system on 2012 and what I see from that anchorage point is in the 67 year cycle from 1945 to 2012 we have reached that point which resonates with the larger 4,306 year cycle at that point which corresponds to the collapse of the Roman empire around 475 AD, in other words, we have been through a period of Imperialist expansionism which has lasted for a number of years, certainly since the beginning of the 80s, but I see a re-trenchment of that and a recidivism tendency, a tendency towards religious fundamentalism, rigid social structures and in short the sorts of things which could be seen as valid resonance patterns to the early Medieval phase of European civilization.

The period from AD 474, lets for shorthand call it 500 AD, the period from 500 AD to 1500 AD, in other words till the discovery of the new world by Columbus, that 1,000 year period is the resonance that we are going to experience from now to the late 90's, from now until 1998 we will reach the beginning of the Renaissance and the discovery of the new world, but we are going to have to endure a period not entirely to our liking, we represent the pagan Hellenistic spirit which has held full sway within the empire for the past 25 years. We may feel constricted now but I think that our ideas and our position in society has further constriction to undergo before it reflowers downstream a bit.

When I first realized that I felt very pessimistic, then I asked myself "What aspects of Medieval life could I groove? What aspects of that Medieval eschatology were solitary to my needs and wishes?" then I discovered it was an age of great mystical faith and illumination, it was an age of communities of like-minded peoples seeking transformation far from the turbulence of the collapse of the empire.

My theory leads me away from those people in the New Age who think we're about to be catapulted into the corridors of power, I think that's preposterous, and the evidence for it: Zero

I think better we should tend our gardens and form brotherhoods and sisterhoods of affinity and realize that the task of transformation is one of a lifetime, our lifetimes you know.

Every time someone like Dick Price or Tony Lilly moves from the wheel I always wonder "How did it feel to know it wasn't finished?" To go with it undone?

I have no doubt that when the saucer comes that Tony or Dick will be in control, one of them. What is it Bob Dylan says in his song? "Ezra Pound and T.S Eliot fighting in the captains tower"?

But yes so I don't know if that answered your question but I wanted to get it in because the real meat for most people for this idea about time is not the mathematics of it and the symmetry of it, that's only pleasing to a certain mentality. But really what does it tell us about the years immediately ahead?

What it says is "consolidation, illumination, community, and self-discipline"

(Commentary) I can always say thanks a thousand times we don't have to go through it for 1,000 years, and only for like 15 years, this acceleration seems to be very, very convenient. Imagine if we were born in 500 AD and we had to look forward to that

Yes well that's why I say you know, imagine the people who lived in times when the temporal river was stagnant, or even when counter currents swept it backwards. This is the anguish of the ancestors, this is the sacred trust that must not be betrayed, the pagans and the invasions, and the atrocities conducted across history can only be somehow redeemed if we, who are the living way front of this genetic experience do not fumble the ball. All our ancestors are watching to see how we will do.

Kat: It seems like you were asking on a more mechanical...how did this happen.

Commentator "Well yeah how can it be that the Mayans or we on psychedelics can travel through time and see these things"

Kat: My image for it that explains that phenomenon to me and I've had the same experience, past and future, is Terence just referring to the temporal river. It's a river which flows two ways, from the past to the future and from the future to the past

And if you put yourself out in the middle of it, let go of control, let go of fear and maybe you want to choose your orientation, or maybe you don't...

You can just find out where you float and sort of face the past or face the future and just float there. I mean this is not a physicists explanation of how this happens but it seems to work that way you know and we think perhaps far too much of the past creating the future and that we should think more, and perhaps other people have of how it's flowing the other way.

And this is how some so-called primitive people have managed to conserve the very simple effective beauty of their lifestyle, and that REAL strong feeling that every moment is now...because they're thinking of it simultaneously...

(commentator) I think about it and that also sets my mind off, you know that's kind of like the river is flowing both ways, and if you take a step to the side somehow that you'll catch the current from the future. That's appealing, but I am always playing with these metaphors and maybe I'm literalizing too much. Is it possible to step out of that stream in some way and then looking above sort of choose where you are going to descend into and then another image that came to mind was...are there somehow holes in the fabric of time that you can shoot through, sort of like in 2001 the Stargate opening up and there's this hole in between and where you emerge is not the other side of it but some place completely different

Terence: If you take the wave seriously and apply it on these short scales of time, you know you can find your way into unique configurations of the moment, it's like astrology in that way. Often the content of a psychedelic experience can be later seen to be because of the situation of historical resonance that you weren't perhaps even aware of at the time.

Kat: Or if there are parallel worlds, one or many, which ones happen to be adjacent in that moment as the cosmic weather comes, you know sometimes I've taken the mushroom just to say like a weather person would say "I just want to see what's happening out there right now" not with a will, you know you can find that it's about knitting in your rocking chair you can find that you are just in some landscape that you couldn't have conceived of before.

Terence: The essence of Tao is the correct apperception of process. That's what Taoism is, is to understand processes to be Taoist. I think that this is almost a formal rendering of the notion of Tao, almost an effort to create a mathematics, an algebra of the Tao.

And as long as it's true to the notions of what Taosim conserves, which is flow, and determinacy, and indeterminacy, it serves. This is what understanding time is to understand process, but to understand it so well that it's like a sense for you, it's like seeing. This is the kind of seeing that is very important, to see into time.

It's what history and culture have experimented with.

It's what we now, by identifying that as what is going on, can accelerate much faster.

(Commentary) I was picking up a conversation earlier this morning, maybe you could talk more about The Other.

Oh, the other.....well I'm not sure exactly what he meant by talking about the other, I mean the other is just a way of thinking about all of these things that we name "spirit, God, demon, void" it's that there just necessarily is a place off our map, whenever you have a map it implies the part that is not on the map.

The other, the truly other, it lays outside the domain of language, its like the unspeakable, all you can do is point at it, you know.

The Gnostic idea of God was that it was totally other, that there was nothing in this universe that gave any clue whatsoever as to the nature of God. That that was its essence, to be completely other.

The other trickles through and reverberates in our lives in all kinds of dimensions, the first other that you meet is the world, and a later point in your development, your attachment to another human being can become a confrontation with the other. It's just a way of shorthand, signifying, right?

The dimension that carries you beyond yourself into the things that you previously couldn't expect or imagine.

Or Vitchkinstein's Unspeakable or, you know, I'm always fond of quoting this poem by Trumble Stigny where he says "I lean over your meanings edge and feel the dizziness of the things you have not said" That's the other, it's the dizziness of the things unsaid, the things that lay beyond the edge of meaning.

(Commentary) Part of the question to do specifically in the mushroom experience in high doses, this sense of alien intelligence or other, I think that like you said I think that its some of our conceptions of God, many psychedelic experiences, at least with LSD or other light doses are that I am connected to that, I am part of that thing, but somehow the tryptamine said its this alien intelligence, I mean what do you make of that?

Well I don't know what quite to make of that, LSD is self-reflective and integrative I think. These tryptamines seem to be informational, and largely unconcerned with the impact that the information they carry has on the perceiver.

I don't know I think it just must have to do with the fact that the universe is not all smoothed out and filled in, and that this is really an area of personal exploration where you can penetrate into an area, a terra-incognito, a place where nobody knows exactly what is going on.

We're not used to that experience. We expect to have maps of everything we look at and everywhere we go. And it is strange that in this one area we don't, that apparently our taboo at looking at the unconscious or delving into the mind has made us content to just fence off this area.

Well then if you climb over the fence and start wandering around out there, you don't know what you're going to find because the culture has carefully engineered itself to go around all of this stuff.

Even I think shamanism is largely concerned with gaining power to protect yourself from the onslaught of the other.

I mean, you know they're very concerned...to hold stuff back, they don't really have this "Lets hurl ourselves into it" attitude that we have.

We found in the Amazon, we were looking for this one plant which had DMT in it, and the ayahuascera that we were working with, I kept leading the questioning back to the matter of this one plant, first he said that it was "comida del perro" food for dogs, which seemed like maybe a putdown of some sort.

Then he went back over it again and he said "Whoa it's mallen bizarre, it's too strange!" So this was a man who his whole life was about taking ayahuasca and triggering hallucination, but he felt to go into that plant it was too weird. You often have the feeling with those people that they involve themselves in the psychedelic effect like a dancer, almost as little as possible to get the job done.

Kat: Refers to the history of that particular man and his opinions on psychedelics including mushrooms, and do different things on different nights and he would try new plants and new combinations, he was pretty intrepid, he did have boundaries.

Terence: In 1983 or whenever it was that I was down there last we were dealing with a different group of shamans on the upper Apeyaku and it was to get this orally DMT thing made from tree resin, and we had pure chemical DMT as a trade item, or we weren't sure why but just in case we needed it.

Then talking to the shaman that could make the verolla paste stuff we said this and he said "oh you have the esencia, you have the essence!" and we said "so what is that like?" You don't take it orally, you don't take it by mouth, you smoke it.

He said "Oh what happens?" So we described it a typical DMT trip to him and said "would you like to try it?" and he said "No thank you" (laughter)

So they're not thrill crazy by any means

(Commentary) I read the Castenada books he goes into what he calls the old seers and the new seers, and the old seers, maybe you're more aligned with them, but they were more willing to explore any territory, they made a division between the known and the unknown. It was the new seers that came up with the third category of the unknowable, in other words there's this reality which is the known, then there's the other realities you go to which are the unknown, which maybe the ayahuascero takes you to the unknown, but then there's this other realm where they don't go, they would probably call the unknowable because the impact it has on you to go there would be dangerous.

(2nd commentator) From the place of the unknown they could glimpse very briefly the unknowable, which is usually a pretty shattering experience.

Well that's interesting, it makes me think of you know I mention Vitkenstein's Unspeakable I think the unspeakable and the unspoken, and all these esoteric and initiatory religious numbers are trading in the unspoken, you know you come to them and they will whisper in your ear the previously unspoken teaching, they will give you an oral empowerment but beyond that lies the unspeakable which no teacher can orally impart, or impart any other way because it lays outside the bounds of transmissibility by its nature and to some degree I would think so, and that's the thing which you validate, you can only validate it for itself, in itself for itself.

It is the private object of being, it is not something which I can tell you about or you can tell me about, it's the private mystery that is ontologically private because it's unspeakable.

Kat: I don't think what we call the unspeakable is the same as the unknowable, I think that all of us who have pursued these dimensions have many experiences that it's very hard to talk about, or that when you talk about them its very silly compared to what you experienced, right?

Its on of the challenges of having this kind of group discussion or these kinds of workshops, to try to talk about that. But there is, I think a big area that just doesn't language, the ineffable is all I can think of.....

Terence: Well you can sort of chip away at it, the whole progress of human development is maybe slowly eroding the unspeakable and turning it into the spoken.

(Commentary) That is the process of everything from the very beginning to the very end, we as human beings on the planet are just somewhere in the middle of this process of the unknowable becoming the known. Tying back to your whole thing with time yesterday, you say that the physicists are interested in the first second, or parts there or and what you're interested in are the final or coming up moments as things speed up, what the physicists are looking at is basically the form, but you're looking at it as the ideas which are coming into being more and more, time is more and more recognition so it's really like spirit, or mind, or knowing, so its like the opposite end, and one is the latter coming into form in the beginning, and the former is the knowing of all of this just coming to a point. An ant, or whatever lower level of consciousness, or say a cell, or an amoeba, they have their thing, and there's the unknowable which is what we are acting in. What about the blood cells inside our body can they know about our world of communication and symbols, such as we are on this unknowable is really a greater universe, a higher level of just known by a higher way of being, so it's like each end, the matter here and the mind coming into it, this point comes shortly, this 2012 is significant in that it is possibly the opposite end of knowing becoming complete, like life

becoming completely aware of all life in and of itself. But is that the end of everything?

It seems that its just a point, like a mid swing of the pendulum.

Yes well then some other process having to do with the career of spirit instead of matter is initiated.

Yes well that's the end of everything, it's a complete end of one way of being, of us a species as a life development, it's not just humans, it's all life, if that life entity goes through a great metamorphosis another way of saying what happens to the rest of the universe is that the universe is a concept in our minds. Right well that's the metaphysicality of it.

But to say what's never been said, to do what's never been done, to paint what's never been painted, to dance what's never been danced, this is somehow you are acting for everybody when you do that.

It's an amazing thing to do what's never been done, it means once you've done it, it's been done!

-Refers to something like a big fence that is becoming larger and more extensive and the great minds fence off a particular area where all of humanity can run around and you know it's a whole process of ...

It's what aeronautical engineers call "stretching the envelope" when you fly a fighter plane you have the predicted engineering performance characteristics, but once you validate that it can do that, then its up to the pilot to find out, to stretch the envelope, to find out what it can really do...how fast it can turn, how fast it can climb.

That's what we as creative artists can do for the human enterprise.

The lacking ingredient is courage, I think.

Often I have the feeling that it's no longer at least in my own life about seeking the answer, its about facing it.

It isn't about "Is it yoga? Is it Taoism? Is it this is it that?" I think now I know, at least for me what it is, but that the answer is so appalling and requires such courage to execute it and carry it through that I don't know what to do.

I have no doubt that we could all become the Taoist hermit on cold mountain, and be that person of whom people in the valley say "Oh him! We see him sometimes when it snows very deeply, because he comes further down for wood" He comes and goes in the mist and never talks to anybody, we could all become that person.

There are no barriers to ultimate spiritual attainment, but what about your mortgage? And your lover? And your devotion to French chocolate? And all of these things.

That's tricky. That's very, very tricky.

For instance like the matter of the flying saucer, I have no doubt that if you took 10 people selected from this group and trekked days east of Death Valley and stayed up all night and everybody took 8 dried grams of mushrooms and hoped and hollered and waited that something would happen that would be so appalling and so destructive to our preconceptions of what's possible in this universe that you just come out of it pointing into the desert saying "mmMMM mmMMM MMMM!!!"

I'm careful, I don't doubt that appalling, appalling, appalling things can happen and reality can be completely pulled to pieces, I don't know what that means but I really want to deal with that on my terms. That's a kind of fear you know, it's a kind of holding back. That's why, I know people who seem to me superhumanly reckless, I mean they tell me the thing they do and I just shake my head, you know because of the power, of the vistas of the energies that they must have laid their hands on. It's too much for me, I am a simple scholar and bookish collector type. I am like Brother John here.

We like our home and hearth. But that's the challenge you see, that's the weird things of psychedelics. It's a path, but in a sense it's the end of the path, and then what do you do? Now it's up to you, it's no more about the guru says "In 5 years you'll make progress, or if you just keep eating this spirulina, or fiddling with your crystals" or something, but no, you've arrived, now what do you do with it?

Do you really want to be a wandering figure at the edge of civilization glimpses occasionally with your tattered clothes and your wild ravings...

Kat: Nick and I were talking this morning about envisioning something and how these plants help you to generate a vision of something real that you want to create or organize in the world and then they help you to have the discipline and dedication to carry it out.

In the real day-to-day telephone call, how do I get the money for it? Kind of way.

That I think is a real strength for it that all of us have, it's one of the responsibilities of being granted the visions is to make the visions then as real as you can.

We do have our bodies here on earth for some time to come, we do have pleasure of course which we should all indulge in, but we also have responsibility to make it as much as like, even if it's a small step, as much like as that fantastic thing we can see in our visions and I think that it gives you the object then it helps you move towards it, and we need to do that work and keep refreshing our vision if it starts to get weak or we start to give up on it. If we need to shift directions slightly.

(Commentary) Let me go back to astrology, with Saturn being on a ring around a vision and then Saturn stairway, envisioning the steps that it takes to get there, and how you can't jump 40 steps up without losing part of the foundation, as an artist myself I'm finally getting to a place of patience that the slower it goes, the better it gets, and my statement goes "If I only had more time, I'd use less words to write", I would start using things carefully, and allowing the process, for years I was just like "I gotta get this out!" but not anymore, I'm just taking the slow, patient steps to create a foundation strong enough to someday, even if its not in this lifetime to manifest that dream.

KM: If you use the quality of your daily life as your currency for how you're proceeding towards something. If you know the quality of your daily life is good, deep, and satisfying and you have a goal, you're probably on the right path.

But if you're saying "God it's just going to be hell for 3 years until I can get this project together" you maybe should think about it again.

I could reflect all this on a greater scale to the evolution of life itself, and that if life were to very quickly achieve the knowing pure spirituality, then what good is it? And that's like (through humanism?) and through history and through all of our time, and even this coming moment 2012, that might just be this reflection of another even ultimate, and it most likely is, it's just that reflection, and it's really endlessly drawn out patient process is just taking its time as long as possible so that every aspect can work into place.

This quality of daily life thing is an interesting point, because I think it was yesterday or two days ago we meditated or thought "What would you do if you could do anything? How you imagine...or if the genie were to tell you you had not 3 wishes but thousands, and you begin to dabble in fulfillment and of course all the trivial and superficial things I mentioned, palaces and Ferraris and all this, but then things that you could move anywhere instantly, how would you choose to travel instantly if you could move anywhere instantly?

At La Chorrera, these possibilities were real to us that we actually grappled with it sufficiently to see how it would develop. How it develops is that if you discover that you can do anything, the only values which have any meaning, if you can do anything and have anything, are aesthetic values. If you could travel anywhere instantly, how would you travel? You would walk...obviously. You know, because it's so tasteful, it's so completing, it's such a complete reverence for space and time in your body and the correctness of the situation. Time and time at La Chorrera, someone would be doing something some way, and someone else would be saying "Well you're omniscient, why don't you just make it be done?" and the answer is that is crass to do that.

The way to do things, if you can do anything, is to do them right.

KM: Cooking is like that.

I guess, but that realization of the total richness and correctness of the moment is that's the correct interpretation of the attainment of these cities. The things that would go on at La Chorrera, as an example of how the Tao works, I would walk out into the jungle and there would be butterflies circling.

I would hold out my hand and speak to the butterflies with my mind and invite them to come down and land on my hand and display themselves. And the butterflies would do this, they would come and land in my open hand and turn, and strut, and show me all facets of themselves, and this would go on for 2 or 3 minutes where I would experience gratitude, reverence, delight, and then this other emotion: the need to show somebody else what I could do.

Then I would walk back to the camp and smiling with a bizarre inward smile I would select one of my camp mates and ask them to walk out into the jungle with me. Then to their horror, I would stand underneath this tree and gesture, and ask for the butterflies to come down from the trees and land in my hand, and people would just turn away in a mixture of horror and embarrassment that anyone could be such a jackass first of all, and that anyone could be so mentally deranged as to operate like that. Of course the butterflies would have nothing to do with me, I would be left just sputtering and it happened many times. It was not only the butterflies, it was that as long as I had no ego I could work magic, but it was magic that was the necessary magic.

It absolutely had no use other than to make my life a more perfect work of art, as an example we had a pot in which we could de-vein (...?) every morning it was our magic pot, and the scrubbing out of this pot was a major pain in the neck and was consequently a rotating camp duty. So at the height of this it was my turn to scrub this pot and I went down to the little spring where the sand was, and I squatted down by the water and I picked up the sand and I rubbed it on to the pot to get ready to scrub it. Then I looked and the black stuff was just flaking off, it was like easy off or something, and I just took the pot holding it by its 2 little protrusions and immersed it in the spring like this and looked and all the black stuff was just flaking off and crudding off and I was just amazed. The magical scouring agent.

So then I went back to the camp and got my most severe critic and again, smiling with inward benign-ness I lead them down to the river and said "I'm going to teach you how to wash a pot", the Zen master you see. So we squat across from each other by the spring and I pick up the sand I put it on and she says "So I'm supposed to know that sand can wash a pot?" I say no, look. And again it failed me. By then I was getting the message, and I stopped...and there was one other instance which was actually very puzzling because I saw another person go into it too. It had to do with this prophecy which my brother had made.

One of the motifs which circled in his mind space during this period was what he called 'The good shit' and this was, he had claimed, imagined that sometime in the past he had got a sample of Afghani hash that had had cow manure, very, very carefully worked into it and the hash had been infected with psilocybin mycelium and all of the cow manure had been converted into psilocybin, so he had this psilocybinated hash, and he had this notion that he would invent a musical instrument like an electric guitar, which when you played it, it would cause this stuff to come out of the air and reign down on great crowds of people.

So anyway there was this thing about the good shit, and one night he announced that the good shit would appear at a certain time. So then I went back to my hammock in this hut in the jungle and the woman who was with me came as well and we had no watches, but he had said that at 11 PM the good shit was going to get here. I was settling down to roll my evening joint, and it was this Colombian weed that we had brought in with us. As I lit the joint, this little thing fell out of the end of it on the floor burning, and I picked it up and I smelled it and it was unbelievable hashish. I mean hashish to die for. I put it in the pipe and I smoked it and I said to this woman, and I said "Smoke this" and she agreed that it was astonishing. I looked and opened this baggy with this stuff and started smoking it, it didn't change its appearance, but the odor and everything was just the most finest hash I've ever smoked. I thought the millennium had come.

[AUDIO BREAKS HERE]

So I thought that the millenium had come, that forever after we would all trash. Yes. The end of the world is when all trash, as Muzare Sharif, uh [Terence laughs] ...when trash becomes hash. [more laughter]

But, but at the crack of dawn the next morning I went tearing down to my harshest critic and knelt beside her hammock and woke her up and said, you know "You've got to smoke this!" and of course, you know, garbage was back! [Terence laughs] So, so I don't know why I got off into this, I guess it was the 'life is art thing and this thing about what would you do if you could do anything.

K: Enhance that. The myth, isn't it from New Guinea? Uh, about the good ship? Remember that one, where they generated.

TM: You mean the thing about the resin, where the resin bar grew longer? I'm not sure how this relates to it, but I'll tell it. In the study of Messianic movements, in fact you can read about this in Sylvia Thrupp's book *Millennial Dreams in Action* where she talks about a number of millennial religious groups. There was a movement around 1910 in Java called the calloupan [?] movement and it was some guy was sitting on his porch on day in a hut off in the jungle, and he was playing his flute, and they collect Kopal in the forest there and sell to traders. And as he was playing his flute, he noticed that this bar of rolled-out Kopal multiplied to twice its size right in front of him. And not only did this happen, but the same moment it happened his mind was flooded with the sudden realization that the meaning of this event was that all human lives were now going to be twice as long as they had previously been before.

And he started, uh, he told people in his village and he had the proof because they had this bar of Kopal that was twice as long than anybody had ever rolled them in the village. So it spread from village to village and, uh, before long people from all over, uh, Java were vectoring in on this place, and, uh, eventually the army had to be sent to put up road blocks and turn people back, and uh, it all had to do with uh, this piece of resin which had doubled in length while this guy was playing his flute.

KM: And that is what you call a cognitive hallucination..

TM: A cognitive hallucination..

KM: Right, where an idea becomes so real to you that you see it, but then there's this funny border where maybe it becomes so real that other people see it, and maybe that's actually how we keep enlarging and complicating reality is by having consensual cognitive hallucinations of what's possible.

TM: That's right, that's right.

KM: Yeah.

TM: The ayahuasquero that Kat mentioned she liked so much and worked with in Peru, Don Fidel, he lived behind- he lived off this road we knew and a few miles down this trail, and we would go over there often and we would walk with him back and forth between his house and where we could catch these little Jitney busses into town.

And he said one afternoon as we were walking along the Amazon jungle, apropos of nothing he said "This is the path that Christ walked when he lived on Earth" and it became so, you saw that somehow this was not a logical statement, this was a statement about the transposition of time and dimensionality, and that he was living in the light of Christ, that he was living in the presence of the master through being enveloped in a cognitive hallucination, and uh, I think our entire culture is headed for being enveloped in a cognitive hallucination where our real wishes will be fulfilled and that's why its so important to, uh, to find out what our real wishes are.

One of the most powerful forms of yoga, one of the highest forms of yoga is what is called Yanutatara-Yoga-tantra and it involves a series of visualizations and they say "Imagine your home as a sp- splendid palace, and imagine the common utensils of your everyday life as golden vessels, vessels of beaten gold encrusted with jewels. Imagine your raiment as being made of the finest silk, and imagine yourself as a God centered in the midst of all of this splendor. Well, this is like trying to induce what is called in Western psychotherapy "A delusion of grandeur." A delusion of grandeur is when you are a hell of a lot happier other people think you should be, you know? [audience laughter] And uh, say "What do YOU have to be so happy about?!"

And it's all about infusing the quality of life with greater purity. We were saying around the fire last night that the way to relate to the millennium is to make it happen as soon as possible in your life so that you become a spectator to it as a historical phenomenon. Well the way to make it happen in your life is to not transcend desire but to transmute it so that what you really want is what you actually have, you know.

KM: I um, that, the mushrooms particularly, that to will, to choose, to become an archetype that I of course both have to be able to identify as an archetype, but one that I can relate to or wish to be, and become, you know, as large, a hundred, a thousand times larger than we are, and as smooth, and as...everything is light, you can practice being in the Tao so deeply in those states, and that everything you do no matter how minuscule it is you're doing most gracefully, and everything you say you're saying most eloquently. And, you know, even um,

I've used the mending-sock thing, because sometimes I think that's what I'm doing, that level of work, but that I'm doing it perfectly, you know, and that's, that's a great feeling.

If you indulge in the feeling of being a Goddess, or a God or Goddess, or one of whatever you identify with, you know, you get to choose whatever, then you get to carry it back. It's a really good way to carry it back into your daily life, and, and uh learn to practice it either in moments when you're wobbly and you suddenly need to grow into the situation, or in moments of ecstasy, you know, and to be archetypes making love is pretty good.

TM: Well that's the technique of tantric practice, imagining these Gods in union with their consorts in sexual union...

Q: Want to have a break?

TM: Yeah let's have a break.

[Guitar Music & Singing Interlude ends 1:10:19]

TM: The people burning to speak should speak. [Terence chuckles]

Q: I have one comment, um, that in different part I keep hearing people say we don't know anything. But I think we're all dancing around it very well. I think you're dancing around it really well, and so I think we know something, not a lot perhaps, but we do know something. If words are that important and do have that meaning, meanings, whether it's what we're saying is true, or the sound of our voice that is true, something is true right here. Uh, I think we're beginning to say the unsayable. I just have that feeling. [Audience chuckles] [Terence chuckles]

TM: And what a feeling it is! Yes, well, we're f- feeling the dizziness of the things not said, we feel it, we're dizzy from it, it's here.

Q: I think a lot has to do with trust. A lot of times [???] You just gotta say it, and you move on. That's how it keeps forming, creation, words, thought idea. They attach themselves to this larger structure and just keep getting larger and larger. Pieces fall off, people add, uh, but Its about trust and that leap of faith to the other side to what you can understand, to trust it, as you trust your lover, as you trust a friend, it doesn't always work out, but trust is the only way. Uh, because otherwise there's only fear, fear of ourselves, fear of others, fear of ideas. I think this community is part of that building trust among people who have different ideas." [1:13:10]

Q2: learning and teaching [???] psychedelic experience....You can use a lot of verbiage to explain to people what that search is about, but in the end probably the best communication is...dispense the sacrament (inaudible) I just want to express my appreciation to those involved in the work, with great respect for the sacrament. I just am very deeply wishing the best, it's something I missed for a long time since the days in the 60's was the last time I was around people who knew about that work and approached it with the kind of reverence that I see here.

TM: The great thing about the psychedelics is that they speak for themselves, so they need no priest, no interpreter, uh, they can deliver their message all by themselves.

Q2: [??] seem to be so wonderful with words. Even the unspeakable [???] together in silence. -to say. For me it was always babbling. It's quite an event.

TM: Well it's wonderful that you feel so comfortable with people that you don't have to rattle on. Why don't you lead us now, Kat, in a meditation.

KM: Hold hands. We've seen, uh, many eggs in the last two days and had the pleasure of holding them and swallowing them, and um, I've spoken about luminous eggs and feeling very "eggy" today, resurrection and all that stuff. Um, so I was thinking that our luminous eggs should meet each other in maybe a less verbal way. Ok close eyes, and find your center, the light. And let it swell out into your egg, your shape. And then you feel that light of yourself moving into your head and letting everything else out of it. You can breathe through the top of your head, and through your forehead and your eyes and let it become, let your head become like a cloud of light. When it gets strong, that floats up above your head so you have a sphere of light that you can feel and see just above the top of your head that seems to get more charged as you perceive it. And then it grows. The light is growing, the sphere is growing rounder and fuller and softer until it meets the lights of your neighbors. And we have a huge halo over us together. If you travel through it, in your light, you'll encounter everyone very softly. And we can charge that halo of light to be stronger and bigger than us. I feel like it, uh, becomes a sphere, a dome above and beneath us which meets the light of the spirit of this place, the spirit that lives here. It's partly in the earth and partly in the air, and very old and wise with a sense of humor. And so we're all inside our collective luminous egg which we could take anywhere actually, but perhaps for now we should just greet the spirit of this place and gradually breathe and draw the white light energy back into ourselves, into our circle and into our individual spaces. Above and through and beneath us. And when we go out and sit out on the rocks alone we can keep doing this even though we're not in a circle.

It's good to connect with all of you. Thank you.

TM: Thank you. Mhm.

Q: I don't know how to phrase this best, um, you were suggesting that this kind of, um, visual language, somehow, um, our future lies there, I know Gueyes talks about the future of technology being light and sound in probably the same way you're talking about it. Um, I guess my interest in formulating this question has to do with, um, things like the Mayan hieroglyphic language system or, um, also Egyptian hieroglyphs, basically that kind of um, visual language that maps Northwest coast Indian designs were there's very particular kind of uh, design patterns. Another piece of this question is the interface between the past use of that and the future use of that somehow. That is seems that- I mean, my sense of these hieroglyphic languages used in the past, they would literally see these things that are being drawn, or these things would speak to them and provide information as you are talking about. Um, and that somehow as we evolved we lost that ability somehow, or buried it, or shunted it off to one side. And so my question has to do with some sense of the re-emergence, or the uh, in

the Joyce sense here comes everybody, the democratization of, uh, of that ability in future cultures.

TM: Yes well I think so, I think that the way that these, uh, hieroglyphic languages especially Mayan and Egyptian differ from uh, alphabetic languages is that, uh, etymology remains on the surface in a hieroglyphic language so that, uh, thousands of meanings are immediately visibly present. And, and so it's more like an ideogram rather than like a word with a dictionary meaning. You couldn't really- I doubt that a Mayan could conceive of a dictionary of Mayan glyphs because they're, they're, uh, they infinitely shade off one into another so that- and, and that kind of sensitivity to the depth of language and to the uh, presence of the past in the present, in a word, in what Joyce is trying to do in Finnegans Wake, you know. And that's why if you read it carefully, you feel many historical layers of meaning in the same

passage because he wrote it with almost a pictographic consciousness of the meaning of the words rather than a lineal and literary sense of it. So yes in that sense, it's like that. How this will be achieved in the future in our culture I'm not sure.

The control of the macintosh through an internationally set of unders- internationally understood set of control glyphs is very weird and if any of you have worked with a macintosh you immediately see "Ah" this idea which seems very odd, could in fact, I could learn this very quickly and anyone could do it, kind of thing, may be presages a world of illiterate computer users who communicate with computer through symbols, because literacy has been lost. But it's it's very interesting.

Q: [??] So the computer plays a role in the visual component. Like I heard you talk about actually when you asked your question "Will computers become intelligent?" I've heard you talk about it more, and that the technology of computers will become available to us as almost a biological extension from the-

TM: Yes that's what I think will happen. I mean my vision of a perfect world is where, you know, the earth is restored to its prehistoric, edenic perfection but technology has not been eliminated, it's merely been micro-miniaturized to the point where the computers which maintain the history of the race and the governance of the planet have all been secreted in a certain pebble which lies on a certain beach somewhere on the planet and we walk around in perfect harmony with nature and in perfect and complete touch with an imaginary

holographic world that is our self-expression, as a city is our self-expression.

To then be simultaneously, you know, in the world of techne and in the world of nature, but with neither violating the other, and I think that's reasonable. In fact, I think perhaps in a sense this is what so-called preliterate cultures in the Amazon have achieved. That's how it looks to them from the inside. They have an extremely rich inner life. It isn't maintained by vast computer networks and projected into holographic space and taped on to magnetic tape and all of that, but it's still, in feeling, it's the notion that the richest world is within and that you uh, promote a balance with the exterior world, but then the purpose of the leisure created when you have achieved balance is not then to accumulate things but to explore the interior horizon of transcendence through the recitation of myth, and ecstasis, and uh, and

this sort of thing.

Q: Terence, in connection with Roberts question, in conjunction with it, could you further elaborate this idea of the material externalization of the soul and the internalization of the body as a definitive thing in evolution.

TM: Well, I think imagination is where we want to go, that this has become the arrow of our epigenetic development because everybody says "In the future, you'll have everything you want!" Well if we believe this then we have to think seriously about "what everything you want" is.

I mean obviously you want plenty of food, plenty of clothes, plenty of money, plenty of friends, but then if you get all that and they say "Well you still- you haven't even dented your credit account" and you say "Well I want to live in Versailles, surrounded by brilliant robots who- and I want great writers and artists to have lunch with me every day, and then the Hope diamond, and Rembrandts." Eventually this becomes very silly and instead there is an ascent toward truly grandiose aspirations, you know. Truly bodhisattvic calling. And I think that

uh, this- the rich imagination is the real frontier, this is why the poets and the artists are so important.

This is why, I think, one of the aspects of the space thing that is never mentioned by the AI-Phi society or any of these engineering types who are so into it, is the interesting thing about outer space, we are not going to go through space to other worlds. That will be very incidental to going into space. Going into space will be going into space, that space itself is a medium with unique properties for a species such as ourselves, and one of those unique properties is the engineering, which on the surface of the planet always has to always be cognizant of stress, and bearing loads, and the limitation of materials, engineering is just going to become like ballet. And objects miles in extent can be created that are obedient only to the laws of the human imagination, and of course the funding available to create these

things, in other words the constraints of nature are pretty much lifted.

Outer space is very much like what you see when you close your eyes in a dark room. It's a vast unfiltered void into which anything whatsoever can be projected. The hallucinations of the individual are, are the cultural artifacts of the species 500 years from now, I mean, all these visions and dreams that we have will be realized, I mean, in ways that we can not imagine, but realized nevertheless. This has been consistently what has been going on. The alchemical dreams of the 16th century are fully realized in the 20th century, you know. And of course it has facets that they never imagined.

But, uh, going into space and going into the imagination is the same thing, and in the same way that the new world presented a tremendously tight genetic filter to immigrants so that only the soldiers of fortune, the religious fanatics and exiles came to this place and that created a unique gene mix, space is going to be a much tighter genetic filter. I mean, most people who go are going to be very smart and very healthy, and uh, and uh, very quickly I think a space type will arise but I don't think you can create a space-based civilization without recourse to psychedelic plants and the psychedelic experience, because it's too much the same thing. You know, without- if you don't integrate psychedelics into the leap to space and realize that what is happening is that more and more we perfect the uh, aspiration to vertical ascent.

In the myth of Icarus and Daedalus you get this, then in the brother Mongofie [??] and their gas-filled balloon, and then the Wright brothers, and then the Apollo project. All of these things are this aspiration to ascension. Apparently it is a biological drive, some people have suggested it is a nostalgia for the canopies of the rainforest that no longer exist, but whatever it is, it's going to take us eventually outwards to the stars and inwards to the stars because, uh, you know the real question mark which hangs over all this is the nature of mind, and we do not know what mind is, and yet everything goes on upon the stage that is conditioned by and assumes mind as a given. And, uh, every society has assumed that it had the answers, that just fifteen years more of fine-tuning of the current ideology would do it. And no society

has ever been right about that, so why should we be right?

We are hurtling toward an unimaginable future in the same way that our present would have been unimaginable to people 200, or 500 years ago. But it is uh, it is the imagination because it is consciousness that is growing and expanding and strengthening itself. And if we take the notion that these uh, psychedelic plants are consciousness expanding agents, this is what they were originally called, "consciousness expanding drugs," if you take that seriously for a moment how can you not center it in your life? I mean obviously consciousness is what

must be expanded as fast as possible at all costs in all times and places because it is a lack of consciousness that will, uh, be toxic to our species and the planet. Consciousness is the saving grace and so it has to be cultivated by any means, uh, available. Yeah.

Q: You were saying that this urge to ascend is related to this biological urge and that maybe something related to the rainforest.

TM: Well I think we are the trigger species...

Q: What I want to make is that, when we think of going to space we're so human centered, yes us as humans can exist in space, but what I think is really important about going away from this planet's surface is that it's not just a human centered thing, it's a totally biological thing and that we are just implements of it, we are the thinking conscious creative tool-makers that will be able to implement this getting off this "gravity trap", this "gravity well" but it's not just for humans it's for all life, and we have to, it will be a complete synthesis of all biological life that will exist away from the planet.

TM: Yes if we go to space we will take everybody with us.

Q: Just like in a rainforest, it's not just....it's everything.

TM: That's right we are the species that is deputized to use energy to do the thing for all life on the planet. That's why I'm not pessimistic about history and I don't see history as unnatural or somehow opposed to nature. What history is is a 10,000 year process by which the monkeys attain an understanding of physical processes to build the habitats in to which all life on the planet can then migrate. That's what I was talking about this morning when I said "I think the planet senses the finite of its- the finiteness of its existence and that biology is a wild scheme for getting out to the stars for dispersal of uh, of life, and you're right, we have great hubris and believe "we are doing this" and man will go to the stars. It's more that man is the pecking beak of the cosmic egg- of the cosmic chick in the egg of life on earth, and the entire bird will emerge and fly but it was man with his atomic weapons and his radar and all this who, who can break the shell and then the whole of the biosphere will flow outward into space and escape the cycle of energy degradation that will eventually turn this solar system into a group of cold cinders rotating around a uh, a red giant or something.

Q: Terence..

TM: What?

[AUDIO SKIPS HERE]

TM: Yes, well we're trying to compare our maps, everybody has seen different pieces of a geography whose total size we don't know. So we don't know, maybe none of our maps overlap, or maybe some do and some don't. And maps which don't overlap are not invalidated, it just means nobody has been there but you. I mean, I often have the feeling that I am seeing things that no one has ever seen before. Often.

[AUDIO CUTS OUT HERE]

Leon asked me to talk about time, Leon is off on alone time, so he'll miss this. The thing that really interests me or draws me back to the psychedelic experience again and again is the notion that there's something that you can learn that would somehow be, uh- have an impact on society at large, that when, that when you have the psychedelic experience, it's like you're a sailor on some kind of a vast ocean where you let down your net into the deeps and the hope is that you will snare an idea of some sort and of some size. And it may be, you know, that you come up with the equivalent of tuna, which is many small ideas, or- and perhaps you bring up your nets and see that they have just been shredded by something so large [audience laughter] that you scarcely care to imagine it.

But the, the hope is to land an idea of intermediate size that, uh, you can then fully, um, explore and understand. When you s- go into that ocean as a swimmer you see these things passing in review, uh, things of such beauty and intricacy and complexity that you are literally speechless, and even speechless in terms of an interior dialogue about what you're seeing. You can't, uh, it just blows your mind and washes past you in such profusion that there seems to be- the notion of capturing it seems to be like a child emptying the ocean with a cup. But

if you have a net, and I'm not sure what a net is exactly, but it's a way of somehow capturing these psychedelic ideas and then bringing them back for examination.

And I think, um, part of it rests on a technique of, uh, cyclical recitation to yourself of what you have seen so that you carry a vision to a level of reflection in memory as you pull away from it, and then 10 minutes later you tell yourself again what has just happened, and then 20 minutes later again so that you get a series of telescoping images which are granted a compression of the original event, but nevertheless they bear the, uh, the stamp of what the thing was.

So, the thing of this class that has happened to me is a very peculiar idea about time which was developed, uh, fairly suddenly as I would imagine ideas develop, uh, in me in the early and mid 70's and then it was pretty much formulated in my head but it took the invention of small computers to make it possible to write software so that I could actually talk to other people about this idea. Well since we have no computers and not even a blackboard this will be a kind of feeling-toned uh, excursion into talking about this theory of time.

Its, um, it has an abstract foundation and a practical foundation. Its abstract foundation is the notion that, uh, time is different than we have come to conceive of it as the legacy of Western science. The legacy of Western science is that time is duration, that time is a dimension necessary for process, and it's usually thought of as a flat plane against which some other fluctuating variable can be plotted. This is called, you know, "linear time."

Um, and Newton's physics took the same view of space. The Newtonian view of space was that it was essentially emptiness; it was something which you had to have if you wanted to put something somewhere, so it was a kind of an abstract, uh, plenum, but Einstein showed that space is actually some kind of a thing, it has properties of thing-dom, it is distorted in the presence of a large magnetic field and, uh, and so it beca- it rose out of the realm of abstraction and then was cognized as an objectifiable entity, a topological manifold that was real.

This is, I think, the same step that has to be taken for time. Time is not simply the dimension of duration required for the successive occurrence of occasions. It is rather some kind of conditioned topological manifold. We can think of it as, um, uh, a fluid medium flowing across a surface, a river in other words. In some places the river is very broad and shallow and meanders because the pitch of the incline over which it's moving is so slight that it can barely discern which way to move. You see this often in the Amazon. In other situations the incline increases and the speed of the flow increases, and the depth of the channel increases, and the sides o- distance between the banks decreases, so time runs slowly and it runs quickly. It has a kind of modulated speed.

Well, it's been a, uh, a commonplace of Western cosmology since Darwin, although it's never been elevated to the status of a law or even a principle that complex- steady complexification has occurred in the universe since its very beginning. That this is, uh, something that we see in the very first moments of physics and proceeding right up into our own day. In other words, in the era before physics, that period of time so short that it's the period of time- it's less than the amount of time necessary for the photon to cross the radius of the nucleus of the atom, there was absolutely chaos and a complete absence of physics. And then what sprang into being was a physics of pure electrons, of pure energy. And it was not for many seconds that, uh, temperatures fell to a point such that other factors could come into play, such that free electrons could fall into atomic orbitals and, uh, and, and this sort of thing.

And at each successive level of cooling new forms of order became possible. At first everything was just this plasma of particles and energy, and then atomic systems sprang into being. And then at still lower temperatures these atomic systems were able to form molecular systems. The energy level in the general medium dropped below the level at which it would disrupt the molecular bond, so then molecules came into being. And then at that point there was the aggregation of stars and the cooking out of the heavier elements through the by- the process of cooking hydrogen so that iron and carbon and these things then arose. And by this time the universe is much cooler than it was at the beginning, and then finally you get, uh, temperature regimes and environmental situations where very large colloidal molecular, uh, species can come into being, large polymerized molecules and, uh, and this sets the stage for DNA which once it emerges- and the, the thing to notice at each of these stages of complexification is that it requires a shorter time than the processes preceding it.

If the universe is, uh, let's uh, take the long view and say 20 billion years old, then the first 10 billion years not very much happened that was interesting in the realm of complexity. There was star formation and, uh, the percolation of heavy chemistry but not life and- or it's doubtful that life occurred in the early universe. So what we see then is the emergence of more and more complex animal forms at a greater and greater speed. And then finally the emergence of self-reflection in the primates, and then epigenetic methods of encoding information in other words writing, and storytelling, and language.

And uh, at each point what is happening is there's a progressive time-binding of energy and a progressive intensification and speed-up of the complexification of certain parts of the universe. Right now the most complex part of the universe that we know is the human brain- mind situated in its network of computers and cultural conventions and social obligations and expectations and hopes and fears and historical aspirations, et cetera. This is the realm of the densely-packed that the Buddhists are talking about.

So it seems to me that this should be seen as the operation of a general law and we are not outside of this. We are in fact the cutting edge of it. Somehow of all the animal species on the earth the human beings are carriers of this temporal, speeding-up process which is now engulfing, uh, the entire planet. And, uh, so that's the general law, or the general perception upon which this idea I elaborated was based, the notion that complexification is being conserved through time and being built up as, uh, some quality that the universe is very interested in maintaining.

And then I looked at the I-Ching which I hope, uh, is familiar to most of you. I'm sure it probably is. It's a very ancient Chinese oracle system of- that uses what are called hexagrams which are 6-leveled ideograms of broken or unbroken lines, and the possible subset of these things is 64 which is an interesting number because it's the number which DNA operates on because it uses 64 codons, and in fact I came to see that as no coincidence, that actually life was organized around this number and the I-Ching as well because both were subject to, uh, a set of rules which was, uh, surfacing in the phenomenon of biological organization and the organization of a Chinese oracular theory for understanding past and future time.

But- and I looked at what is called "The Sequence" which is the way in which you move from one hexagram to the next, and I sought order there and found order that I think had been lost since pre-Han perhaps pre-Zhou time. And I came to see the I-Ching as we possess it today as an archaeological artifact, a piece of broken machinery. It's like the turbine of a jet plane. You puzzle over it and you see that it can be used for various things and you do use it for things and you see that it's very effective but it's really a piece of broken machinery from a very ancient technology which ceased to exist before the rise of the Han dynasty. And what it was, was, it was like a uh, Taoist technology of understanding time, that by the practice of certain techniques whose historical, uh, echoes I think you get in the stilling-of-the-heart techniques of Vajrayana Buddhism, these people were able to see into the quantum-mechanical foundations of thought and consciousness and they noticed there a flux which they called The Tao and it was a thing which came and went. The Tao Te Ching says "The way that can be told of is not an unvarying way" and they stilled their body functions and they looked inward with a cataloging, analytical mentality, and they noticed that while this flux was variable it seemed to be not infinite in its, in its, uh, in its uh, contributing factors but that in fact it seemed to have a pattern and they discerned the pattern as revolving around the number 64.

In other way- in other words, they discerned through this process of meditation temporal elements that had a kind of ontological validity that the material elements of the periodic table have for matter. That there is not one kind of time or two kinds of time, but actually 64 facets of the possible temporal jewel. And they saw that any moment in time was the combination and the overlay of, uh, this a- wave system which they called Tao and it was a harmonic wave system, it had, uh, re- it had, uh, periods of self-expression which were very short in duration, on the order of seconds or hours or microseconds, it had levels of expression which were cognizable in the human world as years and decades and centuries, and it had vast resonant periods which were as large as history and then larger many times. Periods of historical- or periods of, uh, temporal resonance which could only be referenced to the life of the planet. And this is, I think, uh, you know, part of the Chinese notion of, uh, the Tao of heaven, earth, and man. These are different speeds at which these temporal waves of conditioning of the world of phenomenal appearance are moving.

And if you, if you take an idea like this, uh, seriously, even as a personal discipline of thought to, to picture it, to visual it- visualize it in a Vajrayana spirit then you see that what's really being offered is a map of time. It's saying that, um, the condition of knowing a fading past and facing an unanticipatable future is not a n- ontologically given necessity of existence, that it is possible to imagine an existence in which one saw into time the way we as animals see into the space in front of us so that we are able to run, and leap, and dance among the rocks. It's because we can see into space. A creature that- or a culture that could see into time could anticipate where the river of time would flow quickly, where it would broaden out and move slowly with a rich sense of the conservation of accomplishments achieved, where it would cascade and break-up its previous patterns and produce great cataclysms of novelty. A civilization which knew these things, or a person which knew these things about their own life would claim a new dimension of existential freedom for being.

And um, you know, I was having this whispering entity, this daemon, this Logos show me these things and it was expressed on a very, very practical level. I mapped what is called "The first order of difference" in the sequence of the I-Ching. That means how many lines change as you go from one hexagram to another. And I discovered that it looked like a random wave, it looked like a stochastic slice except that at the beginning and the end there were tongue-in-groove points of fit if you rotated the thing 180 degrees and brought it down against itself so that the thing achieved closure at the beginning and the end. This satisfied me that I was dealing with an artifact of natu-uh, that, you know, I was dealing with an organized structure either of nature or created by intelligence. And then using the principle of hierarchical resonance and stacking of modules into, uh, into hierarchies which is really the principle by which all Chinese metaphysics has operated from the very beginning, I created, um, a cosmic calendar which had- where each level was a resonance of the level below it,

but either collapsed or multiplied by a factor of 64.

I discovered a very- well, recall that, um, because the I-Ching is 64 hexagrams with, uh, 6 lines in each hexagram, it's composed basically of 384 "yao" or lines. And I discovered that this number 384 has a very interesting property, the, uh, cycle of the moon is 29.5 days so that if you take 29.5 times 13 it's something like 383.93, and it seemed to me then immediately obvious that, that part of what the machinery of the I-Ching was describing in the humanly cognizable phenomenal world was the cycle of the moon using a 384-day lunar calendar which precessed 19 days a year against the solar calendar. And when you take that 384 day unit and multiply it times 64 you, uh, get 67 years and some months and days. This is exactly six 11-year sunspot cycles, and China is the first place where we have historical records of the observation of sunspots.

So that's one sunspot cycle for each line in the six-line hexagram. Also sunspots cycles have a greater peak every third cycle so that's one large sunspot cycle for each hexagram in that trigram. And I saw then that there were, uh, these resonances. When you take that number, 67 years, again times 64 you get 4306 years. And uh, that was- that works out to...let's see 4306... two hundred, one hundred and fifty years for each zodiacal sign, each zodiacal sign is slotted to one trigram. These are all- notice that all of these things that this resonance calendar is predicting are things that are visible to the naked eye. We're talking about movements of constellations, sunspots, and, um, and the moon.

So I saw then that this was a tremendously powerful natural calendar that- that, that was a, a technology developed by proto-Taoist central Asian shamanism very, very long ago. But it had this curious property of when the wave was mathematically analyzed in modern mathematical- by modern mathematical methods so that we could draw these maps of novelty, we could see then that it showed us the map of the temporal river from earliest beginnings to the collapse of the state vector at some time in the future. And so it was obvious then that if we could lay the map over the portion of reality we had already experienced we could then propagate the map forward into the future and know- and begin to take hold of ourselves in this other temporal dimension. And so it became a question of what is the best fit of this undulating wave of novelty?

And I used the word novelty out of Alfred North Whitehead's philosophy because he, he had this notion that novelty was the concreting of a force which knits things together. And, uh, and I like that, that's what I felt it was, that the Tao is making itself and that this compression of novelty through the speeding-up of time will eventually reach a place where everything is connected to everything else. And this is, you know, the universe's self-birthing of itself.

Well, you must be aware of all these, uh, very straight studies which say "If we keep increasing how fast we go by the year 2020 we'll go 10 times the speed of light, if we keep increasing the amount of energy we release by so-and-so we'll release the energy in the sun. The propagation of all these curves of development become asymptotic and then nobody knows how to interpret what they mean, they just seem to mean that the whole culture is just going to go kazowie, you know.

And this is sort of the idea that this theory implies, it implies that far from the universe being a steady-state entity uninfluenced by the existence of the human mind, which is going to go on and exist for billions of years until the stars burn out and the 2nd law of thermodynamics is going to reduce everything to heat death, that that's all wrong, a hundred percent wrong, and that actually the universe is made by mind within and without organism, and that mind is a- capable of bootstrap leaps in its organizational self-expression and that we are, uh, privileged to be the witnesses of the final act of life going through some kind of immense transformative, um, unfolding from itself in a kind of vortex which has been building on this planet for billions of years but which has been accelerating to, you know, such excruciating intensities over the last 25,000 years that it has called forth self-reflective intelligence from the monkeys, and the invention of quantum physics, and spaceflight, and shamanism, and it is novelty upon novelty. Novelty so intensified that the genetic machinery can no longer carry it and it bubbles out into the epigenetic, into art, and language, and poetry, and religion, and religious mania and romanticism and, uh, all of these things. It is a progressive knitting together, an expression of the universe's will to become, that causes me to think that we may be in the shorter "gyres" as William Butler Yeats called them, the shortening spirals, of this vortex of novelty and compression.

You see, a curious quality about this kind of cosmology that I'm describing, a cosmology where each, uh, epoch is preceded by an epoch which is a 65- 64 times greater in duration. The curious thing about that is that you only need about 20 multip- instances of multiplication before you go from a period of time smaller than the duration of Planck's constant, which is, uh, ten poi- 1.55×10^{-23} , which is a very short period of time, to- then by 20 multiplications of 64 you reach a period of time in excess of the required time for the age of the universe, a period of time on the order of 72 billion years. Well, if each time the, uh, spiral goes into a state of collapse at the end of one of its cycles, then in the last 384 days of the existence of a universe like that it would transit through half of its epochs of transition. Do you see what I mean? It's like a screaming mimi, it really winds up.

And, uh, instead of the w- the vision which physics gives us, is that the really rapid transitions of phase and state occurred at the beginning of the universe, they- whole professional lives are given over to discussing the first ten pico-seconds of the physics of the universe, right? And well I'm saying it's- I don't care about that, I think that the really interesting stuff will happen in a big hurry at the end of the universe. That the picture that the 2nd law of thermodynamics gives us of just...[sighs] you know, tumescence, maximum de-tumescence is what it's picturing is all wrong, and that actually this strange hyper-dimensional force in the universe called life and information transfer is in the process of working itself up into a real tizzy and wrapping all space and time around itself.

And, uh, what was startling and what made me think that maybe I was losing my marbles was that when you look at that time that way and push these novelty graphs against the historical continuum, I reached the conclusion that we entered the last 67-year period before the collapse of the state vector at 8:30 in the morning on August the 6th, 1945 when the atomic bomb went off over Hiroshima. You see, it was a temporal reflection of the birth of the universe. It was actually a- you could call it an event which was a reincarnation of the big-bang, because each cycle begins with a bang, and that cycle, inti- the fact that human beings had used atomic weapons on other human beings meant that we had entered a new era, a new epoch of moral danger, and the stakes had been raised, you know, by a power of 64 to a new level.

Now, using the mathematics inherent in the cycle, if you propagate forward from that date, 67 years, 104.25 days you reach, uh, um, late November of 2012 AD. And I concluded based on all kinds of factors, personal, and historical and so forth that that was the fit. That, that if Hiroshima was, was day 1, then the place where it all came together was this date in 2012. And I worked with that for several years before some kind soul, Henry Munn I think, pointed out to me that the Mayan calendar which is a cycle of three- of thir- the long-count calendar I'm now talking about, is a cycle of 13 time periods which are called baktuns, and the baktun is 396 years in duration. After 13 baktuns the world ends completely, and the 13th baktun of the classical Mayan long-count calendar is the winter solstice of AD 2012.

within 30 days of the date that I had fastened in on, using a completely different, uh, path of analysis.

And so this raised all kinds of questions, uh, one of which is, is it simply that individuals and civilizations who take mushrooms become, I want to say privy slash engulfed by a certain mathematical secret about the cosmic machinery? What is so important about this date in 2012? You know, the meso-American cultures have the most uncanny history of, uh, successful prophecy in the world. I mean, the Aztecs anticipated the coming of the Spanish, the day, the book of Chilam Balam [pronounced wrongly as 'Belam' by TM], gives the day when the Spaniards would weigh anchor off the coast of Mexico. And of course, the fact that it happened exactly as prophesied was a major undoing of that civilization.

So I put this out, I- this was a very confusing experience for me to, uh, channel or transmit this idea because I was interested in the I-Ching, I had carried it with me in India, I used to throw it at each full moon, but I was not mathematically inclined and when...

-AUDIO BREAKS HERE-

-s reading the philosophy of science, like Paul Firob [TM may have meant Feyerabend?] and Imre Lakatos, and reading the history of science, Thomas Kuhn, and all of those people trying to understand you know, well what is a true idea? What is true and what is false? And, and when you have an idea which makes claims as sweeping as these, then you want to try to understand just what the limits of knowability are, and I discovered that, um, all you can require of any idea is that it be self-consistent, that it not generate any contradictions within its own set of rules, you see. And that's why astrology is, uh, beyond criticism, because astrology is a mathematical theory with an interpretive exegesis attached to it, and who can quibble with a mathematical theory? Well then the ma- the, uh, interpretational exegesis has to do with the sensitivity and subtlety of the interpreter. Well, isn't this true of mathematical data in science exactly the same way?

So, I discovered that what I had created was a self-consistent idea that appears to be sealed beyond refutation in some weird and uncanny way which makes it seem very non-human because you can't really find your way in to telling whether it's- can answer- can be answerable

to the notion of objective truth. So what I've decided about it is, that it's a teaching, or it's, um, it's a kind of - it an exemplary model about how all process goes on and it's a way of learning how things happen. To see time as a modulated flux of elements; to see it as a series of waves moving at different speeds through which you are taking a vertical slice and then stacking that slice and that gives rise to the multiplicitous ever-changing flux that is called the now. It is actually made up of reflections and adumbrations of the past, and it's made up of, of, uh, anticipatory shock waves and intimations of the future.

The past and future are co-present in the now, they are in fact what's making it happen. You can almost think of it as a hologram where you have two- or, or a standing wave, where you two wave systems—one from the past, one from the future where they cross an interference pattern forms which has a curious, uh, stability as a system in, and of itself. And, and yet it's almost a ghost created by these other two realities and that is the moving present. And uh, ah, mathematically this notion of time that I evolved delivers, you know, the map of novelty, a two-variable flux, a wandering-line graph that's, uh, very pleasing for arguing with formalists. But what lurks behind it and what is so rich for the romantic, and the shaman, and the poet, is these- this wandering-line graph is the composite of s- of the the overlay of certain historical time periods which are in a state of flux at various speeds so that they give rise to an endless kaleidoscopic unfolding in what we call three-dimensional space and of what we call reality.

And this is why I often mention Finnigans Wake in my lectures because Joyce understood this, he understood that every moment is caused by everything that happened in the past, and everything that happened in the future, and I like to give, you know, the, the trivial example that you find yourself in Hadrian's hamburger joint, this is because the emperor Hadrian invaded England in a certain year and conducted a campaign. We are ghosts of past and future events. And what the- what the chaos at the end of history that we are now living through is, is that for thousands and thousands of years people have felt a vague thing calling across time to humanists, calling us to be a certain way, to practice certain rituals, to observe the stars, to observe the plants, to observe birth, and observe death, a calling, and that thing which some people have called "God," whatever it is, is throwing a gigantic shadow over human history now, because now the creode of development that leads to our merging with this thing the walls are very steep, the water is moving very swiftly, and it's almost as though the future event is throwing off great sparks that are themselves faceted, contradictory epitomizations of this mystery. This is what Mo- Mohammed, and Christ, and Buddha are. They are human personalities that were situated in time in such a way that they became macrocosmic reflections of the super-ordinate edenic humanity that is going to be generated at the end of history.

And we are close, we are close. It is, uh, all of history can be seen as the shockwave of this eschatological event. This is what the prophets were anticipating: the culmination of man's God-making effort in time will be the perfection and the release of the human soul. And it has- it- it's not that we are doing it, you see, it's that a natural law that we were previously unaware of is inexorably unfolding. And that is what all this cross-connectedness of, of, uh, man into matter, plant into animal, uh, earth into space, all of this flowing interconnectedness, this reaches right down into the rocks of the planet. This is not simply a phenomenon of biology. This is the unfolding of a general law of which biology is only the cutting edge of a wedge of becomingness which includes all being and reaches right down into the neutrinos.

And it is, uh, you know, i- to be a being in time is to share in the immense flood of pre-cognitive anticipation that fills the universe in, uh, anticipation of this event, and that's what being is and that's why it's so rich and complete within itself, and yet always somehow pointing beyond itself because, uh, the, the richness of the matrix through which we are moving is, uh, incomparable and beautiful.

And, uh, and so I- this is the basis of my extreme optimism, is I think that everything is under control, that we are in the grip of a force so powerful that the notion that we could jeopardize or overthrow it is completely preposterous because uh, we are acting in accordance with a resonance that was set going millions and millions of years ago. And of course being is fraught uh, with danger, but uh, the stakes are uh, you know, to be at play in the fields of the Lord, to be at rest in the mansions of the Goddess, and uh, it's- it's soon I think. At least the historical mimicking of it is clearly soon because, uh, the- the thrust toward the millennium of this society will not be, uh, turned aside, if it is not a law of the universe then it will become a myth of human beings and be created anyway. So, since we are human beings I see us as the central actors in that mandala, and this is the task of the next hundred, or five hundred years to realize the alchemical nature of, uh, humanity and being and have everything fused into a super-numinous conscence that is time. Joyce said "All space in a nutshell",

you know, all time bound into a lenticular vehicle which is bo- both everyone's and mine alone, and yours alone, and yours alone...

[REPEAT from 'Leon is off on alone time']

What I want to talk about this morning is an idea, I've talked about it in a couple of places, uh, some of you may have heard it before. I think it bears repeating. It's a much more serious idea than what I put out yesterday which had a note of whimsy in its genesis. This idea is important, whatever that means, because it would change, uh, not only the area of its concern but our view of the world generally. And Easter is an appropriate time to discuss this because it concerns the genesis of man, of consciousness and self-reflection which is what the

Easter mythologium is uh, also an expression of.

So what I wanted to talk about this morning is a new notion of how human evolution occurred, and what the critical factors were in it and how to draw a, uh, picture for us that shows how our intellectual complexity and symbol manipulating facilities could have emerged naturally from a background of animal existence and over a fairly rapid period of time. Over the last, uh, 3 to 5 million years actually the African continent has been growing more dry and has experienced fluctuations of aridity. Nevertheless as recently as, uh, 2,000 years ago the Roman historian Pliny called North Africa "The breadbasket of Rome" because wheat was being grown over thousands and thousands of acres. Now, it's in this same area [TM clears throat] of Northern Africa, the great rift zone of the Serengeti plane where physical

anthropologists place the origin of human beings and it has to do with the following sequence of events.

Arboreal primates living in an unbroken ra- continental rainforest ecology achieve a close adaptation to existence in the canopy and this is stabilized for millions of years. They are insectivores they have the opposable thumbs and binocular, or uh, rudimentary binocular vision. The drying up of the African continent caused the breakdown of this continental rainforest into a configuration of patches of forest with uh, grassland in between. And in this grassland ecology, uh, herds of mammals evolved, proto-cattle, proto-bison, exotic mammals like giraffes and gazelles of all types. At the same time the primate adaptation to this increasing aridity was to begin to descend from the trees and to hunt in packs and to shift from a diet of, uh, canopy fruits and berries, and roots dug from the ground to an omnivorous diet that

could include meat.

So, in this situation these, uh, tribal monkeys developed a complicated repertoire of signals to aid in pack hunting in exactly the same way wolves are known to do. Now, into this situat- their, and their habit was nomadic and to follow behind these great herds either killing the animals that were uh, less well and could be killed by the crude means at their disposal, or living off [TM clears throat] the kills of other carnivores and this is still the habit of uh, baboons.

Now into this situation comes a mushroom which grows in the manure of the ungulate animals that have evolved on this plain. And in this protein intensive environment where there is pressure on the availability of protein, these foraging primates are testing every object in the environment for its food value. So, uh, Roland Fischer who was a researcher into the effect of psychedelic drugs and the structure of consciousness showed that small doses of psilocybin, sub-psychedelic, thr- uh, sub-threshold doses of psilocybin actually increase visual acuity and he had a very elegant experiment where t parallel lines could be deformed by turning a dial, and you would put graduate students in front of this stoned, and unstoned, and ask them to press a buzzer when the lines no longer appeared to them to be parallel. And he showed that consistently a small amount of psilocybin allowed you to detect this change uh, sooner than an ordinary subject was able to. And he said to me, he said you see that "This proves that drugs give you a clearer picture of reality than their absence." And what it means is that these primates who were inculcating the mushroom into their diet were gaining a subtle adaptive advantage over their fellows who were avoiding the mushroom, because they were gaining in visual acuity which is one of the critical parameters that a uh, pack hunting

carnivore would be subject to in that kind of an environment.

So, uh, without any teleology being involved, without any invocation of extraterrestrial intelligence we see that a feedback loop was established in the food chain of these primates very early on. Those who ate the mushroom tended to survive and outbreed those who did not, at the same time the relationship between these animals and these herd ungulate mammals was shifting from a hunting situation to a situation of domestication which was bringing the mushroom ever more into the fore, and if you look back, uh, at the archeological evidence in North Africa, especially the paintings, the uh, late Neolithic paintings on the Tassili Plateau in Southern Algeria you see there magnificently portrayed herds of cattle, and, and, I mean, num- beautifully painted. More sensitively portrayed cattle than you find at Altamira and

Lascaux, and you see also shamans dancing with mushrooms sprouting out of their body and with mushrooms clutched in their hands, groups of them running holding on high with geometric matrices of connected dots all around them.

And, uh, now of course in that area its very similar to this, its an area of sculpted sandstone, and uh, cross-cut arroyos with undercut cliffs. And it's very dry, but in some places the Neolithic detritus is several meters deep. And the people who lived in the Tassili Plateau when the aridity of the Sahara further increased are the people who migrated east to the valley of the Nile and established the proto-Egyptian civilization of six to ten thousand years ago.

The important point I want to make about this later phase of the, uh, human involvement with the mushroom was that it was always intimately connected with cattle. And the Goddess religions of Ancient North Africa and the Middle East are, are, uh, religions of cattle

Goddesses, and this connection between the cow and the mother Goddess and the mushroom is some kind of, uh, key to understanding the evolution of, of uh, religious sensitivity in early man and that part of the Middle East.

It carries forward into, uh, historical time with the mysteries at Eleusis where there is a, uh, a clear indication that a psychedelic substance is being used. Either ergotized rye or, uh, a mushroom of some sort. And this, uh, this notion that uh, it was the presence of the mushroom on the African veldt at a critical bifurcation of primate evolution that created uh, the feedback loop which eventually developed into self-reflecting consciousness. Because you see at lower doses the psilocybin is giving increased visual acuity and it seems like increased symbol-processing ability, its strange effect on the language centers. But of course inevitably they would have discovered its higher dose effects which would be to convey then into an inner tremendum that became then the cultural guiding image. In other words it

was perceived as, as a God, as a Goddess, as *the* Goddess and became then the arrow for cultural dynamics and evolution.

And the reason I think this is important is because the spinoff implications of the acceptance of an idea like this would bring us into much greater harmony with our environment. We sort of have the anxiety of an orphan about our origins because our best people in physical anthropology don't give very good accounts, can't seem to make sense of how we could have l- been forced out and emerged out of primate organization. And so there's been much talk in the 20th century for the search for the missing link which was always been conceived of a physical skeleton of a certain kind of intermediate hominoid form. But it isn't a missing link I think, it's a missing factor. And the factor which accelerated the forward evolution of the brain size of this particular primate line was the inclusion of psychedelic plants in the diet, which then fed the tendency towards symbol formation and self-reflection.

If this idea gained wide acceptance uh, some of our laws and some of our ways of relating to nature and to medicine plants in particular would have to be altered and brought into line. This is the source of our humanness. Apparently the, the psychoactive compounds being elaborated by plants throughout nature are regulators of various forms of evolution in animals, and food chains and all this which appear very trivial on the surface are actually the message-bearing, uh, medium of the, of the hand of God which is forming and sculpting nature along these various creodes of development.

And, uh, the thing to understand about this, or why this has impact in the future is because it's a continuous process which we can foster and husband, uh, and help develop in healthy ways if we recognize that it's going on. I mentioned Eleusis as this kind of thing going on in historical time, also of course Soma, the sacrament of the Vedic civilization, appears to have been a mushroom, was certainly a psychedelic plant. And it isn't only psychedelic plants but all plants which affect and shift consciousness.

I mean, a history of the human race could be written analyzing it not in terms of class struggle of the impact of great personalities but as a shifting set of interactions between sugar, tobacco, opium, caffeine, uh, alcohol, and psychedelics so that, you know, we need to understand that- chocolate, that these food- cocaine- that these foods and drugs and spices, we have subtly overlooked them and taken them for granted. They have regulated human history, and individual self-expression, how much you know, how you look, how, uh, pure

your transmission of your genetic heritage to the next generation, all of these things are being regulated and controlled by these plants in this way.

Now, if we could create a civilization or even a, even uh, a clique within a civilization that understood this and that had its fingers on a vertical monopoly of research from the jungle to the clinical hospital, great things could be understood. Uh, this is the way to do it, to systematically explore these relationships and see that Gaia apparently works through the intercession of catalytic compounds that convey revelation, and revelation is then the factor which has historical impact. The people, the messiahs, and the teachers are merely the pipelines for ideas and the, the metabolic release of these ideas in the macro-environment is being controlled by the plant-animal interaction. And so it will be on into the foreseeable future, and by understanding this a kind of new science looms into view. A kind of integrated, dynamical understanding of, uh, the flux of energy mediated by chemistry in the environment so that the, the guiding image of culture can be revitalized and realized, uh, in a much shorter period of time. And this whole shortening period of time thing has also

been going on for a while.

You see it isn't astonishing I think that self-reflection could emerge giving basic- given basic primate organization, but what is astonishing about it is the speed with which it happened. I mean in the last thirty to fifty thousand years the human brain has changed more than it changed in the previous 3 to 5 million years. So, you know, factor has entered, a catalyst is in the mix and it must be something in the food chain, or something in the environment, or the hand of almighty God, or the extraterrestrials, or, you know, elf invasion from hyperspace... but something is causing this accelerated development. And I thi- and what I said this morning could be criticized as being reductionist, I try to give a very sober account of it, I haven't said why the mushroom appeared in the manure or discussed whether it has

awareness or a stake in the catalyzing of this primate evolution. I just introduce it as a chemical factor, and that's how it would be written if it were presented to a straight audience.

The fact of the matter is that it raises all kinds of questions, I mean why is this process being catalyzed in the primates? Is it just by happenstance? Where has the mushroom been? Is it, uh- what is its relationship to the evolution of other forms of life on this planet? Did it

drift in from the stars? If so, long ago or recently? And with intent, or by chance? And, you know just a host of questions. The thing that puts us in such an existential situation, individually and culturally, is this puzzlement over our origins.

We are not strictly speaking religious in the 19th century way so that we can not really, I think, accept that, you know, God sculpted us out of clay and set us down here on a world he created, and yet if you were to look for the thumbprint of God on this planet you would certainly have to focus in on the human beings and their activities as a special case of natural phenomenon. Perhaps so special a case that it had to be accorded a separate ontological status. We are different and, uh, why, and for what?

Um, I think that probably we are the agent of change that Gaia has unleashed upon herself, that the planet itself is aware of the finiteness of planetary existence. And it's sort of like the story of the ant and the grasshopper. You can have a planetary consciousness which says "Well I look forward to 3 to 5 billion years of sentient existence and then I am willing to be extinguished with the death of my star" or you can have a plant with an ant-like mentality that says "I can sense winter coming 3 to 5 billion years down the line and I'm going to organize some wild strategy to break through the tyranny of the energy cycle of one star and I'm going to organize biological existence so that energy can be brought- greater and greater amounts of energy can be brought under control so that eventually a kind of liberation can occur where life can burst out of the planetary cradle and disperse itself through the universe."

And here are apparently several strategies for this, one is evolve intelligence and build starships. Another is, you know, become a mushroom and produce 3 to 5 million spores per minute during sporulation, that are particles small enough to percolate by Brownian movement away from the atmosphere of the given planet and by sheer numbers, uh, and the slow gradient of drift by light pressure and that sort of thing, emanate through the universe, and establish yourself in any planetary regime that is suitable.

The- the obvious next great revelation in biology, and it's strange that we can state it because once it's stated by Carl Sagan it will be headlines everywhere, but it's obvious that space is no barrier to life. It's a- it's a- it's a barrier, in the same way that the Pacific Ocean was a barrier to life's colonization of the Hawaiian islands, but that's all. It's just a tight filter, but spores and starships, and shamans probably get through to other, uh, closed topologies in orbit around other stars. You know, there must be a dimension somewhere where all surfaces in the universe are contiguous, and if you could move into that dimension you could just walk to Zeta Reticuli.

So, uh, the means by which life will penetrate these larger dimensions that free it from its dependency on the energy cycles of the material universe are not by any means clear. I mean, it may be that it's about organizing the mind and building an inner vehicle and moves off into the imagination. The imagination may be, in fact, a 3-dimensional slice of a higher dimensional universe that is holding all of this, uh, in being and causing it to happen. The imagination, it's hard to account for it in evolutionary terms if it is not, uh, somehow mapping a, uh, field of data that is important for development.

So that's that notion, the notion of the importance of, uh, psychedelics in the formation of the- this species and a continuing formation of the cultural design. I think what the psychedelics do is they de-condition from cultural programming and allow models to be replaced at a much greater rate of speed so that, uh, that the culture that uses psychedelics can trim itself to every historical current. And this is really the challenge of the future. We are moving as a culture faster and faster through the temporal medium, through the historical space, and this is creating a compression of events. And it's almost like an airfoil approaching the speed of sound. There is a wave of concussive shock building in front of our culture and we have to almost re-design ourselves in mid-flight in order to push through that barrier and into the, uh, different order, the different set of laws that will prevail once we have gotten through that. But this whole sense of everything accelerating, of all historical input being intensified and all previous times being somehow co-present, this is the phenomenon of the winding down of a universe, or the building up of an eschatological shockwave in front of a, uh, a vehicle that is trying to transit out of history and into some kind of millenarian space that is not, uh, not subject to the anxiety that history involves.

And that's what the whole crisis and, uh, around the millennium and the whole 20th century really is about, you know, is this, this effort to create a complete summation that can also be used as the force to propel us beyond everything we have been or thought before because there's obviously no other escape from the culture crisis. It is, uh- that kind of situation is called a forward escape. It means the only thing you can do is move forward into the crisis at ever greater speed, because the only solution is to pass through it and move beyond it.

And, and, as we move toward the millennium and as, you know, the intelligence of our machines, the size of our databases, the desperation of our politicians, the intensity of the visions of our visionaries, all of this will build to a crazy concatenatious climax. It can't be any other way because Christian civilization has wired us up for these things at the end of every 1,000 year period.

I mean, in the year 1000 everything just went haywire, I mean people stood in the streets for months just gaping at the sky, no work got done, you know, there was such an eminent expectation of the onslaught of the millennium. Nevertheless this archetype of renewal is seeking in thousands and thousands of ways to be born, and I think that the rediscovery of psychedelics, LSD, everything that Wasson did, all of these things are critical factors in this cultural mix that is going to gel towards the recognition of the things which we hold as clichés. You know, that the inside and outside are the same thing, that the universe can be crossed by thought in an instant, all information is somehow co-present, and, uh, and so on.

Are there any questions about any of this? Yes, I said that what we take for granted, that the inside and the outside are the same thing, these things will be assimilated by the larger culture. And things like, uh, you know, human-machine interface and the ego identification with the body, I think all these things are going to be obviated. That, you see, we don't know what man is and we have a strong association that humanness is related to the monkey body, but yet our whole historical career has been of projecting ideas into technical, uh, accretions, and now that we have computers and things which, uh, mimic intelligence we are beginning to explore, you know "What is humanness ontologically?" That's what people are really talking about when they say "can machines think? Will machines think?" They mean "is what we have focused in on as the defining factor of our being that sets us apart from all other things something which we could manufacture?"

And the answer is probably to some degree yes. Because much of what is intelligence, or appears superficially to be intelligence is simply data and retrieval so that, you know, more and more of the culture is being hardwired into an electronic coral reef that is simply the outermost of each of our own exoskeletons. We all, uh, have telephones in our homes. Many of us have computer terminals. These things introduce us to a global skin of information but as the hardware grows more and more unobtrusive we will more and more come to identify these things with our own ego. And we won't even realize that we're being charged for thinking about certain questions because we're actually accessing a database somewhere which is feeding us data. So that the commonality of mind is I think going to be- somehow the triumph of socialism would be the commonality of mind in a capitalist context. That there really will be an ocean of thought that you will swim in and that will be composed of deeper and deeper levels of integrated information. Perhaps this is all that hyperspace is, is the entirely expressed informational ghost of this physical universe.

And that it's in the, it's in the informational reconstruction of the physical universe that the mind will eventually come to swim like a fish, you know, and will come and go from various constellations of aggregation and integration. I mean you see, what's going to happen is that the rules of the imagination are going to replace physics so that we are going to be able to do and be whatever we can imagine. Well, none of us have ever probably put in much thought to what would I be if I could be anything I could imagine?

And just 20 minutes of that meditation will lead you into pretty strange places. So what would it be like if the culture evolved for a thousand years in that way? If you could be anything. I guess the first step everyone takes is they imagine themselves as the flying saucer, the lenticular, uh, mind-object made of light that can move at any speed and become any object and answer any question. And, uh, well it's an archetype of wholeness in Jung in his flying saucer book, uh, talked about this thing in alchemy called the "rotundum" which is the thing which spins, you know? It's also in alchemy called "the scintilla", the spark, and it's, uh- simply because it's round and spins it's a symbol of wholeness, but it's like the exteriorization of the human soul. The realization that, you know, expressing what is within us may culturally eventually mean actually exteriorizing the human soul and interiorizing the human body so that this world is traded in for the imagination. And this is sort of what art has always been trying to do, but we're talking about a breakthrough in ways and means on such a scale that you can just march off into this art.

Q: Terence, do you find it reasonable to anticipate that eventually human technology will succeed in producing computers that are just as conscious as we are, and can be able to do anything that we can do?

TM: Oh yes well Kat and I did that without even a flashlight battery, just by having children. [audience chuckles] I mean there's an epigenetic component and a genetic component and, but what I'm saying is the difference between these things may become dim indeed, in other words the way a person is made is the way a DNA message is read by RNA, and it's a, it's a group of codons of nucleotide bases which are then templated and then a ribosome reads it and, and assembles little pieces correctly and then the protein is created.

Well, there's no reason why anything should be made any other way. All machines should be produced by the transcription of molecular templates, so then all our machines will become strangely quasi-biological. You wo- Chevrolets will not be manufactured, they will be grown [audience laughter] in yeasty vats and when they talk to you, the question, you know, becomes very moot as to whether this is a pet, a friend, a colleague, or uh [Terence chuckles]... Because that's- you see, nature works with very low energies, DNA can make anything and there's no smelting, no huge release of toxic byproducts and uh, and the amazing thing about these proteins is that the ribosome stamps them out and they come out in like a line, but they have forces, electrostatic, and other kinds of forces, uh, scripted into them so that they fold in very, very complicated ways, and they always fold the same way. And their memory of how to fold, where this comes from is one of the great, uh mysteries of molecular biology, it's not at all understood. Well imagine if we could make machines which just uh, emerged as a strange form of spaghetti which then folded itself into jet planes, refrigerators, automobiles, color television sets, lipstick cases, and what have you.

This has to do with my notion that uh, really the next evolutionary leap is uh, well, I shouldn't call it an evolutionary leap, is uh, it's a leap in epigenetic development, but is what I call the genesis of visible language. That there is an ability just under the surface of human organization waiting to be coaxed out either through yoga, or slight genetic engineering or something like that, and it is, uh, something that was anticipated by the Alexandrian philosopher Phylo-Judeas. He talked about the Logos, and- which is this teaching voice, this informing thing which is heard, and he was interested in what is called "The more perfect Logos." And he said "What is the more perfect Logos?" and then he answered his own question and said "it would be a Logos which went from being heard to being beheld without ever crossing over a uh, border of transition." In other words a form of synesthesia.

Well, what using ayahuasca and DMT and compounds like this which are very closely related to our ordinary brain chemistry, and practice and dedication, you can begin to explore places where a vocal synesthesia becomes a colored topological manifold. And you can communicate- you can show someone your thoughts by singing in such a way as to condense visible objects into the air in front of them. And these objects are, they are hyper-words, they are words which you don't hear but which you see. And they are, and like objects they have sides, and facets, and can be rotated and examined from all sides.

Well now, the biases in our language that cause us to say things like "I see what you mean" when we mean "I understand you fully" shows that we really place a greater emphasis on seeing the truth than on hearing the truth. So, the truth seen is somehow more valid than the truth heard. And, uh, ayahuasca is a perfect example of a plant which communicates with a visible language. The mushroom, you often hear it, and often the hearing evolves into a uh, visible synesthetic field of photonic input. But the ayahuasca always communicates visually, and it's like the Mayan glyphs or something. It's this fantastically complicated surface which is conveying alien meaning. After an ayahuasca trip you just feel like your eyes are sticking out of your head because you've just been looking, a- as one looks as the page of a book, for hours and hours as this strange, uh, alien, uh, 3-dimensional language flows through your mind.

But I believe this is a human ability just under the surface, and that in psychedelic states of mind this happens to people. This is why all the fiddling with glossolalia, it's the hope of reaching, you know, that concordance of chemistry and that the moment will allow this to happen because it's for some reason very satisfying, it's like an utterly harmless siddhi- it seems to ha- it is true magic and the person doing it is utterly transported by their ability to project vis- visual beauty. But it appears to have no use other than entertainment of one's self and others, but eventually when it is integrated as a cultural mode I think it will be- it is what telepathy will be. Telepathy will not be hearing other people's thoughts in your head. Telepathy will be when you switch into the language which lets people see what you mean. It will be the "see what I mean" language.

And I think that, uh, psilocybin from the very beginning was catalyzing the language centers, and in fact the kind of language that I'm speaking to you right now is a prototypic type of this eventual development in human organization, and that this is the thing that makes humans unique, is this ability to make small mouth noises which are arbitrarily coded with conventionally agreed-upon meanings, which allows us then a vast control of a previously invisible, uh, linguistic space. And it's in that linguistic space that we have erected our cathedrals and conducted our pogroms, and gone about all our, uh, forms of business. And, uh, and becoming aware of this, of language as a thing to journey into, and language as a thing to avoid the pitfalls of. To be- you know, the Buddhists say "awareness of awareness" maybe it's easier if one thinks of it as "awareness of language," you know.

Q: I wanted to, um, pursue this thing of the visual language, because they'll have their mouth open and there will literally be these beautiful things coming out of their mouth with flowers and they interpret this flowery speech, but perhaps, uh, they were in fact doing what you're talking about.

Q2: Huh!

TM: They don't interpret that as flowery speech they call it that, that yes I think that's what it must have been. This is all very puzzling to me, and if anybody knows, if anybody is an acoustics person, or I don't know what's going on exactly, but the question of how- "what is voice?" and "what can you do with self-generated sound?" How neutral is it to your own organism? In other words, any of you who read The Invisible Landscape, the theory in there is that you take a certain drug, a certain plant, and you hear and interiorized tone which is not a psychological phenomenon, but rather it is actually the electron-spin resonance of this highly biodynamic molecules by the millions entering into the synaptic cleft and competing with the endogenous, uh, transmitter there for uptake.

And that this "mmmmMmmMMmmMm" is molecularly real and hence can be treated as a manip- a variable to be manipulated with the input of other kinds of sounds such as the sound which cancels it or sound which uh, reinforces it to then manipulate these molecules in, in one's body. And this is uh, this is really I think the frontier of shamanism world-wide, that everybody is trying to figure out how far you can go with sound, and what you can do with it and also how dangerous is this? How permanent can some of these brain changes be? And what is the mechanism? You know, is the electron spin resonance thing pretty close to it or is that just a myth, and that an entirely different set of coupling mechanisms are, are making that happen?

But all of the ayahuasca shamans are great hummers, and great controllers of their voice, and, uh, you know, they do operate on your body with light and sound, and there are sounds which can slice into your body. And, uh, and it seems to me this is where experiential and experimental work with these things should concentrate to try and understand just how much of humanness can we take control of?

How bound in are we? What do these special abilities mean and uh, and uh that tradition, if any, have anticipated them?

The thing--

The poster says 'The Syntax of Psychedelic Time: Fractals, Endpoints, End-times, Zero points', something like that. What all this indicates is a set of ideas that I want to share with you that are a slightly different tack than my normal lectures. My normal lectures deal with the psychedelic experience as a generalized and, uh, historical phenomenon, but this effort at communication is slightly more personal in that it's an effort to impart *one* idea that came out of an involvement with psychedelic, uh, substances: *my idea*. It is idiosyncratic; it is a psychedelic idea, certainly, but it's only one of, uh, an infinite possible set of such ideas. And the reason I spend time on it to communicate it to a group of people like this is because I think it can serve as an example of psychedelic ideas, uh, generally--how they're formed, how they operate, and what's so great about them. And, (perhaps with an element of ego) I think that this idea *intrinsically* has an elegance that makes it worth pursuing. But before I talk about that, I want to, uh, talk about fractals for a moment, as they are understood in orthodox mathematics, because the idea 'fractals' will serve as a basis for much of what I'm going to talk about. Fractals are technically defined as, uh, curves with a dimension greater than 1 and less than 2, or surfaces with a dimension greater than 2 and less than 3, none of which need concern us. What's important to know about fractals is that they have the peculiar property of, uh, presenting the same appearance at all scales. Uh, an examples of a fractal in nature or a fractal-like phenomenon would be a mountain range which, when you get up to it and examine small pieces of rock that are sloughing off the face of the cliff, and hold one up against the light, you discover that the edge of the small fragment of rock and the edge of the mountain range are in fact the same thing. And at first this doesn't appear startling because you say 'well, the mountain is made of this stuff, this small boulder is made of this stuff, and it simply...fractures the same way.' But actually, a number of issues are being touched on, uh, in this phenomenon. First of all, when you begin analyzing nature, you discover that, uh, many, many forms of phenomena are fractal. Uh, coastlines, islands, uh...the way processes condense, the way solids condense out of liquids in cheese-making, for example, or something like that. There are many kinds of processes where, uh, a single process is reflected and refracted at many levels of magnitude so that, uh, the whole and its parts and many levels within the whole composed of its parts all have the same, uh, structure. Some fractals have been known for quite some time, since the late 19th century, but they

were considered pathological curves because they had the property of, uh, infinite lengths in very short distances because they adumbrate themselves so intricately that their, uh, length can be said to be infinite. In the same way, you can understand that very readily if you can ask yourself "how long is the coast of California?" Well, it depends on h-what we mean by this, if you... because the.. smaller the unit of measurement that you use, the more detail that will arise. And, at some level, the unit of measurement is so small that it's smaller than the molecular interstices of that which composes California. And at that point the length of the coastline becomes infinite.

Ok, so you get the drift of what fractals are and how they've been treated by, uh, mathematicians, particularly one mathematician. You can't discuss fractals without giving all the credit there is to Benoit Mandelbrot because if you don't give him all the credit there is, he'll ask you why not. So, he has invented this branch of mathematics. He has perfected it, and he's given us, uh, marvelous books where you can see these curves, and I thought about making this a slideshow because the fractals are tremendously beautiful objects aesthetically, but I decided against that because I want to, uh.... hold to ideas. This is a think-along lecture, by the way, and you're free to think along at any point that you feel so moved to do so. [audience laughs and a couple of small claps]

Ok, so that's what fractals are for orthodox mathematics. The psychedelic part... and what I did with this was I began to think about time. I've always had this idea that our physics has failed us because it is not true to experience, and every advance in physics has been gained at the expense of moving the terms of physics further and further away from anything that could be called concrete experience, so that what we finally have is an integrated set of complicated equations that we are told correctly map at the microphysical or the cosmological level the objects of nature that we're interested in, but it does not come tangential to our experience. I'm sure you've heard me say this before. So I meditated on time, with the idea of fractals in the background, and I noticed certain things which are obvious except they have implications when the idea of fractals is linked to them. And they're trivial things, really. They're things like, uh, 'every day is rather like every other day, and every week is rather like every other week, and every year, and to some degree every century, and to some degree every millennium. But, I noticed that as you raise the ante on these temporal scales, change *did* become apparent, but at the daily level, every day is very much like every other day, but every day also is obviously different. And it's in the differences that we have the feeling of advance into a future, and, uh, and a feeling of, uh, completion. So, I took all these ideas and, uh, in the Amazon when we were investigating, uh, the beta-Carboline drugs, which were used in combination with DMT... I, uh,... under the influence of these drugs, fell into a long, extended meditation about all these themes. In fact, it actually went on for years. In fact, it's still going on in some sense. It was a true boost, and I looked at the I Ching, which I was familiar with but had never particularly been obsessed with, and I noticed something very interesting about it, which is: the King Wen sequence, which is the oldest sequence of the hexagrams, uh, a sequence which precedes any written commentary. When mathed for its first order of difference (and its first order of difference is nothing more than, as you pass from one hexagram to another, how many hexagrams change--[corrects himself]-- lines change. So

for instance as you go from hexagram 1 to 2, all lines change, so 6 is the value of that, 6 lines change. When you go from 2 to 3, there is another value, and I graphed the I Ching this way for its first order of difference. Now, in a random distribution, you would expect a fairly even distribution of breaks of orders 1, 2, 3, 4, 5, and 6, but, I found immediately that there were, uh, no 5s whatsoever, no breaks of order 5, and that there had been an obvious effort to, uh, optimize breaks of value 2 and 4, so.. that in itself, I mean, obviously it's ordered some way, so this wouldn't be too startling to discover a property like that. And I should pause for a moment and point out for people who have interest in the I Ching, that the I Ching is actually formed of 32 pairs. If you've ever looked at it, it's formed of pairs such that the second term in each pair is the inverse of the first term, except there are 8 cases, naturally, where inverting a hexagram has no effect on it. The obvious case is where you invert the first one. It's all solid lines, so inverting it has no effect. In that...in those 8 cases, the rule is 'all lines change'. And you see following the first hexagram, which is all solid lines, is the second hexagram, which is all broken lines. So, in studying the sequence of the I Ching, your problem is not really wh--'how are these 64 hexagrams arranged'? The question is 'how are these 32 pairs of hexagrams arranged.' So, I graphed the first order of difference as I mentioned, and, uh, and then I noticed a peculiar visual symmetry in my graph, which was: it looked basically like a random squiggle except that the beginning and the end of the wave were stereo-isometric reflections of each other. Now, what that means is that if you were to rotate in the plane an image of this wave without lifting it off the paper, you could bring the two graphs together and they would dovetail together perfectly at the beginning and at the end but nowhere in between. And this seemed to me a very powerful argument for, uh, order; that I had in fact discovered a previous kind of order that was implicit in this thing. Now, to some audiences I have to make a complicated apology about *Logos* and voices in the head and all that. I'll just skip that and say 'and so I continued working with this thing under the instruction of the voices in my head'. And...and, the first thing that I noticed when the wave was fitted together in this particular way, was that the hexagrams paired up so that they always summed to 64. In other words, 63 would pair with 1, 62 would pair with 2, 61 with 3, 60 with 4, and so on. So, it was as though a kind of magic square was being generated, where the I Ching was additive to itself in all directions on a grid. And so I took this forward-and-backward-running 64-term...glyph or graph and I said 'aha, it is the complete I Ching running forward and backward against itself'. Since it is the complete I Ching, all 64 hexagram, all 384 lines, I will follow the principle of constructing modular hierarchies. I will collapse it to the simplest term in a system...of levels, and I will treat this rather complicated looking thing as though *it were* a line, one of only 384, and then I, uh, then from there, over a period of years and many pencil sharpenings, we went to computers and produced very complicated versions of this graph and, uh..... then found a way to mathematically quantify it so that it could be, instead of a network of lines running forward and backward against each other, it became, uh, a single line running in one direction into the future.

Ok, so now, what's so great about this?..... In its own terms, it is a self-consistent idea about time that tries to be true to experience. It's saying that, uh..... time is made of elements. It is not simply an event-space, something required for things to have duration. You see, before Einstein, space was thought of as

a... the place where you put things. The necessary adumbration of a thing having *being* was that it be in space. Einstein came along and said, no, time can be thought of as a surface, as a continuum, as something which in and of itself can affect the outcome of the propagation of a beam of light or an electromagnetic field or something like that. What this idea suggests is something similar about time: that time is made of elements, and that what we intuit about time is more true to the facts of the matter than what physicists are telling us about time. What we intuit about time, and what astrology and all forms of prophecy and intuition and *clairvoyance* and all these things are are the idea that we can *know* about time by deploying our feelings into it, and, uh.... what this theory does is take what has generally been a very, uh, feeling-toned, intuitional kind of idea and, uh, mathematicize it and give it rigor, and say that with a very simple computer we can predict novelty. We can understand, first of all, that what is happening in the world of becoming, the world that we all experience as beings, is that novelty is entering into being and it is changing the modalities of the real world toward greater and greater levels.. of integration, and no matter on what timescale you view the universe, you see this happening. In other words, the universe, uh, in its early moments, is all chaos. There are...er, er...Temperatures are too high to allow even inter-atomic bonding, so there's only a plasma of stripped, uh, er, uh... particles, charged particles, and then as the universe cools, atomic bonds become possible and atomic systems come into being, which, which, uh, indicate a...m-more refined level of organization, and then later, much later, molecular systems and st--and on another level, stellar dust and star systems and organization of large aggregates of matter. Then life, and it represents another one of these quantum leaps in complexity, which is old stuff. But something else besides a leap in complexity is happening with each of these ingressions into novelty. What is happening is a speeding up of the speed at which these ingressions are happening, so that the early, uh, the first half of the history of the universe, you can say virtually nothing happened. Everything happened in the last half of the universe, uh, of the life of the universe. And, about, uh, a billion or two or three billion years ago, about 20% of what we assume to be the total life of the universe ago, life appeared, and then the mammalian line, the early mammalian line appeared 60 or 70 million years ago at the close of the dinosaurs, then we get culture, 25, 30, 50 thousand years ago. And very shortly after that, mathematics, and very shortly after that, uh, electronic circuitry, and there is this compression of events which, from the point of view of the historian, is the major thing that he sees when he looks at the history of the universe, but science has never mentioned this peculiar compression of events and densifying of complexity. Science takes the position that if that's happening, it's unimportant, and it probably isn't happening at all, and science goes to great lengths, though it admits evolution, to make sure that it arises out of non-teleological processes, and to make sure that it's always confined within the realm of biology so that a real..., uh, an orthodox evolutionist is very uncomfortable if you start speaking of stellar evolution or cultural evolution. I've heard these guys say 'if there are no genes involved, you do not use the word evolution'. See, they don't want to see it as a formative process touching the organic, the inorganic, the social, the psychological.

Uh...So, uh, I took very seriously this deepening ingression into novelty, and I said it is a physical quality

of the continuum that we're existing in. It is not a, um, a loose and unconstrained tendency, but it is a predictable tendency like charge, speed, momentum, that kind of thing. And I noticed something very interesting about the number 384, which, if you'll recall, is the number of lines in the complete set of the I Ching. The number 384 is 13 lunar cycles. There are 29.29, I believe, days in the lunar cycle, 13 of which gives you 383.89 days or something like that. So in other words, it's to within a fraction of the day, 384 days, so, I.... it suggested to me a calendar. And, then I noticed that in, uh, hexagram 49, which is revolution, it specifically says, "the magician is a calendar maker." And then I, uh, used resonances of this 384-day solar year, uh, resonances of 64. So, for instance, I would take the 384-day year and multiply it times 64. This gives you a period of time which is 67 years, 104.25 days. *That is*, uh, 6 minor sunspot cycles and 2 major sunspot cycles. Plus it also...in *The Invisible Landscape*, the other astro..logical... astronomical, pardon me, correlations are made clear. Uh, when you rise to the next level; when you take the 67-year cycle times 64, you get 4,306 years. This is, uh, very close to, uh, uh...let's see, half of the zodiacal age. In other words, the precession of the earth on its nutational axis requires about 25,000 years, and that is what is spoken of when they talked of the Piscean age, the Aquarian age. They're talking about how, through the slow procession of the equinox, it is moving from sign to sign, and it takes about 2000 years for a sign to be transited, so two signs can be transited in exactly the cycle of time indicated.

I've spent so much time laying this out because I've noticed that in other lectures that I've given of this theory, what has come through to people is the notion that I have a prediction about the end of the world, that I predict an end time. And then there's always lots of questions about "what is your eschatology, what kind of an end of the world do you foresee?" But, what I really, uh, am interested in is not the end of the world, but everything which precedes it [some audience laughter], and, uh, that's what this wave is looking at. And, uh.... by comparing the wave, with the computer, to various historical periods, *defining* the quality that the wave is describing as novelty, which is this form of connectedness, uh, we have been able to get very good fit between certain historical periods and, uh, and the wave. And, naturally, since the wave is a mathematical fixed entity, once you have a good fit to a historical period, if it's a very good fit, the wave will fit, then, all of history, so that you can... say you've been using Periclean Greece as your benchmark date with a certain idea about how the wave *must look* in that period, so then you find the configuration that fits, you say "ok, that perfectly fulfills my intuition about how the wave should look for Periclean Greece, however I have an equally strong intuition about how it should look for the French Revolution, so now let's, uh, scroll forward and see how it looks against the French Revolution. And, as the intuition of the fit builds, you define the number of, uh, applicable cases where the wave seems to be working, and we have done this and settled on a date which I discussed a little bit last time, which is November 12, 2012, and someone brought up that the Mayan calendar also predicts the end of the world, whatever that means. It simply means that your calendar spins off, uh, its axis and you have to reset your clock. Maybe. It may mean something else. [audience titters] Whitehead, who I'm a great follower of, had the idea of what he called 'epochs', and he pointed out that a constant, for instance, the speed of light, we'll say, which is a favorite constant, the speed of light has only been measured for about 80 years, and yet all of our physics

hinges absolutely on the supposition that this is unchanging over the life of the universe, 20 billion years. And, so what sample of 20 billion years have we looked at? Uh, we have sampled 80 years in one spot in the universe, and yet from that our physics is extrapolated. Whitehead had the idea of what he called epochs, which were, like, bubbles in the universe of possible time, and within these bubbles, certain laws were operating, and they would operate consistently throughout the bubble, but when you passed beyond the bubble, you found a different set of physical laws operating. And very recently, this idea, I noticed, has been brought back with this inflationary nothing cosmology that's catching on, where the universe may have a false vacuum bottom, and may be suspended in a much deeper stronger denser vacuum. But, what *this* theory is suggesting is that there are not only epochs of very long duration, such as the epochs which were in force when temperature and pressure in the universe were such that, uh, molecular organization couldn't, uh, sustain itself, we'll say. There may be very short epochs, where laws manifest that, uh, are normally hidden. For instance, the puzzle of human history is something like this. Uh, uh...a million, two million years ago, there were only monkeys on this planet, and a very advanced bipedal chimpanzee perhaps. Now, suddenly, there are, uh, atom-smashers and videogames, Barry Manilow, [audience laughs] all these things, and this has happened with startling rapidity [more laughs], and it well may be it is because *mind* is manifesting-- the constraints on mind as a force in nature have been lifted over the last 10 to 15 thousand years, and mind is claiming these new levels of freedom. And what I see happening, and this is why these lectures always seem to gravitate toward the future, is *we are living* in a very pivotal time. The time that we inherit from science is a time to humble you, to dwarf you. It tells you that the sun will not fluctuate for another billion years, that, uh, species come and go, and that, in other words, on the temporal scale, that you don't matter, and that *now* doesn't matter. But when you look at the release of energy, the asymptotic speeding-up of processes, we tend to be, uh, xenophobically oriented toward the human. So what we say is that, uh, human history is taking place. But, if you were an extraterrestrial lying off in your flying saucer and looking down at earth, you would not see species. This is a Linnaean, European concept that aids in the cataloging of natural products. What you would see if you saw biology is you would see a gene swarm on the planet earth, using species as the reduction valve as it flows through time, but only, uh, only generally. There are many other ways that genes are transf-f-f-transferred, through episomes and vegetative propagation and this kind of thing, which doesn't need to worry us. But, uh, *process* and information, which is what has been happening from the very beginning; the atomic system codes and releases more information than the plasma, the molecules have a similar relationship to the atomic systems, and so on right up until the cultural systems. And now we have reached the point where the culture is cohering, and, uh, we are becoming too big for the planet, all the natural resources are running out. All the political institutions which normally controlled the monkey tribe are breaking down, so that every man can *know* everything, which is not...which makes, uh, previous forms of social organization virtually impossible. All of these things, uh, are happening, and it is because there *actually is* closure into the shorter epochs. We can *now*, after almost a thousand years, if not more, of moving man off the stage and saying, 'no, man is not the image of God, man is not the beloved of the creator, we are on a small planet around a small star off on the edge of the universe, and our fate, if we have one, rests in our own

hands, if in anyone's'. This may not be true in the sense that, if we change our values and say that nature conserves complexity and *strives* for complexity, if that's true, then the human neocortex and human society are the most precious and advanced, uh, objects and organizational dynamics, uh, in the universe.

Now, I want to talk briefly about, uh, something which happened in the past which happened, possibly, hypothetically, and how it relates to this running into the short epochs where all time and culture and information seem to flow together in a kind of psychedelic, uh, eternity, uh, and information stasis, a kind of standing-wave hologram that is, uh, the now. I mean, I believe the poster says, "Plato says, time is the moving image of eternity," because we, we talked about that last time. Julian Jaynes, who was a psychologist at Princeton, talked about, uh, what he called 'the origin of consciousness in the bicameral mind', and he said that [clears throat] in pre-Homeric times...excuse me [takes drink]...what we experience as ego-consciousness was experienced differently by people, uh, in those early societies. What we experience as *our selves*, something which we completely dominate and somehow enfold in our bodies--this is the cultural metaphor that the self is inside the body--they experienced as outside the body and exterior from the ego and, uh, somehow independent of their own will, so that what we experience as the self and the ego, they experienced as a kind of disembodied god, or guiding voice, or inner spirit, or guardian angel. The important concept in all of this being that they experienced it as separate from themselves. Uh, and then Jaynes goes on to suggest that it was *traders*, who were people who passed from one society to another for the purpose of exchanging goods, who were the first cynics, because they realized that everybody's gods in different places were saying different things, and they realized therefore that there was something funny about these gods: that they were, in fact, somehow rooted in, uh, in human...psychology, rather than in theogony, in some sense. And, they became the world's first egotists, or the world's first individuated people, because they correctly identified a psychic function as arising from themselves and they integrated it. And, then, he goes on--I don't want to spend too much time with this--but then he goes on to say that it was the spread of trade, the rise of money, all these things, which broke down these dialogues between cultural wholes and their gods, and that, when it broke down, that was what shattered that, uh, world of city-civilizations that is the *true* ancient world, in other words, the world of Babylon, Ur, Sumer, Chaldea, the states which precede the Hellenic world, were shattered by the breakdown of this dialogue between the people and the god...and kingship. He talks a lot about how the kings assimilate, were associated with, this voice in the head, so everyone thought the king was speaking to them when they were told to...go pump water, uh...herd the cows, shear the sheep...whatever they were told to do.

Ok...I mention this, because, I think that something similar is happening in the present, and that, unwittingly Jaynes may have provided a, uh, metaphor for understanding this. We talked a bit last time about the flying saucer and how it was, uh, a projection of a future state of mankind, a mobile psychic entity, linked to the idea of the exteriorization of the soul and the interiora....interiorization of the body in electronic circuitry. I think that, uh, what we all experience as...our culture...fashion, rock and roll, politics, music, media....all of these things which we experience as the clothing that we must put on in order to be

able to talk to each other. This is a kind of god, or a kind of autonomous psychic function that has slipped out of our control, or which has arisen outside of our control as a legacy of this earlier, uh, uh, process of integration in the Hellenistic period, so that...phenomena like the Nuclear Freeze Movement, or, uh, the rise of the term 'networking', or, uh, all of these integrative, holistic, feeling-toned, you could almost say 'liberal', or you could almost say that liberalism in its classic 19th century guise is the first faint, uh, uh, uh-uh, sounding of this theme; this rising global humanism is in fact the rising into consciousness of a tribal god, similar to the kind of tribal god that functioned in..in these pre-Hellenic societies. And, however, in the present cultural context, cultural evolution is happening *so* fast that it is not going to take a millennium to pass through, you know, the first faint enunciation of the theme, the full-fledged exploration of the theme of, uh, cultural wholeness as exteriorized, uh, uh...God, or God-like mind to the integration of it. And, the psychedelic, I believe, are the keyyy to moving from wearing culture like clothes to recognizing that culture is this intensifying reflection of an aspect of the *self* and *integrating it into the self*. And, that's what all the hullabaloo is about, I think. And, I think that, uh, this is happening. And, uh, if, if the date 2012 means anything, it means, uh, simply that, uh, we can take that as...we can make a statistical model of what's happening and say that, uh, on, uh November 15th, 2012, a sufficient number of people will have integrated this state of global electronic self-hood that it will be uh, um....irreversible. That, up until a certain point, when any stochastic process begins to happen or when any...cascade begins to get going, up until it has a certain momentum, there is a possibility of many different bifurcations leading different end-states. But, once a certain amount of energy is in the system, then, you know, you can say it's going to go all the way, and I prefer to think of....I prefer to probabilitalize all of these predictions of the end of the world and to think of them simply, uh-uh, the way you think of a particle in the quantum mechanical model. When we assign a position to the particle, we understand that the particle isn't at that position, that that point is merely the center of a cloud of probably positions, any one of which could be occupied. Nevertheless, outside of a certain short distance from that point, the probability of finding the particle drops off asymptotically. So, it's a cloud of probability, and this date up after the first of the century is the center of a cloud of probability. Now, what kind of ethics decline from that kind of a position. It seems to me obvious that the first thing that's apparent from that is that you don't sit around *waiting* for the apocalypse. You understand that as soon as you push yourself over the brink, you've done the major piece of work that has to be done in *your cosmos*. From then you just sit around, uh, watching it happen. So, uh, it's an invitation...we're, we're all very fortunate. It reminds me, and I probably mentioned this last time, I think about it fairly often, of the Irish prayer, 'May you be alive at the end of the world'. Uh....probably we all have a very good shot at it [audience laughter], but I have no idea what the probabilities are for any one of us. Uh...I've spoken of this tonight more in its operation terms, rather than in the 'gee whiz' kind of terms, which I did last time, where I painted a picture of what it will be like to invoke this global electronic, uh, uh, aspect of the self and to integrate it. But, these ideas about collapsing time vectors, about history having an end, about, in fact, history being the shockwave of an event at the end of time, these are the ideas that religions handle, uh, fairly well...I mean, not religions so much but theology. Religion tends to concern itself with, uh, with public morality. But, underpinning religion is

theology, and it seems to always, at least in the West, meaning in Judaism, in Christianity, in Islam, and in all of the spectrum of cults that each one spawned, or, and continues to spawn, there is this wish to put an end to time, to close it off, to redeem us from the cycle of becoming. And, I think that the reason these ideas are so persistent in the human psyche is because, uh, all of history can be seen, in biological time, as so brief that it is simply, uh, a prelude and an anticipation...[end side 1 of tape]

[start side 2 of tape--ambient music in background]...so that they actually look down on their culture. They become extra-environmentals is a way of putting this: they act the role of the extraterrestrial. And, and, uh, we all connect the role of the extraterrestrial when..and do, when we adopt this extra-environmental position. It can be viewed as alienation if what arises out of it is, uh, uh, a feeling of forlornness and being 'cast into being', as Heidegger says. But, that need not *necessarily* be the feeling. The extra-environmental is also tremendously, uh, freed from the cultural conditioning. And, when you travel, you are always an extra-environmental and, extra-environmental and, you have a, uh, very deep insight into societies that you may only spend a short time in. Uh...I think the emerging archetype of the other or the alien is an effort to integrate alienation and actually make it a positive thing. And, I think I mentioned either here as Will [last name?]'s show about ET and how clever this was to make people identify with something which looks like a cross between a can of anchovies and the Pilsbury Dough Boy [audience laughter] and to actually....you know, *love* is what that movie is about and it's *alien love*, and, uh, it's a very important form of love to cultivate, because this process of integration of the electronic overself that is one way of looking at the end of history; that is, uh, that is the process that we're all involved in, and psychedelics, uh, which I haven't mentioned too much tonight, but which I hope you realize are the, uh, entire source *and* motivation and *raison d'etre* of all of this, because what psychedelics are doing, uh, are they are anticipating this future state, this electronic global information organism is, in fact, already present in the same way that most of the future is present in the past. I mean, think of any point in the past. Think of 1950. Think of how much of today was present in 1950. It means that this idea that science fiction has sold us that the future is a total other world just up around the bend, it isn't actually true. The future is, uh, 95% present *in the present*, and it is that 5% that eludes us that we will provide the great adventure for the next 20, 30, 40 years as we come to terms with the fact that, uh, we are moving off into the human imagination. That's what this godlike thing is. It is not a filled space, a loving figure, an angel, a god, or a demon. It is an empty space, a space which we will fill, uh, with our dreams, essentially, because our dreams have always been the appetite [an Alfred North Whitehead term] leading us forward into history. But, we have not understood why, especially over the last 500 years when it's become very unfashionable to believe in dreams and visions and revelations, but I think actually the faith is well-founded. It's well-founded because of the nature of the physics of time, and that is a physics that your own experience will reinforce for you if you, uh, if you examine it carefully enough. Thank you once again very much. I think we're gonna have a brief break and then, uh, questions. [audience applause] Thank you. [ambient music still playing in background]...[tape edit]

...There's no question that what the human imagination has now taken to itself so much power that it can no longer remain on the surface of the planet. We sort of have to part company with the planet for our own good and for its, and, uh, it's just a, uh, commonplace of evolutionary theory that every frontier presents a

genetic barrier, because only the hail, the hearty the adventurous, uh, the healthy go. Certainly space is going to be the tightest genetic filter of that sort that has ever been, uh, laid on a human population. It's said that, you know, the dynamics of North American society are due to the fact that we're...we can all trace ourselves back to misfits and malcontents and religious screwballs, and all these people who were out of it relative to Europe came here. A very similar thing will obviously happen in space, uh....but your question is interesting. I can't quote him exactly, but when I spoke in Santa Cruz, Tim Poston, who's a mathematician, after it was all over he s--he quoted a modern poet saying, "It won't end with a statue of Jayne Mansfield 50 miles high. It won't end....," and he list several things. It will just go on. It will continue and continue and continue, and perhaps that's what human society will always be about. Perhaps there will always be a tacky element and we will always [audience laughter], uh, 'flop on the seamy side' [quoting James Joyce's *Finnegans Wake*], but I'm not sure. I'm not sure. The things which we take to be so basic to humanness, such as all that that I just mentioned, have all arisen *since* this hypothetical moment in Julian Jaynes' theory, when we integrated the ego. Perhaps, uh, integrating the super-ego will actually make us stand taller and see more clearly into each other's needs. Uh...I think that the old evolutionary model, which was that evolution was the struggle of the fittest and the devil take the hindmost is pretty much discredited, and we now understand that, uh, what is maximized in evolution is not the, uh, sharpness of the fang or the, or the length of the claw, but the ability to cooperate with other species harmoniously [audience applause]. That's what's being maximized. Every parasite...er, or, I mean, every disease wants to be simply a benign parasite. No disease wants to see it's host die, because then the party is over for everyone. Uh..so, I would say in answer to your question, I'm hopeful, but I certainly, uh...human's are a perverse lot, and I suppose, reasonably, what one can hope for is incremental advancement toward the good. I studied political philosophy under Joe Tussman, and one of his favorite remarks he used to say to us was, 'When you look around at the world, it's a terrible show to be run by angels, but if you think of it as run by monkeys, *pretty amazing!*' [audience laughter] Another question...any other question...yes.

[male audience member]: Yea, I'd like to know if, uh, you've had any experience with ketamine, and, uh, what you think of its place in the future and....whatever.

[Terence]: Interesting question...what, what about ketamine? What do I think about it? Well, different things. First of all, uh, you all know what ketamine is, or should I briefly sketch it. Ok, this is a psychedelic drug that's recently come on the scene that, uh, is what's called a disassociative anaesthetic. It was used as a veterinary and children's anaesthetic from the early 60s onward and it was..only slowly was it realized that, uh, at low doses there were peculiar psychic phenomena, and, uh, i-i-i--when done as an anaesthetic, it's done 600 mL IV push. That means straight into the vein under pressure as fast as you can, 600 milliliters, which would be just like being hit by a truck. But, when it's done for its...I don't like to say 'recreationally', so, when it's done for it's, uh, 'psychic' effect, it's done like 100 milliliters, IM, into the muscle. And, uh....it's a, it's a....troubling psychedelic, because a lot of people, I think, are doing it who have never done any other. And, I think that would be very, very misleading. I..When I did it, the first thing that...my first reaction was..complete amazement that, here was a category of experience that I had no idea existed. In other words, it was a slot on the bookshelf that I didn't realize was there. It is not like mescaline, not like LSD, not like psilocybin, not like DMT, not like ayahuasca, not like any of these things, and yet, you cannot get away from the fact that it's a powerful psychedelic. So....it'sss, it's useful for that alone, to further expand the definition of *what is a psychedelic drug*. The problem that I have--I have two problems with it, and both of them may be..curmudgeonly on my part, so you don't have to take it from me. The first one is that it's very easy. The first thing that happens after you've done ketamine is that you cease to be concerned that you've done ketamine [audience laughter]. Before there is any other effect that effect takes

hold [audience laughter]. And, uh, that's a funny thing. I'm on, on these tryptamine hallucinogens, you are fully aware that you have taken a drug, that you're walking on egg shells, that you should keep yourself alert to what's going on, and, and....In other words, it puts you on your toes. You know you're in a dimension of risk and opportunity, and you comport yourself that way. On ketamine, your definitions dissolve so completely that it's a major accomplishment to realize that you're a human being on a drug. You keep discovering and losing that realization. You keep saying, 'Oh yes, that's what it is; I'm *somebody* and I'm stoned *somewhere!* And that's what this is...now it's coming back to me.' Which brings me to the second thing about ketamine which is, uh, puzzling, and this is a problem with all psychedelic drugs, but, but, you have to, sort of, get a 1-life strategy for dealing with it, because it's important to overcome, and that is, it's very "state-bounded," which is the that the psychologist Rolland Fisher coined, which means that you can't remember anything about it. It's like an intense dream where you're intensely dreaming, and the alarm goes off, and as you stumble to the shower it's just.....and there's nothing there. And ketamine is very much like this. There's..while you're on it, there is a complete conviction that this is of staggering import to you and mankind [audience laughter]...and then, it is just totally mercurial and elusive and slips away. Now, that, in itself, is obviously an interesting experience, and, uh, so ketamine seems to teach obliquely. It teaches you that there are psychedelic states that you might not have called psychedelic. It teaches you that there are wonderful insights that totally, uh, elevate you that you can't remember 15 seconds later. So, it sort of teaches you the richness of mind, but, uh, by, uh, example, rather than by the imparting of information that you can take away. And, then, whenever this question is asked, uh, unlike my acquaintance John Lilly, I always feel like I *have to* say to people that, if you're going to take a new drug, you should go to the medical literature read it, and I know there's this much in reprints on ketamine, because I have it. And, what it will tell you is that, um....there's a kindling effect, which means each time you do it, it is easier the next time to get loaded. Uh, however, on the, uh, neurophysiological level, er, or the level of

an electroencephalogram, this kindling effect is....can be cons---I don't want to say it's dangerous. I just want to say, it's a warning sign, because the same kind of kindling will proceed, uh, petit mal seizure and other forms of seizure. Let me say, though, on this matter of drugs and how you judge them, especially now, since there're so many drugs in the MDA series making their way into society: MDA, MMDA, MDMA, MDM--MMDA-2, a whole gamut of these, and there will be more down through the years. I've always taken the position that it was important that the psychedelic have a relationship to a plant. And, uh, that's almost a perfect fit for me, because I approve of psilocybin and it comes from a plant, and mescaline and it comes from a plant, and...uh, LSD is sort of problematic, because the LSD-25 that is what most people are familiar with, is not from a plant. That's a creature of pure, of the laboratory, but, uh, analogues, active in the milligram range, diethyl, uh, ethyl lysergic acid amide, uh, occur in morning glories of several species and in ergot, er, uh, and in some cases non-toxically. So, I....as I live into the 80s, it's becoming harder and harder to maintain this thing about the importance of the plant, because, so many people don't..can't imagine what you're talking about. They are totally devoted to one or another completely synthetic drug, and are having revelation and, uh, loving insights and all these things, and, so, I feel a little bit like a Puritan. But, until I know more about it, for myself, that's sort of the categories I'll work with. Also, I'm...the, the plant drugs almost always have a shamanic tradition associated with them that's several thousand years old. So, they're use-tested in human societies both for psychic effects and for physiological effects, uh. If a drug has been taken for 10,000 years, chances are, it's fairly benign.....Any other questions, yes...

[male audience member]: I was wondering, if you've read, in the introduction of 'Psilocybin' by Oss and O.N. Oeric, a statement that the authors purport to be from the mushroom, whereby the...mushroom offers

a possible symbiont...for the humans....offers to give information on how to build spaceships, and, what, uh...what do you think about that and what do you think about the symbiosis between humans and mushrooms, other than, you know, just taking mushrooms, is there....this....have you ever reflected on this...er, have this this introduction?

[Terence]: I've read that introduction, yes. You're a brave man to ask the question. Uh...Oh no, I shouldn't kid you...I wrote the introduction. [audience laughter] Because, I am O. T. Oss and my brother is O. N. Oeric. I can tell you this now, because this book is going out of print. Uh, well, when we wrote that, that was, uh, that was straight transcription. That's what the mushroom said. Uh...I don't know exactly what to make of this. These things stretch our....uh....our, uh....categories, because we, s--we, because it deals with our own definition of humanness, uh.... It's curious that the psilocybin mushroom that my book, or that our book is about, occurs in the dung of domesticated cattle, the Indian humpback cattle, *Bos indicus*. Uh, so that it has been since very early in human history, in a sense a symbiot of man, because a symbiot of a domesticated animal, wh--which man had a symbiotic relationship with. And, when you study symbiosis, uh, among lower animals, you often find this situation where it isn't simply two species involved, but three or even more. Uh...the mushroom has this peculiar ability to invoke, or allow, or trigger a voice in the head, this Logos-like phenomenon of information unrolling in your head. Uh...no other drug that I'm familiar with does that consistently. And, our model of what psychedelic drugs should do has no room in it for this. Our model of what psychedelic drugs should do is derived from Freud and then secondarily from Jung. From Freud, we derive the idea that the psychedelic drug should, uh, introduce you to neurotic thought processes, repressed memory, traumatic experience, um.....g-guilt, uh.....-laden incidents that have been forgotten, this sort of thing. From Jung, we inherit the idea that beyond that, there is a landscape of myth, and that we will encounter the great...mythological motifs of the collectivity of the human psyche. What psilocybin seems to be saying is that, yes, these two areas do exist, but beyond them and far larger than them, if we can speak of such dimensions in terms of relative size, there is an area which has very little to do with humanness, collective or particular. It is simply like a landscape. It is a world in the mind, but not related to our neuroses or our religious, totemic, and mythological figures. It is in fact highly independent of the human ego, but nevertheless discoverable, uh, uh, through these drugs. And, uh, in those dimension, we come up against things like, the voice of the mushroom claiming to represent a galactic form of organism, or, uh.....wh-wh-what are conventionally called angels, or demons, or jinns, or afrits; in other words, these traditional, but rarely encountered by modern people, autonomous forms of psychic existence, and we have no models for those things. For our civilization, the other, if it exists, can only come from the stars, in ships. It must be a carbon-based lifeform with the political and social and intellectual aspirations similar to ourselves. Science is not yet ready to entertain the idea that all points in our universe may be co-tangent, that every form of intelligence in the cosmos may have the potential to communicate with every other, in the here-and-now, eh, simply because to do this science would throw open a floodgate of information that it cannot deal with. The repression of magic has been a very important part of science's program for explaining the world, not because science has anything, uh, intrinsic....an intrinsic antagonism to magic, but simply because magic, if tolerated, would unleash more information than any scientific theory can cope with. Scientific theories must first limit the amount of information that they're dealing with before they can begin to model things. So, in answer to your question about the mushroom and its role in human history, I've gone through many changes about this since the mushroom began talking to me, since I wrote that forward. I have a manuscript now, which, uh, one of the titles that we toy with for it is, uh, 'Alien Intelligence and Psilocybin'. Although it probably won't be called that, a lot of what it deals with is that, is the fact that post-modern people, which is you and me, are getting in touch with something which modern, the modern worldview, cannot handle at all. For modernity, voices

in the head are a clear instance of pathology. And, yet, for the Hellenistic world and the world--the post-modern world, voices in the head are a clear, uh, aspect of, uh, following the path. And, this was classic before the rise of the forms of reductionist thought that characterize modern thinking. Socrates had a daemon. He mentions it many times. It told him what to say. It helped him with what he should think, and, uh, it was a commonplace for sages and philosophers of that time to make that kind of claim. Psilocybin places it within the reach of modern people, but it also, by so doing serves to demonstrate that the old models of psyche, Freudian and Jungian, just won't serve. [Audience member says something] I don't think that these things can be reconciled very easily. I think science, if it's going to take up the Enochian tables and that sort of thing is going to transform itself to the point where it will no longer *be* science. Uh, Paul Feyerabend, who lives in Berkeley--I don't know if he still teaches--has written a couple of books, one called 'Against Method' and another one called 'Science in a Free Society', and he makes the point there that, uh, science has really become an enemy of the free society, simply by virtue of the fact that it ca--it wishes to, uh, arbitrate *all models*. So that, somebody says, 'well, I believe that the universe is such and so' and everyone says, 'well, go ask the scientists if it's true or not'. Uh, this is a staggering amount of power for, for any group of people to have, especially a group of people whose accomplishments, and I'm not now talking about the technicians and the engineers but the scientists, what they have accomplished is only to give us an unrecognizably abstract model of the world. Uh, so I would prefer a world of intellectual pluralism, where, uh, astrology, and astronomy, and kabbalah, and information theory, and all these things, worked in their own area, but no one claimed pre-eminence, because, you see, this claiming of pre-eminence, uh, rests on a false assumption. No idea can be dismissed that is internally consistent. There's nothing more than that. Science is not...*more than* internally self-consistent, and astrology is not *less than* internally self-consistent, so why should these things be placed on two different levels in terms of, uh, arbitra--uh, being arbiters of the truth.

So, I think that, uh, that there will be, by psychology for instance, fringe human abilities and things like that discovered, but I think higher magic will always operate according to the laws of higher magic, and that this will be a closed book to science, simply because of the nature of the premises of both, uh concerns. One of the things I didn't get to say about this time theory that I've put down this evening was that, uh, it's a very anti-scientific theory. It cannot be integrate---this is not merely a physics of time that can be grafted onto orthodox and have science survive, because what I'm saying has, uh, certain consequences in the realm of cause and effect and experimental design that make what is normally called a scientific experience, out of the question. And, another untestable hypothesis that riddles science from end to end is the idea that if A causes B at time F, then A will cause B at time anything else, and that's just obviously nonsense in any realm where we experience things, but it's necessary to believe that....and, so what science ends up being able to do (this is interesting)...science, then, becomes a way of explaining anything which happens the same way over and over again, regardless of the time that it happens. We could almost describe science as, uh, the descriptive, uh...that branch of human knowledge which is concerned with the description of those processes which are not effected by the time in which they occur. And, those proc---and none of those processes are interesting to living, thinking, feeling people, because everything you experience is unique, every moment, every event, every person, every situation.

So, what happening, here? Something is happening to the monkeys. And, it's very dangerous. And, it takes about 25,000 years to happen. It's a mad rush, because for it to happen, the most dangerous processes in the universe have to lie 'present at hand' [Heidegger terminology]: nuclear fusion, nuclear fission, so--uh, social control, genetic control. Everything has to be possible for the Good to be possible. The species is completely...free to mirror itself. That is, in fact, what this test is about. What freedom means is, you find

out how good you are by discovering what you do when you have the power to destroy yourself. And, we, as a species, are in that position, and no one can do it but us, and, if we do not destroy ourselves then, very obviously, the intellectual tools that we have taken in hand are the tool which will send us, uh, out to the stars. Now, as far as this idea that I talked about tonight about, uh...temporal fractals and the nature of time and that sort of thing, that is only one aspect of this conquest of reality by information. And, I think you can see, if you look back through biological and cultural history, though no one, so far as I know, has ever actually described it this way: What it really is, is a conquest of dimensions. With the earliest, uh, forms of life, you get...they are like the amoeba. They essentially have a tactile perception. They can only perceive what they are immediately physically in contact with. And, then, in slightly higher organisms, you get the evolution of cells which distinguish light and dark. So, there is at least the idea of a sense that there is something out there that comes and goes that cannot be tactilely recorded. It's the coming and going of light. But, then, as organisms advance in complexity, the eye is where the evolutionary thrust comes once you get past the eye spot. Then, uh, there is sense of things at a distance, which do not tactilely impinge on the organism but nevertheless have importance for the organism. They are distant pieces of food, or distant enemies, and, uh, the organism learns to move forward or away from these things, and toward or away are dimensional concepts. Then, when you get truly mobile organism, you get, uh...for instance, like monkeys or that sort of thing, they move in a much larger control space, and they move through it to grasp what they desire, and, and you get the evolution of a tactile sense that is under the control of the eye, and then, uh, that essentially ends with the binocular vision and the bipedal locomotion. That ends the conquest of physical dimension for biological objects, but then you then get language, which seems to have something to do with time, because language allows memory, and the re-collection of memory, so that past states can be brought to bear on the present with an eye toward anticipation of the future, and suddenly you realize that what language is allowing this organism to do is to claim a whole new dimension. Language, then, is a dimension, uh, a dimension-exploring vehicle of some sort. And, to what degree, we don't know, because, for instance, obviously, as animals, we contact the dimensions 'past' and 'future'. These are dimensions with great importance to an animal, because what you learn in the past may keep you from being eaten in the future. But, then, once you have the luxury of civilization, we get language applied to subjects which are neither related to the past or the future, like mathematics. And, lang--mathematics is a language, which has gone out and described, uh, multidimensional spaces.

[tape cuts out]

I think that, er, nothing is more exquisite than the interior music, and all music is obviously an effort to approximate this interior music, and, I don't know if it's apocryphal or not, but I'm sure you all know the story of Beethoven saying, you know, if you, 'if you could hear what I can hear, you wouldn't bother with what I've written, because, it's just..compared to what I'm hearing.' Uh....you have to....it's, it's a knife edge, because the music does lead deeper into these visionary states, but I still think that once you are where you want to be, that if you can cast loose from exterior musical input that this interior music will rise into perception and reward you for that. Uh, the way that I take psychedelic drugs seems very natural to me, but then when I describe to groups of people like this, I realize that people have all kinds of styles, and this caus--this has caused the psychedelic experience to be sort of blurrily defined in the mass-mind. My idea of how you take a psychedelic drugs is that you reduce sensory input as low as you can without the reduction itself becoming an impediment. In other words, I'm not talking about isolation tanks and all that. I'm just saying a dark, quiet, calm, cool, empty room is the best kind of situation. And, uh, some of the most interesting trips, that I've had, have been to the accompaniment of a single sound, which is simply a drone, it's like the *bindu*, the seed around which, then, the multiplicity of the hallucinogenic vision can

gather itself and constellate. I mean, I blush to tell you this, but some of my most interesting, uh, trips have been to the accompaniment of my floor heater [audience laughter], which makes a buzz like a refrigerator, and that buzz becomes, you know, the cutting edge of a light, which is like a comet, giving off, in the eddies of its trail...hallucination, all the hallucinations there are. So, I think that, m-music is intrinsic to everything that we are talking about. We are aspiring to the condition of music, and we need music, therefore, we should have it as an exterior input, uh, when we can have it no other way. So, saying that musi--that I don't listen to music during those states, is not a put down of music, uh. Music is obviously the ideal, because it *is* one of these tonal languages that you understand by hearing. It is an *Ursprach*. It has...it's a language of emotion, yea...

[male audience member]: Real quick question...according to the, um, to the graph that you've developed, it seems to me that the end date that you've pinned down, that you could have almost your own running biorhythm chart based on this graph and you tell whether novelty's gonna be coming up in the next week or three months, or...have you gone that far?

[Terence]: Oh yes, definitely. One of the things that I do is I have a counseling service called 'Anamnesis', and the reason I organized it as a counseling service was because I wanted people to interact with my Wave on the level of their personal history, and I didn't want them to be contaminated by being my friends, so I basically just advertised this service in 'Common Ground', which says something about 'Understand novelty in your life, maps of the past and the future', this and that, and then people come to me and I interview them about their life, and we search the wave for a good fit to their life and then we integrate their wave as a statistical component of the larger wave and then we can make maps of the present, the next six months, the next ten or fifteen years, at different levels, and then people live it out and see if it works, see if when the graph indicates novelty in their life should be increasing, it is increasing, and when it shouldn't be it doesn't. It's like I've invented one-term form of astrology. It only talks about novelty. It tells you when it will go up, when it goes down, when it will go down. It doesn't, in any given situation say *what* will happen. It only defines the level of novelty that must be fulfilled by *whatever* happens.

[tape edit]

Synchronicity...you see, what, what's, um, one way that I think of this Timewave is, orthodox chemistry, biology, uh, probability theory, all these things, go together to describe what..mm..is possible. So, you say, you know, could an asteroid strike the earth? Let's ask the scientists. And, they say, 'well, yes, it's possible, there are enough of them. the probability is very low'. Or, you say, you know, 'can we cleave this molecule with the input of this energy?', and they say 'well, yes, it's *possible*, physics allows for that'. But, what my theory seeks to describe is not what is possible, but what out of the set of all possible things, why is that certain things undergo the 'formality of actually occurring' [an Alfred North Whitehead concept]. It is as though they are selected at of this vast pool of possible things, things which could happen without violating any known laws, but out of that vast reservoir certain things undergo the formality of occurring, and once they have occurred, the fact of their occurring has defined the level of novelty in that now-passed moment. And, so, that's what...it's like this novelty wave is a...an additional variable which has to be added into physical laws. It's the variable which dictates what, out of the possible states, which ones actually are realized. And, it's the flux, the coming and going, of that wave of novelty which controls that. Now, if you're in a highly novel situation, then, you get what Lilly calls Cosmic Coincidence or Jung calls synchronicity. You get obvious connections which have no obvious casuistry behind them. They..s-they are connected through meaning, not through the chain of cause and effect. And, that is simply happening

because the level of novelty is so great that these sideways connections are beginning to come apparent. And, at the end of time or at the ingression into this higher dimension, I think this will become excruciatingly, uh, present in the foreground of our experience. In other words, synchronicity is getting stronger, coincidence is getting stronger. The world *is* becoming more irrational. Science *did* work better in the 19th century [audience laughter] than its working in the 20th, because reality is slowly slipping through it's fingers. There was a maximum moment when the dreams of science and the nature of reality overlaid almost perfectly but now reality is growing beyond it and pulling away from it, and, uh, I think soon, I shall be pulling away from this meeting.

Thank you very much. [applause]

The Transformations of Language Under the Influence of the Psychedelic Experience

October 1983

Location, Berkeley, California

Description

- [Audio Link](#)
- [Transcription](#)
- [Other links](#)

So, I've spoken about five times about various aspects of the psychedelic experience to audiences here and at Esalen and in Santa Barbara, and, one of the things that is a personal interest of mine that stands out from the general background of the psychedelic experience is the way that it throws light on language, and I discovered that, uh, audiences seem fairly responsive to this question even though it seemed to me, at first, fairly hard to articulate it, and fairly hard to say too much about it. So, tonight, to indulge myself and anybody else who has a particular interest in this aspect of it, I want to say more about it and maybe talk for 40 minutes or so, and then, uh, take questions. And, I think it's by talking, uh, it's-it's perhaps a tautology to think that by talking about a linguistic phenomenon or a linguistic problem you can illuminate it. But, uh, I'm interested in how it strikes other people and the kind of dialog that can be generated by, uh, talking about it.

First of all, to background what I'm saying a little bit, I recently ran across, uh, a very interesting, uh, analogy or metaphor that seemed useful to me, which was- it was a historical analogy- saying that, uh, when civilizations come into crisis they inevitably- one of their strategies for survival is to cast back to an earlier period of time, an earlier cultural ideal, and then to try to exemplify its- to exemplify its values, and, as the obvious example and the most recent, uh, phenomenon of this sort on any large scale is the Renaissance in which the breakdown of Medieval society and the rise of mercantilism, uh, generated a need to cast back into time for a set of values and then to realize them. And, the period of time that was chosen was Classical, uh, Greece and Rome. And, so painting, sculpture, poetry, reflected an effort to recapture Classical values.

Um. What I think is happening in the present, and by 'the present' I mean the whole 20th century, is, uh, a similar thing, a similar culture crisis, but on a much grander and more global and more threatening scale and a casting back for a previous cultural model that can- whose ideals, if we could realize them, would save our own civilization: the same idea that the Renaissance had about Classical, uh, Greece. But, strangely, the period that we have decided, that we have fastened on without ever making a conscious decision, but as a reflection of decisions made in the mass psyche of the species, the period that we have settled on is the Archaic period, which *precedes* human history. And, so, uh, Cubism and, uh, uh, the things that were done for literature by Joyce and Pound and the, uh, glorification of barbarism and the recovery of the unconscious, first the sexual nature of the unconscious through Freud, later the mass archetypal, uh,

structure through Jung. In other words, the great movements of the 20th century, even Marxism, can be seen as efforts to recapture, uh, prehistoric sacral values. And, this process has been going on for 50 years or so, different adumbrations of it at differing times. And, now, and for the past 10 years or so, the theme of shamanism, the rediscovery of paleolithic religion, and the rise of the use of hallucinogenic drugs, which were the driving force of paleolithic religion has, uh, come into the fore.

Well, ok. Holding that in your mind for a moment, recall, uh, Marshall McLuhan's idea that, uh, technologies for conveying information shift ratios in the mass psyche in the way that it relates to the world. And, he, uh, was famous for partic- predicting what he called electronic feudalism: he said that the, uh, the television screen was more like a page of manuscript than a page of print and that, as the linearity and uniformity and rational, uh, assumptions of grammar were transcended in the conveying of information to be replaced by electronic gestalts that were looked at rather than read, that, uh, the ratios between the, uh, senses would shift and that this would have profound effects on art and the history of ideas and this sort of thing.

What is happening is that a kind of super-McLuhanistic phenomenon is happening where we are collapsing, not into the electronic feudalism that he discussed, but into, uh, the electronic tribalism which he discussed, and it is shifting our, um, sensory ratios away from, uh, the audial and toward the visual, and this brings me now to my subject, which is the transformations of language under the ps- uh, under the influence of the psychedelic experience. The fact that there is a spectrum of vocal and psychological and psycho-mental phenomena that range all the way from, uh, the recess- the recitation of learned material through freely formed speech and into these trance-like, uh, religious phenomena that go under the category 'glossolalia'. And these things are experienced, uh, by the people who do them as having a varying relationship to the visual rather than the audial sense.

I've- we had a discussion a couple of nights ago with Ralph Abraham about when you are, uh, asked to conjure the idea of an orange, what is this idea made out of? When you close your eyes and think of an orange, is what you think of made of language or is it made of light? And, what you say in answer to this question, what does it say about you and your, uh, the way in which you're embedded in your culture? Under the influence of psilocybin, particularly, uh, the language-forming centers are activated, and they are activated in s- in tandem with, uh, the visual cortex, so that forms of synesthesia are experienced which are linked, first of all, to sound, so that people singing control the fabric of hallucination through sound, and we found this to be true of ayahuasca in the Amazon where definitely the shaman's use of voice controls the fabric, the visual fabric, of what's going on.

But, there is yet another level to that phenomenon, which is: with the addition of meaning, the control of the visual surface, the topology of meaning, if you will, rather than the ongoing decoding from a dictionary, is, uh, is transcended. Meaning, then, is able, also, to work its adumbrations on this topological surface, and you see into, um... well, there are different ways of cognizing it: the place where the *ursprach* is coming from, the assembly language that lies behind all formalized or culturally, uh, validated languages, Wittgenstein called it 'the Unspeakable'. It's, it's the place where explication cannot go, almost by definition, in order to avoid a tautology.

Well, now, it seemed to me that, uh, uh... the nearness of these tryptamine hallucinogens to normal metabolites of brain chemistry and the fragileness that people like McLuhan and Julian Jaynes have shown to be, uh, a part of the way we construct our world; in other words, that it's a delicate balance of chemistry

and language and history, uh, *and* these sensory ratios; that, given all this, it seemed probable to me that this phenomenon encountered in deep psychedelic experiences with psilocybin actually has a potential historical impact. It is a kind of human ability which is, at present, submerged in the psyche, contactable only by the shamanic means of journeying into historical hyperspace; in other words, of going into that place where the adumbrations of the future are intense enough that you can have, uh, an intimation, at least, of what is to come. And, I think *this is* what is to come, and it is a kind of telepathy, but it's not telepathy as we imagined it to be. I sa- I- when I imagined telepathy, I thought of it as hearing another person think and having them hear what you think. This is something where the modality of meaning is shifted out of a common dictionary that is, uh, a cultural convention, and into a, uh, a shared visual topology which is examined by both parties, both the speaker, who caused this thing to be, and the audience, who shares the space where this is happening.

Uh, it's interesting that, uh, beta-carbolines, which are used to, uh, accentuate the hallucinogenic effect of DMT in these ayahuasca preparations in, in, uh, Amazonas, is, um - is, uh, very definitely a part of normal human metabolism, brain metabolism. And, the MAO-inhibition that it's performing on, uh, DMT that is, uh, introduced from the outside is a mirror image of the kind of function that it's performing in the brain. So, the shifting of these sensory ratios is causing language to become more visual, and at this point I always have to quote Philo Judeas, who was a first century Alexandrian Jew who talked about the Logos. And, I have made analogies between the phenomenon I am describing and the Logos. But, in the critical quote, what he said was that a more perfect Logos was possible and that it would be a phenomenon which would pass from, uh, the modality of being heard to the modality of being beheld without ever crossing through a quantized point of transition where you could say it was one, now it is the other. And, I think, uh, the cultural shockwaves that will be generated by the emergence of visible language will so- will totally transform the culture to the point that the point beyond the end of history, the entry into hyperspace, the eschatological monad, all these, uh, religious or theological constructs about history are actually intuitions about language undergoing this transformation.

Now, several things about this transformation: it's obviously not something which the culture is doing as a decision; it isn't like home computers and cable TV; it isn't being brought on as an information utility; it's something which is being imposed from outside, and I think it is, uh- I'm sure most of you are familiar with the Gaia [pronounced gae-uh] or Gaia [pronounced guy-uh] hypothesis of homeostatic regulation of the environment of the Earth through the interaction of all life acting as a single organism. Well, it obviously regulates, uh, trigger species such as we are, are part of this homeostatic method of regulation, and I think the gradual evolution of language is actually the gradual lifting of the veil that is imposed between ourselves and meaning by the planetary ecology. In other words, the forward thrust of history is actually regulated by the ecology, and it is regulated through control of the evolution of language, because what you cannot think, you cannot do, and where you cannot imagine, you cannot steer your culture and go. So I'm proposing, on one level, that hallucinogens be thought of as, uh, human macro-, uh, almost, uh, social pheromones that, uh, regulate the rate at which language develops and therefore regulate, uh, the evolution of human culture generally.

Now, one final, uh, thought about all this. Um...[someone coughs], it seems clear to me, and I've mentioned it in the other lectures, that the evolution- that another aspect of what psychedelics are doing, and an aspect of what's happening to the culture generally, is it's transformation into a space-faring species and that the momentum for this has been building for millennia. It is not something that was decided in the 1950s. It is, in fact, what we're all to- about. I, I looked at a book recently by Terry Wilson about Brian

Dyson called *Here To Go*. And, uh, he asked the question: "What are we here for?" And, he answers himself: "We're here to go." And, I think there's great truth in that, especially in the current historical moment where it's clear that, uh, man as a species and the planet as a unified ecosystem have become antagonistic to each other, and, uh, this is not unusual in nature. In fact, it's a phenomenon, um, that occurs between a mother and a fetus. When the fetus comes to term, when the birth is imminent, it must happen. Otherwise the, the, uh, survival of both parties is threatened. Even though the birth trauma for the mother and the child represents, uh, one of the major, uh, crises that they will face in their sojourn in existence. Nevertheless, it is inevitable and necessary, and if it comes off correctly, why, it's, uh, to the good of everyone.

Where psychedelics comes together with that is that it is going to require a transformation of human language and understanding, uh, to stop the momentum of the historical process, to halt nuclear proliferation, germ warfare, infantile 19th century politics, all these things. It cannot be accomplished through a frontal assault upon it by political means, and the I Ching says, you know, never- you never confront evil directly, because when it is named it sharpens its weapons and it learns to defend itself. So, what is called for is this *sideways attack* through hyperspace. Uh... God forbid, I think it was Tim Leary who said we should become ecological secret agents, uh- [audience laughter]. Is that what I'm concluding? Maybe.

Anyway. The transformation of language is, I think, uh, the signal that this archaic- that this nostalgia for the archaic world is coming to a head and that this is its culmination; this is the peculiar thing that we all sense is coming that we can't quite imagine, that is synthetic yet natural, that is obvious yet hidden, uh, and it, it- the interesting thing about it is that it is- emerges from an inner personal frontier. In other words, you're not going to hear this on the evening news, the President is not going to explain it to you, the secretary of- general of the UN isn't going to explain it to you. You are only going to advance into understanding this phenomena to the degree that you apply yourself to your being, to attention to being, to reflection on reflection, to attention on attention. And, then, it, uh, it will become clear, and because it is a, uh- a, um, gradient of evolution, it, it doesn't, uh, come with the force of a revelation. It is something which is drawn out almost in the same way that we move forward into time, this thing is drawn out. In fact, you could almost say that the act of history or the fact of history is a macro-phenomenon that arises out of the micro-physical fact of millions of people evolving their language. That is what causes the moving wave-front of, uh, of historical becoming.

So, uh, transformation of language through psychedelic drugs is, uh, a central factor of the s- evolution of the social matrix of the, of the rest of the century. My brother is working on, uh, the theory, putting together the argument for the idea that, uh, actually human history has *always* been mediated by man's interaction with hallucinogenic drugs, and that *this is* the pheromonal regulator that links us to the rest of ecology, of the ecology, and it's simply accidents of, uh, botany and, uh, alkaloid distribution and historiography that allowed a culture to arise in Europe, which was an area confined geographically and poor in psychedelic plants, so that the mystery was confined to places like Eleusis and peripheral cults like the, possibly the mushroom berserkers or *Agaricus*, I mean, um, *Amanita*-using cults in the Arctic regions. Uh, and, because of those accidents of, of botany and geography, a culture was able to get loose from, uh, such a tight- the tight constraints that the unconscious imposes. But, nevertheless, that culture, then, was the Promethean culture, the Faustian culture, which claimed the energies which will then send the mind **[ed. note: 'mind tribes?' I'm not sure I follow his remark here]** tribes to the stars. If it had not been for this historical episode, we would essentially be at the Amazonian level of culture, which is: suspended in

the hallucinogenic dream but oblivious to the historical forces which are bearing down on that. And, tribalism is a social form which can exist at any level of technology. It's a complete illusion to associate it w-, uh, with low levels of technology. It is probably, in fact, uh, a form of social organization second only to the family in its ability to endure.

So, this must seem very strange to some people and home ground to other people [Terence laughs]. Are there any questions at this point? Nary a taker. Yes?

Q: Yeah, that last generalization sounded real broad. Maybe you could expand on tribalism is a social form which can exist at any technological level.

TM: Well, I think it's an attitude toward, uh, genes and property and, uh, information. Uh, the institutional hierarchically-structured societies that we associate with [someone coughs], uh, our own culture, which I assume we define consciously or unconsciously as somehow the superior culture, is just inherited from, uh, tribal organization but with a need to abstract the leadership quality so that control could function over wide areas. But, electronics actually is, you know- the entire human community is enclosed in a light-second of travel, so there is- the globalism is real. I mean, when I first read McLuhan, it seemed to me *very* true, but a thin voice crying in the wilderness. It was hard to see if, out of all the trends working in society, that was how it would come to be, but it certainly seems to be so. I, I think, uh- Well, it's, uh- H. G. Wells said, "history is a race between education and disaster." And I think, you know, that education was losing that race until electronics came along and, uh, now I would probably, uh, be optimistic.

I think that, uh, there is a global commonality of understanding coming into being, and it is not necessarily fostered by institutions. For instance, the invention of the microchip which makes possible the personal computer, uh, it was actually thought to be a mistake. It was not fast enough for the defense department purposes that it was engineered- that the research project that produced it was aiming for, and they produced instead this weird thing, which they couldn't imagine what to do with, because it was too slow for any military or industrial application. And- but, someone realized, you know, that, uh, it was just fine for human beings, and that it would va- and, that it would shift the, the, uh, pieces around on the board in the war between, you know, freedom and oligarchy and, uh, and, uh, human individuality and all these forces which seek to oppress it. So, I don't believe, you know, that the historical process is, is under the control of the many, many institutions that would wish to control it.

I don't- the break between nature and man has been over-stressed, I think, and that we should realize, you know, that we are very strange, but you can find very odd adaptations at many levels. And, uh, when you look at the, at the global ecology, you see that there *must be* a species like us or otherwise it would mean that evolution gives up at the planetary level, that somehow when it encounters the edge of the atmosphere, it just says "Ok, well that's it. If the star goes, we all go, and there's no way around that." But, actually the obvious way around that is, uh, a technical species, a minded species that will open a hole using energy and understanding through which everything could escape if it had to because, uh, you know, as we, as our- the data flows back from these probes moving out through the solar system and beyond, it turns out that the 19th century intuition of catastrophism was, uh, very correct, that the universe is, in fact, a very turbulent place, and that you only have to open your time window a little bit, to like 100,000 years, for the probability of *very* turbulent events, uh, that a global ecosystem would react to and, uh, strategies have to be evolved.

I mean, Francis Crick has come out, uh, with his belief, the panspermia idea, that life actually evolves in a deep space environment and is conveyed then to planetary environments where it can, uh, uh, adapt and evolve evolutionary strategies by cometary material. At one point, we suggested that *Stropharia cubensis*, the psilocybin mushroom, was actually an intelligent species whose method, uh, whose strategy of evolutionary, uh, advance was the spore which could actually go into a kind of suspended animation for hundreds of thousands, millions of years and, by that means, radiate through the galaxy over very long periods of time, and, uh, that seemed like a very radical idea at the time. We hypothesized that, uh, spore liberation by an *agaricus* on a planetary surface, then, through Brownian motion and, uh, accumulation of global charge on the surface on the spore, that there would be a small number of these tending to percolate out of any given atmosphere. And, given the enormous amounts of spores that are released, you could make an argument for this kind of evolutionary strategy. But, Crick, who *discovered* DNA, makes a much wilder hypothesis, which is that you don't even require a planetary ecosystem for, uh, DNA and life chemistry to evolve, that it can evolve in ultra-cold regimens in interstellar space, and then be conveyed to various planetary chemical regimens where it can respond and grow.

And, uh... all of these things, life, which we know from the rock that is dug out of South Africa chert, you can date back to at least, uh, 3.5 billion years. That's longer than the life of, uh, 40 percent of the stars in the universe. So, life is not an ephemeral process in an entropic universe. Life is a process that, uh, has a duration that exceeds that of star, uh, star life. And, life strategy for running against the second law of thermodynamics and, uh, expanding and conserving ordered structure over vast periods of time is a strategy of encoding information and retaining it. In other words, languages. And, these languages, which are abstract systems of notation that can be laid onto nucleotides or coconuts or scratches on clay or whatever, allow the conserving of complexity. And, uh, the- the, uh, the cross into visible language, that I see as the culmination of human historical culture, is a similar advance into this information self-expression of the magnitude, uh, similar to the generation of epigenetic information. In other words, the first writing, the first notation: that represented a break with genetic information that allowed, then, culture and memory and self-reflection.

Visible language will, uh, allow similar forward thrust deeper into human becoming, But, it will- it is also part of a phenomenon of leaving the planet and being anticipated now in these psychedelic drug states, because as we continue to insist on exploring the archaic through drugs and music and archaeology and, uh, our f- the whole thrust of 20th century self-explication, I think we're going to find that this was the basis of the Ur-shamanism. This is what magic is: it's, uh, being able to speak in a voice which makes things happen, being able to speak in a voice which causes facts to be beheld by groups of people in a way that has been purged from profane language, for us relegated to poetry and, uh, and that sort of thing.

Q: Would this kind of visional or beheld language have any basic structural units to it, like an alphabet, or would it be, uh, something so abstract which you couldn't re- resolve into basic... [??]

TM: Well, you know, people had to look at language probably fifteen thousand years before Noam Chomsky was able to write down the 15 rules of transformational grammar. It may have, there may be some, uh, a pixel or an alphabet or a, a reducible unit to it. It doesn't seem like that. It seems like, um, [clears throat] well, no, no, maybe topology, that we could imagine that René Thom's, uh, catastrophes, of which there are 7 good in 3 dimensions, but as you add dimensions to any system, the number of these potential catastrophes increases, and Ralph Abraham has described a number of the hyper-dimensional catastrophe states. Perhaps they could eventually, it could eventually be recognized as a grammar of

catastrophe flow, where it changes first into one thing, then into another.

What you're asking basically is, w- you know, 'what is the meaning of meaning?', or, put another way, 'does language eventually become somehow a mirror of mathematics?'. And, I don't know, it would take a lot more analysis, uh, than I have done. I, I think describing this stuff is at the level of sailing up jungle rivers and sticking to the broad rivers and noting that, you know, at 3 in the afternoon you passed a river mouth flowing in, it was a mile-and-a-half wide, and you don't know where it was coming from or how many thousand square miles it was draining, and you just put a note on your map to return some day and ascend it. In other words, there's, uh, this archaic area of the mind. It's going to take a long time to explicate it. By the time we have assimilated our recontact with the archaic, you know, there will be colonies on Alpha Centauri, there will be thinking machines, there will be trans-dimensional vehicles and, uh, out-of-body consciousness via electronics. All these things will arise out of our grappling with an understanding of this shift in the sensory ratios that, uh, will essentially return modern man to the age of miracles. And, uh, though we won't put it that way, but we will privately experience it that way. I mean, that's what psychedelic drugs are. We don't put it that way, but we all who have been through it, you know, privately experience it as a miracle.

Q: It occurred, something that I've been devoting a fair amount of thought to lately -.haven't gotten very far - and that's the conviction under certain experiences, you're getting information from deep within your psyche or so, from deep within some sort of racial or human information - sometimes what you talked about before, foreign but yet human information and yet another experience that you are just willing to absolutely bet that's not human information that is coming into your brain, or whatever. Many people talk about this and I was just wondering if you would share your thoughts on that division or any hypotheses, whether you feel that that's accurate, not accurate...

TM: Well, it seems as though there is a, a tuning mechanism that you must somehow, by trial and error, find how to twiddle this knob and you move through these very concentrated areas of information. And, some of it can be blindingly personal, some of it appear to be movies of historical periods, some of it, uh, appear to be conformed to Jungian stuff, and then the alien part of it. And, I don't, I - I don't know, I mean this is the area I work in. I've held all kinds of opinions about this information and finally decided, you know, that it's too early to say what it is.

There's a school of, uh, New Age, or, I don't know exactly how to put it, but, the Seth books and that, uh, the, uh, Ilsa [Isha?] Schwaller De Lubicz and these people, where it's just, nobody asks any hard questions, it's just "oh, you're channeling a being from Arcturus and they're laying the law down." Fascinating; what are they saying? Well, that's interesting, what they're saying, but more interesting is trying to actually, uh, work up close to the mechanics involved in this channeling, uh, and I'm very skeptical, and yet it hasn't stopped me at all from doing it. I mean, I talk to them, but I don't, uh, give away the barn or the cow, I just try to engage in dialogue and, uh, you know, s- some traditions are very blasé about this sort of thing.

Buddhism, for instance, Vajrayana, it's just "oh yes, many worlds, many beings, beings, beings [audience chuckles], all kinds of beings on every level and you have to learn to deal with them." But, it- that's well and good until you actually are doing- dealing with these beings and go through, like that wonderful moment in Rosemary's Baby where she says "my God, this is really happening?" Well, there are those moments where you realize, you know, that this doesn't appear to be a hypostatization of discriminating intellect. It appears to be some kind of eight-armed shmiggy which is coming at you with all these, uh,

[audience laughter] implements.

And, uh, I don't know, see, I think It's going to take a long time to sort this all out, and that in order to learn what we had to learn about matter to leave the planet, we had to *really* put ourselves through a head trip and close down the imagination or, uh, deputize special people to be imaginative who we called poets, and then labeled irrelevant. [audience laughs] Uh, it's going to now come upon us, and science is flowing into this area and beginning to recognize that it must have a romantic component. Uh, this is just the way of things. Ideas beget their opposites and then are subsumed by them. Anyone, yes.

Q: Can you relate this in any way to the crisis their having currently in the art world [???] the end of art, you know - that kind of thing...

TM: Could - could all this be related to the crisis in art? Well, I don't know what do you mean, the crisis since 1905 or 1975 or which...

Q: Take your pick. [laughs]

TM: Well. I-I'm not - it's not exactly a crisis. It - Art i- the goal of art is to be incomprehensible, or a portion of it has to be incomprehensible. I think, the- you know, these paintings at Lascaux and Altamira, which are now dated at 19,000 years old, when the first ones were discovered in the 1890s, they were thought to be, uh, 400 to 500 years old. And, as it dawned on people what this was, and this was like 1905 to 1925, it just- the abyss of time and history that opened up for people who were sensitive to it, the realization that, you know, my god, people have been feeling what I've fee - been feeling, thinking what I've been feeling for at least 20,000 years, and this impacted on Picasso, it impacted on Miro, it impacted on Clay, it impacted on Marcel DuChamp, all of these people.

And, much of the, of the 'bad boy' antics of modern art is actually, it's, uh, when you bring a primitive home to dinner. You know, when the 19th-century academy brings home a savage from the South Sea Island, Jarry with the cast of his penis, Marcel DuChamp, uh, insisting on wearing a, uh, a toilet thing around his neck at certain formal occasions. I - they were - and, and, for instance, in the punk, the current punk phenomenon of body painting, you know, they would be perfectly at home in the mountains of New Guinea. People love to paint themselves. This was very big before the last Ice Age. [audience laughs]

And, uh, you know, if you, if you believe heavy metal sets fashion, it looks like it's going to be very big in the next century. [audience laughs] Uh, but a more serious answer to your question is: I think that the, the crisis is onl- not- it depends... It's a crisis, it's an opportunity. What it is that art is becoming eschatological. The, the- from, uh, um, Duccio on, from the close of the medieval period on, art was conceived of a series of self-transcending styles moving toward various goals which usually derived from the philosophy of the time, um, beginning, you know, so that realism or mannerism, these various tendencies, would be pursued. What's happened in the 20th century with the legitimizing of experience and the, uh, and, and the legitimizing of experiment, and the destruction of the patronage system in the academy is that everything happens. There are people painting in New York today in the style of Jan Van Eyck and making a living at it.

And, there are also people doing all kinds of things, but it's very, very hard to pick out a new piece of art, if by- I don't think, uh - well, the art of the last 20 years has been art outside of time. Since the middle 60s,

since William Wylie and funk and all that stuff began, uh, it's impossible to date art objects. They can have been made any time in the last, uh, 20 years. This is what eschatological time will be like, a transcendence of style, and people simply working in these various modes of self-expression which compete in a great atemporal carnival, um, wherein, unfortunately, the values of the marketplace play too great a role, but no other way of mediating it has been found. Part of what's happened to art is that it's been transformed into a, an enormous industry that must produce objects to decorate the apartments of the affluent, uh, on all continents who want to, you know, have art and be involved in art, but they are not, they don't have enough power to dictate style. They'll take whatever's put before them, which is very liberating for artists [audience laughs].

Anybody else have anything on their mind?... Not a soul. Yes, Mark.

Q: You talked about language as information structures...

TM: Uh huh,

Q: ...and, but you could also think of personality structure, that with which the witness consciousness identifies with as an information structure, too. Wh- Where do you draw the line between language that is beheld as something other and language that is, or- that - those information structures which are part of the, the identity experiencing?

TM: Well, you're asking 'what is the difference between self and other?'

Q: Yeah.

TM: Well, the-

Q: In terms of language.

TM: What you're asking is 'how do you know you're not talking to yourself?'

Q: Yeah.

TM: Uh huh. [audience laughter] Well, that's a very tricky question [clears throat and laughs; audience laughs]. Uh, I'm surprised that in 3,000 years of philosophizing somebody hasn't, uh, figured out a nifty way to always tell this. It would make a marvelous short story. Some little litmus test that you could perform. Uh, pretty much you have to go on intuition. Of course, what you always say is "I can't possibly know what I'm being told, therefore it isn't myself," but that's a very naive view of the psyche. On the other hand, when that reaches excruciating proportions there's a tendency to abandon, uh, sophistication and just believe in it anyway. But, uh, this thing about the shifting, uh, boundary between self and other is very tricky.

When I first smoked DMT, for instance, I mean, I th- I saw an absolute break between self and alien. I mean, I was myself and they were the aliens [audience chuckles], but then, you know, over years of working at- with it and seeing how it comes on with psilocybin, where instead of forming up over 40 seconds or so, it comes together over a half-an-hour or 40 minutes and you have to breathe and you have to

ease it in, then you see how, you know, it is a kind of, uh, it is a kind of thing which emerges out of myself. It's like I pull a psychic plug and the opaque ink drains away, and there is this marvelous coral-like organism which I didn't think was a part of me but, you know, perhaps all through life and death we keep discovering new organs capable of amazing things that we didn't know we had.

And, uh, but I don't know. I mean, I don't think you can ask a single person to know. I think this is the question that shamanism deals with, and, and, not all- it's a mystery, you know, it's a mystery. Not only is the Other the Self, but is the m-, is the Other God? Is the Other the species-mind of the planet? Is the Other a *genius loci*, a kind of god but a local force of some sort? I mean, these are wonderful questions to entertain when they have immediacy. And, this is what people did before history was: religion was their job and they worked at it, uh, very hard. And, but I'm not sure there are ever answers.

More and more recently, I've, uh - and I've always known this on some level - I think about, when I was about 16 or so, I realized it and briefly pursued it and never did, never returned to it, but I think that Taoism, if I had to pick an ontological vision that, uh, was compatible with what I think these drugs are about and with what I think, uh, is trying to happen, I would pick Taoism...for the following reasons: It's the only mystical tradition I know of - uh, possibly with the exception of shamanism, but shamanism doesn't really reflect on this - it's the only mystical tradition I know of that is not anti-scientific. It has no hostility to science; it is highly experimental. It's *about* compounding drugs with fungi and minerals and doing strange things on the side of fog-swept mountains and looking into your head and looking into your head and *looking into your head*. And trying to refine description, and it is open-ended.

And it is, um, botan- it is ethno- uh, ecologically sensitive. It is sensitive to the - it is not at all antagonistic to drugs. In fact, uh, o-on the subject of drugs, it's extremely straightforward and practical. Its stated goal is to compound the ninefold elixir of immortality. And, then how you do this, various methods came and went through the ages. But, its stress on *techne*, its stress on analysis, its stress on contemplation without method. In fact, it's general antagonism toward method, all these things, uh, endear it to me a lot, and I think it's very compatible, uh, with the shamanic, uh, stance. In fact, you know, we cannot, uhhh - we are modern people, and even if you think of yourself as a practicing shaman - I don't think of myself that way; I think of myself as a shamanologist - but even if you think of yourself as a practicing shaman, you have to, uh, weld it to later traditions that answer more sophisticated questions that were posed later in historical time. And, Taoism would be an excellent vehicle for that, I think. Yeah.

Q: Yes- in Hindu, um, mythology there is reference to a state of being dissolved into the absolute, or being "one without a second", not, uh, defined by, uh, any past historical reference. Does that in any way connect to what you're talking about?

TM: Yeah. I think it is. This "one without a second" causes me to think of Plotinus. One of his definitions of the mystical experience was he called it "the flight of the alone to the alone," which mathematically adds up to the one without a second. Uh, as far as the, the, this end of history that seems to be appointed for history by Western religion. Yes, it is like dissolution, uh, the dissolution of the cosmos that goes on in Hindu cosmology. Hindu cosmology is a set of nested cycles similar in structure to the set of nested cycles that I proposed for time, uh, in *The Invisible Landscape*. And, uh, I think we're running into one of those compression points, that everything that has been going on on this planet for the last billion years has been a series of telescoping, telescoping processes of ever-accelerating, uh, intensity, connectivity, and momentum, leading finally to the generation of consciousness. A moment after that, uh, historical

civilization. A moment after that, uh, modern science, and a moment after that, star flight. And, it is just, you know, a-a-a 10,000 year rush from monkeyhood to star-flight. A geological moment, but historically a grand opera that has everybody on the edge of their seat, because if the ball is fumbled, that's all she wrote. And, there's nothing that says that we *must* succeed, or at least we cannot *assume* that there's something which says that we must succeed. Um, even if we are the chosen, uh, target species of Gaia, Gaia may not, uh, have all fingers on the button. We don't know where our own power ends and begins and where the power of the Other begins and ends. And, so we have to make our way carefully into these dimensions. Shamanism is thousands of years of accumulated information on how to navigate in these spaces. If we're becoming a shamanic society through the metaphor of space flight, uh, we're going to have to recover this information and, uh, there'll be some chills and spills along the way, I'm sure. Yeah.

Q: Yeah, Terence - I had a question: in the traditional use of substances that you've described - this ritual around it.

TM: Right.

Q: The - There's also intention generally from shaman around healing, uh, and focus around hunting, uh, real earthly kind of pursuits around survival... and that seems to ground the experience in many ways or provide a focus for it. When we do it by ourselves, shans, uh, sans ritual, sans this kind of language, sans this kind of training, we're prey to the whole deceptions of the mind.

TM: Right...

Q: And, so my question to you is, uh, what sort of critical inquiry do you personally use, what kind of critical language do you personally use with these forms in front of you? How do, you know w-... guard against self-deception? Uh, you use the words "critical analysis." What does that mean when you translate into practice these things?

TM: Well, it isn't so much, uh, in confrontation with the being that you have to un- have this critical analysis. In confrontation with the being, you act from the heart and in the moment. But, it's later, it's what do we think about these things as we sit here now, relatively unstoned and, uh, ah, your question raises all kinds of issues. I said I didn't think anyone was a shaman, or that I thought of myself as a shamanologist. This is because a shaman is, uh, educated by other shamens, inculcated, chosen out, educated, and brought along. In our society, we have to do it all by ourselves. And, you know, I've made a comparison to, uh, a man walking along the beach and coming upon a fully-rigged sailboat. How likely, comparing the sailboat to the psychedelic drug, how likely is it that this man can learn to sail without killing himself? Where, you know, it is no great matter to learn to sail if you learn from a sailor. So, this is the first barrier that's posed for us, or was posed, I think, in the 60s, when there were a lot of casualties to psychedelics, because it was assumed that everyone should do it, and so millions of people did, and actually, there are few societies, uh, where everyone does it, and those where that *is* the case, or where, for instance, all men do it, are not, uh, probably the most advanced, uh, shamanisms on the planet. So, it's a kind of a profession. It's a, it's, uhh, almost like clergy. It's to be deputized by the society as an ecstatic for the purpose of introducing back into society the material that comes from the mystical voyage for purposes of cultural renewal.

The chief thing which grounds the shaman, uh, at least in my practical experience with them, is the curing, the, that- and Mircea Eliade insists on this, that the primary function of the shaman is to cure and that all

these other things go toward that. Uh, we all have to cure ourselves in a sense, in the sense that is contained in the notion that a psychedelic drug is a deconditioning agent. Now, I don't think a psychedelic drug is particularly a deconditioning agent if you're Witoto, or Bora, or Muinane, or something like that and you take it. You don't, then, denounce being that and leave for Lima. [audience chuckles] But, uh, but in our culture, psychedelics have had this effect of triggering a very fundamental question, of- questioning of, uh, values, and, and uh, intensifying alienation, creating alienated sub-classes.

Uh, this is n-, is a symptom of the general unhealthiness of the society, that you can't be psychedelic and be one hundred percent of this society, that certain things seem to impose themselves in your way. So I don't think that there is, uh, any easy answer to your question. We have to m- we, what we have over shaman is, uh, our wonderful electronic information retrieval systems. And the way that works is like this: you go to the Amazon and you're dealing [audience cough] with a tribe and they say, you know, 'we need this certain drug plant', and uh, um, 'the secret word for it is so-and-so, and we'll go and get it'. And, they do, and they know more about that drug plant than you do by a *long crack*. But, you ask them 'did they know that the people 20 miles further up the river use a different plant called something else?' And, you know this because you read it in a Harvard Museum botanical leaflet which tells you that- and they are astonished, you know? You have this weird overview, which they cannot conceive of. They are com- they are fully informed in a vertical fashion about one tradition, but you, by writing to Boston, Massachusetts and getting these leaflets and reading them, are more prepared to discuss the generalities of Amazon shamanism than *most* of the people you meet, and this is a great resource not to be sneered at. Uh, uh, there's a lot of information, and, like for instance when you read Mircea Eliade's *Shamanism: The Archaic Techniques of Ecstasy*, this is a global overview and you - I'm not saying you know more than any one single shaman knows about shamanic ecstasy, but you have a certain kind of knowledge which prepares you, a generalized cosmology which prepares you, and this is- these are the best maps that we have so we have to make use of them.

Ellen?

Q: Could you comment on how *that* issue relates to the more general one that seems to contain it: of the turning towards the archaic, the attempt to recapture or reintegrate the unconscious forces after a period of deliberately not being able to do so as a society and what- how that's going to affect both individual and social change over the next visible historical horizon?

TM: Well, obviously just on the surface of it, Freud in *Civilization and Its Discontents* made the point that sexuality is necessarily repressed for civilization to be possible. Sexuality is being redefined, uh, in this modern context, in an archaic context, so that it becomes, uh, more generalized. The romantic ideal gives place to a kind of tribal ideal. Uh, this is obviously happening and related to psychedelics and this effort to recapture the archaic. Uh, that's probably the m- the major impact that will- it will have, because we have no- our hangups are all hung around the issues that sexuality posed for civilization and the various solutions that were found in various times, all of which were, uh- or none of which were ever viable. This is what makes us feel sort of uncomfortable about ourselves is, there's never been a set of social rules that worked so well that most people weren't involved in trying to subvert them. And, uh, you know, what does that say about us and the, the 10,000 year endeavor we've been involved in, but I see that giving way to a more natural order.

In other words, many constraints have been placed upon us. We have accepted many constraints; we've

accepted a kind of wounding. The myth of the fall is a statement about our feelings about ourselves, you know, that we had to go into history to recover something which had been lost that had been ours in the beginning but that we fumbled away, and then we had to descend into history and recover it, and it is this Edenic innocence and, uh, and the adumbrations that it will create at all levels of society.

[ed. note: this seems possibly to be a break in the talk]

Singing is a ritual act that automatically sets up its own rules and can be initiated at any time without hardly moving a muscle.

We were saying during the break up here that, uh, it's possible to imagine a kin-, a form of psychoanalysis where what you would do is simply ca- uh, urge people and go through with them as- learning as much about history as possible so that there were no blank spots, so that their amnesia about their historical position was recovered, as a way of treating neurosis, a way of actua- by locating people on the grid, by forcing them to find out who they really are in terms of all the other somebodies who have been around in all the other some-places that preceded them. And I think that- you can almost see that that is a recovery of the unconscious, that hi- the history of man that *you don't know* is what your unconscious is made out of, just as you- the history of yourself that you don't know is what your personal unconscious is made out of. However, much of the history of man that you don't know can probably be found by going and reading a book on the subject, and this has a tremendous, uh, centering, a spiritual efficacy that- all out of proportion to the act of studying history, which seems rather removed from everyday concerns.

Anything else?

Q: Yeah, what about a development of a suh- a language of consciousness, which we don't have - like Sanskrit's theoretically, uh... [??]...Maslow was playing around with words that would scientifically [audience cough] [comment inaudible] ..ase. Could you comment on that?

TM: Well, I think the I Ching is an effort, the most advanced effort, to do something like that, but it's a language of gestalt, and, uh, you know, I- I don't speak Japanese, but it's said of Japanese that nothing which is obvious is ever mentioned. Language is reserved for clarifying the unclear, so people are not saying "it's a hot day, isn't it" and that kind of stuff. They're reserving language. Uh, the other possibility is, you know, that the visual language is this and that as more and more of it is experienced and done, uh, it will be realized. It is the, the visual language- I'm not sure I stressed this this evening, but it is perhaps, uh, non-translatable into English because it is a language of emotion where emotion is seen to be as subtle a spectrum with integrated gradients of meaning as, uh- or integrated gradients of combination, as meaning has, so that there isn't, you know, love, hate, disgust, and something else, but, in fact, an infinitude of emotional states that can be triggered by vocal sound. And, in a way, of course, I'm simply describing singing, wordless singing, except that I'm describing how that can tra- rise to an ontologically different level and become *so* emotive that you understand *very subtle* differentiations of emotion. I, I noticed when we were in the Amazon taking ayahuasca with these people, and they would sing these thousand-year-old songs, and you would eventually- you would get to the place where you had the absolute conviction that you understood, because you could stand off from your mind and say "the speed at which I'm going through emotional changes over what I'm hearing must mean that I understand what I'm hearing, because if I didn't understand it, I would just have a certain generalized emotion about it, but it is changing my interior state so rapidly that it is *like* the experience of understanding. That's the only thing it can be

compared to.

Yeah?

Q: Could you elaborate more on the effect of the ayahuasca and with the combination with *Stropharia cubensis* that you mention in *Invisible Landscapes* [sic] in effect altering, uh, the DNA and when you mentioned the [stone box?]

TM: Uh-huh, yes, well the core chemical idea in *The Invisible Landscape*, for those of you who haven't read it, is, uh, that it is possible, or it was hypothesized that it was possible to use sound to cause hallucinogenic drug molecules that were present, uh, in the neuro- in the nucleus of neurons, having arrived there through axioplasmic transport from the synapse, uh, to cause them to- to, uh, occupy bond sites in DNA. The bond sites, specifically, which lie between the nucleotides. And, the molecular dimensions and everything are correct for this to be possible. In fact, it's been shown, in vitro, that certain hallucinogens *do* preferentially bond into DNA in very elegant experiments in which, uh, DNA was exposed to hallucinogenic drug molecules and then centrifuged and shown that its specific gravity had increased by precisely the molecular weight of the drug molecule, and no other compounds were present.

So, there is an affinity for bonding with the DNA on the part of these drug molecules. We hypothesized that the general psychedelic experience, the common psychedelic experience is simply these things, uh, displacing normal neurotransmitters such as serotonin at the synapse, undergoing axioplasmic transport to the nucleus, intercalating - which is the technical term for this kind of bonding - intercalating into the nuclear material there and shifting the electron spin resonance of the general, the generalized electron spin resonance signature of the molecule so that millions of cells having this happen to them are amplified into a higher cortical experience, which is the hallucinogenic experience. But in answer to your question, my brother went beyond this and hypothesized that you could intervene in this process, which would normally, you would expect to be quenched in 4 to 6 hours, whatever the duration of the psychedelic drug was, that it would be possible to intervene in the process with vocal- vocally generated sound, uh, generated in such a way that, of these millions of molecules in these bond states, a very few of them would be oriented in space toward the incoming wave front of sound in such a way that they would, uh, be canceled, that they would undergo the kind of harmonic canceling that happens when you like sound a note on the cello and then quench the string you've sounded and you hear the overtones above- in octaves above and below it. And, he felt that this could be done with the human voice and performed an experiment to test this idea which seemed to indicate that, uh, it was possible, or at least that some bizarre drug synergy was prolonged and triggered by vocal sound. And, we have never proceeded into this any further. It would be easy to do so, you would get square wave generators and oscillating systems and you would try to tune in to this sound, because it's a very specific sound. Now, it, it sounds at first preposterous that, uh, quantum acoustical, uh, uhh, acoustically-mediated quantum mechanical changes could be controlled by the voice, but you have to remember, populations of millions of molecules are involved. Only a very few of which have to fulfill the complete set of special conditions that would allow this situation to arise. S- And, also, it isn't generally realized at what level the human perceptual apparatus operates in relationship to quantum mechanical events. For instance, uh, a single photon can be registered by the human eye. I'm sure some of you who had chemistry sets when you were children, they threw in a little thing call the spintharoscope, which was nothing more than a closed, uh, tube with a little lens in the end and at the other end a speck of radium on the end of a pin and then a phosphorous screen behind it. You would sit in a dark room for 10 minutes and then look into the spintharoscope, and you would see flashes of light coming out of the phosphorous screen

at the end of it. Those flashes of light were single photons being released from, uh, the phosphorous matrix by the impact of decaying hard radiation from the radium.

Uh, in a similar vein, a single molecule bumping against the tympanic membrane of the human ear can be distinguished, and they've done this in very elegant experimental situations. So, actually, the human sensory apparatus, for what a continuous picture of the world it gives us, is under experimental conditions, uh, shown to be rather closer to portraying the quantum mechanical nature of reality, uh, than we might expect. So, I don't think it's, eh, on the face of it, preposterous that there could be technologies of vocal sound and, uh, control of physiological states of oneself and other people through the- through the controlled use of sound. After all, if you are of the brain theory of consciousness, and believe that, uh, every thought that we think is accompanied by chemical, uh, changes, the breaking and forming of chemical bonds, well, that means that, as I speak to you, my voice, if you understand me, or maybe if you even don't understand me, is going through a continuing process of generating and breaking down hundreds of compounds as *your* brain takes on a configuration somewhat analogous to the configuration of my brain at the moment of speaking. This is what communication must be seen to be by people who have a, uh, hard-brain theory of consciousness.

Q: What if you don't know anything about any of this?

TM: Well, then you're probably in better shape than all of us. [audience chuckles] You should go to the, uh, side of Cold Mountain and compound mushrooms and draw cold water from a well and, uh, thank lucky stars that that's the situation you find yourself in. In other words, in other words, uh, knowledge or verbal facility is no, uh, is no proof of knowing what you're talking about. [audience chuckles] You know, it's just verbal facility. No, I think the Taoist thing, I'm coming more and more to it, to, to see that its, its open-endedness, its insistence on humor, it's, uh, not grinding a bunch of dogmatic knives. And, now I'm talking about the cultural idea of Taoism. Taoism became secularized and, you know, played power politics at various times in the history of China just like the other Chinese religions, but its ideal remained the psychedelic ideal, I think. And, it's basically a dropped out, uh, a dropped out idea. It isn't that you should return to the court and, uh, take up the council of the king and try to save his ass; it's that, uh, you know, someone else can take care of that. But, these Taoist immortals became strange people. I mean, they were fleetingly glimpsed from the road running naked in the woods as, uh, people passed to and fro. Knowledge, I have said this before- made the analogy between understanding and gravity, that, you know, as something becomes gravitationally more and more dense, it eventually is so dense that light can't leave it, no information can leave it. It's said to be a black hole. It has curved space around itself and no information can leave it. I think as you advance on the path toward enlightenment, it becomes harder and harder for people to understand you, and when you finally achieve enlightenment, you ca- there's nothing- you can't say anything at all, and anything you say is- *must* be misunderstood; that's the proof that you're enlightened..... you know? [audience laughs] If you're a perfect black hole, you must be incomprehensible, no information must leave you.

So, if you understood anything I said tonight, it's a perfect proof that I'm far from enlightened [audience laughter]. But, thank you for coming anyway! [Terence laughs; audience laughs] Maybe on that note we should knock off. Is anyone burning? Good, then let's knock off. [Terence laughs; audience claps; Terence clears his throat]

[Forest Noises]

Faustin Bray: Greetings, this is Faustin Bray for Sound Photosynthesis, Brian Wallace is recording, and today we have the good fortune to talk with Terence McKenna. He has chosen a subject that has been interesting to him for quite a while, and, um, the title of this tape is "The Voynich Manuscript."

Terence McKenna: What I'd liked to talk about today and, uh, what's brought me to the edge of my chair recently is, uh, the Voynich Manuscript, which is something that, uh, though I had read in occultism fairly deeply, and in alchemical literature and that kind of thing, I had never heard of this until about a year and a half ago, and uh, a friend of mine, Ralph Abraham, who's a mathematician at Santa Cruz, began pushing this at me, mentioning this encoded manuscript that, uh, people were interested in trying to figure out what it said, and since I had never heard of it I dismissed it, uh, I assumed that he was misinformed uh, or that if this thing existed I surely would have heard of it. But, uh, eventually I tracked down the references that he gave me, and I discovered a very curious *cul-de-sac*, uh, in the, uh, history of ideas.

First of all, it is a manuscript. That means it's written in long hand; it's not a printed book. Only one copy is known to exist. It's at the Beinecke Rare Book room at Yale, and it was deposited there by the estate of mister Alfred Voynich, uh, when his wife died. The Voynich Manuscript, here are the known facts: It was, it first appears in, uh, 1586 at the court of Rudolf the Second of Bohemia, which if you know that court and that period, this was the 'Mad Rudolf of Bohemia'. This guy was surrounded by astrologers, alchemists, cryptographers, all the intellectual foment of occult, protestant Europe was centered at this court, and, uh, into this situation comes an unknown person, a courier, who sells this manuscript to Rudolf for the equivalent of, uh, fourteen thousand dollars, thirteen- three hundred gold ducats, which is an enormous amount of money to pay for something like this, and, um, it was in his possession. It's encoded, it is not written in any known alphabet, it is written in, what scholars call, Voynich Script, of which this manuscript is the only known example in existence, and part of the problem of the Voynich Manuscript has to do with locating instances of Voynich script somewhere else. It's over 275 pages long, it has 100, over 150 color illustrations of plants in one category, what appear to be astrological diagrams in another category, and then completely unclassifiable set of images which seem to be, basically, little naked ladies bathing in strange fountains, or perhaps dissected flowers, or, it isn't clear what it is.

Uhh, the emperor would not have paid so much money for it if he hadn't been convinced that, uh, there

was something going on with it. He had cryptographers at his court who were very adept at decoding manuscripts. None of them were ever able to make any progress with it. When his court collapsed in the incident of the Winter King and Queen of 1619, uh, the manuscript passed to his botanist, a man named Marci, and at his death, it passed, uh, to an unknown party who owned it for 20 years, and the next place where it's picked up is in the library of Athanasius Kircher, who's one of the great polymaths of, uh, the 17th century, and a man who himself worked on artificial languages and synthetic languages. And he, uh- letters exist of his inquiring after this manuscript and eventually it came into his possession, but there's no mention of it in any of his known work on artificial languages. At, uh, a-a-around 1635 he decided to join the Jesuit Order, and, uh, gave all his books to a Jesuit college south of Rome, where this book apparently sat on the shelf at the next, uh, what is it, 230 years, uh, until 1906 when Mister Alfred Voynich bought the entire library, a rare book dealer, shipped it back to Brooklyn, and in going through this stuff came upon this manuscript.

Um. Now, what's so great about a book which nobody can read? Well first of all, it's very unusual, books which no one can read. Codes, immensely powerful methods exist for breaking codes because this is a matter of military intelligence and, uh, defense, uh, concerns, and, uh, very sophisticated, uh, computer techniques exist to analyze any supposed piece of code and extract meaning from it, determine whether it is in fact encoded language or not, whether you can tell what it says or not. And the Voynich Manuscript has become a kind of conundrum of the intelligence community. Retired intelligence officers take it on, and attempt to crack it. In fact, one of the best books written about the Voynich Manuscript is called 'The Voynich Manuscript: An Elegant Enigma' by Mary D'Imperio and it is only available from the National Security Agency Central Security Office, Fort Meade, MD; this is what your tax dollars are being spent for is to decode this 400 year old manuscript.

Okay, um, Voynich script. The most sophisticated computer analysis shows that the manuscript definitely is, uh, a language. There is meaning, the occurrence of prefixes and suffixes, certain internal rules of grammar have been identified, but, uh, the meaning has eluded all comers. And it- and several people, if there were more time we could go into people whose whole careers have rested on their supposed decoding of it. A man named, uh, William Newberry in the 1920s claimed a complete decipherment and it was later exposed to be a sincere but misguided mental derangement that contributed to his belief that he had decoded. Other people have made attempts but all of them- none are convincing, and so this is where the matter rests: one edition of this, of this, manuscript exists; it's never been decoded.

My idea about it is that, um, to understand the Voynich manuscript you have to understand the career of John Dee, who was, uh, the greatest Magus of the Elizabethan age, the court astrologer of Elizabeth I of England, the man who had more- he had the largest library in England. Elizabeth and Sir Walter Raleigh, and Sir William Sidney visited him to see his collection of books. He wa-, he, uh, wrote on the elements of Euclid, he wrote books on navigation and astronomy, but he also was an occultist and into secret codes; he was also an intelligence agent. He had been at the court of Rudolf the year before the sale is alleged to have taken place. He and his friend Edward Kelley, and, uh, they had bruted it about that Roger Bacon, the 13th century English monk, was the greatest astrolo-, uh, greatest alchemist of all time, and they had really made a flap about Bacon--(swallows) in Prague at the court of Rudolf. Then, a series of alchemical experiments where they had promised the emperor to make gold and had failed caused them to be exiled to Treblona. So they were in Treblona when this alleged sale of this manuscript took place in Prague.

Now, all occult codes in Europe are based, or, at that time, were based on the work of one man, the Bishop of, uh, uh, Johannes Trithemius of Sponheim who wrote a book called the '*Stenographica*' [sic. '*Steganographia*'] which was published in 1535, and in it he explained numerous methods drawn from Roman sources and his own imagination for composing codes and encrypting messages, and all of the, uh, occult codes which follow are based on this. Dee hand copied, uh, a manuscript of the '*Stenographica*' [sic. '*Steganographia*'] when he encountered it in Paris. He was involved with a series of Angel contacts where he elaborated a language called Enochian, which like Voynich, is not written in, uh, characters of the English alphabet but has a peculiar set of characters unique to itself. Over 3000 words have been defined in Enochian, first through Dee's, uh, uh, spirit contacts and later the Golden Dawn took it up and further expanded it. But in Dee's diaries which are deposited in the British Museum there are 93 pages of encrypted material which are columns of numbers, and uh, I believe that, uh, uh, to eliminate the possibility that Dee was the author of the Voynich Manuscript the encoding methods of this material in his diary need to be computer analyzed and then compared to the Voynich material.

The other possibility, which still involves Dee, is, uh, this person I mentioned, Edward Kelley, his companion of many years. Kelley's entrée- Kelley was a man of the lower classes, a much younger man, a scoundrel by all accounts, and his entrée to Dee was he came to him with a book, which was in code, which he had claimed to have found in a, uh, crypt of a, uh, looted Catholic monastery in Wales (this was, uh, during the period just after Henry the 8th's break with Rome), uh, which- and he called this book "The Gospel of St Dunstable" and Dee worked on the decoding of it, but we lose sight of that book, and no known copy of it, no copy of it exists, so far as we know. But Arthur Dee, John Dee's son, in his diary, talks about how, in the period before Dee and Kelley went to Europe, his father spent a great deal of time studying a book which was covered all over with hieroglyphics. An-, and, uh, I believe e-uh... one of two things. I mean, this is what seems reasonable to me, that, uh, that either Dee or Kelley ponied up a phony manuscript, which they sold into the court of Rud-, because they were poor there's no question about it, I mean these guys had come to the end of their ropes. I believe only, John Dee is the only man who could have produced the Voynich Manuscript if it's contemporaneous with him. Either that, or, there is actually some truth to this strange story about Kelley bringing a book to Dee, uh, that he had found in Wales, and in that case, Welsh, and computer analysis of Welsh, and looking at Welsh as the possible basic text of the Voynich Manuscript should be done, and this has never been done.

So I'm saying a further advance in Voynich studies logically demands an analysis of the codes in John Dee's diaries in *A True and Faithful Relation*, and analysis of Welsh in relationship to the known internal grammar of the Voynich Manuscript and, uh, there are other angles, uh, on it. Ummm. Let me think. For instance.

FB: What would you like to do with it?

TM: Well, I would like to know what it says, uh. At first it sounds very mysterious, and you actually reach out towards the idea that the reason the Voynich manuscript can't be read is because it is not in code at all. It simply is in a non-human language. It's like an object from another dimension which just, you know, here it is. It cannot be decoded because, uh, the bridge is too great. But I- another possible problem is: perhaps modern people, modern cryptographers who deal with codes are over confident of their ability to break any code. Perhaps there is just some weird, quirky, way in which this code is composed that it would

forever elude your effort to decoding. I mean, for instance, what if, somewhere there exists a set of grids which, if laid over the pages in a certain way, caused the part of the Voynich script which could then be subjected to normal methods of, uh, decoding and would quickly reveal its, uh grammar...

FB: [unintelligible] and it's um...?

TM: Yeah...

BW: What does it look like?

TM: What does the Voynich Manuscript look like? it's a small book, ten by seven inches and probably about two and a half inches thick. These, uh, these water color drawings are extraordinarily, uh, peculiar. I mean especially for that period because all herbals, of which there only about 50 or so in existence at that time, were, uh, a, uh, drew from a common pool of imagery which went back to the herbals of Dioscorides and that kind of thing. There was a very limited pool of images in the European mind at this point in time, and yet the Voynich Manuscript is utterly unique. it's completely peculiar. And the way-

FB: What are the ingredients of the inks and the...?

TM: Ah, well, none of this has been looked at and should be looked at. This is another thing: Chemical-, a chemical attack on the manuscript itself should be mounted. See, Newberry [sic: 'Newbold'], the guy who advanced, uh, a, uh, decipherment in the 20's, he believed, because a letter accompanied it, that said it was a Bacon manuscript, Roger Bacon, and this also points at Dee because Dee was under the patronage of the Earl of Northumberland, and he, uh, looted a number of monasteries where there were large Baconian libraries, and in fact Dee had 53 Baconian manuscripts in his possession, in- cataloged in his library at Mortlake. Only 41 of those texts are known to exist in any form at all today. His library was burned while he was in Europe. It was burned by a mob incited against this wizard, and, uh, uh... hi- so it may-, but-, so Newberry [sic: 'Newbold'] believed, then, that it was a Baconian manuscript, but-

FB: Boy, Bacon gets in there everywhere-

TM: -but when you look at it it's obviously 16th century. Everything about it marks it, and Bacon, of course, was 13th century, so it's clearly... It- There are many other angles, I mean like, Dee is implicated-

BW: [Unintelligible]

TM: -in the Rosicrucian conspiracy. He was definitely involved at the very beginning. His book, 'The Hieroglyphic Monad', served as a model for the two primary Rosicrucian documents, the *Fama* and the *Confessio*, which were released secretly, uh, in the early 17th century. And uh, it all was coming from central Europe, from Bohemia, and uh, Prague, uh, the court of Frederick the Elector Palatine of Bohemia, and this guy Rudolf the Second of Bohe-, of uh, of Bohemia.

This court- these were the alchemical courts, these were where the alchemical presses were operating and the uh, this Protestant alchemical enlightenment was taking place that the coming of the Thirty Years' War and the collapse of the Winter King and Queen obliterated this hope. This is a very complicated moment

in, uh, European history.

FB: Collapse of the Winter King and Queen?

TM: Yes. This is an incident- you see Frederick the Elector Palatine of Bohemia, who was the patron of all these alchemical presses and alchemists, wedded, uh, the daughter of James the First of England, whose name was Elizabeth, and he, uh- this was around 1615, and he thought that by wedding the daughter of the king of England that he was getting a nod from the king of England to go forward with this, uh, protestant alchemical revolt. Actually, James' plan was to wed one of his sons to a, uh, Hapsburg Spanish Catholic empress to balance it out, and he was appalled when, uh, when, uh, Frederick the Elector began to move on this alchemical revolution.

Well, then, when Rudolf of Bohemia, the guy who bought the Voynich Manuscript, when he died, uh, there, he, there was actually a set of German princes who, by election, would choose his successor, and they chose Frederick, and his queen Elizabeth, the daughter of James, and they moved from Heidelberg into Prague and ruled in the Winter of 1619 and 20, but by May of 1620, uh, uh, the Hapsburgs had mounted an army and they lay siege to Prague, and uh, Frederick was killed, she fled, it was actually an amazing moment in European history. Michael Maier, who is one of the great alchemists of that period, died in the streets of Prague in that siege, and one of the young French soldiers in this Hapsburg army was the 18-year-old Rene Descartes, off soldiering and sowing his wild oats.

This is the period out of which this manuscript emerges: a period when secret societies were rife across Europe; when John Dee was spying for the throne of England and, at the same time, pursuing his own peculiar interests in angel communication and astrology and Kabbalah and, uh, all these things. And, um... the Voynich Manuscript is indicative of this paradoxical state of mind and of the, uh, the uh, really peculiar and now nearly incomprehensible sort of world view that these people had. And it would be very interesting to know what it says. I mean it looks very promising. After all John Dee was, uh, definitely the preeminent intellect of his time and the fact that he may have faked this to pay the bills, uh, I would bet that even at that there is sense embedded in it somewhere. But the key is Dee, and Dee and the lines of research which study of his life would suggest, the Welsh angle, the diary codes, all of this.

FB: Are you pursuing it?

TM: I'm advising a group of people in Santa Cruz. Computer people, and just interested people, and my voice is one of, uh, several. But, uh, definitely it's one of the great oddities of human thought, and not much heard of because it simply is, uh, an elegant enigma.

FB: And so concludes the interview with Terence McKenna in 1983. Since that time, a book composed of interviews by Terence and various other people, including this one, called "The Archaic Revival" has been put out by Harper Collins, and in that book he continues on with the, um, research that's been done about the Voynich Manuscript, and he writes, on page 182, of that book, The Archaic Revival:

"And there the matter rested until 1987. It might have rested forever but for the questing curiosity of one man. Enter Dr Leo Levitov, author of "Solution of the Voynich Manuscript", a man who claims a complete understanding of the dynamics of Voynich and translation of the manuscript. He gives us good news in his subtitle: "A Liturgical Manual for the Endura Rite of the Cathari Heresy, the Cult of Isis." Levitov's thesis

is that the Voynich is nothing less than the only surviving primary doctri-..., document of the great heresy that arose in Italy and flourished in the Languedoc until was ruthlessly exterminated by the Albigensian Crusade in the 12-13th, no: in the, uh, 1230s. Very little is known about the beliefs of the Catharite faith and all the knowledge that we do have of it is secondhand, obtained from the records of the inquisition, whose task was the destruction of the Cathar society. Levitov's translation, if substantiated, would throw new light on the puzzling rise and extermination of the greatest here- heretical challenge that the Roman church ever faced.

There are a number of problems with Levitov's notions, but there are also triumphs. He makes several startling claims that he supports very well. The little women in the baths who puzzled so many are, for Levitov, a Cathar sacrament: the Endura, or death by venisection, cutting a vein in order to bleed to death in a warm bath. The plant drawings that refuse to resolve themselves into botanically identifiable species are no problem for Levitov, actually there is not a single so-called botanical illustration that does not contain some Cathari symbol or Isis symbol, he quotes. The astrological drawings are likewise easy to deal with: the innumerable stars are representative of the stars in Isis' mantle.

Levitov's strong hand is translation. He asserts that the reason it has been so difficult to decipher the Voynich Manuscript is that "it is not encrypted at all, but merely written in a special script, and is an adaptation of a polyglot oral tongue into a literary language that would be understandable to people who did not understand Latin and to whom this language could be read." That is a quote. Specifically a highly polyglot form of the medieval Flemish with a large number of old French and old High German loan words. Good, so now we know.

Where there's a danger for Levitov is the contents of the translated material. Levitov freely admits from his translation that Catharism is a religion of Isis, is a religion of the great goddess. Apparently he is alone in his belief, although A. E. Waite says in his discussion of the Cathars in 'The Holy Grail' (1961), "the grail mythos is, like the veil of Isis, which no man can rise, rather than tolerate the suggestion that this nightmare fates are behind it." Save for the Waite's lucky turn of phrase, no commentator, ancient or modern, has ever breathed a word concerning Isis in connection with the Cathars. At one point the Cathars became the focus of latter-day occultists, but not even their literature mentioned Isis.

Levitov is almost casual in his presentation of his work, questioning at one point whether now that he has figured out how to translate the manuscript it is worth actually doing. A complete translation of more than 200 pages waits in the wings, a "long, arduous, and possibly unrewarding task." For Levitov, the problem seemed to be one of the solving of the language problem, the larger problems are now raised, if in fact the Voynich is to be seen as a primary source showing the Cathars to be not at all what we have come to think of them. Students of Gnosticism, Paganism, and the Goddess will have to digest this new slant on the role of the Cathars.

As for what the manuscript actually says, it is a gloomy and repetitive work, made partly so by Levitov's decision to present it in a rather raw state, as it's sense requires scholarly interpretation. At its most lyric-, lyrical the translation is quite interesting. So here it is, presented in this book by Terence. "The person who is knowledgeable about aid knows there is only one way to treat agonizing pain, he treats each one by putting them through the Endura, it is the one way that helps death. Not everyone knows how to assist the one with pain. The one who is with death and does not die will have pain but those who have such pain of death need his help. he understands the need, he is also aware that the person who needs help does not

know that he needs it. We all know that every one of them needs help and each of us will be available to help." End of passage.

The passage refers to the Cathar sacrament for the dying, a form of euthanasia in which pious Cathars were helped to die by specially trained *perfecti*. Levitov mentions extensive personal research into the Cathar material but cites none of it. I cannot tell if he was aware of H.J. Werner's 'The Albigensian Heresy', or W. L. Wakefield's 'Heresy, Crusade and the Inquisition in Southern France'. He states that the Voynich Manuscript is the only primary Catharite document in existence; however, A. E. Waite-... his 'Groly-', 'Holy Grail', mentions, quote: "There is fortunately one fragmentary record of Albigensian belief which has survived, I refer to the Cathar ritual of Lyon which is now well known having been published in 1898 by Mr. F. C. Coinbert." End of quote.

Waite goes on to mention that part of the Lyon codex contains, quote: "certain prayers for the dying", unquote. The codex is in Langua...doct [sic: Languedoc]; does it resemble the Voynich manner--, material? We are not told. If Levitov is right we moderns simply overrate the sophistication of our code-breaking machinery and overlook the possibility that the manuscript was not in code at all. Levitov fails to mention the physical manuscript, yet it seems obvious that one of the first steps that should be taken would be to attempt-, let's see... would be to attempt to confirm the 13th-century origin date for the manuscript. If the manuscript was written before 1250, then it is older than was claimed by even the adherents to the 'Roger Bacon' theory of its authorship. Surely it would be possible to determine whether the manuscript was written in the 13th or the 16th century. If it was a product of the 13th century, then my own efforts to see the hand of John Dee in its composition are immediately rendered futile, although it is still quite possible that Dee was involved in the manuscript's finding its way to Rudolf's court.

Until Levitov, most scho-, scholars have been confident in placing the origin of the manuscript in the early 15th century; therefore, Leo Levitov is to be congratulated: he has made a persuasive case and remains modest doing it. Now we need to hear from the experts: the medievalists, the linguists, and the scholars of heresy; for it will be through the consensus and judgement of the community of scholars that Levitov's claim to be translated-, to have translated the world's most mysterious manuscript will stand or fall. So ends this piece on the Voynich Manuscript, page 184 of Terence's book "The Archaic Revival," put out by Harper Collins. This is Faustin Brey for Sound Photosynthesis finishing the Voynich Manuscript tape as we have the information to this day of September 16, 1994. Thank you for listening. If you want to have a copy of this tape, contact Sound Photosynthesis: PO Box 2111 Mill Valley, 94942 in California, or the phone number is 415-383-6712. Thank you very much.

I was here about five years ago with Tim Leary one raucous evening. Maybe some of you managed to catch that event. This is a little more thoughtful and reflective. I'm not here to talk, speak, or promote my books as I have been in the past. This is the only public event that I'm doing in these ten days and I'm very grateful to David and Petrif for inviting me. This is a wonderful facility and bringing you plants, books and information. It's great to see that the freak community is alive and well in Mannheim.

What I'm in Europe to do is to be part of a film-making effort and I want to describe the project to you a little bit simply because it's what's on my mind, naturally, and to discuss the politics behind the making of this kind of a film. It's not a film about rave culture. It's not a film about Albert Hoffmann. It's not a film about body piercing or any of these things that great films need to be done about and have been done about. It's about one of your local heroes, who is a great hero of mine and should be a great hero to all freaks in Germany and everywhere. I'm talking about Frederick the Fifth, Elector Palatine, Prince of Heidelberg, King of Bohemia. Are you all familiar with this guy? No? Well - this is your guy! This is the prototypic freak of this area. A freak that was not content to sit back and let things happen but was willing to launch a grand, alchemical dream of a reformation of human society.

So just to lay in the background of those who are not familiar with the historical incident that we're here to recreate, here and later in Prague, has to do with Prince Palatine of Heidelberg. A protestant who wedded the granddaughter of Queen Elizabeth the 1st of England, Elizabeth Stuart, the daughter of James the 1st of England. This was arranged wedding. They were both sixteen years old at the time. Frederick went to England, the wedding was held in England and then he returned with his very English bride to Heidelberg. They were the center of a movement of alchemical reformation and revolution, that sought to take the Protestant Reformation an enormous leap forward into a new world of spiritual freedom, and to my mind, a very sort of psychedelic world. They were the heirs and the inheritors of the entire medieval worldview. It was folded into this pair of sixteen year olds who were ruling the Palatinate of Heidelberg, and Frederick was an Elector, meaning he was one of the seven princes who could choose the Emperor of what remained of the Holy Roman Empire at that time. He also conspired to become the King of Bohemia.

[Tape Skip] Visionaries moved the entire court from Heidelberg, from the small-time scene of a

principality, to Prague, to reoccupy the office of the Holy Roman Empire. They would do this with an Emperor friendly to magic and alchemy, and who was the inheritor of a generation old plan - to create an alchemical reformation that had been hatched in the mind of the English alchemist and mathematician, John Dee.

The ending of the story is not a happy ending, or perhaps it is, and we can talk about that. On a superficial level, this alchemical dream, this Rosicrucian Enlightenment, ended badly because the Habsburgs back in Madrid quickly got wind of what was going on and got an army together and sent it to Prague, laid siege to Prague, and caused Elizabeth to flee to the Netherlands with her children. Frederick was defeated at the Battle of the White Mountain and the alchemical dream died. This was really in some sense the beginning of the Thirty Years War. As you know - going into the Thirty Years War, Europe was a place of Popes and Kings. At the end of the Thirty Years War, it was a place ruled by parliaments and peoples and the entire medieval world was swept away. Out of the new political dispensation of the situation at the end of the Thirty Years War, especially in England, modern science took hold and was born, and these angel-dealing, horoscope casting, alchemy pursuing visionaries of this Rosicrucian renaissance became simply objects of historical curiosity. These people were completely incomprehensible to the people who followed them generation after generation after generation, until, I submit to you, the present.

In the present moment, we like they, inherit a world whose ideologies are exhausted and can only be refreshed from the margins. That was what this whole alchemical revolt was about. It was about a suppressed, marginal minority of deeply pietistic original thinkers, but heterodox - non-Christian - keeping together a tradition that I think has been reborn, or rediscovered in our own time.

It's the tradition that Nature is a great distillery of complexity: alchemical gold, novelty, and connection, whatever you want to call it. In our own time, through integrative sciences, like ecology, animal behavior and psychology, we have re-understood what was forgotten during the reductionist centuries of modern science. We've re-understood that the world is one thing and it's a living thing. It's a thing with an intent and a spirit within it, and this is the key concept. It is this concept that the alchemists, the hermetic dreamers and the occultists of the alchemical and northern European Renaissance, were trying to strengthen, condense, distill, and make actual this sense of community. This Spiritus. Then with the rise of modern science, all of that is anathema. Rational analysis tells us that matter is simply atoms flinging themselves through space, obedient to certain mathematical laws that are invariant, and all the creativity, all the sense of connectedness that we experience as living beings, as members of a society, as human beings in contemplation of nature - all of that was denied. It reaches its ultimate culmination, just as an example, in the kind of statement such as was made by Jean-Paul Sartre - the French Existentialist, that said, "Nature is mute." Nature gives no clue, he tells you. Man is alone in the cosmos, with his complexes and his obsessions. He confers meaning. There is no *a priori* reality, to which ethics or intent can be attached. I reject this. I think the entire message of the psychedelic experience, which is basically the *sine qua non* of the rebirth of alchemical understanding; the very basis of that understanding is that nature seeks to communicate. All being is pregnant with language. All reality wants to include the human side of nature in its ongoing intent. The problem lies not with nature, but with ourselves. We believe that we are somehow paralyzed, disempowered, doubting, or cut from the meat of the thing.

Well, so, I'm a great believer in propaganda, obviously. My whole life is about propaganda. It is my goal to take an incident like the career of Frederick the Elector Palatine of Heidelberg and

his bride and make of it a kind of exemplar, a parable. A myth if you will - the myth of the alchemical marriage, a myth that takes innocence, naïveté and belief in the power of ideas, to make a new world. Then tell that story again in film, backing it with these tremendously powerful alchemical images that Jung and others showed work inexorably on the psyche, whether you wish to be part of the process or not.

To merely gaze upon the images of alchemy is to, in a sense, enter into a kind of psychoanalytical process because what alchemy was, and I should stress this or the rap makes no sense at all - alchemy was not the vulgar pursuit of the transmutation of lesser metals into gold or silver. That was the charlatan's game played in every market in Europe for centuries among the simple people. Alchemy is the body of symbols and of literature that accreted around the effort to extract a universal medicine out of Nature for the transformation of societies and human beings – and comes to us from the times of what we call epistemological naïveté, meaning that the people then did not have the strong sense of objective and subjective reality which we inherit from science. So during those eras of epistemological naïveté - what was someone's idea of how matter behaves, what was someone's myth of how psyche behaves - could become entangled in a projective experience with material in a chemical vessel. The processes which we call melting, crystallization, purification, and calcination, processes now well understood through a soulless molecular model of matter, were for them, the birth of the red lion, the coming of the double-headed queen, the murder of the hermaphrodite dog, and so forth and so on.

They had these outlandish images and this outlandish vocabulary because they were trying to create powerful symbols. Powerful mnemonic hooks on which to hold the details, and there are many of them. This extremely complex worldview, were it not for people like Carl Jung, the Swedish depth psychologist, would have remained completely inexplicable to modern people.

It is not chemistry and it is not myth building per se, as we inherit from the Greeks. It is a very complicated amalgamation, a good alchemical word, of psyche and matter. The reason, I think, it is so resonant with our own times is because our generation and generations of people confined with twentieth century, have in a sense and by an oblique path, recovered that universal medicine that the alchemist's dreamed of by going strangely enough, to some of the most aboriginal and least culturally assimilated to European and American values people in the world. Shamanism, is essentially a living tradition of alchemy that is not seeking the stone, but has found the stone!

These shamans, Jivaro, Witoto, Cubeo, notice that they have this same epistemic naïveté. It is this inability to distinguish between subjective and objective world, through the intercession of Newton and Descartes, that Frederick the Elector and the alchemists around him and the alchemists the preceded them through the centuries had. In other words, within the context of the alchemical vocabulary, the psychedelic experience as brought to us through plants - long in the possession of aboriginal people - appears to be the identical phenomenon.

The Jivaro shaman, the Cubeo shaman, does not use a glass retort with cycling sulfur and mercury inside it. The shamans of the Amazon have obtained a sufficient sophistication to explicitly understand that the vessel of alchemical transformation is the body and the head of the experient. This is the alchemical vessel! This is where you will encounter the three-headed dog, the queen dissolving in her bath, and the incestuous couple that combine Sol and Luna to

produce the white essence of the panacea of the universal medicine. These are 'psycho-mental' processes and Jung mapped this. He must have been an extraordinary person because he could approach this without psychedelics, through a very careful inspection of the dreams and the symbol-producing processes of his patients. Over decades, he produced a kind of skeletal map of the psyche. I maintain that map doesn't fill itself in, doesn't become a living experience, until we undergo what is rightly perceived as the alchemical process of dissolution.

Dissolution of what? Of the lumpen prima materia of the ego. This is the shit, the tar, the coal, the dark earth of Egypt, the starting material, the loam, the manure, the night soil, the lowest matter; we start with that, the ego and dissolve it through the intercession of the spirit. Spirit is a complicated concept. It's not naive. It's phenomenologically difficult to define. Somehow through the dissolving spirit of the plants, the plants lift the imprisoning structures of the ego and allow the ego to flow out into the world. For some people this process produces panic. "Pan"-ic, comes from the god Pan, whose screams caused people to go mad. Panic.

For other people, this process is an enormous liberation. It is an influx of material previously hidden in the unconscious, laden with symbolic meaning, and is not to be sustained in this acidic, dissolving, roiling liquid state. That's part of the process, but it is eventually to be recombined, coagulatio, the recombining. The coagulation. It is the coming together at a higher level - usually through the process of an application analogous to heat, but psychic heat which drives off the dross of false assumptions and false attachments.

All of you who have been through high-dose psychedelic experiences know that it's very hard to carry stupid baggage through that keyhole. In fact, your lucky if you just get your soul and yourself through and intact. So, what we have here through the psychedelics - among certain marginal populations in the twentieth century, freaks of all sorts, in all times and in places, within the twentieth century - a kind of almost accidental rediscovery of these alchemical truths.

That's one level. We can do self-directed psychotherapy on ourselves with psychedelic substances out of plants and we can use alchemical symbolism to guide this process, and that's all very interesting but so what? What's so great about it? Well - One of the most famous of all alchemical axioms is, "as above, so below", meaning always, that in every small part of reality, there is a tiny reflection of the great over structure of reality. In the largest structures are hidden the secrets of the smallest, and vice versa. We also have rediscovered this principle in the 20th century through fractal mathematics. The psychedelics have brought us back to this alchemical mystery, shorn of any vocabulary for dealing with it, and shorn of any real living notion of the spirit. So, we have sought as far afield as the Tibetan Book of the Dead, or Freudianism, or there have been various efforts to cast the psychedelic experience one way or another.

The hot one now, of course, is shamanism. I relate to that because I spent a lot of time in the Amazon, with these kinds of people and with these kinds of concerns. Shamanism and alchemy are a seamless enterprise. In alchemy, the connecting figure if you're interested in this, between the shaman and the alchemist, is the smith, the worker of metal. The shaman and the smith, in primitive cultures, are always associated as brother figures. They both work in metals.

What does all this mean for us beyond the commitment to our own sort of ordering the

wunderkammer of our own private imagination? What it means is important because if you look around you, you will see the entire global civilization is undergoing some kind of meltdown. The planet itself is now to be seen as a kind of alchemical retort. The prima materia to be transformed are: the nuclear stockpiles, the toxic waste dumps, the industrial wastelands, the populations devoid of hope, and the populations at threat of fatal and epidemic disease. There is a great deal of prima materia to be worked on at the historical level of the alchemical process. Trying to manage this rationally with some political 'ism'; fascism, Marxism, capitalism, goes nowhere. It just digs us deeper into the mire and the muck.

At the fringes, people like you, people like myself, people I associate with, offer endless solutions. We offer recycling, restraint in child bearing, and increased sexual toleration of unusual sexual styles. Many, many things are suggested but nothing happens because the primary agenda of society has not yet been dissolved. It has not yet come into a state of fluidity sufficient where a new imprint can be put upon in.

In the 1960s, we thought that all that had to happen was - everybody would take LSD and the obvious right things to do would be done. We expected no opposition to this because it's rightness was so obvious. We didn't realize that every righteous crusade in history has marched into the waiting jaws of its oppressors. But the spirit doesn't die. It's interesting but in America, we refer to, and have always referred to freaks as Bohemians. I assumed, you always hear about the left bank Bohemia of Paris in the 1920s - but why Bohemia? What does Bohemia have to do with Paris? Why are freaks called Bohemians? It's because of Frederick the Elector and the alchemical renaissance that he plotted with his wife. Since that time to now, 'Bohemian' has meant a marginal political position involved with bizarre sexual practices, strange drug use and 'funny' ideas.

In the 1960s, LSD was not sufficient even coupled with rock & roll. It only brought oppression. It was like a failed alchemy. Instead of the dissolving and recrystallizing at a higher and more angelic level, thousands of prisons were built and the entire thing failed. But this spirit is the spirit, the spirit of life itself, the spirit of novelty itself, and it will not be suppressed for long in any time or place. So now again it comes.

After thirty years and after many changes, it's among us again. I assume, looking at all of you, that to some degree you represent this or act it out, because it's a spirit of dissent that says we will not serve the values of materialism. We will not serve the values of the ego and the values that separate and breakdown the community.

So here it is again. What is different this time that we might have some greater hope of actually coming through to the beginning of the third millennium without having to hang our heads when we tell the story to our grandchildren? I will submit to you this evening that the difference between then - 1965 through 1970 - and now to the turn of the century, is the following. We have that experience under our belt. We shall not be so stupid again. The I Ching says, "Never confront evil directly and never name it directly because it finds weapons to defend itself."

We are not an army; this is what Frederick didn't understand. He was a king, but he was not an army when it came to the White Mountain. We are not an army, so our strategy must be stealth.

It's an alchemical strategy. What do I mean by stealth? I mean the house of constipated reason must be infiltrated by art, by dreamers, and by vision. What is new? There are massive technologies available to us, not available in the 1960s. They were not designed for us, they were not intended for us, and it was never ever thought that such power should flow into the hands of freaks such as ourselves. Nevertheless, through the perverse nature of the unfolding of the world, we have such tools. I'm referring, as you probably anticipate to the World Wide Web and the Internet.

No gay kind in Montana, no Chinese scholar in Botswana, and no person anywhere with a specialized interest or predilection now need feel alone. There is no aloneness. You can find your people. One of the things Tim Leary said in the 1960s that I always remembered but I never heard anybody talk about or ever really heard him quote. It was a great rallying cry. It was much better than Turn On, Tune In, Drop Out; and it was this: "find the others." "Find the others, and then you will know what to do." Well now you can find the others. You don't have to stick a flower in your hair and go to San Francisco. You just go to the web.

Find the others! We all need to create affinity groups which are subsets of the much larger community that we're part of. Then using this technology, which was designed to keep track of us, to pick our pockets and to sell us junk we don't want, use this technology to produce art. We must produce massive amounts of subversive art, and all art is subversive. I'm not calling for an ideological agenda. All truth which springs from the individual is subversive, because, and this is a theme of mine that I'm getting more and more into the longer I live – Culture is not your friend. This is an odd message for the late 1990s because we're all being told, you knew you were Jewish but your forgot you Sicilian grandmother – you have to honor all of your family. Romanian bring it forward, the dances of this that and the other. I hate all of this stuff. I'm Irish. It's a weird thing to be. It's a haunted, twisted people, as a people. All peoples, meaning tribes, have horrible stories to tell about who they did under and who they screwed over. When you're asked to identify with your culture, you're asked to take this on. I reject it.

My brother years ago invented this term. He called it extra-environmental. He said, this is what we want to be. We don't want to be Americans, or Germans, or English – we want to be extra-environmentalists. Always feel wherever you go that you are a stranger, the outsider, and the one looking in. This is the viewpoint that makes all places the same to you. There's a wonderful English poet and writer, Rudyard Kipling, and he wrote a children's short story called The Cat Who Walked By Himself. It's a story of how the dog came to the cave of man and would lay at the man's feet, but the cat would never come. When the woman asked the cat why it would never come, it said, "I am the cat who walks by himself and all places are alike to me."

I think transcending our cultures is going to be extraordinarily necessary for our survival. I don't think that we can carry our cultures through the keyhole of the stretch of the next millennium. How do you shed your culture? How do you transcend your culture? By digging into your soul with the tools that have been given to you to make art. This is how cultures are transformed. By art, which flows up and actually submerges the previous cultural forms. The Baroque gave way to later periods simply out of exhaustion, but notice, a style can exhaust itself and still continue. Mannerism did this out of the renaissance, for example. When these exhaustive styles are allowed to continue, they become toxic, they become moribund. It's like keeping a corpse around the house. There is an obligation to overthrow that. We are to produce the new, to produce the novel, and by the novel, I don't mean the literary form, I mean all things new.

It is not the function of the artist to be the critic. The winnowing out, the deciding what is good from what is bad, comes later. That is a community process. The community decides what is good and bad art. But the individual should pour this forth. This is what you are: you are some kind of a mystery suspended between two eternities. In that moment, when a mind looks out at a world and asks the question, what is it? In that moment, art can be created. It is the only form of immortality that I have any certainty of and it's available to everyone.

At the present moment – I make no distinction between art and 'techne.' To my mind, these things are the same thing. A great turning point is in the offing. The world is changing; it's changed before but not for a long time in our lives. Not since before our lives, but now it's changing, and there are many, many possibilities. The English biologist, Dawkins, invented the word meme. Do you all know what a meme is? It's the smallest unit of an idea. It's like what a gene is to biology, a meme is to ideology. Our task is to create memes. Madonna is a meme, Catholicism is a meme, Marxism is a meme, and yellow sweaters are a meme. Create memes! Rainbow colored dreadlocks are a meme.

Launch your meme boldly and see if it will replicate, just like genes replicate. See if your meme can infect and move into the organism of society, and believing as I do that society operates on a kind of biological economy, I believe these memes are the key to societal evolution. However, unless the memes are released to play the game, there can be no progress. So I think the obligation on people such as ourselves, and I assume probably without exception, everybody in this room falls into the upper 5% of the Earth's population in terms of wealth, education and freedom. Even if you're some poor pierced metal-head from the dark side of Manheim, you have a better situation than most people on this planet. You have a better chance at actually reaching out toward the machinery that shapes reality and having an impact.

So then the question becomes for some: "but I have nothing to say, or I have nothing to paint, or I have nothing to communicate." Clearly you're not taking enough drugs then – those excuses simply will not be tolerated. If someone finds that decadent, flippant or destructive - then they don't understand what these psychedelic substances are. They open the doorway to creativity. They cleanse the doors of perception, then as Blake said, "reality is perceived as it truly is, as infinite."

Part of what is wrong with our society, and hence, with ourselves, is that we consume images. We don't produce them. We need to produce and not consume media. Media is a huge issue. You can't escape it, so what are you going to do about it? The only solution is to drive it, to take charge, or otherwise you will be poisoned by it. As more and more people are waking up to this – essentially we are seeing I think, a huge artistic revolution. A revolution in values that reaches into science, into politics, and into every aspect of life, but that is coming from the imagination thoroughly stimulated and activated by the discovery of all these natural and synthetic substances that perturb the mind. I'm also not denying that a certain amount of social chaos goes along with this. On the other hand, I can point to pretty psychedelically pure centuries, like the 13th in Europe, and there was still plenty of social chaos going on. I don't think that you can lay social chaos at the feet of psychedelics. I think that social chaos is an inimical part of the system. What psychedelics do is give a direction to that chaos. They give a dimension of

vertical ascent, because inevitably, out of the psychedelic situation emerges, not despair, not self-indulgence, but wild-eyed idealism. That's the inevitable product of any psychedelically driven social process. How well that idealistic idea then brokers its way to the throne, if it does, is another issue.

I don't know if I've hit this technological thing hard enough. I hope that you all avail yourselves of the power of the Internet. In years past, in speaking to audiences in America, it was maddening to me to find that the environmentalists, the feminists, the gays, the psychedelic people, the space people, and the colonization people – none of these people had anything to say to each other. They didn't seem to realize that their marginality united them far more than any difference they might perceive in their positions. They didn't seem to realize that their political disempowerment was a product of their inability to make common cause with people similarly motivated, or similarly motivated toward social change. It's very important to build an inclusive community and a community that has a sense of direction and I think the Internet empowers this far more than any other tool that has been handed to us, except psychedelics. If you take psychedelics, the Internet, music and put all of that together – you have the basis for a new community that is wider and deeper than you know. The people who are building the new machines, who are designing the new circuitry, who are writing the new code – they are all freaks. They work for capitalist dogs of course, because we all do but the creative thrust of these technologies is being driven by people just like you and me. I think this is all tremendously positive.

Finally, I'll close on this. The alchemical return.

All culture is some kind of myth. All cultural stories then have a kind of psychic dynamic to them, which is not suspected by the civilization as it lives these myths. It has to be seen from outside. There is a consistent myth in Western civilization. In the early Jews, you get it as the idea that God will enter history. With Christianity, you get it with the idea that Man and God can be consubstantial. It appears again in Islam with the insistence that God will enter history. Modern science, strangely enough, dumps all of this theology but maintains the idea that Man can become as a God. In other words, the myth that is consistent throughout the entire Western experience is the myth of some kind of defining progressive experience.

Well now we have the power to realize this myth in some kind of, for want of a better word, an alchemical utopia. I think its very interesting that at this very high tech moment in our adventure, the plants return; the humblest of all biology. The plants return and almost stand before us as a beacon and a promise. Have you noticed that plants do all their business with dirt and air? This is something we only wish we could do. Build an industrial society based on nothing more than the ambient dirt and the air flowing past; building sugars and carbohydrates out of gaseous oxygen. This is quite a trick. The plants stand, both in the psychedelic sense but then in the larger sense of the vegetable kingdom, for absolute Tao. They stand for the correct way for life to relate to its environment. They are effortlessly recycling, vegetatively propagating when necessary, sexually propagating when necessary, immune to pain, patient to the tune of centuries. They are always building up structure and always maintaining a leavening effect upon the land.

All of these qualities of care giving and, notice for example, that all the processes of biology occur below the boiling point of water. If only we could build societies that did that. We work in the range of hundreds of degrees, thousands of degrees; fusing metals and creating toxicity. So I think the psychedelic plant revolution is leading towards the nano-technological revolution. This is, in other words, the imitating of nature at the atomic level in the building of machines and the management of processes. What all of this is leading toward is a rarefaction, good alchemical word, a rarefaction of the human imprint on this planet. This means a spiritualization of humanity and a new order of mind; part machine and part human.

Notice that the Internet and the computers that it serves are actually made of the materials of the earth. They're largely metals: silicon, glass, copper, gold, and silver – these are the products of demonic artifice. These are the things that the alchemist dreamed of. They transform space and time, they allow us to speak at a distance, and they allow us to wander through libraries thousands of miles distant. They make it so that no fact is too obscure and no person so hidden that you can't reach them. It is, in a way, the perfection of the magical ideal that was developed and unfortunately, prematurely launched by Frederick the Elector and his wife here nearby at Heidelberg.

So I'm involved, as I've said, in a process of bringing this story to many people who haven't heard it. It's a great story, it's a great myth that the underground community should make it's own. I used it evening just as the scaffold for this talk but I tried to hit the things that are important to me; which are: psychedelics, recovery of archaic lifestyles, use of media to subvert existing paradigms, empowerment of the individual through dissolving the ego through psychedelics, and whatever else! Thank you for your patience and indulgence!

Well, um, 'The World and Its Double' is how we styled this. Uh, this is simply uh-a high-visibility, flashy way of reminding people whose eyes fall upon that text that, uh, the world has a double. The world is not entirely or completely what it seems to be. Culture – and by culture, I mean any culture, anywhere, any time – um, gives you the message that, uh, everything is humdrum, everything is normal. In other words, culture denies experience. You know, we all have had, and even a population of non-psychedelic people have had, uh, prophetic dreams, intimations, unlikely strings of coincidences, uh, all of these sort of things. These are experiences which cultures deny. Cultures put in place –uh, I'm sure you've heard this word – a paradigm, and then what fits within the cultural paradigm is, uh, accentuated, uh, stressed, and what doesn't fit inside the cultural paradigm is denied, marginalized, argued against; and we live at the end of a thousand-year binge, uh, on the philosophical position known as materialism in its many guises. And the basic message of materialism is that the world is what it appears to be: a thing of-composed of matter, and, uh, pretty much confined to its surface. The world is what it appears to be.

Now, this, on the face of it, is a tremendously naïve position, because what it says is the animal body that you inhabit, the eyes you look through, the fingers you feel through, are somehow the ultimate instruments of metaphysical conjecture... which is- is highly improbable. It seems to me, metaphysical conjecture begins with, uh, the logic of the situation, and then proceeds in whatever direction that logic will carry you. Well, if logic is true to experience, then, uh, we have to make room in any theory for invisible connectedness between people; anticipation of a future that has not yet occurred; uh, uh, shared dreaming; all kinds of possibilities that materialism has denied. For approximately 500 years, the great era of the triumph of modern science, materialism has had it's a- the field all to itself; and its argument for its preeminence was the beautiful toys that it could create: aircraft, railroads, global economies, television, spacecraft. But that isn't- that is a fool's argument for truth! I mean, that's after all how a medicine show operates, you know: the juggler is so good, the medicine must be even better!

Uh, this is not an entirely rational way to proceed. And now, at the end of 500 years of the practice of “rational” scientific culture, we are literally at the end of our rope! Reason, and, uh, science, and, uh, the practice of unbridled capitalism, have not delivered us into an angelic realm. Quite the contrary: they've delivered 3% of us into an angelic realm, completely overshadowed by guilt about what's happening to the other 97% of us who are eating it!

Uh, it's not a pretty picture, modern civilization. Most people in the world today are quite miserable, actually. Uh, they have very little hope; their religions, their traditional value systems, are being eroded by, uh, Dallas and Hawaii 5-0, which are on the village television every night. Uh, lifespans are being shortened by pesticides, chemicals, all kinds of things in the environment; and, uh, and there is very little political light on the horizon. So I believe that it's reasonable, looking at this situation, to say that history failed; and that the grand dream of Western civilization has in fact failed. And now we are attempting, with basically a carved wooden oar, to turn a battleship around. And it's a very frustrating undertaking. Uh, the momentum for catastrophe is enormous in this situation. Uh, now what- but it's not 100% certain that catastrophe is what we're headed for, because we are not 100% unconscious. There are people struggling to figure out how to control population, struggling to figure out how to balance the relationship between the masculine and the feminine, uh, struggling to bring, uh, amelioration of hunger and disease to various parts of the world. So we're in essentially a tragic situation. A tragic situation is a catastrophe when you know it, you see. And, uh, part of the Western impulse has been to subjugate all other cultural styles to our own. And this has taken the form of actually swallowing and digesting Native American culture; uh, the ethnicity of European culture has been replaced by the mega culture of Nouveau Europa, whatever that means; cultures are melted down in the belly of the Western scientific beast and then they become structural members in an ever-expanding edifice of Western scientism.

However, the psychedelic experience, as practiced by shamans in many, many parts of the world, is, uh, apparently a bite too large to swallow. Psychedelics arrived on the Western, uh, agenda only about 100 years ago, when, uh, German chemists, uh, brought peyote to Berlin and extracted mescaline; and for the next 50 years, up until about 1945 (55 years, make it), very little happened. Uh, uh, mescaline did not – though it was taken by Havelock Ellis and, and William James, and F. Weir Mitchell, and – it did not spawn a craze; it did not influence large numbers of intellectuals particularly. Then in the 1- in the 40s, LSD was discovered; in the 50s, DMT and psilocybin were discovered; and then, in 1966, all these things were made illegal. There was no real opportunity for Western science to grapple with these things before they were decided to be too hot to handle- made not only unavailable to people such as you and I, ordinary people, but taken off the agenda of scientific research.

In the Middle Ages, the church forbade dissection of human bodies, and medical students would visit battlefields and the gallows at night, and steal the bodies of victims of war and executed prisoners in order to learn human physiology. Where that spirit of scientific courage has gone, I don't know; but there is very

little of it left. Now, people feed at the trough of government grants and enormous corporate research budgets, and the idea of actually pursuing truth, or attempting to understand the phenomenon in an unbiased fashion, divorced from its commercial, social and political dimensions, is unheard of.

...if you look at thousands of these experiences, is: they dissolve boundaries. They dissolve boundaries between you and your past; you and the part of your unconscious you don't want to look at; between you and your partner; between you and the feminine, if you're masculine, and vice versa; between you and the world; all the boundaries that we put up to keep ourselves from feeling our circumstance are dissolved, and boundary dissolution is the most threatening activity that can go on in a society. People – meaning government institutions – become very nervous when people begin to talk to each other. [input from audience] – Yes. The whole name of the Western game is to create boundaries and maintain them. The Church and the State; the poor and the wealthy; the black and the white; the male and the female; the young and the old; the gay and the straight; the living and the dead; the foreign and the familiar... all of these categorical divisions allow a kind of thinking that is completely cockamamie. After all, reality is in fact a seamless, unspeakable something; and we understand that to perceive it separately is a necessary adjunct to the act of understanding, but it is not the end of the program of understanding! Particulate data has to be recombined in a paradigm, a seamless overview of what is happening; and the drugs that Western society has traditionally favored have either been drugs which maintain boundaries or drugs which promote mindless repetitious physical activity on the assembly line, in the slave galley, on the latifundi of the slave-driven agricultural project... whatever it is. In the corporate office.

This is why every labor contract on this planet – at least, in Western civilization – contains a provision that all workers shall be allowed to use drugs twice a day at designated times; but the drug shall be caffeine. Now, the reason why caffeine is so welcome in the workplace is because the last three hours of the workday are utterly unproductive unless you goose everybody with two cups of coffee, and then they can go back to the word processor, the widget-tightening machine, or whatever they're doing, and mindlessly and happily carry on. If it were to be suggested that there be a pot break twice a day [laughter], you know, you would think that civilization was striking the iceberg or something! And alcohol... our society is an alcohol, red meat, sugar and tobacco culture. And all of these are forms of speed, basically, in the way that we use them. I mean, yes, you can tranquilize yourself on alcohol, but you're pushing toward levels where a lifetime of tranquilizing yourself on alcohol will be a short lifetime, if you use it that way.

So there's a lot of tension in society between the great exploring soul and the assembly-line citizen. The citizen is defined by obligation, and by the boundaries that define, you know, the next citizen – either because it's a neighbor, or a worker, or an employer, or something like that; and the grand exploring soul is marginalized as an eccentric or, if necessary, more seriously marginalized as mad in some way. I mean, madness basically – up until the level of physical violence – means “You are behaving in a way which makes me feel uncomfortable, therefore there's something wrong with you.” Yes...

So – Now, it's interesting, and this is one of the points that's dear to me – I mean, they arrive in different orders each time, but – I think of history as a kind of mass psychedelic experience; and the drug is technology. And as technology gets more and more perfected as a mirror of the human mind, the cultural experience becomes more and more hallucinatory. And for at least the past couple of hundred years, boundary dissolution has been underway at every level of Western civilization. I mean, you could push it further back: the Magna Carta, the fact that princes and lords of the realm would actually attempt to force the king's signature on a document defining their privileges – they are, after all, ordinary human beings;

the king is the divine appointed regent of God in Heaven! So this was a severe boundary dissolution, within the context of the age in which it was taking place. They were actually saying, “You, as Christ’s representative on Earth, should seed some of this omnipotence to us mere mortals, suspended in the political process” – well, that leads then to broader demands for human rights: for the idea that a permanent and large segment of society kept in permanent poverty is unacceptable... we got rid of debtors’ prisons, and things like this.

As the collectivity of our humanness becomes an intellectual legacy for all of us, there is a dissolving of boundaries of race, class, status, language, so forth and so on; and the whole of the 20th century has seen a massive acceleration of this. The breakdown of the Soviet Union was in fact simply – it was even so described: the lifting of the Iron Curtain – meaning a membrane has suddenly disappeared; and more and more of these membranes are disappearing, and what is emerging then is a more and more psychedelic experience – meaning a sense of acceleration of information flow; a sense of rising ambiguity about what it all means; everything seems to carry both a good facet and a detrimental facet; the ambiguity of everything is increasing; the connectedness of everything is increasing; and I will argue, later in the day, that this is a general tendency of the time and space in which we are embedded, and that we ourselves are a reflection of this.

Where is life carrying us? What is this all about? Is it carrying us toward extinction, so that the rest of Nature can heave an enormous sigh of relief and then get back to the business of nest-building, mating flights and overposturing, and whatever it is that they’re doing out there? – or is it carrying us toward some kind of a transition? If you look back through the history of life – which is a long history, I mean it reaches back a billion years – it’s... every advance happens suddenly, unpredictably, and in a very short period of time. Some of you who stay tuned to the scientific literature may have noticed this series of articles that were around last week, about what they’re calling the Big Bang of Biology: that there was a period of time – incredibly brief, perhaps between a million and ten million years – when all the phyla of life on this planet radiated into existence: some time between 525 and 535 million years ago – just, it all snapped into existence. The episode in which life left the sea is a similar highly confined transition event. People recently have written about what they call punctuated evolution; evolution is not, apparently, a slow curve of unfoldment – it is instead a series of equilibrium states punctuated by violent fluctuations in between, and then a new equilibrium state.

So history, I believe, is not an aberration, any more than leaving the sea could be called an aberration of marine existence. I mean, obviously it is not marine existence, and obviously we are not living in the same world as groundhogs and hummingbirds, psychologically; but leaving the sea did not represent an ontological transition. It represented an extremely dramatic shift of modality, and this is what history is. History is characterized by its brevity, for one thing. I mean, we have packed more change into the last ten thousand years than the billion years which preceded it. And yet, as entities, as animals, meat, we have not changed at all in ten thousand years. If you were to go back to that era, the people would be exactly like people we see today. They wouldn’t be so racially heterogeneous, because the great gene streamings and migrations that characterize history had not yet taken place; but essentially, perfectly modern people. Well, then history is apparently – if we view it as a process that Nature tolerates, if not encourages – then history is essentially apparently important enough to place into... jeopardize the stability of all the rest of the natural ecosystemic world.

It’s as though Nature is saying, “We are willing to place the entire planetary ecology in danger for 50,000

years in order for the opportunity to be explored of language-using, technological-expressing, intelligence carrying all of life to the next level". And it's a terrifying enterprise, because apparently to carry life to the next level, tremendous intellectual sophistication is required about the release and control of energy. The problem is, energy can be used to destroy as well as build. So as the human enterprise has moved toward greater and greater power, and ability to manipulate the environment, the stakes in the cosmic game have risen. And now what we have is approximately \$100 billion sitting in the centre of the crap table, and one roll of the dice more and we're going to either win it or lose everything. Because intelligence, if we fail, will never again reach the kind of levels on this planet that we have reached.

Why? Because we have extracted all the available metals near the surface of the Earth; an evolving species following after us will find the Earth strangely depleted of usable materials, down to the 1500-foot level; and so intelligence coming beyond us will find it just does not have the resources to make the leap to technical civilization. So it's beginning to look like a one-shot deal. And the psychedelics are in there for two reasons. First of all, because they allow us, as individuals, to break out of the flat cultural illusion and to rise up and look at this situation, so it's for us a tool to understand our predicament; but the psychedelics are also what has driven this circumstance to arise in part, because what psychedelics do – and I think this isn't too challengeable – is they catalyze imagination. They drive you to think what you would not think otherwise. Well, notice that the enterprise of human history is nothing more than the fall-out created by strange ideas! You know: Let's build a pyramid! Let's build a windmill! Let's build a water wheel! – you know – and then empires, philosophies, religions, arise, in the wake of these situations.

I've argued in the past – and I'm going to try not to repeat it here today, because I think you've all heard it, but I will just mention it in a sentence or two – that the critical catalyst propelling us out of the slowly evolving hominid line and caused us to take an orthogonal right-hand turn into culture, language, art, yearning... probably was the inclusion of psychedelic plants in our diet during that episodic moment when we went from being fruititarian canopy-dwellers to omnivorous pack-hunting creatures of the grassland. And it was the inclusion of psilocybin in our grassland diet that caused us to discover that there is a mind! And you can perturb it!

I mean, think about... and I don't think you could discover consciousness if you didn't perturb it, because as Marshall McLuhan said, "whoever discovered water, it certainly wasn't a fish". Well, we are fish swimming in consciousness; and yet we know it's there. Well, the reason we know it's there is because if you perturb it, then you see it; and you perturb it by perturbing the engine which generates it, which is the mind/brain system resting behind your eyebrows. If you swap out the ordinary chemicals that are running that system in an invisible fashion, then you see: it's like dropping ink into a bowl of clear water – suddenly the convection currents operating in the clear water become visible, because you see the particles of ink tracing out the previously invisible dynamics of the standing water. The mind is precisely like that, and the psychedelic is like a dye-marker being dropped into this aqueous system. And then you say, "Oh, I see – it works like this... and like this."

Well, if psychedelics are a catalyst for the imagination, and if history is driven by the imagination, it is driven through the fall-out from the imagination, which is technology and culture. Technology and culture are the consequences, the derivatives, of the ratiocination of the mind. And technology has – like biological life, but on a much faster, accelerated timeframe – technology has this weird tendency to transcend itself; to bootstrap itself. You know, if you have a cart, then it implies better wheels, better bearings, better structure, and then higher speed, more control, more feedback from the machine; it means

we need gas gauges, RPM readouts, so forth and so on. Technology, strangely enough, created by a biological creature, has itself this self-transcending quality.

But ever-accelerating; this is the important point – because the ever-accelerating accretion of technology means that history is strangely foreshortened at the future end, because it happens faster and faster. It's like a process that begins very slowly, but once started has the quality of a cascade – or, you know, the rate at which falling bodies move: 32.5 feet per second, per second! Each second, it accelerates to twice the rate of infall that was occurring in the previous second. Technology is like this; and we now are in a domain where, if we attempt to propagate technological development forward 50 years, it becomes unmanageable as an intellectual task. We can talk about the automobile, what it might look like 50 years from now: it would float, it would go 500 miles an hour, it would be guided by your mind, so forth and so on... these kinds of ideas. But when you think that every artefact of our world will undergo that kind of transformation, and that the synergy among these transformed objects will create phenomena and situations that we can't anticipate – that's the key thing: our inability to anticipate the synergies between our technologies. I mean, the computer, LSD, spacecraft, holograms, organic superconductivity – those are just six areas where the integration of those concerns will produce unimaginable consequences! The ultimate boundary dissolution is the dissolution of ego. I mean, we hope – we straight people – hope that they never meet it except at death; of course, they don't realize that going to sleep at night is a kind of ego dissolution. But the government is expressive of this dominator culture that we're living in. The ego is a very recent invention, and its hold on reality is very tenuous. And consequently it walks around imbued with fear: I mean, it feels itself to be a mouse in a world of dinosaurs. That's because it's a very recent development.

I guess I have to go back to this scenario of human development, and say, just very briefly: here's how I think this worked. I'm not going to run through the whole evolutionary scenario, but this thing about ego... All primates have what are called dominance hierarchies. That simply means that the hard-bodied, long-fanged, young males kick everybody else around. They control the females, the children, homosexuals, the elderly... everybody is taking orders from this dominance hierarchy. And this is true clear back into squirrel monkeys; it's a generalized feature of primate behavior. And it's an aspect of our behavior, as we sit here: women – the feminine – is not honored; the elderly are marginalized; homosexuals, that whole issue; many of our social and political ills stem from this attitude. Well, but you see I believe that when we left the trees, and admitted psilocybin into our diet, that it has the effect of dissolving boundaries, and making this maintenance of a dominance hierarchy very very difficult.

First of all, the key on one level to maintaining the dominance hierarchy is monogamous pair-bonding. That's where it begins. In a society taking a lot of psilocybin, monogamous pair-bonding breaks down, because of the CNS activation, and sexual arousal. So in a psilocybin-using culture, there will be a tendency to orgiastic sexual behavior, rather than monogamous pair-bonding. What that does is it causes an incredible social cohesion, because in an orgiastic society men cannot trace lines of male paternity. So men's attitude toward children is, "These children are all ours. We the group"... it's a glue that we, in our paranoid social style, with everybody having the deed to their property and their 11-foot-high fence, can hardly imagine. But psilocybin was artificially suppressing this dominator behavior style in the primate, the evolving protohominid, now human being.

When psilocybin was taken out of the diet, the old, old primate program was still there. It had not been bred out; the genes were always there; it's just that for 50,000 or 100,000 years, we medicated ourselves –

literally, religiously – we religiously medicated ourselves every new and full moon, perhaps oftener; these orgies were happening, creating social cohesion, propagating everybody forward... the problem was, when the psilocybin was taken away, we had been under its influence for perhaps half a million years. We had evolved language, rudimentary abstract philosophy, a sense of religion. We had invented technology in the form of using fire and chipping flint, and all that. The psilocybin goes away, and suddenly these skills, these tools, these technologies, are in the hands of marauding apes – not any more cohesive caring human social groups, but marauding territorial apes, driven by the desire to control all weaker members of the social group.

And that's our circumstance! We have, you know, the tools that would allow us to sculpt paradise, but we have the reflexes and value systems of anthropoid apes of some sort – so the split between our conscious hopes, our best foot, and the bottom of the human scale, is appalling. I mean, look at the spread! It's a spread from – well, from Mother Teresa to serial killers! – I mean, you don't get serial killers in the chipmunk population, or the grasshopper population – I mean, these animals are not so set at variance with their basic nature that these kinds of pathologies can erupt. We, on the other hand, are half angel, half pack-hunting killer ape. I mean, we are an object-fetish society – I mean, our entire psychology is characterized by a profound discontent. That's what we're about. It doesn't matter – no matter what's going on, after a little while we get restless and move on; other animal species are embedded in a kind of world of endless genetic cycling. No fox grows bored with hunting, you know?! – and yet our thing is a profound dis-ease.

And I believe it's because – and slowly you've forced me to do this whole rap, which I swore I wouldn't do – I believe it's because the psilocybin led us halfway toward a kind of godhead, but then it disappeared, and we are left in this very peculiar situation. This is the myth of the Fall; you know, we are half angel, half beast – and these two natures are united in every one of us. And when you take psilocybin, you feel generally a great sense of community, an ascent to a higher level. If you completely restrict your intake of intoxicants of any sort, then you get the teetotaler type personality, which is characterized by incredible smugness, limited intellectual horizons, and an unbearable aura of self-congratulation that makes it pretty hard for the rest of us to put up with.

See, here is the final piece of this evolutionary key. Psilocybin, in small amounts, increases visual acuity. This is not an arguable point; I mean, you can just give people psilocybin and give them eye tests, and people with astigmatisms see better; your edge-detection ability is greatly increased. Well, you can see that an animal like our remote ancestors, in a hunting environment in the grassland, if there is an item of diet that will make you a better and more efficient hunter, the equivalent of chemical binoculars lying around on the grassland, those animals that avail themselves of this technology will be more successful hunters. And so it was: animals using psilocybin were more successful at raising their offspring to reproductive age. Well, then at slightly higher doses you get this CNS arousal, which in highly sexed animals such as primates, arousal means sexual arousal – an erection in the male – so then there is, without the overwhelming influence of Christian ethics to guide their behaviors, I'm sure these organisms simply flopped in a heap, and – you know, sorted it all out later! So that's the middle range of the dosage. Low dose: success in hunting. Medium dose: social cohesion achieved through ego dissolution and orgiastic sexuality.

Yet higher doses, 5 grams and up: hunting is out of the question; sex is out of the question; you're just nailed to the ground by the campfire, and in the course of the evening you discover religion! [laughter] Philosophy! Art! – and, you know, all of that. So here is a unique chemical that, at every dose level,

synergizes activity that leads to greater coherency and self-expression. The driving of the imagination – yes, in the question back here you said you can't create what you can't conceive of; this is why what the psychedelic experience does, really, is it stretches the envelope of the imaginable. I mean, what can be imagined can be created; what cannot be imagined is not part of the play. So psilocybin really was a stimulant for the production of intellectual product in the form of songs, rituals, dances, body painting, abstract ideas. All of these things are what we are most unique.

Well, that's how it seemed to me. It seemed to me, culture is a shabby lie – or at least, this culture is a shabby lie. I mean, if you work like a dog, you get 260 channels of bad television and a German automobile! What kind of perfection is that?! We have our secular society – religion is completely devalued – and consumer object fetishism is the only kind of worth that we collectively recognize. I'm sure you've all seen the T-shirt that says "He" – notice, he – "who dies with the most toys, wins". That is in fact the banner under which we're flying here. And the level of unhappiness is immense. I mean, the level of unhappiness among the poor, they've always been miserable; but we've managed to create something entirely new in human history – an utterly miserable ruling class! I mean, there seems no excuse for that!

Well, I guess this leads us to a subject worth talking about, which is, it's very important to talk to the state or the substance or...if you don't talk to it, it won't talk to you. It follows the rules of ordinary etiquette, and it does not speak to strangers. But if you will say to it the simplest thing like "Hello?" then it will say, "Hello", and you say "is someone there?" it says "Yes..ready and willing, what's up?" But if you don't speak to it, it won't do that. That is to me the strangest property of psilocybin, is this speaking in English business. I mean, LSD doesn't do that. Ayahuasca doesn't do that. Psilocybin does for some reason. This is not my illusion. Nearly everybody who's spent time with it has commented on this. On DMT you see who you hear on the mushrooms. On the mushrooms you almost never encounter something that you can see. You see hallucinations, but you do not see the author of the data stream that's saying "did you know? I'll bet you did know!" The standard form of address. But on DMT, they come bounding out of the woodwork. The strangest things happen on DMT. The most intense, and you can remember them. DMT is not like a psychedelic drug in the sense that you're getting into the contents of your hopes, memories, fears and dreams. It's much more like a parallel continuum. It's much more as though you've broken through to some alien data space. One of the most puzzling things about DMT is it does not affect your mind, you know? It simply replaces the world one hundred percent with something completely unexpected. But your relationship to that unexpected thing is not one of exaggerated fear or exaggerated acceptance as in 'oh great, the world has just been replaced by elf machinery!' Your reaction is exactly what it would be if it happened to you without DMT. You're appalled!

Because you don't feel your mind moving. You just see that the world has been replaced by something that you could not have even conceived of or imagined before, and these entities, these things which look like dribbling, you know, self-dribbling jeweled basketballs, something that the NBA might take an interest in, you see them and they present themselves to you, they use language to condense visible objects out of the air. Now, I don't know why they're doing that, I mean, perhaps, on one level, I assume that they're trying to teach you to do that. On another level, they seem to be giving a demonstration of the fact that reality is made of language. They're saying, you know, if you don't believe reality is made of language, here, I'll make you one! And then blibbledy blibbledy blip~ there it is! And they hand it to you to be passed around in slack-jawed amazement among the human beings. This technology that they possess of these objects made of gold and emerald and chalcedony [?? -INSERT TIME] and agate that are morphing themselves

even as you look at them are, you know, technological dream come true. I mean, the lapis as elf excrescence, or something like that. And why they're there? I don't know? And, you know, many many questions? Where are they when you're not stoned? You know? Do they have an autonomous existence somewhere, or do they spring into existence a microsecond before you encounter them? Are they rooted in the dynamics of your psyche, or are they no more rooted in the dynamics of your psyche than the World Trade Center? It's not clear.

I mean, I think I mentioned at some point, just briefly, that the archetype of DMT is the circus. These things are clowns, at one level, they're clowns. I mean, when you think of the circus, it's a very complex archetype. A circus is for children, it's a delight, and you take a child to a circus, and there are three rings and absurd clown antics going on, but then you lift your eyes up to the top of the tent and there the lady in the tiny spangled costume is hanging by her teeth, working without nets. It's about eros and death. My first awareness of eros was being 3 or 4 and these women in these tiny costumes spinning around, and realizing, you know, if she falls, she dies. And then, away from the center ring and all this action, there are the sideshows, the goat-faced boy, the thing in the bottle, the siamese twins, and fuzzy Charley. All of that is also very DMT-like. It really is the archetype of the circus. I can remember when I was a kid in this small town in Colorado, every year at the 4th of July, the carnival would come to town for a week and set up. And we anticipated it throughout the year, but as soon as the carnival came to town, then you couldn't play outside after 9 o'clock at night because 'carny people are different', we were told. And, you know, their means of support, sexual proclivities, and choice of intoxicants might have run counter to this Midwestern Catholic mining town I was in. And so then, there's this sense of the disruption, the danger, the drama, the interest, the fun, and then they go away and life is as if they had never been there at all. And that's what DMT is like. I mean, it's a secret of such magnitude that it's inconceivable how it has ever been kept because in a world where information was fairly weighted, we would spend as much time talking about DMT as we spend talking about, I don't know, the West Bank or something. And as you see by studying our newspapers, DMT is rarely, if ever, mentioned. I mean, never would be a good rule of thumb. The Western mind is very queasy around these experiences that cast into doubt its cherished illusions about how reality is put together, and when you get to DMT, you have hit the main vein. I mean, I hold it in reserve as the ultimate convincer. I mean, there are these people running around, you know, who say 'oh, you people who are into drugs, haha! Give me a good branch whiskey and a little TV, I think you're deluding yourself!' Say, oh, do you? Well if you've got 5 minutes to invest in this proposition, my cheerful friend? Because if you do, have I got news for you! It also seems to me, you know, considering the fact that DMT is a naturally occurring neurotransmitter, that you return to the baseline of consciousness in 15 minutes, that it's utterly harmless. What's the matter with our critics? Why are they so phobic of it? You know, what is it? Are you tainted forever if you know the position of your enemy? Why are they so afraid to give it a chance? Well, I think I can answer my own question. Quoting a wonderful thing, Tim Leary said years ago. He said "LSD occasionally causes psychotic behavior in people who have not taken it." Right! That is the problem, I believe! That these drugs are causing outbreaks of psychosis among people who won't get near them! And they are turned into frightened, paranoid, order-freaks reaching for extra-legal and extra-constitutional means to make your life hell. Obviously their minds have been severely bent by the absence of this drug. However, the knowledge of it seemed to practically undo them.

Next Terence discusses the potential teachings of DMT

Yeah, I mean the first teaching is priceless. It's that the world is beyond your ability to conceive or imagine. So, give up any short-term plan to conceive or imagine. I think, really, the worth in these

psychedelics is simply that they allow you to triangulate upon reality. I mean, in other words, if all you've got is awake and asleep, you can't go far with that. But if you've got awake, asleep, and DMT as points, you can build a much more dimensionally rich model of consciousness. I think that it has to do with your own intelligence. Truly stupid people aren't interested in psychedelics because they can't figure out what the point of it is. It feeds off intelligence. It's a consciousness-expanding drug. If you don't have any consciousness, it can't expand it. I've met people who say "Yeah well all this stuff and big bugs talk to you and say strange stuff!" You say, yeah, well, you should have paid a little attention! I mean, it's amazing to me how people don't seem to, like the less intelligent you are, the less challenging the psychedelic experience becomes because the less capable [clears throat] of entertaining the implications you are. Because you just say "well yeah, a lot of bright lights, and there's some talking bugs and spaceships and I don't know, uh I don't know." Well, you know, I guess it's because those people are so ingrained in cultural values that they assume it's not real. They just, they assume it's a trip, whatever that means. It means you have permission not to take this experience seriously. It's a trip. But what I've noticed is that based on quantum mechanics' need for an observer as part of any system, that's big news for our field of study because what it means is hallucinations are as real as anything else. I mean, a hallucination is not like a Chevrolet, but on the other hand a Chevrolet is not like a hallucination. Why should we demand that these things co-map over each other? A hallucination is a species of reality as capable as teaching you as a videotape about Kilimanjaro or anything else that falls through your life.

The question is, does DMT talk to you the way um, psilocybin does. It's interesting that these two compounds, so closely related to each other, both have something to say about language, but they say it in precisely opposite ways. Psilocybin, it's a teaching voice that speaks to you in your language. I had a very interesting experience that was an example of this to me. When I first started growing mushrooms I had to do a lot of batch testing, and so I was taking mushrooms a lot. And I would get into these places with it where it would say "ta-tada-ta-tada-ta-tada-ta-ta says, ta-tada-ta-tada-ta-tada-ta-ta says." It would make these declarative statements and it would always put the word 'says' on the end of uh, the, the, the sentence. I thought, you know, weird, but what do you expect of a talking vegetable? What's weird and what isn't? And then I, I heard Wasson's publication called Maria Sabina and her mushroom ballada. It's a set of six tapes of a mushroom session that Maria Sabina did in 1956. So, so here is Maria Sabina raving in Mazatec and it's going along like this "tada-ta-tada -da su, tada-ta su!" And I look in the inter-linear translation, 'su' means 'says' in Mazatec. So she's, she's hearing it Mazatec, I'm hearing it in English. So that's what psilocybin is capable of. What happens with DMT is it doesn't speak to you in English. It speaks to you in elvish, and you understand. And su- under sufficiently hyped-up conditions you are able to reply. In other words, psilocybin pushes your brain state towards some kind of spontaneous glossalalia, and I think that this probably is mixed up with the generation of language itself because what happens on DMT, on high-dose DMT, is these machine elves, these dribbling basketball things, they use this musical sing-sang-song language to make objects, which they then show you. They're like machines or animals or crystals or crosses between, I don't know, consomme and something else. They have these opalescent depths. They're neither matter, nor mind, neither solid nor liquid, but they make these things and set them loose in this environment. And these things themselves are emitting language and making other things. So they make machines which make machines. Everybody's chattering, squeaking, crawling over each other, clamoring for your attention. And what they're trying to you is get you to produce this glossalalia for some reason which I cannot imagine why. When you're stoned and you do the glossalalia, it's an incredibly pleasurable experience, but so might be eating an orange or having sex if you were to do it at that moment. You can't tell, but you can make this funny pseudo-linguistic stream of syllables that's very very satisfying. And, you know, it has a bit of art in it. I think probably we invented language long before meaning, and that it was

some very practical person who got the idea that uh, the music could have words, and that before that it was simply verbal amusement, uh. After all, the most readily at hand musical instrument is the human voice.

I think that language as we practice it this afternoon in this room is an uncompleted enterprise, that la- tho that language wants to be visual. It is in transition. Remember, it's from the silence of prehistory to the visual language beyond the Eschaton, and the overlapping of silence and visual language gives you audial language. The more perfect Logos would be beheld. This is what Phylojudeus taught. And considering that many of these psychedelic compounds involved in the language phenomena, like DMT and harmine and harmaline, these all occur as part of human metabolism ordinarily. And I think that it's possible that we are on the cusp of an evolutionary transformation of language having to do with an actual change in our physique, in our genetic output, because why is it that monoaminoxidase-inhibiting compounds like harmaline, specifically 5-methoxy-tetrahydroharmalan, occurs in the pineal gland and is, uh. The pineal gland has always been thought of as somehow connected to the soul. It was the seat of the soul for Descartes, and I think that maybe what history is is the rather muddled situation that occurs in an animal species while it perfects a true language, and that we ha- we're not there yet, folks because a true language is beheld.

I think that the real nub of what we're trying to get at here is that the world is mental in some way that we do not yet understand, but that which we're edging toward understanding. And the, the world is made of language. I can't say that enough, and uh, and so uh, whenever we get into these discussions about reality or effects in space and time, we are operating outside this assumption that the world is made of language. If the world is made of language it's very hard to figure out just where the edge of it is. I mean, do we really need to believe in the existence of distant galaxies like NGC-245 if, in fact, the world is being produced in the human cerebellum as a, as a phenomenon of language? What exactly is the ontological status of these distant parts of the universe that register only as the faint tracings on our instruments, then interpreted through the fishy fiat of a bunch of stacked up theories and formulas. I mean, did you know that the entire universe of radioteloscopy- uh, radio telescopes were invented around 1950, they've been used to develop our entire picture of the universe. Did you know that if you took all the energy that has fallen on all the radio telescopes on this planet since the invention of radio teloscopy that it would be less energy than is generated by a cigarette ash falling a distance of two feet? So that's where your data sample is coming from that you've built up this model of exploding galaxies and colliding quasars and mega-this and mega-that. I mean, it's pretty flimsy stuff, folks, compared to the meat of the moment in which we find ourselves.

Now, magical philosophies which are uh- have about 50 to 100 thousand years under their belt as opposed to science, which goes back to the Renaissance, magical philosophies have always claimed that the world is made of language, that you, the, the world is a thing of words, and if you know these words, you can take it apart and put it together any old way you wish. Our entire Western religious tradition begins with the incredibly cryptic statement "in principio et verbum, et verbo caro factum est." It's fairly obscure even in English. "In the beginning was the word, and the word was made flesh." What is this making the word into flesh, and does it not imply then that eventually the flesh will become word? As I descend into mental disintegration and madness, I become more and more convinced that reality is more like a novel than a series of integrated tensor equations of the third degree, which is what physics would have us believe. The world is like a novel. It's a novel in which you are a character, and there's dramatic tension, plot, resolution, tragedy, nobility, betrayal, the whole gamut of emotions and human possibilities. And what we

tend to do is always to marginalize first our own experience and then all human experience. So we- our model of reality is that the universe is a zillion somethings that direction and a trillion somethings that direction, we are tiny and insignificant, our star is typical, our galaxy is typical, everything is utterly humdrum and there's nothing going on here at all.

Well, this is an incredibly dreary and disempowering model of reality. I would rather believe that if, in fact, what the universe is is a novelty producing and conserving engine, and if we define novelty as density of connectedness, then guess what? The human neocortex becomes the center of the cosmic drama, because the human neocortex is the most densely ramified and connected material object known to exist in the universe. So after a thousand years of human marginalization, suddenly, through the injection of science, there is permission to believe that the cosmic drama really is about us, that we really do carry uh, the, the load in this play, that this is a play about the career and preservation of novelty and complexity, and thus we are central actors in that drama. And hence, if something were to happen to us and our enterprise, the universe would be vastly impoverished by that loss.

Well now we're on the brink of decoding the human genome. We will use computers to do this because we're going to have to keep absolute track of millions of units of strings of characters. But the end result of it is, I think, is that the flesh will be made word, and that we are textualizing our reality. And this may be what all these French people are screaming about that we can't understand, the so-called deconstructionists. Because they keep saying reality, it should be dealt with as a text. If you don't treat it as a text, you will entirely miss the point of it.

Well, I've been thinking about this for a while, and first of all, my life is very strange because when I hit the mushroom at La Chorrera in 1971, Interpol was looking for me, I had a price on my head, I had no money, I had blown my college education, I had no job skills. I had nothing. And that is, of course, as all folklorists know, uh, the precondition for exaltation. If you're not poor and humble, I mean, what's the point, you know? So, I was poor and humble, and then I got crossed up with this mushroom, and immediately life became art. Life became i- uh, freakishly ordered, and plot elements began to unfold, and I have in my mind a picture of the curve of my mission, if you want to call it that, and weirdly enough, reality has not yet departed from the curve. Now, the curve is getting steeper and steeper, and at some point, surely, reality and the curve will depart. Otherwise, um, decency forbids that I carry that thought further, but you do see what I mean, I think. And all of us are beginning to take textual control of our lives, and be able to write the plot. You see, if what we're embedded in is a novel or some work of art like a novel, then what you want to do is figure out who in the novel you are. I mean, if your name is Joe Blow, is the name of this novel 'The Lives and Worlds of Joe Blow?' or do you get to draw a bath for someone on page 230 and never be seen again? Now, as a character, the more conscious you become, the more you have free will within the context of the plot. I never understood this, and I'm not sure most people understand it.

Like, like I grew up in Berkeley in the 1960- i- you know I was in Berkeley from 65' to 70', the Golden Age. I was so unconvinced of my own uniqueness that I never understood that the great drama that was unfolding around me, all I had to do was join, and I never joined. I thought it was spectator sport. I mean, I marched in the marches, I took acid, I got laid, I did all of those things, but what I mean by "I didn't join" is I didn't realize that The Grateful Dead were a bus ride away that I could probably walk into that scene and make a place for myself. Or The Doors, or the Stones or The Beatles, you pick it. In other words, I defined myself as a spectator rather than an actor, and we are all doing that far too much.

You can get a lot rowdier than you are. You can make a lot more waves. There's been too much politeness and uh, too much parlor etiquette exercise recently by uh, the counterculture. It's perfectly alright to mix things up. It's perfectly alright to try and accelerate the plot. This will move your character nearer and nearer to the center of the action, and people have asked me then, is the goal to make yourself, the novel, about you. Is the goal to make the novel about yourself? I don't think so. The goal is to become the author of the novel. Then, you can write any damn ending you want for your character or any other. And this 'becoming the author' is this psychedelic detachment, and suddenly you go from being a chessman, a chessman on the board to the chess master looking at the board. It's empowering, it's self-control.

Now, people who don't know this are like made of denser stuff than the rest of us. You can just part them like wheat and move through them because they have no sense of the nature of the game. They are still embedded in the old Newtonian paradigm and, and are completely powerless to control their own lives. That's what happens to you in the Newtonian game. All the power flows to, I don't know, the White House, the UN, Madison Avenue? It's not clear, but it certainly doesn't reside with you.

More and more, I think, we need to de-condition. That's what I mean by following the plot as written. If you never de-condition, you're, you're just a character in somebody else's story, but if you decondition, you can begin to move your life the way you want, and miracles happen. Miracles do happen. They happen even to ordinary people in the realm of, of falling in love because there's something about where the genes go that is very compelling to the universal Logos that's watching over us all. So, you know, the stable boy can marry the princess if his heart is pure and the winds of the Logos are at his back. That's why we love those fairy tales of the stable boy who inherits the kingdom, because we sense that as our story.

The question is how can you bring back the psychedelic experience, or what can you bring it. I know of two techniques, neither very satisfying, both in combination moderately effective, but crude. The first is a voice-operated tape recorder. They sell these for a couple of hundred bucks. I've produced some amazing tapes with these. I have one voice-activated tape where you hear me clear my throat two hundred times in the course of an evening because each time I would clear my throat, half way through the throat clearing, it's voice activated, the tape records, so it would catch the last half of "uhmmhmm! hhmhmm! hmmm!" [Terence chuckles] Um, however, if you have presence of mind sufficient to speak English, this would be a more informative record of your experience. (voice from the audience) Yes.

And then the other technique, which is less technically dependent is uh, if you have an insight at a certain level of the experience, you have to repeat it to yourself at another level of the experience, and then another level, and by this incremental bucketing method, you can carry almost any insight out into the, into the realm of the world. These insights often don't stand up to scrutiny. I had a really interesting experience just a week ago. I'm sure you've all had most of this experience, but I finally had it all. It's the experience of having a dream, a very very complicated dream, the subject of which is the universal secret which if told would transform everything. It's the "I've got it!" phenomenon, and usually what happens is you, you wake up and it's gone, just before you get consciousness. And you say, my God, I understood everything. I had it down to a single statement. If I could articulate it the world would never be the same. Well, this happened to me about a week ago and by some miracle, I actually was able to hang on to the statement into consciousness, and I woke up and yelled this thing. My son was appalled, I mean it was six thirty in the morning and I was able to get it out. I hope you're ready, I sat straight up in bed and said "A song is a song!" Profound stuff! I mean maybe it is profound stuff. The profound stuff usually has that "an X is an

X" construct because essentially what it's telling you is silence would have been an acceptable substitute for this statement.

Well, let me say one more thing here just sort of to wind this up. The metaphor that makes sense for what we're going through because it gets the biology of it, it gets the drama of it, it gets the risk of it, it gets the fun and the joy of it, is the metaphor of birth. We are about to decant from three dimensional space and time. Yes, the earth is the cradle of mankind, but you can't live in the cradle forever, and we're not in this cradle alone. We are squashing and trampling on hundreds of other species that have as much right to be here as we are. So through technology, which means pharmacology, art, and the engineering sciences, we are trying to find a doorway into a new world for the spirit, and it is going to come out of human-machine interfacing, pharmacological redesign of the human brain-mind system, possibly digitalizing and downloading into the microphysical realm, we don't know. I mean if it makes your hair stand on end to think of being downloaded into the digital realm. There was once a fish who had a great deal of doubts about this plan to conquer the land, and tried to urge everyone to think again, that no good could possibly come of it. But in fact, the forward thrust of evolution is toward higher dimensions, greater complexity, more information, greater connectedness, and a deeper and deeper uh, sense of the all-pervasiveness of love and meaning.

That's what it's really about. All these disparate physical elements come to nothing if they don't add up to more than the sum of their parts. And the more than the sum of their parts is this transcendental element which we call love. That is the part of the eschaton that has never left us, that accompanied us across the African grassland and into history. I mean, granted, bloodied and battered by the experiences of sexism and racism, and so forth, but never lost as an ideal, never lost as a guiding light and an experience. And I really think that when we dissolve all the boundaries this is what we will discover, is an unconditional caring, an unconditional affection that flows through all life and all matter and gives it meaning. And you don't have to wait for the end of the world to get this news, you can just short-circuit the collective march toward that realization by accelerating your own microcosm of spirituality through the use of these hallucinogens. They are the doorways that the Gaian mind has installed in the historical process to let anybody out any time they want to, provided they have the courage to turn the knob and walk through the door.

Thank you very very much. [Applause] Thanks.

I don't like the part of what I do that is a cult of personality. I don't like it that a white guy sits at the front of the room and pontificates and I don't know if you've figured out this shuffle, but I have and I know that I don't know anything more than you know, really. And that it's just a funny circumstance of fate that you sit and listen and I speak, because there are no experts, and there is only uh, you know, the integrity of doing and having done, and really if you get the message, you, you will be able to transcend the need for any more of this, because it's really a message of self-trust and self-empowerment and then what I'm also trying to create is a community of shared associations about these weird states so that we don't have to all privately think we're losing our marbles, you know. Let those who talk to the elves find each other and band together. I am basically a scientist without portfolio because no academic institution would ever trust me with a portfolio, but I, I move in the domain of the gurus that channelers, the pontificators, and those with secret revealed knowledge from Atlantis and Lemuria, but I have contempt for all of that, whether its true or not, because they got there the wrong way, you know, you have to come through the rules of

evidence and reason. Reason is not science, don't confuse them. I'm very much a critic of science and the scientific method, but I don't think reason can be tossed out with that bathwater. What is being proposed here is that we're on the brink of the discovery of another world, a world as potentially transforming of our world as the discovery of the Western hemisphere transformed European civilization in the 1500s. But the world that we're about to discover is inside the mind. It's mental real estate. We who have made consciousness our game by building cities, elaborating literatures, tossing up religions, and setting armies marching, we who have made consciousness our game have barely scratched the surface of human consciousness. And it's not like we haven't had a crack at it.

[1:29:35 REVIEW IN PROGRESS]

I mean, these Yogans have been over there digging away for millenia; Egyptian religion, Kabbalism, Alchemy, Western traditions of mysticism. And I am a connoisseur of all that, don't get me wrong, but what astonishes me is how embryonic it all is. We are not the tired inheritors of an ancient and sophisticated civilization in its twilight, which is what they're all telling us. We are the know-nothing, fresh-scrubbed babes who are the new kids on the block, who haven't got a clue as to what the human enterprise could be about. And we are coming now through a very narrow historical neck where the accumulated stupidity of the last 5,000 years—the dues have to be paid. It ain't fair, we didn't do it. You know, we didn't bring the slaves from Africa, we didn't invent oligarchy, we didn't do all these things. Nobody is interested in our whining about how we didn't do it—it's in your face. And, it's clearly a crisis of two things: of consciousness and of conditioning. These are the two things that the psychedelics attack. We have the technological power, the engineering skills to save our planet, to cure disease, to feed the hungry, to end war; But we lack the intellectual vision, the ability to change our minds. We must decondition ourselves from 10,000 years of bad behavior. And, it's not easy. I mean, imagine, I don't know how many of you have ever confronted the fact that you were addicted to something, and some addictions are really serious. If you've ever been addicted to tobacco or heroin, i'm sure you know what I mean. Well then, imagine a global population addicted to a drug the use of which is killing us, but we can't, there's no doctor saying you should, there's no rehab clinic to go to when you're a species. We are on an absolutely destructive bender that will end with the death of the earth, the impoverishment of its animal and plant population, and the collapse of our civilization into scarcity unless, unless, we can somehow restructure our psychology and get hold of ourselves. And psychedelics are the only thing I've ever seen work on an individual level to do that.

You know, in the early 60's, they were curing 75% of chronic alcoholism cases that they treated with LSD. They were curing with one dose of LSD. One 500 microgram dose. Well now, obviously LSD is not a magic bullet for alcoholism. That's a preposterous idea. It's simply that you take LSD and if you're a chronic alcoholic, you review your life and you notice that you're killing yourself, and then you say "my god, I am killing myself. If I don't stop what I'm doing, I will be dead!" That's the strongest motivation to character rehabilitation there is. And that's what we have to carry into the domain of public debate. I can't believe how constipated American institutions are. I mean here we are, under the aegis of a great crusading reformer from Arkansas, a new order in human affairs has dawned, but they suggest closing an airbase out

at Sacramento and their editorial says to whether we can survive the shock of this massive change. Well I've got news for you, you better do your change-related calisthenics if that was heavy lifting, because what you've got coming at you is something very very different. We are now in a position to actually make something of ourselves- extend the design process to human destiny and produce something that will redeem ten thousand years of pogroms and migrations and attempted genocides and pointless wars and stupid religions that make people hate themselves and all the rest of it. If we're going to redeem that legacy, then we have to do something quite spectacular.

Ok, now, I will talk a little bit about what I've learned from psychedelics. I feel self-conscious doing it, but on the other hand, wouldn't it be stupid for me to talk about what you've learned from psychedelics. That would add presumption to the sins already arrayed here. There are different models about what the psychedelic experience is. Here's a couple. Building on Western psychotherapy as elaborated by Freud and Jung, one view of what psychedelics are is it's the part of your mind that you'd rather not do business with. It's the memories of childhood neglect or abuse. It's repressed kinky fantasies. It's in other words, the Freudian idea of the unconscious that somehow these are drugs which dissolve the boundary between conscious and unconscious mind and then you can do accelerated psychotherapy because resistances have been pharmacologically overcome. That's one model. It's good as far as it goes, it just doesn't go far enough. Then there's another model which I would call the traditional or shamanic model, and it says the cosmos is a series of levels, and these levels are connected by vertical routes of access which can be thought of as simply flights through space or magical trees or magical ladders. Anyway, there's an image of ascent, and ordinary people exist on only one of these levels, but a shaman is not an ordinary person. A shaman is a super-human person who has the power of animal allies behind them and they can go up and down in these elevators that move between levels and they can therefore recover lost souls, see social hanky-panky, theft and adultery, see the causes behind that, see the causes behind disease, so forth and so on. That would be the traditional one.

What I have concluded after 25 years of fiddling with this is that both of those ideas have a certain something to recommend them, but that they don't go far enough and that we get more to the meat of this if we leave off psychological, the first explanation, or sociological, the second explanation, and actually go for something a little more formal. To wit- a mathematical model of what shamanism is, and what I mean by that is let's think about what shamans do. They cure disease, and another way of putting that is they have a remarkable facility for choosing patients who will recover, they predict weather, very important, they tell where game has gone, the movement of game, and they seem to have a paranormal ability to look into questions as I mentioned, who's sleeping with who, who stole the chicken, you know, social transgressions are an open book to them. Well, thinking about this from a mathematician's point of view, an all-encompassing explanation that would explain how all these magical feats are done is simply to suppose that the shaman is somehow able to project his consciousness, his or her consciousness, into a higher dimension, not metaphorically, as in Sylvester Stallone has many dimensions, not metaphorically, but literally, as in 1 dimension, 2 dimensions, 3 dimensions, and four because if you could move into the 4th dimension, the dimension orthogonal to Newtonian spacetime, seeing what the weather is going to be next week is easy as seeing what the weather is now. Seeing where the game went is as easy as seeing where the game are. Knowing who stole the chicken is simply defined by looking to see who stole the chicken. And I have noticed that all of biology, not simply shamanism within the context of human society, but all of biology is in a sense a conquest of dimensionality. That as we ascend the phylogeny of organic life, what animals are are a strategy for conquering spacetime, and complex animals do it better than simpler animals, and we do it better than any complex animal, and we 20th century people do it better than

any people in any previous century because we combined data in so many ways that they couldn't electronically on film, on tape, so forth and so on. So, the progress of organic life is deeper and deeper into dimensional conquest. Well, from that point of view then, the shaman begin to look like the advance guard of a new kind of human being, a human being that is as advanced over where we are as we are advanced over people a million years ago because we have, you know, very elaborate strategies for coding the past. It's a dimensional conquest.

So that's part of what I learned about psychedelics, and I could have left it there but I never do. I always want to bring more in under the umbrella of whatever metaphor it is that's being pushed, and what I have discerned is that time is actually speeding up, that the universe is not what physics tells us it is. Physics tells us that the universe is a physical system, an entropic system, that was born in immense energy and chaos and will run down with a bang, I mean with a whimper, not a bang, run down into heat entropy and dissipation. The psychedelic data on this is completely different. The psychedelic data says what that model left out was biology and mind. Now, biology, you might imagine, is a fairly ephemeral, recent, fragile phenomenon. It is not. The average star in this galaxy gutters out after about seven hundred million years. Not our star! We happen to have the good fortune to be around a very stable, slow-burning star. But there has been biology on the planet at least 2 billion years. Three times the average life of a star. So biology is not some Johnny-come-lately epiphenomena. Biology is a phenomenon more persistent than the life of the stars themselves, and biology is not a static thing. I mean, a star evolving now is not greatly different from a star evolving a billion years ago. Biology doesn't work that way. Biology constantly changes the context in which evolution occurs. The way I have downloaded this into a phrase is "the universe is -the biological universe at least- is a novelty-conserving engine". Upon simple molecules are built complex molecules. Upon complex molecules are built complex polymers. Upon complex polymers come DNA. Out of DNA comes the whole machinery of the cell. Out of cells comes simple aggregate colony animals like hydra and that sort of thing. Out of that, true animals. Out of that, ever more complex animals, organs of locomotion, organs of sight, organs of smell, complex mental machinery for the coordinating of data in time and space. This is the whole story of the advancement of life, and in our species it reaches its culmination and it crosses over into a new domain where change no longer occurs in the atomic and biological machinery of existence. It begins to take place in this world which we call mental. It's called epigenetic change, change which cannot be traced back to mutation of the arrangements of molecules inside long-chain polymers, but change taking place in syntactical structures that are linguistically-based, and people have probably been using language with considerable facility for probably 50,000 years, possibly more. In our own time, we have created ever-more elaborate languages, ever more elaborate technologies for transforming, storing, and retrieving language, so that we are actually on the brink of being able to give every single one of you the complete cultural inventory, the complete database of human beings' experience on this planet. That's what these data-highways and networks are all about, the nervous system is being hard-wired. But what I wanted to draw your attention to about this is, it is not only an advance deeper and deeper into novelty, but it's an advance in which each successive stage occurs more quickly than the stage which preceded it. So, you know, once you get the big bang, then nothing much happens for a long long time, i mean, there's plasma streaming through the universe, the universe is slowly cooling, but that's the most dramatic complex process in the universe, this cooling. Then, after a certain point, more complex processes come in, complexification begins to build, and as it builds, it begins to happen faster and faster and faster. And the great puzzle in the biological record is the suddenness of our own emergence, of our emergence, human emergence out of primate, out of the primate line. It happened with enormous suddenness. Lumholtz calls it the most explosive reorganization of a major organ of a higher animal in the entire fossil record, and that's, you know, a great embarrassment to the theory of

evolution because this is the organ which generated the theory of evolution. We're not talking an appendix or an eyebrow, here. We're talking the very organ which generated it. I think that we have taken far too much responsibility for what is happening, and that what we took to be a staircase we were climbing is actually an up-escalator. And if you will stop climbing you will notice that it does not impede your upward progress because the ground you're standing on is moving you toward the goal. And I think that this idea which may be the proof that I'm bonkers requires a fairly radical reorganization of consciousness, because what I'm saying is the universe was not born in a fiery explosion from which it has been being blasted outward ever since. The universe is not being pushed like that from behind. The universe is being pulled from the future toward a goal that is as inevitable as a marble reaching the bottom of a bowl when you release it up near the rim. You know, if you do that, the marble will roll down the side of the bowl, down, down, down, and eventually it will come to rest in the lowest energy state which is the bottom of the bowl. That is precisely my model of human history.

Now, bear in mind what the competition is peddling. The competition is peddling the idea that the universe sprang from nothing in a single moment for no reason. Now whatever you think about that, notice that it's the limit case for credulity. Do you understand what I mean? I mean, if you can believe that, it's hard for me to imagine what you would balk at. If we were to sit down and say, "let's see who can think of the most unlikely thing that could possibly happen," I submit to you nobody could top the big bang. It is the improbability of improbabilities. It is the mother of all improbabilities right there.

So I'm suggesting something different. I'm suggesting that the universe is pulled toward a complex attractor that exists ahead of us in time and that our ever-accelerating speed through the phenomenal world of connectivity and novelty is based on the fact that we are now very very close to the attractor. All Western religions have insisted that God would come tangential to history, but they all lose their nerve when you ask 'when', which is the only interesting question about that hypothesis. I mean, if it's not now, then what the hell difference does it make. It's just pissing in the wind as far as I can see. I think that the very real social crisis that is upon us, the crisis of population, of resource depletion, of atmospheric degradation, of epidemic disease, all these crises indicate that we are now down to the short epochs of this process of universal ingress into novelty, and that in fact it makes no sense whatsoever to speak of a human future. There is no human future. It's inconceivable, given where we are today, that to speak of the human world a thousand years from now or five hundred years from now, it is literally, it either doesn't exist, or it's beyond our power of imagining. It isn't simply going to be non-polluting cars and smaller hi-fi speakers. I mean, that's an idiot's notion.

Q: Better pictures than today.

Yeah, clearer TV pictures. It isn't like that at all. I mentioned this this morning, how when you look at only one line of technological development, automobiles or computers, it looks like you can rationally anticipate what's gonna happen. But when you realize that there are thousands of these lines of development, all transforming themselves, all moving towards some kind of omega point, then you realize that we are in the grip of what I call a conrescence, and I maintain that you don't have to believe me on this. You can see it from here. You just have to climb a high hill. There's one, it's called psilocybin, there's one, it's called ayahuasca. The view from the tops of these hills is of the conrescence. It lies now closer to us than the Johnson administration, for gods sake, in time. And, you know, I have an elaborate mathematical theory to back this up, which you should gratefully learn you are not going to be flayed with this afternoon. But I think it's going to become more and more important for people to delinearize their

view of time. Decondition yourself from the lie of history. After all, you know, if time were space, history would be a spider web. So bear that in mind.

Q: [???

Ah, concrescence. Concrescence is a word that I cribbed from the metaphysics of Alfred North Whitehead, and in fact much of what I say Whitehead provides the foundation for. He, like myself, had the idea that history grows toward what he called a nexus of completion. And these nexii of completion themselves grow together into what he called the concrescence, so, a concrescence is a domain of extremely high novelty in comparison to whatever its embedded in. So, for instance, you walking in the wilderness, you are a concrescence because you are more complex than the medium you're moving through. A raisin embedded in a cornmeal muffin is a concrescence. It is more complex than the muffin-matrix in which it finds itself. So, a concrescence is a local state of unusually high complexity. And a concrescence exerts a kind of attraction, let's call it the detemporal equivalent of gravity, so that all objects in the universe are drawn through time, not space- gravity draws you through space, time draws you toward the concrescence. This is why the universe is seem to be becoming more and more complex faster and faster. The idea being, you see, that each epoch, being shorter than the one that preceded it, this generates an asymptotic curve of approach, and it's become a cliché of our culture that time is speeding up. It actually is speeding up. It's not that it seems like it's speeding up, it looks like it's speeding up, it *is* speeding up. We in our entire world are being drawn into confrontation with something that at this level is lost below the event horizon of rational apprehension. That's a fancy way of saying you can't know jack shit about it at this point in time. There will come a moment when it will rise above the horizon of rational apprehension. And I think that history is a set of nested resonances. This is what I mean when I say 'nothing is unannounced'. Nothing can take you by surprise if you've really been paying attention, because everything is preceded by its harbingers and heralds. And we are living in an era now where there is a great deal of apocalyptic expectation, anticipation and hysteria for several reasons. First of all, because Christianity just is hysterical in all times and places. Second of all, there's a built-in goose in the calendar because we're approaching a millennial year, and that always exacerbates this Christian thing outrageously because of the promise made, you know, amen amen, I say to you this generation shall not pass away before I return to, you know, clean your plough or whatever it is. And there is the physical evidence all around us that we are the witnesses to a planetary crisis that we cannot control or manage. I mean, it's very hard to believe that we could manage ourselves back into a steady state. I mean, yeah the Jews are talking to the Arabs and they're trying to get things straightened out in South Africa, but what about the global population curve? What about the degrading atmosphere? I mean, you know, you're just as dead even if you're not killed by a racist or a fascist, so we can get certain problems under control, but it seems certain problems are beyond our control. Also, there's another level to all this, which is when you take cores from the Greenland ice or make side-ranging radar maps of the Canadian shield, you discover that we are not the only force for disruption and chaos wandering around the universe looking for trouble. The universe is an incredibly chaotic and unstable place. Planetesimal impacts on the earth have reset the biological clock at least three times in the last billion years. What we have been living through for the past fifty thousand years is an unusual era of meta stability and it has allowed us to create a global civilization, but we can't assume that we have fifty thousand years of stability ahead of us or even a hundred thousand years of stability ahead of us. And finally, you know, this curious resistance to idea of the end of the world always amuses me because maybe the world will end and maybe it won't end, but have you ever noticed that the end of your world is an absolute certainty. You're going to go into the yawning grave, and rather soon, I should suspect, and possibly sooner than you're prepared for, so a quibbling over the end of other peoples'

world seems like a philosophical argument compared to the certainty of your own finality, and I've been thinking that the question is out of Stephen Hawking's book about parallel worlds and black holes and stuff, how can these physical oddities or anomalies be related to what I'm talking about. Well, first of all, we don't know what a black hole is. A black hole has at the center of it a singularity. The definition of singularity is, you don't know what it is! This is a fishy way of making theories by the way. Uh, Stephen Hawking is a prime example. At one point in his career he was very keen on what were called mini black holes and these were black holes that were under a centimeter in size, and a certain reading of his theory required 10^{16} of these things in the universe. Well, when you realize that there's a singularity at the center of each one of them, you say hell, what kind of physics are you doing if you have a physical theory that has 10^{16} exceptions to whatever rules it lays down? This isn't a theory, this is a sieve that you're waving around in the air. Uh, however, the black hole does bear on this because um, imagine an observer standing outside the event horizon of a black hole, watching an object approach the black hole. What you see, and this is similar to the argument or the example I gave a few minutes ago of the marble on the edge of the bowl. What you see is this, let's make it a spacecraft, this spacecraft that approaches the event horizon of the black hole, and then it's caught in the gravitational tidal forces of the black hole and it begins to go faster and faster, around and around, faster and faster. And at a certain point it disappears into the singularity. This is from the point of view of an observer outside the system. Now we flash to the stalwart captain and crew on the bridge of this starship. What happens to- from their point of view, what happens is as they sink below the event horizon of the black hole and start the descent toward the singularity, time and space are dilated so dramatically that the singularity recedes to an infinite distance and you fall forever toward it.

Well, what I would like to suggest based on, uh, well, here's what I'd like to suggest. This is one way of thinking about it, that our planet is on a collision course with something which we actually at our present state of knowledge don't have a word for. A black hole is simply a gravitationally massive object so massive that no light can leave it. What I'm talking about is something like that, except that it isn't so much gravitationally massive as temporally massive. We are being sucked into the body of eternity, and I think it's going to happen very soon. Now, an obvious objection that someone would make to this, it's a probabilistic objection, is they would say "don't you find it rather unusual that your own very minute and finite life should occur so close to this moment of universal dramatic climax? Doesn't that clue you to the fact that you might be slightly deluded?" To which I reply, not at all! Because I think of this event-horizon as a series of like ghost-horizons and once you enter into history, what history is is the outer shell of the gravitational field of the attractor of the conrescence. In other words, history is the disturbance in nature which precedes the conrescence. It precedes it by only 50,000 years. A microsecond, so a geological microsecond before all life is melted down in the presence of the singularity, there is a curious interface zone that is not the singularity and not the absence of the singularity. It's the singularity in the act of becoming, and it only lasts, as I say, a geological microsecond, 50,000 years. But if you happen to be born inside that microsecond, then you have a very curious perspective on the phenomenon indeed because you observe it from within the shell of the historical vehicle.

Here's the point I want to make. If you have a universe like that, 72 billion years in duration, it will undergo half of its evolution in the last 30 seconds of its existence. Can you imagine? Now, this is what the scientists do, except they spin it around and that's why, I can't remember who wrote it, but the book called "The First Three Minutes." Stephen Weinberg's book, *The First Three Minutes*, a book about the first three minutes in the life of the universe, where he leads you through all this complex physics as matter is crystalizing out of hyperspace and all this stuff. All I'm saying is let's put the complexity in the more likely

end of the cycle. Let's put it at the end when after billions of years of evolution and all kinds of complexity and that sort of thing, everything comes together. So this kind of a cycle, if we were actually living in a universe like this, could completely unfold itself according to its natural laws, and yet provide a miracle, the miracle of the concrescence. That's why I'm so keen on boundary dissolution. The more boundaries that have dissolved, the closer to concrescence we are, and when you finally reach it, there are no boundaries. You are eternity, you are all space and time, you are alive and dead, here and there before and after. The singularity is a *coincidentia oppositorum*, it can simultaneously coexist in states which are contradictory. It is Thomas Aquinas's vision of God. It's something which transcends rational apprehension, but it gives the universe meaning because all process then can be seen to be a seeking and a moving and an effort to approximate, connect with and attend to this transcendental object at the end of time. One way of thinking of it is like those bar balls that they hand in discos that send out thousands of reflections off everybody and everything in the room. Well, think of the transcendental object at the end of time as that bar ball, and then those reflective twinkling refractive lights are religions, scientific theories, gurus, works of art, poetry, great orgasms, great souffles, great paintings. In other words, and we use this phrase, anything which has this spark of divinity in it is in fact referent to the original source of sparks of all divinity, which is the concresced, compressed, experience of life and mind after billions and billions of years of unfolding itself within the confines of three dimensional space. And you can make this vision your friend through psychedelics, because as I said at the beginning of this rave, you can see it from here! Of course, not if you have your face plunged in your stock portfolio, you're not going to see it, no! But if you will go up on the mountain and take 5 dried grams in silent darkness and pray through the night, you will absolutely guaranteed come into a sense of this thing. And it's real. And history is simply a perturbation on the surface of the waters of time as we approach the lip of this cascade into concrescence, novelty, and completion. And the psychedelics raise you out of the historical matrix and give you a sense of participation in this transcendental reality. It's the essence of religion, it's the essence of psychic balance, it's the source of shamanic power and mental health.

(2:11:30) break

...thousands of these molecules are arriving at the synaptic site of activity, elbowing aside the local population of the endogenous neurotransmitters, getting them out of the way, plugging themselves in to the receptor site, and beginning to lift the electron spin resonance level as in push them in new directions, and you can almost hear it doing this. And then beyond the hypnogogia there is the actual trip, and it usually is encountered, you have to go through what Merceiadé called "the rupture of the mundane plane." This means that the world has to, it like falls apart or explodes or settles down on you. There's a sense of a rupture of plane and then visually coherent, emotionally laden, information laden, high content hallucinations occur and many people have taken psychedelic drugs and never gotten past the hypnogogia. They don't know that there's something out there besides dancing mice and spinning geometric wheels and stuff like that, but beyond that you cross over. That's the typical model of a trip. Now, what happens with all of these things to greater and lesser degrees, LSD, psilocybin, mescaline, ayahuasca, and I've never actually heard an explanation for this. For some reason the experience comes in waves. There's the first wave, that makes sense, that's the drug taking hold. But why then, after 20 minutes of unbelievably outlandish hallucination will it like all stop? You know, and it's like a moment ago you were screaming for mercy, now you look around, you say "I'm down...am I down? I seem to be down." You know, sometimes you seem to come all the way down like on LSD, it's like it totally turns off something. And then about 5 minutes later it comes again and you get another wave. And if you've taken a really dedicated hit of

ayahuasca for example, you will get as many of 5 or 6 of these waves throughout the evening, and the first one is usually the strongest. If you take an effective but not strong dose of ayahuasca, you will get one pass and often, and then if you take slightly less, you'll get one pass and it will be weak. So if you take ayahuasca, at all times pay attention, because you may be looking at something thinking 'well this is not so interesting, i'm sure it's going to be much better in an hour', and actually you may be looking at as good as it's gonna get this evening. And psilocybin also comes in waves like this. LSD, very dramatically, DMT, not because DMT is one enormous brief wave. I mean DMT sort of brings all the issues together, and the way I think of these psychedelics experientially is as a series of concentric circles. Maybe like the outer circle is mescaline and the next circle in is LSD, and the next circle in is psilocybin, and the next circle in is DMT. It's almost as though the psychedelic experience is whatever drug or whatever substance you take, it leads you deeper and deeper in the same direction. And of course, with DMT you not only hear the aliens, you see the aliens, you not only see the aliens, you become an alien. It seems to be the most radical of all of these things in terms of the experience. It's also the most natural of all of these things. It also is the safest. It stands the ordinary standards of courage and risk on their head because here it is, it's the most terrifying, the most spectacular, and the safest. None of us, including myself, have fully come to grips with this paradox. We would rather do less safe less scary drugs I think. DMT is pretty impressive in most situations.

Woman's voice: Next, Terence responds to a question comparing meditation and the use of hallucinogens.

TM: Well no, I think they are completely different realms of human activity. I can't, I mean, meditation, you don't hallucinate, you don't... they say you do, but they aren't very convincing. And plus the monks then rush over and explain that you're doing it wrong! So, you know, what's the deal? Um, I think, i- i- if by meditation you mean lying down and closing your eyes or sitting up and closing your eyes a lot, I do that a lot and I like it. But I-I would never confuse it with the psychedelic enterprise.

Q: [???

TM: Pardon me?

Q: [??]

TM: I- It's only my opinion, but I really don't. I think that it's, that, that all of these spiritual techniques are not um, substitutions for the psychedelic experience but tradeoffs, you know? I mean organized religion is as concerned with controlling social groups as organized politics is and the, the uh, the visionary or ecstatic experience is unsettling to the religious mentality. You know, even among fundamentalist Christians uh, if you're not one they all seem more or less alike, but if you move into that world you discover that they are very strongly polarized in two directions: those who are scripturalists and those who are experientialists, the glossolalias, the speaking in tongues, the holy rollers, that sort of thing, and the scripturalists are very uncomfortable around the experientialists cuz to them it looks like demonic possession, and they get really agitated about that. Yeah, well I think that all of these techniques, like mantra, yantra, tantra, whatever, they work incredibly well in the presence of psychedelics leading me to suppose that what these are are tools that were developed in the paleolithic world of psychedelic magic and all we have now are these tools, but we don't have the original engine that drove them. Yes, I, I am very bored by spiritual practice unless I've taken a psychedelic, and then, you know, mantric chanting is beyond the power of mind to encompass or describe. Sex isn't bad either. [audience laughter] and uh, you know. It seems to be a general

functional enhancer, is what it is. Acoustical driving is also a tried and true tradition. But see, it's not about the exclusivity of method, but the combination of method. I mean, what you want to do is beat your drum while sitting in yab-yum while stoned on X while at the holy mountain while the astrological configuration is correct. [audience laughter] and then you know, you know, line it all up and then push it through. That's the way to do it I think.

Karen on creativity and hallucinogens.

TM: Well, it's again, it goes back to this function of boundary dissolution. Creativity, if you analyze what do, what do we mean when we're saying that it basically means being able to transcend the ordinary. You see it in a way nobody else ever saw it, whatever it is, so that's creativity. Uh, psychedelics by dissolving the boundaries of cultural expectation uh, let you see things in new ways. I was in a situation recently where it was evening and uh, silhouetted against the sky were flame cypress trees, but they were all black. And I was looking at them- I've seen flame cypress trees against twilight skys many times. You all have as well, and suddenly it was like there was this shift, and I didn't see it as a flame cypress tree anymore. I saw it as black dust pouring out of a certain point of the sky and cascading like a waterfall, and I was looking at three waterfalls of micro-fine black powder pouring out of points about 60 feet above the ground. Well, I was, I didn't even mention it to the person I was with, but I, I just noticed this psychedelic uh, perception. Uh, the other night, this was really interesting to me, the other night just as I was falling asleep a phrase came into my mind that I, I liked, but I didn't understand it. In fact, I didn't think it meant anything. I just thought it was an interesting phrase and, and I thought about it for about a minute and then it did the same thing that the flame cypress tree did. It went 'ploink' and this other dimension sprouted out of it, and I understood it and I thought this is a very interesting idea, and I've never thought it before. The thought was uh, if time were space, then history is a cobweb. That was all it was, but I don't take these leaps very often, so I was delighted uh, and because I knew a moment would come when I could lay it on a group of people like I've just done. [audience chuckles, Terence chuckles]

So it's a catalyst for cognitive activity. That's what the mushroom is. Dance, drum, song, painting, body expression, creativity and simply the passive act of understanding. It- this is what it does for us, and this is what we love to do. I mean we are creatures of the mind. You know, they talk about virtual reality as some future technology that's going to change everything. We've been living in a virtual reality for the past 6,000 years. I mean, look at cities like New York and London and Los Angeles. I mean, every- nature has disappeared. Everything you see is a human idea, downloaded into material existence. It's entirely virtual. It doesn't disappear at the punch of a dial, but it is as virtual as the virtual realities that will eventually be made out of, uh, out of light behind goggles.

Culture uh, the whole thing is that culture and language tend to become traps, and yet they can be the platforms for enormous freedom if you understand what it's all about, and what it's all about is you. You are the center of the mandala. You are not marginalized in any way, and the message that the culture gives us is that we are marginal. It doesn't matter whether you- if you've got a hundred million dollars. Fortune Magazine will inform you that so do ten thousand other people on the North American continent. There's nothing special about you, and so we are constantly- this is part of the democratic legacy. We are constantly told you're not special. Special isn't special. Anybody could do it. What the psychedeli- and so then when you look for guidance, direction, mentorship. We always look toward institutions. Well, I'll go to the university, or I'll go to the army or I'll do something. Somebody will tell me, will give me a larger purpose, but it's really yourself that is uh, the final arbiter, and if you keep yourself as the final arbiter, you

will be less susceptible to infection by cultural illusion. Now, the problem with this is that it makes you feel bad to not be infected by cultural illusion because it's called alienation. You know? But this is- I can't solve all problems. The reason we feel alienated is because the society is infantile, trivial and stupid, so uh, the cost of sanity in this society is a certain level of alienation. I grapple with this because I'm a parent, and I think anybody who has children, you come to this realization you know, what'll it be? Alienated cynical intellectual, or slack-jawed half-wit consumer of the horse shit being handed down from on high? There is not much choice in there, you see? And, and we all want our children to be well-adjusted. It's- unfortunately there's nothing to be well-adjusted to, so uh, that's a real problem.

And I really believe that extra-environmentalism, which is a nicer, though longer, word for alienation, is defensible and shouldn't be thought of as pathological. What I noticed in going to the Amazon and Indonesia and these places is that the person you want to get to is the shaman, and that the shaman is different from everybody else, like when you go in to an Amazonian tribe that's way up river or something the people behave the way you would expect naive, untraveled people to behave. They want to touch your Gore-Tex shoes and you know, look at your camera and look through your binoculars, and fiddle with the can-opener and all this. No shaman would ever stoop to such uh, behavior. A shaman is not- knows that cultures are provisional, and is interested in you as a person. The other people don't even see you as a person because you're huge, white, strange-smelling and incomprehensible. The shaman sees you as a person and it's because he is alienated. The reason shamans can do their magic is because they are outside the belief system. I really think that that's true. Everyone else believes, you know, that the guy in the other village can send the mojo and mess with you. The shaman knows that that's not quite how it works, and so then he as it were can go behind the board and fix the cultural TV that everybody else is just watching. So I think alienation, extra-environmentalism, shamanism, whatever you want to call it is simply individualism in the context of cultures that don't value individualism, and cultures don't. You know, it's said "nature acts to preserve the species, cultures act to preserve the illusions of the population." They're not interested in you if you're an Einstein or a Jackson Pollock or- unless they can fit you into the preestablished systems of commerce and canons of aesthetic order and so forth and so on, and then that's called 'being civilized.'

Uh, the question is "What's with licking frogs?" [clears throat] I'm not sure I got it right. Well, you know, you kiss a lot of frogs before you find a prince, you know. You probably lick a lot more. Toads, not frogs. Let's give the devil his due here. Toads of certain species produce a relative of DMT in large glands in their necks. Why this is is not clear uh, considering that this uh, exudate, or this um, material will kill a dog if a dog picks up a toad like that in his mouth. Within minutes. It's pretty spectacular. It's reasonable to suppose that then this is just a defense that has been evolved. Some of you may have seen the dinosaur in Jurassic Park that spits poison in your face. We're talking something like that. Uh, the toad creates this DM- or this 5-methoxy-DMT in this gland, and when glands are squeezed uh, it comes out on the surface of the toad's skin. It's a near-relative of DMT. My- speaking from my personal battery of many prejudices, I would say I don't care for it. It complicates my job enormously because people do this stuff and they think A, that it is DMT, or B, if they're slightly better informed, that it's just like DMT. IT is in fact chemically called 5-methoxy-DMT. However it is nothing like DMT. It's as much like DMT as radio is like uh, television, and that's where the difference lies. The 5-MEO does not trigger the most spectacular effect associated with DMT, which is these 3-dimensional crawling hallucinations that come out of the woodwork and reveal the true nature of reality to you. When you take 5-MEO DMT you have all of the physical presentation of DMT. There's a sense of uh, a kind of light anaesthesia through the limbs. There's a sense of falling forward into a void. There's a sense of losing body boundary. Now, at that point in DMT those symptoms would give way to the trip. At that point in 5-MEO DMT those symptoms give way to the

beginning of the comedown. And if you- people who have never taken DMT sometimes rave about 5-MEO and say, you know, this is the most astonishing thing I've ever had. People who are familiar with DMT can yawn their way all the way through it because you're braced for the DMT thing. I mean, you think "Oh my god, it feels just like it. It's gonna be upon me. Five, four, three, two, one...plus one, plus two, plus three, plus four, plus five. It's not coming in. It doesn't come in. And so uh, and then uh, 5-MEO is fatal in sheep as well as dogs. Spectacularly fatal in sheep, and so I guess if you're a sheep it's counterindicated. Uh, doesn't seem to be harmful in human beings, but with so little data available, I think maybe we should uh, you know, there are old psychedelicists and bold psychedelicists, but there are no old, bold psychedelicists.

Have I had any contact with the government? Uh, not exact- well, up until a week ago the answer to this question was yes, I mean no. When I got home from Esalen the last time there was a really funny letter which I haven't quite figured out how to respond to. Dear Mr. McKenna. I'm an officer of the California State Police fascinated with DMT and recently read your interview with you in the San Francisco Chronicle. I wonder if you would be willing to meet with me and have coffee and discuss this at your earliest convenience. So [clears throat] I- what I did was fairly chickenshit actually. I, I found a copy of Food of the Gods and I sent it off, and I said "This is my latest book" or "this is a book of mine. It deals in part with DMT" uh "give it a quick read and if you're still interested in a get-together, call me." So uh, I, I think- I don't know exactly how to interpret this. I've always felt that the reason the government left me alone was because I'm an intellectual, and in the United States that is the most pathetic, ineffective, and-form of non-entity known to exist.

I think that the, you know, the greatest period of American creativity in literature and in other areas too arguably was the- uh, in the 20th century was the 20's, and that's because an expatriate community conducted a critique of American society from a foreign vantage point. In that case Paris. And I think that in spite of the Clinton Hiatus, that the politics of light have not yet come to settle on the land of Jefferson, and that we should be prepared uh, on a moment's notice basically to, yes, to decamp to Prague and uh, and conduct all this from there. Also, you know, Prague was the capital of European civilization before the Thirty Years War, before the rise of modern science. Uh, it's an Italianate city untouched by either world war. It's uh, it's a b- a beautiful place.

[End of this recording. It does not seem to include the whole talk.]

We closed last night, or we discussed yesterday, a bumper sticker that I saw driving down here, and the bumper sticker said, uh, "Man thinks. God knows." And, then, someone had bought a second copy of the bumper sticker and cut it apart and reversed it and put it under it, so it said, "Man thinks. God knows. God knows Man thinks." [Audience laughs]

Now, it seemed to me there was a lot going on in [audience laughter] what was attempting [Terence chuckles] to be expressed here. First of all, something about God, that God knows, that God exists in a superior state of intellection. Plato said, "Time is the moving image of eternity." My notion of God's cognition is simply the regarding of all points in the spacetime continuum with equal clarity. God *knows*. The limited program of knowing is thought, cognition. Man *thinks*. This is what man can do in imitation of the all-knowing and omniscient example of God. But, implicit is that this is somehow in a- a limited undertaking, this thinking of man. And some of you may recall the famous comment of Pascal that, "Man is a reed bent by the wind." And then, Pascal added, "But a thinking reed."

So, then, the second half of the conundrum was that, "God knows. man thinks." Now this, I thought, was very interesting, because it seems to imply a relationship between the limited project of knowing, which is human thought, and the completed project of knowing, which is omniscience. *God knows Man thinks*. In a way, what this is saying, is that God knows that man is making his way toward God. God knows man thinks. God knows that man is participating in the same project of being, that God regards from this higher dimensional space. And, so, then, this meditation on these four lines closes with a *recurso* which returns you then to this realization that what we are talking about is 'the project of knowing', Heidegger called it, carried out on two levels: on the level of omniscience and on the level of limited being.

So, then I th-- meditated on this after we discussed it yesterday, and I thought tonight it might be interesting, then, to [takes drink] talk about the thinking project of-- that is the essence of humaneness on one level -- the thinking project which has as its vector, um, I call it 'concrecence' following Whitehead's Neoplatonism or one could call it "God." Teilhard de Chardin called it "the Omega point." But, the, the, the, um, process by which knowing transforms itself from, uh, some kind of k- aboriginal, uh, apperception of the possibility of God into union with God, and the process that lies between these two points, is the story of the evolution of human consciousness, or more properly speaking, human history.

And, the interesting thing, I think, about, uh, the Western religions, generally, is their insistence on, um, the tangentiality of God and history, that God was something to be realized in the life of each individual, but that there was also somehow a collective drama of redemption, that was stretched out over a very large period of time, and history then becomes the theater, you see, of the struggle between good and evil, for the redemption of the human soul. And, from the modern point of view, or – let's be more frank, from *my* point of view [Terence laughs; audience laughs] – this is, uh, primarily something to be analyzed within the context of language, and our myths about it, and its evolution, and its potential future evolution.

So, I -- and this is in my personal life, the, the great mystery to me, because I feel that I'm -- my intellectual style is that of a scientist, and I take very seriously science, and yet my -- not only my faith, but my, uh, experience -- has led me to believe that the world is not a construction of space and time and matter and energy. That that mapping is, uh, insufficient. That the world is instead some kind of a, uh, linguistic construct. It is more in the nature of a sentence, or a novel, or a work of art, than it is in the nature of these machine models of interlocking law that we inherit out of a thousand years of rational reductionism. That the world only behaves as science says it should when we confine our engagement with it to information that is at a great distance from us, like reading the New York Times every day.

If you read the New York Times every day, few miracles will occur while you are engaged in that activity. Essentially, what is happening is you are getting your cultural programming for the day, all your switches, if any need being- need to be reset by cultural values, are reset at that point, but when we recede into what I call 'the primacy of immediate experience', the, the rules and models that we've been handed by science, and, uh, what's called, common sense, are just totally found to be inadequate.

And, I don't mean when we perturb ordinary consciousness with psychedelic drugs. I'll speak about that in a moment. But, I simply mean when we go into solitude, when we go into wilderness, when we endure great travail in our lives, or when we put ourselves in extraordinary, alien circumstances, then, it's as though the membrane between the ego, and... something else, which we could call our guardian angel, or the Jungian unconscious, or the Overmind, something like that, the membrane grows thin, and the world loses its, um, – [snaps] what do I want to say? – its mundane character. And, instead, things previously mundane, begin to become charged with psychic energy. They become carriers of meaning. *They become carriers of meaning.*

This is very peculiar. A- At a low level, it's not so astonishing. It's a kind of a generalized opening to the world, because everything is imbued with significance. That tree, that person, that greeting, that conversation, is imbued with a kind of depth and significance that is satisfying. It's like living deeply. Living deeply. But, this phenomenon can proceed to a deeper level of introspection and relationship to the exterior. And, in that case, then, this significance which everything was previously seen to have, begins to concreate or densify, and the world begins to dissolve into animate intelligence.

Now, at this point, um, if you didn't bargain for this, you're probably very concerned about your mental condition, and if you aren't, your friends are, because what you're saying at this point is, *the rivers talk to me, the trees whisper in my ear*. What you're recovering is the meaning, that's all. The meaning that is self-evident in nature, but that we blocked. The meaning is so pregnant in everything that it can actually articulate itself in your native English tongue.

And, uh, you know, talking rocks, talking trees, talking boulders, we define this as, uh, pathology. It

means, uh, in technical jargon, a severely diminished ego is in danger of overwhelm-ment by, uh, material from the inchoate and disorganized unconscious. Well, but what's actually happening, is that, for the first time in somebody's life or experience, they are *meeting* the resident meaning in reality, with its force unblunted by, uh, conditioning and denial.

And, um, this is some kind of a linguistic process. We and all nature, I think, swims in some kind of sea of signification of which we are in the same way that the amphibians were able to drag themselves out of the primitive oceans of this planet on- into air and exist in a completely different dimension; *we*, whether grandly or perversely - the verdict is not yet in - we dragged ourselves out of the sea of telepathic interconnected signification that united all life, and we exist, panting and pop-eyed, in this other dimension called History.

Ego awareness, presence of self, sense of loss, anticipation of gain, all of these, uh, dimensions of experience, really, have been added to what was previously the animal Tao - just the howling at the moon Tao of animal existence. And to this, we have added, you know, a dimension of future anticipation: a dimension of regret, a dimension of: how do I make choices? and so forth and so on.

Um, there is not a -- I don't put a- a moral, uh, judgment on this, but it has to be said, that in the tradition of the West, this has been viewed classically as the "Fall." This is the Fall into names instead of realities, into, uh, constructs of reality rather than reality itself. And this has now been, uh, inculcated into each and every one of us, as, you know, both the glory and the, and the trauma of human existence which is our extraordinary ability to reside in and be in language. [Takes drink]

So, for instance, you know, I've made this example before: a child lying in a crib and a hummingbird comes into the room and the child is ecstatic because this shimmering iridescence of movement and sound and attention, it's just *wonderful*. I mean, it is an instantaneous miracle when placed against the background of the dull wallpaper of the nursery and so forth. But, then, mother or nanny or someone comes in and says, "It's a bird, baby. Bird. Bird!" And, this takes this linguistic piece of mosaic tile, and o-places it over the miracle, and glues it down with the epoxy of syntactical momentum, and, from now on, the miracle is confined within the meaning of the word. And, by the time a child is four or five or six, there- no light shines through. They're- they have tiled over every aspect of reality with a linguistic association that blunts it, limits it, and confines it within cultural expectation.

But, this doesn't mean, that this world of signification is not *outside*, still existent, beyond the horizons, the foreshortened horizons of a culturally validated language. Well, so then, classically, the path through this has been through use of psychedelic plants, or, uh, some form of ascetic practice, or fasting, or prayer and meditation... whatever, some way of breaking through. And, it is literally presented as a breaking through, a penetration to another level, that culture is an imprisoning bubble of interlocking assumptions, that are like, a, um, a collective hallucination. I mean, I hate to say it because it's a recursive metaphor, but culture is like a delusion of some sort. Because, it isn't true, of course. It isn't true, if you're, uh, a Witoto. It isn't true that you came from the piss of the anaconda god when he had to get out of his canoe at the first waterfall. That's not really *true*. But, that's your cultural myth and you live inside it.

Our cultural myths, that the world is made of things called mu mesons and anti-protons is, of course, not true either, but it's a linguistic construct that we culturally validate and live inside, and these cultural myths give permission for certain things. F- Basically, they give permission to ignore certain kinds of realities.

So, our language is uniquely set up to ignore, for example, the suppression of femininity. It's also uniquely set up to suppress the statistically, um, uh, infrequent. We really have no patience with that. We have an assembly mind mentality. What we're interested in is that things run smoothly. One can imagine a completely different mentality that cared nothing for statistical norms and *only* pursued the miraculous. I mean, India, in a way, is that society. They don't give a hoot for, you know, how it works on the humdrum level, but the alien, the peculiar, the other, the unexpected is revered, adored even.

So, these kinds of cultural values shift. But, now, *now*, we are in a global culture with the combined understandings of five, six, seven hundred language groups and half that many literatures being poured into a global database where *some people* are assimilating enough of this to begin to play their part in the creation of, uh, a kind of global meta-program for language. And, uh, I think it's interesting to talk about the form that this may take, because I see this as our, uh -- this is not our salvation, but, this is the angel of our salvation. If we can transform and remake language, then we can have the conversation that we must have in order to save ourselves. But, we cannot save ourselves until we have a language adequate to the problem that we're facing. And, uh, English just won't do it because English is a language of subject opposite, uh, subject/object opposition. It's a language of a past, present, and future, and the kind of world we're living in is not that kind of world.

Now, toiling in the background, misunderstood and, uh, unnoticed for centuries, have been mathematicians, laboring to create, what they call, meta-language of de- of description, that seem to them very satisfying, to the rest of us, very bewildering. And, a question worth asking is: why is it that this language, mathematics, which we have so much trouble understanding, seems so *tremendously* powerful when it comes to the description of nature? This is not a trivial question. Why should numbers, in a sense the most abstract quintessence of the human mind, have anything whatsoever to say about the topology of three dimensional space and time? It isn't clear.

What I believe is happening - and we talked about this last night, generally, in the form of a conservation of novelty throughout the history of the universe, but I tended, last night, to present the universe as a material thing. I spoke of atoms compressing into molecules into organic creatures into thinking beings with civilizations and so forth. But, another way to think of this is a kind of take a spiritual x-ray of the material universe, and then say, "If matter is merely the vehicle of the transformations that we call the life of the universe, well then what is the inner dynamic composed of, *what is it* that is striving, what is it that bootstraps itself forward, what is it that self reflects?"

Well, I think what it is is it's actually information. Information is some kind of, um, ontological modality that is capable of organizing *any* system, in which it inhabits, into self-reflection. So, you pour information into matter and you get back DNA capable of making life. But, you know, there is a persistent spiritual tradition backed up by psychedelic and shamanic experience that says that there are also hierarchies of incorporeal and disincarnate intelligence that is nevertheless highly organized.

Well, until the advent of the computer, I think we were just pretty much at loss to form any conception, whatsoever, of how you could have consciousness without, uh, a body. But, e- the computer shows us that you *can* have large scale systems which have degrees, and then, you know, there's a long philosophical wrangle which we can just stamp as 'for another time', degrees of sentience in operating systems. So, then, it seems to mean that information is the thing which uses matter, uses light, uses spirit, uses whatever it can put its hands on to organize itself into higher and higher levels of self-reflection.

Well, then, to what end? I mean, what is all this? Is it just an innate drive toward totality? Or, is it a process which exists completed in some higher dimensional space and *we* are somehow *trapped* in a lower dimensional matrix and we have to go, uh- we have to endure the illusion that it is incomplete? I mean, I don't have answers for these things; this is the business of theologians, basically, to tell us where we are in this universal machine. But, I think that, uh, what *we* can do to enrich our, uh, experience and to feed data into our heuristic models, is to begin to think in terms of language as the material that we need to work with instead of, uh, public opinion or matter or even energy. It's *meaning* that we need to coax into our lives, number one.

As meaning enters our lives individually, we became- we become more capable of raising our voices, both in joyous song, and in political protest, if necessary. My whole shtick, and the whole shtick of the psychedelic experience, I think, is: *reclaim immediate experience*. Realize that *you* out-vote all parliaments, police forces, and major newspapers on the planet, because, who knows, they may be illusions. Complicated phenomenological forms of analysis can be carried out to show that their existence is in considerable doubt. But, if you carry out this phenomenological reduction, you will discover that it reinforces the notion that *you* must actually exist and be real. So, therefore, you start from *that* -- that nub of immediate experience and real being -- and extrapolation outward should be very provisional.

I mean, I don't know, uh, how Buddhism handles this, my- I, I, um, I grant you all a strong possibility of existing, but I'm not nearly as sure about you as I am about me. [audience laughs] And, I don't think any of you should be any sure- more sure of the rest of us than yourself. I mean, the world could be anything, you know? It could be a solid state matrix of some sort. It could be an illusion. It could be a dream. I mean, it *really could be a dream* ...

So it, uh, it pays to stay on your toes, I think. In practical terms, what does all this come down to, besides that we should speak from the heart, clearly, and with our minds engaged? Well, I th- I think that, remember I said we should see language as the stuff with which we work, rather than matter, and that means, uh, creating a technology of the say-able, making the complete understanding of new puns a national priority on a par with weapons development, it means exploring, uh, the real implications of substituting *Finnegans Wake* for the Constitution, this sort of thing. Because, what we're doing, you see, is-is-is pulling the beard of the linear print-heads, who really believe all of this stuff, who really are lost in the labyrinth of the political errors of the last 500 years. It isn't going- we can't, uh, overwhelm them by the force of arms, nor should we wish to. Uh, they can actually be *teased* out of existence, because they themselves feel their position to be so ridiculous.

It's very interesting how, uh, the way the collapse of our enemy in the Soviet Union has exposed the absurdity of our previous positions. All our previous positions are now exposed as absurd, but n- people don't draw the obvious conclusion. It must also mean, then, that our present position is absurd [audience laughs]. And, so, it's tremendously liberating. Our culture is ruined. It's, uh, it's a disgrace from which we can now simply walk away. Well, then, the question is: into what? And, I believe that our persistent fascination with psychedelic states of mind since prehistory forward has been because, in the psychedelic state, from the, you know, from the very beginning, there was an anticipation of the very end. And the very end still lies ahead of us.

What it is is that our nervous system is in the process of evolving us through a linguistic transformation

where language, which at the beginning of the process was something that you heard, at the end of the process becomes something that you actually *see*. And, this simple shift from seeing to hearing is the key to our being able to finally recognize each other and communicate.

Print and linearity and what's called 'ear bias' for language is what has shattered our sense of ourselves as a collectivity. A positive way of putting it is to say, it's also what created the idea of democracy, individual freedom, labor unions, the vote, all of these atomized notions of human obligation and political participation arise out of print. But, so do ideas like that we're all alike, because letters from printing presses on pages are all alike. The idea that products should be mass-produced out of mass-produced sub-units. This is a print-head notion. It could never have occurred to anyone outside of a printing press culture and never has. These ideas have imparted to our existence a tremendous material opulence and intellectual poverty and spiritual uniformity. And, now, *literally*, we have to illuminate our civilization. We have to take its shoddy, spiritually-empty, Bauhaus skeleton and illuminate it, psychedelice it, let a thousand paisleys bloom [*Audience laughs*]. Uh, in other words, release the design process from a commitment to material values. Well, how can you do that, because the bottom line of material values *is* the bottom line? It costs.

The reason we build in the Bauhaus style, for whatever reason we got into it, we now build in that style, because it's the cheapest around. And, once you start adding filigrees and changing things, costs soar. How can you do that in a civilization with a cult of democratic values, individualism, and print-created linear uniformity? Well, the only way you can do it is, you have to drop design costs to *zero*. The only way you can do that is if you build virtually.

This means, you build in an electronic dimension that is added on to ordinary cultural space like an orthogonal dimension. In other words, it's like a TV that you walk into; it's called cyberspace. And, in cyberspace things are built out of light. So, it costs as much to build Versailles as it costs to build a hamburger stand, because Versailles and the hamburger stand are just two programs that, uh, look exactly the same on disk. So, what this means is that the previous set of class-created values, based on the acquisition and control of matter, begin to break down. This is already happening in America, on one level, where, you know, to live as a middle-class person is to live on a better level than the mogul emperors ever dreamed of. I mean, what mogul emperor could stride to his refrigerator and see cases of French mineral water [*audience laughs*], juices from the South Seas, pomegranates from South America. Eat your heart out, Mogul-deli! No chance!

So, um, in a sense we're beginning to create this leveling, but we have created them by looting the material resources of the rest of the world. Conceivably, it can be created in a virtual space, where we would all, uh, live, in *this* world, a rather monkish existence. But, you know, there's that wonderful passage in *Finnegans Wake* where he says (he's speaking of the red light district in Dublin which is called Moicane), and he says: "Here in Moy Kain we flop on the seamy side, but upmeyant Prospector you sprout all your worth and you woof your wings. If you want to be phoenixed, come and be parked." Well, he was advocating death as a solution for life's problems, so if you want to be phoenixed, come and be parked. Uh, my solution is not so radical. I think if you want to be phoenixed, come and be parked at your local virtual reality arcade. And, then, you can be phoenixed in, in several ways.

Well, some of what I'm saying here, is, uh, is facetious. We talked last night about Stan Tenen's "wonderful object." For those of you who weren't here, this is a man, a cabalistic scholar, who has

developed a piece of sculpture such that when you illuminate it from a certain angle, the Hebrew letter *aleph* appears as a shadow. And, then you move the light slightly and *aleph* turns into *bet* and then you move the light slightly, and so on. *In order*, his sculpture produces all of the Hebrew letters as shadows from this beautiful form, which he calls "the lily." And, uh, uh, it ties in with, uh, an experience I had, but, well, first let me talk a little bit more about this "lily" thing that Tenen has discovered.

He also made one for Demotic Greek, which, you know, for those of us who thought it was proof positive that Hebrew was the language of God, this was a real blow to the chest. But, because he did one for demotic Greek, too, and it works just as well -- implying, and, uh, he's working on Arabic -- implying that perhaps such forms exist for all alphabets. And, so then I was thinking about this last night, and I said, "Well, if there's a sculpture in four dimen- in three dimensions that throws the two dimensional alphabets, then obviously, in a higher dimension, there must be a form which throws into lower dimensions the sculptures that make the alphabet."

So, that means all alphabets, all letters, lead back to a hyper-dimensional surface of some sort which can probably then be described with some kind of weird fractal algorithm. And, so then I thought, 'Wow! This is a pretty Hebraic vision of what's going on here'. We have the alphabets of local languages being generated from higher dimensional objects that are three dimensional that are then referent to still higher dimensional objects that- through which the light of God's love passes, scattering out into the radiance of what can be said. And, uh, in a way, this is sort of my vision of the millennium, that we will be re-soared into the Word. You know, the whole story begins *in principio et Verbum, et Verbo caro factum est* – *in princip-* in the beginning was the Word, and the Word was made flesh. The *whole cosmic drama* is the mystery of what it is for the Word to be made flesh. *Language* is seeking to birth itself into the domain of concrete existence. That's, *obviously*, what "the Word made flesh" means! And, uh, it seems to me, that if the Word can be made flesh, this implies a reciprocity; It implies that the flesh can be made Word.

And, this brings us back to, what I was talking about at the very beginning of this evening, which is the curiously literary nature of reality. That it's much more like a- a novel by Thomas Pynchon than it is like an equation by Ilya Prigogine. And, why is that? Is it because, in fact, the flesh *is* Word? And that understanding this, is the real task of uncovering our spirituality? Somehow, it's a riddle, it's a conundrum, it's a koan. If we could correctly understand this, if the world did not disappear immediately, at least it would roll around in a palm of your hand like a spinning marble as the I Ching promises. It's something about the recognition of the primacy of the Word, that history is the process of the descent of the Word into concrete expression - I didn't say matter - and that our relation to this retro-flexive process is an ascent into the Word, a going toward the approaching mystery, and a meeting there, in a domain of unknowability, essentially. I mean, this is the 'casting into being' that Heidegger talked about, this is the 'going to meet the stranger'. This is 'the flight of the alone to the alone', that is the driving force of Plotinus' mysticism.

Well, that's really all I have to say about that, so [audience laughs], uh, let me see what time it is. How am I doing? [Other voice: Ques- Question and Answer] Yes, let's take some questions, if there are any.

Question: Do you know how to use *Amanita muscaria* medicinally and shamanistically without killing yourself? [audience laughter]

Terence: I can tell you were following my argument with bated breath [clears throat]. Carefully!

Because, it's dangerous. It's dangerous because it's seasonally variable, geographically variable, and genetically variable, and that's enough variables that you should be very careful with what you're doing.

Uh, generally, I don't recommend it. It's v- the attention that has been given to that mushroom is, to my mind, entirely out of proportion to its cultural importance. This is because Gordon Wasson fastened in on it with a tenacious will as *soma*. He decided that it was *soma*. Are you all up to speed on what we're talking about here? *Soma* was this mysterious, ecstatic, hallucinogenic plant that the Rig-Vedas were basically composed about. The major subject of the Rig-Vedas is *soma*. The ninth mandala of the Rig-Vedas is a paean of praise to *soma* that exalts it above all the other gods, and no one knows what *soma* was. And, the descriptions are puzzling. It seems to have been -- it's didn't have leaves; it had yellow flowers. It grew in mountains. And, they speak of pressing it. It was prepared some way. It was pressed, it was filtered, and then they talk about this golden liquid which they drank.

And, Gordon Wasson, because of the importance of the Indo-Aryan people who wrote the Vedas for connecting up all of the history of what archeologists call Old Europe with the Neolithic middle-east and India, it was very important to try and understand what *soma* was. But, the problem that has bedeviled everyone who was an enthusiast for *Amanita muscaria* as *soma* is that it's a bad trip. It is not *reliably* an ecstatic intoxicant. In fact, it's fairly reliably a bellyache. And, uh, people have pounded it with milk curd. There was a whole school of thought which said that the enzymes active in raw milk will decarboxylate *muscarine*, the poison, into *muscimol*, the hallucinogen. But, you know, this didn't stand the test of human trials. It didn't appear to be true.

Then, other people said you have to dry them for months or smoke them over a fire. Again, this is- doesn't seem to be reliable. So, Wasson went to the grave. He, in his last book, *Persephone's Quest*, he referred to *Amanita muscaria* as the supreme entheogen of all time, which was just a completely wrong-headed judgment, I believe. And, this was from the man who discovered the true psilocybin mushroom cult in Mexico! There was an angle on all this which Wasson completely overlooked because of his bias towards certain languages, and *that is* that along with all this Indo-European Vedic Hindu material, there was a Zend Avestan literature, based around *haoma*, the same stuff, same word. And, from there, Flattery argues that, uh, it was *Peganum harmala*, that it was harmaline, that it was not a mushroom, that it was a higher plant in the, uh, *Zygophyllaceae*. And, uh, I think, probably, he's right, actually. It's a very interesting book. Apparently, uh, w-uh, in the Avestan classical period, no one would have dreamed of having a spiritual experience without resort to drugs. They just put it very plainly. They're the most 'matter-of-fact' people. These texts are fascinating! And -- but, they don't devalue it. They say, you know, "Here's our map of the spirit world entirely based on our drug experiences. And, here are the drugs we use. And, to see these angels, you must use this drug. And, to see these angels, this drug," and so forth.

We don't really know what these drugs were, because the-the etymologies are lost, but harmaline figures very strongly in all of this. And, of course, harmaline is a, uh, neurotransmitter present in human metabolism. In fact, I didn't get into it tonight because I was trying to keep it off the biochemistry and that sort of thing, but, this transformation of language from something heard to seen that I was talking about, I believe, is a one or two gene mutation. That's all it would take.

Because, in the human pineal gland, there is a compound called adeneroglumerotropine [sic--adrenoglomerulotropin), that's what the enzymologists call it. But, when you show it to, uh, a plant

biochemist, he says it's 6-methoxy-tetrahydro-harmaline. And, so it is! Adeneroglomerotropine [Adrenoglomerulotropin] and 6-methoxy-tetrahydro-harmaline are the same thing. Well, it's a psychedelic harmine alkaloid similar to what's in *Peganum harmala*. It, uh, could be converted to DMT by a simple methylation! Well, a one gene mutation would make a methylation possible!

Attention, consciousness, cultural values, we don't know how many times *since* the invention of language there have been significant mutations in the n- in the, uh, chemistry of the nervous system that have created significant changes in cultural programming. I mean, doesn't anyone find it a little odd that the laws of perspective were discovered less than 400 years ago? I mean, what the hell was wrong with people before that? How can you *discover* the laws of perspective? I mean, I find that not credible for somebody to say that the laws of perspective were *discovered*. It's always seemed weird to me! It's as though, uh, you know, there was a shift, a very subtle tweaking of the processing of visual space itself necessary to be able to do that. Yeah?

Q: Um, you had spoken about the Word, and the Word made flesh, and, um, Dorothy Sayers wrote a book called *The Mind of the Maker*, in which she discusses the Trinity, as, uhm, really an image of what the creator process is all about. And, where the father is having, like, a great idea for a play. He's the Father. The Son is making the thing happen on the stage, bringing it into the world, and having it 'made flesh'. And, then the Spirit is the response that you have to that completed product, and how all three of them really beget one another and they nurture one another. Um, and she talks about people who have these problems with scalene trinities where there is someone who, let's say, may have only the Father, only have a *great* idea, but be unable to make it into something that's physically real on a stage. And, I wondered if you could pick that up, uh, that story.

Terence: Well, yeah. I mean speaking to it, generally, I think if you think of history, as this kind of a process, Western history, as the manifestation of, uh, the demiourgos, Ialdabaoth, Jehovah, and then you get this middle-declension in the Christos, and then this peculiar and misunderstood promise of the redemption by the Holy Ghost. Uh, McLuhan, who's a very interesting figure, a-as, you know, a radical thinker in communications theory and a devout Catholic, believed that, uh, the Holy -- the manifestation of the Holy Ghost was electricity. And, and to him the ringing of the planet by electronic media was the unfolding arms of an archangel.

I mean, he literally saw electricity as God's love made manifest, and-and he may not -- he hasn't been proven wrong yet. I mean [woman laughs], it may yet knit us all together, and make us one, and lift us off and send us to the stars. It's a wonderful stuff, electricity. You know, for, uh, I-I like to talk about it, because for *thousands of years*, electricity was this stuff which some people knew about, and what they *knew* was that you skinned a cat, and you--and you dried its skin in the wind, and then you got an amber rod, and you -- a polished rod of amber, and then you would go into a dark room with your cat skin and your amber rod, and you would rub it back and forth like this, and then you would pull the amber rod away from the fur, and you would see miniature lightning storms of static electricity. And, that was *it*; for thousands of years that was it.

And, then, in the 17th century, make it the 18th century, uh, people invented what we called Leyden jars,

which were this tricky way of storing this stuff, so that you could store up a lot of it, and then in a dark room you could discharge it across a gap with this snap, and from *that*, you know, I mean, you talk about a shamanic invocation [some laughter], from *that*, you know, we light cities, we smelt steel, we sink shafts miles into the earth, and it's just this little elemental, that we were able to coax into becoming our friend! Well, who knows how much of this sort of thing there is.

According to McLuhan, *that's the major thing*, and 'the electrification of the body', you know, this is a theme you get as early as Whitman: '*I sing the body electric*'. You get it in Steven Vincent Benét in his poem 'John Brown's Body' where he says, '*I see the human body cold electric rage*', and he pictures it as a superstructure. Uh, electricity as information, as the Logos, as the freeing and re-ef--rarefaction of thought. It all, uh, it's credible. It's credible. I mean, when you think about electricity, *in and of itself*, uh, as modern inventions go, it must be the most benign there is, because other than seating criminals in electric-wired chairs, it is not a weapon of mass destruction. You cannot rain it down on your enemy's cities. Uh, it's, uh, pure energy in the service of light, one thing, and information. And, it's generated--I don't know how many of you know this, but it's generated out, uh, stable magnetic fields.

When--when we were in the 5th grade, we made engines by wrapping, uh, nails with wires and setting them, delicately balanced between permanent magnets, and, you know, you coax this stuff into being. *We* take it for granted, because *we* don't understand it, but if you're down close to where it's coming into being, it's like coaxing some kind of demon out of the matrix and into the service of thought and light. *Very psychedelic*.

Q: So, how do you see the body being coaxed back into the Word?

Terence: Well, I don't know, It's a hard thing to picture, isn't it? Um.

Q: Well, maybe it's like those Tibetan letters that start becoming real and vibrating...I don't know.

Terence: Well, there are a number of -- I think we have like pieces of the puzzle, but we don't know quite how to arrange them. One is, Virtual Reality. Do you all understand this concept? Because, I've mentioned it and it's quickly becoming central to my references. Virtual reality is this technology now being developed where they give you a helmet and a body glove, and when you look in the helmet, you see another world, and you're in it. And, you can walk around and pick things up and open doors and -- and it's all sustained by computers, but the illusion is very real, and they're only at the beginning of the process of creating this illusion.

Okay, so that's a technology sitting off there with a potential application. Another is nanotechnology. Nanotechnology is making things very small. And, there's a whole enthusiasm for this. And, people who, uh, you know -- I talked yesterday about, uh, being down at the *baz*, and watching the stratocumulus clouds move over the ocean, the number of water droplets in a stratocumulus cloud exceeds the number of people in the world! Therefore, if we were the size of water droplets, we could simply exist in that kind of a, of a cloudscape! Well then, okay, so that's another technology that's sitting there.

Another is,uh, this wonderful fantasy that I told you, some of you about a few days ago, where we see a man walking on a beach, and the man -- his planet is perfect. Its oceans and its atmosphere and its glaciers

and its -- and its equatorial forests are all in balance. And this man is naked, except for a thread, like a Hindu thread that crosses him. And on this thread, there's sufficient space for as much as a thousand or more small beads. Each bead is a doorway into a technological potentiality that is entirely suppressed in three dimensional space. In three dimensional space, there is just man and nature. But, when this man closes his eyes, there are menus. And, these menus lead to other menus. In other words, the culture, the entire culture, has become virtual.

This is one possibility, that the culture be made virtual. Another possibility, which is sort of the reverse of that, and there's a company on the peninsula trying to do this, is to place a textual reality behind apparent reality. So that everything is a button, you know. It's, it is what it is, but it's also a button. So, I look at this, the question forms in my mind: 'What is this?' The 'What' pushes a button, and textual accompaniment informs me that this is cypress wood, cut three years ago. [Audience laughs]. Do you see how -- what this would do to the world? Now, we're well on our way in the project of making the Word flesh, and the flesh Word. We, at least, have them lined up with the Word behind the flesh, and in some cases, the flesh behind the Word. Embedded. Embedded. Ontologically arranged in a situation of mutual reinforcement.

Oh, okay, another, uh, technology is, um, some kind of, uh, some kind of, uh, severing from the physical connection. And, then there's a lot of debate about is this possible: the old consciousness without an object riffraff? Well, it has to be explored. It can't be known. The other thing is, the persistence of the intuition of non-material worlds inhabited by self-organizing entelechies of one sort or another seems to imply that some kind of dematerialization is, at least, theoretically, possible.

Uh, I've talked a lot in these circles about the-the questions raised by the ecstasis that comes with DMT, where you actually break into a world where there are, what I call, 'autonomous self-transforming machine elves', but what we have discussed in terms of are these the 'sprites' of classical European mythology? Are they dwellers in some parallel continuum, unsuspected by any of our sciences or ontologies? And, then, still more unsettling possibility, are these--is this somehow an ecology of souls? Is the eerie connectedness to the human dimension that these thing have, because, in fact, this is a stage of some sort, in human existence? If, what God coming[?] tangential to history *means* is human beings unraveling the mystery of physical death, then, I think that would be a sufficient fulfillment of the, uh, sort of dramaturgical [sic] demands of a dénouement: that *we* stride towards the mystery, the mystery strides towards us, and everything is resolved in a revelation of the understanding and meaning of death.

I--this kind of thing makes me very uncomfortable, uh, perhaps because it's fairly feeling-toned and emotion-laden. Uh, I can ima--I- it doesn't trouble me to imagine contacting, uh, informational beings in a parallel continuum. But, the notion of encountering an ecology of souls, I think, is hair-raising if you take it seriously, because, uh, even the most spiritual of us are so deeply programmed by the assumptions of scientific materialism that I think something like that on the short term here and now really gives us pause.

Brother David ...

Q: Yes. In this process of, uh, great return to the Word in flesh, where do you see the function of the poets?

Terence: Well, you know, people have talked, Robert Graves and others, about what he called an *Ursprache*, an original speech, and Celtic poetics somewhat assumes this. I think this

language that is seen, is the project that the poets should take very seriously. We need to not simply make better poetry; we need to make poetry of an entirely different order, and we will recognize it when we see it - not when we hear it. It will not be heard. It will be seen. To carry language from three -- from two dimensions into three is the task of the poet and the rebel in the 20th century.

And, there is a model for this which I will explain to you so that it doesn't seem so outlandish and so we can see that nature once again has sanctioned this move, and that is: A long time ago, 700 million years ago, more or less, the great Tree of Life made a primary division between the vertebrates, the creatures with backbones, and the invertebrates. Evolving along the invertebrate line and reaching the greatest, uh, brain size and complexity of nervous system on the invertebrate side of things, were the cephalopods. These are the squids, and the benthic octopi, the eight-armed ones and the ten-armed ones. You may not realize that that they were actually mollusks, related to escargot. So, they are an extremely primitive creature from the point of view of those of us with backbones and binocular vision and frontal lobes, and so forth and so on

Nevertheless, the interesting thing about benthic octopi is that they can change their color over a wide range. Now, you may have heard this fact and assumed that it had to do with camouflage against their surroundings so that they can avoid predators. This is not what it's about at all! Octopi change color, and they can also change the shape of their skin from smooth to rugose and wrinkled, and then what's called pileate, little points all over it. They can go through all of these color changes and texture changes. And, octopi have extremely well-evolved eyes. In fact, evolutionary biologists always compare the eyes of octopi to human eyes, as an example of what is called 'parallel non-convergent evolution' because clearly the two are not related. But, the argument is made. You see, they solved the problem the same way in two different places, so it's a very neat example of convergent -- non-convergent evolution.

Um, but what's interesting for our discussion is the mode of communication of these things. They become their linguistic intent. This repertoire of blushes, dots, stripes, traveling fields, color changes, and then, because they are soft bodied, they can quickly reveal and conceal all parts of their body very quickly. So, if you watch an octopus in communication, its surface texture is changing, its color is changing, and it is hiding and revealing, it's dancing! And it's a dance of pure meaning perceived visually by the object of its intention which is other octopi. So, compare this for a moment to our method of communication. We use rapidly modulated small mouth noises. As primates, we have an incredible ability to make small mouth noises. We can do this for up to six hours at a stretch without tiring. [*Audience laughs*].

No other thing that we can do approaches the level of variation with low energy investment that the small mouth noises do. A person using a deaf and dumb language is exhausted after 45 minutes. But, the problem with the small mouth noises form of communication is: I have a thought. I look in a dictionary that I have created out of my life experience, I map the thought onto the dictionary, I make the requisite small mouth noises, they cross physical space, they enter your ear, you look in your dictionary which is different from my dictionary, [*audience laughs*] but, if we speak what we call 'the same language', it will be close enough, that you will, sort of, understand what I mean.

Now, if I don't say to you, "What do I mean?," you and I will go gaily off in the assumption that we understand each other. But, if I say to you, "Did you understand what I said then?" You say: "Yes. You meant that you don't want to sit with Harry and Sally because their pending divorce makes you uncomfortable." So, "No, that's not what I meant ." So there's a misunderstanding because the dictionaries are not matched.

Now, notice what's happening with the octopi – there is no dictionary. Both parties are seeing the same thing because my body is my meaning. I become my meaning, and you behold the meaning I have become. I am like a naked thought. Not even a naked nervous system. More naked than that! I am like a naked thought, in aqueous space, unfolding in time. I maintain, this is why octopi eject clouds of ink, it's so they can have private thoughts! [Audience laughs]. Because, if you can be seen, you can be understood! Well, uh, this is a perfect model, uh, condoned by nature for the kind of transformation that we want to lead our culture toward. And I don't think it's that outlandish.

Our previous animal totems were chosen unconsciously, and were rather unfortunate, I think. I take the totem of the 19th century to be, um, the horse, expressed as the steam engine. And the totemic animal of the 20th century is the raptor, the bird of prey, expressed as supersonic high performance fighter aircraft, which is just, you know, the leanest, meanest machine you can get together these days. But these, uh, mammalian and avian images are too close to the rapacious heart of the primate inside us. Embracing an image of the soul, like that of the octopi, is a permission for a strange and alien kind of beauty to be led into our lives, and these things are strange and alien, let me tell you.

The situation I describe with these octopi was, uh, coastal, shallow water octopi. So called circolittoral octopi. But, they have also evolved into the depths. The so-called abyssal octopi that exist below 1500 meters in the sea where there is absolute darkness. And to carry their intention to communicate into that darkness over the past 700 million years, they have evolved phosphorescent organs, and have covered themselves with lights, with eyelid-like membranes that can be rapidly blinked and flickered, so that when you descend into the abyss, you then see pure linguistic intentionality among the cephalopodia because they have become what we aim to become under the wise leadership and stewardship of George Bush; namely, a thousand points of light! [Audience laughs] [Terence laughs]

Is this guy for real? Was it Flanders Fields, armies clash by night and that whole business?

Q: Was it only beholding one another, or is there, maybe, a mechanism at work, like when yawning is contagious, that it's not only watching, but actually, perhaps what happens to your body has transmitted it to mine?

Terence: Well, this is fascinating stuff to study. The biologists who are studying these things are actually creating a grammar, and a syntax, and they are beginning to understand what certain things mean. And the level of meaning. There's a wonderful book called "Communication and Non-communication Among the Cephalopods", and it makes the point that, communication is a very double edged thing. You want to communicate to somebody, but usually, you -- your message, it's also important that your message not be picked up by other somebodies. So, there can't be just a full-on drive toward apprehend ability.

There also is a counter-veiling force toward concealment, obscurantism, double entendre, so forth. You

know someone said that language is invented to lie. Well, in a way, that's true, because of the problem of non-communication. As soon as you have something to communicate, there are places that you don't want the message to go. And so this creates a very interesting problem. If I were 20 years old, I'd go back into marine biology just to spend time with these things. They're quite amazing and they have very large brain capacity. I'm -- could be -- I think John Lilly was all mixed up to look for a mind in the water in that it was mammalian chauvinism, that drove them to dolphins and, and whales. That, maybe they are intelligent, but the language feats, when you see videotape of these cephalopods, you realize you are in the presence of an opera!

Q: What kinds of things are they communicating, besides maybe fear, or...

Terence: Well, they are communicating -- they have elaborate sexual displays, and it's a very tricky thing, sexuality among cephalopods because the male usually doesn't survive the encounter. So, a lot of time is spent getting it right, before you commit yourself [*Audience laughs*]. So, they have very complicated courtship thing, and, and one of the things that's always said about them, is that, uh, you know, I mean, every child's book will tell you this about octopi -- they're shy creatures. Well, guess why! It's because they wear their heart on their sleeve! Everywhere they go, other octopi can tell exactly what they're thinking and feeling, so they live alone, and they only get together on special occasions - for communication, basically. And, uh, and the repertoire is as complex as human language. So that they could be discussing the equivalent of, uh, Spencer's epithalamium or something. I mean, we don't know what they're talking about!

Q: Do we have a sort of Rosetta Stone you know about?

Terence: We have a primitive grammar, but, uh, it's only for one species. And, uh, I'm not really interested in what they're saying, because I think it would only make sense if you were an octopus. But I'll be that, uh, -- you see it's a model for us. Wouldn't we like to dance for each other and be perfectly understood, and we -- wouldn't we like to see someone dance and to know that this was their mind and their body, somehow at one? In a way -- God, does everything go back to everything? -- in a way, this is the theme of skinny legs and all! This is the theme of the Dance of the Seven Veils! Octopi do it. Nubile Hebrew princesses do it. Everybody dances toward the truth, dropping veils as they go, and then, of course, the 'nakedness of truth' is a cliché.

Q: You mentioned, um, bringing it to a practical level. [*Terence: Do that, yes!*] You mentioned the hallucinogenic experiences, in one, in one way, that um, I don't think I accelerated anything in my life; I feel that I just have just aligned with it, moving a freer way, so, I wouldn't -- I wouldn't seek out a kind of hallucinogenic experience in order to accelerate or to get more transforming; I do it because it's enjoyable. It's, um, it's truly exciting and passionate, and I do seem to transform in the process and grow. Are there any ways, or other ways, that you might suggest? And also, I'm interested in sound which is -- you're talking about going from sound to light. [*Terence: Mmhmm*]

And I have a way of starting to where I am or, again, following my excitement which happens to be making tones. And I've reproduced experiences such as, uh, very simply, like a hot tub, where I make a tone and another person has an experience of being in a hot tub. They go from being very cold, to being very comfortable, very vulnerable, very open, very loving. And, uh, it occurred to me that I can reproduce a mushroom experience or, um, you know, somebody's drugs you mentioned earlier in the Amazon ... [

Terence: 'That you could reproduce it with sound?'] I could make tones and, such as in Tibet, they can, you know -- tones are, you know -- can bring physical objects into being, and move energy and such... That's my exploration, I was wondering if you had any ideas on them.

Terence: Well, something sort of along that line, um, that I've worked with for years and observed for years, and I find very interesting is, you know, in South America there is this drug, plant-drug of shamanic tradition of great age, called ayahuasca, or yagé. And what seems -- it's -- it's chemically a little different from anything we've discussed, and so, consequently, neurologically a little different. When this -- when this drug was first discovered in the 20's, they called, uh, they isolated a white crystal from it, and called it *telepathine*. Because they believed that these deep forest Indians were having some kind of state of group-mindedness behind this. Well then, and that was all very exciting that there was a drug called telepathine, but then later they found out that the drug had already been discovered in another plant, in the *Peganum harmala*, the *soma* plant I mentioned, and had been named harmine, so that the rules of nomenclature went back to precedent.

But, persistently, since then there have been reports of group states of mind caused by this drug. So we explored this in the 70's fairly thoroughly. In '71, '72, again in '76, and again in '81. And, um, different things were going on. First of all, the people down there who take this drug, are into what they call, *icaros*. Icaros are magical songs, i.c.a.r.o.s., icaro, and the accomplishment of a shaman is judged by how many of these magical songs he has. And they're taught to you by the spirits, they say. But the interesting thing is, is that the icaro, within the culture, is criticized as a work of visual art. It is not thought of as a song. It is not listened to. It is looked at. And when people criticize it, they criticize its form and its color. And in taking this drug, we discovered that there is something about it, it -- it seems to dissolve the cultural barrier between the synesthesia of sound and light. So that you can make a tone, like mmmmmmm and it emerges as a streak of cyan blue, that just stands there in space as long as you... and it clearly, this stripe is related to the sound. When you stop the sound, the stripe disappears. Well then you discover that when you modulate the sound, the color is modulated. Well, then you begin breaking it up and you discover that voice has become transformed into an instrument for manipulating light.

And, again, it has to do with these drugs which are very close to neuro-transmitters, just one gene away from being naturally produced. It's as though, this is a biochemical place where, what we experience as the evolution of language and our abilities, our cognitive abilities to integrate and express language are happening. So that, uh, you know, I think this should be looked at. I think maybe the path to the to the kind of visual lang -- visually beheld form of communication that I talk about, is to look at shamanic cultures where this may have been happening all along, and people assume it. It is true. When you go up these jungle rivers to the really bare-assed people, that um, they, the elders really do get together and take this stuff. And they do have a collective, complex collective image of what should be done for the good of the group! It's not exactly a vision of the future. It's more complicated than that. Because they also have a vision -- a three dimensional vision of the kinship structure of the village, of a whole bunch of clan and sib-group associations to the plants and animals in the forest which are hidden from the eyes of the casual visitor.

They are -- it isn't that so much that they predict the future as that they go into the higher dimension of their own cultural information space, and from there they make decisions. Where should we hunt? Who should we make war on, or not make war on? Where should we move? Um, you know, and even decisions about triage of children, and that sort of thing, since that does go on. So, uh, you know, how much of

human navigation through history has been done by processing ordinary cultural information on a higher dimensional level by perturbing neurological functioning? I mean, if there is any angle that would have given us an edge, we would have found it, and we would have used it. And I've discussed in other lectures, the way in which small doses of psilocybin improve vision, and how this would have fit back into primitive hunter-gatherer system. Very simply, they would have just outbred everybody not using mushrooms because a pair of chemical binoculars, in a hunting environment is an adaptive advantage that could not be ignored! And so forth, and so on. Yeah.

Q: By, copying your hand movements, it helps me see what you were talking about like in a virtual reality, and that's what they do in neuro-linguistic programming and the people who've made fire-walking popular, like, Tony Robinson's country where neuro-linguistic programmers...

Terence: Maybe neuro-linguistic programmers could study octopi? If I had eight hands I could really get gestural. I, I... a funny experience involving octopi. I know a woman, I'm sure she would not begrudge me this description of her. She's a very frank exhibitionist. I mean, this is the woman who at every party takes her clothes off and dances on the table tops and so forth. She's an inveterate exhibitionist and she's totally frank about it. And I, uh, I had been to the Monterey aquarium, and seen the octopus there. They have a giant octopus. Well, most of the time this guy just hunkers low, and he's a sort of off in the corner, one beady eye checking you out. But, of course, because octopi have this mode of communication, uh, they're very set up to respond to visual display. So, this woman walked pass this tank and this octopus practically leaped into the air. It came down out of the tunnel. It was pressing against the glass. It was beating against the glass and what it was, was one exhibitionist recognizing another [*Audience laughs*]. I mean, it was just clear across the species' lines. The power of neurosis knows no barrier [*Terence and audience laugh together*].

Q: But she also had almost orange hair, very red, bright hair that the sunlight ...

Terence: That's true, it was probably sending a message to this octopus that was, uh, obscene, in the very least.

Q: Was she dancing?

Terence: No, she was just trying to be unobtrusive, but this woman being unobtrusive is a show stopper.

Q: Terence, when you talk about language, or the word use in the way people talk, to me that sounds like a whole body language. And, and when you go into print, I'm making all these unconscious assumption values of what you're saying is true partly based on your body language?

Terence: True, but body language is probably, is --, has really faded for us. Probably because of the telephone. And the telephone really staunches that. And, uh, yes, it would be... there... we probably were much more linguistically rich in the past. We muted ourselves.

Q: Terence, just to let you know what happens when you discover sparks nowadays. When I was a kid, I was a science buff, and I made a Tesla coil and so on. Before that, I accidentally induced a spark in a transformer. Unexpectedly, the spark jumped and it was sort of my first religious experience. I saw this spark and all sorts of things burst loose in my ten year old head. Two years later the F.C.C. triangulated my

house for admitting a spurious radiation because, you know, you have to regulate that sort of thing. And, I felt sort of like someone put a big pot lid over my head, and between that and being suckered into that moody vital institute with their big Tesla coil movie, [Terence: Yeah, right?] just left a bad taste in my mouth. I'm glad we're onto other things now besides sparks and amber. [Terence: Oh, okay!] A bitter experience.

Terence: There is a notion, you know, in Latin spark is as, is *scintilla*. This word exists only in English in the legal phrase 'there was not a scintilla of evidence against him'. But in alchemy, this idea lived on for a long, long time, and there's a whole literature of causing the scintilla and seeing it like you did, so you were unconsciously caught up in an alchemical archetype.

Well, why don't we knock off, I think that's enough for this evening ...

The Tykes...

Well, I suppose it's an invitation do describe a DMT trip, which is never to be passed up. Because I think, I think what we're talking about here is a continuum, I'm talking about a very narrow band of experience. A continuum of experience that comes through tryptamine hallucinogens: DMT, Psilocybin, and the DMT-Harmine combination... and that's it... Mescaline doesn't, isn't what I'm talking about. Ketamine certainly isn't what I'm talking about. Datura certainly isn't what I'm talking about. And some of these are plants, and some of them are synthetic drugs, but it's a very narrow spectrum of these highly visionary ones, and then the most visionary, the quintessence is DMT. I mean, I think that DMT is as intense as any drug should ever get; I don't ever want to be more loaded than that. I don't think you can be more loaded than that and come back. You know? What happens on DMT for me, and this is based on, you know, composite image of many experiences, and I've confirmed it to some degree with other people, but I was talking to somebody the other day, somebody who had just done it, and I said, "what did you think?" and they said: "It's the most idiosyncratic thing there is." and I thought, what a wonderful description, that's exactly what it is - it's pure idiosyncraticness. It's so idiosyncratic that's all there's there - it's like idiosyncrasy without an object, is what DMT is.

When you smoke this, the onset is very rapid. 30-45 seconds, you know? There's this feeling which comes over your body - half arousal, half anaesthesia. The air appears to suddenly have been sucked out of the room because all the colors brighten visibly, as though some intervening medium has been removed. And then there's a sound, like a piece of bread wrapper or cellophane being scrunched up and thrown away. A friend of mine says this is radio-entelechy leaving the anterior fontanelle at the top of your head. [laughter] I'm not sure I want to line up with that... but a membrane is being ripped; something is being torn. And then there is a total (what Mircea Eliade called in a wonderful phrase) "a complete rupture of the mundane plane". [laughter] You know? That's like a hit and run accident except the car came from hyperspace, you know? A complete rupture of the mundane plane. And you fall back into this hallucinogenic space, and what you see is a slowly rotating red and orange kind of thing, which, over the years we've nicknamed, uh, 'The Chrysanthemum'. And it's.. this represents some kind of disequilibrium state that has its roots in the synapses. What's happening as you're watching this Chrysanthemum is that millions and then hundreds of millions of DMT molecules are rushing into these serotonin bond sites in the synaptic cleft and disrupting

the serotonin and switching the electron spin resonance signature of these neural junctions in this 'other' direction. And this is taking, you know, 30 or 40 seconds, and there's this rising hum, this nnnmmmmMMMMMMMMMM^^^ that rising tone; the flying saucer tone of Hollywood B movies... you actually hear this thing.

And then, if you've taken enough DMT (and it has to do entirely with physical capacity: Did you take, did you cross the threshold?) something happens [clap] which... for which there are no words. A membrane is rent, and you are propelled into this 'place'. And language cannot describe it - accurately. Therefore I will inaccurately describe it.

The rest is now lies. [laughter] When you break into this space, you have several impressions simultaneously that are a kind of gestalt: First of all (and why, I don't know) you have the impression that you are underground - far underground - you can't say why, but there's just this feeling of immense weight above you but you're in a large space, a vaulted dome. People even call it 'The DMT dome' I have said, had people say to me, "Have you been under the dome?" and I knew exactly what they meant. So you burst into this space. It's lit, soft lighting, some kind of indirect lighting you can't quite locate it. But what is astonishing and immediately riveting is that in this place there are entities - there are these things, which I call 'self transforming machine elves', I also call them self-dribbling basketballs. [laughter] They are, but they are none of these things. I mean you have to understand: these are metaphors in the truest sense, meaning they're lies! Uh, it's a jeweled self-transforming basketball, a machine elf. I name them 'Tykes' because tyke is a word that means to me a small child, and I was fascinated by the 54th fragment of Heraclitus, where he says: "The Aeon is a child at play with colored balls" ... and when you burst into the DMT space this is the Aeon - it's a child, and it's at play with colored balls, and I am in eternity, apparently, in the presence of this thing.

There are many of these things, but the main thing that's happening is that they are engaged in a linguistic activity of some sort, which we do not have words for, but it's visible language. They are doing the visible language trip. When you break into the space, they actually cheer! The first thing you hear when you pass across is this 'hhhyeaaaaayyy' - you know the Pink Floyd song? "The Gnomes have Learned a New Way to Say Hoo-Ray"? This has gotta be what these guys were talking about; how else could it be? It doesn't make any sense otherwise.

[laughter]

You break into this space... the gnomes say hoo-ray! And they come rushing forward and they, and, and the thing then that happens is... and people say "is there risk, to DMT? it sounds so intense. Is it dangerous?".

The answer is: yes, it's tremendously dangerous; the danger is the possibility of death by astonishment. [laughter] And you must prepare yourself for this eventuality, because you are so amazed. Amazement seems to be the emotion that has torn loose and swamped everything else - I mean astounded? When was the last time you were genuinely 'ASTOUNDED'? I mean, I think you can go your whole damned life without being 'ASTOUNDED'... and this is astonishment, you know, raised to the N-th degree to the point that your jaw hangs...

I mean you're like this:

And it raises issues: like you say, "Jesus, ah, huhh ... I must be dead!" And you, and the weird thing about DMT is it does not effect what we ordinarily call the mind. The part that you call "you" - nothing happens

to it. You're just like you were before, but the World has been radically replaced - 100% - it's all gone, and you're sitting there, and you're saying, "Jesus, a minute ago I was in a room with some people, and they were pushing some weird drug on me, and, and now, what's happened? s s is this the Drug? Did we do it? Is this it?" And meanwhile, these things are saying: "Do not give way to amazement; Control your wonder." In other words, they try to bring you down. They say, "Don't just goof out on this; pay attention. PAY ATTENTION... to what we're doing." "OK, what're you doing?..."

[laughter]

Say this is what we're doing, and then they proceed to sing objects into existence. Amazing objects. Objects that are Faberge Eggs, things made of pearl, and metal, and glass, and gel, and you, when you're shown one of these things, a single one of them, you look at it and you know, without a shadow of a doubt, in the moment of looking at this thing, that if it were right here, right now, this world would go mad. It's like something from another dimension. It's like an artifact from a flying saucer. It's like something falling out of the mind of God - such objects DO not exist in this universe, and yet, you're looking at it. And they're clamoring for your attention. " 'k at this! 'ook at This! Look at THIS!" and they pull these things... and each one, you look into it and it begins to open into this wonder that you must fight. You say "No, don't look at it, look AWAY from it!" because it's so wonderful that it's swamping my objectivity and destroying my ability to function in this space. Well, then they say "do"...

And the objects that they make have the peculiar ability to themselves generate this linguistic 'stuff' which condenses as other objects. So beings are making objects, showing you objects, the objects are turning into beings and making other objects, these beings and objects, they jump into your chest - and then they jump back out. They jump into your body and disappear into your body, and then they jump back out, waving these things, just throwing this stuff in all directions. They are - the word that comes to mind is: they are Zany. It's like a Bugs Bunny cartoon, uh, gone mad. And all of this energy - they are elves. This is what elves are. It's this wierd thing, where they love you - or they like you a lot, but you can tell that their sense of humor is Weird. And that you must be very careful of the deals you cut with these things. and in fact I've spent so much time trying to understand what is this. It has different kinds of feelings about it. One is (and this really threw me for a loop when I figured this out) after many many of these trips, and analyzing this place I kept going to, I finally realized: "this place is... somebody very weird... it's their idea of a reassuring environment for a human being! It's like a playpen. It's this warm. well lit, secure, womblike environment, and when I break into it they these things, the elves and the toys, are toys! These are things to amuse me. The way you would hang, uh, cubes and blocks above a crad... a playpen, you know? Because children are supposed to coordinate shapes and bright colors. That's what these things are: they are toys to try and get me to coordinate my perception in this place. It's a holding area of some sort - someone's created this and is watching me.

OK - that's one metaphor for what it is. Another metaphor is... I took this stuff to Tibetans, to the Amazon. I gave it to Tibetans, they said "this is the lesser lights, the lesser lights of the Bardo. You cannot go further into the Bardo and return. This takes you as far as you can go." When I gave it to shamans in the Amazon, they said "It's strong - but this is, these are the ancestors. These are the spirits that we work with. These are ancestor souls. We know this place." Well then, the third and final metaphor, because when you're in that place you have such complex emotions - very complex emotions - something weird is going on with time, because you perceive your body image as infantile. You seem to have a very large head, and a very body, and very short limbs. And, you know, I dunno what that's about.

But they're, uh, this...

Then the last facet of it that I want to mention is: there is this 'you must be on your toes' thing - don't let these guys get behind you. They are tricky. And their elfin humor may not be your idea of a good time. [laughter]

And I said to myself, where have I had, before, this feeling that I'm having now. It's a feeling of being with people that I can't trust, but who want to help me, and who seem to be trying to, uh, cut a deal. That was the word that gave me the clue: "deal". And then I remembered, "I know where I felt like this - I felt like this in the Crawford Market in Bombay when I had a kilo of Gold in my pocket and I was trying to trade it for hashish, and I was surrounded by all these Arab hash traders, and they were saying "we're your friend, just wait, don't worry..." And say "yes, I KNOW you're my friend and I'm NOT worrying, but, you know, brbrbrrr... perform!" And so then I said: "Aha the creatures in the DMT flash are Traders..." They're Traders. And that's what this weird feeling is - it's a business environment in there. [laughter] We're having a business meeting. They're saying... and then the objects! Then I remembered- the objects... they're trade goods! They're saying: "How about thissss! How about This!".

What do they want? What do I have that they want?... They're meme traders, is what it is. And I think that what they wanted, and got, and took - without bothering to even say a word about it - was everything I knew about the "I Ching". And they're like art collectors. They say "well, the idea is primitive, and primitive in its execution, but with a certain kind of internal integrity that one really must respect..." So they're primitive art collectors, and what they left me with, then, was, uh, my own, you know, their model of time. Which is the closest thing to one of these hyperdimensional objects. The objects themselves cannot exist in this world. But the blueprints of them can. And this afternoon, if the computers are up and running, I will run through this 'time idea' with you.

And I think I will be able to convince you that it has a weirdly crafted patina to it, that, the feeling is it didn't spring from human minds, it, it is a creature of another kind of mental universe. And I think, you know, aside from the crisis on this planet and our own personal difficulties this is the real challenge of the psychedelic thing; is to meet the inhabitants and trade with them. And set up a relationship. The notion traders. They can trade hyperspacial notions from across the cosmos. And this may be all the extraterrestrial contact that we're, uh, going to be vouch-safed, you know?

Inner Work Videotape

Time and the I Ching with Terence McKenna

Jeffrey Mishlove: Hello and welcome, I'm Jeffrey Mishlove. Today we are going to examine the nature of time and the relationship between time and the human mind. With me in the studio is Terence McKenna, a specialist in shamanistic traditions and also hallucinogens. Terence is the co-author, with his brother Dennis, of *Psilocybin: The Magic Mushroom Grower's Guide*, and also *The Invisible Landscape: Time, Hallucinogens, and The I Ching*. In addition, he is the developer of a computer software program called Timewave Zero and is the founder of Botanical Dimensions, a non-profit organization devoted to preserving hallucinogenic plants as used by native peoples throughout the world. Welcome, Terence.

Terence McKenna: It's a pleasure to be here.

JM: It's a pleasure to be with you again. You know, shamanistic peoples and, uh, early peoples throughout the entire world have all been involved in systems of what we call divination. It could be throwing bones, or using the I Ching, or looking at the end trails of animals, or clouds of smoke, but each system seemed to involve some sort of a unique way of linking the human mind with-with the very nature of time itself in order to understand cycles of time and understand, perhaps even to predict, the future.

TM: Yes, well it's certainly true that, uh, preliterate and aboriginal peoples have had an obsession with time, however it's an obsession shared by the historical societies as well. Time seems to be the dimension about which we have the greatest anxiety, perhaps because it's the dimension into which we see with the least clarity. Uh, numerous peoples throughout the world have dealt with this lack of clarity, uh, as far as time is concerned, by developing various methods of divination or sortilege, as it's called. The Maya, to

this day, practice sortilege of a very complicated sort in the highlands of Guatemala. Uh, African peoples have complex divinatory systems ...

JM: We don't even have to mention the enormous sales of the I Ching and tarot decks and astrology products here in the United States.

TM: Yes, the I Ching is the divinatory system *ne plus ultra*. It seems to, very early, uh, have captured the imagination of western orientalists James Legge and Richard Wilhelm. Their translations made it available to the Western world, and the psychologist Carl Jung, in inventing and discussing the phenomenon that he called synchronicity popularized the I Ching by using it as an example of this particular phenomenon.

JM: And, I know in the literature today, especially in trans-personal psychology, there are many psychotherapists who use the I Ching as a regular part of their practice. And, parapsychologists have, have found striking evidence that the [stutters] coincidences of tossing the coins in the I Ching do have, uh, psychological validity.

TM: Yes, well the thing which amazed me about the I Ching and caused me to become so deeply involved with it is this fact that it seems to *work*, against all rational expectation. The carrying out of this, uh, random ritualistic activity seems then to give a reading which is, in fact, applicable to the unique situation. Now, Jung's explanation of this was what he called, uh, acausal connected or synchronicity. This was simply the idea that it was possible for there to be a coincidence of, uh, congruence between an internal state--a psychological state--and an exterior event. Uh, an obvious example of this would be: you think of someone you haven't thought of for years and an hour later, in the mail, a letter arrives from them. Jung was fascinated by these kinds of apparent, uh, coordinations of the interiorized psychic sphere and the exterior, three-dimensional, objective world.

My approach was, uh, went somewhat deeper than Jung's in that I felt that, eh, uh, I had looked at many divinatory systems with the notion that I was looking at, uh, artifacts of *culture*, uh, productions of the human mind that were to a large degree arbitrary. My involvement with the I Ching led me very slowly and reluctantly to the conclusion that this was not simply a product of a cultural mentality or the stance of a particular people in a time and a place, but rather that the ancient Chinese had somehow gotten a leg up, even on modern physics, and had produced a theory about time that was in fact objectively, uh, possible to correlate with our own experience. In other words, a theory of time much more akin to a physicist's, uh, description of it than a shaman's description of it. And, uh, you mentioned in your introduction this Timewave Zero software that we've developed. We, what we've done is simply to formalize the notion of the Tao to make a deep study of the mathematics inherent in the structure of the sequence of the I Ching.

See, most people are quite familiar with the fact that the I Ching is composed of hexagrams; hexagrams have six lines; they may be broken, they may be unbroken. Less well known is the fact that there is a very ancient tradition, even before the Han dynasty, of a particular sequence being *the* correct sequence. It's called the King Wen sequence. And, while it has been agreed upon by all scholars commenting on the matter that the King Wen sequence is somehow primary, no one had ever explained how it was ordered.

JM: You mean, the order of hexagrams from 1 to 64.

TM: That's correct. *Why* is the first one the hexagram with all solid lines? *Why* is the second one the

hexagram with all broken lines? And so forth, and so on. I carried out, uh, an exhaustive mathematical analysis of the properties of the King Wen sequence and reached a number of conclusions, uh, such as, it is not a random sequence; it was very, very carefully constructed, uh, to conserve certain mathematical goals. For instance, uh, the number of lines that break as you transit from one hexagram to another is arranged and controlled in such a way that when you're all done you have a ratio of even to odd of three to four. Uh, yet this is achieved without any breakages, uh, first order of different breakages, of magnitude five.

JM: Now, you're beginning to lose me a little bit.

TM: Yes, well what, eh, what this all means very simply is that the King Wen sequence was, uh, constructed by minds the equal of research mathematicians working in the world today.

JM: It sort of reminds me of the, uh-uh, builders of the great Greek temples who used the, uh, mystical rectangle.

TM: Proportion and symmetry [JM: Mmmhm] seems to be the central concern here. You see, we have in-inherited from our fascination with Eastern philosophy the idea of Tao. And Tao, in the East, is a concept which antedates the introduction of Buddhism into China by many, many centuries. Tao is the notion of a flux, which comes and goes, a transient medium which builds structures up and pulls them apart according to *its* internal dynamic. Now, because these notions were introduced to the West by mystics and philosophers and people with an interest in metaphysics, it wasn't immediately grasped that a philosophy of this sort *could be* a mathematical formalism. That, if we're talking about a medium which comes and goes, we're talking about a wave-mechanical phenomenon. Well, science in the West for the past 150 years has developed a powerful set of techniques for dealing with wave phenomenon.

JM: They--and, you seem to be suggesting, then, that the 64 hexagrams of the I Ching, in their mathematical relationship one to the other as you go through the sequence, describes a waveform.

TM: A waveform which is experienced in the world by human beings as time and history. You see, it's almost a though, uh, in Western science, uh, we're pretty confident that there are approximately 100 elements, physical elements, to matter.

JM: That's right, different atoms.

TM: That's right, that are incommensurable, they are somehow primary. The Chinese looked not at the world of matter, energy and space, but the world of *time* and carried out a very rigorous analysis of their own perception and discovered to their amazement that *time* is actually composed of elements.

JM: And, as we have then, if I can extrapolate from what you are saying, the periodic table of-of elements in Western chemistry which defined not just 100 elements but a relationship between them, cycles and patterns ...

TM: Bonding relationships, that's right.

JM: Families of chemicals [TM: That's right], so we have in other words families of ways of looking at time.

TM: Well, the hexagrams *are* the elements in the Chinese physics of time. They, uh, created a science that reinforces primary perceptions that we all have but for which we have no science. For instance, I'm sure you've noticed that every day is rather like every other day. Nevertheless, I'm sure you've also noticed that some days are radically different than others. Well, this sameness-but-different rule applies on all levels in a temporal hierarchy. Centuries are rather like each other, and yet occasionally a century will come along that is quite anomalous. We call this sameness-and-difference nesting fractal. This is a new branch of mathematics, and quite simply what the Chinese discovered circa 3,000 B.C. was the fractal nature of time, that the rules of expression of temporal elements which govern the rise and fall of dynasties also govern the rise and fall of love affairs and moods.

JM: Now, you're describing this in mathematical terms, and I'd like to come back and ask you to define the term fractal in a moment, but I-I'm also curious about how you seem to be going back and forth between something purely quantitative and something qualitative.

TM: Well, that's the interesting thing, you see. The Chinese understood that these temporal elements were, in, in a sense, uh, creating interference patterns with each other, much in the way that pure tones struck out on a keyboard will, through their interference with each other, create a melody. So that, for instance, uh, if I find myself sitting in Hadrian's hamburger joint enjoying a burger, by this theory, there would actually *be* a relationship between *that act* and the emperor Hadrian's campaigns in Britain, uh, before the fall of the Roman Empire. This is the amazing thing which James Joyce used and understood in the construction of his literary works, that a man, leaving his home in Dublin on a day in 1905 to buy kidneys to fry for breakfast is, in some mysterious way, actually repeating the peregrinations of the hero Odysseus around the Mediterranean in his campaign to destroy Troy and return to his faithful wife. Allegory is what we're talking about, but allegory has never been taken seriously by science; analogical reasoning is definitely *déclassé* in the better laboratories. But, in this ancient Chinese way of looking at things, everything was caused by its analogical resonances with past and future events which had the same temporal elements embedded in them. Now, it's difficult to go into this without resorting to, uh, at least charts and diagrams if not puzzling equations with sigmas embedded in them.

JM: Well, let me step back for a moment, uh, because we've been talking very intensively about the I Ching, which is *one* system, a very popular and profound and highly respected system of this type, but there are other comparable systems; for example, there is astrology.

TM: That's right. Astrology is another one of these systems that seeks to define pre-potent relationships in nature that can be known by man in order to ease movement into the future. Uh, the success of astrology, I think, i-is, uh, born out by its persistence; it is, after all one of the most persistent of human intellectual tools. It was developed four or five thousand years ago. Um, but it--I think what troubles modern human beings about astrology is that it is a mechanistic system, it's like a group of cogs and wheels which all can turn at given rates and therefore their end states can be predicted.

JM: But, then we're dealing again with the nature of [stutters] nested cycles.

TM: Well, we have a strong intuition [JM: Mmhm] of free will [JM: Yes], and this is why I think quantum physics, with its probabilistic notion of, uh, of determinacy, has been so attractive to the modern mind. My conclusions looking at the I Ching have been that it is not possible to know the future, for if it were

possible to know if life would be a determinism and thinking would be divorced from meaning, and we would be out of business. Uh, but what is possible to know about the future is levels of novelty which future states will fulfill by the happenstance of unpredictable events. Now, this is a formal way of saying, uh, 'we know where the road goes, but we don't know what the scenery looks like'. I think, where the future is concerned, we can know where the road goes [JM: Mmhm], but we cannot know what the f-what the scenery will look like. People who have looked at my theory have said 'Well, these time maps that your computer draws, you're trying to get rid of the future'. And, as a matter of fact, a map of time no more eliminates the future than a map of South America eliminates the need to go there. It simply gives one a better handle on one's destination.

JM: Now, you mentioned quantum physics a moment ago [TM: Yes], and, in-in quantum physics there are a number of different notions related to the future. One is a notion of multiple universes, another [the Wheeler notion]--yes--and, another is a notion of-of pro-everything is probabilistic and while we can't know with any certainty what will happen, we can state with various probabilities what-what the possibilities are. Uh, how does this relate to-to your view of time and the future?

TM: Well, I think that at the macro-physical level things are rather rigidly determined with the exception of living organisms. So, my interpretation of what biology is and how it relates to quantum physics and time is really biological systems are, uh, amplifiers of quantum-mechanical indeterminacies. They are a way of taking the smidgen of indeterminacy that exists at the mac- at the micro-physical level and coaxing it into a kind of macro-physical cascade which is life, consciousness, and self-reflection.

JM: And, you see this described in the I Ching?

TM: Yes, I think the I Ching is an abstract modeling system for breaking this down to its simplest elements and then seeing how it works. Now, we're accustomed to thinking of science as linear progress from the distant past to the present. What I'm suggesting is that, at least in the matter of time, uh, the Chinese of the pre-Han period had a much more *true* and formally, uh, applicable notion of time than we ourselves do [JM: Mmhm]. We have failed in our effort to assimilate time into our physics, because of our obsession with matter and the release of energy.

JM: Now, there are some scholars who suggest that the African, uh, Yoruba people which their system of divination called Ifa, which-which has a cycle, I think, of 244 or 264 various myths and stories is even more sophisticated than the I Ching which has only 64. Do you- have you looked into that?

TM: I have looked into it. What makes the I Ching so powerful, in my mind, is that it appears to be an exact analogy to the mechanism of DNA [JM: Ahh]. There are 64 codons which code for amino acids in DNA, uh, there are 64 hexagrams, there are 8 primary hexagrams, there are 8 indispensable amino acids. I felt that, uh, really, the I Ching is like mankind's best shot at this, because it has this reflection in the biological matrix out of which consciousness emerged.

JM: In-In other words, the various ancient divination systems may all reflect a-a striving of human beings towards this, this intuitive understanding of the cyclical nature of time and the relationship between mind and-and the flow of time, and yet the I Ching may have hit the nail on the head better than the others.

TM: Well, it's looking- it's like looking at a 17th century description of the motion of the planets or a 20th

century description; these are basically refinements, but, yes, I think that the I Ching represents a primary perception of the organization of mind, time, and matter. And, I'll even tell you how I think they got a leg up. I think, basically, there is a tradition in central Asia of the so-called 'stilling the heart' techniques, vis-à-vis yoga. These are techniques where vital functions are suppressed: breathing becomes very minimal, all exterior inputs are suspended, and eventually I think the Chinese sages who practiced, uh, this form of meditation noticed a flux at the center of the stillness, which they called Tao, and which they set out to phenomenologically describe not knowing whether it was physics, organism, or deity. And they did not pre-judge, uh, this question. They simply gave a phenomenological description of the transcendental flux that they encountered in states of deep yogic ecstasy. And, lo and behold, it turns out that this is the perfect technique for studying time. Time is not a phenomenon where you build machines with 8 kilometer diameters that cost trillions of dollars. Time is a phenomenon to be studied by attending dinner parties, perhaps, or, uh, pursuing love affairs, or watching the passing of the seasons, activities much more commiserate with our vision of the Taoist sage than the white coated, uh, scientist of the present world religion of science. So, uh, really I think it was an involvement in organism and in the human experience.

JM: In other words, the laboratory for studying time would not so much be our observatories or our systems of quartz clocks but rather looking inside of ourselves, observing our own organism.

TM: That's exactly precise, and the workings of our own psychology--to my mind, uh, the greatest commentator on time in the 20th century, after Albert Einstein, would certainly have to be Marcel Proust. Uh, Proust understood more about the time we experience, and was able to communicate it, than any other person who has ever lived. And, that's within the confines of what most people consider, uh, a fairly effete, high-brow literary project.

JM: *Swann's Way*?

TM: Well, the entirety of t-of, uh, *Remembrance of Things Past*.

JM: Mm, yes, well, I haven't read that, so you've got me, a-buh, a bit in the dark here, we have about five minutes left, so could you summarize that point or amplify it a bit.

TM: Well, I think the point we're trying to make here, that I have been involved with over the past few years, is that a revisioning of time would, uh, assuage much of what is called modern anxiety. And, that we have limited our-- the categories we were willing to entertain in dealing with this problem, and that we must genuflect to the ancient Chinese and take a page from their notebook in this matter. The I Ching, as a divinatory system of great age, reflecting the dynamics of our own genetic material, and also, though I didn't mention this this evening, it also has deep calendrical properties, can be used to keep track of time, lays a basis for an understanding of this curious phenomenon called synchronicity: the coincidental meshing of interior psychic events and exterior events in the real world. It lays a basis for us to understand the unity of ourselves with the real world that our present approach makes difficult to discern.

JM: So, whereas Carl Jung, the great Swiss psychiatrist who wrote, incidentally, the preface to Richard Wilhelm's *Book of the I Ching* and postulated this theory of synchronicity, well, well, Jung didn't really provide any mechanism for synchronicity. He-he simply said it works this way, that the mind seems to be related to these events, and he found enormous therapeutic benefit from that understanding. What you're suggesting is that the potential mechanism behind the Jungian notion of synchronicity has to do with the

structure of time itself, and [TM: That's right], and, and, you must be suggesting therefore that the human mind, at this very deep level that the sages discovered from stilling their organism, that the mind has a parallel structure, an isomorphic structure.

TM: That's exactly the central point: the mind arises out of matter. This is why the I Ching works in both worlds; one is the reflection of the other. The key to healing the apparent dualism lies in studying the temporal mechanics indicated by the I Ching. And, I believe we've done this, uh, formally, mathematically.

JM: Terence McKenna, you're taking the provocative position that the I Ching, which some people view as religion and other people dismiss as superstition, is actually a science. And, I gather that your computer software package Timewave Zero proposes to be the demonstration of that.

TM: We believe it does demonstrate it. Of course, ultimately it will be up to our colleagues to judge the worth of our, uh, case.

JM: Terence it's been a pleasure. Thank you very much for being with me.

TM: Well, it's been a pleasure to be here Jeffrey and discuss this with you. It's *not* an easy subject, believe me.

JM: And thank you, very much, for being with us.

[Outro Music]

An elf told me that – now, there's a fine thing for a scientist to say – an elf told me that time travel is possible, but it is constrained in ways which are not normally part of our expectation of time travel. The way in which it's constrained is, once time travel is discovered, you can travel as far into the future as you wish, but you can't travel into the past any further than the, uh, moment of the invention of the first time machine. The reason for this is: that before the invention of the first time machine, there were no time machines and how can you take a time machine into a domain where there aren't any? [Audience laughs] You see, it's just to preserve logical consistency.

[Audience] – That's like saying that you can't drive a car where there hasn't been a car driven before.

That's right. You can't take a car where there are no roads. When cars were first invented, the main objection to them was, "What are you going to do with this thing? It can't go where a horse can go, so what good is it?" Um, so here's a fantasy scenario which, for a while, I liked very much. It's that quantum physics and nanotechnology, and all this malarkey is, uh, refined and focused towards the notion of building a time machine, so that then on the morning of December 22nd, 2012, at the World Time Institute in the Amazon, the first time journey is about to be taken. And, the whole world is watching on holographic television as the Lady Temponaut is strapped into the machinery that will hurl her centuries into the future. And, there's a countdown and a button is pushed, and off she goes. Now, most people's interest would be to follow this woman wherever she's going, but let's forget her for a moment. The point has been made. She disappears. We assume she went off into the future, but what happens right there, right then?

It seems to me in the very next millisecond, thousands of time machines would begin arriving from the future simply because they had driven to the end of the road. They had come back in time to witness the first journey into the future. It's as though you could take your Piper Cub and fly it to Kitty Hawk, North Carolina in 1906 to see the Wright Flyer take off. You see? Are you all with me so far? Oh yeah, right! [Audience laughs]

Now, there is a problem with this which some of you, I'm sure of, are thinking, I hope, anyway. Uh, it's what is called, "the grandfather paradox," which is the old conundrum that haunts all time travel schemes which is: if time travel were possible, you could go back in time and kill your own grandfather. Well then you wouldn't exist. Well, so then this sets up a logical impossibility. Either you exist or you don't exist, and some science fiction authors have assumed that somehow massive influxes of synchronicity would preserve your grandfather. You know, you would approach him with your Saturday night special, but it would blow up in your hand or it would ricochet off the St. Christopher medal he always wore [audience laughs] or something like that because he cannot be killed by you because, in that case, you wouldn't exist, in which case, he couldn't be killed by you.

And this troubled me for a long time. What exactly would happen in this situation because, according to Hans Moravec of the Robotics Institute of Carnegie Mellon University, I mean, time travel is no big deal? The first paragraph, uh, of this paper, "The last few years have been good for time machines," Kip Thorne, from the renowned General Relativity Group at Cal Tech, invented a new quantum gravitational approach to building a time gate. And, an international collaboration gave a convincing rebuttal of the grandfather paradox arguments. Another respected group suggested time machines that exploit quantum mechanical time uncertainty. The technical requirements for these suggestions exceed our present capabilities, but each new approach seems less onerous than the last. There is hope yet that time travel will eventually become possible, even cheap.

So, I then saw another possibility and this is the way we can fulfill the expectation of Christian hermeneutics, but not require the second coming of Christ or the intercession of God Almighty into history or all these other extreme unlikelyhoods. And, to understand it, we have to have recourse to, uh, physical model in a very simple realm of chemistry and physics, which is the Bernoulli gas laws. Some of you, I'm sure, are familiar with these and they're very intuitive and easy to understand. Uh, we have a cylinder and it's a vac -- it contains a vacuum. At one end of the cylinder, we have a valve and the valve is connected to a line, which is connected to a tank of some inert gas -- say, nitrogen. So, we open the valve to let the nitrogen rush into the cylinder, uh, that previously was a vacuum. Now, what happens inside that cylinder, I think, is intuitively obvious to all of us. The pressure equalizes over all points equally. In other words, you can't have 50 pounds of pressure at one end of the cylinder and five pounds of pressure at the other. We understand that, in a gas, pressure distributes itself evenly in order to achieve equilibrium. Okay. Hold that notion in your mind.

Now, think of our world in the late 1990s, uh, as a, uh, sphere or a cylinder of that sort and think of cultures as gasses at various pressures. And, let's assign low pressures to the bare-assed folks in the Amazon and eastern Indonesia and let's assign high pressures to the folks in Manhattan and at Cal Tech and Cambridge and Los Angeles and London. Well then we can predict, correctly, in fact, what is happening sociologically on this planet. What is happening is that the high tech cultures are totally overwhelming the traditional cultures. The values of Manhattan and Los Angeles are flooding everywhere, and in spite of the tiny lip service we give to shamanism and body painting, the truth of the matter is Amazon cultures are not really, uh, making a major contribution at this point to the evolution of high tech, global, information-dense, electronic culture.

Okay. That's the second level of this Bernoulli metaphor. So, now, lets go back to situation where we send the Lady Temponaut off into the future. I'm not familiar with how they overcame the grandfather paradox, so we'll pretend that the grandfather paradox is very strong.

[Audience] -- I want to say something about the grandfather paradox.

Okay. Let me -- I'm close to question time. Let me press forward relentlessly here because the coffee is running out. I can feel it. *[Audience laughs]* The equilibrium density is dropping.

Okay. So, we send the Lady Temponaut into the future, but now with what we know about the equalization of high cultures vs. low in a temporal medium, what happens from our point of view is that the rest of the history of the universe happens instantly. That, even if it's billions of years of, uh, of human culture and downloading into machines and claiming star system after star system and so forth and so on, somehow that -- the state vector of all those event systems collapses. I call this, "The God-whistle principle." It's that we can actually call God into history. We can summon the end state of human evolution to appear a millisecond after we successfully achieve the implementation of this technology of time travel in order to avoid all the paradoxes that would prevail if there were any extension to the post time travel era beyond the moment of its inception.

So, uh, this is a -- this is a way of, in a sense, forcing the evolution of, uh, the universe and it creates the phase transition of the eschaton. And, uh, is, to my mind -- it creates the basin of attraction within the domain of our own lives. Now, is there any kind of precedent for something like this, even metaphorically, in our own experience? Well, it turns out, yes, there is, in a kind of bizarre anecdote, which should sober us considerably as we think about these things. When the first atomic weapon was built by the Manhattan Project in the desert of New Mexico, Fermi and Oppenheimer and all these people got together the night before the test at Trinity, and Fermi had, uh, a pad like this on which he had scrawled some equations. And, he had reached the conclusion in the week before that they were not sure how high the temperature would go when they triggered this device and Fermi had some back-of-the-envelope calculations which caused him to believe that the nitrogen in the atmosphere of the planet would begin to burn if they tested this thing.

And, they would, in effect, ignite the atmosphere of the planet and the whole -- the fireball would spread around the entire planet and destroy everything. And, they spent half the night going over these things and they finally decided that the information necessary to make the decision was not available and so, they said, "Well, Hell! Throw the switch! You know, at least, it'll show those 'Japs' and Germans that we mean business!" *[Audience laughs]* Of course, the test was carried out, the nitrogen did not burn and, instead, we were ushered into the glorious era of weapons of mass destruction.

So, let me see if I've got some notes here. I think I've covered everything. What's interesting about this is, for the first time... In this article by Frank Tipler called, "The Omega Point as Eschaton," he seems -- and this is why Paul is here and I couldn't really get into it 'cause it's crazy to repeat what you can't understand *[audience laughs]* -- but by an analysis and interpretation of quantum mechanics, Tipler reaches the conclusion that there is an omega point and it does represent the funneling together of all the, what are called world lines. And, he, for purposes of mental comfort, sets it far in the future, but in principle, there is no reason to do that. Uh, 12 or 13 years ago, the Swedish cosmologist Hannes Alfvén wrote a wonderful little book called, "Worlds and Anti-worlds" in which he, uh, made the suggestion that, um, that the, uh, entire universe is what's called a vacuum fluctuation *ex nihilo*, literally out of nothingness. However, there's a caveat which is -- this creation *ex nihilo* can only occur if what's called parity is conserved. Now, what this means is that, um, these particles, uh, which come into being out of nothingness must come into existence paired with their anti-particle. And, so it comes into being, let's say, an electron and an anti-electron and they divide on separate trajectories and then they reconnect, and collide with each other and parity is conserved. In other words, nothing really happened. No laws of physics were violated because they annihilated each other.

Now, for a long time, a while, this was thought to be entirely a kind of a theoretical construct. But, then it was noticed that the theoretical models of black holes, which we referred to a few days ago, seem to imply that no radiation could leave a black hole and yet certain kinds of black holes were observed to be giving off hard radiation in the form of x-rays. And, it was realized, uh, that what was happening was, uh, vacuum fluctuations were taking place in the vicinity of the black hole and, because one particle went one way and one the other, the black hole interfered with the conservation of parity, and one of the particles was being sucked into the black hole and the other particle was flying off into the ordinary universe and being seen by astronomers as hard radiation. So, the fact that this process goes on has now been confirmed.

Well, now, an interesting thing about these vacuum fluctuations is that quantum physics places no upper limit on the size of a vacuum fluctuation. What it says is that the smaller the vacuum fluctuation, the fewer particles that are involved, the more likely the vacuum fluctuation is. And, obviously, from observing black holes, we can see that very small vacuum fluctuations occur quite frequently. Well, Alfvén took all this and said, well then is it not possible that the entire universe, our entire universe, is simply a very large vacuum fluctuation? A vacuum fluctuation involving something like 10-high-50 particles and they have poured into, uh, the manifold in which we find ourselves and an anti-matter universe, invisible to us because it's in another dimension, was born at the same time. And, so, one universe went off into a higher dimensional manifold this way and the other one went off in the other direction, and what this sets us up for is the possibility allowed by this interpretation of quantum physics that the entire universe could disappear instantly; not gradually. You wouldn't see the stars going out, but the -- because this is all happening in a hyperspace of some sort which treats this manifold as a point-like entity.

So, what you would have is just "click" and all particles in the universe would disappear and the original unflawed nothingness would be restored. Actually, no, there's a further caveat to all this, which is: all particles have their anti-matter, anti-particle twin, except -- except the photon. The photon is this mysterious particle which is different from all other particles. It either has no anti-particle or somehow it has its own anti-particle embedded within it. So, what would happen in the case of a universe which was a vacuum fluctuation which encountered its ghost image and conserved parity and cancelled all particles except photons is that you would suddenly have a universe made of nothing but light. Nothing but light! We then have to model the physics of a universe where the only kinds of particles that exist are light. Well, it's interesting that all these human traditions of transcendentalism make a big deal about light. I mean, light is the metaphor for spirit. And, the supposition is that the rarefaction of matter and of the flesh releases us into a realm of light.

And, I am not physicist enough by a long shot to say what the behavior of a universe made of light would be, but I do know enough to say that, if you or I were made of light, uh, our subjective experience of the universe would be ruled by relativistic physics. And, we would have the impression that we could go anywhere instantly and we would have the impression that the universe was aging around us at a tremendous rate because, you see, the time dilation of the general theory of relativity, um, says that as you approach the speed of light, time slows down. Now, it's assumed that you can't reach the speed of light because as you approach the speed of light, your mass asymptotically increases, so that to push a single atom to the speed of light would require more energy than there is in the entire universe because this particle would have become so massive that there isn't enough energy to propel it. But, a photon never moves slower than the speed of light. It never moves faster than the speed of light either. So, the photon -- if you were made of photons and you went from here to Zubenegeubi, let's say, a star in our galaxy with a wonderful name, uh, your impression of the travel time would be zero. You wouldn't and so -- again, here is a way without invoking God Almighty where physics seems to lay into our hands, uh, metaphors for the anticipation of the, uh, eschaton. Paul do you want to say something at this point?

[Audience] -- It's fascinating. You're playing with physics. Um, you know, everything has to be conserved; it's not just parity in the vacuum fluctuation. I mean, matter and antimatter are just one of the dozens of the conservations that has to be conserved in those phenomenon. And, um, they're happening all the time from the point of view of physics. Inside our body there are trillions of these virtual, um, reactions occurring all the time and they can be intercepted. I mean, you can have a -- a gamma ray break into a particle and an anti-particle, and you can intercept before they come back together again. And, that's how they detect them on photographic plates on cloud changes. But, everything you say is right. One thing, I don't think this notion of the big bang -- and I'm not sure whether I subscribe to the big bang model -- but, it sounds so far fetched because if, uh, if there were something in the universe then we'd have a real problem explaining how it got here. So, the simplest thing to us humans is nothing here.

You mean that we are in a vacuum fluctuation?

[Audience] -- No, it's just that there's nothing here. I mean, there is nothing before the big bang and there's nothing after.

This sounds like Buddhism.

[Audience] -- A vacuum fluctuation includes everything; good/evil, male/female, the whole thing added together like a zero. Just like it always was.

Well, then what are the complex appearances that impinge upon our senses and what are we then?

[Audience] -- Because we choose to pay attention to only half of the situation. But, if we could -- if we would let ourselves be and experience the whole, then it's all unified.

It cancels.

[Audience] -- It all cancels to zero.

Well, this refers back to something you and I were talking about at, at, uh, dinner. We all assume that there is one past and one future, but it's not clear why we assume that. I mean, think about it for a moment. We're all here gathered in this room, sharing this moment, but we all have different pasts. Not one of us has the past of another and so what we have in this room is a convergence of pasts. And, when this meeting is over, we will go our separate ways into a variety of futures. So, the assumption that there is one past and one future is just some kind of convenient mental bookkeeping.

Uh, we could -- and we are tremendously under the spell of this illusion. I mean, we worry about 'the' future all the time. Well, notice that you could just move to an island somewhere and get a brown-skinned girl and then you wouldn't have to worry about anybody else's future because you would have made your own future. We can step out of the assumption of a universal history in which we're trapped. And, I think realizing this is the beginning of a kind of liberation. Our assumptions, uh, are the edges of our worlds and this is one of our strongest assumptions. The assumptions that there is a past and a future and our destinies are all caught up in that. But, actually you can -- a word that rarely passes my lips -- you can deconstruct that assumption and, uh, and then you're given back a-a whole different way of looking at the experience of being, which is empowering. Because, somehow when we are embedded in *the* future, we feel we have no

control whatsoever. We're like corks in a raging river. But, in fact, that's a false model, I think. Anybody want to get in on this?

[Audience] - Sometimes when I'm listening to you, um, I have sort of the troubling thought that Terence hasn't done enough psychedelics. Or, I think that you're too straight in some way. When you get onto some of your scientific tracks, and as you put it, you're a rationalist, I start thinking, um, why get lost? I start thinking -- I start referring to experiences I have had of being altered where a lot of this seems, um, incidental to the experience to one experience of eternity, which I know you had. And, how do you reckon with yourself sometimes and think when you doubt yourself and think this is just my ego, um, concocting things to make me feel good, etc., etc. whatever would be the worst-case scenario for you? It's hard for me to express this sort of well, but there's something about the way you often refer to what seems to be a scientific model that's, um, very linear even as you talk, you know....

Well, I would certainly say that I haven't taken enough psychedelics. [Audience laughs] Um, reading these people, it seems like, uh -- I mean, I doubt these guys are real psychedelic heads and they're much further out than I am. Um, the real truth -- the real truth is and I've said it many times that the world is not only stranger than we suppose, it's stranger than we can suppose. And, in a way, that's either permission to suppose anything you want or to just stop supposing, you know. Um, these things are models. The real -- nowhere is it writ large that bipedal apes should be able to understand how the universe works. Still less likely is it written anywhere that Terence McKenna should be able to understand how the universe works. Were you here the other night when we talked, uh, about the black hole theory of enlightenment? It was two nights ago?

[Audience] -- I was here. [Audience laughs]

Well, that's the idea - that the real truth can't be told. I'm very aware, uh, that all of this is just stuff to support me, to make a living, in other words [audience laughs], you know. Um, that, in fact, what's really going on defies rational apprehension. I hope! [Audience laughs] I mean, I would hate to think -- I would hate to think that we could understand what's going on. Nevertheless, there's something to be said for this modeling process and I agree. I think I'm getting old. Uh, you can only push yourself so far. I mean, when I read one of these things today and he was off on some tear, and I just realized, you know. It struck fear in my heart. And, I said, "My God! You know and I actually did a, mirror, mirror on the wall, who's the weirdest one of all?" And, it said, "Hans Moravec is the weirdest one of all." I said, "Shit!" I should bring him here and sit at his feet! I don't know. Am I talking about what you're talking about? Oh good!

[Audience] -- I find a fantastic parallel between psychedelic experience and physics. I mean, I haven't found anything in the psychedelic experience that would be any problem to relate to the point of view of the physicist. And, actually, I think that all the stuff in physics got out of the bag because of the psychedelic, you know, breakthroughs in the '60s. Fritz Capra and others had psychedelic experiences and then started to ferret it out. I mean, in the 1920s, people were puzzling about these things and having the spiritual crises and throwing away all of their assumptions about reality and having these types of breakthroughs, and then it got lost because we started to bag physics to use for the military. It was all an environment that opened up because of the psychedelics.

But, I don't think that science -- that the purpose of science is to understand reality. This may go to what you saying. I think the purpose of science is to advance technology, which is a heresy. I don't think reality can be understood and that it's absolute hubris for science to, you know, cloak itself in the mantle of philosophy. All it's for is to make better toys or, if you're nuts, better weapons. And, um, ultimately there's not going to be any closure in the effort to understand and I think that the real -- the thing that you take away from psychedelics finally is that all models are provisional. That there is no truth.

We talked at one point in here about Wittgenstein's phrase, "true enough" -- true enough to get you to the gas station -- true enough to get your taxes paid. But, uh, there'll be no, uh -- there'll be no closure on this stuff. We have to live in the light of the mystery. But, I think we also said in here, you know, it's the death of conversation, if we glorify the mystery too much cause then I'll be just like everyone else here and I'll announce that we're now going to have a meditation, which I've never done to you, I want to point out! [Audience laughs, applause] Somebody wanted to say something?

[Audience] -- With that in mind, I wonder how you can project an end to eternity at a certain time?

Well, I didn't mean to imply a nothingness beyond. It isn't like that. I think it's an everythingness. That when I talk about what I envision it as - as boundary dissolution. If all boundaries dissolve then, you know, I am you, and you are me, and we are all together. [Audience laughs] It's a -- it's an exfoliation of the human experience. The great boundaries are -- no, the small boundaries are man/woman, self/world. And then the big boundaries are life/death, uh, past/future. All of these will be dissolved into something like William Blake's Divine Imagination. And, we will become, you know, our, our grandest dreams. And, so, the whole challenge is to dream a dream worthy of that dimension. I mean, it's a very interesting exercise. I don't know if you've ever done it. God! It comes close to being a visualization, I'm sorry to notice, but have you ever played the game, uh, "What would I do if I could do anything?"

First of all, you have to wrap your mind around the concept "anything." What would I do if I could do anything? And, I used to think about it in terms and for some reason for me it takes the form of an architectural fantasy. You know, first of all, I just locate myself in the house featured in last month's *Architectural Digest*. Then from there, I begin to work it out. Well, if you could do anything within a few minutes of entering into that exercise, you're unrecognizable to yourself. I mean, you don't even have to exist in a forward flowing casuistry of three dimensions. Uh, you can be a number of species and all possible sexes. You can be translocated at many points in time. Uh, you begin to realize that you are tremendously limited by your assumptions. And that, this is sort of what I imagine death is: It's release into the divine imagination and if you're, you know, blown up in an airliner, then immediately after dying, you're just a dead person, but then you begin to unfold and test the boundaries.

And, you know, as James Joyce says in *Finnegans Wake*, uh, "up n'ent prospector, you sprout all your worth and woof your wings." And that's just in the first 30 seconds that you woof your wings. And then you're able to assume to divide your consciousness to assume any form, to be any place, to know anything. Anything recognizable as human, I think, would quickly drop away or would just become a tiny and familiar touchstone that you would occasionally return to, to touch. And, somehow the dying, which occurs to each one of us, that's the microcosm of the planetary and historical process that we're caught up in. It's the thing that we hate most of all. We fear it. We really get agitated when death is raised as an issue. James Joyce called it, "The Grim Reaper" -- a blessing in disguise. "If you want to be Phoenixed, come and be parked." Meaning: You know, you have to die to fully exfoliate into this dimension.

And, sometimes I think -- and I don't often say it to groups because I fear I'm misunderstood and I don't want people to go out of here depressed -- but, sometimes, I think that what human history pushes for is the extermination of all life on the planet for the simple reason that we'll never be free till then. That we are in some kind of hell world and we are locked in a world of matter and energy and space and time, and that it is not -- you know, my God! This sounds like, you know, Southern Baptists -- [audience laughs] but, we are living death at this moment and that we must die in order to be born again. In other words, that somehow what we are has become trapped in a lower dimensional matrix and our greatest delusion is to cling to this most tenaciously.

Jorge Luis Borges, in one of his stories, has this idea that, uh, the species, uh, any species, is somehow not completed in eternity until the last member of that species dies. And, it is interesting that if you think about biology, 95 per cent of all species that have ever lived on this planet are extinct. This is what happens to species: they go extinct. And yet, we're driven to pursue immortality. It pains us greatly to imagine the death of all life on this planet, and particularly, the death of our individual selves or our species. But, the fact of the matter is, we don't know what death is. I mean, one of the puzzling things about the DMT trance is, you know, these creatures, made of light, in the mind, that are so different from us, but have such affection and love for us, they seem like relatives. They seem like -- dare we whisper the word -- they seem like ancestors. And yet, you know, we would rather believe that they were aliens from Zeta Reticuli or elves in a parallel continuum than apply Occam's Razor to the phenomenon, and say -- since we are the only intelligent entities that we have ever contacted in this universe -- these things which we contact in our minds in the center of the DMT flash, they must be human beings of some sort, but they don't look like human beings. But, they love us so much and understand us so well!

Well, is it possible that the kind of human being that they are is a dead human being? That we're actually breaking through into an ecology of souls. I mean, if we say that the psychedelic experience is an experience of boundary dissolution and, if we say that DMT is the strongest of all psychedelics, then may it not be that it is dissolving the most resistant of all barriers, which is the barrier between the living and the dead? And that what you actually come into is the antechambers of eternity for a brief glimpse. If you were to take that rap and properly translate it into Witoto or Munangi, or something like that, and go to the Amazon and query those folks, they'd say, "Of course. I mean, your own Mircea Eliade tells you that shamanism depends on the spirit ancestors." And, for all the credit we give shamanism, we've never actually come to grips with the possibility that, uh, shamans really do work with the spirit ancestors, that there really is an ecology of trans- trans-material human beings in a nearby continuum that can be approached by a boundary-dissolving drug.

And, it's because, you know, we and certainly I -- and certainly proven by this rap tonight -- are obsessed with technological explanations of it and how it's going to be the flying saucers, or it's going to be the time machine, or the collapse of the quantum vector or something like that. But, because the forward thrust of our technology is toward immortality. I mean, that's what gnawing at the back of our minds. And yet, what may actually be coming towards us, orthogonal -- meaning at right angles to the historical process -- is the dissolving of the barrier between the living and the dead, which is so unsettling and mind boggling to us that we'd take a flying saucer invasion any day over having that happen to us! [Audience laughs] And yet, it's very, very late in the game. You know, human nature is going to have to undergo a radical, vertical translation of some sort, if we are to avoid, um, the extinction of ourselves and all life on the planet. Well, so then, you know, uh, maybe that's what it was for. If we believe that we were always embedded in the machinery of nature - that we could never act outside the purposes of nature - then this must be what it's for.

It's very interesting in embryology. I think most people think, you know, of a fetus in the womb, um, as you all know -- we begin as very fish like creatures in the womb and then out of what are essentially little paddle mitts, the human hand appears. I think most people think that the tissue retracts tightly and that the human being emerges, but if you've seen fetal stages in bottles in medical schools, what's actually going on is that cells die off. And, massive amount of dying goes on in the womb in order that the human form may emerge out of the fetal form. The webbing between the fingers doesn't retract. Those cells die and are released into the amniotic fluid. The growth of the fetus involves the death of millions and millions and millions of cells. So, we are born, we are -- you could almost say sculpted into life by the hand of death. I mean, I feel as nervous about all this as you must, uh, but, you know, this is what we're here for, right? -- to stretch the envelope. Yeah.

[Audience] -- Terence, I would like to go back to something you said about the beings of light and the shamanic capacity to see and interact with these beings, and they could be the ancestors. Thinking in terms of those individuals who refined their senses to being able to see more than the average ability to see and to hear more than just the normal ability to hear, where there's a growing awareness of inner-penetrating planes of beings that are actually co-existing with us, but we can't hear them or see them because we haven't refined those senses enough. And, the more psychically sensitivity individuals have an increasing ability in a non-drug state to be aware. It's just that they can see more and hear more, and I haven't heard you say that.

Well yeah, I mean, that's a very good point. The perfect example of it in terms of a cultural tradition is, uh, uh, Fairyland. Fairyland, I mean, uh -- the pre-Christian Celtic peoples believed that dead souls stayed around in the immediate vicinity and that there were thousands of them all around. The accumulated dead, very much in the way that when you smoke DMT, then there are thousands of these things and it raises the question -- were they always there or what's going on? Saint Patrick, who, uh, brought Christianity to Ireland, found this belief (and also Anita makes the point about sensitivity). In Irish folklore, there's the idea that if you have the eye, you can see these things, uh, and no drugs are required. It's a psychic ability which the country Celtic people have sometimes claimed. So, when Patrick came to Ireland on his mission of conversion, he found this belief in Fairyland so powerfully entrenched in these people that he invented purgatory. Purgatory was invented by St. Patrick to convert the Irish. And then when word was carried back to Rome that Patrick, who was this great bishop of the early Church, that he had made this doctrinal concession to Celtic folk thinking -- the Pope thought it was such a fine idea that they just wrote it into dogma.

So, uh, purgatory, which as you all know is neither heaven or hell, but a place where you expiate your sins for some amount of time before you pass on to heaven, is nothing less than a cleaned-up version of Fairyland written in to Christian theology. Now, I don't know why the Celtic people had, not a monopoly but a firm grip on this. I mean, it may be their innate gloominess, their obsession with death, their, uh, uh -- it's called the "Ayenbite of Inwyt": it's that, we just chew on ourselves until we dissolve -- but, there was something about that character that set it up for perceiving, uh, these entities. Although, in all traditions all over the world, uh, if you dig deep enough, you can usually find a tradition of small people that live in the hills or under the hills -- meaning graves, right? -- under the hills and they are the ancestors. And, the best that straight folklorists can tell is they have some weird law that as a people recedes into time, they shrink, which seems to me preposterous. I mean, I just don't understand that.

I think the evidence is pretty good that this is going on. The fact that DMT is, uh, a naturally occurring neuro transmitter is very suggestive. Rupert Sheldrake has made the suggestion that dying is a unique chemical experience and he calls DMT a necrotic hallucinogen. That, that you actually -- if you are truly dying, your brain will be flooded with DMT and then you will see the ecology of souls waiting to receive you. I once questioned a very well known Tibetan teacher, uh, about what was going on in DMT, and he said, "Yes, these are the lesser lights." He said, "You can't -- if you go further than that, you will break the thread of connection and be unable to return." And, so, you know, I think this is the most

challenging idea to us on the conscious and unconscious level because we may, you know -- I mean, I'm only speaking for myself, but it seems to me true that we really have, at a profound level, accepted the scientific lie that death is non-
entity, you know. And it gives us -- it's a permanently weakening idea because it makes us each such a finite being. I mean, it means that no matter what you do, eventually, you know, it will all end in the cold, cold ground.

You know, "But at my back I always hear / Times winged chariot hurrying near." "This coyness, lady, were no crime." "Had we but world enough and time." "The grave's a (fine) and private place / But none, I think, do there embrace." Well, maybe Andrew Marvell was wrong. Maybe there's more fun on the, uh, other side than, uh, you might wish to be congealed. Anybody? Save me from myself! [Audience laughs]

[Audience] -- What I'm wondering, I have the impression of what comes to mind is a world that you project where everybody is schizophrenic. So that today I can be Napoleon, tomorrow Jesus, and then I can meet somebody else who also believes that he is Napoleon, Jesus, Buddha or whatever, and back and forth in time. I'm just wondering what kind of a place that's going to be.

Well, I would buy into that. I think schizophrenia is the absence of cultural expectation, you know. In the most profound sense. I mean, the casuistry doesn't even apply. I mean, I consider myself schizophrenic and I have observed schizophrenia in other members of my family at close up and in great detail. And, what it is, is simply the breakdown of casuistry and then ordinary people - imprisoned in the hallucination of culture, language and linear time - lock you up and put you away because, uh, you're reporting from outside the cultural envelope and carrying information that terrifies, alarms, disturbs and just... You drive other people crazy is what it is! [Audience laughs]

I'm talking now about process schizophrenia, which is the spectacular kind: where you bring back information that is absolutely incommensurate with the models of your culture. No, I think -- It's been said that the world is becoming more schizophrenic. Well, that's just because they didn't have the word "psychedelic." Psychedelic experience is essentially a kind of schizophrenia and the people who, in the early phase of psychedelic research -- they wanted to call it a psychomimetic, meaning it mimics psychosis. It doesn't mimic psychosis; it's a schizomimetic of some sort. Psychosis is a whole different pathology. But, uh, schizophrenia is simply a, uh, category for, uh, behavior and insight that the rest of society is unable to do anything with, I think. Yeah. No, that doesn't trouble me at all. I like talking about how I'm schizophrenic. Maybe this answers your, uh, criticism that I'm linear and running down and old. I can always go nuts. [Audience laughs] You know, if all else fails, you can go bananas, I suppose. [Audience laughs]

The schizophrenics return with the great aesthetic visions and the scientific breakthroughs and the poetic understandings, I mean, uh, and, it's almost as though they have been aided by the demon artificers. They have taken into their, uh, retinue, uh, supernatural helpers and a shaman would say, of course, allies. And, I'm sure you all know the way in which schizophrenia and shamanism map together. I mean, our own Julian Silverman is the great pioneer in the one-to-one mapping of shamanism and schizophrenia. And years ago, when I was completely bananas, every time they would approach from three sides with nets, I had Julian's paper called, "Shamans and Schizophrenia," and I could quote it chapter and verse and back them off [audience laughter] because, uh, what is called the initiatory crisis in shamanism is nothing more than a schizophrenic break with ordinary reality.

The problem is, we freak out completely and rush to drug people and give them electroshock and tie them down and slap them around. Well, so then the, uh, unfolding of the process is interrupted and it's as though you were to, you know, perform surgery on a fetus or something and then be amazed when it turns out a monstrosity. When, if you would have just left it alone, for crying out loud, it was unfolding along its own cryodes of morphological development. This is why people like R. D. Laing seem to me to be the ones who thought most deeply and correctly about schizophrenia.

To become schizophrenic is a wonderful, wonderful opportunity. The trick is to make sure that you're nowhere where straight people can get at you. [Audience laughs] And, uh, my schizophrenic episode occurred in the Amazon basin and, you know, it was five days march to just a mission. And, I've always felt that evading modern mental health care facilities saved my mind. Absolutely! And, in a traditional society, it's supported, you know. If someone shows signs, uh, because their dreamy or they hallucinate or they're epileptic or something like that then this is encouraged and they're put under the care of shamans, and drugs are used to initiate the crisis in some cases. And, it's a cause for great rejoicing to have these personalities because -- in the culture -- because they're the antennas of culture that are contacting the, uh, raw stuff of real being and transducing it down into, uh, cultural artifacts and institutions that then are useful. Anything else?

[Audience] -- The grandfather paradox.

Oh, yeah What did you want to say?

[Audience] -- I don't think, I mean -- your idea of the end point makes perfect sense to me and I don't think the grandfather paradox is an objection. It's not really a paradox.

No, I don't think it's a paradox.

[Audience] -- It's a self-consistent universe. You're here so you didn't kill your... If you killed your grandfather, you wouldn't be here to ask us the question.

I think that's the way to handle that. I think that when we finally really understand time travel, we may find out that it's common as dirt and has been going on all around us in all kinds of physical processes.

[Audience] -- We make up stories. I mean, the human mind likes to make up stories. So, if you came back and killed your grandfather and you're still here then we'd have to make up a story. Like somebody else got -- even your grandmother.

But, since that isn't how it works.

[Audience] -- Well, it may be working that way. I mean, people disappear mysteriously and all sorts of things happen and we just fit them into a framework that makes sense to us. When we're in the realm of time travel, then maybe we'll have to reinterpret all that weird stuff that occurred in history.

That's an excellent point. That all kinds of stuff goes on around us that may be, in fact, the collapse of paradoxical situations that we don't understand. Like, you know, all these well-documented cases of spontaneous human combustion and stuff like that. I mean, unless you just flat out deny that this goes on, which is a kind of cop out, I think, because it just means that you don't believe large bodies of evidence. I mean, not everything weird that's claimed goes on, but on the other hand, I don't think God is a republican. I think that there's plenty of weird shit flying around and as I said, nowhere is it writ that anthropoid apes should understand reality. And, every culture that's ever existed has operated under the illusion that it understood 95 per cent of reality and that the other five per cent would be delivered in the next 18 months.

And, from Egypt forward, they've been running around believing they had a perfect grip on things. Yet, we look back at every society that has preceded us with great smugness at how naive they all were. Well, it never occurs to us that then maybe we're whistling in the dark, too. That the universe is stranger than you can suppose. And that that openness that that perception imparts is a great joy, a great blessing because then you can live your life not in service to some fascistic metaphor, but in service to the living mystery. The fact that you're not going to understand it. It is not going to yield to logic or magic or any other technique that's been developed. It's bigger -- you know, the novelist John Crowley has this wonderful aphorism: The further in you go, the bigger it gets. And, I think this is true of most things.

That's all, folks! [Audience laughs] We got through another one of these. [Applause]

Okay. Thank you all for coming. I do not understand why you put up with this [audience laughs], but I appreciate it. I do appreciate it!

First of all, I am delighted to be here. The great thing about being here in New York is you don't have to worry if you're the smartest person in the room. [audience chuckles] What uh, impels me to talk to groups like this is uh, the conviction that uh, a major aspect of what it means to be a human being has received short shrift in our civilization for at least a couple of millennia. And that, to some degree, the solution to the uh, mega-crisis that is bearing down on Western institutions is to be found in a revivifying of uh, the archaic. And this takes many different kinds of forms. It's nothing to do with what is popularly presented as the New Age. It's, to my mind, a much larger and deeper and persistent phenomenon than that. In fact, the entire intellectual tone of the 20th century can be seen as a groping toward a recapturing of this archaic mentality. This is what psychoanalysis was about. This is what cubism, surrealism, and uh—in the political s- uh, zone—negative phenomena, such as national socialism. All of these various intellectual concerns, to my mind, can be traced back to a kind of unconscious nostalgia for the archaic.

Now, when a society feels itself to be in crisis, the unconscious response is to look back into time to attempt to find a previous model that seemed to work and then to crystallize energy around that model in a def- in an effort to reorient society. The last time this happened was with the breakup of the medieval stasis of the pseudo-eschatology of Christianity, and out of that chaos, of that sense of disconnectedness, came classicism.

In other words, people were looking back into time for a serviceable model that could step in to the vacated shoes of the discredited medieval church. And what they came up with was, uh, platonic philosophy, Roman law, the aesthetics that ruled Periclean Athens, and so forth. And to a degree we are still living in the twilight of that return to classicism, but it no longer serves. And in its place is this inchoate groping for a- uh, yet another historical paradigm that can somehow be contextualized in the late 20th century and give meaning to the experience that is coming, is sweeping over the world.

Now, to my mind uh, the Freudian breakthrough, what the surrealists were doing, what the abstract expressionists were doing, the replacement of phonetic alphabet linear print culture by electronic media that has happened over the last 25 years, these things are all well and good, but they are insufficient because once you begin to zero in on the notion of the archaic mentality and what it really means, you discover that at the center of it is, God forbid, the psychedelic experience.

Now, the psychedelic experience is as much a part of life as birth, death, making love, eating, conniving, so forth and so on except in this particular kind of culture that has evolved out of Western European traditions. Why this is is a very complicated question; many factors bear on it. But what I would like to talk about this evening is just offer you a model of history, how we got into the dilemma that we're in, and what we might be able to do about it. So I will tell, uh, my version of the story of human emergence. And it goes like this:

At some time in the past—experts vary, but the numbers are in millions of years—the adaptation of advanced primates to the canopy uh, ecosystems of the climaxed rain forests of the African continent was disrupted by the cycles of desertification that periodically affect the planet, and this had the effect of forcing these primates out of their arboreal niche and into evolving grasslands.

Now, to my mind, the important point in the argument that I'm about to put forward is the idea that the previously unidentified factor impinging on human evolution and shaping the evolution of our species was tertiary mutagenic constituents of the human diet as we made the shift from a specialized fruit eating diet to an omnivorous diet that included meat. Most animal species have a very limited repertoire of acceptable foods. This is reasonable because it's a strategy for avoiding contact with mutagenic tertiary compounds that may be elaborated by plants. But when a species comes under pressure it has to expand what it considers acceptable dietary constituents. And at that point the organism uh, is subject to mutagenic influence because testing in the diet is bringing the body in contact with all kinds of toxic compounds—tumor producing compounds, compounds which interfere with the endocrine system, compounds which are neuroactive, compounds which, uh, uh affect fertility. This has never really been discussed by evolutionary biologists as perhaps a critical factor in the emergence of the human species. My scenario goes something like this:

These pack- these primates already had a fairly complex linguistic repertoire because they had developed a pack signaling system in the treetops. They transposed this system into, uh, hunting bands, or carrion-gathering bands that were following along behind the large herds of ungulate mammals that were simultaneously evolving in this African environment. And in that situation, they came upon, uh, coprophytic —means dung-loving— fungi that were occurring coincidentally- coincidentally with the presence of these evolving ungulate animals.

Now, at that point the stage was set for what I believe is the greatest leap that organic organization has made probably in the last hundred million years, and there was nothing miraculous about it. Psilocybin, which is the psychoactive amine that occurs in these mushrooms, was studied by Roland Fischer in the 1950s, and the first thing he learned was that small doses of psilocybin—doses so small as to be undetectable as an actual, s- uh, experience—nevertheless uh, confer improved visual acuity. And he did elaborate tests on thousands of graduate students. In other words, you see better if you take small amounts of this drug. And Fisher said to me in his wonderful Viennese accent, "You see, this is a situation in which you actually have a better picture of reality if you take a drug than if you don't take a drug." And he had the data to back him up. Well, you don't have to be an evolutionary biologist to realize that a constituent of the diet which improves visual acuity in an animal that is surviving through its hunting skills is quickly going to be inculcated as an extremely favorable adaptation.

Now, when you- when slightly larger doses of psilocybin are uh, ingested accidentally or deliberately the immediate effect is increased arousal, this i- and that includes sexual arousal. And this is typical for the

bioactive amines. So what you begin to see is, here is a constituent of the diet whose, whose first effect is to make those who use it more effective hunters, whose second effect is to uh, increase instances of what primatologists call successful copulations.

Q: Is that what they call it?

TM: Oh yes, indubitably.

And the combination of increased sexual activity on the part of those animals admitting this constituent into their diet becomes a kind of reciprocal feedback loop.

Now, at yet higher doses, uh, psilocybin flowers out into a profound hallucinogenic experience, uh, so profound that, in truth, it is utterly confounding to 20th century human beings. We have no metaphors for this; we can't take its measure; we prefer to turn away from it. This is our cultural response to the presence of this dimension. But the idea that it is any- in any way understood, or uh, its implications have been assimilated, is absurd.

Now I believe that what we have here, is, in this pre- uh, historical situation, is an incipient symbiosis. I want to make clear what I mean here: I am not suggesting that there was a true symbiosis between human beings and mushrooms, uh because a true symbiosis requires millions of years to be established and is actually almost a genetic bonding of two species. But it was an incipient symbiosis. Given enough time it might have turned into a true symbiotic relationship. Unfortunately, it was disrupted by the very forces which had created it, which was a further exacerbation of this climatological aridity which was overtaking the African continent.

So the notion is that these biogenically active amines acted as a kind of catalyst on the evolving uh, neurophysiological organization of these primates. One of the most interesting effects of psilocybin is that it seems to stimulate the language forming capacity. This has been remarked upon by writers such as Henry Munn and Gordon Wasson. I mean, it is literally true that the mushroom shaman is a man of language. It is- it seems to facilitate a kind of release of the Logos and this linguistic facility, which marks- which is the great watershed in the evolution of our species out of animal organization has never been satisfactorily explained. There had to be a catalyst for it. And I am suggesting that in this early situation this catalyst was this self-reinforcing cycle where uh, uh, group sexuality, visual acuity, frequent copulation, and a devotion to ecstatic trance all combined to create an entirely different psychology, a psychology in which the ego barely existed. The- it's almost as though you could say psychedelic drugs are an inoculation against the formation of the narcissistic ego.

Now, why should this be? It's because, operationally speaking, what these psychoactive compounds do, not if you look at one trip, but if you look at thousands of peoples' trips, and say, "What is the common denominator of these experiences?" what they do is, they dissolve boundaries. And this is what gives them their power, and it's what makes them so controversial because the dissolution of boundaries is something around which we have profound anxiety both as individuals and our institutions are even more anxious about this. Any uh, compound or dietary constituent which dissolves the boundaries between human beings poses a profound problem for the kinds of social organization that we have been familiar with throughout recorded history.

As the drying of the African continent continued, the- this orgiastic communal use of the mushroom, uh, became less and less frequent simply because the mushroom itself was less and less available. Ultimately, I believe, there's evidence to suggest that honey was discovered as a method for preserving mushrooms through periods of scarcity. It's still done this way in Mexico; however, there's a profound problem here. Honey itself, can serve- after it has gone through chemical changes involving fermentation, it itself becomes a psychoactive compound; it becomes crude alcohol. And if your mushroom supply fades slowly enough and there isn't sufficient attention paid to what's going on, over a couple of millennia a- an egoless, ecstatic mushroom-using cult can turn into essentially a cult of alcohol. And the, the psychology of an alcohol cult is entirely different from the cult- the, the psychology of the psilocybin cult.

Around 12,000 years ago people began moving out of Africa and, uh, settling in the Middle East, in Palestine. Before that time, the stratigraphic record in Palestine indicates that it was very uh, sparsely populated. But these new people appeared called Natufians, and there's considerable argument about where they came from. The general assumption is that they came from the area that Marija Gimbutas calls "Old Europe." But this is really based simply on the belief that they were so advanced that they couldn't possibly have come from anywhere else, when in fact, an analysis of the, of the wall paintings of these people and an analysis of, uh, the pottery, seems to indicate that they came from Africa; that these were African peoples.

Uh, they at-at first they settled the lips up, you know, under rock escarpments. This is exactly the settlement pattern that we see in the Tassili n'Ajjer Plateau in Algeria where there are actually paintings on the rock walls dated 7,000-8,000 BC where we see shamans with mushrooms sprouting out of their bodies, thousands of them. Now, this mushroom-using uh, culture established itself in Palestine at Jericho. And Jericho, at its triumph, was the most advanced civilization in the world. The tower at Jericho was by all measures the most sophisticated culture of its time.

Later these same people tr- uh, settled into Çatalhöyük in Southern Turkey. Çatalhöyük is 3,500 years in advance of any other civilization on Earth at that time. The chief investigator of the site, James Mellaart, called it a premature flash of complexity and brilliance. And it disappeared. Mysteriously. The motifs may have been transferred to, to Crete, but as far as we can tell that was the last vestige of this psychedelically motivated partnership society. And it was destroyed by the Kurgan invaders, the wheeled chariot people who came from north of the Black Sea with an entirely different psychology. You see, their psychology was shaped by the domestication of the horse, which was a permission for a, um, a raiding psychology, a psychology of nomadic plunder, while the domestication of cattle in Africa some 5,000 years before had created the opportunity for this goddess/mushroom/cattle kind of psychology to evolve.

Now, these people were living- the, the, the mushroom-using peoples of the ancient Middle East and of pre-desert Africa were living in a dynamic equilibrium with the environment; this was the edenic state. I mean if you, f you read the story of Genesis carefully it is clearly the story of a drug bust. It is clearly the story of a woman's transgressions, and Yahweh, walking in the garden, says to himself, "If they eat of the tree they will become as we are." There's no shillyshallying about about this. What was at stake here was whether or not human beings should claim a stake of, in godhead, and the decision was made that they should not. And they were cast out of Eden. And an angel was set at the gate of Eden with a burning sword so that they cold not find their way back. This is the story of continual- centuries of continual drought, shattering the back of a partnership civilization that was at equilibrium in central Africa 15 to 25,000 years ago.

Now, we are the sad inheritors of this situation. The mysteries survived in a very attenuated form for several millennia in Crete. And Crete then became the bastion of the mystical impulse in Hellenic—in Hellenistic religion, at the mysteries at Eleusis for example. What the ancient authors said, what was practiced secretly at Eleusis was practiced openly at Gnosis. And there's considerable evidence that the mushroom cult may have persisted a long time in Crete. These puzzling so-called aniconic pillars that are, uh, erected in the center of many of the rooms of the palace at Gnosis seem very much to argue that there was a memory of this ancient religion, that the linear-B tallies on opium use yielded such high numbers when translated that the early assumption was that the glyph for opium must be the glyph for wheat. Now it's understood that this is not the case. And it is true that the twilight of Minoan religion was an opiated twilight.

My belief is, you see, that our proclivity for drug use—this itch that we can never scratch—which really places us in a completely different category from the rest of animal organization, and I am perfectly aware that elephants intoxicate themselves on papayas and all that malarkey, but those animals that have intoxication preference for intoxicants usually prefer one or two. We have scoured the biosphere for drugs of all sorts. And a drug that was used 200 years ago by 5 or 6,000 people can probably be bought within minutes if you walk out of this building because the news spreads.

We have an absolute obsession with the alteration of consciousness. And I believe it's because we are in a state of um, I don't know ... call it trauma, denial. We, as a species, are the victims of a dysfunctional childhood. We were torn from that which gave life meaning by climatological and cultural factors which forced us then into the nightmare of history. And it is from that nightmare that we must awaken, or the lethal momentum of egocentrism is going to shove us right over the edge.

The ego is like a calcareous tumor on the personality of each of us. This tumor must be psycholytically removed. It must be dissolved. Not that we must have no ego. After all, when you take someone to dinner you want to know whose mouth to put food in. The big ego that flowers out beyond the operational need to identify with a single body is an entirely maladaptive response, and we're sick with it, through, through and through. No less a bastion of conservative and establishment thinking than Arthur Koestler in his book, *The Ghost In the Machine*, finally concludes, you know, we have to have a drug which inhibits the territorial impulse. That was when the territorial impulse was a big buzzword. But what he meant was, we have to interfere with the ego; It's completely unnecessary; It's a burden to everyone who has it, and the collective impact of it is absolutely thanatopic.

The archaic revival is an impassioned and unconsciously driven reaching back into time: nope, the Renaissance won't do it; nope, the Greek ideals are not sufficient; no, Pharaonic Egypt isn't enough, no, no, no, until finally we reach the brink of the last glaciation and there we find people who are functioning. Their fertility levels, their, uh, supply and demand relationship with their environment—all this is working.

Now, it's easy to object to the notion that an adaptation that worked for nomadic herders 15,000 years ago has any relevance to today's problem. The fact of the matter is it is the psycholytic effect on ego that makes it necessary to take the psychedelic experience extremely seriously because we want to live. We want to turn off the series of lethal, uh, cascades that seem to be leading toward a very heart-stopping conclusion, which is that this is a sinking submarine and that we cannot get out unless we change our minds. There's no question that we have the resources, the intelligence, the infrastructure to save our neck.

But do we have the sense to change our mind? It is the mind that is intractable, and into our hands has then been placed this tremendously powerful tool, which our institutions immediately leap upon and attempt to stigmatize, drive under ground, criminalize, and discredit. But they have a vested interest in the continuing momentum of all of this insanity.

Ok, so that's uh, a kind of political argument for why this is a very good thing, and I trust I've convinced you all. Now I want to say something different about it which appeals more, I think, to us, not as political animals, but as dreamers, and uh, philosophers, and that is that people have not been straight with each other about how weird these psychedelic experiences are. Uh, this stuff is absolutely confounding. Uh, it is not sensory distortion; it is not a delusion of reference; it is not recovery of traumatic material from the personal past. All of these psychoanalytic models fail utterly because ultimately the psychedelic experience hardly seems to be addressing the personality of the individual, rather it is some kind of insight into a tremendum before which we are as helpless as the herders of Africa of 35 millennia ago. We don't understand what it is. We haven't got a clue. We believe in matter, causality, the here and now, the discreteness of objects, the unknowability of the future and so forth and so on. I mean, it's just a laundry list of wrongheaded notions that you can immediately disabuse yourself with- of with five grams of dried mushrooms. I mean, it is the Gordian knot of all of these, or it is the sword of Damocles cutting the Gordian Knot of these philosophical, uh conundrums. Um, so then we line up on two sides. People who say well it's not natural and it's psycho- that it induces psychosis and so forth and so on. This is all nonsense.

This is our birthright. It is profoundly our birthright in the same way that our sexuality is our birthright. The notion that a person would call themselves intelligent and aware and present in the world and that they would go from the cradle to the grave without ever having a psychedelic experience is nothing short of obscene; it's absurd. It makes my flesh crawl in the same way that celibacy and virginity make my flesh crawl. What a horrible, horrible waste of a human life.

You know, the Muslims used to say of the city, Isfahan, in Iran at its architectural height, that it was half the world—Isfahan is half the world. The psychedelic experience is half the world. If you don't have this under your belt, you don't know what's going on, you haven't got a clue about what's going on. And uh, it's not a big deal, you don't have to sweep up around my ashram for 15 years before I'm going to put the whammy on you. It requires nothing more than a personal act of courage to discover whether or not what I'm saying is true or horseshit. You know, you just have to go and look. And people want to talk about it, they want to argue about it. This is not a philosophy, or a theory, or a position, this is an experience; it's an experience. And, you know, talking to people who have not taken psychedelics and trying to convince them of the worth of it is like trying to talk a 9 year old boy out of his aversion to sexuality. He knows that it's a bad thing and should be stayed away from. But we, uh, who have found ourselves, by hook or by crook, in positions of prominence and influence cannot have the luxury of this kind of "know-nothing" attitude. If the expansion of consciousness does not loom large in the history of the human species then -in the future of the human species- then what kind of future is it going to be?

Now these compounds were originally just given a phenomenological description. They were called "consciousness-expanding drugs." We must investigate this possibility. If there were only a thousand to one chance that it was so, it would still merit intense investigation by the scientific community and everyone else with an interest in it. And yet it's fairly clear that these things do expand consciousness; that they do promote insight; that they do catalyze the release of ideas into society; that they do diminish the ego; that they do provide real insight into the functioning of things that then allows everything to move more

smoothly toward a reasonable conclusion. So, it's incumbent upon anyone who is concerned about the fate of the earth, their own well-being, so forth and so on, to investigate these things. We cannot allow a frightened and constipated establishment to control this agenda.

And I am perfectly aware that there is a drug problem. There is a terrible drug problem. Uh, but it's a different problem. It's not a problem caused by people who are seeking expanded or higher consciousness, it is caused by people who are blotting out how the consequences of living in this kind of civilization make them feel.

And we need a mature dialogue in which each drug is dealt with on a case by case basis, and we examine the social consequences, the risk benefit picture, and then commit ourselves to those uh, compounds and courses of action that seem promising. It is an absolute disgrace that science has tolerated the intrusion of small-minded politicians into what is traditionally its bailiwick. Doctors are allowing the government to tell them what compounds they may or may not investigate? Where is the AMA on this? How can we tolerate the least informed among us controlling the agenda, when the agenda deals with the question of planetary survival?

Now, I see myself- I used to think of myself as simply a cunning linguist, but now I realize that I am actually a meme replicator. A meme, as I'm sure you all have been told many times, is the smallest unit of an idea that still has coherency. Memes are to ideas what genes are to proteins. And my notion in coming here tonight is to replicate the meme, to give permission to discuss this. And what I think should be kept center stage in thinking about this is the depth of the mystery, the mysteriousness of it, how confounding it is. I mean, there are psychoactive drugs in use in shamanic contexts, which, when purified and- and smoked for instance, give experiences the duration of which is only minutes. And yet these experiences are such a profound, uh, dissolution into another dimension that they seem to imply that we have moved hardly off the dime in terms of getting a grip on the real nature of reality.

Uh, one of the things that I find very interesting, I said in the early part of this talk, that psilocybin synergized language, and I described how it synergized consciousness in this early African situation, but it continues to act; it's acting even as we speak. And what it seems to be holding out to those who have explored it at depth are things like, uh, an ontological transformation of the basis of language. For instance, uh, language seems to become something visible. You know, Philo Judaeus writing about the Logos, said he- he was concerned with what he called the more perfect logos. As you all know, the Logos was an informing voice that was, uh, the *sine qua non* of Hellenistic spirituality. And when you got right with the world, this voice opened in your head, and informed you and guided your actions.

So, Philo Judaeus was talking about the more perfect Logos, and he says, "The more perfect Logos would go from being heard to being beheld without ever crossing over a qu- a quantized moment of transition." This actually happens on psilocybin. The project of communication which in ordinary reality devolves down into the generation of small mouth noises which move across space to be decoded inside private minds using what we hope are congruent dictionaries, can potentially be replaced by a Logos beheld—a thing seen.

The clue to this is that in our own language our notion of linguistic facility is always backed up by visual metaphors. We say, "he spoke clearly", "I see what you mean", "she painted a picture." This is saying that at unconscious levels our notion of truth is rooted in the visual. I believe that the evolu- in a sense, history

is a psychedelic experience. We are unfolding endlessly into the consequences of the contact with the tremendum that raised us to self-reflection 25- or 30,000 years ago. And the question then becomes, how do we make sense of this in the future? What kind of world incorporates these kinds of insights?

Well, I believe that the place to lean is on a new modality for language, that syntax, properly understood, is beheld. It's very interesting to me that the most powerful of these hallucinogens are also endogenous neurotransmitters. DMT, without contest, is the most terrifyingly powerful hallucinogen that exists in nature, and it occurs in the human brain as a normal part of human metabolism. The fact that the experience only lasts a few minutes is a profound statement about the brain's ability to identify and, and uh, render inactive these compounds. I mean, the brain is hit by a wave of DMT and it says, I know what this is. And we can shunt this to indoleacetic acid and excrete it in a matter of minutes. So this, this state is not far away from us. It could be as little as a one or two gene mutation away. The pineal gland is generating adrenoglomerulotropin [???]. This is an MAO inhibitor of the beta-carboline class, very similar to the compounds that occur in ayahuasca and yage. It appears that the chemistry of thought and the chemistry of shamanic ecstasis are simply points on a continuous spectrum.

So, to my mind, this is the great untold secret of our civilization. To not know about this is to be absolutely in the dark about what is going on. And how many people do know? Some of you may know a story by the Argentine poet, uh, Jorge Luis Borges, a story called The Cult Of The Phoenix. And he says that there is a cult; its practitioners have suffered in every pogrom in history; its practitioners have participated in every pogrom in history; it honors no class, no race, no place, no time; one child may initiate another; ruins are propitious places. The initiate do not speak of it, and to some it seems absurd. What he is describing is the fact that in this world of ours, there is in fact an umbilical knot. There is in fact a blind spot that we have all overlooked, or many people have overlooked. The people in this room, I assume, are an exception.

But the fact of the matter is that if you search far enough, if you look at the oldest places the densest jungles, if you talk to the least assimilated tribes, sooner or later you are going to confront the psychedelic experience. And at that point your relationship to reality becomes very different from that of everyone around you because everyone around you is searching for the answers. The task of the person who by one means or another has found their way to the psychedelic experience is to face the answer. The answer is found.

We have arrived at the end of the road in terms of a powerful tool for inducting us into what Wittgenstein called the realms of the unspeakable. We need no more powerful tools than what we've inherited from these shamanic cultures. It's a question, pure and simple, of courage, of having the guts to use it, of surrender. And of course it had to be that because surrender requires the abandonment of the ego. And it is the ego's house of cards that is entirely at risk if we begin to look more deeply, uh, at the psychedelic experience. So it is a challenge for the society. It is a challenge for the individual. It is, it- you are not an ingénue if you have arrived at this place in the spiritual quest. Now the tools and the information are put into our hands and it's up to us to decide what we're going to do with it and how we're going to apply it.

And, uh, the evidence that this is our birthright, that this is what we came from and yearn to return to, is all around us. But it has been suppressed by a male dominated phonetic alphabet, yack-yack-yack kind of culture, which we are all unquestionably embedded in. But I can't stress enough that the consequences of not taking this seriously, are, I believe, the death of the planet. I don't think that through exhortation and preaching, and legislation, and manipulation through propaganda, that we're going to get people to do what

must be done in order to set this ship right. They are going to have to be touched by the tremendum.

And I scoured India, and sat with these roshis and rishis and geishas, and gurus, and went through the whole nine yards. And as far as I'm concerned it's a skin game. They're standing in for the real thing. The real thing is the felt presence of immediate experience and that's what this is giving back to us. It is putting you back into your place, and your time, with the knowledge, now, that there is a goal, there is reason to hope, there is something to save.

The inner richness of the human being causes everything else to pale by comparison. I could loot Madison Avenue to my heart's content and furnish my apartment, and it would be as garbage compared to the inner richness of the mind of one of these Mexican or Amazonian shaman. We have to find our way back to the authenticity of the body and to the connection to the vegetable matrix of the planet.

We are not apart from nature, but are if we cut off our channels of communication to it, and I don't mean this in some airy-fairy way. I mean that if you are not embedded in the use of a plant hallucinogen, there is no way for you to get your instructions in the larger dance of what is happening because the Gaian mind, the over soul, whatever you want to call it, this is how it controls the global mega system, through the shedding and release of chemical messengers of all sorts that move all kinds of organisms around, including self-reflecting higher organisms.

Well, I think you get the drift. [audience chuckles] So why don't we knock off. Now you can bring out the knives.

—
Q:Bravo

Q: Bravo

TM: Thank you.

JB: Terence, what's this "inside" stuff? You know, you, you, you talk about Whitehead, and then you insist upon this notion of interiority. I object to your attack on "Harry Winston".

TM: Well, is he here?

JB: I don't see the difference between "Harry Winston" and the inside your "soul". If you want to talk about language preeminence, or the idea of language as de-creation, which I think you are getting at- that languages strips something away and reveals, then, as Wallace Stevens noted, it's the "to be said" is what do I want to strive for, and then you can't differentiate between "gems" or "inside the mushroom", inside the "soul". I mean, you have this real interiority thing, this idea of depth, when language is surface. Language doesn't go inside. It doesn't go outside.

TM: Yes, you're right. The trick is to operationally realize that, see. And that's very hard to get from here to there in the present situation.

JB: But that's accretion, going from a to b, from here to there. That's the same as interiority.

TM: Yes. This is true. But if everybody had a devotion to Harry Winston the politics of South Africa would be much more complex. Uh, and it's funny, this Harry Winston argument goes clear back to *The Doors of Perception*. You probably all remember where Aldous Huxley says, we like gems because they remind us of the things glimpsed in interior worlds. So he's saying really that the material world at its best is a poor simulacrum of this, uh, of this other place. And culture strives for it. Design is clearly this effort to drag ideas into matter. And yet for them to retain their quintessential aura as nonmaterial things, it seems to be the most successful ones are that.

JB: But I, I mean, aren't you saying that we're talking about something that can't be talked about? And aren't all these phrases we throw around merely comfort words?

TM: Oh, absolutely.

JB: And straw horses?

TM: Oh yes, you know, this is a con.

JB: So why don't we have some coffee.

Q & A [NOT INCLUDED IN CURRENT AUDIO]

Q: Is it essential to your argument, Terence, to establish that there were in fact more or less egoless societies, partnership societies, pre-patriarchal?

TM: Is it necessary to establish it? I'm sure you recognize this as Riane Eisler's notion. Her word. She and I have worked together. She doesn't care to publicly embrace my conclusions, but she does say, you're right, there is something going on where pastoralism emerged. And the emerging of pastoralism and the discovery of the mushroom would be very much intertwined. I don't see how a society could use psilocybin orgiastically without being egoless. I believe the concern with paternity, with tracing the paternal line, which could have only arisen post ego was what then shut down these orgiastic religions, because men were more concerned with determining paternity than they were with having a good time, in fact.

Q: They were getting egos that needed to be defended that way.

TM: They needed to know who their sons were and they wanted to pass on their property, their cattle, their

cash, affluence, or whatever it was.

Q: Do you think the evidence for these more or less egoless societies is pretty strong?

TM: No, I would say that I wish it were a lot stronger. How in the world, through archaeology, are you going to establish the egoless nature of a society? What I would like to see done would be someone to go into southern Algeria, to the Tassili n'Ajjer Plateau, and carry out a serious archaeological project.

To my mind, if you could find a Çatalhöyük-style site in Algeria that was 3- or 4,000 years older than Çatal, it would be perfectly reasonable to headline it as Eden dug up. In other words, that would prove that this high civilization was flourishing in Africa and that it was disrupted by desertification. And that would pretty much make it circumstantially fall into place.

Q: The archaeologists in Budiš, as you know, have presented something that looks like evidence. Whether it's conclusive or not is another question. Cities without walls, for example, burials without battle-mutilated bodies, burials without the typical trophies that are found in patriarch suit. And heroes, too.

TM: Around 10,000 BC we get what's called the ten point techno complex, meaning the sudden accumulation of pointed flints at village sites rather than in hunting areas, indicating that there were large concentrations of arrows fired near habitation sites. This was not hunting. The indirect evidence for this kind of egoless society, to my mind, is in the Amazon today. I've spent a lot of time down there taking ayahuasca, for example, with these up-river folks. Harmine before it was found to become specific with an alkaloid taken from a cereal plant, was called telepathine.

It is literally true that these Amazonian small hunting-gathering societies achieve a state of profound group-mindedness under this drug. And it's in those situations that they decide whether to go to war or whether to move the village, what crops should be planted, whether to take slaves. It's a state of group-mindedness. I have participated in these states and if you want anecdotal evidence I can give anecdotal evidence that very odd things are going on in these sessions. What you think are your own private hallucinations can suddenly begin to be critiqued by the guy sitting at your elbow. This is very impressive.

Q: One last thing, a speculative kind of thing. Do you think that if you allow that there are things that should be salvaged from our ego and scientific culture, do you think the best of our culture might be salvaged in a synthesis culture?

TM: Oh, yes. I'm not an anti-science person or anything like that. I think everything went toward a purpose. I look at western man through the metaphor of the prodigal son. We are the prodigal son. We wandered from the family hearth into history. And then we returned to the way of our fathers. But we have made the peregrination of the history that descended into a Faustian relationship with matter. Now, knowing what we know about matter, those techniques in the hands of a shamanically inspired society will create the global solution that we're seeking. But in our own hands we can seem only to use these techniques to destroy our enemies and poison ourselves.

Q: It seems to some extent that you're preaching to the choir in this particular group.

TM: Well, what a relief.

Q: There's an attitude you have towards the establishment in some way as if they object to this. I don't think they have an objection. The mega hospitals are filling up with narcissistic personalities and borderline personalities, and hysterical personalities. Do any of you know roughly what I'm talking about? Now, we could very easily, if you tell me the dose, send a grant in. Or the makers of leading drugs would be happy to find something for this group of people. It has nothing to do with objecting. If you have the right dose of psilocybin, which will, theoretically, these people are a narcissistic personality, is the extreme of it. If you set it up in a scientific way, they'll buy it.

TM: I'm very close to efforts to do this kind of thing and I can tell you it's an absolute nightmare. A drug as innocuous as MDMA is a schedule one drug. That means it's to be treated like heroin.

Q: No, no, no. For prescribing. But you can use a lot of drugs in the research. So you get special numbers and things like that.

TM: There are no protocols for human administration of psychedelic drugs in this country, nor have there been for 15 years.

Q: This was Humphrey Osmond and other peoples' agenda many years ago but it was shut down fully.

Q: It starts with Timothy Leary. What you're saying gives me deja vu of Timothy 20 years ago.

TM: Only because you misremember what he said. He never said anything like this. The rhetoric of the '60s was entirely devoid of any sensitivity to shamanism, of any awareness that these things had ever been done in the human past. They thought it was a miracle drug that had come out of a Swiss laboratory. They didn't realize that it was the way religion has always been practiced except for the last 2,000 years.

Q: Can you comment on the ways of triggering these experiences, psychedelic experiences, electromagnetically? You know, Persinger's work in Canada?

TM: For those of you who don't know, Persinger believes that UFO encounters are caused by geomagnetism in the earth, which then can be sufficiently strong to actually disrupt neurological functioning. But the general answer to your question is, no, I don't believe you can do this any other way. I mean, theoretically perhaps electromagnetism or something like that, but practically speaking, nothing works like this does. Yoga is futile. It's absolutely pointless.

A DMT trip lasts seven minutes. And five minutes after you come down you cannot tell that you have taken a drug, you don't have a headache, you're not trembling, you don't even have a dry mouth. It is the most profound psychedelic experience a human being can have this side of the grave. So what's holding everybody up?

Q: Terence, you don't want to admit that some people don't want to have an experience that they'll never forget.

TM: Well, you're right.

Q: Will you talk about the relationship between psychedelics and the materialization of objects or the ability to transmute matter?

TM: Well, this is a very fringy sort of thing. It has to be anecdotal. You know, Whitehead, who I base a lot of what I think and feel on Whitehead, and he enshrined in the English language the phrase, the "fallacy of misplaced concreteness." This means believing that that's there, and this is here—the fallacy of misplaced concreteness. The most puzzling aspect of the psychedelic experience, and I'm loathe to even raise it because I don't want to defend it, is, if you do it enough and you watch it enough, you come to the conclusion that there are no boundaries; that the world is some kind of linguistic structure. It is not made of quarks or electromagnetic fields or mu-mesons. It's made of language. And the objection always brought against this point of view is, okay, so say something and make it come to be. And of course this is quite a challenge.

But on the other hand, perhaps that's not a fair approach. After all, everything around us as we sit in this room, for miles and miles in all directions, is an exudate of the human imagination. There is nothing that didn't come out of human minds. We have surrounded ourselves with a self-generated hallucination. We are like coral animals and we excrete ideas. We take matter and we lay into it platonic forms of tremendous complexity. So I think I'm fearful of this area because I think that you can sail off the edge. I'm fearful of it all. I am impressed by the awesome power of it. I think all of these things should be studied with an absolutely unbiased mind. And in no other area do I think this is possible.

Q: Let me ask you this question. You're very persuasive that at some period in time if the shamanistic culture had not changed very much the world might be a rather peaceful and glorious society today without much population growth, without much technology and so forth. But take the world as it is today, which I guess you have to do, and assuming, let us say, that because of the tremendous power of this little group, the day after tomorrow your message has gotten across and we are back in the shamanistic world. Could you sketch in your own mind what the society that we now have, which is hugely overpopulated and highly over technologically-encrusted and so forth, give us five or six minutes of your wonderful words as to what you see the society coming to.

TM: The thrust of history is toward the imagination. This was Blake's position—that our destiny was in what he called the divine imagination. Now, I know that virtual reality was slammed up one wall and down the other, so I don't want to clutch it to my breast this evening. But I do think that some combination, that the difference between computers and drugs is going to migrate toward the vanishing point, that the computers of the future will be drugs, and the drugs of the future will be computers. In other words, they're both information processing systems. Obviously microminiaturization and greater insight into the functioning of these compounds and so forth ... everything is syncing toward the microphysical realm. My fantasy of an implementation of a psychedelic future is a world that looks very much like the world of 25,000 years ago, except that if you are a person in that world, when you close your eyes, there are menus, there are choices, there is an invisible interface. In other words, the imagination has become hardwired as the cultural dimension in which we all live.

By referring to New York as an excrescence of the imagination, but New York has tremendous solidity, a tremendous lump in momentum because it is made of matter. But if the implementation of design ideas were nothing more than the pushing of a button and skyscrapers a thousand stories high could spring up in virtual reality, then design will become the leading edge of culture. This is our future. Our future is in art.

Our future is in realizing the imagination. And then, inhabiting it. And I grant you, in five minutes I cannot explain to you exactly how do we back out from 5 billion people, how do we feed everybody while this is going on.

The politics of the psychedelic experience are such that you introduce people to the idea of inner riches. Why bother with Harry Winston? Because the better stuff is inside. The better stuff costs nothing. The stuff cult, which is sweeping the planet and emptying the earth of its metals and polluting the rivers could be chalked off in a world where the imagination was the value that was being maximized. The short answer to your question is, a radical mentalization of culture to pull back from resource extraction and toxification of the environment.

Once you unleash psychedelics in the population the dreams that will be dreamed are large dreams, indeed. It's very clear that within the next 50 years we will understand the human genome to sufficient depth to probably take control of the human form, we will become who we want to be. We will design ourselves into being the kind of organism that is consonant with our politics. Strangely enough, the only kind of organism I can think of that is congruent with our politics would be something like a mushroom.

A mushroom is a mycelial network through the soil. It has as many connections as a neuro network. If it's a psilocybin mushroom it's a network filled with neurotransmitters, yet it's as fine as a cobweb. Look at how delicately the mushroom touches the earth; it lives only on decaying matter. But if it has menus inside of itself, then it may be living in situ, a fuller, deeper, richer, more feeling filled existence than we can imagine. So I don't think we should cling to the monkey form. Shedding the monkey is a real potential possibility. Techno freaks will want to download us into a solid state cube on the dark side of the moon. I would rather download us into planktonic life and put us into the oceans.

I was recently in Mexico and these huge stratocumulus clouds float over the Yucatan Peninsula. And I was looking and thinking, you know, if a person were the size of a water droplet every one of us could fit into one of these clouds. And look how non-destructive these stratocumulus clouds are. They just drift around, and around.

Q: Terence, do you suggest that civilization or whatever the form is, to change from the forest to the grasslands goes back about 30,000 years? Two questions: First, with that you suggest that Africa is where the cradle of civilization is. Are you also suggesting that civilizations don't go back anywhere in the world farther than that? And what about South America?

TM: Oh, yes. I accept all ordinary dates. I am no friend of Atlantis.

Q: Unlike Thor Heyerdahl?

TM: What I've done here this evening is just create a string of metaphors to try and pique your interest. Not once did I do justice to the truth of the situation or the depth of the psychedelic experience, because it cannot be told. It cannot be told. My technique is to tell the wildest, strangest story I can think of, claim that's the psychedelic experience, and leave it at that. But you should all know that the journey begins where the words stop.

Q: I want to go back historically for a minute. If we can. The shift of psilocybe, obsidian versus what appears to be a later shift to copper and amanita. Do you see a relationship with the shift from psilocybe to

amanita in the ego context?

TM: I'm not sure I accept your premise. Were these two mushrooms ever overlapping in their range? Amanita is a creature of the arctic, generally, the arctic.

And psilocybin, in the *stropharia cubensis*, which is the worldwide one associated with cattle, was a lowland tropical mushroom. Gordon Wasson, who was a wonderful man, spread a lot of confusion about amanita muscaria, and it would take an evening to sort that all out.

Q: On the Pacific coast of the northwest amanita and psilocybes grow virtually side-by-side.

TM: Although there is no proof that the people of the northwest coast ever were aware of those mushrooms.

Q: I have an answer to that. I was in a place called Magadan, Soviet Far East, in the fall. I had a conversation with a Soviet scientist, who showed me a photograph that they had of a man, which they discovered on Kamchatka, which had a mushroom on his head. And that same exact figure was found in Mayan culture. So it seemed when people came across, they worked their way down and they brought the mushroom culture with it.

TM: Well, that's a theory that doesn't give much credit to the mushroom. You don't require cultural diffusion theories if you believe that the mushroom simply speaks.

Q: But you have a DMT experience that ...the one that you will never forget. . .

TM: Well, it depends on your personality. I've seen people smoke DMT and give an entirely convincing display while they were on it, and then come down and say, number one, "I will never do that again," number two, "I don't remember anything," number three, "please leave."

Q: Could you trigger this without mushrooms?

TM: It's a very interesting question. Once a person has smoked DMT it's possible to have a dream in which the subject is raised, the pipe is produced, and it happens. I find this profoundly interesting because it's absolute proof that all the machinery necessary is present in the unstoned natural brain.

At one point, in grappling with the UFO problem, I tried to think in terms of perhaps DMT was loading into adipose tissue and some kind of stimulus could suddenly cause all this stuff to drop out into your system and you would have this sense of hackle-raising strangeness and a rising sense of energy, then a descent into hallucinogenesis.

When DMT was first discovered people were jumping up and down. They thought they had found the schizogen—the chemical key to psychosis. The current thinking about DMT coming out of this University of Alabama, is that probably DMT mediates attention. They believe that when you scan a room, lock on to a face, and grock it, that something is happening with DMT there. It's very useful, these compounds which can be activated and deactivated so quickly. And this is what the body needs to make use of. And many neurotransmitters have this spiking ability where they can shift from one catalytic state to another very

rapidly.

There's a generation of hard science that needs to be done here. You can think up great experiments and find projects forever. None of it has ever been done because it's forbidden. It's taboo.

Q: Let's go back to the issue of menu. This is more of a technical question for you. You've been emphasizing psilocybin and mushroom-based psychedelics. How would you, for instance, compare them with mescaline or lysergic acid, or ketamine, or ibogaine, or yage, the same thing, all appear to address some portion of this opening, this ascending door. Now, if we have a collectivistic culture, that is, to say the least, and we are fusing, would you produce a hierarchy of availability? Would you produce a kind of synthetic mix of all these sources, or would you recommend a kind of graduated measurement of intake? How would you appropriate each of these substances with specific forms of psychedelic insight?

TM: I don't want to talk as though I would make social policy because I think people should be free to do what they want. What I would tell you, though, is to my mind the word psychedelic has been used far, far too broadly, and that where we need to concentrate is on the tryptamine hallucinogens. Specifically psilocybin, DMT, DET, DPT. Then secondarily, the indole hallucinogens including LSD and ibogaine. Mescaline, I consider to be a visually active amphetamine. And not nearly so interesting.

Q: So you would produce a hierarchy?

TM: Let me tell you my rules. If you're going to take a drug, here are the three questions you should ask yourself about this drug, to my mind. Number one, does it occur in nature as a metabolite in some organism? This tells you already that it's not pernicious to life. The next question is, does it have a history of human usage? This makes it even more acceptable. If you have a plant or a drug that has a history of human usage over thousands of years, you don't have to worry about tumors, blindness, infertility, anything weird like that. You've got your human data in hand in the form of the anthropological record. The third and most difficult test for a compound to pass is, does it occur as a constituent of normal human metabolism? The only drugs which can pass all three of these filters are tryptamine hallucinogens, specifically DMT.

You see, serotonin is 5-hydroxytryptamine, this major neurotransmitter system in the brain. Psilocybin, 4-phosphoryloxy and N-dimethyltryptamine. DMT, dimethyltryptamine. I prefer thinking of these things not as drugs really, but as diddling with levels of endogenous neurotransmitters.

Q: It's interesting that you excluded ketamine from your hierarchy.

TM: Oh, no, that stuff is ... I found it very interesting, I have played with it too, but it's not in this ballpark.

Q: What is the natural form of DMT?

TM: Dimethyltryptamine occurs in the human brain and certain deep sea fish, in many generative plants. In fact, interestingly enough, DMT is the most widely distributed hallucinogen in organic nature.

Q: What is the most common one? Or the most optimally used by traditional cultures?

TM: It's used in ayahuasca. Ayahuasca is a combinatory drug where, if you take an MAO inhibitor, and that causes the DMT to become active if taken orally, if you don't back DMT with an MAO inhibitor you take it orally, it will be destroyed. So ordinarily it's smoked. In terms of a shamanic religion that is regularly accessing DMT for sure it's these banisteriopsis cults in the Peruvian, Ecuadorian Amazon.

Q: And is there a tradition similar to that going on in another culture, in another part of the world?

TM: One of the puzzles of psychedelic botany that has never been successfully dealt with is the tremendous concentration of these plants in South America. The Asian tropics are almost devoid of hallucinogens and the South American tropics have like up to 53 species. No one has ever created a satisfactory model for how evolutionary forces could end you up in a hemispheric segregation of drug molecules.

Q: Based upon what you said earlier, might that not leave you to believe that South America could be the cradle of civilization rather than Africa?

TM: No, because I see ample evidence in Africa, and there's a mountain of paleontological evidence that you would have to go against to move the human origin point to South America. I have enough troubles of my own without taking on somebody else's battle.

Q: Why do you need the notion that we are in a bad moment in time? Why do you need for your argument the notion that, you know, you are going to go and rediscover your roots, and this will solve the problem? I have a problem with anybody's talking with the crisis in order to explain a viewpoint that can be valid or not valid without a crisis.

Q: Could I put a rider on this one? You took us down one side of the view, this stereoscopic view is, you have you and history, and that which you didn't get to say tonight, which was that software and that reading of the pattern of the evolution of what's going on. This is where the crisis moment and the chaos moments come in. I was just wondering if you would, as you respond to this, tell us a little bit about that.

TM: I attempted to compartmentalize my intellectual life to make it easy for you. When John asked me here, I said, "Okay, I'll talk about my theory of time." And John said, "Oh, no, if there's a computer involved nobody will come." So I said, "Okay, I'll drop that." Well, next time, if you ever get a next time with the Reality Club. It seems to me that cultures do not create new paradigms except under pressure of crisis. Because if there's no crisis there's, you know, if it ain't broke, why fix it?

My view of history is that time is a kind of variable. Novelty is a previously unrecognized constant in the universe, and novelty ebbs and flows; it's the force which builds up and tears down—empires, love affairs, species, investments—it operates on all scales. Out of a deep inspection of the functioning of our own nervous system we can extrapolate maps of a fractal nature and a mathematically formal nature that, lo and behold, can be overlaid over the whole of reality. Again, feeding back into my conclusion that reality is made of language.

It would be fairly disingenuous in any context to argue that we're not facing crisis. And then, in terms of the politics of this position it's necessary to remind people that they're facing a crisis because otherwise there is no impetus to an act of courage. In other words, who's going to jump out of a fourth floor window? But everybody will jump out of a fourth floor window if the building behind them is on fire. You

have to get people aware of what's going on.

Part of the ego sickness of our society is our incredible ability to deny what's going on. It's all around us. This is a dying planet. It's been dying for 10,000 years. The species count is falling exponentially. What does it take to get people off the dime?

Q: We're not facing a crisis, we're facing thousands of crises, all different kinds of crises and they're very different in nature. I find your talk very problematic, because I'm in favor of taking psychedelics into adulthood. I like the drugs, but there's something about the way in which you argue for it. You propose an evolutionary and very globalizing model instead of an ideological model. It's as if something inevitably will happen through the use of these drugs rather than a sensitivity to the many different kinds of things which will happen through the use of substances like this, depending upon the culture into which they fall.

There's been quite a similar debate in anthropology in terms of literacy, where, in the '70s people like Goody in England, and Havelock, thought that literacy inevitably produced certain kinds of phenomena in society, and then a spate of evidence showing that that's not the case. Literacy is used in many different ways. It's in favor of both secrecy and the free dissemination of information, in abstract thought and non-abstract thought. And the differences are not available.

TM: I don't agree with your premise that we have thousands and thousands of problems. We have one problem; it's the ego. And the retraction of the ego, it will all fall into place. You know? Humility: the ability to defer to the other person; the ability to forestall gratification; the ability to assess consequences. If we can get a hold on the ego, all the rest will fall into place. And I think if we can get a hold on the ego, the best-intentioned programs will come a cropper.

Q: Terence has spoken a lot this evening about the shrinking of the ego. Okay. And I'm curious, and it's a bit rhetorical question, but when your ego shrinks and when your personality shrinks, what do you find beyond the veil of the personality? Because your denial of, let's say, an Akashic record or something like that, a membrane of life that one can visibly turn to and view, presupposes an understanding reincarnation is not possible, that perhaps the empathy within different life forms, where a human and a plant can communicate, or an animal can communicate. I wonder, Jimi Hendrix put it, "Are you experienced?"

TM: As I understand your question, it is, what do I feel when I shrink my ego? The felt presence of immediate experience. That's what the ego dams from reaching the self.

Q: Have you passed into a place where the colors disappear, a void appeared before you? A pure void of consciousness where perhaps the bubble of the personal self breaks and you will then open up into a sea of consciousness that was much higher than you are personally?

TM: Well, you have those kinds of experiences, but you can't navigate through the world like that.

Q: Isn't that what tribal cultures do? They're synesthetic cultures. From what I've heard the only place that happens in western civilization is when people like us are on psychedelics.

Q: What do you think you're going to get, and don't get, when you get it? When you get rid of the ego, then, what happens to all of us in our endeavors?

TM: We mis-define it. We can all keep doing a lot of what we're doing. You just feel differently about it. Probably most of the people in this room, powerful as they are, have their ego under control because when you have your ego under control you don't take yourself seriously. That's all. You know, it's provisional. You know, it's all a game. But the people who take it seriously, my God, they're like another species.

Q: Are you sure that it's not excessive testosterone?

TM: No, I have stayed very clear of gender-specific denigration or association.

Q: There are theories that anything with testosterone climbs hierarchies and is very egotistical, even if it is raised as a woman and has some organ producing testosterone that's not we're not aware of.

TM: Stoned men don't participate to the same degree in those kinds of monkey games. I don't mean us. We probably do. I mean, in pre-history. This was while it was being taken. Imagine a culture where, at every new and full moon, let us say, everybody took a strong hit of mushrooms and made love in a heap. Well, how are you going to come out of that talking about my cattle, my hut, my land because you don't even know who your children are. And it's a different head.

Q: Is your experience of South America, that any isolated tribes such as these people are devoid of ego?

TM: Yes, there are tribes for whom all they know is cooperation. How about the Machiguenga?

Q: I've been with the Machiguenga, in Peru and I noticed among them a very warlike tendency. They said that we don't like those people up the river. I was on the Manú River. We don't like those people up there. They had bows and arrows. I have them at home. They're very violent people.

TM: Within the group.

Q: But that's essential. Part of its essential. Then your group is always localized, always provincial.

TM: But we have a global tribe. We know that.

Q: I'm really curious, because at one time in Africa you painted a picture, at least from the impression that I got, that these cultures which existed were devoid of aggressive tendencies through the mushrooms. Got rid of our ego. And we do not worry about our children, about copping somebody else's cows. Now, am I to believe that these two isolated cultures still exist in some place in the Amazon?

TM: No, because a number of factors that were present aren't present.

Q: Is it possible that they could be? Because as you all know there are still cultures down there we cannot get in contact with.

TM: Almost. Yes. Theoretically there's nothing against it but there's going to be 20 people who are probably nomadic and who flee at even the sound of an outboard motor. You're not going to get a lot of satisfying interaction with these folks.

Q: It's very idealistic and I accept everything you say. But what about the fallout? Do you think everybody can react this way, this wonderful way and ... a shaman, to see the world wonderfully, lose their egos, good, nice, clean, and interact? We'd have chaos.

TM: Chaos.

Q: In the '60s, when LSD came out, there was no stigma. Everybody was roaring and ready to do research on that. I was doing research; I was injecting it into patients with focal cerebral disease. I had all sorts of phenomena, and I wrote it up and it was great. Then you start carrying the people in who overdosed and did too much of it and so on and it became a real mess. I'm from the standard society that says no drugs or anything like that. I'd give drugs to everybody, legalize the whole damn thing. But to envision an idealistic world coming out the way you picture it, is absurd. It ain't gonna happen.

True Hallucinations Missing Chapter 20: The Oversoul as Saucer

Day Month Year

Description

- [Scribd text](#)

There is building in global society an increasingly intense expectation of the intervention into human history by UFOs. It is very similar in tone to the buildup of messianic expectation in the Hellenistic world in the several centuries preceding the birth of Christ. The leaders of Roman society may have been caught off guard by the appearance of Christ, but they had no one to blame but themselves since millions of people in the ancient world were expectantly awaiting some kind of messiah. So today, science and government koo-koo the idea of world contact with the UFOs, while the contact cults grow ever larger and more insistent that contact is about to occur.

Imagine, therefore, what you may never have seriously imagined before. Imagine what would happen if the UFOs were to appear. Imagine a spaceship of the close encounters of the third kind variety suddenly appearing in orbit around the Earth. Television and mass media would carry its image to every man, woman and child on the planet. Governments would be paralyzed. Science would be helpless to explain where it came from or how it got there. Millenarian hysteria would break out everywhere. The UFO would be hailed as savior and denounced as antichrist. The end of the world would appear imminent, and all this would occur before the contact was more than a visual image. Then the UFO would begin its revelation. Vast displays of beneficent power can be expected. Perhaps it would mysteriously neutralize all weapons of mass destruction, or it might use some sort of ray to cure all terrestrial cancer. Whatever it does one may be sure that its actions will be impressive. Its actions will convert millions to the UFO religion in a space of hours. Indeed, its actions will be specifically designed to overwhelm us with the reality of its power and presence. That will close the first stage of the revelation.

The second stage will be the teachings. Telepathically imparted, the specifics of the teachings cannot be anticipated, but they will urge love, voluntary simplicity, concern for one another, renunciation of war, perhaps renunciation of the destructive application of science. Whatever the teachings, the UFO will promise immense reward to those who follow them and dire consequences for those who do not. And the teachings will be delivered in so poetically perfect a way, so rich in understanding and appealing nuances that no one will doubt their origin in a being wise and good and immensely superior to ourselves. The delivery of the teachings will set the stage for the third and last and most shocking phase of the revelation: the departure.

The saucer, promising vaguely to return, will simply disappear. The entire process could take less than a month. If this seems a short time recall that the entire public career of Christ lasted only three years. Christ's career occurred in a world where information could move no faster than a horse's gallop. Yet three years in one small part of the world was all that was necessary to launch a world religion that was vital for 1500 years. In a world of electronic communication the impact of the saucer's arrival, miracles, teaching

and departure would be incalculable - even if it all occurred within a month. The saucer would leave in its wake a science utterly unable to provide any answers to the important questions concerning what had gone on. The vast majority of people would be fanatical converts to the teachings of the saucer, and any institution in opposition to those teachings could expect to be swept away almost overnight. The departure of the UFO would create a sense of abandonment, the agony of which could be expected to echo in the human psyche for centuries. The only panacea would be the religion of the saucer, the religion left behind. Science would be discredited and soon abandoned in favor of a thousand or more years of exegesis of the saucerian message. Is it not a familiar pattern in the light of our discussion of Christ and Rome?

What will never be said in the wake of such an event and so must be said now while there is still time for all of the above to occur and yet still be deception. A benign deception designed to save us from our advanced science and infantile ethics, but a deception nevertheless. The saucer, no matter how alien it appears, no matter how advanced its demonstrations of power, is NOT a vehicle from some other star system, it is the oversoul of humanity up to its oldest trick. If one knows this one can live through the revelation and the destruction of our scientific world and yet evade the immense power of this most powerful of all transference phenomenon and thereby maintain the integrity of one's own soul and spirit. Remember, I am not a debunker of flying saucers or a defender of science, I am a contactee, and this book is the painstakingly told story of my own involvement with the UFOs. I am one of those Vallee has pinpointed as being a carrier of ideas that pave the way for the scenario I have just described. Yet from it all I have learned that there is no religious revelation more satisfying than the hard won fruits of simple understanding. And there is no liberation to compare with freeing oneself from the illusions and delusions of the age in which one lives.

I reach these conclusions through my use and familiarity with psilocybin and other psychedelic drugs. They immerse their user in the world of the oversoul and make one privileged to at least a part of its mechanics of operation. They allow a private dialogue with the oversoul that is outside the context of the struggle between science and revelation that leaves no choice between the alienation of the rationalist and the tired formulas of the fanatic believer. Psychedelic drugs hold out the possibility of healing the breach between science and morality at the level of the individual, thus freeing one to evolve independent of the chaos and transformation the UFOs may soon bring to humanity. Vallee's recent book 'Messengers of Deception' vibrates with fear of the unconscious and alienation from the matrix of the larger psyche out of which rational thought has emerged. He fears the destruction of rationalism and scientific thought, yet never once does he mention the potential world wrecking crisis that the undirected development of science and technology has brought into being. He paints himself as an open-minded investigator of UFOs, yet never questions the motives of the retired and unnamed intelligence officers in which he places so much faith. It is impossible that the CIA is unaware of the social impact belief in UFOs is having? If they were unaware of it before then surely the recent writings of Vallee himself must have alerted them to the potential challenge UFO beliefs pose to orthodox institutions. Based on Vallee's own ideas of an informational struggle between rational and irrational elements, how was he able to ignore the possibility that the mutilations which he is so eager to connect with UFOs are nothing more than a government agency's clumsy attempt to discredit the genuine UFO phenomenon? It is a typical method of the intelligence community to discredit human groups it opposes by faking atrocities in such a way that they appear to have been committed by the group whose discrediting is sought. Vallee gives examples of this but never suspects that some government agency might be using this technique to impede the transfer of loyalties from political institutions to the UFOs. He mentions the proximity of animal mutilations to high-security government installations but never suggests this might be because such installations are the source

of these mutilations. Few UFO sightings involve confusion among witnesses over whether or not what they saw was a UFO or a helicopter. Yet in the animal mutilation cases many witnesses insist a helicopter was involved. Vallee is at pains to say no physical evidence of a UFO has ever been collected. Yet later he passes over the fact that a quite ordinary surgical scalpel was found at one cattle mutilation site. It seems possible to me that some people in government have read Vallee and are familiar with his theories regarding UFOs as a factor introducing shifts in belief systems and institutional loyalties on a global scale. Without knowing what UFOs really are these persons and agencies have launched smokescreen operations designed to cast doubt on the motives and harmlessness of UFOs and so to retard or halt the shift of loyalties and beliefs now reaching epidemic proportions. I suspect that Vallee's book may be the opening shot in a media war whose purpose will be to connect the occult, right-wing fanaticism, and animal mutilations to the UFO, all in an effort to cast doubt on the vast power and benign intent of the saucer phenomenon. Vallee's title 'Messengers of Deception' bears a curious resemblance to J. Edgar Hoover's 'Masters of Deceit'. There the boogey man was communism. In Vallee's book we are told the new boogeyman is UFO phenomenon. Who chose the title for Vallee's book? Was it Vallee or the mysterious major who was so helpful in guiding Vallee down these new avenues of speculation? I believe that Vallee whether wittingly or unwittingly is himself a messenger of deception and has become the spearhead of a conscious effort to sow even deeper confusion in society regarding UFOs.

We might say it is an effort foredoomed to failure. The collective overmind of our species is the source of the UFO and its designs cannot be deflected or turned aside. Its viewpoint is one of thousands of years and its means visionary and charismatic belief systems which act to restore the balance between understanding of and reverence for the universe is a message more powerful than any offered by the profane materialist societies that have grown so foolish as to imagine themselves the stewards of human destiny. Humanity alone and each of us individually is the steward of human destiny. This is the real meaning of the UFOs and the experiment at La Chorrera.

Tryptamine Hallucinogens and Consciousness

December 1982

Lilly/Goswami Conference, Esalen Institute, Big Sur, California

Description

- [Audio](#)
- [Transcription](#)
- [Other](#)

Well, perhaps this morning's session will be a difficult, uh, act to top; I'm not sure. It was a little rough getting here. I want to call your attention this morning to a very circumscribed place in organic nature that has, I think, an implication for what's been discussed here, uh, not in the general sense of the--some of the theories that we've heard, but in the more particular and experiential sense [clears throat], and that area is, uh, a family of hallucinogenic drugs that are--have not been mentioned particularly, which are the tryptophan-derived hallucinogens: uh, dimethyltryptamine, psilocybin, and, uh, a hybrid drug which is an aboriginal drug used in the rainforests of South America, called ayahuasca, which is dimethyltryptamine but made orally active by being taken in the presence of a monoamine oxidase inhibitor. And, the reason it seems to me appropriate to talk about these drugs in a conference devoted, not only to consciousness, where its appropriateness is obvious, but devoted to quantum physics, is because, uh, it's my interpretation that the major quantum mechanical phenomenon that we all experience, aside from life itself, uh, is dream and hallucination, because, uh, these states, at least in the restricted sense that I'm using it, take place when the large amounts of, uh, radiation of various sorts that are conveyed into the body by the senses are restricted. And, instead we see interior images, interior processes, which are mental. And, uh, these things definitely arise at the quantum mechanical level. Uh, it's been shown by John Smythies and others that there are quantum mechanical correlates to hallucinogenesis of one mol--of one atom. In other words, a compound will be inactive and one atom is moved on the ring and then the compound becomes highly active. And, to me this is a perfect proof of the dynamic linkage at the formative level between matter, quantum mechanically described, and mind, as experienced.

So far what I've said is true generally of hallucinogens and of the, uh, the anesthetics that John is interested and of other drugs and experience as, uh, as well. In other words, ordeals, dieting, this sort of thing can elucid--can elicit hallucination. But, what makes this tryptamine family of drugs interesting is the intensity of the hallucination and the concentration in the visual cortex of the activity, so that, uh, there is an immense vividness to these interiorized landscapes. It is as if information were being presented three-dimensionally and fourth-dimensionally deployed as light, as surfaces which have information coded into them. And, when you confront these dimensions, the--the dynamic relationship that, uh, is evolved is one of you relating to it, trying to decode what it is saying. And, uh, this phenomenon is, uh, not new - people have been talking to gods and demons for millennia. In fact, people have been talking to gods and demons for far more of human history than they have not.

It is only the conceit of post-industrial society's science and technology that allows us to even propound

some of the questions that, uh, we take to be so important. For instance, the--the question of contact with extraterrestrials is, uh, a complete red herring, because it is hedged about with a number of assumptions which a moment's reflection will tell you are completely false. In other words, the search for, uh, a radio signal from an extraterrestrial source is probably as culture-bound an assumption as to search the galaxy for a good Italian restaurant [audience laughter]. That is just, uh, not going to happen. And yet, this has been ruled [audience laughter] as the means by which it is going to happen. Meanwhile, people all over the world - psychics, shaman, mystics, schizophrenics - are--their heads are filled with information, but it has been ruled *a priori*, uh, irrelevant, incoherent, or mad. Only, uh, that which is consensually validated through these certain instrumentalities will be accepted as a signal. The other problem is that we are actually so inundated by these signals from these other dimensions that there is a great deal of noise in the circuit.

This is what I say to John if he were here: that, uh, it is no great accomplishment to hear a voice in the head. The accomplishment is to make sure that it's telling you the truth [audience laughter], because, uh, "the demons are of many kinds: Some are made of ions, some of mind; the ones of ketamine, you'll find, stutter often and are blind." [audience member: "Alright!"] And, of all the others, I might say as well; It is not that you kneel in genuflection before a god, because you will be like Dorothy before Oz. There is no dignity in the universe unless you meet these things, uh, on your feet, and that means that you have an I/Thou relationship, and you say, "Okay, well, you say you're omniscient, omnipresent, or you say you are from Zeta Reticuli, or you say, you say; you're long on talk, but what can you show me?" And, uh, magicians, people who invoke these things, have always understood that you go into it with your wits about you.

Well, what does it--all this have to do with this family of drugs that I was talking about? Simply this: that *this* family of drugs has been overlooked. Eh, whenever you--psilocybin is the one that most people have some experience with. Psilocybin, legally, and in people's assumptions about it, is lumped with LSD. They say, "psilocybin, LSD, mescaline, da da da da." It is, uhm, each one of these things is a phenomenologically defined universe unto itself. And, uh, psilocybin and DMT, although DMT is more intense and briefer in its action--these things invoke the Logos, which means they work directly on the language centers, so that the important, uh, aspect of the experience is the dialogue. And, as soon as you discover this about psilocybin, about tryptamines, you have to decide whether or not to enter into the dialogue, to try and make sense of the incoming signal. And, uh, this is what I've done.

I don't call myself a scientist; I call myself an explorer, because the area that I'm looking at, there is not enough data to dream of a science. We're at the stage where people map one river and indicate other rivers flowed into it, but they didn't ascend those rivers and so nothing is known about that. And, this Baconian collecting of data, with no assumptions about what it has yielded--what it will yield, has pushed me to a number of conclusions that, uh, I didn't anticipate. I, uh, maybe by chronologically going through it I can explain to you what I mean, and describing these trips raises all of the issues.

I first took DMT in 1965, and a friend of mind came to me with this substance--how many of you have smoked DMT? [audience: "by injection"] By injection [audience member: "Yea. Wow!"] Yea [laughs]. Well, it's surprising so few have, because we live in a society that is absolutely obsessed with sensation; every kind of thing you can imagine: every therapy, every drug, every sexual configuration, all forms of media overload, all of these things are adored in this society. And, yet, here is something that actually, uh, hedonists that we are, pursuers of the bizarre that we are, this thing, uh, is too much. Or, at least as they say

in Spanish, *bastante*, "it's enough!" - so much enough that it's too much. Uh, you smoke it, and it comes on in about fifteen seconds. You essentially fall back unconscious; your eyes are closed, and you hear a sound like ripping cellophane, like someone crumbling up, uh, Saran Wrap or something like that and throwing it away. A friend of mine says this is your radio entelechy ripping out of the organic matrix. And, you hear a tone, one of these ascending [makes ascending tone], this kind of thing. And, then, there is the normal hallucinogenic drug modality, which is a shifting geometric surface of migrating and, uh, changing colored forms. And, then, you come up against this; it's like the [clears throat]--well, there must be some analogy in the--at the site of activity. All the bond sites are being occupied and you're actually seeing the state begin to come into being over a period of about thirty seconds. And, then you are in a place, which is, uh--well, I haven't taken all drugs. I think if someone tells you they have taken every drug, you know they're confessing they're a dilettante. It's, uh, much better to lean hard on a few. But, I've taken most of the ones that would reflect or give, uh, uh, a measure against this experience--and you find yourself in a space, uh, it has a feeling of being underground or somehow insulated and domed. It's what, in *Finnegans Wake* is called the "merry go raum," from the German word *raum*, for "space." And, you actually--the room is going around, and in that space you feel--and Amit brushed this this morning--you feel like a child; you feel that you have come out somewhere in eternity. And, it always reminds me of the fifty-third, uh, fragment of Heraclitus, which is: "The Aeon is a child at play with colored balls." And, you not only *become* the Aeon at play with colored balls, but there are entities, which are, in my book, *The Invisible Landscape*, I describe them as, uh, self-transforming machine elves, but--and this is sort of what they are; they're, um, dynamically contorting topological modules that are somehow distinct from the surrounding background, which is itself undergoing this continuous transformation. They al--I always think of the scene in, uh, *The Wizard of Oz* after the house knocks the witch down and she's in Munchkin Land and the head of the Munchkins comes with a scroll, and they all have very squeaky voices and they sing a little song about [in high pitch voice] "you are absolutely and completely dead" and they're marching around her [audience laughter]. So, the Munchkins come, these hyperdimensional machine-elf entities, and they bathe you in, uh, love, which is spelled L-U-V. It's a kind of, um--well, it's not erotic and it's not heartfelt, but it *sure feels good* [audience laughter]. And, what they are saying is "don't be alarmed. Remember. And, do what we are doing." Now, another [stutters] and one of the interesting characteristics of DMT, and another reason that I would prefer it over something like ketamine. With ketamine, you are not afraid. You go unafraid. I think one of the interesting things about judging a drug is to see how eager people are to do it the second time. If they're eager to do it the second time, it's probably not worth bothering about, because what is necessary to have validity in these experience is, uh, the terror. The terror is the stamp of validity on the experience, because it means, you know, *this is real*. We are in the balance, and, uh, in these states with these tryptamine drugs, we read the literature, we know what the maximum doses are, the LD-50, this and that. But, so great is one's faith in mind that, when you are out there, you *know* that the rules of pharmacology do not really apply and that control of existence on the plane is a matter of decision and luck and the roll of the dice. With ketamine you don't get this.

Uh, so they are reassuring you, these little entities, and saying, "don't worry, don't worry, do this, look at this." Meanwhile, eh-uh, you are completely there. Your ego is intact. Your fear reflexes are intact. You are not fuzzed out at all. And, consequently, your reaction is this.....[silent].....you know, and it persists, and it persists, and you breathe, and it persists, and they're saying, you know, "don't, don't get some loop of wonder going that quenches your ability to understand; just try not to be so amazed; try to hang in and look at what we're doing." And, what they're doing is, um, emitting sounds, like music, like language, and these sounds, uh, pass, as Philo Judaeus said that the Logos would when it became perfect, pass from being heard, without ever going over a quantized, uh, moment of distinction, into things beheld. And, so what

you--you hear and behold a language of alien meaning, which is taking place right in front of you and it is conveying alien, uh, information, which cannot be Englished.

Now, being a monkey, there is a--there is, uh, a kind of cognitive dissonance that is set up in our hindbrain when you a--encounter an unenglishable object, because you try to pour mind over it and it just sheds it like water off a duck's back. And, then you try again and you are looking at it, and this cognitive dissonance, this "wow" or "flutter" that is building off this object, uh, causes wonder or awe, awe at the brink of terror. So, you have to keep controlling that. And the way to control it is to do what they're telling you to do, which is "do what we are doing," and then you begin to experiment with your voice, and, uh, I've, uh--a phenomenon is possible. And, uh, by the way, I give this lecture in this way to invite the attention of experimentalists, whether they be shaman or laboratory people or tank people or whatever. Because, I'm telling you: there's something going on in this, uh--with these drugs that is, uh, not part of the normal spectrum of hallucinogenic drug experience as its, uh, known to be. So, you begin--you begin this glossolalia-like phenomenon, although it isn't classical glossolalia, which has been studied. In classical glossolalia, pools of saliva eighteen inches across have been measured on the floors of these South American churches after these, uh--where people have been kneeling. And, people always ask, after the glossolalia has happened; they turn to the people next to them and say, "Did I do it? Did I do it? Did I speak in tongues?" This isn't like that. This is simply a brain state which allows a--either the assembly language which lies behind language, or a primal language of the sort that Robert Graves was talking about in *The White Goddess*, or a Kabbalistic language of the sort that is described in the *Zohar*, a primitive, primal, proto-*Ursprache* that comes out of you, and you discover *you* can make the extraterrestrial objects - the feeling-toned, meaning-toned, three-dimensional rotating complexes of light and color in transformation...and you feel like a child. And, you are playing with colored balls; you have become the Aeon.

So, this happened to me twenty seconds after I did this drug, uh, on this day in 1965. And, I was, uh, appalled. I mean, I thought that I had my ontological categories intact, and I had taken LSD, and, just, it was all going forward, and this thing came upon me like a bolt from the blue. And, I came down and I said (and I said it many times while I was coming down), "I *cannot* believe it; this is *impossible*, this is *completely* impossible." Because, it was not, you know, that I was kneeling at the feet of some rishi or roshi or geshe or one of those guys; it was not, that it was--there was a declension of gnosis. It was that, friends, right here and now, one quanta away, there is raging a universe of active, uh, intelligence that is transhuman, hyperdimensional, and--but extremely alien. The god that John Lilly talks to, that they play these games with about moral values and setting the constraints of the universe is not like this god at all. The chief thing about the 'god of tryptamine', if we can use that; I call it the Logos; that's what I think it is--and I make no judgements about it. I constantly engage it in dialogue, saying, "Well, what are you? Are you some kind of diffuse consciousness which is in the ecosystem of the Earth? Are you, uh--and the problem with it is that it is just full of answers to these questions [audience laughter], you know. It's--it's the *true* history of the galaxy over the last four and half billion years is, uh, trivial to it. And, it can show you. You know, you can tune these images. And, of course, the question always is: independent validation, at least for a time, for me, the question was...but, as I attended more and more conferences like this and realized that the structure of the Western intellectual enterprise is so flimsy at the center that apparently no one knows anything, I became less, uh, reluctant to talk about these experiences. Because, they *are* experiences. They are primary datum for being. It is, uh, this is, uh, not remote, and yet it is *so* unspeakably bizarre that it casts into doubt *all* of man's historical assumptions. And, any of you who are familiar with the books I've written, I've entertained various ideas about it. When we first discovered the

mushrooms in South America, and, uh, it does these same things that DMT does, although it builds up over an hour and is sustained for a couple of hours and then comes down. But, there is the same confrontation with an alien intelligence, and, um, these extremely bizarre unEnglishable information complexes and the hint, the hint that's--that these drugs suggest that there is something that you can do with your body that you have never done, that no one has ever done, and that, yet, once it is done, it will be so obvious that it will fall right into the mainstream of cultural evolution. And, I suggest that, uh, language either is the shadow of what I'm talking or that what I'm talking about is a further extension of language. Perhaps, uh, you know, I mean *perhaps* a language, a human language is possible where there--actually the intent of meaning is beheld in three-dimensional space. If this can happen on DMT, it means it is at least, under some circumstances, accessible to human beings. Well, given ten thousand years and a high pressure technology looking at that, does anyone doubt for a moment that it could become, uh, just a cultural convenience in the same way that mathematics has become a cultural convenience or language has become a cultural convenience?

But, anyway, in confrontation with this organized entelechy on the other side, I--many theories were elaborated. Uh, the theory that we wrote about in the book on psilocybin, that teaches you how to grow it, was, uh, that it was in fact an extraterrestrial; that, in fact, the physical body of the mushroom was the flesh of a species that did not evolve on Earth; that, uh...and it, it--it said this; it had a whole rap. It said, "yes, well, once a culture takes control of its, uh, has complete understanding of its genetic, uh, information, it reengineers itself for survival. And, our version of that is a mycelial network strategy when in contact with the planetary surface and a spore dispersion strategy, uh, in terms of--as a means of--of radiating through the galaxy." And, uh, though I am troubled with how freely Bell's non-locality theorem is thrown around, nevertheless, my friends on the other side do seem to be in possession of a--a huge body of information drawn from the history of the galaxy. And they say that there is nothing unusual about this, that man's conceptions of, uh, organized intelligence and the dispersion of life in the galaxy and this sort of thing are just hopelessly culture-bound, and that the galaxy has been a, uh, an organized system for billions of years. And, that, and that life evolves under so many different regimens of temperature and pressure that searching for an extraterrestrial who will sit down and have a conversation with you is like searching for a good Italian restaurant out in the galaxy. The main problem with extraterrestrials is to *recognize* them. Because, time is so vast and evolutionary strategies so varied and environments so varied that, uh, the trick is to know that contact is being made at all. The mushroom, uh, if one can believe what it says in one of its moods, is a symbiote, and it desires symbiosis with the human species. It achieved it early, ah, by associating itself with the domesticated cattle that people keep. In other words, like the plants man grows and the animals he, uh, husbands, the mushroom sought to inculcate it into--self into that family, because it's very clear that where human genes, those genes will be carried. It's the old 'develop, uh, burrs so you can attach yourself to the fur of an animal and it c--will carry you with it wherever it goes'. The mushroom, by being domesticated by human beings, has become a part of the human family. But, this is all just beginning, in terms--speaking for a moment in terms of the classic mushroom cults of Mexico, they were destroyed by the coming of the conquest. The--the Franciscans had an absolute monopoly on theophagia [sic--theophagy], which is eating God; and when they came upon these people calling a mushroom *teonanacatl*, the flesh of the gods, they set to work. The Inquisition were able to push this thing into the mountains of Oaxaca so that it only survived in a few villages until Valentina and Gordon Wasson went, in the 1950s and found it there.

And, I--the metaphor I like, uh, for that, another metaphor; you see, you balance these explanations: now I'm going to sound like I don't think it's an extraterrestrial. It may be, it may not be. It may be what I've

recently come to suspect - that the human soul is so alienated from us in our present culture that, uh, we treat it as an extraterrestrial. The most alien thing in the cosmos is, uh, the human soul. That's why these movies like 'E.T.', or even 'Alien', uh, those guys could come tomorrow and, uh, the DMT trance is weirder [some audience laughter] and holds more promise for, uh, for information for the human future. Uh, it is--it is that intense a kind of thing. But, what I was saying was, um, they burned the mushroom cult, they forced it into repression, they burned the libraries of Greece at an earlier period, they dispersed the ancient knowledge, they shattered the stellar and astrological machinery that had been built (and, by "they," I mean the Greco-Hellenistic-Christian-Judaic tradition), and they build a triumph of mechanism; they realize the alchemical dreams of the 15th and 16th century and the 20th century with the transformation of elements, the discovery of, uh, gene transplant, and this kind of thing. But then, having conquered the New World, having driven its people into cultural fragmentation and diaspora, in the mountains of Mexico, they came upon the body of Osiris - the condensed body of Eros - where it had retreated at the coming of the Christos. And, this thing is now unleashed.

If any of you read, Phil K. Dick's--one of his last novels, *Valis*, where he talks about, uh, about the Logos, how it went into the ground. It was a creature of pure information, and it went into the ground at Nag Hammadi at the burying of the Chenoboskion Library in 270. But, it was information, and it existed there until 1947, and then the texts were translated, people read them, and as soon as people had the information in their minds, the symbiote came alive, because it is a thing of pure information. And, this is the same sort of thing. The mushroom consciousness *is* the consciousness of the Other, both in hyperspace, which means in dream and in the drug trance, at the quantum foundation of being, and in the human future, and after death. And, all of these places which were thought to be discrete and separate parts are seen to be part of a single continuum. The--what history is is the dash, over ten to fifteen thousand years, from monkeyhood to flying saucer, without ripping the envelope of the species so badly that the birth [sic]--that the birth is aborted and, uh, and, uh, fails, and we remain in physics.

[32:38] - BREAK IN REVIEW 1 (KW)

And, um, history essentially then is the shockwave of eschatology. Something is at the end of time and it is casting an enormous shadow over human history, drawing all human becoming toward it so that all the wars of history, the philosophies, the rapes, the pillaging, the migrations, the cities, the civilizations - all of this is occupying a microsecond of geological, planetary, and uh galactic time as the monkeys react to the symbiote, which is in the environment, which is feeding the information from the true- about the historical situation and the galaxy. And it is not [clears throat] I don't belong to the school of people who say 'well, we couldn't have done it if they hadn't taught us writing' and that sort of thing, this 'they came from the stars and taught us to measure' rap. What I'm saying is something I hope is more profound than that.

It's that as nervous systems evolve to higher and higher levels, they come more and more to understand the true situation in which they are embedded. And the true situation in which we are embedded is an organism, an organization of active intelligence that is on a galactic scale. And uh, science may be culture-bound, mathematics may be culture-bound. People can argue about these things but no one knows because we have never dealt with an alien mathematics or an alien culture except in this limited area that is ruled out of bounds by the guardians of the truth. In other words, shamanic experience, drug experience, this is ruled out of bounds and it is because it is the source of novelty, the cutting edge of the ingression of the

novel into the plenum of being is happening there.

I mean think about it for a moment: if the human mind does not loom large in the history, in the coming history of the human race, then what is to become of us? The people who worry about getting the epistemological and ontological bases of these things nailed down say that that the mathematics is in good order. What the problem is is that the mathematics does not map well into English or any other natural language, and so people have violent disagreements in English when they are completely in agreement over the mathematical foundation of it. So I am saying, uh, we are at the beginning of human thought. This is uh, the birth crisis of intelligence, and intelligence is something which is moving through the higher primates now at greater and greater speed. We know that the primate species, that were not human, that chipped tools and made fire and drilled beads. So, uh, the question 'are we unique' it has already been answered by the physical anthropologists. There have been other intelligent monkeys walking this planet. We exterminated them, and so now we are unique, but uh, what is loose on this planet is language, self-replicating information systems. Uh, it may be a further rarefication or a further hyposthetization of what is happening in DNA, in other words, learning, coding, templating, recoding, testing, re-testing, re-coding. It may be- and the immune system does that too- it may be an extension of that or it may be a quality of an entirely different order. But whatever it is, it is in the monkeys now and moving through them and moving out their hands and into the *techne* with which we have surrounded ourselves.

The end state that this pushes toward tryptamine state seems to be in that sense transtemporal; it is an anticipation of the future, it's, it's [clears throat] as though Plato's metaphor were true. Plato said "time is the moving image of eternity." The tryptamine state is as though you've stepped out of the moving image and into eternity, into the *nunc stans*, the standing now, the nunc stans of Thomas Aquinas. In that state, all of human history is seen to lead toward this culminating moment. Acceleration is visible in all the processes around us: the fact that fire was discovered several million years ago; language came perhaps thirty-five thousand years ago; measurement, five thousand; Galileo, four hundred; then Watson-Crick and DNA. What is obviously happening is that everything is being drawn together. On the other hand, the description our physicists are giving us of the universe - that it has lasted billions of years and will last billions of years into the future - is a dualistic conception, an inductive projection that is very unsophisticated when applied to the nature of consciousness and language. Consciousness is somehow able to collapse the state vector and thereby cause the stuff of being to undergo what Alfred North Whitehead called "the formality of actually occurring." Here is the beginning of an understanding of the centrality of human beings. Western societies have been on a decentralizing bender for five hundred years, concluding that the Earth is not the center of the universe and man is not the beloved of God. We have moved ourselves out toward the edge of the galaxy, when the fact is that the most richly organized material in the universe is the human cerebral cortex, and the densest and richest experience in the universe is the experience you are having right now. Everything should be constellated outward from the perceiving self. That is the primary datum.

The perceiving self under the influence of these hallucinogenic plants gives information that is totally at variance with the models that we inherit from our past, yet these dimensions exist. One one level, this information is a matter of no great consequence, for many cultures have understood this for millennia. But we moderns are so grotesquely alienated and taken out of what life is about that to us it comes as a revelation. Without psychedelics the closest we can get to the Mystery is to try to feel in some abstract mode the power of myth or ritual. This grasping is a very overintellectualized and unsatisfying sort of process.

As I said, I am an explorer, not a scientist. If I were unique, then none of my conclusions would have any meaning outside the context of myself. My experiences, like yours, have to be more or less part of the human condition. Some may have more facility for such exploration than others, and these states may be difficult to achieve, but they are part of the human condition. There are few clues that these extradimensional places exist. If art carries images out of the Other from the Logos to the world - drawing ideas down into matter - why is human art history so devoid of what psychedelic voyagers have experienced so totally? Perhaps the flying saucer or UFO is the central motif to be understood in order to get a handle on reality here and now. We are alienated, so alienated that the self must disguise itself as an extraterrestrial in order not to alarm us with the truly bizarre dimensions that it encompasses. When we can love the alien, then we will have begun to heal the psychic discontinuity that has plagued us since at least the sixteenth century, possibly earlier.

My testimony is that magic is alive in hyperspace. It is not necessary to believe me, only to form a relationship with these hallucinogenic plants. The fact is that the gnosis comes from plants. There is some certainty that one is dealing with a creature of integrity if one deals with a plant, but the creatures born in the demonic artifice of laboratories have to be dealt with very, very carefully. DMT is an endogenous hallucinogen. It is present in small amounts in the human brain. Also it is important that psilocybin is 4-phosphoralkoxy-N,N-dimethyltryptamine and that serotonin, the major neurotransmitter in the human brain, found in all life and most concentrated in humans, is 5-hydroxytryptamine. The very fact that the onset of DMT is so rapid, coming on in forty-five seconds and lasting five minutes, means that the brain is absolutely at home with this compound. On the other hand, a hallucinogen like LSD is retained in the body for some time.

I will add a cautionary note. I always feel odd telling people to verify my observations since the sine qua non is the hallucinogenic plant. Experimenters should be very careful. One must build up to the experience. These are bizarre dimensions of extraordinary power and beauty. There is no set rule to avoid being overwhelmed, but move carefully, reflect a great deal, and always try to map experiences back onto the history of the race and the philosophical and religious accomplishments of the species. All the compounds are potentially dangerous, and all compounds, at sufficient doses or repeated over time, involve risks. The library is the first place to go when looking into taking a new compound.

We need all the information available to navigate dimensions that are profoundly strange and alien. I have been to Konarak and visited Bhubaneswar. I'm familiar with Hindu iconography and have collected thankas. I saw similarities between my LSD experiences and the iconography of Mahayana Buddhism. In fact, it was LSD experiences that drove me to collect Mahayana art. But what amazed me was the total absence of the motifs of DMT. It is not there; it is not there in any tradition familiar to me.

There is a very interesting story by Jorge Luis Borges called "The Sect of the Phoenix." Allow me to recapitulate. Borges starts out by writing: "There is no human group in which members of the sect do not appear. It is also true that there is no persecution or rigor they have not suffered and perpetrated." He continues,

- ...the rite is the only religious practice observed by the sectarians. The rite constitutes the Secret.

This Secret...is transmitted from generation to generation. ...The act in itself is trivial, momentary, and requires no description. ...The Secret is sacred, but is always somewhat ridiculous; its performance is furtive and even clandestine and the adept do not speak of it. There are no decent words to name it, but it is understood that all words name it or, rather, inevitably allude to it.

Borges never explicitly says what the Secret is, but if one knows his other story, "The Aleph," one can put these two together and realize that the Aleph is the experience of the Secret of the Cult of the Phoenix.

In the Amazon, when the mushroom was revealing its information and deputizing us to do various things, we asked, "Why us? Why should we be the ambassadors of an alien species into human culture?" And it answered, "Because you did not believe in anything. Because you have never given over your belief to anyone." The sect of the phoenix, the cult of this experience, is perhaps millennia old, but it has not yet been brought to light where the historical threads may run. The prehistoric use of ecstatic plants on this planet is not well understood. Until recently, psilocybin mushroom taking was confined to the central isthmus of Mexico. The psilocybin-containing species *Stropharia cubensis* is not known to be in archaic use in a shamanic rite anywhere in the world. DMT is used in the Amazon and has been for millennia, but by cultures quite primitive - usually nomadic hunter-gatherers.

I am baffled by what I call "the black hole effect" that seems to surround DMT. A black hole causes a curvature of space such that no light can leave it, and, since no signal can leave it, no information can leave it. Let us leave aside the issue of whether this is true in practice of spinning black holes. Think of it as a metaphor. Metaphorically, DMT is like an intellectual black hole in that once one knows about it, it is very hard for others to understand what one is talking about. One cannot be heard. The more one is able to articulate what it is, the less others are able to understand. This is why I think people who attain enlightenment, if we may for a moment compare these two things, are silent. They are silent because we cannot understand them. Why the phenomenon of tryptamine ecstasy has not been looked at by scientists, thrill seekers, or anyone else, I am not sure, but I recommend it to your attention.

The tragedy of our cultural situation is that we have no shamanic tradition. Shamanism is primarily techniques, not ritual. It is a set of techniques that have been worked out over millennia that make it possible, though perhaps not for everyone, to explore these areas. People of predilection are noticed and encouraged.

In archaic societies where shamanism is a thriving institution, the signs are fairly easy to recognize: oddness or uniqueness in an individual. Epilepsy is often a signature in preliterate societies, or survival of an unusual ordeal in an unexpected way. For instance, people who are struck by lightning and live are thought to make excellent shamans. People who nearly die of a disease and fight their way back to health after weeks and weeks of an indeterminate zone are thought to have strength of soul. Among aspiring shamans there must be some sign of inner strength or a hypersensitivity to trance states. In traveling around the world and dealing with shamans, I find the distinguishing characteristic is an extraordinary centeredness. Usually the shaman is an intellectual and is alienated from society. A good shaman sees exactly who you are and says, "Ah, here's somebody to have a conversation with." The anthropological literature always presents shamans as embedded in a tradition, but once one gets to know them they are always very sophisticated about what they are doing. They are the true phenomenologists of this world; they know plant chemistry, yet they call these energy fields "spirits." We hear the word "spirits" through a series of narrowing declensions of meaning that are worse almost than not understanding. Shamans speak

of "spirit" the way a quantum physicist might speak of "charm"; it is a technical gloss for a very complicated concept.

It is possible that there are shamanic family lines, at least in the case of hallucinogen-using shamans, because shamanic ability is to some degree determined by how many active receptor sites occur in the brain, thus facilitating these experiences. Some claim to have these experiences naturally, but I am underwhelmed by the evidence that this is so. What it comes down to for me is "What can you show me?"

I always ask that question; finally in the Amazon, informants said, "Let's take our machetes and hike out here half a mile and get some vine and boil it up and we will show you what we can show you."

Let us be clear. People die in these societies that I'm talking about all the time and for all kinds of reasons. Death is really much more among them than it is in our society. Those who have epilepsy who don't die are brought to the attention of the shaman and trained in breathing and plant usage and other things - the fact is that we don't really know all of what goes on. These secret information systems have not been well studied. Shamanism is not, in these traditional societies, a terribly pleasant office. Shamans are not normally allowed to have any political power, because they are sacred. The shaman is to be found sitting at the headman's side in the council meetings, but after the council meeting he returns to his hut at the edge of the village. Shamans are peripheral to society's goings on in ordinary social life in every sense of the word. They are called on in crisis, and the crisis can be someone dying or ill, a psychological difficulty, a marital quarrel, a theft, or weather that must be predicted.

We do not live in that kind of society, so when I explore these plants' effects and try to call your attention to them, it is as a phenomenon. I don't know what we can do with this phenomenon, but I have a feeling that the potential is great. The mind-set that I always bring to it is simply exploratory and Baconian - the mapping and gathering of facts.

Herbert Guenther talks about human uniqueness and says one must come to terms with one's uniqueness. We are naive about the role of language and being as the primary facts of experience. What good is a theory of how the universe works if it's a series of tensor equations that, even when understood, come nowhere tangential to experience? The only intellectual or noetic or spiritual path worth following is one that builds on personal experience.

What the mushroom says about itself is this: that it is an extraterrestrial organism, that spores can survive the conditions of interstellar space. They are deep, deep purple - the color that they would have to be to absorb the deep ultraviolet end of the spectrum. The casing of a spore is one of the hardest organic substances known. The electron density approaches that of a metal.

Is it possible that these mushrooms never evolved on earth? That is what the *Stropharia cubensis* itself suggests. Global currents may form on the outside of the spore. The spores are very light and by Brownian motion are capable of percolation to the edge of the planet's atmosphere. Then, through interaction with energetic particles, some small number could actually escape into space. Understand that this is an evolutionary strategy where only one in many billions of spores actually makes the transition between the stars - a biological strategy for radiating throughout the galaxy without a technology. Of course this happens over very long periods of time. But if you think that the galaxy is roughly 100,000 light-years from edge to edge, if something were moving only one one-hundredth the speed of light - now that's not a

tremendous speed that presents problems to any advanced technology - it could cross the galaxy in one hundred million years. There's life on this planet 1.8 billion years old; that's eighteen times longer than one hundred million years. So, looking at the galaxy on those time scales, one sees that the percolation of spores between the stars is a perfectly viable strategy for biology. It might take millions of years, but it's the same principle by which plants migrate into a desert or across an ocean.

There are no fungi in the fossil record older than forty million years. The orthodox explanation is that fungi are soft-bodied and do not fossilize well, but on the other hand we have fossilized soft-bodied worms and other benthic marine invertebrates from South African gunflint chert that is dated to over a billion years.

I don't necessarily believe what the mushroom tells me; rather we have a dialogue. It is a very strange person and has many bizarre opinions. I entertain it the way I would any eccentric friend. I say, "Well, so that's what you think." When the mushroom began saying it was an extraterrestrial, I felt that I was placed in the dilemma of a child who wishes to destroy a radio to see if there are little people inside. I couldn't figure out whether the mushroom is the alien or the mushroom is some kind of technological artifact allowing me to hear the alien when the alien is actually light-years away, using some kind of Bell non-locality principle to communicate.

The mushroom states its own position very clearly. It says, "I require the nervous system of a mammal. Do you have one handy?"

Revision History <#>

- v1.0 - Dec 1982 - Dolphin Tapes - From a talk given at the Lilly/Goswami Conference on Consciousness and Quantum Physics at the Esalen Institute in Big Sur, California. This was the first of many lectures that Terence gave at Esalen. A transcription of his talk appears in Terence's 1991 book *The Archaic Revival*, wherein the incorrect year of 1983 is given for the talk.
- v1.1 - Oct 1999 - Hosted by Erowid. Text taken from the Hyperreal Drug Archives, which used *The Archaic Revival* as its source.
- Erowid Note: The audio recording of this talk was republished in 1986 by Lux Natura, and has [recently been posted online](#). In addition to appearing in the 1991 book *The Archaic Revival*, a longer transcription of the recording that includes some of the audience question-and-answer session was published in 1993 in the *Jahrbuch für Ethnomedizin und Bewußtseinsforschung/Yearbook for Ethnomedicine and the Study of Consciousness* Nummer/Issue 2, 1992. Versions of this talk also appeared in the 1996 magazine *Towards 2012, Part II* and in the 2003 *Book of Lies: The Disinformation Guide to Magick and the Occult*.

[Introduction of Timothy Leary]: He's an old friend of all of ours, so, I'd like you all to welcome, uh, Timothy Leary [audience applause and cheers].

[Introduction by Timothy Leary]: Yea.....[laughs] I for one am overjoyed to be here [audience applause].....
[LEARY INTRODUCTION NOT FULLY TRANSCRIBED]

This has not been an easy ten months for the people of this planet or the planet itself. I want to reach back tonight and invoke a vanished tradition, get to the heart of it and try to show how we can bring this forward in our lives to empower hope in the most dark of situations and even make these dark situations the raw material of a clearer, stronger hope than might ordinarily be the case. A few days ago I was talking to a friend of mine and he wanted to tell me the story of sitting in the presence of a 104 year old Vietnamese monk. The guy had basically kept his mouth shut, the monk, and hadn't said much around the monastery where he just sort of cleans up. Then he announced he wanted to talk about meditation and he opened his remarks by saying, "we are all luminous beings, why then do we not appear before each other radiant in our lumination?"

This is the conundrum of life. This is the problem. It was T.S. Eliot who said, "Between the idea and the reality, between the motion and the act, falls the shadow." Why is that? As psychedelic people, this is the problem that we grapple with in our own lives and when we look out at the world. You've heard me say many times, we have the vision, we have the money, we have the technology but why can we not then appear before each other as radiantly luminous beings and why cannot we reclaim our planet from toxification, disease, overpopulation and bonehead politics. You know the list. What is the hang up here? What is the problem? Why is perfection so distant?

Well what I've learned from life, vegetables, travels and books can be summed up in two Greek words. It's the central message of the philosopher Heraclites. He was always my favorite philosopher but whenever I would read about him, he was called the crying philosopher. I had to live to be 44 years old to understand the poignancy of Heraclites' message. He said in a nutshell, *Panta rhei*. All flows. Nothing lasts. Nothing is permanent. This is the hardest message life has to teach because what it says is: your joy is transient, your anguish is transient, your fortune, your home, your dream, your moments of great ecstasy, your moments of great insight and your moments of great empowerment. Everything is flowing through your hands at the

moment that you are aware of it.

William Blake, who in a way set this engine going a couple of centuries ago said, "What is the price of experience? Is it bought for a song or wisdom for a dance in the street? No, it is bought with all that a man hath. His wife, his home, his children." Now this is not a pessimistic message and William Blake was not a pessimistic guy. He was the same guy who told us that if we could but cleanse the doors of perception, we would perceive the world as it is: infinite in a grain of sand. How can we take this poignancy, this sense of impermanence, and weld it into something that is paradoxically indestructible and has meaning in our lives and gives us not only the strength to carry on but also the power to be exemplars. The power to stand up before other people and let them feel the power of vision in the paradox of permanence in the face of the need for indestructibility.

To answer that question, I felt that we had to leave the narrow confines of 20th century thinking and we had to reach back into the byways of human thought that have been, by most of us, somewhat passed over and forgotten. After all, modern life makes great demands on us. It's enough just to keep your checkbook balanced and your insurance paid. We can't all spend our time delving in the libraries of noetic, Gnostic, Hermetic and magical traditions. But I thought it was worthwhile to talk to you about this tonight because we have been through such a difficult ten months.

It was also Heraclites, the all flows guy, who said 'all is war.' All is war. What he meant was, everything occurs in the presence of it's opposite and out of that, there is generated the friction, the heat and the light that all comes together in an indissoluble package as part of life. So what I want to talk to you about tonight and how it relates to unfolding the stone is the notion of alchemy of all things. Alchemy as I'm sure many of you know, is really the secret tradition of the redemption of spirit from matter. Many of you may imagine that alchemy is simply a discredited pre-scientific obsession of unbalanced minds interested in changing base metals into gold; lead into the stuff of commerce. This is the beknighted reputation that alchemy has acquired in the century so given over to the literal, the material and the non-spiritual that it lost all touch with the adumbrations of meaning that vibrate behind the perceptions of the alchemist.

The central conception of alchemy is the conception of the philosopher's stone. What is it? It's the universal panacea at the end of time. It's the chocolate cake that your mother made once a week when you were a child. It is the *pana supersubstantialis*. It's all things to all men and all women. If you're hungry, you eat it. If you're dirty, you shower under it. If you need to go somewhere, you sit on it and you fly there. If you have a question, it answers it. It's something that the human mind senses in itself and is related to, invoked and worshipped over centuries, before the slow rise of the patriarchy, rationalism and materialism turned it into a myth and a fairy tale.

It is not a myth or a fairy tale. It is the burning primary reality that lies behind the dross of appearances. Alchemy is based on a philosophy called Hermeticism that was developed in the first and second centuries by Gnostic thinkers, Greeks, Jews and people inside the Roman Empire as it was beginning to show the first signs of degradation and decay that felt a profound disaffection with their world. A disaffection that on the scale of those times was as profound as our own existential disaffection. The Hermetic philosophers drew back from the rise of Christianity with its doctrine of the fall of man, original sin and the stain of Adam and Eve. These hermeticists took a different tact and made two points that I think we need to recover and live out for ourselves.

The first point was that 'man,' which means men and women - human beings - are divine beings. Not lower than the angels but higher than the angels. The message of the alchemical and hermetic thinkers and the corpus hermeticum actually uses the phrase; "Man is God's brother." We have no idea what it would mean in our own lives if we could throw off the notion of ourselves as fallen beings. We are not fallen beings. When you take into your life the gnosis of the light filled vegetables, the psychedelic plants that have stabilized the same societies of this world for millennia, the first message that comes to you is that you are

a divine being. You matter. You count. You come from realms of unimaginable power and light and you will return to those realms.

The second point that these philosophers wanted to make was that fate can be overcome. Fate can be overcome! Now for the Greco-Hellenic world, what that meant was the starry engines of the machinery of fate that they saw strewn across the night sky. They were intensely aware of the power of the zodiac, the stellar shells inhabited by demons that extended out to the unimaginable imperium of the all father that was beyond fate. Into that world of astrological fatedness, which is such a strong idea for the Greek mind, the hermeticist announced that fate can be overcome and they have a novel answer for how this could be done. It can be done through magic. A word not often enough heard in the present world.

The overcoming of fate is achieved through magic and then the stellar machinery becomes not an invasive force into one's life but an empowering force. Now, some of us may believe in astrology and some of us may not, but we are all strongly influenced by the notion that fate and of our powerlessness in an existential world. John Paul Sartre said that nature is mute and we, embedded in the media dense, message dense and programming dense matrix of these hyper societies that we have created – often feel like hapless atoms running endlessly according to the blueprints and programs of unseen masters. Whether it's the banking industry, Madison Avenue, whoever, we tend to disempower ourselves. We tend to believe that we don't matter and in the act of taking that idea to ourselves, we give everything away to somebody else and to something else. So the rebirth of the sense of the stone and its possibility within each of us entails these two ideas - our divinity and our power to overcome fate. There is no inevitability in our lives unless we submit to the idea of inevitability and then give ourselves over to it.

I wish there were more jokes but it's just been such a tough go. It's been a tough go, I have to tell you. Where can we look in the world to see some confirmation of what I'm saying? How can we draw it down from being an airy-fairy rap of a bardic Irishman? Well, I think the place to look is history. If you go to the academies, those Ivory towers that Tim Leary was talking about and ask, what is history? They will tell you that it is a random walk. They will tell you it's an endlessly pointless fluctuation. Empires rise and fall. Migrations of people come and go. It is essentially meaningless. I don't believe this. I don't even think there is strong evidence for it because what I perceive when I look at the world, not only the world of history but the world of nature out of which history has emerged, I see novelty. I see something wonderful, maddening, paradoxical, ever increasing and ever more conserved. Every iota of novelty that comes into existence is somehow saved and passed on. That's why when we walk or drive down Melrose, we see Egyptian fashion motifs and we see fashion statements drawn from the 14th century, the 2nd century, Assyria, Egypt and Angkor Wat. All of the novelty of history coalesces in the living moment. It's always been that way. Every society in the moment of its existence has lived as a resonance, a completion and a distillation - a good alchemical word - of what has proceeded before.

The alchemy idea that spirit can be redeemed from matter begins to get teeth when you connect the idea of spirit to the idea of novelty, which has not ordinarily be done. Novelty is the life of the party and the life of the party is to be high-spirited. This is what we need to focus on as the thread of the dark labyrinth of the prison of the material world that can lead us back to the light. The universe is an engine for the production of novelty. It always has been since the first moment of the big bang, 20 to 25 billion years ago. Simpler states have been replaced by more complex states, which have then set the stage for greater complexity.

The drift of this then is the emergence of language, tools, culture and higher ideals, like courage and love and self-sacrifice. These ideas are not flukes, sports or mistakes. These are further steps along the way in the process of the great alchemical furnace of being – heating and casting, dissolving and recasting, purifying and recasting alchemical gold. So, hard as the world may appear, dark as the hour may appear, in reality we exist in a dimension of greater opportunity, greater freedom and greater possibility than has ever

been. The challenge is to not drop the ball. The challenge is to know this, to act on it and to slough off all the leeches, back handlers, weasels and crypto-fascists who want to deny that and turn man into a machine for their own purposes.

Alchemy has always perceived this and has delineated stages in the transformational process. These stages are worth talking about, not in the details, but in the two bipolar states that define this. They used a bastard Latin and they called them the Nigredo and the Albedo. The Nigredo is the precondition for transformation and what is it? It's shit. It's detritus. It's flotsam. It's debris. It's being HIV positive. It's being deep into your 4th marriage and sinking fast. It's bankruptcy. It's serum hepatitis. It's the inevitable dark night of the soul that comes upon us, and these dark nights of the soul come on all of us. Nobody gets through this world without a little dung raining down on them. Believe me, you may evade it for decades but then there'll be a knock on the door. It's said that the millstones of fate grind slowly but they grind exceedingly fine.

So what do we do with that? The answer is, we welcome it. This is what the alchemists awaited: the Nigredo, the prima materia, the dark matter and the chaos that is the precondition then for redemption. And God knows, we've got lots of chaos right now. We have war, famine, and revolution, millions of homeless people on the move. The nation state is dissolving. The relief agencies of the world can't keep up. The various secret societies, mafias and cabals that have always tried to tie us into chains, they're all working overtime. We are in the nigredo condition. Hallelujah. This means that the kissing has to stop but the fun can begin; the real fun.

The other end of this bipolar condition in alchemy was called the albedo. The albedo, the whitening, and that means out of the chaos can come a new beginning, a new reality, and a new hope. These alchemists existed in a philosophically more naïve, quote "more naïve" world than we do - so they actually projected onto the processes of matter their own interior psychic condition. They did work with matter, fire, furnaces and retorts and what they would do is - they would take the prima materia, lead or excrement or something else, and then they would heat it. They would turn it to ash and then calcinate the ash, or pour solvents through the ash and get an extract, and then heat that and sublime it. Out of this, almost as a footnote, came modern chemistry, but that was not the important side of it. The important side of it was that they were projecting mental states onto the swirling retorts of their laboratory. It was like a magical mirror for them. It was in fact, dare we say the P word; it was psychedelic. What psychedelic means is getting your mind out in front of you by whatever means necessary so that you can relate to it as a thing in the world and then work upon it.

So from the nigredo to the albedo, there were a series of these stages. Now I said a few minutes ago that magic was the key and by magic I mean, the reclaiming and the reconstruction of language to a sufficient degree that it becomes at first possible, then probable, then inevitable to each one of us, that miracles can happen. Miracles can happen! The Grateful Dead have a song, "we need a miracle everyday." We do need a miracle everyday. Well is that too tall an order? I don't think so.

Years ago, one of these talking vegetables said to me, "mind conjures miracles out of time." Out of time! Time is the prima materia on which the alchemical process works. The alchemist, again in their 'naïve' way, believed that precious metals, diamonds, gold and sapphires actually grew in the earth because from the alchemical point of view, everything was alive. My friend Rupert Sheldrake is leading the charge to create a new birth of that perception inside science. The idea that nature, all of nature, is alive. Not simply organic cellular nature but that the earth itself is a living being. So mind conjures miracles out of time. The proof that this can be done and it's an incontrovertible truth - and I defy any naysayer or bring-down to overcome it - is ourselves. We are the proof that mind can conjure miracles out of time. If it weren't for us, there would just be birds, foxes, coral reefs, and glaciers, but nature was not content with that level of novelty. A million years ago; 100,000 years ago, nature grew discontented. It said, let's raise the ante. Let's

go to higher stakes poker in this planetary game. Let the monkeys speak. Let them build fires. Let them elaborate tools. Let them march forward onto the stage of creation. And remember I said that Hermetic faith was that humankind could act as the brothers and sisters of God. Not moats in God's creation, but co-partners in the invocation out of being of yet greater novelty. Why? It is for play, for fun, just the cosmic madness of it all, and the pure cussedness of it all to raise the stakes higher and higher and higher. Now, I keep going back to this thing of 'can it be done?' I want to convince you because I'm so certain.

I love Herman Melville and his rhetoric, and friend's of the whale, bear with me. For Herman Melville, the whale was not the endangered creature it is today. It was the dark cosmic God of Christianity that haunts us and tries to pull us down. There's a wonderful speech in Moby Dick where Starbuck, the first mate - you remember wimpy little Starbuck, he stood for Christian right reason - he says to Captain Ahab, "to seek revenge on a dumb brute seems blasphemy." Ahab says, "Blasphemy Starbuck? Speak not to me of blasphemy; I would strike out the sun if it insulted me. For could it do that, then could I do the other? For there is ever a sort of fair play." That's the point of that rap. There is a sort of fair play. You've been told from the cradle that the deck was stacked against you with the fall of man, original sin and so forth and so on. It's bullshit! It's absolute bullshit. There is a sort of fair play and if you can get in touch with that in your life.

When Mohammed wouldn't come to the mountain, the mountain came to Mohammed. That's fair play! If you can have that perception, the world will begin to work for you. It will begin to move towards you as the mountain moved to Mohammed. The mushrooms said to me once, nature loves courage. Nature loves courage and I said - what's the payoff on that? It said, it shows you that it loves courage because it will remove obstacles. You make the commitment and nature will respond to that commitment by removing impossible obstacles. Dream the impossible dream and the world will not grind you up. It will lift you up. This is the trick. This is what all these teachers and philosophers, the one's who really counted, who really touched the alchemical gold - this is what they understood. This is the shamanic dance in the waterfall. This is how magic is done. It's done by hurling yourself into the abyss and discovering that it's a feather bed. There's no other way to do it. This is why I have always taken the position, that as modern people we can't go out and set arms marching or launch religions - who would want to anyhow - but to the people who say adventure has fled, that it's all humdrum, I just know that they have forgotten the 5 grams of psilocybin in their refrigerator.

Magellan may have had excitement rounding the horn but you in your living room later tonight can put him in the shade if you have the courage to do the things that are necessary to do, and we know what they are. The first thing to do is to tell society to fuck off because they don't know what's going on. This is a matter between the person and the planet. It is a matter between the person and the planet. All the detritus of history and all the games that people have tried to lay on you; know that they just want to get you down in the ditch they're in. We know this because aboriginal societies have never broken the faith. The living gnosis is still there and not only for people who paint themselves blue and dance around buck-naked but for us as well. It takes an act of courage - not a weekend at Esalen and not a trip to the ashram where they tell you that if you sweep up for a dozen years then they'll hand on a whammy. No, the speed with which you can reach depth is under 45 seconds if you know where the elevator shaft is, and you do. I don't have to tell you, I've been telling you.

There's one more alchemical metaphor, or stage, that I want to mention here because I think it refers to this psychedelic possibility. Not all the alchemists included this stage in their recensions of the work, but for me, I think it's central. Again in their church of bastardized church Latin, they called it the *cauda pavonis*, the peacock's tail. Now the physical basis of this, if you ever played around with metal and fire, there are certain metals when they pass to a certain temperature range, iridescent colors play across the surface and sometimes even freeze. In the glazing of pottery at low temperatures, like in Raku, what these

pottery masters are aiming for are these wonderful iridescent surfaces that play across the glaze and then can be frozen into it.

This is the peacock's tail and in alchemy, this was thought to precede the final whitening. This is the passage into the pure and the goal really. Rather than see the present world as exclusively a veil of tears and a black prison - none of these metaphors are mutually exclusive - the great strength of alchemical thinking and the way in which it is completely antithetical to science and in fact why science has so much contempt for it, it's because the alchemist had the wisdom to see that everything occurs in the presence of it's opposite. It's not either-or, it's both-and. They called this the *coincidentia oppositorum*. This is the coincidence of opposites, the union of opposites.

This is a great truth because I think all of us live under the rubrics of, "am I good or am I bad? Am I lazy or am I obsessed?" The answer is that it is never one or the other. It does a tremendous injustice to being to ignore the union of opposites. Now science in order to do it's work, which is essentially a technological work and not a deep philosophical work - it's a minor art, science, that's all it is - it's the art of the physically possible. But it has presumed to be the arbiter of all thoughts, all feelings and all work. My God, the hubris of Rene Descartes to divide the world into the primary and secondary qualities, and what are the primary qualities? They are motion, mass, spin and momentum. What are the secondary qualities? They are color, feeling, taste and tactility. This tells you that you're nothing. You never touch reality; you live in that world of sense. Therefore can only aspire to the real world through some kind of mathematical disembowelment of what your own body and what your own feelings are telling you.

In the *cauda pavonis*, the peacock's tail, this is where the contradictions meet. This is where they generate heat and light, and an excruciating sense of poignancy, meaning and identity. Our world, as we experience it tonight, is quintessentially - another good alchemical word - quintessentially that *coincidentia oppositorum*. Where do we meet this most dramatically in our lives? I think we meet it in the phenomenon of birth. If you had just parked your flying saucer in the bushes and came from a world where sexuality was unknown and people were grown in vats and you came upon a woman in the act of giving birth, it would appear to be a catastrophe in progress, a tragedy at the limits of tragedy. Blood is being shed, anguish is on the surface, real agony pervades the situation, and yet - nature in her wisdom, has bound pain and ecstasy, death and completion, regeneration and dissolution into that experience in such an indissoluble fashion that no woman can miss the point. No *woman* can miss the point.

Unfortunately men have traditionally averted their eyes and this has gone on in the hut at the edge of the village. Nobody wanted to be there. Maybe the shaman would be there, but he was loaded in order to be there, and the mystery of mysteries goes on outside the site of men.

Now in our world, we are caught in this kind of metaphor. A cosmic birth, a birth of planetary scale is underway. There is agony; there is no doubt about it. I remember an embryologist, who once taught me that the fetus in the womb is literally sculpted by the hand of death. The immature hand of the fetal organism is a webbed claw and that it isn't that the flesh retracts to form the human hand, it's that the cells in between die and slough off into the amniotic fluid and are carried away. The fetal child is literally sculpted into life by the hand of death. Our world is in this kind of circumstance. There are no rational solutions at this point. We are now in the hands of the miracle makers - the shamans, the mind of the planet, the life of the ocean and the atmosphere. It's going to get tougher so we have to forge the indestructible adamantine stone of alchemical hope because heavier challenges lie ahead.

One hundred years from now, two hundred years from now, I cannot but imagine that this planet will be empty of human beings. Not because we have become extinct but because we have gone to our fate. It's unimaginable at this moment because we are in the planetary birth canal. We are at the peak of transition right now and the walls are literally closing in. We are being suffocated. We are fighting like a strangled man to try and save ourselves. Yet we have to believe, and I invite you to educate yourself about the

history of the planet, there is no reason not to believe that we will come through. We will come through! There is light at the end of the tunnel. There is a meaning to history, but it's an alchemical meaning. History is a vast alchemical engine for the forging of an alchemical humanity.

I don't have the answers, believe me. I don't know whether we go to another star or whether we become eight angstroms high and all live in a block of metal underneath Mt. Everest, or whether we march off to the heart of the sun. The scenarios are endless because the human imagination has such a power to bootstrap itself to higher and higher levels. What would Paleolithic man have made of the religion of Pharaonic Egypt? What would the Pharaohs have made of the engines of war and hydraulic machinery created by the Romans? What would the Gothic Scholastic Enlightenment have made of the age of cybernetics, psychedelics and virtual reality? The imagination is the alchemical Deus Ex Machina that can lift us out of time, out of the nigredo of history and into higher and higher states of being.

Now there is no reason to simply ride along in this process, because another perception of the alchemist that is central to getting this all lined up so that it works, is the idea of the macrocosm and the microcosm. What does that mean? It means that the world truly is fractal in the most profound sense. Meaning that what is going on, on some very large scale, is condensed, intensified and recapitulated on smaller scales. So the dynamics of a love affair are the dynamics of an empire. Both are the dynamics of the evolution, expansion and extinction of a species. There is only one way that things can happen and whether were talking about microphysical events or the life of an entire solar system, the curve of binding energy is going to be the same. That means that this redemption of spirit from matter, which is the historical process that we are embedded in, we can do our part by working on our small section of this - which is ourselves. This is why alchemy was so fascinating to the Jungian psychologists. They saw that this work of redeeming spirit from matter is nothing more than the work of redeeming the self from the contaminated dross of the traumatized and damaged psyche that we each inherit from our passage through the parental shit pile. We each have that gift to deal with. That nigredo is within ourselves. This is why we're in therapy, why we take psychedelics or why we meditate. We do this because we all have this dross within us, and this is a great gift. It means that we can begin consciously the process of distillation and sublimation, and casting of ourselves into that golden being, that luminous creature that this 104 year Vietnamese monk sensed and evoked to my friend. But it's more than that.

We do that alchemical work to perfect our own sense of the union of opposites and our own sense of the presence of the living alchemical stone within, in order that we may then participate, act in and be part of the transformation of the planet. It is an immense transformation and there is no reason to doubt it because the emergence of organic life from what preceded it is as dramatic a miracle as anyone could imagine. The emergence of language from mute bestiality, which is only 100,000 years in the past, is as dramatic a miracle as anyone could imagine. The emergence of a planet instantaneously unified by electricity and media is - and this is only 50 or 60 years in our past and it's still going on - as dramatic a miracle as anyone could imagine.

It's absolutely irrational to not be filled with the fire of consuming hope. You just have to overcome the leveling that we inherit from these empty, existential scientific ideas. When we do that and lift our eyes to the real, living spiritually empowered reality that exists in nature, in society, in our lover and in ourselves, then you see that the peacock's tail, the cauda pavonis, is a transcendental object at the end of time. An enormous unspeakable something that beckons across the historical landscape and that casts an enormous shadow that reaches clear back to the earliest moments of the universe. We have always been in the grip of that iridescent, strange attractor. It has propelled our poetry and our art. Our best moments have always been when a tiny scintilla - another good alchemical word - a tiny spark of that alchemical completion burned for a moment in our mind, in our life and in our perception.

We occupy a special position in regard to this. Millions of people, thousands of generations of human

beings have come and gone and could only glimpse this in the ecstasy of eroticism, psychedelic empowerment and ritual magic. But we are the last people. Beyond us lies the mystery, if we have but the courage to move forward into that abyss. To believe that nature will reward the dreamer, then we can complete that wonderful Irish toast, which says, "May you be alive at the end of the world."

It's that close, it cannot wander much longer. All of the preconditions have been met and the peacock's tail grows daily, whiter, more radiant and more brilliant, as we sense it now, breaking into our dreams, breaking into our waking lives, the presence of this attractor. It has always given people meaning but we are the privileged inheritors of that meaning. We have then, the privilege of putting it all together in one piece and standing ready at the end of history to go into the mystery and be completed.

That's the end of my song.

OK – let's have some questions here:

[Question]: Once one has acquired the bundle weed, how does he consume it?

Technical questions here. Detail freaks and recipe mongers. For the benefit of those not initiated into this, it's interesting. Aboriginal human beings have searched the world for psychedelic sources, and have been, such as in the Amazon, very successful but not exhaustively successful. So it's recently become known in the phytochemical literature that a plant, *Desmanthus illinoensis*, the Illinois bundle weed, appears to have one of the highest concentrations of DMT of any plant that has been looked at and it has no history of aboriginal usage.

The question is, how to activate this into a useable psychedelic. Probably the way to do it would be to attempt to create an analog to the South American drug/plant drug Ayahuasca by combining the bundle weed with a North American source of a beta-carboline, such as Harmine, which is what is in Ayahuasca. That would activate it and the obvious candidate for that would be a succulent plant that grows in the desert of New Mexico and Nevada, *Peganum harmala*.

Peganum harmala combined with *Desmanthus illinoensis* in the correct proportions would probably deliver a stunning psychedelic experience.

[Question]: Would you eat it or smoke it?

You would drink it. You would boil them together. Smoking, you can't, it's too diffuse in these things. No, you would perform an alchemy. You would boil the two for many hours in a large volume of water, pour off the wash, add new water, boil more hours, pour off the wash – and then combine the two fractions, get rid of the physical material and drive it down until it looks like thick coffee. But don't be consumed by your alchemical investigations. Proceed carefully with this stuff because it's going to work if you get it right.

[Question]: In the absence of a scale, how might one measure 5 grams of dried psilocybin.

Spring for the scale!

[Question]: Unknown Question.

I don't like these big events because I don't like sitting up here in the light and looking out over the sea of faces. I'm against guru-ism and leader trips. The whole point of this message has to be that it's for everybody. Nobody is special. If it can only happen to some kind of an elect, then it has no impact and no ability to save the planet. It's a human mystery. It doesn't belong to the intelligentsia or to the wealthy. It doesn't belong to the Irish regardless of how we kid around about that. It's got to be for everybody, so take this man [himself] seriously.

Here he is, the second year in a row, pleading for unity. The community is the backbone of the thing. When I first started doing this, one of the most empowering experiences that I could have after talking to a crowd like this is someone would come up afterwards and say to me, I thought I was crazy until I talked to you; until I heard you talk. What they meant was, they had done psychedelics in the 1960s and they had

seen the elves and the machinery of joy – but then other people had turned to market analysis and international banking and it all seemed to flow away. People need to find like minded people.

[Question]: I was interested in your concept of fate. It reminded me a quote by Jung where he said “fate is doing willingly that which I must do.” I was wondering about this concept of fate. You were talking about the Greeks and how they thought of fate as the one thing that you couldn’t go beyond; even Zeus himself was terrified of the fates, the moirai. The idea of not being able to pass beyond the physical body, not being able to pass beyond boundaries and that we are bounded by fate even the gods themselves. And yet – you were talking about the concept of the alchemist believing about going beyond ones fate. I find this idea very delicious. I thought maybe you could elaborate about going beyond ones fate and this type of freedom.

Yes, so the way they did it, as I briefly indicated but didn’t get into, was through magic. The kind of magic was the following: it was the style of renaissance magic that developed in the wake of the translation of this hermetic corpus. Previously magic had been sort of as the cartoon image we have of it - the lonely wizard off in the woods grinding up his potions and toads or that sort of thing. But in the renaissance, in the courts of the Medici court, people like Marsilio Ficino and Tommaso Campanella; these people took the idea of astrological associations.

In other words, plants, minerals, and odors could all be associated to given zodiacal signs and they created a theatrical style of magic. A ceremonial magic where, say you wanted to counteract a Saturn aspect of some sort – by choosing the opposite - the ergs, jams and perfumes associated with the opposite sort of situation and gathering them to you – you could make a new model of the universe. They did this in round rooms and built orreries, and practiced a kind of ceremonial magic that then made them the companions of princes. The dark figure of the lonely magician in the woods was replaced by the renaissance Magus, who was manipulating political realities, counseling Popes and taking magical power into his hands specifically for the purpose of counteracting the machinery of fate.

It had to do with this idea. If fate is decreed by God’s cosmos but man is the co-creator with God, then by setting up a magical microcosm, the ordinary asterisms - the ordinary influences of astrology - can be deflected. If you’re interested in this sort of thing, Dame Francis Yates wrote a wonderful book called, *Giordano Bruno and the Hermetic Tradition*. There is another book by D.P. Walker called, *Spiritual and Demonic Magic: From Ficino to Campanella*. These are not easy books to find. If they were easy to find, what fun would it be? Part of the quest is getting this stuff together. That’s the basic theory of renaissance magic, to create a microcosm to counter the fatalistic machinery of the macrocosm.

I just want to leave you with one story because it sort of fills out the theme and shows how peculiarly the spirit moves and how the coincidentia oppositorum is present in so many unexpected situations. I think somewhere in the body of my talk, I got a dig in at Cartesian logic or Cartesian rationalism. As you know, Rene Descartes, a French philosopher of the 17th century; founded modern scientific materialism but what the historians of science have been at great pains to keep from view is the following story. This story is attested to in Descartes own journal.

When he was a young man of about twenty-two years old, he decided to go soldiering and wenching around Europe, which is something that young men of that era did. He joined a Habsburg army, which was on a mission to lay siege to the city of Prague in Bohemia to suppress what was essentially an alchemical revival. I won’t go into the details but a young prince of the northern leagues and his queen, who was the daughter of James of England, and was named Elizabeth after her grandmother, had managed to gain control of the empire. He had been elected in fact. He was called Frederick the Elector Palatine and this Habsburg army was sent to destroy this protestant alchemical reformation and it did so. It laid siege to the city and killed this young man and his queen fled to The Hague.

Then, the army retreated across Germany. I believe it was the 17th of August of that year, which was 1619, the beginning year of the Thirty Years’ War – they made camp at Ulm in Southern Germany. Just as

an aside, Ulm was the birthplace of Albert Einstein. That night, Descartes had a dream. In the dream, a radiant angel appeared to him and said, "The conquest of nature is to be achieved through number and measure." In that moment, Rene Descartes went from being a nobody to being the founder of modern science. Modern science was founded at the direction of an angel and the angel showed how it was. To this day, modern science has made all of its strides through the application of number, mathematical analysis, and measure. That is the secret of the scientific conquest of nature and it was a secret that was imparted to Rene Descartes by an angelic entity. So I'd like you to leave this evening wondering: who do we work for and how does it work?

Thank you very, very much!

Vision Plants: The Transpersonal Challenge (Non-Ordinary States of Reality Through Vision Plants)

Day Month 1988

International Transpersonal Conference, City, State

Description

- [Audio Link](#)

- [Other links](#)

TM: This presentation will explore the models that shamanic use of vision plants provide for transpersonal psychology, particular attention given to the role such plants play in personal integration, deeper implications of shamanic use of plants, role of mind in the natural order and the planetary future. Basically for myself, my involvement with shamanism has been a deepening meditation over now about 20 years, and it seems to me very fruitful because it continues to change and integrate itself ever more deeply into the meaning of reality at large so that, uh, for me shamanism has become a kind of overarching metaphor for not only personal being in the world, but the historical adventure, the being of the species in the world.

So I want to talk about it today and, and as an advocate, I want to make it seem indispensable to living a life of rife reason in the world. I want to show that without shamanism, the notion of humanism itself is in a kind of jeopardy. And probably most of us can find ourselves in agreement with that. But then I want to leave most of us behind and go further [audience chuckles] and the jest that this humanness rooted in shamanism is a humanist, ultimately rooted in very complex symbiotic relationships with plants and chemicals in the environment.

I want to argue, in fact, that, uh, people without plants are in a state of potential neurosis, a state of existential wanting, and that- and that in fact part of the Western dilemma is the sense of abandonment that followed the breaking off of these symbiotic relations with vision-producing plants, uh, that characterized the rise of Western modern monotheism and even more characterized the rise of modern society, but let me return, then, to the origin because this is where I think the case can be made. My interpretation of the time we're living through and this amorphous movement which we are all somehow in some way are a part of which calls itself the New Age or what have you. I call it the Archaic Revival, and the reason that I call it the Archaic Revival is rooted in my conviction. Models and energy forms of Archaism, and shamanism then is suddenly centrally highlighted. Shamanism was the profession *ne plus ultra* of the upper neolithic era. And what was this profession precisely about? Well, it was about exploring the envelope of cognition. Pushing against the linguistic membrane of what it was possible to say, symbolize, conceive, and communicate. But why should one species out of all those competing on the earth attain somehow a kind of mega-adaptive ability that causes a kind of compression of biological time into the phenomenon that we call history.

Is it simply, as our theologians have always been forced to conceive, that divine agency entered in to the mechanism of the world and somehow set a spark in motion that kindled and grew into humanity? Or is it, as the 19th century explored so exhaustively, the possibility that incremental change can eventually initiate, uh, and insinuate into a situation new states of higher order, including even possibly the state of higher order we call self-reflecting consciousness. That somehow this is no more than a gradual refinement out of previous states of nature. Well, what I want to suggest is that it is a bit of both of these points of view- the divine intervention and the evolutionary.

I think what evolutionary biologists have missed in looking at the emergence of human beings out of the primate phylogeny is, generally speaking, the mutagenic influence of foods. The fact that a fruit-eating, arboreal primate, because of a situation of spreading dryness in the environment, evolved into a pack-hunting creature of the grassland with an omnivorous diet, and omnivores by their very nature expose themselves to a very large number of mutagenic influences. I'm speaking alchemically. Mutagenic influences that interfered with the correct copying of protein, interfere with, uh, spacing of children, lactation, uh, interfere with mentation, psychoactive compounds in the food chain. And it's very interesting that as human beings transform themselves into omnivorous, pack-hunting omnivores, you begin to see the first faint stirrings of self-reflection. you begin to get the fire pit and laser the chipped flint leavings of earliest neolithic toolmaking. What this to me is that there was a unique confluence of factors present in the evolutionary situation that were capable of kindling this ontological transformation of what had previously been the animal mind. And what I suggest this factor is, or was... Psychoactive plants in the environment, specifically psychoactive plants in the grassland environment in which human pastoralism evolved in Africa over a million years ago. The plants must be African. It must be extraordinarily noticeable in the environment. It must not be a deep-forest endemic because this is not where human evolution was taking place. The only plant which fits this, uh, description is, uh, a mushroom of the psilocybin-containing variety. And it's very easy to see, I think, that the presence, then, of, uh, psychoactive compounds of this sort in the early human diet set the stage for a number of structural and psychological changes.

Psilocybin, ingested in low doses increases visual acuity. Now, it's not difficult to see that in an animal en- under evolutionary pressure in a pack-hunting environment increased visual acuity will mean a more successful reproductive strategy. This means that those animals not including the psychoactive substance in their diet will be mitigated against and fade from the scene. And by this process a steady bootstrapping process, self-reflection was born in our species. How do we get from visual acuity to self-reflection? Low doses of psilocybin give increased visual acuity. Medium-range doses of psilocybin give an increased interest in erotic activities. [audience laughter] You should laugh. There may not be too many laughs with this one. [Terence laughs] Slightly higher doses of psilocybin, uh, give an experience of the numinosum. An actual contact with a mystery in the human psyche which is no less mysterious to us today than it was to our ancestors when the last glaciation was retreating against Canada. I mean, don't kid yourself, in the face of this- the content of this symbiotic relationship, modernism, rationalism, positivism- all is exposed as just whistling past the graveyard because the numinous death of the mystery that seems to have called us out of the animal mind is, uh, completely impenetrable to modern analysis. That's why even discussing its presence is mitigated against so intensely.

So, I don't want to spend much time on this early facet of the emergence thing. I want to move ahead and show that as pastoralism developed, as the domestic relationship between cattle, human beings and mushrooms settled down into a self-reinforcing cycle of consciousness, language arose, religion arose of

the goddess oriented variety, and the connection of the cow to the goddess is there at the dawn-time. There is no question about it.

Language seems to have been the particular prerogative of women in the early emergent phases. This is uh, uh, possibly because men were involved in hunting activities where great premium was placed on silent stealthiness. So women were engaged in- as gatherers in the hunting-gathering phase, women were engaged in gathering plants, and as all botanists can tell you, gathering plants involves an extensive taxonomic language so that the difference- the minute differences between cereal grains and insects and all of these things need to be linguistically defined and characterized, and to this day a taxonomic description of a plant is, uh, a Joyceian thrill to read because, you know, "sub-apically glaborous with lanceolate trifolium" and so on for many many lines, uh, but in a strange way that is a law repeated over and over again through history, each advance somehow outsmarts itself, and the wonderful linguistic depth which women attained as gatherers through the production of folk taxonomy eventually lead them to a terrible discovery. The discovery of agriculture. Because they learned that rather than maintain this vast library of shifting information about seasonal plants randomly distributed according to the whims of nature, they could in fact focus on a very small number of plants, learn how to grow these plants, learn their needs alone, and at that point the retreat was on, and the dualism was fully in place and there was that which was domesticated, that which was of the hearth, and that which was of the ausland, 'the howling unknown', that which was 'beyond the pale'. I think it was Weston LaBarre, great old anthropologist who felt, he said, uh, hallucinogens can only be used in hunting and gathering cultures because when agriculturalists use them it makes it impossible to get up at dawn and go hoe the field. And so suddenly the gods become the Corn God and the Wheat god, gods of- symbolizing domesticity and hard labor and, uh, and that sort of thing.

And at this moment of agriculture which lead to overproduction which lead to trade which lead to cities and so forth, there is a beginning of the breaking away of this symbiotic relationship which had bound human beings to nature, to this time. And I don't mean this metaphorically, I mean I want to be taken seriously as proposing that the all-we modernity is the consequences of a disruptive symbiotic relationship between ourselves and vegetable nature, and that, uh, only a restoration of this in some form is going to carry us into a full inheritance of our birthright as human beings.

Now what did this symbiotic relationship consist of? What was the effect of this psychedelic use, this embeddedness of language-using, cognition-using, but stoned primates in the natural order? Well I submit to you that what it was or how it acted operationally was as a, uh, feminizing pheromone, that the continuous exposure to the tremendum represented by the hallucinogenically- induced ecstasy acted to continuously dissolve that portion of the psyche which, as moderns, we call the male ego. And I don't mean that it only works on men. I mean that wherever in human personality this certain catch began to form and build like a calcareous tumor in the personality, the psycholytic presence of the undeniable fact of the tremendum tended to dissolve this back in to Tao, psychic health, however you wish to style it. And that the evolution of language, then, setting up this movement off into specialization and a movement away from nature set up the consequences of the all-we which permeates Western civilization. It is only in Western civilization that you get this steady focus on this monotheistic ideal and working out the implications of what is essentially a pathological personality pattern, the pattern of the omniscient, omnipresent, all-knowing, wrathful male deity- no one you would invite to your garden party. [audience laughter]

It's very interesting that this ideal is the- the only instance, the only hypothestization of deity that I know of

that has no congress with woman at any point in the theological myth- the God of Western civilization has nothing to do with women, and the presence of the Sophia, and the presence of the mater de la rosa and all of these things have only been tolerated as heresies, uh, in the Western tradition. And it is the Western tradition that has the most continuous break with this symbiotic relationship. In other words, we have wandered into a state of prolonged neurosis because of the absence of a direct pipeline to the unconscious. And we have then fallen victim to priestcraft of every conceivable sort. A similar situation, which may give us some objective perspective on our own, haunts the fates of those portions of Indo-European humanity that went east instead of west. In other words, the whole story of Indian civilization is the story of, uh, a masculine, static, hierarchically organized, uh, system coming into place in the wake of the loss of the secret of soma, the loss of the portal to another kind of vegetable gnosis.

Well, so, provided then that I have made my case and convinced you that this is all gospel [audience chuckles]. Uh, what kind of options are there to someone who believes this? Well, uh, what that means is a brief survey of the anthropological opportunities to explore hallucinogenesis presently afforded by societies living throughout the world. There are of course the psilocybin complex discovered by Gordon Wasson, the magic mushrooms of central Mexico which may have played a role in the Mayan and Toltec civilizations, and the wider-ranging pan-tropical *stropharia cubensis*, *solosopy* [??] *cubensis* which originated in Thailand but is distributed throughout the warm tropics. Interesting, all of these, uh, shamanically sanctioned hallucinogens are in the indole family, a very narrow family of compounds with the exception- I- I almost blew it- with the exception of mescaline, which is in a different family, a kind of amphetamine. But all the others, including the morning glory complex with its LSD-like alkaloids, chenocazine and, uh, ergonamine, uh, the psilocybin complex which involves, as I said, several pandemic species and many highly indennicized species, especially in the Pacific Northwest, the iboga cults of Gabon and Western Africa, which is sort of the exotic cousin of all these things, but nevertheless structurally, uh, uh, an indole, and then the short-acting tryptamines and the beta-carbolines. The short-acting tryptamines can be used separately. The beta-carbolines, though hallucinogenic in themselves, are usually used as monoamineoxidase inhibitors to enhance the effect of short-acting tryptamines. This is a highly evolved pharmacology and shamanic complex in South America.

One of the peculiar puzzles of shamanic anthropology and ethnobotany is the clustering of hallucinogenic plants in South America. Why are the old-world tropics, the tropics of the Mollucas and Indonesia, not equally rich in hallucinogenic flora? No one can answer this question, but certainly Mesoamerica and the New World seem to be the great home of these things.

You notice that I don't mention any synthetics in the list. This is because I would sort of like to keel away the vision-producing plants from the whole strom and dang of the, uh, of the drug problem and the drug issue, which is a whole other kettle of fish and has to do with the fates of nations and trillion-dollar scamola and,uh, who knows what else. I prefer the, uh, organic hallucinogens and recommend them to other people because I think their long history of shamanic usage is the first feel of approval that you must look for. I mean, if these things have been used for thousands of years, then you can be fairly confident that they do not cause tumors or micscarrages or - because nature is far richer in exotic and poisonous and mutagenic and psychoactive chemicals than the human pharmacopoeia. I mean, many things are avoided. There are many potential hallucinogens that are not utilized by human beings, so there has been a certain trial and selectivity applied to these things.

I think it's important to confine one's self to uh, to compounds which are least insulting to the physical

brain, not because the physical brain has anything to do with the mind particularly, but because it certainly has to do with the metabolic end-state of indoles. And so things which are alien to the human brain should probably not be introduced into it. One way of judging how long a relationship between a human population and a plant has been in place is to see how benign the compound is in human metabolism. I mean, if you take some plant and your knees are feeling rubbery three days later, or your eyes aren't in focus, uh, 48 hours later, then this is not a benign compound- this is not a compound where there has been a smooth hand-in-glove fit with the human user. This is why, to my mind, the tryptamines are so interesting and why, another reason why- one I just thought of- that I argue for the mushroom as the primary hallucinogen involved in human origins because these things bear a weird resemblance to human neurochemistry. Uh, the human brain and indeed all nervous systems run on 5-hydroxytryptamine, serotonin. Uh, n-n-dymethyltryptamine is- the hallucinogenic compound of this Amazonian complex is the most powerful of all hallucinogens in the human system and yet clears your system in a matter of minutes. This argues for a great antiquity of the relationship, uh, between these things.

So, so then having discussed options it would remain, it seems, to discuss techniques since it's almost what Huxley called a gratuitous grace. All conditions for success can be present and one can still fail, although not if all conditions for success are present and one does it over and over again. Maybe there's a temporal variable there, I'm not sure. But, technique, to me, is a kind of a- I'm reluctant to talk about it because it seems so obvious to me what good technique is. I mean, you sit down, you shut up and you pay attention is basically the good technique. And then the footnotes add on an empty stomach in a dark room feeling comfortable, and then sit down, shut up and pay attention. It's something which happens behind the eyelids. It is not eidetic hallucination although it begins like eidetic hallucination.

I've been talking about this kind of stuff now for about 10 years publicly like this, and one of the major things, the major conceptual and linguistic problem to get over is to actually convey to people what is being talked about because probably I would assume 95% of people in this room have something under their belt which they call drug experience. But did you know that yours is different from everybody else's, and these things range from, you know, mild tingling in the feet to, uh, language fails. And, and, the thing to put across is the reality of the presence of this thing, and this is the important thing talking to a group of people interested in transpersonal psychology. The situation that we now reside in is not one of seeing the answer, but facing the answer. The answer has been found, it just happens to lie on the wrong side of the fence of social toleration and legality. And so we're just forced into this strange little war dance where everybody knows that psychedelics are the most powerful instruments for the study of the mind conceivable and yet, uh, you know, a lot of people are still ratomorphically involved in the academic and university system trying to ignore the fact that the tool has been put in our hands. Like the 16th century when the telescope was invented, we have proven that we are not large enough to take the tool into our own hands without a social and intellectual transformation, and I think it must begin in the field of psychology by acknowledging that if- if what we are involved in, if what this paradigm transform is is the archaic revival, and that we really can create a caring, re-feminized, eco-sensitive, global world by going back to these very very old models, then it isn't going to be possible to do it on the strength of political exhortation and wrath alone. It's going to have to rest on an experience that just shakes you to your root, that is real, that is generalized, and that can then be talked about and dissected. We need to acknowledge, uh, the depth of our dilemma and the real truth, I think, that we know about our options out. I mean, we're playing with half a deck as long as we tolerate, uh, that the cardinals of government and science should dictate where human curiosity can legitimately send its attention and where it cannot.

I mean, it's a- it's a, uh, essentially preposterous situation. It is essentially a civil rights issue, because what we're talking about here is the repression of a religious sensibility- in fact not *a* religious sensibility, *the* religious sensibility! Not built on some con game spun out by eunuchs [audience chuckle] but based on the symbiotic relationship that was in place for our species for fifty-thousand years before the advent of history, writing, priestcraft, and propaganda. So, it's a clarion call to recover a birthright, however uncomfortable that may make us. A call to realize that life lived in the absence of the psychedelic experience that primordial shamanism is based on is life trivialized, life denied, life enslaved to the ego and its fear of dissolution in this mysterious mama-matrix which is all around us and which apparently extends into infinity, and where our historical future actually lays. This is the other thing. It is now very clear that techniques of mind, human, interfacing, pharmacology of the synthetic variety, all kinds of manipulative techniques, all kinds of data storage, imaging and retrieval techniques- all of this is coalescing toward the potential of a truly demonic or angelic kind of self imaging of our culture. And the people who are on the demonic side are fully aware of this and hurrying full tilt forward with their plans to capture everyone as a 100% believing consumer ins- inside some kind of beige furnished fascism that won't even raise a ripple! So... [audience claps]

So the shamanic response in this situation I think is to push the art pedal through the floor. This is again one of the primary functions of shamanism and the function that is tremendously synergized by the psychedelics. They are, in fact, if, as I spoke of them earlier, pheromones which dissolve the male ego, then they are also pheromones which synergize the human imagination, cause us to connect and reconnect the contents of the collective mind in ever more architectonic, implausible, and yet self-fulfilling ways. The- I really think that the only escape from the trap which post-industrial male dominated, politically manipulative, drug-running urban technocracy has in store for us. The only escape is a forward escape- the kind of rushing past it and brushing it aside by virtue of an immense expansion of unpredictable creativity. That what shamanizing means in the ordinary folkloric level is healing, and the art function is somewhat in the shadows, but in the face of a need for planetary healing the art-making function of the shaman is going to stand front and center because what this art making function is is generating a new guiding image of ourselves. This is why it relates so fundamentally to psychology. We need a new paradigmatic image that will take us forward through the narrow neck of historical forces that we can feel impeding and resisting this more expansive, more at ease, more caring dimension that is insisting on being born. And so in terms of political obligation in terms of reforming and trying to save the soul of psychology, in terms of trying to goose along, connecting up the end of history with the beginning of history...all of this impels us, I think, to look at shamanism as the paradigmatic model, to take its techniques seriously, even those which challenge, uh, the divinely ordained covenants of the constabulary [audience chuckle]. Because if- if we don't do that, as I said, we're not playing with a full deck.

You know, years and years ago before the term 'psychedelic' was settled on, uh, it was just a phenomenological description, these things were called 'consciousness-expanding drugs.' So I think that's a very good term. Think about our dilemma on this planet. If the expansion of consciousness does not loom large in the human future, what kind of future is it going to be? Now, to my mind the psychedelic position is most fundamentally threatening when fully thought out because it is an anti-drug position and make no mistake about it, the issue is drugs. How drugged shall you be? Or, to put it another way, consciousness. How conscious shall you be? Who shall be conscious? Who shall be unconscious? And, uh, imagine if the Japanese had won World War II, taken over America, and introduced an insidious drug which caused the average American to spend six and a half hours a day consuming enemy propaganda? But this is what was done, not by Japanese, by ourselves. This is television. Six and a half hours a day, average! That's the

average. So there must be people out there hooked on 24 hours a day. Or, I visit people in LA who have one set on in every room, so they're racking up a lot of time for the rest of us.

Uh, you see, what is needed is an operational awareness of what we mean by drug. A drug is something which causes unexamined, obsessive, habituated behavior. You don't examine your behavior, you just do it. You do it obsessively, you let nothing get in the way of it. This is the kind of life we are being sold on every level; to watch, to consume, to buy. The psychedelic thing is off in this tiny corner, never mentioned. And yet it represents the only counter flow toward a tendency to just leave people in designer states of consciousness. Not their designers, but the designers of Madison Avenue, the pentagon and so forth and so on. This is really happening. I mean, it's only a matter of how tight you draw the metaphor, that you realize you know- I've been coming and going from Los Angeles recently a lot, and when the plane swings out over the, uh, Eastern part of the city, looking down it's looking like a printed circuit- all these curved driveways and col-de-sacs with the same little modules installed on each end of them, and you realize, you know, that as long as the Readers' Digest stays subscribed to and the TV stays on, these are all interchangeable parts. The- this is this nightmarish thing which McLuhan and Windham Lewis and others foresaw- the creation of the public. The public has no history, has no future, lives in a golden moment created by credit which binds them ineluctably to a fascist system that is never criticized.

This is an ultimate consequence [audience claps] this is the ultimate consequence of having broken off this symbiotic relationship with the vegetable, feminine, maternal, matrix of the planet. This is what ended partnership, this is what ended balance between the sexes, this is what set us on the long slide. We can now examine the options available and put in place archaic options which will restore this balance. And to the good credit of people like Dick Schultes and Gordon Wasson and Albert Hoffman, we have in this century taken into our hands the tools, the information, and the means to do this. But psychology- there had better not be a Nuremberg because not enough people have stood up for this. People have contented themselves with ratomorphism [sp?] for 25 years when they knew in their hearts it was wrong! Feeling guilty out there? [Terence & audience laugh]

You could cheer to show that it wasn't you. [laughter, clears throat]. So now, I think, uh, you know the culture crisis grows ever more, uh, intense. The stakes rise ever higher. If there were ever a time to be heard and be counted and try and c- clarify thinking on these issues, you know, it would be now because, uh, you know there is a major attack on the bill of rights underway in the guise of a so-called drug bill and somehow the drug issue is even more frightening than Communism. Even more insidious. McCarthy told America that communism was under the bed. He was wrong. Ronald Reagan and George Bush told America that drugs are in the living room, and they are right. It is here, it is real, it is the hydrogen bomb of the 3rd world. And the quality of rhetoric, the quality of rhetoric emanating from, uh, therapists and psychologists, and psychoanalysts is going to have to radically improve or we're going to have happen to us what happened to genetics in the Soviet Union. We're going to be like sanchoized [???], we're going to be made lily-white and all opportunity for exploring this dimension is going to be closed off. Almost as a footnote to the suppression of these synthetic poisonous narcotics which are mostly dealt by governments anyway. But the psychedelic issue, as I said, it's a civil rights issue, it's a civil liberties issue. The reason women couldn't be given the vote in the 19th century- there was a very simple, overpowering reason that was always given. It would destroy society. And that's the reason given- this was also the reason why the king could not give up a divine right, the right of consequence- chaos would result. And this is why we're told drugs cannot be legalized. Because society would disintegrate. This is just nonsense. Most societies have always operated in the light of various habits based on plants. The whole history of mankind could be

written as a series of made and broken relationships with plants. Think about the influence of tobacco on mercantilism in 17th and 18th century Europe. Think about the influence of coffee on the modern office worker, or the way the British influenced opium policy in the far East to rule China, or the way the CIA used heroin in the American ghettos in the 1960's to choke off black dissent and black dissatisfaction with the war. History is about these plant relationships. They can be raised into consciousness, integrated into social policy and used to create a more caring, meaningful world, or they can be denied the way sexuality was denied until the force of the work of Freud and others just made it impossible to maintain the fiction any longer. This choice of how quickly we develop into a mature community able to address this issue is entirely with us, I think. And certainly, people like Sam Gross and others have worked valiantly to keep this thing alive, but my god, you could count them on the fingers of one hand!

So, that's really all I wanted to say. Uh, [audience chuckle] I left a- I left a half an hour for questions...

Announcer: At this point, Vision Plants: Transpersonal Challenge continues with an informal question and answer period. To make it easier for you the listener to follow along with this segment SoundsTrue[??] will repeat the questions from the audience. The first question: Why don't you mention that DMT is an endogenous neurotransmitter and a schedule 1 drug?

TM: Yes, DMT, the most powerful of all hallucinogens occurs in the human brain as a normal part of metabolism. Uh, it also is a schedule 1 drug- when, uh, so you are all holding- and, uh, this might be the basis for some kind of, uh, case to- to just show what absolute poppycock all this nonsense is. Uh, people have been made illegal. Probably they should have thought of that sooner as a solution to the drug problem.

A: It seems to me that often psychedelic insights are co-opted by the larger society and perverted. Don't you think that this is what happened in the 1960's? And my other question: Does ??? say anything about people who experience difficulties with mushrooms in terms of electrical storms and seizures?

TM: You know, understanding passes everywhere. The information is really neutral. These things, how they work, the information they carry back to us, how we apply it, sort of depends on the moral order that we're embedded in. To a large degree I think the 60's were, uh, probably misplayed, but uh on the other hand it seems to be the last decade when anything happened. The, the lid has been utterly on ever since. It's an illusion, all this change. There is no change. I mean, we're living in some kind of weird eschatological hiatus while the people who rigged the game try to send out for new batteries or something. I don't know what's going on. There's a sense of an immense, uh, there's energy for change, change-building. When it comes, uh, which i don't think will be before this election. but when it ultimately comes I think it will probably be fairly spectacular. It's astonishing actually the way in which change has been halted. Everyone is running around saying change, change, change, but on the other hand there, uh, is a curious sense in which things have become eerily dreamlike and still while we just teeter on the edge of the end of history. And the same personalities, the same design elements, everything has looked the same in the galleries for 20 years, uh, there is an eerie suspension. Perhaps because the, the 60's did anticipate so much that it took 20 years to live them out.

As for your other question about difficulties with mushrooms. Um, the literature is not large. It's generally considered fairly safe. That doesn't mean it isn't strange and it doesn't mean that people don't become alarmed. A friend of mine recently thought he was having a heart attack, and, uh, after he'd been taken to the emergency room and put on 10 machines and all this stuff, he said to the doctor on duty, he said: "is

the mushroom doing this to me?" and he said "no no, you're having an anxiety attack. We get these all the time from people who haven't taken mushrooms. " This is an oasis of liberalism I didn't expect to find. [audience laughter] Sir?

A: How would you explain widespread use of sacred substances as party drugs in our culture? Why doesn't this occur in native cultures, this use of sacred substances as party drugs?

TM: Well I think it took place in our culture because there was no one to guide us. And that the real truth about it is, the real experience is so deep and so boundary dissolving that it's frightening, and a lot of people took these things only in order to be able to say that they'd done so. And if they had a light trip, they just said to themselves "thank god it didn't work for me, and now I can say I know about it and pretend to be an expert but I saved my ass." Uh, the feeling I got in the 60's from people who didn't want to take it was they knew damn well they were crazy. You know, you just mention to them accessing the unconscious and they just froze in mid-step.

In the, in the traditional shamanic situation there are elder shamans who know what you're shooting for, and they won't let you out of the box until they're satisfied that you've gotten the whammy. So there's no evading it. So yes, I think that's a good point. The way it should be taken is reverently in a calm, quiet, empty, clear situation. And then the question of the sitter, certainly there should be no more than one other person there. And, you know, I outrage people and give probably bad medical advice by saying it is very good to do it by yourself. But, you know it just can't be beat because then there's no game, you know, there is no surface, there is nothing to maintain. But that's not for the beginner, I think. But nobody should do therapy who hasn't had these experiences because this is where you see the full spectrum of what the human organism is capable of. And it's astonishing. I mean, yeah, sir.

A: Do you feel the awareness or enlightenment of the sitter is a powerful factor in the nature of a psychedelic session?

TM: Absolutely. That's why having a sitter is no casual decision. It would almost be better not to have a sitter than to have a bad one, you know, because then they are going to become your problem. Here..

A: Would you comment on the difference between having a psychedelic session in a dark room compared to being in a natural outdoor setting?

TM: To me this really revolves around pharmacological issues. I have a- I guess it's a prejudice. It's so strong in me I think it's a piece of revealed gnosis, but I have a prejudice in favor of outlandish visual hallucinations. To me that is the *sine qua non* of the experience. That for me always defines success. Well, the kind of hallucinations that I'm talking about require silent darkness in order to form. Now, if you take psilocybin or one of these that I've mentioned out in nature, nature is, you know, wonderful, filled with light, extremely affirmative, complex, and you can dissolve into it. I guess- there's something of the scientist in me, I guess, and I, I wanted to see what it was, the [??] the thing in itself. With no music, no pretty scenery, no tactile sensation, just what can it do with pure velvet darkness behind closed eyelids, and the reward is that's where it works best because then there is nothing for it to interfere with it or to, uh, set it thematically in one direction or another. Finally you can see what is this bird on its own, you know. And, and so that's why I recommend darkness and, uh, isolation.

A: As a person who's never taken psychedelics, could you describe for me what a typical psychedelic trip is like?

TM: Let me begin by saying each one is different, but I won't stop there. Uh, in the case of psilocybin, like most of these indoles, they vary, but you take it on an empty stomach. I do not fast elaborately. Maybe 6 hours of not eating. And then you take it on an empty stomach in silent darkness. And I always basically calm down and ritualize the space as soon as I've taken whatever it is. I mean, we were amazed in South America with these ayahuasceros. They would stop everybody talking, everybody would knock back their hit of ayahuasca, and then the party would continue as though nothing had happened for 30 minutes and then they would call the meeting to order, and then it would happen 10 minutes later. But the way I do it is I sit for the hour, hour 20 minutes leading up to it. And I carry out what catholics call an "examination of conscience". This is where you think of the commandments, whatever they may be, one by one, and decide if you've violated any of them since the last time you did this. And I do this not, uh, in a planned fashion or out of piety, but more out of fear [audience laughs]. Bec-[Terence laughs] because if I were to discover a huge violation, I, I might, well, I don't know what I would do. The purpose seems to be to anticipate any bad trip in the hour and 20 minutes before it actually comes on. And then at about the hour, hour and 20 minute mark with your eyes closed you begin to see what is called streaming. Just streaming lights, and it's sort of what you see when you press on your eyelids, these things you see when you press on your eyelids- don't do it if you're wearing contact lenses- uh, are called phosphene imagery. And, uh, and there can be a wave of that, and then there's a feeling, a full-body feeling as these- you can almost see thousands of these drug molecules fitting into their receptors in the synaptic cleft and the electrical energy beginning to rise and then there is, uh, what Mircea Eliade brilliantly named the "rupture of plane". And the rupture of plane is fairly rapid. Well, then once the plane is ruptured you're in some other plane. And it is then- then it is what it is, and this is what you don't find out 'til you get there. It is some kind of x-ray of yourself, but you're unrecognizable to yourself and there is information. The most startling thing about these indole hallucinogens is the information. But we're not talking here about geometric patterns and, and whirling fizzgigs and stuff like that. We're talking about scenes, songs, strings of imagery, bursts of poetic flight that hover between being felt, seen and tasted that go on for minutes on end as though meaning itself has somehow taken on a self-replicatory light in the visible surface of the mind. And then it's all about, you know, how you come to terms with this. If you are ver- have always been a very tight-assed, denying, rational, fearful sort of person, well then you're just completely, completely appalled because boundary has dissolved, you don't know whether you're Agnes or Angus [audience laughter]. You don't know whether it's up or down and, uh, you know, it looks to you- it's like the E. B. White cartoon "it looks like melagomania- megalomania to me Martha!" [audience laughter]. So, uh, and you know, the old-style model was that you're supposed to swing from heaven-states to hell states and that the Tibetans have something to say about this. Well, I don't know, I think it's pretty much up for grabs. It's- I don't know, it, it builds in a fugue of images and meaning that finally leaves the realm of the sayable. And then it just goes off into what Wittgenstein called 'the unspeakable', and there, you know, it's the peace that passeth understanding and all things are made right, but you can't say very much about that when you come down.

A: Could you comment on your experience with the personality of the mushroom, with the mushroom as an entity.

TM: Oh yeah, how could I have gotten this far. Yes. I would have been remiss not to mention it because I think it's the central conundrum, at least for me personally and I think for any rational person dealing with these things. We're not just talking about passive agents of transformation and slideshows of alien worlds

and stuff like that. The central mystery is that the thing is animate, that, that there is at the center of these experiences an organized entelechy- an ally, a spirit, an other, and an I-thou relationship is possible. And this is just...now this leads us to the, to the edge of simply wild hyperbole and out into the realm of the utterly improbable. We have no place in our worldview for something like this. I mean, is it an extraterrestrial, is it Gaia, is it, uh, as some Jungians have said merely autonomous fragments of the personality that have slipped from the reins of the ego's control and now return to haunt us as gnomes, qabiri, water spirits, and silks of the air? Well, I don't know, [audience laughter] but, but the uh, who does know, you know? [chuckles]

That- the point not to be lost sight of is that, again, this is real. This is not rare. This is common on psilocybin. What the- what you don't get with- I don't believe anyway- but what you don't get with yoga, what you certainly don't get with mystical experience is any degree of on-command repeatability of these bizarre mental and physical states. And yet with something like DMT if you get somebody who is transported into a realm of self-transforming chattering machine elves. Chances are they will get elves every time. Well, imagine the impact of this on the rational mind. That you can be swept into a space where you, you have to entertain the possibility that- is this a UFO abduction, or am I dead, or am I just simply god forbid totally insane now, or what is happening? The animate entelechy at the center of the experience is I think the greatest challenge for psychology for historical assimilation of this phenomenon generally. Because what is it? I mean, our science is trained to allow the slim possibility of extraterrestrials, and so our electro- I mean our radio telescopes point to the stars shifting millions of signals at a time, searching for a radio civilization, but what is it going to do to the forward thrust of historical continuity if right next door in the human mind there is an other so other that it cannot be assimilated and yet so accessible that it's only a matter of choice to stand it its awesome presence. Uh, I don't have the answer to this question. I think it's amazing that I am able articulate the question [audience laughter] because it is [clears throat] you know, it is against 500 years of expectation and programming that we are finally able to wake up almost as from a fever and say "my god, nature is alive! It's talking to us, it's alive!" No, you know, this is not a metaphor, I am not a Romantic, this is not an artistic or aesthetic stance. Nature is alive. Someone is on the line [audience laughs]. As far as who, I- I don't rush in to say. I mean, I'm very wary of anyone who claims to know who, because the- the problem seems to me one of great subtlety and depth. How can we know who is the other until we know who is the self? And perhaps one problem will cast, uh, significance on the other.

A: Speaking of the self. Isn't any discipline or spiritual path ultimately the threshold looking into the light of the one who sees? And if one can do that without physical substances influencing the body look through that window and experience that luminous beingness isn't that sufficient without the use of physical substances?

TM: Well, I think that's the challenge that the temporary encounter with this thing sets us, that yes, if we can encounter it temporarily through these shamanic means, then must it not become the historical arrow of our becoming? Must we not then recognize that this numinosum must rise into history as a fact of realizing the eschaton? That's what I think, that actually the shamans are seeing and have always seen some kind of trans-historical object, some kind of vast hyposthetization of our selves as deity that is casting a shadow back through time, and that all magic, all religion, all vision is an anticipation of this future state. What excites me is the notion that we may have reached the point in this process where we can consciously know that that is what we are doing, that that is what we are about, that our task is the architectonic expression of the divine other, and then set about it without any more haggling and, uh, tail-dragging. In

other words, to realize what our destiny is will cause us to move toward it with much greater, uh, facility and smoothness. This woman at the door.

A: I have a son who was in a fog for 2 years using dope. What do we say to our children about this?

TM: Well, this, this is a real problem I think it goes to the general state of the drug problem, which is it is one of utter ignorance and victimization. I mean the government whines and yaps about education. But they're not doing any education. I mean the- what do you mean by dope? They have so linguistically impoverished us that we can't even make a distinction between marijuana, methamphetamine, cocaine, LSD, what have you. A whole new vocabulary of consequences has to be created. That's what I said earlier. What we don't want is habitual, obsessive, unexamined activity. We don't want it in commerce, we don't want it in drug use, we don't want it in social relations. We don't want unexamined, habitual forms of activity that are obsessively expressed. What we do want is conscious, caring, self-examining, inquisitive, uh, thinking people and institutions. So whatever mitigates against that has to be seen as a drug. And things like television, money, propaganda, all of these things then are seen as great evil, which they may not have been seen that way before. We have to get smart. You have to be smart to use drugs. You have to be smart to survive a planetary catastrophe. Now, our ancestors were smart. They got us this far. It wasn't easy. Five times the ice moved south from the poles. Five times the human family was islanded and divided by moving ice. It hasn't been easy all the way along. Until a hundred years ago there were no inoculations for infectious diseases. Most women died in childbirth. Many children died in childbirth. The average lifespan, even in Western society, was 35 years old. So, it- you know, it's going to be tough until we get to heaven. There has to be, uh, intelligence. And, you know, one way to be intelligent is to be conditioned. Our lives are not going to make sense if we tolerate propaganda in our lives. You cannot be half- slave and half free. You cannot be half hip and half yup [audience chuckle] you know.

So, uh, the main thing with the drug thing is to get smart, get real smart fast. So you will lose your children, and your mind, and your freedom because all this is at stake. This audience is- has supposedly a stake in psychology, in transpersonal psychology, which means the destiny and fate of the human mind. So, getting smart about the natures and opportunities of chemistry, archaic and modern, should be right at the top of the agenda.

We're going to have to end this. Thank you for your tolerance!

There is no scientific truth or new paradigm ----- in a vacuum ----- the opinions of the general informed public. If it doesn't fly with the general informed public, it doesn't matter what degree of internal ----- it has. An idea is probably doomed to a kind of obsolescence or a kind of obscurity. So this idea that I want to put forth, which is the product of many people's thought on the subject, not the least of which is my brother Dennis, and I've developed the idea in conversations with Rupert ----- and Kat, and Ralph Metzner, and other people over the years, is basically an extension of orthodox evolutionary theory as it applies to the question of human origins, and then, having once established that part of the theory, going forward to try and see what kind of implications this revisioning of evolutionary mechanisms might have on contemporary life and the way in which we relate to ourselves and each other. The orthodox theory of human origins takes the position that the evolution of human beings from higher primates was an evolutionary process no different than the evolutionary processes which have refined the mammalian forms which preceded the primates, nor is it thought to be different from any other evolutionary process. There is no --- logical difference hypothesized. However, I think that, uh, using the language of the evolutionary biologists, we can show that there were factors present in the pre-human and early human environment that, constelated a unique concatenation of events and genetic filtration devices which created the phenomenon of self-reflecting language-using culture-creating animals on this planet. Orthodox evolutionary theory takes the position that as the African continent became subject to an increasing period of dryness, which may have initially begun as early as 2000000 to 25000000 years ago that the general tropical forests which cover the continent began to retreat in certain areas where water was a constraint, and grasslands arose the arboreal primates which where occupying a kind of climaxed evolutionary ----- in the tropical forests before this eridity began, suddenly found themselves under pressure because the forest was disappearing. By changing their gate and learning to walk on the surface, by changing their diet and learning to include meat, and they, and by refining the symbol-processing capability, the transformed themselves from tribes of arboreal monkeys into creatures much more like the modern ----- . In other words, they became omnivorous pack-hunting animals capable of moving over the ground at high speed and capable of exchanging a large number of vocal signals that related to, uh, exchange of information about hunting strategies, -----, because as I neglected to mention, simultaneous to these evolutionary changes in the higher primates, other mammals were evolving in an opportunistic situation -----, the grasslands, into the many forms of ----- animals which grace on the grasslands of Africa, not only cattle but --- and jiraffes, and many forms which are now extinct. These... the primates and the higher mammals then came into a relationship where both were competing for the grassland, and one became the primary

predator on the other. Now... the cu..., one of the curious and unexplained things about the nature psychotropic ----- that occurred on this planet is that several of them are remarkably involved with, uh, human culture and the domestication of plants. I'm thinking, uh, of the ergotized rye which figures in the hallucenium mysteries. Rye was a domesticated grass that through selection had been bred into this large ----- serial brain. Similarly, the psychedelic mushrooms which are most noticeable in nature are the so-called coprophilic ones, the ones which grow on ----- . In the Pacific Northwest, there are numerous species of ----- mushrooms, which grow in the ----- of the forest floor, but as far as we know, the northwest coast indians never noticed them sufficiently to utilize them as a shamanic vehicle; however, the coprophilic mushrooms are extremely noticeable in any environment because here you have this golden or silvery or golden yellow anomalous object standing from 4 to 7 inches high in the grassland, and because of this coprophilic or ----- loving, they invariably aggregate in the droppings of these ----- animals. Well, its very clear that they could hardly choose a situation more opportune for their being encountered by, uh, these omnivorous primates who are preying on these hordes of animals. So that, and I should mention that there is, its assumed that there was considerable pressure on the availability of protein in this grassland situation. In other words, everybody was running hungry and if youve ever seen films or actually observed the behavior of baboons in the wild, they are, they pick things up and look at them, and they sniff the ground, and this is their main behavior pattern, its sniffing the ground and picking things up and ----- and testing them to eat them. Well, uh, vary, almost I would say, coincident upon these factors all converging on the African belt, the mushroom would then become included as part of this omnivoric diet of these primates. Now I mention, uh, when I talk on the radio today, this very important series of experiments by Roland Fisher, who is one of the great and really, he isnt given the credit he deserves one of the greatest researches of altered states, hes retired now and live in ----- but he did a series of experiments which were a model of behaviorist rigour, he had an apparatus which had two ----- bars, which could be deformed by ----- a ----- which would impart mechanical pressure to one of the bubbles so it would be tored and slowly parrallelism would be lost between these two bars and he gave psilocybin in small amounts to hundreds of people and sat them down in front of this apparatus and told them to watch the situation with the two parallel bars and to press the buzzer when they felt that the two bars were no longer parallel and he did it with hundreds and hundreds of controls all of this work was done in ----- Maryland in the early 70s and he showed to the satisfaction of everyone I think that the people who were given the, uh, subthreshold doses of psilocybin were able to pick up this deformation faster than the controls the unstoned ordinary subjects and he said to me jokingly "this proves you see that drugs give a truer picture of reality than being straight" but it was quite so what he... he didnt then make the leap to ask the question, well then what impact would this increased visual acuity have had on an animal which was including this mushroom in its diet? and the answer is if you were as a matter course where you were eating all protein available in your diet including this vision acuity improving compound you would gain an adaptive advantage over individuals of your species which were not including this vitamin in their diet and this, this is just, a straight an exposition of the evolutionary mechanism as could ever be given theres nothing wild eyed about it and the conclusion is that very quickly any primate not including this item if its diet would be ----- of the picture by being maladaptive. Well thats what happens when you take psilocybin in subacute dose but obviously it would be explored at all dosage levels now it has another curious property which a number of researches have, uh, noted a property of the mushrooms which is that they seem to activate or stimulate the languageforming center of the brain whether thats a physical location or simply a name for a set of functions it seems clear that psilocybin by its ability to inspire glossolalia inner voices spontaneous shamanic singing etc operates on the symbolic, uh, processing parts of the brain. These were ----- pack hunting animals which had already evolved a complex set of signals arising first out of their arboreal existence and then transfered into this pack hunting mode. So its reasonable I think to suggest that

psilocybin can be seen in that situation as a catalyst for language it is a catalyst for greater visual acuity and enhanced hunting ----- and its a catalyst for greater hunting ----- its ----- through a greater facility for the processing of symbols at a still higher level this gives away of course to the shamanic experience that we associate with psilocybin which is the visionary state that does not have any obvious evolutionary efficacy they simply because you lie down and close your eyes and dont move around it seems to be an actor on the stage of, uh, of, uh, Darwinian competition so i think its reasonable to suggest that,uh, the development of language and the dominance of this particular adaptation of the primates can be put down to the fact that there was a catalitic ----- diet which

Rap 1.
The Archaic Revival. History is ending because the dominator culture has led the human species into a blind alley, and as the inevitable chaotrophic approaches, people look for metaphors and answers. Every time a culture gets into trouble it casts itself back into the past looking for the last sane moment it ever knew. And the last sane moment we ever knew was on the plains of Africa 15,000 years ago rocked in the cradle of the Great Horned Mushroom Goddess before history, before standing armies, before slavery and property, before warfare and phonetic alphabets and monotheism, before, before, before. And this is where the future is taking us because the secret faith of the twentieth century is not modernism, the secret faith of the twentieth century is nostalgia for the archaic, nostalgia for the paleolithic, and that gives us body piercing, abstract expressionism, surrealism, jazz, rock-n-roll and catastrophe theory. The 20th century mind is nostalgic for the paradise that once existed on the mushroom dotted plains of Africa where the plant-human symbiosis occurred that pulled us out of the animal body and into the tool-using, culture-making, imagination-exploring creature that we are. And why does this matter? It matters because it shows that the way out is back and that the future is a forward escape into the past. This is what the psychedelic experience means. Its a doorway out of history and into the wiring under the board in eternity. And I tell you this because if the community understands what it is that holds it together the community will be better able to streamline itself for flight into hyperspace because what we need is a new myth, what we need is a new true story that tells us where we're going in the universe and that true story is that the ego is a product of pathology, and when psilocybin is regularly part of the human experience the ego is suppressed and the suppression of the ego means the defeat of the dominators, the materialists, the product peddlers. Psychedelics return us to the inner worth of the self, to the importance of the feeling of immediate experience - and nobody can sell that to you and nobody can buy it from you, so the dominator culture is not interested in the felt presence of immediate experience, but that's what holds the community together. And as we break out of the silly myths of science, and the infantile obsessions of the marketplace what we discover through the psychedelic experience is that in the body, IN THE BODY, there are Niagaras of beauty, alien beauty, alien dimensions that are part of the self, the richest part of life. I think of going to the grave without having a psychedelic experience like going to the grave without ever having sex. It means that you never figured out what it is all about. The mystery is in the body and the way the body works itself into nature. What the Archaic Revival means is shamanism, ecstasy, orgasmic sexuality, and the defeat of the three enemies of the people. And the three enemies of the people are hegemony, monogamy and monotony! And if you get them on the run you have the dominators sweating folks, because that means your getting it all reconnected, and getting it all reconnected means putting aside the idea of separateness and self-definition through thing-fetish. Getting it all connected means tapping into the Gaian mind, and the Gaian mind is what we're calling the psychedelic experience. Its an experience of the living fact of the entelechy of the planet. And without that experience we wander in a desert of bogus ideologies. But with that experience the compass of the self can be set, and that's the idea; figuring out how to reset the compass of the self through community, through ecstatic dance, through psychedelics, sexuality, intelligence, Intelligence. This is what we have to

have to make the forward escape into hyperspace.

Rap 2.
Alien Love Hello... So that was like an introduction, now for some preaching to the choir on the subject of how come it is that the further in you go the bigger it gets. I remember the very, very first time that I smoked DMT. It was sort of a benchmark you might say, and I remember that this friend of mine that always got there first visited me with this little glass pipe and this stuff which looked like orange mothballs. And since I was a graduate of Dr. Hoffman's I figured there were no surprises. So the only question I asked is, 'How long does it last?' and he said, 'About five minutes.' So I did it and... there was something, like a flower, like a chrysanthemum in orange and yellow that was sort of spinning, spinning, and then it was like I was pushed from behind and I fell through the chrysanthemum into another place that didn't seem like a state of mind, it seemed like another place. And what was going on in this place aside from the tastefully soffited indirect lighting, and the crawling geometric hallucinations along the domed walls, what was happening was that there were a lot of beings in there, what I call self-transforming machine elves. Sort of like jeweled basketballs all dribbling their way toward me. And if they'd had faces they would have been grinning, but they didn't have faces. And they assured me that they loved me and they told me not to be amazed; not to give way to astonishment. And so I watched them, even though I wondered if maybe I hadn't really done it this time, and what they were doing was they were making objects come into existence by singing them into existence. Objects which looked like Faberge eggs from Mars morphing them - selves with Mandrian alphabetical structures. They looked like the consecration of linguistic intentionality put through a kind of hyper-dimensional transform into three-dimensional space. And these little machines offered themselves to me. And I realized when I looked at them that if I could bring just one of these little trinkets back, nothing would ever be quite the same again. And I wondered, Where Am I? And What Is Going On? It occurred to me that these must be holographic viral projections from an autonomous continuum that was somehow intersecting my own, and then I thought a more elegant explanation would be to take it at face value and realize that I had broken into an ecology of souls. And that somehow I was getting a peek over the other side. Somehow I was finding out that thing that you cheerfully assume you can't find out. But it felt like I was finding out. And it felt... and then I can't remember what it felt like because the little self-transforming tykes interrupted me and said, 'Don't think about it. Don't think about who you

are. Think about doing what we're doing. Do it. Do it now. Do it!!!'

Rap 3.
Speaking in Tongues And what they meant was use your voice to make an object. And as I understood, I felt a bubble kind of grow inside of me. And I watched these little elf tykes jumping in and out of my chest; they like to do that to reassure you. And they said, 'Do it.' And I felt language rise up in me that was unhooked from English, and I began to speak... like this, 'Eyo ca dema fla gwa si pipi eng...' or words to that effect. And I wondered then what it all meant and why it felt so good if it didn't mean anything. And I thought about it, a few years actually, and I decided that meaning and language are two different things. And that what the alien voice in the psychedelic experience wants to reveal is the syntactical nature of reality. That the real secret of magic is that the world is made of words, and that if you know the words that the world is made of you can make of it whatever you wish. And one of the things that I learned about DMT was that if you've ever had it, even just once, then you can have a dream, and in this dream somebody will pull out a little glass pipe, and then it will happen! It will happen just like the real thing. Because there's a button somewhere inside each and every one of us that gives you a look into the other side. And that's the button that resets the compass that tells you where you want to sail. Good luck... Rap 4. Timewave Zero Hello... alright. Have you ever noticed how there's this quality to reality which comes and goes, and kind of ebbs and flows and nobody ever mentions it or has a name for it except some people call it a 'bad hair day' or some people say 'Things are really weird recently.' And I think we never notice it and we never talk about it because we're embedded in a culture that expects us to believe that all times are the same, and that your bank account doesn't fluctuate except according to the vicissitudes of your own existence. In other words, every moment is expected to be the same and yet this isn't what we experience. And so what I noticed was that running through reality is the ebb and flow of novelty. And some days, and some years, and some centuries are very novel indeed, and some ain't. And they come and go on all scales differently, interweaving, resonating. And this is what time seems to be. And Science has overlooked this, this most salient of facts about nature: that nature is a novelty conserving engine. And that from the very first moments of that most improbable big bang, novelty has been conserved because in the very beginning there was only an ocean of energy pouring into the universe. There were no planets, no stars, no molecules, no atoms, no magnetic fields; there was only an ocean of free electrons. And then time passed and the universe cooled and novel structures crystallized out of disorder. First, atoms; atoms of hydrogen and helium aggregating into stars. And at the center of those stars the temperature and the pressure created something which had never been seen before which was fusion. And fusion cooking in the hearts of stars brought forth more novelty; heavy elements - iron, carbon, four-valet carbon. And as time passed there were not only then elementary systems but because of the presence of carbon and the lower temperatures in the universe, molecular structures. And out of molecules come simple subsets of organism. The genetic machinery for transcribing information, aggregating into membranes, always binding novelty, always condensing time, always building and conserving upon complexity, and always faster and faster. And then we come to ourselves. And where do WE fit into all of this. Five million years ago we were an animal of some sort. Where will we be five million years from tonight? What we represent is not a sideshow, or an epiphenomenon, or an ancillary something-or-other on the edge of nowhere. What WE represent is the nexus of crescent novelty that has been moving itself together, complexifying itself, folding itself in upon itself for billions and billions of years. There is, so far as we know, nothing more advanced than what is sitting behind your eyes. The human neo cortex is the most densely ramified complexified structure in the known universe. We are the cutting edge of organismic transformation of matter in this cosmos. And this has been going on for a while; since the discovery of fire, since the discovery of language. But now, and by now I mean in the last 10,000 years, we've been into something new. Not genetic information, not genetic mutation, not natural selection, but epigenetic activity; writing, theater, poetry, dance, art, tattooing, body piercing and philosophy. And these things have accelerated the ingression into novelty so that we have become an idea excreting force in nature that builds temples, builds cities, builds machines, social engines, plans, and spreads over the Earth, into space, into the micro-physical domain, into the micro-physical domain. We, who five million years ago were animals, can kindle in our deserts and if necessary upon the cities of our enemies the very energy which lights the stars at night. Now, something peculiar is going on here. Something is calling us out of nature and sculpting us in it's own image. And the confrontation with this something is now not so far away. This is what the impending apparent end of everything actually means. It means that the de-no-ma of human history is about to occur and is about to be revealed as a universal process of compressing and expressing novelty that is now going to become so intensified that it is going to flow over into another dimension. You can feel it. You can feel it in your own dreams. You can feel it in your own trips. You can feel that what is about to transform itself, then think of it this way: think of a pond, and think of how if the surface of the pond begins to boil - that's the signal that some enormous protean form is about to break the surface of the pond and reveal itself. Human history IS the boiling of the pond surface of ordinary biology. We are flesh which has been caught in the grip of some kind of an attractor that lies ahead of us in time, and that is sculpting us to its ends; speaking to us through psychedelics, through visions, through culture, and technology, consciousness. The language forming capacity in our species is propelling itself forward as though it were going to shed the monkey body and leap into some extra-surreal space that surrounds us, but that we can not currently see. Even the people who run the planet, the World Bank, the IMF, you name it, they know that history is ending. They know by the reports which cross their desks: the disappearance of the ozone hole [?!], the toxicification of the ocean, the clearing of the rain forests. What this means is that the womb of the planet has reached its finite limits, and that the human species has now, without choice, begun the decent down the birth canal of collective transformation toward something right around the corner and nearly completely unimaginable. And this is where the psychedelic shaman comes is because I believe that what we really contact through psychedelics is a kind of hyperspace. And from that hyperspace we look down on... we look down on both the past and the future, and we anticipate the end. And a shaman is someone who has seen the end, and therefore is a strikebreaker, because you don't worry if you've seen the end. If you know how it comes out you go back and you take your place in the play, and you let it all roll on without anxiety. This is what boundary dissolution means. It means nothing less than the anticipation of the end state of human history. A return to the archaic mode. A rediscovery of the orgasmic freedom of the African grasslands of 20,000 years ago. A techno-escape forward into a future that looks more like the past than the future because materialism, consumerism, product-fetishism, all of these things will be eliminated and technology will become nanotechnology and disappear from our physical presence. If we have the dream, if we allow the wave of novelty to propel us toward the creativity that is inimitable to the human condition. That's what we're talking about here: psychedelics as a catalyst to the human imagination, psychedelics as a catalyst for language; because what cannot be said, cannot be created by the community. So what we need then is the forced evolution of language. And the way to do that is to go back to the agents that created language in the very first place. And that means the psychedelic plants, the Gaian Logos, and the mysterious, beckoning, extraterrestrial minds beyond. Hooking ourselves back up in to the Chakras of the hierarchy of nature, turning ourselves over to the mind of the total other that created us and brought us forth out of animal organization. We are somehow part of the planetary destiny. How will we do determines how well the experiment of life on Earth does, because we have become the cutting edge of

that experiment, we define it, and we hold in our hands the power to make or to break it. This is not a dress rehearsal for the apocalypse. This is not a pseudo-millennium. This is the real thing folks. This is not a test. This is the last chance before things become so dissipated that there is no chance for cohesiveness. We can use the calendar as a club. We can make the millennium an occasion for establishing an authentic human civilization, overcoming the dominator paradigm, dissolving boundaries through psychedelics, recreating a sexuality not based on monotheism, monogamy and monotony. We. All these things are possible if we can understand the overarching metaphor which holds it together which is the celebration of mind as play, the celebration of love as a genuine social value in the community. This is what they have suppressed so long. This is why they are so afraid of the psychedelics, because they understand that once you touch the inner core of your own and someone else's being you can't be led into thing-fetishes and consumerism. The message of psychedelics is that culture can be re-engineered as a set of emotional values rather than products. This is terrifying news. And if we are able to make this point then we can pull back, we can pull back and we can transcend. Nine times in the last million years the ice has ground south from the poles pushing human populations ahead of it and those people didn't fuck up. Why should we then? We are all survivors. We are the inheritors of a million years of striving for the unspeakable. And now with the engines of technology in our hands we ought to be able to reach out and actually exteriorize the human soul at the end of time, invoke it into existence like a UFO and open the violet doorway into hyperspace and walk through it, out of profane history and into the world beyond the grave, beyond shamanism, beyond the end of history, into the galactic millennium that has beckoned to us for millions of years across space and time. This is the moment. A planet brings forth an opportunity like this only once in its lifetime, and we are ready, and we are poised. And as a community we are ready to move into it, to

claim it, to make it our own. It's there. Go for it, and thank you.
