of-view is a matter of retooling language. If nature is psyche, ayahuasca is the auto-poetic self-reflecting cloud of cognition that manifests as language. It is partly based in the structure of matter, it is partly based in the implicit syntax of the perceiver, it is partly an interference pattern between the two; but it is as close to the ground that one can approach without theory.

The key to the forward-looking expression of the archaic revival, the key to making the New Age fulfill its best hope and not fall into a crypto-fascism of paradigmatic warfare, is to enunciate two principles. The primacy of experience and the toxic nature of ideology. This to me is the core. If the New Age, the archaic revival, can exemplify these two principles then we can navigate past the dangerous shoal that threatens any idea that attempts to leave its cult status and enter the mainstream.

I connect the primacy of experience to Heidegger's notion of what he called "care for the project of being". The primacy of felt experience begins with a notion as simple as "be here now". We must take ourselves more seriously, more lightly and more seriously. We are not at the bottom of a pyramid of goods and information production where we pay the sucker's price for everything as it is handed down through pieces of intractable cultural machinery that we have no effect on. That is the myth that is being promulgated by those very institutions; the myth of the hapless consumer; the myth of the meaning of faddism. As if there is a meaning to switching from one ideology to another the way hemlines and perfumes and decorator colors come and go. This is allowing ourselves to be self-victimized.

The other side of that is the toxicity of ideology. Ideology itself is poisonous. In the 15th and 16th centuries there was 120 years of intermittent religious warfare because people were so uptight about whether you were a Catholic or a Hugenaught or a Walloon. These were life-or-death issues. Finally people just became sick of it. I hope, I choose to believe, that we may be approaching such a watershed with the social ideologies that have been dinging themselves into the global population for the past hundred years. They are extremely bankrupt. The notion of any kind of serious competition between Marxist-Leninism and capitalist-democratic techno-fascism, or whatever it is, is ludicrous. Neither system works within the need to wage ideological warfare against the other.

Ideology has become an anachronism. It's a kind of lack of good taste. It's like being a nut. You come on with some ideology and people just look at their plates; they're embarrassed for you.

The ideology that naturally claims our attention is pretty well understood. It says in the Old Testament, "You can know the truth, the truth is the still small voice in your heart." You don't have to take courses in theology and ethics to get all this down. The political agenda is fairly clear; you feed people, you cure disease, you anticipate and solve social problems having to do with sewerage disposal, distribution of land and wealth. None of this stuff is controversial unless you're living inside a locked ward.

This anti-ideological position has to be articulated by causing language to evolve. You cause language to evolve by saying new and intelligent things to each other. And then other people say, "Oh so this thing that I've always thought but never felt like saying is actually legitimate and okay and I can say it and I will say it". It begins to move like a wave through society.

You will be told that for me to advocate the poisonous nature of ideology without calling it anarchy is to peddle my own private ideology. But this is absurd. It's like saying that if someone tells you not to drive they're advocating a certain style of driving. That's not it at all. It's a translation of levels, it's something entirely different.

We cannot afford the continued existence of the unconscious. It is a neurotic excuse for not getting our act together as a species. The way in which the unconscious is eliminated is by turning the language machinery back upon itself and reflecting on the process of attention. This is what Buddhism is all about; attention to attention. Awareness of the modality of the cognitive process. Doing that to oneself has a kind of morphogenic field effect, a kind of chain-reaction which sweeps through society. It's simply that the act of conscious self-inspection creates more conscious people which creates a more conscious society, which erodes the possibility of the poisonous and toxic effects of ideology.

This is what psychedelics are about in terms of their social and legal position in society. Psychedelics are illegal not because a loving government is concerned that you may leap out of a third-storey window. Psychedelics are illegal because they dissolve opinion structures and culturally laid-down models of behaviour and information processing. They open you up to the possibility that everything you know is wrong. Government and society spend a lot of money educating you into being a loyal worker, consumer, debt-payer and citizen.

I think anarchy is the great future for human society. Only responsible human beings can exist in an anarchistic society. To the degree that people are responsible, we will have anarchy.

I want to leave you with the notion that nature, the linguistically expressed topological manifold of the psyche, is indeed a historical object that is pulling us forward. When we cross over into the eschatology that appears fairly eminent, we will find it to be anticipated by the human relationship with nature, the embedding of psyche in nature, the mysterious relationship mediated by language.

The key to unfolding a sane society, in my single humble opinion, is an obligation to reason that clearly distinguishes between reason and science, an obligation to self-involvement in immediate experience, which means psychedelics, sexuality and what I call "time"; a deep literary involvement with the felt present. Psychedelics, sexuality and time. To empower the individual. To make the individual naturally responsible. To create the basis for a caring global society that will transcend the historical cultures as though we were just moving very naturally out of winter and into spring; no apocalypse, no millennium, no rescue by flying saucers, no Mayan return, simply the unfolding of a program of mutual caring and responsibility. This is the highest aspiration of the New Age and I feel that it is attainable.

[Announcer]: The big issue these days, and it has nothing to do with his talk... is this idea of self-reflection and and of, uh, things that, uh, self referential things and the paradoxes that can come out of that, and I find Terence McKenna a kind of self-referential person. Uh, he's spoken to us at least once; [Terence: Twice] twice I think, right, uh, and each time, uh, I have experienced, uh, an almost hallucinogenic experience in listening to him talk, and I'm looking forward very much tonight to hearing him speak on dreams, hallucinogens, and UFOs... New and Old Maps of Hyperspace; take off.

[Terence McKenna]: Well, thank you very much. I'm very glad to be here. Special thanks to Ruth and Arthur and the Institute for asking me back for a third time. Perhaps the third time is the charm; we'll see here [clears throat].

My name is Terence McKenna, and my training is basically, uh, in shamanism and botany and ethnography, and, uh, my interest is in hallucinogenic drugs, especially plant hallucinogens as they are used in a shamanic context. And, uh, what impels me to speak to a room full of people like this is the belief that the major important point regarding hallucinogens has been largely overlooked, even though we're now fifteen or twenty or thirty, depending on how you count it, years in to the psychedelic age.

The central point about the psychedelic experience is the content of the experience, and this has been, uh, occluded or obfuscated by the behavioral and statistical and scientific methods that have been brought to bear to study hallucinogenic experience. So, what I'm going to address this evening is essentially my own experience with hallucinogens and how I extrapolate it into the world based on.. its own being and other peoples' psychedelic experiences that I have interacted with.

Uh...Before I get into that, I want to clarify something about shamanism. There are two schools about the basis of shama-- of shamanism, shamanistic experience. One is the older school exemplified by Mircea Eliade, who holds that all narcotic shamanism is decadent. He prefers drumming, dancing, self-mutilation, even ordeal poisons, all precede the efficacy of hallucinogens. He believes they are resorted to when the tradition is vitiated and people are grasping at straws. I take this to be simply a cultural bias of the school of anthropology that he exemplified and the time in which his work was done. Now, Gordon Wasson has taken the opposite tack, and takes the position that non-narcotic shamanism is decadent, because it is on its way to becoming ritual. In other words, drumming, fasting, flagellation, all these things work to a degree and sometimes. And, uh, they are not, uh, dependable in the same way that hallucinogens are, and this has created, uh...this plays on Western peoples' biases in favor of the idea that you have to work hard to get somewhere, and if you don't work hard, it isn't useful.

Uh, my own experience in looking at non-narcotic shamanism, essentially non-narcotic shamanism in Indonesia and in Nepal, was that, uh, Wasson's intuition was very correct. There is a grasping-after, and I

see that grasping-after blending into the evolution of all higher religions. In other words, experientially, there is only one religion, and *it is* shamanism and shamanic ecstasy, but it is [takes drink] very difficult to maintain in, uh, agrarian context. Hunting and gathering societies, which have much less structured social hierarchies, seem to be able to function with the hallucinogenic experience embedded in them. As soon as you rise even to the level of primitive agriculturalist, it becomes much more important to be able to get up in the morning and go to work than it does to have these ecstatic experiences, because the plants have to be tended, the fields tilled, and so on.

Uh, I formed these opinions about, uh, non-narcotic shamanism early in my career of looking at this phenomenon. Uh, I didn't contact narcotic shamanism until I went to the Amazon Basin, uh, initially in 1971, and, uh, although I was familiar with the hallucinogenic state from, uh, growing up basically in the counterculture in Berkeley. But what I found in South America after sifting through these various experiences is that the family of drugs constellated around tryptophan, specifically DMT (dymethyltryptamine), and psilocybin, which is chemically very similar to DMT; that these compounds had a relationship to reality far different from all the other hallucinogens- uh, the scopolamine, hyoscyamine, tropane family that you get in datura and that kind of thing- or LSD, which...uh, laboratory LSD does not occur in nature, but isomers of it occur in nature, although to be taken at hallucinogenic doses they must be taken at hundreds of times the amount, uh.

So, that's basically the scientific, medical, anthropological basis of what I'm saying-- a career spent in Asia, and, more recently, in the Amazon looking at this phenomenon. And, I want to take my conclusions tonight and contrast them with the modern predicament and try to make a model using the hallucinogenic experience, a model that makes some of the anxieties of-of being human, and especially some of the anxieties of being human in the 20th century context, uh, more palatable. And to do that, I want to evoke a number of, uh, abysses, a number of empty places that our minds tend normally to shy away from. First to invoke them, and then to integrate them, uh, through the idea of what is conventionally called, uh, the UFO or the UFO experience.

These abysses are basically four embedded in a fifth. The four are: the, uh, the biological abyss that is represented by death and dying, that is the, uh, the central crisis of every individual existence, and, uh, almost as a reflection of that crisis on a higher plane, the historical abyss represented by the end of history and the apocalypse, and possibly the millennium. But in any case, the end of history that Western religion, whether it be Judaism, Christianity, or whatever, has appointed to our world and made basic to Western man's view of things, and which now, because of the existence of nuclear weapons and this kind of thing, poses a terminal threat to the culture.

So, two abysses, the biological and the historical, the latter being symbolized in the apocalyptic crisis. A third abyss could be called, uh, the psychological, and this is represented by dreams, most, uh, in general experience and by hallucinogens. It is this casting off from the moorings of the ego, making the night sea journey into the other, and being at the mercy of... call it the collective unconscious, the overmind of the species, uh, what have you. The third--the fourth abyss, which is one whose emergence is unique in our time, is, uh, the actual physical abyss which surrounds this planet for light-years in all directions, because suddenly now, because of our level of technology and--and scientific mapping, uh, we realize that it is there, and we realize that it is, uh, a source of our cosmic loneliness, and we realize that it presents an immense challenge.. of the sort we like to accept as a Western culture-- challenges of energy, engineering, and distance.

So, these are the four abysses: the abyss of space, the abyss of death, the abyss of the psychedelic experience, and the abyss of dying. And, these four general categories have to be seen embedded in a somewhat subtler kind of abyss which is the abyss of the unspeakable. In other words, that language, which is the primary tool of cognition of the species, casts nets against these other, uh, gulfs and comes away with different kinds of maps. But you cannot, uh, you cannot put much trust in these maps unless you've carried out a thorough analysis of language. And once you've done that, for sure you will not put much trust in any of these maps, because the thinness of the web on which it all is hung will be readily apparent.

Ok [laughter]. It's my assumption, whenever I am confronted with opposites to try to unify them, to create a *coincidencia oppositorum* as was done in alchemy, to not force the system to closure, but to try and leave the system open enough so that the differences can resonate and become complimentary rather than antithetical. So, I would like to unify, here, not two dualisms but these four, uh, opposed, these pairs. You could think of them as the quadripartite, uh, elements of a kind of mandala. The means to unifying that mandala is integration of the psychedelic experience, specifically, I'm going to make the assumption, specifically, the psilocybin or tryptamine experience. And, what it appears to be is, uh... something which is much more assimilable to the science fiction metaphor of a parallel universe than it is to the Freudian, uh, metaphor of the repression of desire, or even the Jungian metaphor of an inter-- of a, uh, a collective species-wide memory and experience bank. It is, uh, it is much more, I think, of the character of a parallel continuum. And, our-- in order to erect the intellectual edifice of the past thousand years, this possibility has had to be ignored much in the way that you would apply Occam's razor to a situation, and just say 'well we will not admit the more complex phenomenon, because we should form a theory that is true to the simplest phenomena first and then build out from it'. And, this has worked in a demonic kind of way in the sense that we have taken command of the, uh, atomic world, which is a very simple world compared, for instance, to the variables that you meet in sociology or biology- but at the cost of formulating, uh, theories about how the world is put together that nowhere come tangential to experience. So, we have, uh, a bizarre situation where our best models of reality that are kept for us by the priesthood of science are like exhibits in a museum, because they cannot be mapped onto the simple fact of individual experience.

Shamanism, on the other hand, is this worldwide, since paleolithic times, tradition, which says that you must make your own experience the centerpiece of any model of the world that you build. No amount of readings from meters, whether they're metering cyclotrons or any other kind of instrument, are going to satisfy you. Once you understand that, then what the task becomes is one of making sense of these metaphors, so-called, or myths, so-called, that are the pre-Western, pre-print, pre-literate mappings of the world.

An example of, uh, of how this problem distorts other problems is the problem of extraterrestrial contact, which is-- the way science presents the problem of extraterrestrial contact is that we are alone, and that, to assuage our cosmic loneliness, we should build ever larger radio telescopes and million-channel signal analyzers, and sift the radio noise coming from the stars, and eventually if a signal is found, an immense philosophical turning point will have occurred, and we will then place ourselves in the context of the cosmos. This is actually a red herring kind of argument, because, uh, outside of the highly technical Western societies that have evolved in the last 300 years, people have been talking to the Other for-- since man began. Angels, demons, fairies, sprites, elves, all of this is as phenomenologically a part of human experience as, uh, we'll say, birds of paradise, which I'm sure none of you have had anything to do with, but believe inflexibly that such creatures exist because it is allowed by the experts that they exist.

What, uh, psilocybin focuses as a problem that these other hallucinogens do not is it allows a dialogue with the Other that is full of give and take. In other words, there are entities in the hallucinogenic world that psilocybin and DMT and a few other not well-known or widely distributed plant hallucinogens induce. I think it was William Blake who said, uh, "the truth cannot be told so as to be understood without being believed." And, this is the kind of information that is coming through the psilocybin experience. It is information which you have to believe it. You have to believe it because it has this ring of authenticity. It *is* the Logos; it is the Word somehow, and, uh, what is being said is that our alienation --and this word is interesting, 'alienation'-- our alienation from ourselves has caused us to set up a number of straw men that are keeping us from building actually a mature, uh, model of how the universe really works. The content of the dialogue with the other is, uh... a content that indicates that man's horizons are infinitely bright, that death is in fact, uh-- well, as Thomas Vaughn put it, uh, 'the body is the placenta of the soul', and this fact has not yet been assimilated, because it runs counter to Western reductionist, materialist, uh, empiricism. But, this idea, that the body is placenta to the soul, is not a--an object of faith or a dogma. It's a program for activity. The activity that, uh, it implies should be undertaken is a familiarization with the soul, and the soul has been banned from Western thinking about the self for nigh on 400 years, at least in leading circles.

Uh, but I take this concept very seriously. And, I think, uh, if any of you are familiar with the literature of alchemy; alchemy is about, uh, the generation of a psychic construct, a wholeness, uh, a thing which has many properties, which is paradoxical, which is both mind and matter, which can do anything. This is the last gasp of the soul before it's submerged completely. In other words, it became trapped in an association with cthonic matter in the last historical epoch before it disappeared completely from Western consciousness.

Psychedelic drugs, especially psilocybin, allow a searchlight to be thrown on these deeper levels of the psyche as Jung correctly stated, but it is not a museum of archetypes or psychic constructs as he seemed to assume. It is a--a frontier of wholeness into which any person so motivated and so courageous as to wish to do it can go and, uh, leave the mundane plane far behind. In other words, it is a dimension of vertical gain that is *real* and is present in all of our lives, and that we do not acknowledge except as an anomaly, because we have been told that it's an anomaly. We have been told that these perceptions have to be devalued. The result of this is to so distort the psychic life of the species in the present historical context that we have this UFO disease, which is essentially a rupture into three dimensional space of this archetype of wholeness, and it haunts time like a ghost, and it haunts human experience in the 20th century, because it is a symbol of alienation, and the word 'alien' has in fact come to be applied to this thing. It is alien. It comes from the stars, it is totally non human, it has great potential for mankind, but it can barely be englished at all. And actually what it is is, uh, the self in the form in which it is most accessible to the ego, given the ego's programming with all this scientific garbage about the density of life in the universe, the distance to the stars, the probability of chemical evolution occurring here and there and yonder. It is, in other words, something which, in order not to alarm us, has disguised itself as an extraterrestrial being, but is in fact, uh, the collectivity of the human psyche signaling a profound historical crisis.

I talked about this before. I talked about, uh, the danger of succumbing to belief in UFOs, because of the damage it did to free will. And that, yes, the UFO is a-- it is making war on science, because science has created such a masculine overbalance in the intellectual life of the, uh, species that, uh, this automatic mechanism has been triggered. A history-stopping archetype is being released into the skies of this planet,

and if we are not careful it will *halt* all intellectual inquiry in the same way that the Christos archetype halted intellectual inquiry in the Hellenistic age. I don't want to go into this too deeply, but it's clear to me that Hellenistic science, uh, was destroyed by the Christos archetype because the Demo--the Democritean atomists and materialists who ran Roman civilization had no patience whatsoever with this superstition that was being circulated among the servants about a man who rose from the dead and all of-- that went with it. But, before they knew what had happened, their whole civilization was in ruin because the archetype had frozen the forward thrust of this masculine, dominant, ethically de-potentialized, technologically obsessed, slave-built society. And, for a thousand years hydrostatics, mathematics, uh, metallurgy, you name it, that was nothing. Only the words of one Gallilean radical could occupy the time of any intellectual successfully.

Ok, we have now, two thousand years later, fought our way somewhat clear of that problem, but the problem it solved, which is the problem of this masculine overbalance and, uh, this obsessive technological thrust, this dehumanizing thrust, has reached an even more intense peak, and, uh, now appears the flying saucer with the capacity of undoing that by *again* destroying science, by simply being a miracle. That's all that is required to wreck science is a miracle visible worldwide [laughter], and because scientists say that that can't happen. Consequently, if that does happen, their house is in real disorder. Oh--so I touched on this before, any of you who heard me. Tonight, I want to talk more about the flying saucer, not from the point of view of, uh, the people who are going to get the whammy when it appears unbidden, but from the point of view of an insider.

In other words, one can do more than simply say, 'oh yes, I understand what this is. The overmind is visibly manifest in the skies of earth in order to skew history toward an eschatological mode that will stifle inquiry in order, basically, to preserve the species from extinction'. But, a mature humanity could get into a place where we no longer require these metaphysical spankings from messiahs and flying saucers that come along every thousand years or so to mess up the mess that has been created and to try and send people off on another tack. And the way to do this is to look at the abysses that confront man as species and individual and try to unify them. And, I think that psilocybin offers a way out, because it allows a dialogue with the overmind that is not-- you won't read about in *Scientific American* or anywhere else; you will carry it out, and the carrying out of this dialogue will place--will essentially eschatologize you as a person, and lift you out of the historical context. It's like Stephen Dedalus said in *Ulysses*, "history is the the nightmare that I am trying to awake from." Well, I would turn it around a bit and say that history is what I'm trying to go to sleep from in order to get away from it. In other words, the dream is eschatological. The dream is zero time, and outside of history. Escape into the dream. Escape-- a key thing charged against these drugs, that they are for escapists. I think the people who make this charge hardly dare dream to what degree they are escapists [audience laughter].

Escape. Escape from the planet, from death, and from the problem, if possible, of the unspeakable. This-- so now, to say a bit about about death and dying. If you leave aside the last 300 years of historical experience as it was handled in Europe and America, and examine the phenomenon of death, the doctrine of the soul in all its ramifications, neo-Platonic, Christian, dynastic Egyptian, et cetera --I'm sure you're all familiar with some or all of these. What you get is the idea that there is a light body, or a, a uh, a thing, an entelechy, that is somehow mixed up in the body during life, and at death, or at dying, is involved in a crisis in which these two envelopes separate and one, uh, loses its, uh, *raison d'etre* and falls into dissolution; metabolism stops. And the other one goes we know not where, perhaps nowhere if you believe it doesn't exist, but then you have the problem of trying to explain life, which, by the way, though science makes great claims and has done very well in systems of nuclear particles and even simple atomic systems,

the idea that, uh, science can make any statement about what life is or where it comes from is preposterous. Uh, science has nothing to say about how you can decide to close your hand into a fist, and it happens. This is utterly outside the realm of scientific explanation because what we see in that phenomenon is mind as a first cause. In other words, we see matter, it's an example of, uh, telekinesis. Matter is caused by mind to move. So science has--we need not fear the sneers of science in the matter of the fate or origin of the soul.

There...and, as I say, my thrust into this has always been the psychedelic experience, but I've been thinking recently more about dreams, because dreams are a much more generalized form of experience of the hyper-dimension, or the, uh, the mode in which life and mind seem to be embedded. And, uh, looking at dreams and looking at what people with shamanic, uh, traditions say about dreams, you come to the realization that, experientially, for those people, it *is* a parallel continuum. The shaman accesses it with hallucinogens, or other things which I mentioned, but most efficaciously with hallucinogens, but everybody else accesses it through dreams.

Now, Freud's idea about dreams was, I forget the German term, but he called them 'day residues'. He always felt that you could trace the content of the dream down to a distortion of something that happened during the day, or, you know, during waking time. I think that, uh, it's much more useful to try and make actually a kind of geometric model of consciousness, and to take seriously the idea of a parallel continuum, and to say that the mind and the body are embedded in the dream, and the dream is a kind-- not a kind of, but a higher order spatial dimension, so that, uh, in sleep you are released into the real world of which the world of waking is only the surface. And, in a very, in a very literal sense it's the surface. It's the surface in a geometric sense, that there is a plenum --and, and recent experiments in quantum physics tend to back this up-- there is a holographic plenum of information, information--all information is everywhere. Information that is not here is nowhere, and *that* information stands outside of historical time. It's like Plato said: "time is the moving image of eternity." *Eternity* does not have a temporal existence, even the kind of temporal existence where you say it always existed. It does not have temporal duration of any sort. *It is eternity.*

We are not, uh, we are not primarily biology with mind emerging as a kind of iridescence, a kind of epiphenomenon at the higher levels of organization of biology. We are, in fact, hyperdimensional objects of some sort which cast a shadow into matter, and the matter-- the shadow in matter is the body, and at death what happens basically is that the shadow withdraws, or the thing which casts the shadow withdraws, and metabolism ceases, and matter, which had been organized into a dissipative structure in a very localized area, sustaining itself against entropy by cycling material in and degrading it and expelling it, that whole phenomenon ceases. But the--the, uh, thing which ordered it is not affected by that; and when I make these declarative statements, I'm making them from the point of view of this shamanic tradition which touches all these higher religions. Everything basically except rationalism holds to some version of what I'm saying.

So, then the psychedelic, uh, the dream state and the psychedelic state acquire great import because they-- there is then a task to life, and the task to life is to become familiar with this thing which is causing being, and to be familiar with it at the moment of passing. In other words, um, the metaphor that is used, uh, by several traditions of a vehicle, an after death vehicle, an astral body, something like that. And, shamanism and uh, and uh, certain yogas, Taoist yoga, claim very clearly that the purpose is to familiarize yourself with this after death body *in life*, and then the act of dying will not create confusion in the psyche. You will

recognize what is happening, you will know what to do, and you will make the clean break.

And, there does seem to be the possibility of a problem in dying. In other words, what I'm telling you is not that you're condemned to eternal life. I'm saying, it's a possibility that you can muffle it through ignorance. In other words, the-- at the moment of death there is a kind of a separation. It's like birth. Its-- the metaphor is trivial but perfect. It is, uh, there is a possibility of, uh, damage, of incorrect activity. Again, William Blake, who said that as you start into the spiral there is the possibility of falling from the golden track into eternal death. But it is only a crisis of a moment; it's a crisis of passage. And, the whole purpose of shamanism and of *life*, correctly lived, is to strengthen the soul and to strengthen the relationship to the soul so that, uh, this, this uh, passage can be cleanly made.

Ok, this is not anything earth-shaking. Or, it's well known; it's a traditional position, actually. Uh, but now I want to assimilate one more abyss into this model, uh, a less-- one less familiar to us as rationalists, but well familiar to us just one level deeper in the psyche as Christians and Westerners, and that is this idea that the world will end, that there will be a final time, that there is not only the crisis of the death of the individual, there is the crisis of the death of the species. What this seems to be about is that from the time that there is an awareness of the existence of the soul (we'll say circa 50,000 B.P), until the resolution of the apocalyptic potential, there is something like 50,000 years which, in biological time, is only a moment, but it is the entire span of history times five. In that period, everything hangs in the balance, because it is a mad rush from monkeydom to starshiphood. And, in the leap across those 25,000 years, energies are released, religions are shot off like sparks, philosophies evolve and die, science arises, magic arises, all of these things which control power with greater and lesser degrees of ethical constancy appear. There is the possibility, as in the metaphor of dying, there is a possibility of mucking it up, of aborting the species transformation into a hyperspatial entelechy.

We are now-- there can be no doubt that we are now in the final seconds of that crisis, a crisis which involves the end of history, the departure from the planet, the triumph over death, and the release of the individual from matter. We are in fact closing distance with the most profound event a planetary ecology *can* encounter, which is the freeing of life from the dark chrysalis of matter. The old metaphor of psyche as the butterfly is a species-wide metaphor. We must undergo a metamorphosis in order to survive the momentum of the historical forces already in motion.

Well, if you know anything about evolutionary biology, you know that man is considered to be an unevolving species. In other words, sometime in the last hundred thousand years with the invention of culture, the, uh, the biological evolution of man ceased and evolution became a cultural phenomenon. Tools, languages, and philosophies began to evolve, but the human somatype began to remain the same. And, ha--and so we are very much like people a long time ago. But technology is the real skin of our species. Man, correctly seen in the context of the last 500 years, is an extruder of a technological shell. We take in matter that is, uh, has a low degree of organization, we put it through mental filters, and we extrude Lindisfarne gospels, space shuttles, all of these things. This is what we do. We're like coral animals embedded in a technological reef of extruded psychic objects [clears throat]. And, *the* tool is the flying saucer or the soul exteriorized in three dimensional space. It's as James Joyce said, it's the problem of how man may be dirigible, alright? And how man may be dirigible is basically by turning himself inside out. In other words, the body must become an interiorized hologramatic object embedded in a solid state hyper-dimensional matrix which is eternal, so that man wanders through Elysium in his body, --this is a kind of Islamic paradise that I'm putting out here-- wanders through Elysium in his body experiencing all the

pleasures of the flesh but not realizing that he is a holographic projection of a solid state matrix that is micro-miniaturized, superconducting, and nowhere to be found.

It is part of the plenum. And, eh-eh, we-- all history is about producing prototypes of this situation with greater and greater closure toward the ideal so that airplanes, automobiles, condominiums, space shuttles, space colonies, uh, starships of the hardware, speed of light, spin-dizzy drive type; all of these are, as Mircea Eliade said, self-transforming images of flight that speak volumes about man's aspiration to self-transcendence, so that we are-- our wish, our salvation, and our only hope, basically, is to end the historical crisis by becoming, uh, the alien, by ending alienation, by recognize the alien as the self, in fact; recognizing the alien as, uh, an overmind which holds all the physical laws of the planet intact in the same way that you hold an idea intact in your mind.

In other words, all these givens which are thought to be so writ in adamantine are actually merely the moods of the god, if you will, which *we* happen to be. And the *whole* thing about human history is recovering this piece of lost information so that man may be dirigible, or again, to quote *Finnegans Wake*, uh, uh. Moicane is the red light district of Dublin. "Here in Moicane, we flop on the seamy side, but n'ent, prospector, you sprout all your worth and you woof your wings. So if you want to be phoenixed, come and be parked." It's that simple, you see [clears throat]; but it takes courage to be parked when the grim reaper draws near [clears throat]. 'A blessing in disguise', Joyce calls him.

Uh, so, to me, what psychedelics point out, and where I think society will go once they are integrated to the point where large groups of people can plan research programs without fear of being persecuted for it, is it models the after-death state. It may do more than model it. It may, uh, essentially reveal the nature of it, that our mind, what we each call our mind, can be, eh-eh, the modalities of appearance and understanding can be shifted so that we see it within the context of the one mind. And, uh, then problems like the existence of extraterrestrials and that kind of thing become trivial, because the one mind that I am talking about contains *all* experiences of the other.

There is not the Newtonian universe deployed, uh, throughout the parsecs and chiliocosms of physical space *and* the interior mental universe. They are the same thing. We perceive them as, uh, unresolvable dualisms because of what is called, or what I call a code--the quality of the code, meaning the language we use to discuss this problem has these built-in dualisms. This is a problem of language. *All* codes have code qualities except the Logos. The Logos is perfect, and therefore it partakes of no quality other than itself. But, uh, so long as you deal, so long as you map with something other than the Logos, there will be code qualities. And, the dualism built into our language makes the death of the species, the death of the individual, these seem to be opposed things. Likewise, the problems biology, and, by extrapolation, exobiology, pose by examining the physical universe, versus the angel and demon haunted world that depth psychology is reporting on is again set up as a dichotomy. Uh, all that is needed to, uh, go beyond an academic understanding of what I've been saying is to have the experience of this tryptamine-induced ecstasy. In other words, for reasons which I leave to my brother, uh, the tryptamine molecule has this unique property of releasing the structured self into the overself. And, uh, each person who has that experience undergoes a mini-apocalypse, a mini-entry and mapping into hyperspace.

For society to change in this direction, nothing is necessary except for this experience to become an object of, uh, general concern. Now, what I--I'm not saying everybody should rush out and take mushrooms, in case you thought that's what I was saying [laughs and audience laughs]. But, I am saying that these fields of

information which-- I don't know if you're like me, but my experience of these things is basically literary. I read Plotinus, I read Heraclitus, I read all this stuff, and I try to integrate it intellectually, but it is a plane of experience that is directly accessible. And, uh, the role that we--that each of us, uh, plays in relationship to it determines how we will present ourselves in the final transformation that this hints of.

In other words, in this theory, there is a kind of teleological bias. There is a belief that there is a hyperobject called the Overmind or God or what have you, that casts a shadow into time, and history is the experiencing of this shadow, and as you draw closer and closer to the source of the shadow, the paradoxes intensify, the rate of change intensifies, the, uh-- because what is happening is that this hyperobject is beginning to ingress into three dimensional space. Uh, one way of thinking of it is that, uh, the dream--and the waking world and the world of the dream begin to become one, so that the school of flying saucer criticism which has said flying saucers are hallucinations was in a certain sense correct in that the laws which operate in the dream, the laws which operate in hyperspace, can at times operate in three dimensional space when the barrier between the two modes becomes weak, and then you have these curious experiences, sometimes called psychotic breaks, sometimes called.. whatever, but which always have a tremendous impact on the person they're happening to because there seems to be an exterior component that could not possibly be mental. This is what I'm talking about is when coincidences begin to *build and build and build* until you finally say, you know, *'I don't know what is going on,' but it's preposterous to claim that this is a psychological phenomenon'*, because these are changes in the world (what Jung called synchronicity, and, and made a certain model of). But, what it really is is that an alternative physics is beginning to impinge on uh, on, uh, reality, and it is the physics of light, essentially. Light is composed of photons; photons have no antiparticle. This means that, uh, there is no dualism in the world of light, and if you try to imagine the experience from the point of view of a thing made of light, you realize-- I'm sure you're all familiar with the conventions of relativity, which say that time slows down as you approach the speed of light, but what is never said about that is that if you move at the speed of light there is no time whatsoever; there is an experience of time zero. So if you imagine for a moment yourself to be made of light or to be in possession of a vehicle which can move at the speed of light, there-- you can traverse from any point in the universe to any other with a subjective experience of time zero. This means that, uh, you cross to Alpha Centauri: time zero. But, the amount of time that has passed in the relativistic universe is, whatever it is, four and a half years. But, if you move very great distances, if you cross 250,000 light years across to Andromeda, you still have an experience of time zero. The only experience of time that you have is a subjective time that is created by your own mentation, but in relationship to the so-called Newtonian universe, there is no time whatsoever. You exist in eternity, you have become eternal. Now, of course, the universe is aging at a staggering rate all around you in this situation, but you perceive it as a fact of the universe the way we perceive, uh, uh, Newtonian physics as a fact of this universe, so you have, uh, essentially translated into this eternal mode that I mentioned: time as the moving image of eternity. You are then away from the moving image; you exist in this static mode.

I believe that this is, uh, what technology pushes toward, and that there is no opposition between, you know, ecological balance and the people who want to leave the planet and the hyper-technologists and the hyper-naturalists, uh. All of these are red herrings. The real, uh, historical entity which is becoming imminent is, uh, the human soul..and it is-- the monkey body has served to carry to this moment of release, and it will always serve as a focus of self image, but it will exist in a world made by the human imagination. This is what the return to the father, the transcendence of physis, the rising out of the Gnostic universe of iron that traps the light, all these metaphors, this is what it means. It means release into the human imagination. Uh, Very shortly a--a, uh, as it were, a dry run for this phenomenon will take place in

the form of-of space exploration and space colonies because there, the coral reef-like animal called man that has extruded technology all over the surface of the earth will be freed at last from the constraints of anything but his own imagination and the limitations of materials, so that, for instance, the earliest space colonies-- of course there will be an effort to duplicate the ecosystem of Hawaii and this and that, you know, these, like, uh, exercises in ecological understanding to prove you know what you're doing, but as soon as this is under control, we will be released into the realm of art, which is what we have always striven for. We will make our world, *all* of our world, and the world we came from will be maintained as a garden. But, what Eliade indicated as these endless metaphors of self-transforming flight will be realized momentarily as the technology of the space colony.

What is lining up right behind that, of course, is the fact that the transition from earth to space is a staggeringly tight genetic filter, a much tighter filter than any previous frontier ever has been, even the--the, uh, filter, the genetic demographic filter, represented by the New World. It's said that, you know, that the vitality of America is because only the-the dreamers and the pioneers and the schemers made the trip across. This will be even more true of, uh, of the transition to space, and the technological conquest of space will set the stage, then, for the interiorization of that metaphor, and the conquest of inner space, and the collapse of the state vectors associated with this technology deployed in Newtonian space. And then, uh, uh, man will have become more than dirigible. I think a break here is in order. [audience laughter, clapping]

[Announcer: Let's have a break] [Applause]

[BREAK]

I'll just say a couple more things, and then there seemed to be a lot of questions, so I'll throw it open for questions. But, before I do that, I mentioned this book, *The Invisible Landscape*, that my brother and I wrote, and I'll say just a bit about it, uh, because it relates to what's been said. I spoke in general terms about the technology which would interiorize the body, exteriorize the soul, spoke of it as a long-term technological goal, meaning visible within the next hundred or so years, following on to space travel, that sort of thing. Um, but what *The Invisible Landscape* is about is an effort to short-circuit that chronology and to actually, uh...in a certain sense, force the issue. It's the story, or rather, it's the intellectual underpinnings of the story of an expedition to the Amazon by my brother and myself and several other people in 1971 in which, uh, my brother formulated an idea that involved, uh, using harmine and harmaline. These are compounds which occur in *banisteriopsis caapi*, which is the woody vine that is the basis for ayahuasca, and ayahuasca is one of these plant hallucinogens that releases you into this dimension I'm discussing. An effort to, uh, use harmine in conjunction with the human voice in a--what we called the experiment at La Chorrerra, which was basically--you can take it as very loose science or very tight magic, but, uh, [audience & Terence laughter] it-it was, uh, an effort to use sound to charge the molecular structure of these harmine molecules, uh, metabolizing *in vivo*, in the body, uh, in such a way that they would bind preferentially into certain molecular structures. Our candidate at the time was, uh, DNA. I think Frank Barr has convinced me that there is as great a likelihood that it involves, uh, binding into melanin bodies, as, as likely a possibility as that it involves DNA, but it involves binding into a molecular site where information is stored so that this information is then broadcast in--essentially in the mind in such a way that you begin to get a readout on the structure of the soul. In other words, this was an effort to use a kind of shamanic technology to bell the cat, if you will; to hang a superconducting, telemetric, psychedelic device on the overmind so that there would be a continuous readout of information from this

dimension, and, uh, the success or failure of this you may judge by reading the book, because the first half of the book describes the experiment, the theoretical underpinning of the experiment. The second half of the book describes the theory of the structure of time that derived from the bizarre mental states that followed upon the experiment.

Uh, I don't claim that we succeeded. I just claim that our theory of what happened is better than any theory any of our critics have been able to bring forward. But, uh, whether we succeeded or not, that kind of thinking points the way. In other words, when I say, when I speak of the technology of building the starship, I imagine that it will be done with voltages far below the voltage of a common flashlight battery. This is, after all, where the voltages--where the most interesting phenomenon go on in nature. Thought is that kind of phenomenon, metabolism is that kind of phenomenon. So I think that, you know, an aquarian science, or a science that places the psychedelic experience at the center of its program, uh, of investigation should be--should move toward a practical realization of this goal, the goal of eliminating the barrier between the ego and the overself so that the ego can perceive itself as an expression of the overself, so that the anxiety of being cast into matter, of apparently facing a tremendous biological crisis in the form of death, of apparently facing a tremendous physical cri--, uh, uh, species crisis in the form of the apocalypse, the crisis of limitation in physical space by being planet-bound, all of these things can be obviated by cultivating the soul basically, by practicing shamanism using these tryptamine drugs that I've described.

And my plea to scientists, administrators and politicians who may be listening to my voice is to look again at psilocybin, to not lump it with the other psychedelics, to realize that it is a phenomenon unto itself and it has an enormous potential for transforming mankind; not simply transforming the people who take it, but it is like an art movement or a mathematical understanding or a scientific breakthrough. It holds the possibility of transforming the entire society simply by virtue of the information that is coming through. This is a source of gnosis, and the voice of gnosis has been, uh, uh, silenced in the Western mind for at least a thousand years.

I like to think that, uh, when these Franciscans and Dominicans arrived in Mexico in the 16th century, they immediately set about stamping this thing out. The indians called it *teonanácatl*, the flesh of the gods. Well, the Catholic church has a monopoly on theophagia and was not pleased by this particular approach to what was going on. Now, three hundred, four hundred, whatever it is years after that initial contact, I think that the uh, that eros, which retreated from Greece and retreated from Europe with the rise of Christianity, retreated to the mountains of the Sierra Mazteca essentially, and then was finally pushed into seclusion there. It now reemerges in Western consciousness, and our institutions, our epistemology, all of these things are so shakily founded and so misconstrued, that with the, uh, help of shamanically inspired personalities, we can release this thing once again. I mean the Logos can be unleashed once again, and the voice that spoke to Plato and Parmenides and Heraclitus, that voice can speak again in the minds of modern people, and when it does, uh, the alienation will be ended because we will have become the alien, and this is, uh, this *is* the promise that is held out, and I realize that it may seem to some a nightmare vision, but it-- all historical changes of immense magnitude have had that quality, because they propel people into a completely new world. Are there any questions? [audience laughter]

Question: Uh, well, you indicate that this essentially needs to be done through hallucinogens. I'm not saying they're good or bad; I'm just saying that there appear to be many ways of discovering that, that, um the inner reality, the ultimate reality.

Terence McKenna: You want me to comment on that?

Q: Yea.

TM: I agree with you that this is a strongly held position. I always in my, uh, explorations have recourse to my own experience, and I have not had good luck with any of these other techniques. I spent time in India, practiced yoga, scoured the various rishis, roshis, geshes and gurus that Asia had to offer, and, uh, I believe they must be talking about something, but it, uh, in my experience, uh, it is so pale and so far removed from, uh, the actual closure with the intense tryptamine ecstasy that I don't really know what to make of it, and I am willing to believe these things are possible, I just must be a very grounded person.

Q: Well maybe it's, uh, it's a shortcut for a lot of people.

TM: Well tantra, for instance, that's what tantra means, is the shortcut path. And, uh, certainly, uh, they might be on the right track. Sexuality, orgasm, these things do have tryptamine-esque qualities to them, but the main thing about psilocybin, and I stress it over all these other hallucinogens, is information, immense amounts of information. In my experience, a hallucinogen like LSD, the hallucinations seem largely to be somehow related to the structure of the optic nerve, or they are essentially trivial. They are geometric patterns, shifting lights, this and that, but, unless synergized by another drug, the classic psychedelic experience that started it all with Huxley and those people was, I believe, 200 micrograms of LSD and, uh, 30 milligrams of mescaline. And I would believe that that would deliver a--a visionary experience rather than an experience of hallucinations. And the difference is what psilocybin shows you is not colored lights and moving grids, it shows you places: jungles, cities, machines, books, uh-uh, architectonic form of incredible complexity. Um, just click, click, click. [snaps fingers] There is no possibility that this can be construed as, uh, noise of any sort. It is, in fact, the most highly ordered visual information that you ever experienced; much more highly ordered than the visual experience I'm having at this moment of this room. [some laughter]

Q: But information in the form of a flood of data. That isn't gnosis, I mean could you spell out what you mean, you certainly must mean something more important than data.

TM: Well, no, no. I think I talked about this last time, that Philo Judaeus talks about what he calls a 'more perfect Logos'. He says a more perfect Logos would be beheld rather than heard. In other words, the formulation you get in the gospel of John: *In principio erat verbum, et verbum caro factum est*. In the beginning was the word, yes it was the word in the beginning, but this is a strange kind of word. It is a word which is visually beheld, and the language in which the gnosis communicates is, uh, a language of visual forms such that there is no ambiguity about meaning because there is no recourse to a dictionary of, uh, agreed upon signification. It is *purely* beheld.

This is why it's very hard- one of the main problems of psychedelic drugs is to bring back information because it is hard to English it. And the reason it's hard to English it is because it's like trying to, uh, make a three dimensional rendering of a fourth-dimensional object. Only through the medium of sight can the true modality of this Logos be perceived. That's why it's so interesting, uh, and I should have maybe talked more about it, that psilocybin and ayahuasca, which is this aboriginal drug which uses tryptamine to make it run, is uh, there's a telepathic component which is there is a shared state of mind because the unfolding

hallucination is shared in complete silence and, you know, it's very hard to prove this to a scientist, but if four people are having this experience, you know, one people can like monologue it, and then cease the monologue and another person will take it up. Everyone is seeing the same thing. Uh, and this--it is the quality of being visual information, to answer your question, Arthur, that seems to make this logos, uh, believable in the way that I quoted William Blake when he said 'the truth cannot be told'...

Q: Yes. That is a very powerful statement

TM: And you do believe it, [**Q:** Yes, Yes] you do believe it, you do believe it.

Q: But I was going to say that, that you're speaking of 'seeing', and we say 'Q.E.D.' after the demonstration in geometry but, the Hindus says 'Behold'. Now the seeing involved there, I wouldn't think of as visual, but does get the word 'seeing' or name 'seeing'. You somehow, your whole, uh, whatever it is, I wouldn't say 'mind', your 'being', resonates, I like to use the term 'recognize'. You say "i see that this is the same thing as the other thing." And, I don't know whether it's 'seeing' but it, 'seeing' is a good word, but it isn't, I wouldn't call it visual.

TM: No, well, it isn't exactly visual. But I mean, again, to quote Philo Judaeus on the Logos, he says that the Logos goes from a thing heard to a thing seen without ever crossing through a quantized transition point. And, yet this seems impossible, it seems a logical impossibility, because it is either one or the other. And, yet, when you actually have the experience, you see, aha, it is as though the thought is heard [**Q:** well, yea, that's the recognition], the thought which is heard becomes more and more intense until finally its intensity is such that with there being no jump or glitch, you now are beholding it in a three dimensional visual space and you command it, and this is very typical of psilocybin. Yes.

Q: I have, uh, two questions. One, when you were talking in terms of the dialogue, I was wondering if you could be more descriptive in that regard. And the other thing was as far as the effects of this type of experience, especially over, say, a prolonged period of time, on the body and the body as-as an energy system. And how do you, how do you balance that or how do you counteract possible negative effects or...?

TM: Ok, well I'll take the last part first, which is about the body. I'm not an abuser. It takes me a long time to assimilate each experience, and I feel, you know, I never have lost my respect for it, I mean I really feel dread is one of the emotions that I always feel as I approach it, because I have no faith that my sails won't be ripped this time. I always make the metaphor, you know, it's like sailing out into a dark ocean in your little skiff, and, you know, you may view the moon rising serenely over the calm black water, or something the size of a freight train may roar right through your scene and leave you, uh, clutching at an oar. And, I don't know, astrology is maybe helpful in figuring out when to go and when not to go, but there needs to be a way to figure out when to go and when not to go.

Now, your question about the dialogue. I, I mean this very literally, uh, it speaks to you, you speak to it. It says things. I don't know how many of you have read the book that my brother and I wrote under pseudonyms called *Psilocybin: The Magic Mushroom Grower's Guide*, but in the introduction there, there is a rap, which is all about "I am old, fifty times older than thought than your species, and I came from the stars." Well that's verbatim, you know. I just was writing it furiously, and sometimes it's very human. I mean my approach to it is hasidic. I rave at it; it raves at me; we argue about what it is going to cough up

and what it isn't. And I say "well look, you know, I'm the grower, you can't hold back on me!" And it says "well, but if I showed you the flying saucer for five minutes you would figure out how it works!" And I said, "well....you know, come through!" [audience laughter] I remember once I asked it, oh what was it. It has these many manifestations. Sometimes it's like Dorothy, sometimes it's like a very Talmudic sort of pawn-broker, and I asked it one time "what are you doing on earth?" And it said, "well, you know, you're a mushroom, you live cheap. It's very, uh... [audience laughter] This was a quiet neighborhood 'til the monkeys got out of control.' (lots of laughter). Yes..

Q: I'd like some clarification on some of the things you said. I can, um, understand, at least in my own way, how this idea about, uh, an overconsciousness--or, you know--casting a shadow, and, um, that our psychedelic experience or dream experience has to do with getting in touch with that. But you said that, um, some--I'm not really positive about this, which is why I need some clarification on it, is that in some sense that, uh, that, uh, those brief experiences, something about that our experience was in order to get back there, and that was the reason for us to be?

TM: Let me see, well, I think that this object that--as a friend of mine said, uh, "history is the shockwave of eschatology." In other words, we are living in a very unique moment, ten or twenty thousand years long, where there is this immense transition is happening and the object at the end of and beyond history, which is the human species transformed into this eternal superconducting overmind spacecraft thing, is casting a shadow back through time. And all religion, all philosophy, all wars, pogroms, persecutions are because people do not get the message right, and that's because there is both the forward-flowing casuistry of being, causal determinism, *and* the interference pattern that is formed against that by the backward flowing fact of this eschatological hyperobject throwing its shadow across the landscape. So we exist--there is a great deal of noise. This situation called history is totally unique. It will only last for a moment. It began a moment ago, it will only last for a moment. But in that moment there is like this tremendous burst of static as the monkey goes to godhood, and there is this crossing of the, the uh, I don't like to call it the casuistry, but the efficacy of the eschaton, this final eschatological object, and the forward flow of entropic circumstance. Does that get it for you?

Q: Um.

TM: Maybe.

Q: Well, I have a bit of trouble thinking kind of like which came first. Are you saying the chicken or the egg? Are you saying this overmind has something to do with, uh..

TM: Well, I'm certainly saying that life is necessary. It is not an idea that we have been skewed onto a siding called organic existence and that our actual place is in eternity. No, there is something about...this is a very important part of the cycle. It is, uh, it is a filter. Remember, I mentioned that I thought there was the possibility of extinction. There was the possibility of falling into physis forever, and, uh, so in that sense the metaphor of the fall is valid. There is a spiritual obligation; there is a task to be done. It isn't, though, simply something as simple minded as following a set of somebody else's rules. It's that the noetic enterprise is a primary obligation of Being in this circumstance, and, uh, uh, that your salvation is linked to it. And, not everyone has to read alchemical texts or study superconducting biochemistry to make the transition. Most people make it naively by, uh, thinking clearly about the present at hand, but we and I, we are intellectuals trapped in a world of too much information. Innocence is gone for us. We cannot, uh, we

cannot expect to cross the rainbow bridge through the act of a good act of contrition. That won't be sufficient. We have to understand, and I recall, you know, Whitehead said "understanding is the apperception of pattern as such" because, uh, to fear death is to not understand what's going on. And, uh, to even see it as a big deal is to not understand what is going on, though I do not claim to have reached that exalted plane. But, uh, cognitive activity is the defining fact of humanness. Language, thought, analysis, art, poetry, myth-making, these are the things that point the way toward the realm of being of the eschaton. That is what Joyce means when he says 'man may become dirigible'. In other words, man may be released into a realm of pure engineering. The imagination is everywhere. This was Blake's perception, this is where we come from, this is where we're going, and, uh, it is only to be, uh, approached through cognitive activity- I think! [audience laughter] Yes.

Q: Can you comment on the, um, importance of your discussion on the I Ching in your book.

TM: Well, very briefly, because tend--I always feel that this part bores people more than any other because it hinges on tiny details, but briefly, the--what the Logos said to me was that time is not simply a homogeneous medium where things occur. Uh, you can think of it as a fluctuating density of probability. So that though we--though science will tell us what can happen and what cannot happen, we have no theory that explains why, out of everything that could happen, certain things undergo what Whitehead call "the formality of actually occurring", and, uh, this was what the Logos sought to explain to me: why out of all the myriad things that could happen, certain things undergo the formality of occurring, and it's because there is a hierarchical, a modular hierarchy of waves of temporal conditioning, or temporal density, or, in other words, uh, a given moment it is more likely for a certain event rated highly improbable, it is more probable at some moments than others. And taking that simple perception, uh, and being lead by the hand by the Logos, we were able to construe maps of time which we run on a computer, and which give a map of the ingression of what I call novelty, the ingression of novelty into time.

Now, as a general statement, it's obvious that novelty generally is increasing. It has been since the very beginning of the universe because first there was only the possibility of nuclear interaction, and then, as temperatures fell [stutters] below the bond strength of the nucleus, atomic systems could be formed. And, then as temperature fell molecular systems could be formed, and much later life became possible, and then as very high lifeforms, complex lifeforms, evolved, uh, thought became possible, culture was invented. Then, with the invention of printing and language and then printing and then electronic information movement and this kind of thing. What is happening is there is an ingression of novelty toward what Whitehead--and I took his term--called concrescence. And, this is a tightening gyre; everything is flowing together. And, in fact, the man-made lapis, the alchemical stone at the end of time, occurs when everything flows together, when the laws of physics are obviated and the universe disappears and what is left is the tightly bound plenum, the monad, if you wish, able to express itself for itself rather than able only to cast a shadow into physis as its reflection.

And I...don't, I speak, I come very close here to classical millenarian and apocalyptarian thought. My view of the rate at which change is accelerating and the way the gyre is tightening causes me to think, and the wave predicts this, that it is not long, it is soon. Uh, fifty years, twenty-five years, thirty-five years, then this event will occur. It is the entry of the species into hyperspace, but it will appear to be the collapse of, of the state vector and the end of physical laws and the release of the mind into itself. Um, and all these other images, the starship, the space colony, all that, these are precursors. Again, the idea that history is the shockwave of eschatology. As you close distance with the eschatological object, the reflections it is

throwing off become more and more true to the thing itself, and in the final moment God stands revealed; there are no more reflections of, uh, the mystery. The mystery in all its nakedness, then is seen, and nothing else exists, uh, but what this is decency can safely scarcely hint at it.

Terence McKenna: The human imagination in conjunction with technology has become a force so potent that it really can no longer be unleashed on the surface of the planet, uh, with, uh, safety. The human imagination has gained such an immense power that the only environment that is friendly to it is actually the vacuum of deep space. It is there that we can erect the architectonic dreams that drive us to produce a Los Angeles or a Tokyo and do it on a scale and in such a way that it will be fulfilling rather than degrading. So, yes I think, uh, we cannot, uh, move forward in understanding without accepting as a consequence of that that we have to leave the planet, that we are no longer the bipedal monkeys we once were. We have become almost a new force in nature, a thing of language and cybernetics and, uh, an amalgam of computers and uh, br- human brains and societal structures that, uh, has such an enormous forward momentum that the only place where it can express itself without destroying itself is as James Joyce says "Up n'ent".

Michael Toms: So, long, long ago in a far away galaxy, uh, Star Wars style may be in our future?

TM: Well...

MT: As opposed to our past?

TM: It's in our present, I think. Our future is probably almost unimaginable because, I think, the transformation that leaving the planet will bring will, uh, also involve a transformation of our consciousness. We are not going as, uh, 1950s-style human beings. We are going to have to transform our minds before we are going to be able to, uh, leave the planet with any amount of grace. This is where I think the psychedelics come in, because they are anticipations of the future. They seem to channel information that is not, uh, strictly governed by the laws of normal causality, so that there *really is* a prophetic dimension, a glimpse of the potential of the far centuries of the future, through these compounds and, uh, no cultural shift of this magnitude can be unambiguous. I mean, the very idea that as a species we would leave the earth behind us must be as rending an idea as that a child would leave its childhood home. Obviously, it's a turning away from something that, once left behind, can never be recaptured. However, this is, uh, the nature of going forward into being: a series of self-transforming ascents of level, and we now simply happen to be at that moment of ascent to a new level that is linked to leaving the planetary surface physically and to reconnecting with the contents of the unconscious collectivity of our minds.

These two things will be done simultaneously. This is what the last half of the 20th century, it seems to me, is all about.

MT: Well by and large, uh, psychedelics have, uh, really not been accepted into the mainstream - do you see a change in that?

TM: Well, not particularly, uh, they, u-uh, hold a certain fascination for a persistent majority, and in that way they do their catalytic work upon society, which is to introduce new ideas and to, uh, uh, release a certain kind of creative energy into society. I certainly would not like to see a return to the-the psychedelic hysterias of the 1960s. I think it's fine that these things are now the subject of interest of a much smaller group of people but perhaps a group of people with a, uh, greater commitment and a, uh, better idea of exactly what these things are. And, it's really, uh, the same people; it's just a smaller group of them, and they have accumulated experience over the past twenty years. Uh, however, I d-certainly don't think all psychedelic frontiers are conquered. One of the things that I write about and speak about are the phenomena that, uh, many people confirm with the, uh, the psilocybin family of hallucinogens that no one has, uh, included in the standard model of psychedelic drugs, and by that I refer to the Logos-like phenomenon of an interiorized voice that seems to be, uh, almost a superhuman agency, a kind of *genius loci*. And, I've been writing recently about alien intelligence which is what I call this, where uh, you have contact with an entity so beyond the normal structure of the ego that if it is *not* an extraterrestrial, it might as well be, because, uh, its bizarreness and its, uh, uh, distance from ordinary expectations about what can go on is so great that if flying saucers arrived here tomorrow from the Pleiades it would make *this* mystery no less compelling, because I believe that, uh, the place to search for extraterrestrials is in the psychic dimension, and *there* the problem is not the absence of contact but the, uh, *volume* of contact that [stutters] must be sifted through, because the fact of the matter is shamen and mystics and seers have been hearing voices and, uh, talking to gods and demons, uh, since the paleolithic and probably before.

That doesn't mean that, uh, we can rule out this approach to communication. Uh, it seems to me far more likely that an advanced civilization would communicate interdimensionally and telepathically, uh, that amounts of time available for an intelligent species to evolve these kinds of communication are *vast*. So, I think, uh, that it's very interesting then that the tryptamines, psilocybin and DMT, at ,uh, the 15 milligram level, very reliably trigger what could only be described as contact-like phenomena. And, not only the interiorized voice in the head, but also the classical flying saucer motifs of, uh, the whirling disc, the lens-shaped object, the alien approach, uh, this seems to be something hardwired into the human psyche, and, uh, I would like to find out why. I think it's a very odd, uh, uh, fact of human psychology, and I don't buy any of the current theories ranging from that nothing at all is happening to that this is in fact another species with a world around another star that is getting in touch with us. I think it's something so bizarre that it actually masquerades as an extraterrestrial so as not to alarm us by the true implications of what it is. But, I suspect it is something like uh, an overmind of the species, [stutters] that actually the highest form of human organization is not realized in the democratic individual, it is realized in a dimension none of us have ever penetrated which is the mind of the species, which is *actually* the hand at the tiller of history. It is no government, no religious group, but actually what *we call* the human unconscious, but it is not, uh, unconscious, and it is not simply a cybernetic repository of myth and memory. It is an organized entelechy of some sort, and human history is its signature, uh, on the primates, and it is so different from the primates it is like a creature of pure information. It is made of language. It releases ideas into the flowing stream of history to boost the primates toward higher and higher levels of self-reflection of *it*, and we have now reached the point where, uh, the masks are beginning to fall away and we're discovering that, uh, you

know, there is an angel within the monkey, struggling to get free, and this is what the historical crisis is all about, and I'm, for no reasons in particular, very optimistic. I mean, uh, I see it as, uh, a necessary chaos that will lead to a new, uh, and uh, uh, more attractive order.

MT: Terence, you were talking about, uh, extra-ordinary realities and it occurs to me that there's, um, an enormous amount of prejudice against um, the... psychedelics and the, uh, use of hallucinogenic, uh, substances and, um, it's almost as if there's an inordinate fear to open up the, um, door to the closet that these substances, uh, reveal. Um, what about that prejudice? What do you think is- how's that gonna be resolved? What is the resolution of that?

TM: Well, I think it's uh, it's more complicated than a prejudice. It's, uh, a prejudice born of respect, because, uh, most people sense that these, uh, compounds probably actually do what their adherents claim they do. It's possible to see the whole human growth, uh, movement of the 1970s as a wish to continue the inward quest without having to put yourself on the line the way you had to when you took 250 gamma of LSD. And, I think all these other methods are efficacious, but I think it's the sheer..., uh, uh, uh, power of the hallucinogens that puts people off. Uh, you either love them or you hate them, and that's because they dissolve worldviews, and if you like the experience of having your entire ontological structure, uh, disappear out from under you, if you think that's a thrill, uh, you'll probably love psychedelics.

On the other hand, for some people, that's the most horrible thing they can possibly imagine. They navigate reality through various form of faith, and I think, uh, that the psychedelics, uh, the doors of perception are cleansed and you see very, very deeply. Uh, I spent time in India, and I would always go to the local Sadhus of great reputation, and I met many people who possessed, uh, what I call wise-old-man wisdom but wise-old-man wisdom is a kind of Tao of how to live. It has nothing to say about these dimensions that the psychedelics reveal and, uh, for that you have to go to places where hallucinogenic shamanism is practiced, specifically, uh, the Amazon Basin. And, there you discover that beyond simply the wisdom of how to live in ordinary reality, there is a gnosis of how to navigate in extraordinary reality. And, this reality is so extraordinary that we cannot approach what these people are doing with any degree of smugness, because the frank fact of the matter is *we* have no viable theory of what mind is either. The beliefs of the Witoto shaman and the beliefs of a, uh, Princeton phenomenologist have an equal chance of being correct, and there are no arbiters of, uh, who is right.

So, uh, it's the power of these things, the fact that here is something we have not assimilated. We have been to the moon, we have charted the depths of the oceans, the heart of the atom, but we have a fear, uh, of looking inward to ourselves because we sense that here's where all the contradictions flow together and, uh, the same prejudice against psychoanalysis that characterized the 20s and 30s, when it was thought to be, uh, uh, superfluous or, uh, some kind of fad, uh, attends the psychedelics now. It's because it touches a very sensitive nerve; it touches, uh, the issue of the nature of man, and, uh, people are uncomfortable with this or *some* people are uncomfortable with this.

MT: What is the value of exploring, uh, extraordinary realities?

TM: Well, I guess it's the same value that attends the exploration of ordinary realities. There's, uh, an alchemical saying that, uh, one should read the oldest books, climb the highest mountains, and visit the broadest deserts. Uh, I think that, uh, being imposes some kind of obligation to find out what's going on. And, uh, since all primary information about what is going on comes through the senses, any drug or any

compound which alters that sensory input has to be looked at very carefully. I've often made the point that, uh, eh, chemically speaking you can have a molecule which is completely inactive as a psychedelic and you move a single atom on one of its rings and suddenly it's a powerful psychedelic. Well, now it seems to me this is a perfect proof of the, uh, interpenetration of matter and mind. A s-the movement of a single atom from one known position to another known position changes an experience from nothing to overwhelming. This means that mind and matter at the quantum-mechanical level are, uh, all spun together. This means that, uh, in a sense the term 'extraordinary reality' is not correct if it implies a, uh, division of category from ordinary reality. It is simply there is more and more and more of... *reality!* And some of it is inside our heads and some of it is deployed out through uh, three-dimensional Newtonian space.

MT: Most of us, I think, just simply accept, uh, the everyday reality as the only one. Uh, and, and you're talking about uh, uh, journeys into the nether regions of, uh, uh, which- far beyond most peoples, uh, conception or even wanting to conceive of, uh, such a reality. Uh.

TM: Well, I think there's a shamanic temperament which is, uh-uh... a person who craves knowledge, knowledge in the Greek sense of gnosis. In other words, knowledge not of the sort where you subscribe to Scientific American and it validates what you believe, but immediately- uh, cosmologies constructed out of immediate experience but are found always to be applicable. You see, I-I don't believe that the world is made out of quarks or electromagnetic waves, or stars, or planets, or any of these things. I believe the world is made out language and that this is the primary fact that has been overlooked. Uh, the construction of the flying saucer is not so much a dilemma of hardware as it is, uh, a poetic challenge. And, uh, people find it very hard to imagine exactly what I'm talking about. What I'm saying is that the leading edge of reality is mind. And, mind is the primary, uh, substratum of being. We, in the West, have had it the wrong way around for over a millennia but, uh, once this is clearly understood, uh, with what we have learned in our little excursion through three-dimensional space and matter, we will, uh, create a new vision of humanity that will be a fusion of the East and the West.

MT: Well, the world being made of language and I think of these extraordinary realities which are totally beyond any language that we [laughs], we use in any ordinary sense.

TM: Yes, well they are beyond ordinary language. I always think of, uh, Philo Judaeus writing on the Logos. He-he posed to himself the question "What would be a more perfect Logos?" And, then the answered saying, "It would be a Logos which is not heard but beheld." And, he imagined a form of communication where the ears would not be the primary receptors, but the eyes would be. A language where meaning was not constructed through a dictionary of little mouth noises, but, actually, three-dimensional objects were generated with a kind of hyper-language so that there was perfect understanding between people. And, this may sound bizarre, uh, in ordinary reality, but these forms of synesthesia and, uh, synesthesia glossolalia are commonplace, uh, in psychedelic states.

MT: Terence, could you identify Philos for us and tell him-tell us who he was?

TM: He was an Alexandrian Jew of the second century who, uh, made it his business to travel around the Hellenic world and, uh, discussed all the major cults and, uh, religious and cosmogonic theories of his day, so he's a major source of Hellenistic, uh, data for us.

MT: How would you relate to, uh, Socrates view of the world?

TM: Well, I think, uh, that, uh, it's hard not to be a Platonist, but it's something perhaps we should struggle against or at least struggle to modify. I think of myself as sort of a Whiteheadian Platonist. Certainly, the central Platonic idea, which is the idea of the Ideas, these, uh, archetypal forms which stand outside of time, is one which is confirmed by the psychedelic experience and, uh, uh, Plato's formulation of time as the moving image of eternity is another one of these aphorisms that the psychedelic state confirms, and certainly neoplatonism, uh, Plotinus and Porphyry, and that school, uh, are psychedelic philosophers. Their idea of an ascending hierarchy of more and more rarified states is, uh, a sophisticated presentation of the shamanic cosmology, which is the cosmology that one experientially discovers when they involve themselves with psychedelics.

MT: What I think most of us don't understand, or don't-don't really know is the fact that Greek culture and the Eleusinian min-mysteries, um, incorporated the use of something that- very akin to psychedelics.

TM: Yes...

MT: And, and, essentially Western civilization [Laughing] is based on the culture that, uh, had at its core root, um, an experience and a ritual that-that used, as I say, something akin to psychedelics

TM: Yes, well, for over 2000 years, everyone who was anyone in the ancient world made the pilgrimage to Eleusis and had this experience, which Gordon Wasson and Carl Ruck have argued very convincingly was a, uh, hallucinogenic intoxication on ergot. But, of course, w-as soon as the church solidified its power, it, uh, closed these Platonic academies and, uh, moved against, uh, uh, anc-pagan, so-called pagan knowledge, and heretical knowledge, and not only the Platonists but all the Gnostic sects, uh, all of these people, all of these viewpoints, were repressed. I like to think that, uh, the end of that repression came in a very odd way when, uh, in nineteen fifty s- three, I guess it was, Gordon Wasson and his wife Valentina, in the village of Huautla de Jimenez in the Sierra Mazateca of Oaxaca, discovered the psilocybin mushroom cult. It was as if Eros who had been martyred in the Old World was then found sleeping in the mountains of Mexico and resurrected. And, uh, the experience of the mushroom is very much the experience of a *genius loci*, a god on the Grecian model, not 'the God who hung the stars in Heaven' but a local god, a, uh, a, uh, pre-Christian bacchanalian nature power that uh, is-is very alien and yet resonates with our expectations of what that experience would be like.

MT: Interesting that the mushroom also is a symbol in our culture of death and destruction, being the symbol of the nuclear explosion.

TM: Yes well, uh...

MT: Mushroom cloud.

TM: My brother has made the point asking, you know, 'what mushroom is it that grows at the end of history? Is it the mushroom of Fermi and Oppenheimer and Teller, or is it the mushroom of Wasson and Hoffman and Humphry Osmond?' Uh...

MT: Somehow, I think the latter is safer!

[Laughter]

TM: Well, it may not only be safer; it may open the way to escape from, uh, the former. It's like a pun in physics that the force of liberation and the force of destruction could take the same form. It's, uh, what alchemists call a *coincidentia oppositorum*.

MT: Hm, it is an amazing synchronicity it seems uh, that uh... Also, I was interested in--interested in talking with Andy Weil some, uh, time ago about the fact there are new genus of mushrooms appearing that, um, have psilocybin in them that have never been seen before, never been, um, tracked before, and it's almost as if they're appearing now.

TM: Well, it's amazing how many have disc- been discovered since people have bent their attention to it. There have been psilocybin mushrooms reported from England, France, localities where, so far as we know, there is *no* cultural history of usage at all or, uh, however, it's interesting that, uh, cultural usage seems to disappear very early in human history. Hallucinogens are hardly even welcome in agricultural societies. Uh, I think it was Weston La Barre made the point that, uh, once you learn how to grow plants, your god shifts from the ecstatic god of the hallucinogens to the corn god or the food god, and it no longer is about, uh, divining, uh, the hunt and weather through the ecstatic use of hallucinogens; it's about being able to get up every morning and go to work and hoe the crop. So, uh, y- you mentioned earlier the prejudice against hallucinogens; I think it reaches back, uh, to the beginning of agriculture. This competition among plant gods, which exemplified lifestyles that must have seemed very, uh, very, uh, alien to each other.

MT: Is psilocybin illegal?

TM: Oh yes, it's a Schedule 1 drug, uh; Without any public debate, uh, it was placed, uh, on the list, uh, er, at the same time that LSD was, and yet the issue was always couched in terms of LSD being made illegal but actually at that point in time a whole bunch of things were made illegal, and there was never any, uh, public debate. All psychedelics were viewed as the *same drug* and LSD was used as the model. Actually, uh, these drugs, there's a spectrum of psychedelic effects and certain drugs trigger some of them and certain ones others, but yes, psilocybin is illegal.

MT: Are the mushrooms illegal?

TM: The mushrooms also are illegal, as they contain psilocybin.

MT: I recall Andy Weil saying that he walked along a downtown Seattle residential street picking up psilocybin mushrooms from the front yards of...

TM: Oh yes! [chuckles]

MT: ...residential homes. [chuckles]

TM: Well.....Eh, English law took the view that, uh, it was preposterous to try and outlaw a naturally occurring plant, and they uh, took the position that only the chemical was illegal, which I think is a very, uh, very wise position, but I noticed that Canada recently chose the American interpretation over the

British one.

MT: Hm, interesting. It turns out, uh, going back to the Andy Weil story, that, uh, the reason that these mushrooms were in such plenitude in various locals in the northwest was that, uh, that their spores were contained in a mail order company's, uh, um, mushroom growing, uh, product that they send out, mail order, and so...

TM: Yea. So, this is an interesting phenomenon; you see the spores of the mushroom are not illegal because they do not contain psilocybin. They only contain the message in the DNA of the mushroom for the production of psilocybin, so it's a kind of bizarre catch-22. The mushroom spores can move anywhere legally, can be bought and sold but they are the *sine qua non* for the production of mushrooms, of course.

MT: Terence, the-the kind of knowledge and kind of information you're putting forward is... is not generally available. It's not the kind of information or knowledge that one would find in the typical academic anthropology, uh, curriculum, um, and yet it seems to be, um, a knowledge that, uh, is ever-expanding, but somehow it's outside of the cultural institutional, uh, entities in some way. Um, number one, why do you think that's the case? Of course, there's a logical answer to that one, but, um, what do you see as the future of this kind of information, this kind of knowledge?

TM: Well, I think in a sense it signals the rebirth of the institution of shamanism in the context of modern society, and, uh, anthropologists have always made the point about shamen that they were very important social catalysts in their group but they were always peripheral to it, peripheral to the political power and actually usually physically peripheral, living at some distance from the village. And, uh, I think the, uh, electronic shamen, the people who pursue these-the exploration of these spaces, exist to return to tell the rest of us about it, that we are now coming into a period of racial maturity as a species, where we can no longer have, uh, forbidden areas of the human mind or cultural, uh, uh, machinery. We have taken upon ourselves the acquisition of so much power that we now must understand what we are.

Uh, we cannot, uh, travel much further with, uh, the definitions of man that we inherit from the Judeo-Christian tradition. We need to truly explore the problem of consciousness, because as man gains power he is becoming the defining fact on the planet in the near-space area. So, uh, the question that looms is "Is man good?" and, then, if he is, what is it he's good *for*? And, uh, the shaman will point the way, because what they are, are, uh, visionaries, poets, cultural architects, forecasters, all these roles which we understand in more conventional terms rolled into one and raised to Nth power. They are cultural models for the rest of us. This has always been true. [stutters] The shaman has access to a superhuman dimension and a superhuman condition, and by being able to do that he affirms the trans- the potential for transcendence in *all* people. He is an exemplar, if you will. And, I see the attention that's being given to these things signaling a sense, on the part of the society, that we need a return to these models. This is why, for instance, in the *Star Wars* phenomenon, Skywalker, Luke Skywalker, Skywalker is a direct translation of the word shaman out of the Tungusic, which is, S- where Siberian shamanism comes from. So, these heroes that are being instilled in the heart of the culture are shamanic heroes. They control a force, which is, uh, bigger than everybody and holds the galaxy together, and this is true, as a matter of fact. And, as we explore how true it *is*, the, uh, limitations of our previous worldview will be exposed for all to see. I think it was J. B. S. Haldane who said, uh, "The world may not only be stranger than we suppose, it may be stranger than we *can* suppose."

MT: I think of, uh, the chara-[clears throat] excuse me, the character Yoda...

TM: Right...

MT: ...certainly as a shamanic type character.

TM: Very much so.

MT: Yea.... As we talk about shamans and shamanism, again that brings up, uh, cross-cultural currents, and, um, do you see the-the shaman taking on a new uh, -certainly you don't see Indian shamans walking, uh, into metropolitan areas, uh, but do you see the shaman taking on a new form?

TM: Well I th- I believe, along with Gordon Wasson and others, but in distinction to Mircea Eliade who was a major writer on shamanism, that, um, it is hallucinogenic shamanism that is primary and that where shamanic techniques are used to the exclusion of, uh, hallucinogenic drug ingestion, the shamanism tends to be vitiated. It is more like, uh, a ritual enactment of what *real* shamanism is. So that, uh, uh, the shamanism that is coming to be is coming to be within people in our culture. Uh, the people who feel comfortable with psychedelic drugs and who, by going into those spaces and then returning with works of art, or poetic accounts, or scientific ideas, are actually changing the face of the culture. I connect the psychedelic dimension to the dimension of inspiration and dream. I think history has always, uh, progressed by the bubbling up of ideas from these nether dimensions into the minds of receptive men and women. It is simply that *now* with the hallucinogens we actually have a tool to push the button. We are no longer dependent upon, uh, whatever factors it is that previously controlled the, uh, ingress of novelty into human history. We have taken that function to ourselves and this will accelerate and, uh, and, uh, intensify the cultural crisis, but I think in the end it will lead that much sooner to its resolution.

MT: So, as we, uh, continue to, uh, move towards the further exploration of these spaces, um, we, uh, can expect that, um, social change is a result? Personal change?

TM: Tremendous social change. I see in fact, uh, what is happening is a tendency to, uh, what I call 'turn the body inside out'. We are, through our media and our cybernetics, we are actually approaching the point where consciousness can be experienced, uh, dis-, uh, in a state of disconnection from the body. We have changed. We are no longer, as I said, bipedal monkeys. We are instead a kind of cybernetic coral reef of organic components and inorganic technological components. We have become a force which takes unorganized raw material and excretes, uh, technical objects. We have, uh, transcended the normal definitions of man; we are like an enormous collective organism with our data banks, and our forecasting, uh, agencies, and our computer networks, and the many levels at which we are connected into the universe. Our self-image is changing. The monkey is, uh, all but being left behind and shortly *will* be left behind.

The flying saucer, again, I take to be an image of the future state of humanity. It is a kind of millenarian transformation of man where the soul is exteriorized as the apotheosis of technology [Toms coughs], and it is that, uh, eschatological event which is casting enormous shadows backward through time over the historical landscape. That *is* the siren at the end of time, calling all mankind across the last ten millennia toward it, calling us out of the trees and into history and through this series of multi-leveled cultural, uh, transitions, to the point where, uh, the thing *within* the monkeys, the creature of pure language and pure

imagination, whose aspirations are entirely, uh, uh, titanic in terms of self-transformation. That thing is emerging, and it will emerge as man leaves the planet. And it's not something quantized and clearly defined. It is, in fact, what the next 50 or so years will be about. But, at the end of it, the species will be off-planet and transformed and fully-wired from the depths to the heights.

MT: Are we just talking about another version of the Christian death-ressurrection-ascension into heaven?

TM: Except that it is coming into history. What is happening is that uh, the uh, the paradise promised, *the soul*, is actually going to enter into history, because technological man took the apocalyptic aspirations of Christianity so seriously that we're going to make it happen. It has become the guiding image of what we want to be, and I'm reminded of the poem by Yeats, it's 'Sailing to Byzantium', where he speaks of how after death he would like to be an enameled golden object, uh, singing to the lords and ladies of Byzantium, and it's the image of man transformed into eternal circuitry and released into a hyperspace of information where, uh, you are a thing of circuitry but you appear to be walking along an unspoiled beach in paradise. It is that we are going to, uh, find the power to realize our deepest cultural aspirations. This is why we must find out what our deepest cultural aspirations are. Again, another way of phrasing the question "Is man good?".

MT: What about the idea that these spaces that we've been talking about, that you've been illuminating, are spaces that can be achieved without the use of psychedelics?

TM: Well, again, I scoured India, and my humble personal opinion is, uh, that, uh, it is highly unlikely. Uh, I've always approached, uh, people of spiritual accomplishment with the question, "What can you show me?," because, as I said earlier, this 'wise-old-man wisdom' is one thing, but only the- the hallucinogen using shaman of the Amazon seem to be able to go beyond that. Uhh, there may be techniques for doing this but, uh, the efficacy and the dependability of the hallucinogens seems to me to make them the obvious, uh, choice. It would only be a series of cultural conventions that would cause one to want to engineer around that. It is the obvious, uh, path to transcendence. People must face the fact that on one level we are chemical machines. That doesn't mean we are that at every level, but it does mean that that is a level where we can intervene to change the pictures that are coming in and going out and higher levels.

MT: You're not suggesting that people should do this by themselves?

TM: Take hallucinogens? Well, I don't know about 'take it by themselves'; probably not, although, uh, I always do. And, uh, I seem to prefer it. What I am suggesting is that they take it in a situation of minimum sensory input. Lying down in darkness with eyes closed cannot be surpassed, and people want music, they want to walk around in nature, they want all these things but nature and music are beautiful in their own right. They are the adumbrations of the psychedelic experience that we deal with in ordinary reality. In confrontation with the psychedelic experience, these things are hardly more than impediments. There very interesting things are happening in the utter blackness behind your eyelids, lying still in darkness. And, uh, that is where the mystery, uh, comes from and goes to.

MT: My question had to do with 'with or without a guide'.

TM: Oh, I don't think people should do it without a guide unless they feel very confident *from experience* that they don't need a guide. I like to have these ideas get out. I think it's important that we discuss all this

in a way that is only now becoming possible because of how it was in the 1960s. Now we need to shed all that and look back and look forward and try to make a mature judgment for our culture, based on the facts of the matter.

In James Joyce's *Ulysses*, Stephen Dedalus tells us, "History is the nightmare from which I am trying to awaken." I would turn this around and say that history is what we are trying to escape from into dream. The dream is eschatological. The dream is zero time and outside of history. We wish to escape into the dream. Escape is a key thing charged against those who would experiment with plant hallucinogens. The people who make this charge hardly dare face the degree to which hallucinogens are escapist. Escape. Escape from the planet, from death, from habit, and from the problem, if possible, of the Unspeakable.

If one leaves aside the last three hundred years of historical experience as it unfolded in Europe and America, and examines the phenomenon of death and the doctrine of the soul in all its ramifications - Neoplatonic, Christian, dynastic-Egyptian, and so on, one finds repeatedly the idea that there is a light body, an entelechy that is somehow mixed up with the body during life and at death is involved in a crisis in which these two portions separate. One part loses its *raison d'etre* and falls into dissolution; metabolism stops. The other part goes we know not where. Perhaps nowhere if one believes it does not exist; but then one has the problem of trying to explain life. And, though science makes great claims and has done well at explaining simple atomic systems, the idea that science can make *any* statement about what life is or where it comes from is currently preposterous.

Science has nothing to say about how one can decide to close one's hand into a fist, and yet it happens. This is utterly outside the realm of scientific explanation because what we see in that phenomenon is mind as a first cause. It is an example of telekinesis: matter is caused by mind to move. So we need not fear the sneers of science in the matter of the fate or origin of the soul. My probe into this area has always been the psychedelic experience, but recently I have been investigating dreams, because dreams are a much more generalized form of experience of the hyperdimension in which life and mind seem to be embedded.

Looking at what people with shamanic traditions say about dreams, one comes to the realization that for these people dream reality is experientially a parallel continuum. The shaman accesses this continuum with hallucinogens as well as with other techniques, but most effectively with hallucinogens. Everyone else accesses it through dreams. Freud's idea about dreams was that they were what he called "day-residues," and that one could trace the content of a dream down to a distortion of something that happened during waking time.

I suggest that it is much more useful to try to make a geometric model of consciousness, to take seriously the idea of a parallel continuum, and to say that the mind and the body are embedded in the dream and the dream is a higher-order spatial dimension. In sleep, one is released into the real world, of which the world of waking is only the surface in a very literal geometric sense. There is a plenum - recent experiments in quantum physics tend to back this up - a holographic plenum of information. All information is everywhere. Information that is not here is nowhere. Information stands outside of time in a kind of eternity - an eternity that does not have a temporal existence about which one may say, "It always existed." It does not have temporal duration of any sort. It is eternity. We are not primarily biological, with mind emerging as a kind of iridescence, a kind of epiphenomenon at the higher levels of organization of biology. We are hyperspatial objects of some sort that cast a shadow into matter. The shadow in matter is our physical organism.

At death, the thing that casts the shadow withdraws, and metabolism ceases. Material form breaks down; it ceases to be a dissipative structure in a very localized area, sustained against entropy by cycling material in, extracting energy, and expelling waste. But the form that ordered it is not affected. These declarative statements are made from the point of view of the shamanic tradition, which touches all higher religions. Both the psychedelic dream state and the waking psychedelic state acquire great import because they reveal to life a task: to become familiar with this dimension that is causing being, in order to be familiar with it at the moment of passing from life.

The metaphor of a vehicle - an after-death vehicle, an astral body - is used by several traditions. Shamanism and certain yogas, including Taoist yoga, claim very clearly that the purpose of life is to familiarize oneself with this after-death body so that the act of dying will not create confusion in the psyche. One will recognize what is happening. One will know what to do and one will make a clean break. Yet there does seem to be the possibility of a problem in dying. It is not the case that one is condemned to eternal life. One can muff it through ignorance.

Apparently at the moment of death there is a kind of separation, like birth - the metaphor is trivial, but perfect. There is a possibility of damage or of incorrect activity. The English poet-mystic William Blake said that as one starts into the spiral there is the possibility of falling from the golden track into eternal death. Yet it is only a crisis of a moment - a crisis of passage - and the whole purpose of shamanism and of life correctly lived is to strengthen the soul and to strengthen the ego's relationship to the soul so that this passage can be cleanly made. This is the traditional position.

I want to include an abyss in this model - one less familiar to rationalists, but familiar to us all one level deeper in the psyche as inheritors of the Judeo-Christian culture. That is the idea that the world will end, that there will be a final time, that there is not only the crisis of the death of the individual but also the crisis of death in the history of the species.

What this seems to be about is that from the time of the awareness until the resolution of the apocalyptic potential, there are roughly one hundred thousand years. In biological time, this is only a moment, yet it is ten times the entire span of history. In that period, everything hangs in the balance, because it is a mad rush from hominid to starflight. In the leap across those one hundred thousand years, energies are released, religions are shot off like sparks, philosophies evolve and die, science arises, magic arises, all of these concerns that control power with greater and lesser degrees of ethical constancy appear. Ever present is the possibility of aborting the species' transformation into a hyperspatial entelechy.

We are now, there can be no doubt, in the final historical seconds of that crisis - a crisis that involves the end of history, our departure from the planet, the triumph over death, and the release of the individual from the body. We are, in fact, closing distance with the most profound event a planetary ecology can encounter - the freeing of life from the dark chrysalis of matter. The old metaphor of psyche as the caterpillar transformed by metamorphosis is a specieswide analogy. We must undergo a metamorphosis in order to survive the momentum of the historical forces already set in motion.

Evolutionary biologists consider humans to be an unevolving species. Some time in the last fifty thousand years, with the invention of culture, the biological evolution of humans ceased and evolution became an epigenetic, cultural phenomenon. Tools, languages, and philosophies began to evolve, but the human somatotype remained the same. Hence, physically, we are very much like people of a long time ago. But technology is the real skin of our species. Humanity, correctly seen in the context of the last five hundred years, is an extruder of technological material. We take in matter that has a low degree of organization; we put it through mental filters, and we extrude jewelry, gospels, space shuttles. This is what we do. We are like coral animals embedded in a technological reef of extruded psychic objects. All our tool making implies our belief in an ultimate tool. That tool is the flying saucer, or the soul, exteriorized in three-dimensional space. The body can become an internalized holographic object embedded in a solid-state, hyperdimensional matrix that is eternal, so that we each wander through a true Elysium.

This is a kind of Islamic paradise in which one is free to experience all the pleasures of the flesh provided one realizes that one is a projection of a holographic solid-state matrix that is microminiaturized, superconducting, and nowhere to be found: it is part of the plenum. All technological history is about producing prototypes of this situation with greater and greater closure toward the ideal, so that airplanes, automobiles, space shuttles, space colonies, starships of the nuts-and-bolts, speed-of-light type are, as Mircea Eliade said, "self-transforming images of flight that speak volumes about man's aspiration to self-transcendence."

Our wish, our salvation, and our only hope is to end the historical crisis by becoming the alien, by ending alienation, by recognizing the alien as the Self, in fact - recognizing the alien as an Overmind that holds all the physical laws of the planet intact in the same way that one holds an idea intact in one's thoughts. The givens that are thought to be writ in adamant are actually merely the moods of the Goddess, whose reflection we happen to be. The whole meaning of human history lies in recovering this piece of lost information so that man may be dirigible or, to paraphrase James Joyce's *Finnegans Wake* on Moicane, the red light district of Dublin: "Here in Moicane we flop on the seamy side, but up n'ent, prospector, you sprout all your worth and you woof your wings, so if you want to be Phoenixed, come and be parked." It is that simple, you see, but it takes courage to be parked when the Grim Reaper draws near. "A blessing in disguise," Joyce calls him.

What psychedelics encourage, and where I hope attention will focus once hallucinogens are culturally integrated to the point where large groups of people can plan research programs without fear of persecution, is the modeling of the after-death state. Psychedelics may do more than model this state; they may reveal the nature of it. Psychedelics will show us that the modalities of appearance and understanding can be shifted so that we can know mind within the context of the One Mind. The One Mind contains all experiences of the Other. There is no dichotomy between the Newtonian universe, deployed through light-years of three-dimensional universe, and the interior mental universe. They are adumbrations of the same

thing.

We perceive them as unresolvable dualisms because of the low quality of the code we customarily use. The language we use to discuss this problem has built-in dualisms. This is a problem of language. All codes have relative code qualities, except the Logos. The Logos is perfect and, therefore, partakes of no quality other than itself. I am here using the word *Logos* in the sense in which Philo Judaeus uses it - that of the Divine Reason that embraces the archetypal complex of Platonic ideas that serve as the models of creation. As long as one maps with something other than the Logos, there will be problems of code quality. The dualism built into our language makes the death of the species and the death of the individual appear to be opposed things.

Likewise, the scenarios that biology has created through examining the physical universe versus the angel- and demon-haunted worlds that depth psychology is reporting is also a dichotomy. The psychedelic experience acts to resolve this dichotomy. All that is needed to go beyond an academic understanding of the plant hallucinogens is the experience of the tryptamine- induced ecstasy. The dimethyltryptamine (DMT) molecule has the unique property of releasing the structured ego into the Overself. Each person who has that experience undergoes a mini-apocalypse, a mini-entry and mapping into hyperspace. For society to focus in this direction, nothing is necessary except for this experience to become an object of general concern.

This is not to suggest that everyone should experiment with mushrooms or other naturally occurring sources of psychoactive tryptamines. We should try to assimilate and integrate the psychedelic experience since it is a plane of experience that is directly accessible to each of us. The role that we play in relationship determines how we will present ourselves in that final, intimated transformation. In other words, in this notion there is a kind of teleological bias; there is a belief that there is a hyperobject called the Overmind, or God, that casts a shadow into time. History is our group experience of this shadow. As one draws closer and closer to the source of the shadow, the paradoxes intensify, the rate of change intensifies. What is happening is that the hyperobject is beginning to ingress into three-dimensional space.

One way of thinking of this is to suppose that the waking world and the world of the dream have begun to merge so that in a certain sense the school of UFO criticism that has said flying sources are hallucinations was correct in that the laws that operate in the dream, the laws that operate in hyperspace, can at times operate in three-dimensional space when the barrier between the two modes becomes weak. Then one gets these curious experiences, sometimes called psychotic breaks, that always have a tremendous impact on the experient because there seems to be an exterior component that could not possibly be subjective. At such times coincidences begin to build and build until one must finally admit that one does not know what is going on. Nevertheless, it is preposterous to claim that this is a psychological phenomenon, because there are accompanying changes in the external world. Jung called this *synchronicity* and made a psychological model of it, but it is really an alternative physics beginning to impinge on local reality.

The alternative physics is a physics of light. Light is composed of photons, which have no antiparticle. This means that there is no dualism in the world of light. The conventions of relativity say that time slows down as one approaches the speed of light, but if one tries to imagine the point of view of a thing made of light, one must realize that what is never mentioned is that if one moves at the speed of light there is no time whatsoever. There is an experience of time zero. So if one imagines for a moment oneself to be made of light, or in possession of a vehicle that can move at the speed of light, one can traverse from any point in the universe to any other with a subjective experience of time zero. This means that one crosses to Alpha

Centauri in time zero, but the amount of time that has passed in the relativistic universe is four and a half years. But if one moves very great distances, if one crosses two hundred and fifty thousand light-years to Andromeda, one would still have a subjective experience of time zero.

The only experience of time that one can have is of a subjective time that is created by one's own mental processes, but in relationship to the Newtonian universe there is no time whatsoever. One exists in eternity, one has become eternal, the universe is aging at a staggering rate all around one in this situation, but that is perceived as a fact of this universe - the way we perceive Newtonian physics as a fact of this universe. One has transited into the eternal mode. One is then apart from the moving image; one exists in the completion of eternity.

I believe that this is what technology pushes toward. There is no contradiction between ecological balance and space migration, between hypertechnology and radical ecology. These issues are red herrings; the real historical entity that is becoming imminent is the human soul. The monkey body has served to carry us to this moment of release, and it will always serve as a focus of self-image, but we are coming more and more to exist in a world made by the human imagination. This is what is meant by the return to the Father, the transcendence of *physis*, the rising out of the Gnostic universal prison of iron that traps the light: nothing less than the transformation of our species.

Very shortly an acceleration of this phenomenon will take place in the form of space exploration and space colonies. The coral-reef-like animal called Man that has extruded technology over the surface of the earth will be freed from the constraints of anything but the imagination and the limitations of materials. It has been suggested that the earliest space colonies include efforts to duplicate the idyllic ecosystem of Hawaii as an ideal. These exercises in ecological understanding will prove we know what we are doing. However, as soon as this understanding is under control we will be released into the realm of art. This is what we have always striven for. We will make our world - all of our worlds - and the world we came from will be maintained as a garden. What Eliade discussed as metaphors of self-transforming flight will be realized shortly in the technology of space colonization.

The transition from earth to space will be a staggeringly tight genetic filter, a much tighter filter than any previous frontier has ever been, including the genetic and demographic filter represented by the colonization of the New World. It has been said that the vitality of the Americas is due to the fact that only the dreamers and the pioneers and the fanatics made the trip across. This will be even more true of the transition to space. The technological conquest of space will set the stage; then, for the internalization of that metaphor, it will bring the conquest of inner space and the collapse of the state vectors associated with this technology deployed in Newtonian space. Then the human species will have become more than dirigible.

A technology that would internalize the body and exteriorize the soul will develop parallel to the move to space. The Invisible Landscape, a book by my brother and myself, made an effort to short-circuit that chronology and, in a certain sense, to force the issue. It is the story, or rather it is the intellectual underpinnings of the story, of an expedition to the Amazon by my brother and myself and several other people in 1971. During that expedition, my brother formulated an idea that involved using harmine and harmaline, compounds that occur in *Banisteriopsis caapi*, the woody vine that is the basis for ayahuasca. We undertook an effort to use harmine in conjunction with the human voice in what we called "the experiment at La Chorrera." It was an effort to use sound to charge the molecular structure of harmine molecules metabolizing in the body in such a way that they would bind preferentially and permanently with

endogenous molecular structures.

Our candidate at the time was neural DNA, though Frank Barr, a researcher into the properties of brain melanin, has made a convincing case that there is as great a likelihood that harmine acts by binding with melanin bodies. In either case, the pharmacology involves binding with a molecular site where information is stored, and this information is then broadcast in such a way that one begins to get a mental readout on the structure of the soul. Our experiment was an effort to use a kind of shamanic technology to bell the cat, if you will, to hang a superconducting, telemetric device on the Overmind so that there would be a continuous readout of information from that dimension. The success or failure of this attempt may be judged for oneself.

The first half of the book describes the theoretical underpinnings of the experiment. The second half describes the theory of the structure of time that derived from the bizarre mental states that followed the experiment. I do not claim that we succeeded, only that our theory of what happened is better than any theory proposed by critics. Whether we succeeded or not, this style of thinking points the way. For example, when I speak of the technology of building a starship, I imagine it will be done with voltages far below the voltage of a common flashlight battery. This is, after all, where the most interesting phenomena go on in nature. Thought is that kind of phenomenon; metabolism is that kind of phenomenon.

A new science that places the psychedelic experience at the center of its program of investigation should move toward a practical realization of this goal - the goal of eliminating the barrier between the ego and the Overself so that the ego can perceive itself as an expression of the Overself. Then the anxiety of facing a tremendous biological crisis in the form of the ecocrises, and the crisis of limitation in physical space forced upon us by our planet-bound situation, can be obviated by cultivating the soul and by practicing a new shamanism using tryptamine-containing plants.

Psilocybin is the most commonly available and experientially accessible of these compounds. Therefore my plea to scientists, administrators, and politicians who may read these words is this: look again at psilocybin, do not confuse it with the other psychedelics, and realize that it is a phenomenon unto itself with an enormous potential for transforming human beings - not simply transforming the people who take it, but transforming society in the way that an art movement, a mathematical understanding, or a scientific breakthrough transforms society. It holds the possibility of transforming the entire species simply by virtue of the information that comes through it. Psilocybin is a source of gnosis, and the voice of gnosis has been silenced in the Western mind for at least a thousand years.

When the Franciscans and the Dominicans arrived in Mexico in the sixteenth century, they immediately set about stamping out the mushroom religion. The Indians called it *teonanacatl*, "the flesh of the gods." The Catholic church had a monopoly on theophagia and was not pleased by this particular approach to what was going on. Now, four hundred years after that initial contact, I suggest that Eros, which retreated from Europe with the rise of Christianity, retreated to the mountains of the Sierra Mazateca. Finally, pushed into seclusion there, it now reemerges in Western consciousness.

Our institutions, our epistemologies are bankrupt and exhausted; we must start anew and hope that with the help of shamanically inspired personalities, we can cultivate this ancient mystery once again. The Logos can be unleashed, and the voice that spoke to Plato and Parmenides and Heraclitus can speak again in the minds of modern people. When it does, the alienation will be ended because we will have become the alien. This is the promise that is held out; it may seem to some a nightmare vision, but all historical

changes of immense magnitude have a charged emotional quality. They propel people into a completely new world.

I believe that this work must be done using hallucinogens. Traditionally it has been thought that there were many paths to spiritual advancement. In this matter I must fall back on personal experience. I have not had good results with any other techniques. I spent time in India, practiced yoga, visited among the various rishis, roshis, geysheys, and gurus that Asia had to offer, and I believe they must be talking about something so pale and removed from closure with the full tryptamine ecstasy that I don't really know what to make of them and their wan hierophanies.

Tantra claims to be another approach. Tantra means "the short-cut path," and certainly it might be on the right track. Sexuality, orgasm, these things do have tryptaminelike qualities to them, but the difference between psilocybin and all other hallucinogens is information - immense amounts of information.

LSD seemed somehow to be largely related to the structure of the personality. Often it seemed to me the visions were merely geometric patterns unless synergized by another compound. The classic psychedelic experience that was written about by Aldous Huxley was two hundred micrograms of LSD and thirty milligrams of mescaline. That combination delivers a visionary experience rather than an experience of hallucinations. In my opinion the unique quality of psilocybin is that it reveals not colored lights and moving grids, but places - jungles, cities, machines, books, architectonic forms of incredible complexity. There is no possibility that this could be construed as neurological noise of any sort. It is, in factm the most highly ordered visual information that one can experience, much more highly ordered than the normal waking vision.

That's why it's very hard with psychedelic compounds to bring back information. These things are hard to English because it is like trying to make a three-dimensional rendering of a fourth-dimensional object. Only through the medium of sight can the true modality of this Logos be perceived. That is why it is so interesting that psilocybin and *ayahuasca* - the aboriginal tryptamine-containing brew - both produce a telepathic experience and a shared state of mind. The unfolding group hallucination is shared in complete silence. It's hard to prove this to a scientist, but if several people share such an experience, one person can describe it and then cease the monologue and another person may then take it up. Everyone is seeing the same thing! It is the quality of being complex visual information that makes the Logos a vision of a truth that cannot be told.

The information thus imparted is not, however, merely restricted to the mode of seeing. The Logos is capable of going from a thing heard to a thing seen, without ever crossing through a discernible transition point. This seems a logical impossibility; yet when one actually has the experience, one sees - aha! - it is as though thought that is heard does become something seen. The thought that is heard becomes more and more intense until, finally, its intensity is such that, with no transition, one is now beholding it in three-dimensional, visual space. One commands it. This is very typical of psilocybin.

Naturally, whenever a compound is introduced into the body, one must exercise caution and be well informed with regard to possible side effects. Professional psychedelic investigators are aware of these factors and freely acknowledge that the obligation to be well informed is of primary importance.

Speaking for myself, let me say that I am not an abuser. It takes me a long time to assimilate each visionary experience. I have never lost my respect for these dimensions. Dread is one of the emotions that I feel as I approach the experience. Psychedelic work is like sailing out onto a dark ocean in a little skiff.

One may view the moon rising serenely over the calm black water, or something the size of a freight train may roar right through the scene and leave one clinging at an oar.

The dialogue with the other is what makes repetition of these experiences seem worthwhile. The mushroom speaks to you when you speak to it. In the introduction to the book that my brother and I wrote (under pseudonyms) called [//Psilocybin: Magic Mushroom Grower's Guide//](#), there is a mushroom monologue that goes: "I am old, fifty times older than thought in your species, and I came from the stars." Sometimes it's very human. My approach to it is Hasidic. I rave at it; it raves at me. We argue about what it is going to cough up and what it isn't. I say, "Well, look, I'm the propagator, you can't hold back on me," and it says, "But if I showed you the flying saucer for five minutes, you would figure out how it works," and I say, "Well, come through." It has many manifestations. Sometimes it's like Dorothy of Oz; sometimes it's like a very Talmudic sort of pawnbroker. I asked it once, "What are you doing on Earth?" It said, "Listen, if you're a mushroom, you live cheap; besides, I'm telling you, this was a very nice neighborhood until the monkeys got out of control."

"Monkeys out of control:" that is the mushroom voice's view of history. To us, history is something very different. History is the shock wave of eschatology. In other words, we are living in a very unique moment, ten or twenty thousand years long, where an immense transition is happening. The object at the end of and beyond history is the human species fused into eternal tantric union with the superconducting Overmind/UFO. It is that mystery that casts its shadow back through time. All religion, all philosophy, all wars, pogroms, and persecutions happen because people do not get the message right. There is both the forward-flowing casuistry of being, causal determinism, and the interference pattern that is formed against that by the backward-flowing fact of this eschatological hyperobject throwing its shadow across the temporal landscape. We exist, yet there is a great deal of noise. This situation called history is totally unique; it will last only a moment, it began a moment ago. In that moment there is a tremendous burst of static as the monkey goes to godhood, as the final eschatological object mitigates and transforms the forward flow of entropic circumstance.

Life is central to the career of organization in matter. I reject the idea that we have been shunted onto a siding called organic existence and that our actual place is in eternity. This mode of existence is an important part of the cycle. It is filter. There is the possibility of extinction, the possibility of falling into *physis* forever, and so in that sense the metaphor of the fall is valid. There is a spiritual obligation, there is a task to be done. It is not, however, something as simple as following a set of somebody else's rules. The noetic enterprise is a primary obligation toward being. Our salvation is linked to it. Not everyone has to read alchemical texts or study superconducting biomolecules to make the transition. Most people make it naively by thinking clearly about the present at hand, but we intellectuals are trapped in a world of too much information. Innocence is gone for us. We cannot expect to cross the rainbow bridge through a good act of contrition; that will not be sufficient.

We have to understand. Whitehead said, "Understanding is the apperception of pattern as such;" to fear death is to misunderstand life. Cognitive activity is the defining act of humanness. Language, thought, analysis, art, dance, poetry, myth-making: these are the things that point the way toward the realm of the eschaton. We humans may be released into a realm of pure self-engineering. The imagination is everything. This was Blake's perception. This is where we came from. This is where we are going. And it is only to be approached through cognitive activity.

Time is the notion that gives ideas such as these their power, for they imply a new conception of time.

During the experiment at La Chorrera, the Logos demonstrated that time is not simply a homogeneous medium where things occur, but a fluctuating density of probability. Though science can sometimes tell us what can happen and what cannot happen, we have no theory that explains why, out of everything that could happen, certain things undergo what Whitehead called "the formality of actually occurring." This was what the Logos sought to explain, why out of all the myriad things that could happen, certain things undergo the formality of occurring. It is because there is a modular hierarchy of waves of temporal conditioning, or temporal density. A certain event, rated highly improbable, is more probable at some moments than at others.

Taking that simple perception and being led by the Logos, I was able to construct a fractal model of time that can be programmed on a computer and that gives a map of the ingression of what I call "novelty" - the ingression of novelty into time. As a general rule, novelty is obviously increasing. It has been since the very beginning of the universe. Immediately following the Big Bang there was only the possibility of nuclear interaction, and then, as temperatures fell below the bond strength of the nucleus, atomic systems could be formed. Still later, as temperatures fell further, molecular systems appeared. Then much later, life became possible; then very complex life forms evolved, thought became possible, culture was invented. The invention of printing and electronic information transfer occurred.

What is happening to our world is ingression of novelty toward what Whitehead called "concrecence," a tightening gyre. Everything is flowing together. The "autopoietic lapis," the alchemical stone at the end of time, coalesces when everything flows together. When the laws of physics are obviated, the universe disappears, and what is left is the tightly bound plenum, the monad, able to express itself for itself, rather than only able to cast a shadow into *physis* as its reflection. I come very close here to classical millenarian and apocalyptic thought in my view of the rate at which change is accelerating. From the way the gyre is tightening, I predict that concrecence will occur soon - around 2012 A.D. It will be the entry of our species into hyperspace, but it will appear to be the end of physical laws accompanied by the release of the mind into the imagination.

All these images - the starship, the space colony, the lapis - are precursory images. They follow naturally from the idea that history is the shock wave of eschatology. As closes distance with the eschatological object, the reflections it is throwing off resemble more and more the thing itself. In the final moment the Unspeakable stands revealed. There are no more reflections of the Mystery. The Mystery in all its nakedness is seen, and nothing else exists. But what it is, decency can safely scarcely hint; nevertheless, it is the crowning joy of futurism to seek anticipation of it.

"We're playing with half a deck as long as we tolerate that the cardinals of government and science should dictate where human curiosity can legitimately send its attention and where it cannot. It's an essentially preposterous situation. It is essentially a civil rights issue because what we're talking about here is the repression of a religious sensibility. In fact not "a" religious sensibility, the religious sensibility. Not built on some con game spun out by eunuchs, but based on the symbiotic relationship that was in place for our species for 50,000 years before the advent of history riding priestcraft and propaganda. So it's a clarion call to recover a birthright, however uncomfortable that may make us. A call to realize that life lived in the absence of the psychedelic experience that primordial shamanism is based on is life trivialized, life denied, life enslaved to the ego and its fear of dissolution in this mysterious mama matrix which is all around us and which apparently extends to infinity and where our historical future actually lies. This is the other thing..It is now very clear that techniques of machine-human interfacing, pharmacology of the synthetic variety, all kinds of manipulative techniques, all kinds of data storage, imaging and retrieval techniques, all of this is coalescing toward the potential of a truly demonic or angelic kind of self-imaging of our culture. And the people who are on the demonic side are fully aware of this and hurrying full-tilt forward with their plans to capture everyone as a 100% believing consumer inside some kind of beige furnished fascism that won't even raise a ripple. The shamanic response in this situation I think is to PUSH THE ART PEDAL THROUGH THE FLOOR." "Years and years ago before the term "psychedelic" was settled on there was just a phenomenological description. These things were called "consciousness-expanding" drugs. I think that's a very good term. Think about our dilemma on this planet. If the expansion of consciousness does not loom large in the human future, what kind of future is it going to be? To my mind the psychedelic position is most fundamentally threatening when fully logically thought out because it is an anti-drug position, and make no mistake about it, the issue is "drugged." How drugged shall you be? Or to put it another way: consciousness. How conscious shall you be? Who shall be conscious? Who shall be unconscious? Imagine if the Japanese had won World War II, taken over America, and introduced an insidious drug which caused the average American to spend six and a half hours a day consuming enemy propaganda. But this is what was done. Not by the Japanese but by ourselves. This is television. Six and a half hours a day! Average! That's the average! So there must be people out there hooked on twenty-four hours a day. I visit people in L.A. who have one set on in every room so they're racking up a lot of time for the rest of us. You see what is needed is an operational awareness of what we mean by "drug." A "drug" is something which causes unexamined, obsessive habituated behavior. You don't examine your behavior, you just do it, you do it obsessively. You let nothing get in the way of it. This is the kind of life we're being

sold on every level: to watch, to consume, to buy. The psychedelic thing is off in this tiny corner, never mentioned and yet it represents the only counter flow toward a tendency to just leave people in designer states of ...

Andrew C. Voth: Well, I am most pleased and most happy to introduce our very special guest speaker for tonight, Mr. Terence McKenna. [long applause]

Terence: Well, it's a pleasure to be hear. It's wonderful to see..so many familiar faces, and so many faces period. [audience laughter]. I've never been to Port Hueneme before; probably some of you feel the same way. [audience laughter] But, uh, I've been doing a lot of traveling recently. I was, uh, in New York last weekend at the Open Center, and in Prague two weeks before that, so this is the end of a long season of traveling. I'm not home yet, but at least, I'm in my own time zone. [audience laughter]. I want to especially thank Andy Voth and the Carnegie Museum of Art in Oxnard for inviting me to participate. Uh...it represents a real commitment to, uh, free speech and first amendment rights, I think, for [applause] an art museum [applause continue].....Art museums have been taking some knocks recently, and so I think they doubly should be commended for their, uh, courage.

And, I want to explain, as Andy mentioned, this is a benefit for Botanical Dimensions, which explains the double price over the ticket. All of this money will go to the preservation of, uh, medicinal plants with a history of shamanic usage. That is the special focus of our botanical garden in Hawaii, and before I start the formal lecture, I'd like to just say a little bit about that. As you know, the rainforests of the world are being cleared at a v-very frightening rate, and, uh, perhaps, uh..voices are beginning to be heard to halt this destruction of the natural environment. But, whether it's halted or not, the destruction of the knowledge of native peoples concerning the uses of the plants in the rainforest, this is disappearing without doubt in the next 30 years, because these people are moving into cities, uh, taking jobs in the ordinary market economy, and thousands of years of accumulated folk medical knowledge is being lost. So, the real-world political work that Kat [Harrison] and I do is associated with Botanical Dimensions. We conceived it together many, many years ago, and then about six years ago, uh, Kat took it over, put it on its official feet, made it a-a, uh, non-profit foundation, and has run it day to day since then, uh, with tremendous energy and efficiency. So, I'd like to acknowledge Kat McKenna here [points to Kat, applause].

My better half; in fact, my only good half. [audience laughter] And, then I wanted to underscore what Andy said, a very special event, two weeks from now, at the Carnegie Museum. Roy Tuckman, Roy of Hollywood, *bon vivant*, [audience laughter] countercultural figure, informational ferret of our time,

[audience laughter] will be recast as an experimental composer of great, uh, energy and imagination, and I hope you'll all, uh, turn out for Roy. He's been a wonderful force, uh, and in my life and I think in the cultural life of Southern California. Both Roy and Diane [surname] have done a wonderful job in raising the quality of public dialogue in Southern California, which I think is a precondition for any kind of, uh, clear thinking about our future or our political situation. So, [applause] here's to Roy and Diane.

Ok.....

Well, the theme that unites these lectures is, uh, creativity and the techniques by which the artist can, uh, refine his or her vision, expand the vision, communicate the vision. And, um, before I get into that issue, I thought I would talk just a little bit about my notion of creativity, per se. What is it, uh, uh, in and of itself? And when I think like that of course I cast my mind back to nature. Nature is the great visible engine of creativity, against which all other creative efforts, uh, are measured. And, creativity in nature has a curious distribution. It's something which accumulates through time. If we stand back and look at the universe, we see that at its earliest moments, it was very simple. It was a plenum. It was without characters or characteristics. It was what is called in Hindu mythology the *turiya*, which is described as attribute-less. And, naturally if something is without attribution, you can't say much about it [some audience laughter]. It takes a while for it to undergo a declension into more creative realms. And, these creative realms are distinguished as domains of difference. The precondition for creativity is, I think, disequilibrium: what mathematicians now call chaos. And, through the light of the universe, as temperatures have fallen, more and more complex compound structures have arisen. And, though there's been, um, you know, many a, uh, slipping back in this process, over very large spans of time we can say that creativity is conserved, that the universe becomes more creative. And, out of that state of creative fecundity, more creativity is manifest. So that, from that point of view, the universe is almost, what we would have to call, an art-making machine. An engine for the production of ever more novel forms of connectedness, ever-more exotic juxtapositions of disparate elements. And out of this, uh, I believe, arises, implicitly, a set of principles we can then, uh, apply to the human artist in the human world. [takes drink]

Nature's creativity is, obviously, the wellspring of human creativity. We emerge out of nature almost—and this idea I think was fairly present close to the surface of the medieval mind—we emerge out of nature almost as its finest work of art. Uh, uh, the medieval mind spoke of 'the productions of nature'. This is a phrase you hear as late as the 18th century: 'the productions of nature'. And, human creativity, uh, emerges out of that, whether you have a model of the Aristotelian great ladder of being, or a more modern evolutionary view where we actually consolidate emergent properties and somehow bring them to a focus of self-reflection.

Now, I'm sure that we couldn't..carry out a discussion of this sort without observing that the prototypic figure for the artist, as well as for the scientist, is the shaman. The shaman is the figure at the beginning of human history that unites the doctor, the scientist, and the artist into a single notion of care-giving and creativity. And, I think that, you know, to whatever degree art, over the past several centuries, has wandered in the desert, it is because this shamanic function has been either suppressed or forgotten. And we've...eh, different images of the artist have been held up at different times: the artist as, uh, *artisan*; the artist as handmaiden of a ruling class or family; the artist as designer for the production of integrated objects into a civilization. Uh, this notion of the artist as mystical journeyer, as one who goes into a world unseen by others, and then returns to tell them of it, was pretty much lost in the post-medieval and renaissance conception of art. Up until the late 19th century and the beginning of the 20th century, where,

beginning with the Romantics, there is a new permission to explore the irrational. This really is the bridge back to the archaic, shamanic function of the artist: permission to explore the irrational. The Romantics did it with their, um, uh, elevation of titanic emotion, of romantic love specifically. The symbolists, in the mid-19th century, did it by a reemphasis on the emotional content of the image and a rejection of the previous rationalism, and that emphasis on the image and on the emotions set the stage, then, for what I take to be the truly shamanic movements in art, which begin really with Alfred Jarry, in the late 1880's and early 1890's.

Jarry, you may remember, was the founder of something called the *Ecole du Pataphysique*—the Pataphysical College. Jarry announced pataphysics is *the* science. The problem was, nobody could understand what it meant or what it stood for, including Jarry. [audience laughter] Jarry is, uh, was tight--Jarry was tight with Montremont, who you may recall said, "I am fascinated by that kind of beauty that arises when a sewing machine meets a bicycle on an operating table." See, this was a true effort to bend the boundaries of art, to create new permission... permission really for the unthinkable. And this,uh, again, reinforces the shamanic function.

What do we mean when we say the unthinkable? We mean the envelope of that which can be conceived. And, for, uh, at least 200 years, the ostensible mission of the artist has been to test the conceptual and imagistic envelope of what the society is willing to tolerate. And, this has taken many forms: the, uh, deconstruction of imagery that we get with abstract impressionism going back into impressionism and the pointillists. Or the permission for the irrational imagery of the unconscious; surrealism and German expressionism make use of this permission. Always the idea being to somehow destroy the idols of the tribe, dissolve the conceptual boundary of ordinary expectation.

Well, in order to do this, it seems to me there is a precondition for the creation of art which I call 'understanding'. And I don't mean this in an intellectual sense; I mean it in the sense that Alfred North Whitehead intended when he defined understanding as the "apperception of pattern as such." *As such*. There's nothing more to it than that. You see, if we were to look at this room, and we were to squint our eyes and, uh--I'm doing this right now and I see that the room divides itself into people dressed in red and people dressed in blue. This is a pattern, and it tells me something about what I'm looking at. Now I shift my depth of field. Now I'm looking at where men are sitting and where women are sitting. This is a different pattern, and it tells me more about what I am looking at. The number of these patterns theoretically present in any construction is infinite. That says to me, then, that the depth of understanding cannot be known. It cannot be known. Everything is imminent. William Blake makes this point, you know, that you can see infinity in a grain of sand.

So, understanding, then, is the pre-, the precondition for creativity. And this understanding is not so much intellectual as it is visual. Visual. [takes drink] And in thinking about this, I realized what an influence on my own ideas in this area Aldous Huxley was. Not, the Huxley that we might ordinarily associate with my concerns, but the Huxley of 'The Doors of Perception and of Heaven and Hell', but the Huxley of a very modest book that he wrote in the early 50's that he called 'The Art of Seeing'. The Art of Seeing. And in that book, he makes the point that a good art education begins with a good drawing hand. That to be able to coordinate the hand and eye and to see in to nature—to see into the patterns present as such—is the precondition for a kind of approach to the absolute. Now, out of this process of seeing, which I'm calling 'understanding', the creative process ushers in novelty.

And, many of you have heard me speak of novelty in another context: in the context of nature being a novelty-producing engine of some sort. And ourselves, almost as the handiwork of nature. But this same handiwork of nature which we *represent*, we also internalize and re-express through the novelty of the human world. Well, now, if we take seriously the-the shamanic model as a basis for our authentic art, then certainly in the modern context, what we see missing from the repertoire of the artist are shamanic techniques. And it's for the discussion of these shamanic techniques, I believe, um, that I was brought here this evening.

So, I want you to cast your mind back to a great.... seminal moment, germinal moment, in the history of human thought, which was, about 25,000 years ago, the great glaciers that had covered most of the Eurasian land mass began to melt. And human populations that had been islanded from each other for about 15 millennia began to re-contact each other and reconnect. And, out of this comes what is called the Magdalenian Revolution, from 18,000 to 22,000 years ago. And what it is, is nothing less than a tremendous explosion of creativity and aesthetic self-expression on the part of the human species. We find, uh, the--for the first time, bone and antler technology takes its place alongside stone technology. Musical instruments appear over a wide area. And, cave paintings—some paintings in areas and recesses so remote from the surface of the ground that it takes several hours to reach them— are painted and set up in dramatic *tableaus* specifically designed to bring together sound, light and dance in hierophonies. Extravaganzas of aesthetic output that invoke a kind of transcendent other, that human beings, for the first time, are trying to come to grips with and make some kind of cultural statement about. And this pulling into matter of the ideas of human beings—first, you know, in the forms of, uh-uh, bead-work and chipped stone and carved bone—within twenty thousand years, ushers into the kinds of high civilizations that we see around us, and points us toward the kind of extra-planetary mega civilization that we can feel operating on our own present like a kind of great attractor.

Now, this whole intellectual adventure in exteriorization of ideas is entirely.. an aesthetic.. adventure. Until very recently, utility is only a secondary consideration. The real.. notion is a kind of seizure by the tremendum, by the Other, that forces us to take up matter—clay, bone, flint—and put it through a mental process where we then excrete it as objects that have lodged within them ideas. This seems to be the special, unique transcendental function of the human animal is the production and condensation of ideas. And, what made it possible for the human animal is language. If you're seeking the thumbprint of the transcendental on the f--on the, uh, myriad phenomena that compose life on this planet, to my mind the place to look is human language. Human language represents an ontological break of major magnitude with anything else going on, on this planet. I mean, yes, bees dance and dolphins squeak and chimpanzees do what they do, but, it's a hell of a step from there to Wallace Stevens, let alone William Shakespeare. Language is the unique province of human beings, and language is the unique tool of the artist. The artist is the person of language. And, I've, you know, given a lot of thought to this because, uh, the work that I've done with psilocybin mushrooms and the observations of psychedelic plant use in the Amazon, centered around ayahuasca, lead me to the conclusion that it is the synergy and catalysis of language that lies behind not only the emergence of human consciousness out of animal organization, but, then, its ability to set a course for a transcendental dimension and *pursue* that course against all the vicissitudes of biology and history over ten or fifteen thousand years. Language has made us more than a group of pack-hunting monkeys; it's made us a group of pack-hunting monkeys with a dream. [audience laughter and Terence laughs]

And the fallout from that dream has given us our glory and our shame. Our weaponry, our technology, our art, our hopes, our fears. All of this arises out of our own ability to articulate and to communicate with each other. And, I use this in the broad sense. I mean, for me, the glory of the human animal is cognitive activity. Song, dance, sculpture, poetry, uh... all of these cognitive activities... when we participate in them, we cross out of the domain of animal organization and into the domain of a genuine relationship to the transcendent. As you know, shamans in all times and places, uh, gain their power through relationships with helping spirits, which they sometimes call ancestors, sometimes call nature spirits. But, somehow the acquisition of a relationship to a disincarnate intelligence is the precondition for authentic shamanism. Now, nowhere in our world do we have an institution like that—that we do not consider pathological—except in the now very thinly spread tradition of the muse. That artists—alone among human beings—are given permission to talk in terms of “my inspiration,” or “a voice which told me to do this,” or, uh, “a vision that must be realized.” The thin line—the thin thread of shamanic descent into our profane world—leads through the office of the artist. And so, if society is to somehow take hold of itself at this penultimate moment, as we *literally* waver on the brink of planetary extinction, then the artist, like Ariadne following her thread out of the labyrinth, is going to have to follow this shamanic thread back through time. And, you know one of the most disempowering things that has been done to us by the male-dominant culture is to, uh, brush out our footprints into the past. We don't have a *clue* as to how we got here. Most people can't think back further than the first Nixon administration, let alone, you know, the arrival of the Vikings, the fall of Catal Huyuk, the melting of the glaciers, so forth and so on. We have been disempowered by a rational tendency to deny our irrational roots, which are kind of an embarrassment to science, because science is, uh, the special province of the ego.

And, magic and art are the special province of something else. I could name it, but I won't. It prefers to be unnamed, I think. So, how seriously then, are we to take this, um, I'll call it an obligation to follow the shamanic thread back into time? Well, I think that it is, uh, a matter of saving our own souls. That this is the real challenge. You know, I love to dig at the 'Yogans' by saying “nobody ever went into an Ashram with their knees knocking in fear over the tremendous dimension they knew they were about to enter through meditation.” Still truer, and more sad--still more true and more sad is the notion that very few of us pick up our sculpting tools or our airbrush with our knees knocking with fear because we know we are invoking and acting with the muse at our elbow. And somehow, I think the artists need to recover this sense of, uh, mystery. One of the most depressing thing to me about the art scene—and I had a chance to reconnect with this because I was just in New York—is, uh, it now has a kind of directionless quality. You can go into a gallery and you cannot tell whether it is 1990, 1980, 1970 or 1960. Because a kind of eschatological malaise has settled over art. All notion of any forward movement toward a transcendental ideal has been put aside for, um, the exploration of idiosyncratic vision. And, I grant you this is a tension—and perhaps in the question period we can talk about this—there is a tension between the individual vision and, uh, the notion of an attractor or a collective vision which wants to be expressed. But to my mind this is the same dichotomous tension that haunts the individual in his or her relationship to Tao.

You know, we don't want to be lost in ego, but on the other hand, if we completely express the Tao, we have no sense of self. The ideal seems to be a kind of *coincidencia oppositorum*... a kind of literalizing of a paradox where what we have is Tao, but we perceive it as ego. And, in the application of this notion to the art problem, I would say, what we need is a situation where schooling—if you want to put it that way—or a tendency toward a coherent vision expressed by many artists—is spontaneous. Each artist imagines that they are pursuing their own vision. Yet, *obviously*, they are in the grip of an archetype which is rising

through the medium of the unconscious. Now, the last time we saw this in American art was in abstract expressionism, which was probably—in terms of the values... in terms of, um, tension and the amount of, uh, emotional gain between one artistic moment and another—the break between abstract expressionism and, uh, what preceded it was the most radical break in American art in this century. Abstract expressionism actually carried us into a confrontation with what the quantum physicists were telling us. That the universe is field upon field of integrated vibration. But there is no top level, there is no bottom level. That the ordinary structures of provisional space-time are simply that. That if we can rise out of the human dimension, then we discover these larger, more integrated dimensions where mind and nature somehow interpenetrate each other. A vision like that, a coherent vision, has yet to announce itself here in the, uh, post-history pre-apocalypse phase of things.

Well, [takes drink].....I guess I have a kind of reactionary side when I think about the creative endeavor. I believe that the psychedelic experience, as encountered by each of you in the privacy of your own mind, or as encountered by a pre-, uh, literate society somewhere in the world, that that psychedelic experience is in a way the Rosetta stone—not only for, um, understanding the encryption that our own lives represent, each to ourselves—but it's also a Rosetta stone for uncoding the historical experience. Art *is* this endeavor to leave the animal domain behind. To create another dimension, orthogonal to the concerns of, uh, ordinary history. And this orthogonal domain, to my mind, is glimpsed most clearly in the psychedelic experience. The psychedelic experience shows you more art in an hour and a half than the human species has produced in fifteen or twenty thousand years [some audience laughter]. Now, this is an incredible claim. This is why I make it [audience laughter]. Uh, the, the energy barrier which separates us from this tremendous repository of transcendental imagery is very low. You know, it's a matter of a little personal commitment and, uh, the substances which make the transition possible. The perturbation of brain chemistry is easily done. What is not so easily done is the assimilation of the consequences of this act. Uh, ordinarily, we assume that consciousness is channeled between tremendously deep walls. That there is no way to, um, force, uh, a confrontation with the Other or the transcendent or the unconscious. We tend to assume that, you know, we're going to have to do double-duty at the Ashram for three decades [some audience laughter] before we're vouchsafed even a glimpse into these places. This is not true.

Culture—and this is my message to artists and to anybody else who cares to notice—culture is a *plot* against the expansion of consciousness. And this plot prosecutes its, uh, its goals through a, uh, limiting of language. Language is the battleground over which the-the fight will take place. Because, what we cannot--what we cannot say, we cannot communicate. And, by 'say', I mean dance, paint, sing, meme. What we cannot say, we cannot communicate. We can conceive of things that we cannot communicate. And, I think every one of us here has done that. And that's a *thrilling* thing. That's the deep homework. The psychedelic inner astronaut sees things which no human being has ever seen before, and no other human being will ever see again. But, in fact, this has no meaning unless it is possible to carry it back into the collectivity. And, what motivates me to talk to groups like this is the belief that we do not have centuries of gently unfolding time ahead of us in which to, uh-uh, you know, gently tease apart the threads of the human endeavor and create a bright new world. That's not our circumstance. This is a fire in a madhouse [audience laughter]. And, uh, to get a hold on the situation, I think we are going to have to force the issue. One way of forcing the issue, or a chemical definition of forcing the issue when you're talking about a chemical reaction, is catalysis. We want to catalyze consciousness. We want to move it faster toward its goals, whatever those goals are. Well, I believe that to the present moment, language... again in the broadest sense: speech, dance, musical composition... language has just been allowed to grow like topsy

[sp?]. It's, uh, been a kind of every-man-for-himself situation. Now, what we really need, as we see ourselves moving from one species among tens of thousands of species on this planet, over the past ten thousand years, we have redefined ourselves. And now, like it or not, *we are* the custodians of the destiny of this planet. Our decisions affect every life form on the planet. And yet, we are still communicating with each other with the extremely precise medium of small-mouth noises mediated by ignorance and hate [audience laughter, Terence clears throat]. This doesn't seem like the way to do business [audience laughter, Terence takes drink] as we approach the third millennium.

So, it-it, what I, uh, what I'm hopeful for, and what I actually see happening—I mean, I think we're on the right track—the birth of a new kind of humanity is going to take place. But there are still a lot of decisions to be made. How violent shall this birth be? What toll shall it take upon our mother the earth? What shape shall the baby be in when it is finally delivered... these are the decisions that artists can mediate and control. Most people are afraid of the unconscious. This is why, uh, you know, you can have a psychedelic compound like DMT, which is very much like ordinary brain chemistry, uh, appears completely physiologically harmless, only lasts ten minutes, extremely powerful, and generally in this society you have *no takers*. This is because there has been a failure of moral courage. And, the failure of moral courage is perhaps most evident in our own community: the community of, uh, of the artist. In a way, uh, it's the poets who have failed us. Because, they have not, uh, provided a song or sung a vision that we could all move in concert to. So, now we are in the absurd position of being able to *do anything*, and what we are doing is fouling our own nest and pushing ourselves toward planetary toxification and extinction.

This is because the poets, the artists have not articulated an, a, um, a moral vision. The moral vision must come from the unconscious. It doesn't have to do, I believe, um, with, uh, you know, um.... these post-meaning movements in art: deconstructionism, and this sort of thing. I mean, I'm basically putting out a very conservative, but I think, um, exciting program for art: that art's task is to save the soul of mankind. And, that anything less is a dithering while Rome burns. Because if the artists, who are self-selected for, uh, being able to journey into the Other... if the artists cannot find the way, then the way cannot be found.

Ideology is extremely alien to art. Political ideology, I mean. And if you will but notice it is political ideology that has been calling the shots for the last seven or eight hundred years. We can transcend politics if we can put some other program in place. You cannot transcend politics into a void. And I-I believe that a world without ideology could be created, if what were put in place of ideology were the notion or the realization of the Good, the True and the Beautiful. You know, the three-tiered canon of the Platonic aesthetic. Reconnect the notion of the Good, the True and the Beautiful. *Then*, use psychedelics to empower the artist to go into this *vast* dimension that surrounds human history on all sides to an infinite depth, and return from that world with the transcendental images that can lift us to a new cultural level. The muse is there. The, the dull maps that rationalism has given us are nothing more than whistling past the graveyard by the bad little boys of science. You only have to avail yourselves of these shamanic tools to rediscover a nature which is not mute, as Sartre said in a kind of culmination of the modern viewpoint. Nature is not mute; it is man who is deaf. And the way to.. open our ears, open our eyes, and reconnect with the intent of a living world is through the psychedelics.

Now, as you know, biology runs on genes. And genes are the units of meaning of heredity. But we could make a model of the informational environment that is represented by culture. And in fact, this is done. A word has been invented: meme. M-E-M-E, meme. A meme is not the smallest unit of heredity; a meme is the smallest unit of meaning of an idea. Ideas are made of memes. And I think the art community might,

uh, function with more efficiency in the production of visionary aesthetic breakthroughs if we would think of ourselves as an environment modeled after the natural environment, where we as artists are attempting to create memes which enter an environment of other memes that are in competition with each other, and out of this competition of memes, ever more appropriate, adapted, and, uh, suitable ideas can gather and, uh, link themselves together into higher and higher organisms.

Now, in order for this to happen, there is an obligation upon each one of us to carry our ideas clearly. Because in the same way that a gene must be copied correctly to be replicated or it will cause some pathological mutation, a meme must be correctly replicated or it will cause a pathological mutation. For instance, I would say what the Nazis did to Friederich Nietzsche's philosophy was a bad copy--a miscopied meme became a toxic mutation inside a culture. So, uh, I would suggest to the people in this room tonight, that you take a good look around at who's here.

Artistic people, psychedelic people, look pretty much like everybody else out in society. But we have come here tonight, self-selected for our interest in the empowering capacity of psychedelic plants and the empowering capacity of art. So we represent an affinity group; a population with the potential for, uh, uh, mutagenic impact on the ideological structures of the rest of society. So, look around. Someone here *has what you need*. And, if you can only figure out who it is, you can make a novel connection to move, then, into a new level of creativity.

[takes drink] What is this new level of creativity? Some of you may be familiar with a theme that was very big in medieval religious art, which was, uh, the apocalypse, uh, of St. John or of somebody; there are a number of these apocalypses. And I think that, uh, many of us may come out of a secular background or have not given this kind of a religious idea too much consideration. But, I-my, uh, idiosyncratic conclusion, based simply on trying to be honest about the content of the psychedelic experience, is that, uh, human history really is on a collision course with a, uh, transcendental object of some sort. Uh, it is not going to be business as usual into the endless unfolding confines of the future. Uh, the very *fact* that human history is *occurring* on this planet; the very fact that a primate has left the ordinary pattern of primate activity and gone into the business of running stock markets and, uh, molecular biology labs, and art museums indicates to me the nearby presence, in another dimension, of a kind of hyper-organizing force, or what I call the transcendental object. And I believe that this transcendental object is casting an *enormous* shadow over the human historical landscape. So that if you're back in, uh, ancient Judea, you have an anticipation of the Messiah. If you are at Eleusis, at the height of the practice of the Eleusinian mysteries, you have an anticipation of, uh, the dark god.

These anticipations of an unspeakable transcendent reality, that are always clothed in the, um, in the assumptions of the individual artist and the society in which he or she is working, are in fact genuine. And that you don't have to give yourself over to fundamentalist religion to connect with the fact that human history *is* an adventure. And, this adventure has a number of startling reverses and sudden plot shifts that are very difficult to anticipate, and that we are coming up on one of those. The civilization that was created out of the collapse of the medieval world has now shown its contradictions to be unbearable. And though no one of us knows what the shape of the new civilization will be, somehow in the singing of the ayahuasca songs in the rainforests, in the tremendous hypermetallic transcendental off-planetary flash of psilocybin, in the teaching of the self-transforming machine elves that seem to dwell in the DMT dimension, we see that the ordinary linear expectations of history are breaking down, and that, uh, the-the truth of the imminence of the mystery is breaking through all the structures of denial of, uh, the male dominator

paradigm that has been in place so long.

The way to make this birth process smooth, the way to bring it to a conclusion that will not betray the thousands and thousands of generations of people who who suffered birth and disease and migration and starvation and lonely death so that we could sit here this evening. The redeeming of the human enterprise all lies, then, in helping this thing come to birth. And each artist is an antenna to the transcendental other, and as we go with our own history into that thing, and then create a unique confluence of our uniqueness, and its uniqueness, we collectively create an arrow. An arrow out of history, out of time, perhaps even out of matter, that will redeem, then, the idea, uh, that man is good. Redeem the idea that man is good. This is the promise of art, and its fulfillment is never more near than the present moment.

Thank you very much. [Applause]

We'll, uh, I think we'll take a ten or fifteen minute break and then we'll come back and, uh, you can have questions and we'll do that for a little while. Thanks very, very much.

Q&A

Terence McKenna: Now I'll-- I'm happy to take questions....here...

Question: You spoke about science being in the realm of ego and art and shamanism being in some other realm [couldn't decipher]. My own psychedelic experience convinced me of the insistence of that other realm, but I felt not enough sense of personal power to be that antennae that you're saying that artists can be for bringing that other, until I became convinced not only of the existence not only of me but then the other realm and the other realm within me, and perhaps the psychedelic experience prepared me for that second awareness, but I guess you could comment on how, if possibly--if possible, that second awareness could become more easily accessible, and st...

T: What do you mean by 'the second awareness'...say a little more about it...

Q: Um, being aware that the other realm is something that's also very personal and

T: Well, yes, I mean, it seems, it's--it's a landscape that begins within the self and seems to extend into the world. I mean, one of the very puzzling things about the psychedelic experience is that it argues that we are not atomic individuals, uh, running around in some kind of society, but that if you actually drain the-the psychic water away, you'll discover that we're all connected at the roots; that the, uh, that it isn't a journey to another world; it's a journey inward to a world that is already present and there. The astonishing thing is how alienated we are from our own interior, from the interior world, to the point where we can hardly recognize it. I mean, the--I've talked a lot about the alien nature of the psychedelic experience and how it seems to be mappable over something as radical as the UFO experience. This is because we *truly* do not know who we are. The past 10,000 years have been *so* disempowering to us. We are really like the children of a dysfunctional relationship. Uh, we don't---we don't know where we have come from. It's very hard for us to emotionally connect with the consequences of what we're doing. I mean, that really horrifies me, that this is a society that loots the future. I mean, the symbol of that is devouring of children. We *literally*, for our own comfort in the present moment are making it very difficult for gen--future generations to contemplate having anything approaching, uh, the level of resource availability that we have. And, this

kind of situation could not be tolerated if we had not gone through a tremendous series of traumatic, uh, emotionally disemboweling experiences

You know, the Native Americans have a litmus test for all activity; you know, does it serve the children? And, so much of what *we* do is so anti-future that it's almost as though the fundamentalist position exists to permit the destruction of the environment. I mean, this was perfectly encapsulated by this clown James Watt, who was Secretary of the Interior, and said 'We don't need to expand the National Parks because Jesus is coming'. I mean, this is, uh, this is, uh, a mentality so against the grain of the obvious that it has to be looked on as pathological.

Another question...Here in the corner.

Q: Hello Terence...I've known you for a long time, but you've never met me. I'm one of Roy's night people, and, uh...I guess, I don't know, I guess I ought to prep this remark by saying that I got about a \$50,000 education and three degrees, college degrees in psychology, but I've never learned anything like I've learned from listening to Roy's show [audience applause] on KPFK [rest of comment indecipherable].....Uh, in pursuing those degrees, I've decided to learn a little bit about it hands-on, so I went to work in [couldn't decipher]. So, it's my misfortune, actually, to be earning my survival at this time to be working as a.....I would like to see psychology take a different direction, and I know that what you're talking about provides a focus to a direction for psychology to take which I think would...blow the lid off things. So, we're really close to, uh...I mean, I'm in total agreement that Freud and Jung discovered the [couldn't decipher]-conscious about a hundred years ago, but they discovered it 900 [couldn't decipher] in Santa Fe.

Um, how do we get closer to this in this kind of society, uh, that's the first part of this question...I'm a little bit nervous speaking in front of all these people. But, um, the second part of this question has to do with a study that you spoke of in '72 where with single-dose administration of LSD, alcoholics were achieving a 72% success rate, and, uh, I would you like you to speak a little bit on the pro-psychedelic, uh, the pro-psychedelic approach being and anti-drug approach

T: Yes, well, thanks for giving me the opportunity to make the point [audience laughter] because, uh, in the present atmosphere of hysteria and misinformation, uh, it's too easily run over. Uh...it is important to make the distinction that the, eh, what has happened really is that the well of language on this issue of consciousness alteration...the well of language has been poisoned; where you cannot make any sense if you use the words that have been granted us to use. I mean, let's take the word 'drug'. You know, we have a 'drug war', but as I drove into town I noticed a 'drug store' [audience laughter and applause]. Well, uh, you know, with that compressed a vocabulary, you can't make any sense at all about what's going on. So, I think what we have to do is make an operational argument about 'drugs' and say, well, you know, what is it that society finds offensive about, uh, drug abuse. And, then, what does that have to do with psychedelics.

Well, my own analysis of this is that what is, uh, offensive about drug abuse is a unconscious, repetitious, and demonstrably destructive pattern of behavior. And, whenever you see someone, uh, behaving that way, everyone feels repulsed and brought down, and, in fact, severe drug addictions are like this. But, as a matter of record, this is what psychedelics make absolutely impossible. Number one, the notion of unexamined behavior; how can you have unexamined behavior if you take psychedelics; it holds you up into a blast furnace of self-reflection [audience laughter]. It is, uh, certainly it does not promote repetitious

drug use [audience laughter]. I mean, uh, I-I consider myself a great fan of psilocybin and if I can screw my courage to the sticking point a couple of times a *year*, I'm doing alright. Uh, I know someone that says DMT is their, uh, uh, favorite substance. And, when I asked them when was the last time you did it, they said '1968' [audience laughter]. I mean it lasted three minutes [audience laughter]. This is not a pattern of drug abuse [audience laughter]...you see. So, uh, uh, it's a matter of educating the public, and, I--this is probably a good place for me to get a pitch in.

I--I wrote a book on contract for Bantam, and hopefully it'll be out next fall, and I'm hoping, I want to call it, and I'm hoping they'll go along with me, 'Why Eve Was Right: Plants, Drugs, and History' [woman squeals in audience]. Because, right there, in the beginning of the Western story, in Genesis, what you get is--it's the story of history's first drug bust. It's the story, of a woman, who follows her own mind and makes a decision about consciousness alteration, and then, uh....it *works* [audience laughter]. I mean, she says, eh, eh 'and they were naked and she perceived them as naked'. In other words, she got true information about the situation. But, you have Yahweh there, mumbling to himself, as he wanders around the garden in an old bathroom, and he's saying 'if they eat of the fruit of the tree of knowledge, they will become as we are'. That was *always* the issue, you see. It wasn't a health issue; it wasn't an abuse issue. It's about who finds out what's really going on and who doesn't. And, this book I wrote for Bantam makes very clear that the cult--the style of a culture is almost invariably a style of seeing the world through a certain set of drugs, or *a drug*. For example, uh, you know, here we're in the middle of a, uh, drug abuse problem, but, uh, caffeine has been entirely institutionalized since the, uh, Industrial Revolution [1:09:25]

Terence McKenna (TM): There's so much, uh, concrescence of time and compression of historical development going on in the world right now that you can, uh, you can hardly, uh, pick up a journal in your favourite field without seeing that all paradigms are being challenged and this is happening regardless of, you know, the area you are working in. It may be the design of solid state circuitry; it may be quantum mechanics or cosmology; or, um, uh, information theory. There are simultaneously now going on so many breakthroughs in -- in, uh, the investigation of nature and mathematics that one of the themes of these discussions will be how unpredictable the consequences are of all this knowledge flowing together. No one is planning how these various technologies, insights, uh, and tools are going to fit together and in a way it creates, uh -- it creates, uh, opportunity because there is so much chaos because very small forces can exert major changes.

I'm sure you all know the cliché about the butterfly whose wing beat starts the hurricane. I got a fax the day before I came down here saying that Interpol had put out an all points bulletin for that very butterfly [Audience: laughter] and was attempting to corner it and halt the hurricane season [Audience: laughter] so they do take this stuff seriously. So, um, it just, I mean, I would, just to review some recent developments that may or may not be related to each other but they are certainly related in the sense that they are all occurring right now. Uh, some of you may have followed the detection of the top quark in, uh, recent series of experiments at CERN in Geneva. Well, this essentially ends an entire program of, uh, nuclear and particle physics that's been carried on since the '20's. Now the quark model of matter is essentially complete in its more modest, uh, formulation.

All the predicted particles have been detected. There is good agreement between theory and theoretical formulation, and this represents, um, the culmination of an effort to come to grips with matter that's been underway since the Greeks and it essentially, you know, in 1994, the general sense is that it's now pretty well nailed down. Uh, this is astonishing and ends a whole intellectual effort that, as I say, began with the Greeks, gained momentum with Newton gained incredible intellectual focus throughout the 20th century and is now completed. It's equivalent of the sequencing of the human genome in biology which is the next subject that I wanted to mention which is this project which was slated to be finished around 2020. It is now probably going to be finished well before 2000 because once they got into it, they discovered it's like riding a bicycle: the more you do it, the easier it is to do and very, very sophisticated computer-driven chemical simulation techniques have been invented and the human genome is just filling up like a

crossword puzzle day-by-day, week-by-week, as we speak.

Q: Could you explain what that is?

TM: Oh, well, every organism in nature is specified by a unique sequence of, uh, chemical, uh, labels, called nucleotides and they are stored in the DNA and this nucleotide message in the case of human beings is like up to, uh, 20 million units long and it's basically the script for a human being. Now whether you get you or me depends on whether the switches are set up and down but all human beings have the same, uh, uh, gene sequence called and so if you can sequence, if you can determine the human genome, you can, uh, predict the occurrence of all kinds of hereditary diseases and, you know, have a kind of utopian approach to medicine where everyone throughout their entire life knows what they are at risk for and in contemplating any possible pairing for procreation you know just down to a gnat's eyelash what the child's genetic predisposition for various diseases and enzyme deficiencies, and this sort of thing. Well, so this is happening and, uh, at a startling pace.

Q: Can I ask you something?

TM: Sure.

Q: Um, so if this is - if you say that this is predetermined, is that like -- do we have anything to say about it? Can you, like, prevent them?

TM: Oh, yeah. You can definitely prevent because you see locate where on the genome the defective gene is...

Q: How do you spell "genome"?

TM: G-e-n-o-m-e.

Q: Thank you.

TM: If you can locate on the genome where the problem is for any genetic defect then you can design a repair gene that can go in there and actually just scissor out the bad piece and put the good piece in. This is not science fiction; this is being done in the laboratory now, uh, and it will, it's happening. The main point of what I'm talking about tonight is that all these crazy, far out, Flash Gordon things are well advanced and yet and the other point highly ignorant of each other so that the cross-fertilization process that is really going to make all this come into a kind of new paradigmatic order hasn't yet been revealed.

Okay, other items, uh, and some of these range toward the "Oh! Wow!." Remember, ultimately this is just a laundry list of things on my mind. The events that will occur in the vicinity of Jupiter, uh, in the third week of July of this year are extraordinarily interesting from all kinds of points of view. Are you all aware of what I'm talking about?

Q: No

TM: Okay. In January an object was detected, uh, breaking up under the tidal forces of Jovian gravity and this was named Shoemaker-Levy 9 and it has, is now in about 25 pieces that are about 3-5 kilometers in diameter each and the Newtonian mechanics of this decaying system of orbits dictates that between the 19th and the 26th of July of this year these objects will smash into the planet Jupiter on the dark side, on the side turned away from the Earth at the moment of impact, but because -- well, it's a fascinating event for many reasons. First of all, it's going to churn up an enormous amount of material from deep below the cloud tops of Jupiter and within six hours the parameter will turn into view of Earth-based telescopes. The other thing is these planet-crushing events, these collisions of large objects in the solar system, have a very interesting and not fully understood role in, uh, the formation of our own Earth and the way the history of life has developed on it. For example, and this is the next new thing I wanted to talk about.

There has been a sudden coalescence of agreement in, in, uh, planetary geophysics over the past six months over a problem which may not have been bothering you but [Audience: laughter] bothered me

which was where did the moon come from (laughter) and there have been for hundreds of years, different theories, I mean, clear back to Lacroix. In one theory, Lacroix noticed that galaxies and solar systems, everything condensed down out of dust and he put this - and this was in the 1770's - put forth the very plausible theory that the Moon simply was an aggregation of material the same that the Earth was an aggregation of material that formed around the Earth. Well, then there are problems with this, technical problems. It just doesn't check out. So then another theory that had its vogue was that the Earth was spinning very rapidly in its early history and a blob actually - it just separated off - a hot blob of stuff which went off into space, uh, suddenly new techniques for analyzing Apollo rocks and stuff brought back from the Moon and all kinds of conferences, and so forth, they figured it out, and the answer is extraordinary and none of the above. The answer is that 4.1 billion years ago, the Earth was struck by an object the size of Mars and that in the -- this catastrophe enough ejective went into orbit around the planet to condense as the Moon. It's remarkable that such a catastrophic and dramatic theory could get unanimous acceptance in the field of planetary science where all this stuff is most haggled over, um.

Q: What was the planet the size of Mars that hit the Earth? Was it Mars, or...?

TM: No. It wasn't Mars. It doesn't exist. Its core has now sunk into the core of the Earth. It had an iron core. It is now part of the Earth and the light-weight, pyroxene ejective formed the Moon and if you're interested in this, this month's *Scientific American* has it on the cover - a photo of the event. [Audience: Laughter] So, just extraordinary revolution in theory, you know, in a very fundamental manner because some people claim that the Moon was captured and that it was captured as recently as 65 million years ago and that the complexity of mammalian phylogeny is related to the presence of the Moon and now, all that's out. The Moon is very old. It emerged in this catastrophe basically at the moment of the solidification of the surface of the Earth. It was a climactic event that came at the end of a series of asteroidal infalls that basically built, uh, the planet. So then other things.

Q: How does this tie into this thing with Jupiter then? Is that just to give us an idea how that happened?

TM: Yeah, that we've never had an opportunity to observe anything like this. The extinction event which killed the dinosaurs and created the beginning of the Mesozoic era, uh, 65 million years ago was not as entergetic an event as this thing that's going to happen in July. It was very interesting to watch how the scientific press played this thing because the Shoemaker-Levy 9 was discovered on January 9 and the bulletin of astrophysics on the 12th broke the news to everybody who wasn't following it on email or something and they called it a once in a hundred-million-year-event which interesting that this once in a hundred-million-year-event would occur at a moment when human beings have instruments on their way to Jupiter. So then they, within the month, they had it down to a once in a million-year-event [Audience: laughter] and now I think they're saying nobody has any idea. This may be once every hundred years it happens. But, it's very interesting. The explosion will be so large and since it can't be directly seen by Earth-based telescopes, the energy release will be measured by measuring the flash of reflected light off the moons of Jupiter. In other words, they will rise in luminosity and then fall very suddenly as this explosion takes place on the back side. So, that's that.

Sort of in line with all of this and with a kind of Esalen spin on it, something every interesting that's been going on if you're a fan of the history of science and ideas is that in the last six months, there's been a very interesting effort to, uh, look again at David Bohm's work. David Bohm is now dead and I believe he taught here or he visited here many times and, in any case, his ideas are well known here and he was sort of always our physicist, "our" meaning the slightly flakier end of things and for that reason, he was not taken seriously as seriously as he should have been in the halls of physics. Well, then I think he died about 18 months ago. Well, now in *Scientific American* and in physical review letters, there have been long editorials saying that a problem which has haunted quantum physics throughout the 20th century could be

solved by admitting that the Copenhagen School which is Niels Bohr and all -- Heisenberg and all those untouchable and god-like figures to admit that they were actually wrong about something fundamental and that David Bohm's quantum physics which gives the same numerical results as theirs is, in fact, a more elegant formulation and what it is that is at issue here is something that everybody who concerns themselves with quantum physics for ten minutes has encountered which is the famous uncertainty conundrum.

Every school child knows by now that you cannot determine the velocity and the absolute position of an electron at the same time because as you bring velocity into focus, absolute position smears out. As you bring absolute position into focus, velocity smears out. This is called the uncertainty principle and probably more muddle-headed prose has been generated around this problem in physics in the last 70 years than any other. Well, it turns out that if you go with David Bohm, there is no uncertainty. You can know the position and the speed, the velocity, with perfect certainty at the same moment of time. The problem is, and the reason why he was never taken seriously, is that all these quantum formulations carry with them certain metaphysical baggage that is hard for other theorists to accept and the impossible baggage that Bohm's theory carried was, uh, what is called non-locality. Non-locality. This is the peculiar feature of nature which is built into Bohm's formulation of quantum physics. Any true particles ever associated with each other at some time in what we call the past maintain a magical and instantaneous connection with each other no matter how far apart they are for the rest of their existence and that this is not subject to the inverse square law that determines that slows the speed of light; this is some kind of magical property which is instantaneous.

Well, this seemed so outlandish that it was just thought to prove on the face of it that Bohm was wrong because they said, "Well, look at the consequences if you were to accept this insane thing would be built in " but now, because of what's called Bell's theorem, they are actually doing experiments which demonstrate in the same way that the charge of the electron or the speed of light, they are actually doing experiments which demonstrate that non-locality is real. You associate two electrons. Uh, you pass them through a grid of some sort which separates them. You capture one of them, determine its charge, flip it to its opposite charge and having captured the other one, you notice that when you flipped the charge on one, the charge on the other one automatically reverses instantaneously and that these things behave as though they never left each other's presence. Non-locality. Well, this sets the stage for a staggering realization because if the universe is non-local in terms of information then all the raving over the past 30 years about holographic universes and psychedelic plenums and the monadic factio higher dimensional akashic "who-ha." [Audience: Laughter], all that suddenly begins to gain vindication. And, okay, so that's all happening. [Audience:Laughter]

Meanwhile, three doors down the hall in the branch of things marked "Information Theory," they're realizing that there is a way to analyze physics, so that what you get, what we call matter, is simply information in association with energy; that information associated with energy *is* matter. So then you go back to this other branch of understanding and they're saying that, uh, that information is non-local and then what that begins to sound like then is that matter also is non-local in some sense and if you could download that into a technology, you could walk from here to "Zevercanoobie" without ever going through high vacuum and that would be big news. Do you understand what I'm saying? [Audience: Rumbling] Good. Yes, it would be reasonable to ask a question at this point.[Audience: Laughter] [TM: Laughter] Q. So how does the principle of non-locality come in to prove that you can determine position and velocity at the same time?

A. Oh, it doesn't. It simply that, as a consequence of accepting the parts of his theory which allow you the absolute prediction of velocity and position you get, as a kind of you-can't-not-order-it side dish, this non-locality thing and when really a way of talking about non-locality is to say and then this goes to a whole other branch of knowledge that's also just boiling at fever pitch which is to say what we're really saying is that the universe is fractal. that it's an infolded set of values such that you can extract the whole story from any sub-set, uh, and again this - all of this: complexity theory, chaos dynamics, fractal mathematics - what's happening is that the computer is allowing us to go beyond the mathematical objects of Greek philosophy which were -- you know, what did we have? We had, uh, the cube, the perfect circle, the dodecahedron, and so on and so forth and then through the genius of Newton and Leibniz and that crowd the infinite set of ellipses that we could extract from the section cone that allowed us to do calculus, that allowed us to do modern science but that's sort of where it ends, you know, with Newtonian mechanics and then statistical mechanics to handle the quantum, but now, with chaos dynamics and fractal mathematics and complexity theory, we are actually producing mathematical models of nature that are more like nature than anything we've ever seen before and it's in a sense the culmination of the holy grail of a certain branch of human thinking that out of numbers and their relationships which are after all objects in the human mind, whatever that is, comes this incredible close correspondence to nature which is the most remotely removed and ontologically independent thing we know vis-à-vis the human mind.

Um, okay, so that was a little paean to David Bohm and then moving through that, um, and going further, Ilya Prigogine who has also been to Esalen and had an influence on many people who taught at Esalen and me among them although I was just sort of, like, sharpening his pencils at that stage who has already established his track record by winning the Nobel Prize for physics by destroying the second law of thermodynamics which was no small accomplishment believe me because there was no law of nature to emerge in the 18th -- in the 19 century more tenaciously believed in than the second law of thermodynamics and Prigogine just showed that, you know, it was a generally true statement of a rather complex situation in which actually sometimes it was bugged and he secured that mathematically. That was twenty years ago. Now Prigogine is coming forward with a theory that I modestly suggest sounds somewhat like my notion about time, that time is, first of all, not a construct of the human mind; it is, in fact, a property of the universe like energy, like matter. It's a "thang" [Audience: laughter] is what we're trying to say here. It's not an abstraction and this is not the first time science has had to make this leap, I mean, the curved field, the electromagnetic field was at first thought to be some kind of weird mathematical contortion you had to go through to understand electricity but couldn't possibly actually have anything to do with what it was and then it was realized, you know, that it was actually a point-for-point description. So, Prigogine is beginning to say that time is a thing and that therefore it has an arrow and that complexity is conserved as you approach the present which is what I've been saying year in and year out here for a while. I didn't call it complexity; I called it "novelty" and used Whitehead's vocabulary, but there is, you know, a very exciting convergence of intuition theory that seem really to hold the possibility of a whole new way of thinking about time and determinism and novelty and the, uh, the buildup of structure in time. Yeah.

Q: Your theory of novelty was that it was not conserved but increasing.

TM: Well, what I mean by "conserved" is that its general tendency is to never slip back. In other words, once novelty is achieved, it is tenaciously retained and it becomes instead the foundation for new novelty and that's how novelty increases over time by building on pre-established levels of novelty so that, for instance, um, molecular structure very novel at its inception becomes ultimately the pre-condition for biology a later arriving phase of novelty and then culture builds on biology and so forth, like that. Yeah.

Q: But when you said that, what was the other, not novelty, but...

TM: Oh, complexity.

Q: ...is maintained as you get closer to the present?

TM: Yes. That complexity seems to be clustering near the present.

Q: Meaning this present or any present?

TM: No, this present. In other words, what he's saying, part of his breakthrough is, he is saying the arrow of time is real. It is, the universe is from end to end oriented in one direction; it isn't an artifact of human perception. This is a break with ordinary physics which insists that all these transforms can be run backward in time as well as forward. He says, no, and that's what I've been saying. My conception is that the cosmos isn't what I call a novelty-conserving engine and that it, through sort of a one step, two-steps-forward-one-step-back process marches ever deeper into novelty and ever faster. That's the other thing, uh, that interests me because I am -- I am now, I have a very palpable sense that time is accelerating and that the convergence of some of these things we've been talking about is going to eventually lead to a discussion of what is the nature of time and experience that, in fact, history does seem to be ending. This vague and murky intuition of religious ontology is now respectable in physics laboratories and, uh, uh, the presence of human culture on the planet in this incredibly advanced state of acceleration and novelty seems to indicate that, you know, we are making it impossible for ourselves to go anywhere but into another kind of, uh, cultural dimension.

Well, which I guess leads me on one level to one of the other things which I wanted to talk about which is in a sense the illusion of stability in social space, if there is one, if you're able to maintain the illusions of stability in social space, it's because, uh, the exciting thing that's going on is invisible and what it is is it's the growth of the Net, it's the rise of the Web which hour-by-hour, day-by-day, is reaching around the planet. Deeper and deeper and deeper. The number of people getting email has doubled every six months for the last five year. It's doubled every six months. If this goes on at the current rate, every man, woman and child on the planet will have email before the year 2000. And, of course, there's nothing to see, nothing to touch. I mean, there's some appliances involved but they're quiet and in the background, and yet what it is is that the human neuro-net, the unconscious of the species is actually being hardwired as an artifact. We're pouring glass and gold and silicon down the micro-tubules of the racial imagination and as it were making a kind of casting of the state of the human imagination at the close of the millennium and to what degree this imaging of ourselves in silicon will ever reach a limit is hard to tell. I mean, we've begun with the past. You know, we're archiving it. We're virtualizing it. We're creating databases that allow us to stroll around in it, but more and more, time will be consumed and eventually the only choice will be to allow it to flow over into the present and, you know, prosthesis is already practically a way of life.

What's coming is very hard to imagine and Prigogine to loop one of these concerns back to another, Prigogine got his start studying traffic theory on freeways. Well, it's now thought by the complexity people that when you get somewhere above 6th to the 9th entities operating in an environment of connectivity that you get and now we switch philosophers and vocabularies what David Bohm called emergent properties and what you and I would call "anybody's guess" [Audience: laughter] and that's what an emergent property is.

Q: What is an emergent property?

TM: It means something utterly unexpected, something completely unexpected. For example, and I mean he used very simple examples. For example, if you have five gold atoms, you don't have the colour yellow. You don't get that until you have hundreds of gold atoms. That colour is an emergent property. It requires a large number of gold atoms for the fact that gold is yellow to begin to be part of the picture. Similarly, wetness. If you have a water molecule, it is not wet in any sense that you can relate to. Wetness is a

property of thousands of water molecules. It's an emergent property. So, there's obviously nothing magical about this unless you have to be conscious at one of these phase transitions and you actually see an emergent property come out of a species and clearly what we are trying to do is overcome our differences. Our "thing" is a curious dichotomy between our individuality and our drive toward community and technology is facilitating the drive toward community at this incredibly accelerated rate.

Q. Traffic is accelerating.

TM: Traffic is accelerating and, you know, my enthusiasm for psychedelic states of mind I see simply as a kind of aboriginal precognitive anticipation of this state of electronic data fusion and information transparency that is being put in place. Essentially what we're doing is we are realizing our cultural ideals whether we are conscious of them or not and one of our conscious ideals is a Gothic Christian love or transparent telepathic sharing and so our technology becomes this, you know. I mean, that's why we invented printing presses and clear windows and lingerie and the computer and all of these things facilitate.

Q. Do you think that anybody viewing "The Celestine Prophecy." What do you think about that?

[Audience: Laughter]

TM: Well, you know O'Henry said, " Never read a book 'til it's five years old" [Audience: laughter] and I don't always follow his advice, but in the case of "The Celestine Prophecy," I have to ... I am kind of weird. I was very embarrassed, a couple of or a week ago I was in New York City and I was with some friends of mine are they're in a rock and roll band and they were on the Letterman show so I went with them to the Letterman show for the taping of the show. It was the Spin Doctors and I had never seen the Letterman show [Audience: laughter] so I kept thinking, "Is that Letterman?" The janitor would go by and I would 'cause" we were there an hour ahead of time and I was not *au courant* with these cultural icons. I wish the author of "The Celestine Prophecy," he, she, them or it, whoever it may be - a he - what I've been able to glean from the either about "The Celestine Prophecy" is that it is a species of, of, um, anticipatory, uh, visionary breakthrough, right? saying that the world is going change beyond our possibility of recognizing it. I think this is absolutely true. The details are where it gets tricky.

Part of my notion of how we should all behave as we move toward this attractor or this transcendental object that is the telos of the historical process is to just try and just spread calm and good vibes so that people, you know, it's like a roller coaster the signs says, "Do Not Stand Up." [Audience: Laughter] You know, people should not... just keep your mouth shut, keep your hands on the handlebars. You can yell your head off if you want but do not stand up, please. Um, just a word about this, I mean, to the immense boredom of half the people in the room who've heard me say this before but this question about anticipations of the millennium, the way I think of it is that huge events have a kind of, um, backwash into the past. They are not cleanly divided from the time which precedes them so that before they happen, you can almost feel the certitude of their arrival, uh, and so, this thing that lies ahead of us now not very far in the historical continuum is the grandmother of all of this kind of thing and social theories, philosophers, psychedelic trips, visions had in the desert, all of these things will just organize themselves like iron filings around the presence of this object ahead of us in time and so, in a sense, all of history is an anticipation of the end of history and the closer you get to the end of history, the clearer the anticipations become, so, you know, when you're two thousand years from it, it's something about how God and man will be fused in one body and the messiah will take a chosen people into a land of milk and honey, and that's the best anybody can do, that's the clearest image anybody can get of what the deal was.

So, then circa 1948, you're up to, you know, the Rigellians will come with enormous ships and advanced medical techniques and teach us how to clean up our Earth, to love one another and grow food from the sea and so forth and so on. It turns out that, no, that isn't it either and as we get closer, the amount of

prophetic, um, speculation is just going to grow exponentially because all the old systems of thought are failing and all the old systems of thought are capable of doing is denying the obvious which is that the Earth is on the brink of the greatest change since the end of the Mesozoic, you know, and -- but people don't like to think about that because all they can think about is, you know, the possibility of personal extinction. Technology, religion, psychedelic drugs, archaeology that could at any moment spew something out of the ground that could completely scramble everybody's notion of what really did go on or something and I'm not a "face on Mars" guy or some malarkey like that. Let me make that clear. But still, you have to be open to the fact that something might come along. What else do we want to say about that? Let me see if I've covered my list.

I think we were talking about the Nets and the Web. Uh, yeah, this collectivity that is coming into being, is coming into existence more rapidly than anyone can chart or clock or understand. Uh, you know, I have a protocol that goes on in the middle of the night and searches databases all over the world for key words of interest to me and when I get up in the morning, these files are just stacked on the screen ready to be gone through and, you know, it can be trivial, but it could be, you know, a heresy, a Greek Orthodox heresy of interest to fully a dozen people on the planet, and, you know, if the information is out there, the computer will eventually winnow and winnow and winnow because it is so tireless and so, and so deeply dedicated to my wishes. [Audience: Laughter] I mean, what else does it have to do? It doesn't know.

Q: What keyword?

TM: Well, the word I was thinking of is "Mandaean" which is a religious cult that I'm interested in that has existed continuously for about 2800 years.

Q: "Mandaean"?

TM: Mandaean. And they are now down to a few hundred people in the swamps of Iran and Iraq and, uh, I wonder about the state of their community. I wonder how they came through the Gulf War. I wonder if they were able to preserve their very strict kosher laws and a bunch of other things. I mean, you may wonder why do I care. I have a lot on my menu. [Audience: Laughter]

Q: Did you say, "kosher"?

TM: Well, they had, what I mean by "kosher," they had rules as a religious community that would be almost impossible to follow in the 20th century. For instance, one of their rules was that if your eye fell on a non-believer, if you're a Mandaean and your eye fell on a non-believer then you had to have six days of purification. Well, since there are only a few hundred Mandaean on this planet, it was tough to not occasionally encounter a non-believer. You can imagine. So, then huge amounts of community time and energy were being taken up in these ritual ablutions and cleansings to try and make it okay, and I wonder how they fare under Saddam Hussein. Well, so then you go on to the Net and program this word and you discover that in Pennsylvania there's a committee of people who are concerned about the Mandaean community and then in Germany, there are people who are preserving Mandaean liturgy and at the University of Heidelberg, Germany, there's a guy who can read the books. You know, Tim Leary said a wonderful thing years and years ago. He said, "Find the others." "Find the others." And the computer is the tool for finding the others and it was never intended for folks like you and me. It's one of those things that fell off the military vehicle as it rumbled by and we peasants pulled it out of the bushes and discovered what [Audience: laughter] we could do with this thing. But you can find the others. There are hundreds and hundreds of conferences going on on Youth Net. If it's a work of literature, if it's a sexual preference, if it's a complex programming problem, if it's an issue of historical research or diet or anything else, there are 50 or 60 people just *waiting* to talk to you about it. [Audience: Laughter]

So, uh, you know, I sort of believe that the psychedelic revolution is beginning to bear fruit and that we

shouldn't have thought of it as the 60's revolution; we should've thought of it as the 30 years war and, you know, victory is now within sight. No one can run or program these vast networks except guys with ponytails and the suits who are depending on all of this stuff to hold the world together are entirely beholden on, you know, guys with one earring and ponytails and all that, everything that loathes and revolts them is interposed between them and the technology because print heads can't hack it, literally, they can't hack it. And as Thomas Kuhn said in "The Structure of Scientific Revolutions," you know, um, the way you really make revolutions is by waiting for the old guard to die off and they are dying off and, uh, and then the synergy that comes from all of these fields melting together. I mean, it is like -- my intuition was always that the psychedelic experience was a fracto anticipation of human history, you know, that it starts out the same way, everything's normal, you're just cooking your food around the fire and then it builds and then there's structure and then dissolution of structure and then technical accretions and vast downloading of ideas and so forth and so on and it's happening. I mean, the unitarian mind is being created. It is in fact in existence. The autonomic functions of the human super organism are already in place and what do I mean by the autonomic functions? I mean, uh, the daily pricing of gold, the computer transactions that characterize the banking system. This is all going on all the time; machines are talking to machines moving billions of dollars around, setting the value of currency and precious metals and commodities, I mean, most of this is on automatic. Human operators are only called in when unexpected fluctuations are picked up inside the system and, and yet, it's not clear, you know, what is being maximized.

The top most level of control is only assumed to exist. This is very exciting. We all assume that if you follow these trees of control up and up, finally at the level of the IMF, the World Bank, the National Security Council, someone is running it, but it's actually not true. It isn't a tree. It doesn't lead to focal nexus of control; it's a net; it's a web and, you know, when you realize this, you realize that a very large amount of power is in your hands. Uh, the people in this room, even if a couple of homeless have crept in here this evening, which is not likely, the people in this room probably represent the upper five per cent of the most powerful manipulators on the planet because if you just have a telephone credit card, you are in the upper ten per cent of the powerful manipulators [Audience: laughter] of information on the planet. Yeah, a calling card. And if you own a powerbook and an email address, you know, you are a member of the 20 million elite that is running the planet through the cyber net and talking to those people, changing their minds, interacting with them is the way to steer it and they are not the suits, they are not the guys chewing the black cigars; they're a much more malleable and open crowd. It's harder to pass a capitalist denominator through the keyhole of cyberspace, you know, you have to be young and lean and mean [Audience: laughter] and tatoos help.

Q: You said something about artists and, say, religious or spiritual sages who might look at the technology that you've been talking about and would say, we have known this all along, this is sort of old hat, um, and how you integrate that into the state of consciousness is much different from the scientific way of seeing things and where these people...

TM: You mean, like, yogins or something like that

Q: Yogins, yeah. Shamans have no need for these ideas or...

TM: Well, shamans, I think, are a good case in that apparently they have no need of these ideas and what I mean by that is their societies are at dynamic equilibrium. Left alone, they seem to do fine so forth and so on. India, I would argue, shows no such ability to deal with its problems. I mean, socio-politically, it's a mess. They should be and, in fact, are very interested in this kind of technology. You see, the difference between eastern and western religion, I mean, there are many differences, but the important ones for what we are seeing here this evening is that Eastern religion is basically timeless. When time is invoked, it's either in the Hindu system of chiliocosms of eternity and there are just cycles upon cycles or it's the time

of Taoism which is the time of the moment and the insight.

The weird thing about western religion: Judaism, Christianity and Islam, and all the cults that they have spawned, is the insistence that God will enter history which is a crazy idea. That God will enter history at a given moment, it will be redeemed and the hell of toiling for our daily bread and the whole thing will somehow be made right by God's direct manifestation at a certain point and this idea finds just no support in the East so then when you ask about how these religious teachers relate to this technical thing, to me, the more interesting, um, relational approach to is through somebody like Teilhard de Chardin who I take as my direct inspiration. I never read de Chardin that carefully when he was hot, but since I've come out where I am about all of this I've looked back at it and he and I are in 100 per cent agreement except I go further. I say the date and he is crafty enough in his Jesuitical way to stay away from anything so likely to expose you to scorn and ridicule. But what he is saying in "The Phenomenon of Man" is that we are now generating what he calls the noosphere and the noosphere is the atmosphere of technical accretions on electronic information transfer and electromagnetic fields VHF, UHF, so forth and so on, and that this is part of evolution. His great insight was to see geology, biology and sociology as a continuous spectrum and, you know, well, McLuhan talked a lot about Teilhard de Chardin.

With McLuhan, you never knew whether he was being entirely serious or just going for the good line, but he maintained -- he said that the age of the Holy Ghost which was to occur immediately before the end of the world, that the age of the Holy Ghost, we had Edison to thank for it and that the spread of electricity around the world was the direct descent of the Holy Ghost and that as cities turned to oceans of electric light, he saw it as an epiphany of the third person of the trinity. This is an argument for keeping Catholics far from machinery and power; they're clearly screwballs of some sort.[Audience: Laughter]

Um, but it seems to me that if consciousness, if you make a religion out of consciousness which unconsciously we in California have done that this is what the New Age is about. We worship mind. We worship mind. Well, if you make consciousness your religion then clearly the -- the body of consciousness is the technical accretion, the super highways, the computers, the colour, the fibre optic networks, all that is how consciousness manifests itself. Consciousness wants -- it's as though we're still involved in the alchemical, uh, concerns of the 16th century, that consciousness achieves its fullest perfection through the fusion with matter, you know, that the union of spirit and matter which in materialist scientific terms is crazy talk. It doesn't happen. But, in the terms of the magical pre-cartesian attitudes toward matter, this is what they were going for and in a sense, you know, Mircea Eliade said this, he said it's ironic that the 20th century with its score for the magical notions of the 16th century has achieved the full program that those notions set forth. In other words, changing of lead to gold. We do this. It costs a lot of money, but we can do it in our reactors, our cyclotrons. We turn lead into gold.

We sequence the genome, the secrets of life and longevity are unfolded before us and then this final thing in the computer. I mean, the computer is the union of spirit and matter and, you know, five or six years ago you used to hear a lot of talk about how computers could never do all kinds of things and they were simply adding machines and this and that. Well, that's a kind of computer, but those voices have grown strangely muted as massive parallel processing and neuro maps and stuff like this. So, I don't know where all this stuff rests. You know, James Joyce said man will be dirigible which is like the flying saucer phase. I would like to think that the philosopher's stone is a suitable goal for human evolution, that we are actually downloading ourselves into a solid state realm where all that moves is ideas in a kind of electronic collectivity of mind and then the earth is left to itself. But how this is to be accomplished, I'm not sure. But

on the other hand, it's not up to me. I mean, if you read people like Hans Moravec, his book. What's it called? "Mind Children: The Future of Machine and Human Intelligence" and there are ideas in there that's so bizarre and far out and yet, you know, being discussed by someone with a tenured position at Carnegie Mellon University that it -- all that really holds us back as these boundaries dissolve is our imagination. The difference between the psychedelic experience and history is that history is real and at the end of it, you're going to be able to stay there, wherever there is, if you want and do those things, and I think it's coming very, very quickly. Even the wildest things that we've said here today to save certain theoretical constructs such as time machines are now being talked about in the popular scientific press. There was an article about time travel three issues ago in *Scientific American*. So does anyone want to say anything? Yeah.

Q: Can you make a distinction between understanding/knowledge and consciousness or do you see those as one and the same thing?

TM: Well, this is a hot and complex thing that's being debated right now. The materialists who hold the high ground in neuromolecular physiology, what they like to say, they're very happy with this formulation, they like to say that consciousness is short-term memory plus attention. This is the new buzz word: short-term memory plus attention. Actually, Henry James or William James said this first, but it's just been brought forward and if you think about it, that's a pretty good, uh, working model. If you say that consciousness is short-term memory plus attention then it's probably a characteristic of most animals, uh, and so then you get a seamless web. Um, where it gets complicated is where we seem to be able to build very, very flexible models of future courses of action and this may be a relationship to long-term memory. The relationship of higher animals between long-term memory is not clear. In other words, a mountain lion hunting, does she retain a memory of an incident with an important learning embedded in it months and months after it occurs? And in what way does she retain it? Does she retain it as a reflex or does she actually, as we do, recall and when we say recall, we mean picture a scene in our minds from the past and run it forward.

How, again, well, this leads to something that I wanted to say, that memory if you wanted to point to an incredible and significant failure, I've been talking about all these far out things that have been going on. The greatest disappointment in science, I would say, in the last 35 years is the utter failure of science to make any progress on the question of memory. I mean, I've been following it for almost, well not 35 years, but 30 years and they're nowhere. They have not gotten beyond the kind of stuff that Karl Pribram was talking about in "Languages of the Brain" which was published in 1973, for crying out loud. Uh, Walter Freeman's work, creative, brilliant work, no conclusion. The hard-core materialists have gotten nowhere and this is a central thing for understanding consciousness because where are the memories, you know? Karl Lashley was the first person to ask this question and it's never been satisfactorily answered and, you know, now there are new theories about interference patterns in the brain and this sort of thing, but, you know, when the telephone was new neurophysiologists like Raymond de Kahal (?) said the brain was like an international telephone network. Now, suddenly we have a hot new metaphor and we apply it to the darkest area of our ignorance which is the brain, but -- and then, you know, you have the hard-core mystics who say the effort to understand consciousness is intrinsically doomed to failure, that brain cannot elucidate brain and there's something to be said for that. You know, Gödel's incomensurability theorem and that whole thing.

I don't exactly understand what it means to say to explain consciousness. Understand, what would that

mean? Would we start with, start with, uh, a synaptic event and end with an experience and be able to trace the transition from synaptic event to experience all the way through? I would like, you know, it's a free enough field. You can say anything you want. I like the idea that the brain is an antenna; not a storage device and that seeking memory in the brain is like tearing transistor radios apart looking for little men. You know, there aren't little men in there so what you have instead is a quantum mechanical antenna. That would make sense because I really believe nature is a kind of seamless self-regulating oscillator of some sort and so it's much more important to be in tune with the larger sects of what's going on than to be isolated from that and somehow inwardly cognizant of what philosophers call an interior dimension of transcendence. I don't believe that. I think, uh, you know, that we are the most existentially isolated of all animal species as a consequence of language and that part of our difficulty in correctly picturing the mind and its place in nature is the fact that we assume our uniqueness and our isolation and the strength of the ego boundary, but if you saw the brain -- that's why my idea -- the regulation of culture through the psychedelic experience is not the there is something magical about the psychedelic experience in and of itself, but that what it is is an attunement to natural harmonics on many levels that we could call, I do call it, the Gaian mind. It's a higher intentionality, but it's not mystical mumbo jumbo; it's biology. But there's a level upon level of pheromones, oscillations, chemical oscillators, all kinds of things that regulate biology besides the gross activation enzyme systems inside the wetware of an organism. When you're in the jungle like the Amazon, you see that, you know, this is seamless. This is one thing. It's only my, my style of knowing that tells me this is a palm tree, this is a crocodile, this is a butterfly, but the way it's all working it's just genes and gene exchange and life and death and procreation and symbiosis and so forth and so on.

Q: I was thinking of Rupert Sheldrake. I was thinking of idiot savants, too, with their minds like an antenna tapping into some incredible knowledge. There's no way they could ever learn.

TM: Yes, well I count myself among their numbers[Audience: laughter] without a doubt. No, that's the only way, that's how I explain my career because it has, you know, fundamentally a mathematic basis that's very solid and beyond reproach by all of the most stalwart and yet clearly I'm a kind of cannabis-smoking lunatic. How did that happen? Well, it's the principle of the idiot savant, I think. And that nature is knowable. You know if you're God's fool, the secret will be given over to you. I mean, it's everywhere. It's in every drop of water, everything has it in it. That was the alchemical phase and it's the fracto phase as well.

Q. I have a question about the antenna thing. As I understand it, you know, in terms of picking up certain ideas or whatever, but when you talk about receiving specific memory that you as a single entity have experienced, so you as an entity would experience this thing and now it's just floating out there.

TM: You mean, does it actually call you up and say, "Hey, you." Is it like that?

Q: What is it that produces that. I mean, I can imagine receiving certain things that are cultural, diet or whatever. But when you receive, you're talking about your own person memories of stubbing your toe eight years ago, you know, why is that floating around?

TM: Oh, I see what you're saying. Well, this is the great problem for all theories of memory. We know that if you live to be 70 years old that every molecule in your body will be exchanged approximately 10 times. Well, then how is it that a 70-year old woman can remember what it was like to be taken in the arms of her grandmother and the smell of the perfume that the old lady wore. I mean, that is just an absolute mystery and the hard-core, if you're a hard-core materialist and God knows they're around somewhere, probably not here, but if you're a hard-core materialist the you say, "Well, something must persist and if we could figure out the one thing that persists then we'd have it nailed." Well, it turns out that there is something that persists. It's the, the neurons do not cycle over. You are born with a certain number of neurons and you die with a few less depending on your drug-taking history and they are never replaced and they are never

cycled out. Well, we -- but then the materialist break down because this magical substance which you would think would help them solve their memory problem, the theories necessary to turn it into the story side of memory are too fantastic for them to swallow. You would have to go to something like the invisible landscape, plug, plug [Audience: laughter] to find a theory radical enough to account for that because you would have to hypothesize molecular storage almost at the speed of a tape recorder of theoretically an entire lifetime. So, 70, let's make it 35 years because presumably you don't retain your dreams very youthful, so let's say 30 years of continuous tape recording being downloaded into something under eight angstroms in diameter with no degradation of the data stream and so --n and so forth. It becomes insupportable and fantastic in their mind but perhaps not. I mean why is, I mean, nature has a peculiar way of using redundancy like once nature finds a way to do something, she will tend to use that technique over and over again in different applications.

We see that the problem of storage of information and retrieval of information and non-degradation of that information has all been solved in the functioning of DNA. Uh, but the information that is stored in DNA, if you talk to an information theorist, they will say, "Well, it's not like memory. It's not like they're people's faces or their addresses or telephone numbers; it's just protein synthesis. It structures for protein synthesis and you mustn't be so naive as to confuse this with real information" with a pat on the head and so forth and so on. But, here we have the DNA, the central molecular machinery of life and for reasons known to nobody vast sections of it are what are called silent DNA. What does that mean? It means those parts of the DNA don't code for protein. Well, but maybe they code for something else. Maybe they code for memory and maybe the so-called random or trash arrangement of nucleitides in those sections of the DNA are, in fact, our memory. I mean, memory is very mysterious and the mechanism which explains it may involve principles at the edge of or beyond the grasp of current science. I mean, think of it. You know, I have memories going back to eight months and many people report memories under three years and often these are in their movies, you know. The most highly degradable and data-dense form of image storage there is. I mean, that's why it's so maddening to store images, you know, videotape on computers today because it's so memory-intensive as they say in the biz, and yet this seems to be how we store our, our memories.

Oh, let's see. What else has to be said? Well, again, this is simply a laundry list of things, cutting edge concerns and ideas in the realm of what I've left out and I'll mention it and then maybe we can knock off our top political ideas. I've talked to you guys before about the idea of one woman, one child. I've slightly modified it recently or made an addendum to it which is, uh, I think it would be very interesting, if 75 -- if every woman had one child. We talked about that and the social consequences of that, but how interesting it would be then if 75 per cent of those children were female and that the feminization of society, I think, should not proceed through the feminization of men; it should proceed by dialing down the overall number of men in the society and I think probably with a 50/50 sexual ratio which is actually an artificial ratio maintained by craved monogomites and their dominator stooges not to judge it, of course, but [Audience: laughter] and that in usually, in large, uh, mammalian social animal groups, males are more at a premium and so that's something I've been following and talking to people.

And then lastly and in somewhat a lighter vein, I want to urge you all to consider the zippies and their crusade to save the soul of America which you may not have heard of. Well, that is how it is with crusades. [TM: Laughter] The zippies are a bunch of English bohemians who are trying to launch a third British cultural wave following in the model of the Beatles first and Malcolm McLaren and the Sex Pistols second, and now come the zippies and they exemplify a certain kind of syncopated house trance dance techno

music and, um, what I like about them is that they operate under the banner of what they call "pronoia" and pronoia is the creeping idea that people are plotting behind your back to help you [Audience: laughter] and I see pronoia as part of the phenomenon of boundary dissolution. you know, things are going to get better and better. And what a zippie is is basically a freak who has their shit together. You know, zippies are freaks, but they don't have large amounts of garbage in their apartments.[TM: laughter] Freaks who recycle. That's your typical zippie. And so they'll be making their way across country and if you get a chance to attend any of their raves, um, you should do it. Raves are very good for the soul. There's a lot of youth bashing going on in this country and it's very weird and directed from large glass and aluminum boxes along Madison Avenue in Manhattan. You know, there is nothing wrong with people under 25. They're fine. Thank you. It's the culture that they're inheriting that is so toxic and weird that they don't know what to do with it. Somehow the response of that culture is to stigmatize them and to lay down all sorts of horse shit trips about Generation X and this and that and the other thing. I really think the zippies are the real, um, youth culture and it's psychedelic and its experience based. That's the other thing. Something we've preached here over and over again that the primacy of direct experience is what life is about. Now *Time* magazine is telling you but, you know, how you feel in your body, right here, right now and, you know, the drugs you take and the sexual acts you participate in and the things you do with your mind and body in real time and everything else is highly abstract and not to be trusted, I think.

In New York I gave a talk for the zippies trying to formulate what it is and it's mostly what it isn't. You know, it's about not believing, not consuming, not following. Uh, it's about taking back direct experience. If we could feel our circumstance, if we could feel what we're doing to the earth and each other, we wouldn't do it. It's that simple because it's too horrible, but, you know, you can anaesthetize yourself with ideology, with wealth, with distance, with religious obsession and so forth and so on, and then you can't, you know, tell shit from shinola, but pain is pain, agony is agony, uh, there's plenty of it out there so I think the precondition for any kind of response to that, any kind of like political or reforming response to it is to feel and that means taking back your own social space from the machinery of media and domination and value manipulation and and so forth and so on. So, I live life with an immense sense of intellectual excitement and hope. That's the thing. I think there's a whole bunch of, uh, cards on the table that permit intelligent people to hope. Intelligence and cynicism which have gone hand in hand throughout the 20th century are no longer good company with each other. It's inappropriate. Cynicism is now inappropriate. It's déclassé. It's not chique, my dears. Something else is on the horizon and so, permitting smart people to hope, that is the goal.

Places I Have Been

15th, May, 1988

Hermosa Beach, Los Angeles, California

Description

- [Original recording](#)
- [Terence's Botanical Dimensions project](#)

Well this talk, uh, how many of you were at the whole life expo yesterday? [pause] How many of you bought a quartz crystal there? [audience laughs; and applause]. Seeming to hold the line and have one each. One, one person one crystal, as I think, uh, a reasonable way to handle the destruction of the tropical rainforest that is going on to allow the airlifting chrysaline, uh, silicon malibu. So uh, [audience laughs], be aware that the trees die so that we, our coffee can find their way into our hands. Which reminds me that, and I'll remind you, this is a Botanical Dimensions benefit. Botanical Dimensions is a non-profit operation that Kat and I founded, and Rupert Sheldrake and Ralph Metzner, and Ralph Abraham, and uh, oh, Leo Zeff, some of you may know Leo, he died recently, he was on our board. And what we do is, we preserve plants with a history of human usage, especially ceremonial usage, you understand what I'm saying? [audience laughs], okay, and no one else in the world is, uh, doing this at the moment. The World Wildlife Foundation and Earth First, and these very large conservation, uh, organizations, are, their approach to the ecological crisis in Latin America is to preserve huge tracts of virgin forest, which is a very laudable and, uh, necessary thing to do. But even more fragile than the rain-forest itself is the web of relationships and information that the traditional people living in the rain-forest have evolved within it. They have, uh, a medical knowledge and a pharmacopeia whose age has to be estimated in millennia, and if we do not act in the next twenty-five years to preserve this information and the plants that it is about, it will be lost forever. And uh, we're not, we're talking immune stimulators, antibiotics, uh, neuro-toxins, hallucinogens, flavorings, uh, foods, the entire gamut of, of uh, gifts from vegetable nature, many of them in the Amazon, are uh, in danger of being lost. Naturally the focus is largely on the plants of shamanic usage, because knowledge of their use is even more endangered because it rests in the hands of fewer people. These shamans are not training new generations of apprentices, largely. The younger men are going off to the sawmills, and uh, and to work in the large cities that have sprung up along the Amazon, and uh, if we don't preserve this information it will be lost. So, this is what your money is going toward, we have a nineteen acre site on the big island of Hawai'i, and there we gather plants from, uh, all over the world, uh, and grow them there with no [tape skip] plants and, that they be available then to, for people who want to do research, and that can be straight academic research, it can be homeopathy, it can be shamanism, it can be aromatherapy, we don't, [tape skip] not judgemental, we just want to make this biological material available.

So, Art's decided that we would call this, Places I Have Been, and uh, I immediately added the caveat, uh, hopefully that means both in my mind and on earth [audience laughs], and uh [clears throat], so maybe I'll,

as an example of what Botanical Dimension does, which ties with, uh, the travel theme, I was, uh, on assignment for a magazine in January, and I went to southern Thailand, uh, in fact it's an amusing story, you may notice I'm wearing very trendy, yuppie rags from [more laughing], from the Banana Republic [more laughing]. Yeah well, clap fast because Banana Republic is being, uh, dissolved into the Gap, which is basically a, a ghetto cheater, [audience laughs], and uh, the uh, the genius behind Banana Republic wanted to have a travel magazine, and he decided, that, that he would call the travel magazine, Trips [more laughing], to my average smile [more laughing]. And he, he further decided, that uh, he would uh, have a monthly column which he wanted to call, Our Man in Nirvana, [audience laughs]. And believe it or not, I was asked if I wanted to be Our Man in Nirvana, well actually I said I have to think it over, and uh, said that, uh, that I was, uh, it was like a dream come true. Can you imagine, a situation where all expenses paid, you roved the world, looking for the most beautiful places, and when they published you get a dollar a word, and when they don't publish what you write, you get twenty-five cents a word, which is more than most magazines pay when they publish you. So uh, I went to southern Thailand on this assignment, that by the way, since the, this happened, the magazine's gone defunct, it had one issue and uh, [audience laughs]. But it's, it's not the first time that I have stowed away aboard a sinking ship [more laughter], but to, to the botanical point of the story, that shows you the kinds of adventures, and, and courage and dedication that Botanical Dimensions brings to bear on the task. Uh, I was in Thailand naturally, you access Thailand through Bangkok, and I had read in Richard Evan Schultes book, The Botany and Chemistry of Hallucinogens, about a plant called, Kratom, Kra-tom, and uh, it said it was illegal in Thailand. Well friends, Thailand is the source of one third of the world's heroin. It is, uh, the destination of most of the sex tours that originate in Frankfurt, Düsseldorf, places like that, in other words, they run a pretty loose scene, [audience laughs]. And, and, here this plant is illegal, and I thought well this is pretty amazing, uh, what's going on? So uh, I was with an art dealer friend, and he had a Thai wife, so I put the problem to her, and she said yes, oh yes, the, the most degenerate people know all about this [audience laughs], and knowing my friend I said, well then you must have several friends [more laughter over Terence's voice], that was the touchful bit, and uh, and so we put out the word, and uh, low and behold, uh, we got samples of this plant, root-stock, uh, and there was this very hush hush, and everyone was either giggling, or, or looking at us with thin, hard expressions as we, uh, scored this plant. And uh, we now have it, it is now growing in Hawai'i, it is available for, uh, certified bio-chemists and bio-chemical researchers, to determine what this thing is. What we learned as we made our way toward it, was why it's illegal. It's illegal because it inhibits and interferes with heroin addiction [audience gasps]. So, who knows, you know, if this is true, but say it were true, well that means, you know, this is ethno-botanically one of the great cues [sp?] of the decade, and it explains then why the tides are, of such a, ambivalent state of mind about it, because it's poised like a dagger at the heart of their economic life, uh, if it's real. So, this is the kind of thing that we're involved in, uh, I saw a review article recently on, uh, over a hundred and twenty plants of African origin that are, have immune stimulating properties. Well, in the age of AIDS, every clue, every claim concerning plants which stimulate the immune system should just be run to ground. I would think that would be a very reasonable strategy along with the millions that are being spent in other ways, uh, uh, to work on, uh, this problem. And in fact, uh, from my brother Dennis whose in NIMH, we've obtained seeds of a number of these immune stimulating plants, and are growing them out, uh, in Hawai'i. But the mention of Dennis cause me to think I, I should tell you, uh, Dennis and his wife Sheila had their first child just over a week ago [non decipherable], so the tradition will not die [audience laughs]. This is not yet a doomed house.

Uh, normally I, you hear me rail about psychedelics, and there will be a question and answer period, so you can probably bade me into that, but uh, I will actually treat seriously theme of, uh, Places Where I've Been.

Because, uh, when I went to Thailand in January on this travel writing assignment, and I went on to Goa, south of Bombay, uh, I was shocked and disappointed really to see how few Americans are on the road. It is apparently something which is not happening for Americans the way it is for Europeans. The German mindset is completely tip-saving [sp?] on overseas traveling, everybody works like a dog, ten or eleven months of the year, and then they go as far away from Germany as they can get [audience laughs], they really go far. Uh, the island of Ko Samui, Goa, all of these places, and the Australians as well. And, my, uh, commitment to psychedelics, as I have had to define for myself, but speaking to groups like this, is really a commitment to the primacy of direct experience. I think we are endlessly ripped off and impoverished in this society by being denied the opportunity to validate our own felt presence, the immediacy of our own being. We sell it out to the t.v., we sell it out to the great life we're gonna have after we quite working sixteen hours a day, we sell it out to all kinds of ideals that, that turn us into their puppets. And of course, psychedelics mitigate that very strongly, they dissolve programming, break up habitual behavior patterns, but strangely enough, so does travel, and this may be why there are so many heads on the road. Maybe, because they're all in doubt of it, [audience laughs]. We have to be reasonable people. Nevertheless they seem to take very well to the road. And uh, when you go traveling in these exotic places, and then you return to the folks back home, one of the weirdest experiences you can have is for someone to say to you, oh, were, were you gone? And said, was I gone? [audience laughs]. I barely escaped having my head shrunk in the jungles of Sarawak [audience laughs; Terence voice not clear] I haven't seen you around, I guess you haven't been around. The point of the story being that, a body in motion, seems to stretch the temporal dimension incredibly. So that if you put yourself into a situation where every night, your head sees the pillow, uh, in a different place, your living at about ten times the speed of your office dwelling colleagues, back at home. And uh, you know it's, it's a, a cliché that travel is the best education, but it's really only a cliché to the people who stay at home [audience laughs], because it's actually, it's absolutely true. There is nothing which dissolves your behavior patterns and your assumptions, and [?] your bowels [audience laughs]. In a remote third world country, it is actualizing the metaphor of the quest, you see, it's actually taking upon yourself the heroic role as the Jungians define it, the role of the hero, and going out into three-dimensional space and time, on a mission, for a reason. As a traveling freak years ago, we always had great contempt for tourists, you know a tourist is ipsofacto a person who has 'I am irrelevant' written across their forehead, I mean it's a sappy notion basically, to be a tourist. So what you must be in the, in the travel adventure I think is, uh, an agent, on a mission. We always did it that way, we were always after something; plants, a tonka [sp?], a meeting with the beady eyed guru of some sort, a drug, you know, whatever, or an artefact of some sort, and uh, then you have this mission, you can behave in this wonderful cavalier way that sets you up for adventure. You arrive in the capitol city of country X, do you want to see the cathedral? No thank you. Do you want to see the national art gallery? No thank you. We just want to [pause] get whatever it is, and by moving that way, with a sense of high purpose and mission, uh, nature responds. One of the little aphorisms that, uh, the mushroom has passed along over the years, and I think it's true is, uh, uh, 'nature loves courage', it said it to me, 'nature loves courage', and I thought for a moment and I said 'how does nature respond to courage? And the answer came back immediately 'by removing obstacles'. That's how nature treats the courageous, by opening doorways, by moving the laws, the old fools rush in where angels fear to tread, uh, sort of idea.

So, uh, my travels began for me, uh, really seriously in nineteen-sixty-seven. It was fed up with America, uh, uncertain about the draft, and uh, I had it basically. I was living in Berkley, where they were beating on our heads every night, and the smell of teargas didn't leave the streets. And I, uh, was with a woman, and uh, we decided that we would emigrate to the Seychelles Islands [audience laughs]. We had a book called 'An Encyclopedia of the Islands of the World', and I knew what the requirements were, it had to be

tropical, English had to be understood, and it had to be remote. And I had never heard of the Seychelles Islands, now they're a very cheechy [sp?] sort of travel destination, but at that time it was Mars. And so we set out, and uh, uh, she was Jewish, and uh, we were young, and so I received a summons from her father, uh, here in Los Angeles, who wanted to discuss our plans. And I was prepared for anything, but he is a wonderful person actually, a dear man. And uh, he said, I'm not going to put on you what you call a trip, [audience laughs], I just have one request, the Seychelles are on the other side of the world, therefore, you could via Hong Kong in the far east, or you could go via Europe and Israel, it is my wish that you go by way of Israel, I said, done, can I go now? [audience laughs]. And uh, this was, this was October of nineteen, uh, sixty-seven, uh, the war, the sixty-seven war was barely cooled. And I [skip in tape]. The plan was by the time we got to Israel, we had far less money than we thought we would ever have, and the government of Israel was so interested in promoting immigration at that point, that they had a deal, where if you worked on a Kibbutz or a Moshav for six months, they'd give you an air ticket anywhere. So, Stephanie was decided would stay in Israel and go to, uh, Moshav on board, on the, uh, sea of Galilee, and follow me to the Seychelles in six months with the ticket that she would earn. So I went on to Africa, and uh, uh, she fell in love with the guy in the next bunk [audience laughs], and she forgot my name, and uh, [more laughter; someone in audience speaks but is not clear; Terence responds, absolutely; more laughter]. So uh, but it was very funny because I didn't want to linger in Israel, I was on a mission, you know. Everybody around me was caught up in, in Zionism and the aftermath of war, and this and that, and here I was an Irishman, and when people asked me where I was going, I said, the Seychelles Islands [audience laughs]. What does that have to do with it? Uh, and so I went to what my guidebook described as, Eilat, Israel's bustling southern port. Well I discovered that at that time, one full month of the Zim line, which was the Israeli state freight line came in there, and so I realized I was stuck there for awhile. And I discovered in the dry eeyores {sp?} washing down to the Red Sea, the most amazing collection of freaks [audience laughs], Colombians, Danes, fed up Kerputzniks [more laughter; unclear word] who had run away from that. All these people sitting in this place, dedicated to the notion that, uh, you should smoke as much hash every day as you possibly can [more laughter] and they had a wonderful technique which beats anything I've ever seen. You know in India you smoke a chillum, and it's a, it's a ceramic cylinder, and you, and you mix the hash and tobacco, stuff it in, hold it with a wet cloth, do this method. Okay, so what these guys were not into, was, you take a, preferably a Dr. Pepper bottle [audience laughs], you break it on a rock near, near the bottom, and then, at that time Israel's, uh, smallest denomination coin was called an 'Agarot', and it had, it was, uh, like a gear, it had deep indentations in from the edge. So you could take a one Agarot coin, drop it into the neck of this Coke bottle, or Dr. Pepper bottle, and then just work up a mass of stuff, about like this. So when you fired this thing across the surface, it had a burning surface [more laughter], the size of a small pancake [more laughter]. So uh, I did that for awhile [more laughter]. And by the time I got to Kenya, and made my way to Mombasa, which was the place where this boat was, which was going to take us to, uh, to take me to Seychelles, I thought maybe I should dry out a little, and uh, and uh, but I, I had scored in Mombasa from the shoeshine boys this outlandish black, uh, camper. But I took the boat to the Seychelles Islands and I was there a couple weeks, and I arranged a small house out on an island, which was almost like the island in the cartoons, the one tree island [audience laughs]. It wasn't quite that small, but there were about fifty families on this island, all spoke Creole, and, and there were coconut trees on this island. Every coconut tree had a number, painted on in white ink, and there were twenty-one-hundred and fifteen coconut trees on this island. So I was there to write a book, and to wait for Stephanie. So I decided, uh, that I, that I had been smoking much too much coming through Israel and down through Africa. So I took this lid and I nailed it above my kitchen door, and I said I won't, uh, smoke until I finish this book, and I will set myself a vision, and I will work everyday, and I did. I'd get up every morning, fry my eggs, feed the stray dog, be at the type-write at

eight, I would work until two in the afternoon, come hell and high water, then I would, brew tea, and, amuse myself. And it was terrible, you know I was insomniac, I was, my dreams, I was both insomniac and my dreams states were completely out of control. And I wrote this book, and it was, uh, it was called, uh, called, uh, 'Crypto-Rap Meta-Electrical Speculations on Temporary Culture' so, [audience laughs]. And it ran to like two-hundred-twenty pages, so as I was closing in with the end of this book, I began to think, and I, I began to think about the lid nailed over the door, finally I decided that my gift to myself, would be, to uh, to get really stoned when the book was done, so uh, finally the book was done, the index was done, it was all done, it was just sitting there, and I had my little evening meal, and I rolled these enormous bombers, and I dragged my lawn chair out in the palm trees, and the lagoon was laughing out there, and uh, and I smoked a couple of these things in short order, I was just waiting for this wonderful sense of relief, and accomplishment and so forth to sweep over me. And this abyss began to grow in my mind, and I kept pushing it back, and saying, no relief [audience laughs], falling relief [more laughter] and it wouldn't, and finally I had to look at it, and it was a realization which grew over about fifteen seconds, from the faintest whisper of a suspicion, to an absolutely incontrovertible certainty, and it was the knowledge that this book I had written, was the most outlandish garbage [more laughter], sophomoric, self-congratulatory, prolapse, exalting, over-written, uh, just, and I was like frozen [more laughter], because, friends, this was true [more laughter]. So then I realized, you know your nuts to try and navigate about this stuff, because it just makes you, it, you know, uh, being straight makes you into a moron [audience laughs; applause].

There's, there's a whole family of uh, of one liners like that, uh, [more laughter], one is, uh, reality is for people who can't handle drugs [more laughter]. The, the, best version of that I ever heard was something which I thought Tim Leary had said but I asked him recently and he couldn't remember him saying it, of course he's brain dead [more laughter]. Tim once said, uh, "LSD is a drug, which has been known to cause psychotic behavior in people who don't take it [more laughter]. So that was really my first foray out into the world, uh, I went back to Bombay, and, and back to Berkley, and by that time is was early nineteen-sixty-eight, and I got back to Berkley just in time for the street uprisings of May, June and July of sixty-eight which really was the, you know that was the cauldron of my generation. And I don't know how many of you were there the night we burned the bank of America, you know these great home [?] [audience laughs; Terence's voice unclear]. When I, when I first started public speaking I had the illusion that you all were there. And that, and that I was talking to the same people and that we were that type, you know. Suddenly I realized, there are people in this room who weren't born, probably, the night that that went down. Anyway, I was in Berkley all that summer and fall, and some of you may remember S.I. Hayakawa, who twisted my finger, a traditional opportunist to, uh, at that time was cutting his way to power, uh, as president of San Francisco state, and there was a very radical strike action against San Francisco state throughout September, October, November, really at standoff. Everyday we would riot, everyday they would call out the tact squad, and, and then we'd do it the next day, and then take off two days on weekends, and finally ended it was just a technician [?] was never a resolution, but it was really a crazy [audience laughs], one of the most Orwellian things I had ever seen, because San Francisco state has a big quad with square cubicle buildings on all four sides of it. Well, the tact squad, intelligence people, the F.B.I. the C.I.A. film scoop, would put their observers up on these rooftops, and they were filming with telescopic cameras and all this, and obviously they also had closed-circuit t.v. because you could, you never saw high columns, you never saw them. But there were these huge loud speakers mounted on the corners of these buildings, and uh, they would hold rallies, and the Black Panthers would speak and some guy would get up and say now, "Ya'll know why we're here, we're here for business", and the business administration building was one of the belfries of "We're here for business". And the crowd would just begin moving toward the business administration building, meanwhile the cobblestone walkways were

suddenly mobile [audience laughs], end of the crowd, and, and you could hear Hayakawa's voice saying "You're clearly escalating!, you're clearly escalating" [more laughter]. And then the tact squad would sweep in and so forth and so on, and uh. Finally, finally Christmas vacation ended that, and the next day as I was leaving my apartment in the hills behind Berkley, I noticed this guy in a car with a funny license plate, and a clipboard mounted on a little stand so he could write while he drove, and he seemed to be taking a lot of interest in my comings and goings. So I told my friend that I thought we had shot our wad, and reminded him that the first duty of a revolutionary is to survive, right? And so we, uh, bought air tickets to, uh, Luang Prabang, Laos, and then on to India, and then back to the Seychelles, uh, there was a possibility at that time of getting real estate in the Seychelles. And, it was really all that traveling in Asia, which pointed me toward, uh, my eventual interest in psychedelics and the Amazon. I, of course I knew about LSD because I went to Berkley in that decade but, but I didn't really understand that these things had been used for fifteen, twenty-five-thousand years, that there was this rich history that was in fact the world's oldest religion. It's interesting you know to me, the uh, press of the sixties, even the underground press like the San Francisco Oracle, and see what themes were not present in the sixties consciousness, that were either absent or rarely mentioned. The theme of shamanism was absent or rarely mentioned. Nobody had connected up the notion that there was this tradition like this. The notion that U.F.O.'s and, and dis-incarnate extra-terrestrial intelligence might have something to do with it. But remember how it was presented as an aesthetic experience by one school, that was the school where you listened to the Bach B. Minor mass, and uh, looked at paintings by Caravaggio and Rembrandt on these subjects, yeah. And then, uh, and then the other school was the psycho-analytic, this is good for you, we have an atheist school, which uh [audience laughter], no I think there was something to be said to that actually. But anyway, in the in-traveling around India, and keeping my wits about me, I became very very simple, and it, those of you who follow me very closely know, that I am no friend of the guru racket, that by, I think uh, if what we're out for is self empowerment and increasing our own felt authenticity, that the first step in the process is not give over your loyalty to some beady eyed weasel from Bengal [audience laughter; applause]. And I went to these guys, you know I was open minded, I, I took Yoga very seriously. I practiced it, I studied the Hindu meta-physics. The reason I was most in Asia, the longest was to study the Tibetan language, and so I was not, you know, I was not a no-nothing physician, but I always set the same question, "What can you show me?". And the best thing I ever, nobody could ever show me really anything, I said "Well, you're obsessed with materialistic effects" [audience laughs]. That's right uncle, and if you don't have any I'll be moving on [more laughter]. Because you know they have the idea that I 'd like to sweep the ashram courtyard for a few years before they lay on the skin. And the other thing was, I noticed, that you know, these guys were as dedicated to smoking hash as I was [more laughter], which clued me that they couldn't have cornered the market on transcendental consciousness too thoroughly. And, and so, I, well the most impressive thing I ever saw, and I respect, uh, uh, the Mahayana tradition very much, I think it's a deep psychological insight into what humanness is, but I don't think they have the doorway into hypser-space. I don't think anybody has the doorway into hyper-space except psychedelic shamans, uh, whether they live in Vedanta[?] beach, or Pucallpa, or central Africa. But uh, so then I, I realized that these traditions were simply that, they were vitiated tradition, and that all of this talk about paranormal abilities could be traced back to earlier strata, and the earlier strata always had the same word with them, Shamanism, that was it. The pre-Buddhist religion of Tibet, Shamanism. The roots of Daoism, Shamanism. The roots of the Vedic civilization, Shamanism. The ancient Hebrew civilization, arising out of Shamanism, so forth and so on. So then, I said well where in the world is shamanism happening today? Well the answer is, of many places, but in its most authentic and, uh, uh, intense forms, it's happening in the Amazon basin. And it based on the use of plants, to which an almost symbiotic relationship has been formed. And uh, as quickly as I could arrange it, and my brother's thinkings have all been along these same lines, uh, we found our way to South

America. And uh, went to Pucallpa, went to Iquitos, went to Puerto Leguizamo in southern Columbia. And there, this same challenge that has caused so much discomfort to the Yogins, and the Vilksūs, and the Vilksūnis, and the Geishays, and the Rōshis, and the Rishis, didn't seem to bother these cats. I said, "What can you show me?", and he well look, "Let me put an edge on my machete, and we'll go out here half a mile and cut some vine, and brew it up, and then I've got this other plant growing in my dooryard, and my Grandfather showed me how to do this, and we'll just put it together", and there it was!

The thing which is our birthright as a species, but which, uh, the powers of profane secularism would deny us. I mean some of you may have heard me say yesterday, it's very clear, 'Life, Liberty and the Pursuit of Happiness'. Well that doesn't, we've interpreted that to mean, the right to run over the other guy on the way to getting your claws on your third Mercedes [audience laughs]. But that isn't really it, the untrammelled permission which we have given capitalism to cheapen our values, is not what the notion 'The Pursuit of Happiness' means. It means the pursuit of existential authenticity, it means the pursuit of meaning in the world. Well, it just so happens because we are the descendants of these primate, and proto-hominoid, and hominoid populations that have this symbiotic relationship with plants, and to vision, and saw that as the source of their spiritual mind. It, it is therefore not only our birthright, but it is the natural path for us to take. You see, this thing of, of drugs, is simply a language game, what we are, are omnivorous animals, and we are also sensual animals. Most animals are neither of these things, most animals pick one thing, or a few things, but to be an omnivorous animal, willing to eat; fruit, roots, meats, eggs, shellfish, nuts, so on, is extremely unusual. And then, to have an interest in flavoring, in shifting things, the way things taste for their own sake, this is a quality of consciousness, and we are unique in possessing it. And the current, uh, fixation with drugs that states it as a new phenomenon is completely misrepresenting what is going on. Throughout history, human populations have, had their societies, their religions, and indeed their entire cultural machinery, uh, sculpted, and created in response to the kinds of foods, spices, drugs and medicines that they were involved in. Think for example, of the impact of coffee on the evolution of modern world industrialism, how the office worker, and the coffee habit are mutually reinforcing activities where one could probably not function with the other, without the other. You know, when coffee first made it's appearance it was served in very sleazy bars [audience laughs], where loose women and pretentious intellectuals hung out together and, and criticized the enlightenment, and got so rattled that they would just talk all night [audience laughs]. That was the, that was coffee was, until it was understood that what it really is, is speed, and it lets you do a job, and then modern office culture came into being. Think of the manipulation of opium policy by the British East-Indian company in the far east. How many people are aware that the island of Java, which uh, has the densest population per square mile of any large area in the world, has that large population because the Dutch in the nineteenth century, payed people to have children, because the sugar industry was so labor intensive? So that, so in order that white sugar could grace the tables of upper class Europe, the demographics of an entire section in southeast Asia would just plunge into hell. Uh, the examples are endless, tobacco, uh, the influence of the Eleusinian mysteries on the development of Greek philosophy, uh, the way in which the C.I.A. used heroin in the nineteen-sixties to quell the revolt in the ghettos, so forth and so on. These are just, uh, uhm typical examples of this. Well, I digressed slightly, I mentioned it because it's important for us, as people with a core interest, to be as articulates, a spokesman, and a spokespeople as we can be. And because we are living through a kind of hysteria, the equivalent of the great red scare of nineteen-nineteen. What people need to realize, what this society needs to realize, is that the pro-psychedelic position, is an anti-drug position. Because drugs, as defined by the establishment; cocaine, heroin, amphetamines and so forth, reinforce un-examined, machine-like behavior patterns, obsession, and a narrowing of consciousness down to a single focus, the acquisition of the drug. This is the exact opposite in all cases [skip] psychedelics do. Psychedelics dissolve

social programming, break up habitual behavior patterns, and incline you to the broadest sort of perspective possible. [audience member says; which they see as an even greater threat I think]. That's precisely why the psychedelics are swept up in the hysteria about the hard drugs. The government is making lots of money on hard drugs, and keeping a lot of people under it's thumb. The psychedelics, by being de-conditioning agents, are just like, uh, you know bringing in gasoline to a bonfire. You're absolutely right, that is the nature of the controversy. That it lifts you out of the ritual genuflection to the idols of the tribe; consumerism, uh, workaholic behavior patterns, duty, and well you know, the whole gamut bourgeois ideas that has made us such a, uh, a poverty stricken culture. So, uh [audience laughs]. Thank you very much, you were great [audience applause; music and host closing].

Plants, Consciousness, and Transformation

8-9 April 1995

Location, City, State

Description

- [Youtube Audio Link](#)

Okay, well, welcome to plant consciousness and transformation. uh I'm terence mckenna. I know many of you, uh we will meet here today and tomorrow 10 to noon, 130 to 5 and uh basically this is uh, uh, workshop to discuss the interaction between plants and human beings. h specifically the psychological and mental interpenetration would be to very different kinds of lifeforms and uh, those of you who are right and who are concerned about a paper that you may write relative to this class, I'll say a few words about that before the afternoon session, so don't fret about it, it will all come clear in time.

uh, I think of this uh course as plants and mind" and, uh, the way I like to teach is to just begin to lay out the basic pieces of what is a very complex interdisciplinary puzzle, and hopefully at some point uh your specialties, your passions your interests will ignite the whole thing and it will have then a dynamic of its own. We could discuss these matters for 2 days 5 days, 10 days, or as I've done 40 years 35 years. there is no end to it and very few areas of human endeavor dissolve the disciplinary boundaries of western academia as thoroughly as uh the study of human and psychoactive plant interactions do. there are important issues here in biology and botany. in biogeography, in ethnography and ethnology, in psychology and neurophysiology, in the study of symbols, uh uh, the number of disciplines that have top be brought to bare on thsi subject is ... to how important it si to uh understanding our our humannes and I represent, uh, a radical point of view on these matters and I don't imagine I was invited here to dumb it down, so, you know if you had darwin, you'd get natural selection, if you had freud so you get sexual attraction. so you got mckenna so you're gonna get psychoactive kitalysis opf consciousness...

but betfore we get to that let me just lay out some of the, the field. uh. Human beings began uh there career. well, we can trace it back to the primordial slime I suppose, but uh, our our animal career was a career of insectivouruous vegetarian and fruititarianism, lived out in the arboreal canopies of tropical rain forests. And all uh all animal species, indeed all life tends to iuh occupy and evolutionary niche and then stabilize itself in that niche. uh termites cockroaches these sorts of organisms found their niche hundreds of millions years ago and have ...

generally nature is not progressive in it's particulars. overall nature is progressive, but it's particulars seek equilibrium. and so it would have been in the case of our primate ancestors. They acheived a dynamical balance with our... a canopy habitat uh uh uh language pack signaling designed to convey danger and information about food sources and so forth and so on. and there they would ahve remained uh had it not been for the larger ecodynamics of the planet. Ecodynamics which are still shaping, uh uh human habitat in Africa,. because what has been going on in africa for at least 5 million years is a slow drying of the continent. and it disrupted this uh rainforest ecology so that about 2 to 4 million years ago, ... the rainforest began to island itself and to be restricted to the wetter areas of africa and into the new environment, the

more viriditic or arid environment that was coming into being, a very diminished plant community took hold. A community of opportunistic grasses, annuals, heavy seeders, this sort of thing. Now we know that the rainforest was primary because the rainforest, just to give you a broad notion, might consist of uh over 100000 plant species. The grassland ecosystem might well consist of under 500 species and all 500 grassland species can be found as rare members of the flora of the rainforest. So clearly what we have are the survivors of a process of clearing and there is argument among botanists about this. Karl Sauer who was a great geographer and thinker on these matters held that there is no such thing as a natural grassland. That grasslands are the earliest artifacts of human impact on the planet. Grasslands are created by burning. uh uh they promote the growth of cereals uh and and so play feed in to this human uh uh food chain. So. our uh primate ancestors ecological adaptation to arboreal life was interrupted by this process. uh, and key to ym thinking about all this, and those of you who are gonna have careers in all this will take it up and adumbrate it. I think the great overlooked factor in any model of human evolution and indeed in evolutionary models in ...

emphasis to diet when we talk about natural selection of an animal species we tend to think, uh, that the genome expresses physical types and the phenotype is then subject to selection by natural environments. Some biologists have seen the thinness of this understanding. LL White wrote a book called internal factors in evolution in which he pointed out that the womb is... before an organism is ever born into the theater of darwinian selection, so it isn't a tabula rasa that you're born into the theater of natural selection you have been subject to natural selection from the very earliest moments of exist...

but what I have emphasized is diet, diet is uh an input of potentially mutagenic factors into the body that can have enormous consequences on the health of the individual... of a population and. I've used the the toolbox of ideas that I'm going to put forward here today and tomorrow to try and address what seems to me one of the sensibly interesting questions to be asked of this world and that is, what is human consciousness. where did it come from, and why does it exist at all? uh, and I believe that we can by thinking about psychoactive plants, diet, and the early human evolutionary situation we can make a lot of progress on this question, and we can illuminate some of our political dilemmas to that persist to this day. The gender friction that typifies human society the hierarchy structures and the tension they create...

... and then we can talk about the larger uh uhm materia medica of, of uh psychoactive change relative to plants.

as the rainforest retreated. our remote primate ancestors came under nutritional pressure. obviously because their area for gathering food was being physically diminished. now when a as you probably know or as observed, most animal species are very particular about their food intake and if you've ever tried to raise butterflies or something for your childre, uh you know that if you capture a caterpillar in the wild but don't pay close attention to the plant you find it on, you can't just put grass in a peanut butter jar with a caterpillar to great success. Animals are highly specialized in their choice of food. why is this? well, as near as we can tell evening all kinds of food from an evolutionary point of view is a very reckless move indeed, because plants represent, um , uhh chemical smorgasborg of various types that have accumulated over time in the genome of a particular organism., if you have a very broad based diet you are exposing yourself to many different kinds of mutagenic influences as a strategy for survival of a species this is not good! uh much better to specialize, to evolve special enzymatic pathways to deal with toxins, so for instance we know certain animals can eat things./.. an all animal species tend to evolve towards these very bland uh monodiets. now, what happens, when uh there is an upheaval in an environment, uh, geological magnetic reversal a volcanic eruption a drought something like that, and ordinary sources of nutrition become restricted, then an organism has basically 2 choices. It can go extinct, starve itself out of existence or if it has more flexible behaviour it can begin to experiment with previously rejected potential foods in the

environment. Rejected probably because of uh strong taste, or something like that which are clues to the presence of marginally acceptable chemical compounds of some sort.

our remote canopy living ancestors, have I mentioned... expand their repertoire of foods. they also began to explore the grassland environment, and I mentioned that the grassland environment is much poorer in total number of plant species than the rainforest thus and logically the potential number of food sources is also limited. baboons and chimpanzees will dig with sticks for the corns the swollen root of grasses so as our remote ancestors began to explore this new environment of the grassland they also began to explore new dietary items. uh and one of the items that they would surely have observed are coprophagous mushrooms... many of these species of coprophagous mushrooms elaborate psilocybin which I assume you know is one of the major psychoactive alkaloids. psilocybin occurs in many species of mushrooms its unknown outside of the fungi and but I maintain in a sense psilocybin is the uh is the best model for human interactions with the psychedelics or that all other psychoactive plant uses are an effort to duplicate return to or somehow evoke the original human relationship to psilocybin and here is this and and it is not simply its psychoactive properties that make psilocybin a potential catalyst for human consciousness it is its psychoactive properties in combination with certain other properties which make it uniquely suited to carry out the role of catalysis of consciousness in a higher animal...

first of all, uh in very low doses psilocybin increases visual acuity. if you want to go back into the literature, Rowland Fisher in the middle 60's took graduate students and gave them small amounts of psilocybin or placebo, and he built an apparatus where two parallel strips of metal could be deformed by winding a crank, and he asked people to push a button when the two strips seemed to them to cease to be parallel and he demonstrated that edge detection is enhanced by small amounts of psilocybin. well you don't have to be a rocket scientist to realize that edge detection is at a very high premium in any grassland situations where predation is taking place. the lion moving in the grass 300 yards away as it creeps upon your camp, or the gazelle trying to slip away in the tall grass from your hunting party. edge detection is the key to your success or failure in hunting in that kind of a situation. It's extraordinary that... what it would have done, you see, is the proto... a slightly enhanced success in hunting that slightly enhanced hunting success would mean more nutritional resources available for them and their offspring. offspring presumably inculcated into the habit of also eating the mushroom. so what we have here is a slight favoring, then, of those animals in the population that would accept psilocybin into the diet. um, at slightly higher levels psilocybin is, uh, like all CNS stimulants causes arousal, and arousal is simply a feeling of unfocused restlessness, it's that 2 espresso feeling. sleep is impossible hands are busy at small tasks, one is aware of one's sphere of awareness extends out somewhat further, and in highly sexed animals like primates, arousal means erection in the male, and this is very important for this theory because we not only have to account for human consciousness, but we have to account for the peculiar dislocation that human consciousness seems to carry with it, that we are both of nature and yet not of nature, somehow creatures with one foot in nature and one foot in heaven, and how does this come about, uh, I believe, and I'm you know willing to argue it against all comers, that the key element to understanding our sociology and our sexual politics and all that, is to realize that psilocybin had 2 effects in the early human populations that were using it, 1 we're very familiar with if we're psychedelic sophisticates ourselves, it's the psychedelic experience, the boundary dissolving hallucinatory shamanic apotheosis that occurs...

mediate the tendency to form dominance hierarchies, and this is very controversial, in other words, what I'm saying is that all primates form dominance hierarchies and what that means, to remind you, is that the hard bodied long fang males take control of the group, they control the children, the women, they order the old, the homosexual and the young, everybody is under their thumb and part of our dilemma as a global society is that though we claim great sophistication we still live under male dominance hierarchies: corporations, universities, family structures, you know long fanged males are still ordering around the

elderly, the weak, and the females among us... it creates great social dislocation and political unhappiness and tension in relationships and so forth and so on, I believe that our unique position in the animal world arose as a consequence of a chemical suppression of a natural behavior pattern, the pattern of male dominance, of forming dominance hierarchies was interrupted by an item in the diet, psilocybin, and into this chaos this egalitarian chaos, which resulted was uh a situation in which everything about us that we treasure and hold up as humans was put in place. in other words, theater, language, dance, story, altruism, ethics, uh, metaphysics, did I say poetry, everything that makes us human, came into being roughly 100,000 in the last well from a hundred thousand to about fifteen thousand years ago. people lived in balance with the earth, with the larger biome in which they were embedded, there was not product fetishism ushering into enormous toxic processes involving the smelting of metals or the extraction of rare elements from the earth.

now you could object and say well they were simply not sophisticated enough to do those things I'll maintain our... comparing us and finding us favorably compared to the civilization of homer or catalhuyuk or alta mira is simply a form of culture chauvenism. okay

but psilocybin had other effects besides this suppression of male dominance that I mentioned and this increased sexual thing which I did mention but I didn't draw the correct conclusion there you... then it is reasonable to expect that you will have more pregnancies and reasonable to expect that you will therefore have again a tendency to outbreed the non-psilocybin using members of the population. ... greater uh food gathering uh capacity, increase sexual activity which tends to outbreed uh the non psilocybin imbibing members of the group, and then on top of all this you have this ecstatic internal state for which we with all our cultural and epistemic sophistication are still unable to come to terms. The mystery of the psychedelic experience. Now, these things taken together with other factors working in parallel created, I think, the dilemma and the glory and the opportunity of humanness. Once we began, under nutritional pressure, to expand our diet, we were delicately poised on the edge of omnivorousness.

Because recall in the canopy... we were not simply vegetarians, we were insectivores. In the grassland environment we began, probably, to um, originally, to uh, follow along behind lion kills and that sort of thing, and eat carrion. One evolutionary theory is that our suppressed olfactory apparatus the fact that we have a very limited sense of smell is because there was a period in our evolution where we did a lot of rooting around in carcasses, this is not the noble image which we might have wished, but uh there it is we need a countervailing theory because you don't like that one is no we lost our sense of smell because when we stood upright we got our faces up off the ground and that's where the smells are anyway so it all sort of became useless... couple of years that is definitely not PC is that I've noticed and my attention was called to it by philip devoshalay whose a friend of mine.... cows have very little interest in the habits of chipmunks or birds or anything else all they do is munch grass. carnivores on the other hand have an acute interest in the behavior of other animals. in fact I'm on the brink of willing to argue that the earliest consciousness was not self consciousness it was consciousness of how dinner thought because if you can think like your dinner you can go out and plant yourself in its path of behavior and have dinner, you see, and if you will if you will look at the difference between ... the intelligence level is striking, and I think that, that this attention to the behavior of other animals on the part of an emergent habit of carnivorous behavior is going to have to be taken into consideration. umm, its interesting that shamanism, which is in a sense the earliest intellectual pursuit emerges in its early phase as a technique for identifying with animals. Hunting magic is what we're talking about here, and so I think that there is a very interesting mix of factors and players in the early human evolutionary situation.

First of all a canopy dwelling primate with a pack signaling repertoire is forced into a grassland environment uh where psilocybin mushrooms occur where small or large animals are preying upon each other and where nutritional options are highly restrictive. as this animal makes its adaptive choices it moves deeper

and deeper into the realm of mind. first the modeling of the behaviors of other animals, and the behaviors of plants because in a hunting and gathering situation when plants produce fruit what environments they prefer what other plants they grow in association with what soil types they prefer all of these things are cofactors feeding into an image of the world and this image of the world by its accuracy or falsity decrees life or death upon those uh uh who terry. uh.\

the omnivorousness forced us into an awareness of other animals, that made us, uh that put us on the level of intelligence of a hunting cat, or something like that, but the psilocybin experience, at higher doses and obviously at this time inculcated for sexual and ritual and hunting purposes into the society.... into a non-local invisible magical world that is to use a jungian term highly numinous, highly charged with the energy of the archetype of the architypal world, and as I said to this day we are not able to come to terms with this no matter how much deruda or husserral or wittgenstein we imbibe it still is a very challenging thing to dissolve your ordinary state of concioussness... mind that we find ourselves embedded in. for a long time, therefore, up lets say a numbers are number, but lets say from fifty thousand years ago to twelve thousand years ago there was a kind of paradise on this planet. Poetry coexisted with uh a balanced ecosystem. uh, observational sciences, astronomy, botany, biology, taxonemy, the observational sciences, coexisted with the natural world. And then the same factors which created this edenic situation which remember what they were it was the drying of the african continent that caused the rain forest to retreat, that same process had been going on slowly inevitably endlessly and about between well after the last glacial melt which began tenty to seventeen thousand... a vast grassland dotted by sandstone pinicals cut by rushing streams and crowded with vast herds of game. that was the theater of human emergence but when ti began to go dry it when dry rather dramatically, these ice cores coming out of iceland make this clear. nevertheless... The breadbasket of rome, because they were growing wheat in vast amounts of north africas s recently as 2000 years ago in areas now where there was nothing. well, this this paridisicle ac...matriarchal, partnership psychedelic, shamanic archaic whatever you wannna call ti society was then pushed into crisis, and a number of things happened. first of all migrations of people out of africa, this happens everytime theres a glacial melt. Human populations were trapped durin... the last glacial period the glaciers came as far south as uh as northern isreal. so human populations get trapped and then in the interglacial and during the melt they radiate outward. people behan leavng the sahara settling in the nile valley, and the use, this shamanic use of psilocybnin was disrupted becasue... and when that happened and this I'm closing the loop here, for you feel my wrath the saying when that happened the patter of male dominance the pattern that was genetically never removed but which had been pharmacologically suppressed for over a hundred thousand years perhaps reasserted itself with avengence it was always there it had never been bred out... people were turning bad suddenly. we get a whole bunch fo things come at once, uh, an end to nomadism, the beginnings of sedentary agriculture. City building, standing armies, slavery, male kingship, dominance, all of these things appear almost over night they spring up and I maintain they are what a monkey would build as a civilization if suddenly all of its worst behavioral tendencies came to the forefront with avengence and that's precisely what's happened. In the eriod where we were self medicating ourselves with psilicybin ... entity that we are. we elaborated observational techniques, theories of magic, language, but when the psilocybin was withdrawn, these tools which had been our glory became instead our curse, because instead of using them to produce theater and dance and eccstatic social interaction, we began to use them to support the new and older agenda of male dominance and its a frightening thing, you know, to think people following their cattle across the african plain, uh eaing the mushroom, seeing the mushrooms as aprt of the output of the cattle in the same way tyhat meat and milk and menuer were output of the cattle, a mother goddess religion a reli9gion,... conflict soforth and so on and. somehow then this process which took a long time of domesticating cattle, because I'ms ure you see you cans ee how it all works, how these factors were disperate and then they flowed together.... uh, kills of lions. uh, you follow the cattle in

the same way that the jackals follow the cattle to deal with the lion kills made by large predators well then in the course of this you encounter weakened animals or abandoned infant animals, and you care for them and over twenty thousand years this turns into domestication of animals, husbandry of cattle, but uh you take away the psilocybin and I think this is a frightening thing to contemplate, the earliest cities, I will argue, were pens for human beings, that's what a city is, it's a pen for human beings. some of these dominant males said woiah ... in the same way, why shouldn't a king order his people in with the same impunity that he orders the slaughter and the movement of herds of goat and cattle, and all of the institutions that we labored under came into being at this moment of transition from the late neolithic, or from the paleolithic to the neolithic, to the agricultural situation.

The reason for this, I believe can be traced to evolution, to the evolution of consciousness, I mean consciousness is a double edged sword, uh at the very, one of the factors I think that contributed to the reemergence of male dominance was that at some point human intellectual capacity... could be connected to an effect, and the effect and cause that were being observed was the ... and women who that men must have understood that an act of copulation if carried out successfully and in the right rhythm to the moon will result in a child 9 months later. If you don't have that understanding you have no sense of male paternity so you have a very tight social bond because for men the children are our children, the children of the group.

Once you have a sense of male paternity then you have ownership and this becomes very problematic. ... that in the yearly round of following the cattle, when they would return to the kitchen middens and fire pits abandoned a year previously, that there would be food in those areas, an abundance of food plants from cast off kernels of cereal and so forth and so on... if we bury food for ... food will come out of the ground. The problem with agriculture in the early phase is that it's hideously efficient, and what it does is it immediately creates such a surplus that you have to stop moving, nomadism has to be abandoned.... and then you must store and defend your overproduction against less fortunate human groups in the area. The most advanced building on this planet in ten thousand eight thousand BC was uh the grain tower at Jericho, and what was it, it was a grain storage tower, and it had a staircase so you... heads of enemies who were trying to batter their way into your grain tower, so I've I've spent some time on this because, um, this could be taught this course without any reference to our contemporary dilemma which is uh and by that dilemma ... male dominance, underutilization of females in society, underutilization of feminine points of view in society, but obviously there is a lot of tension in our society around the issue of psychedelic intoxication, around the issue of these shamanic plants, though there is a growing awareness among sophisticated people that the case is almost entirely emotional... toxic drugs, alcohol, tobacco, uh we're willing to make a trade off of seventy thousand deaths a year in this country for the privilege of driving the automobile... supportive of the agenda being handed down from the top, psychedelics are not, and they are seen as tremendously disruptive, and yet as the ethnographic and pharmacological data comes in they are among the most benign uh uh substances in the world and uh their history of human usage is almost universal, and then the question is do these intoxications limit the spectrum of consciousness and allow hierarchical models to be handed down and brainwashed into the doubters, or do these states of consciousness dissolve cultural assumptions and cast the individual into uh an ocean of existential complexity out of which they have to build their own model of how the world works. well, uh I believe the reason for this tension in our society and anxiety and suppression, furious suppression, of these things is because we sense that this addresses origins, in the same way that it took a long time to overcome our our....

there's something about the origins subject that make us very very nervous. clears throat, okay so that's a very linear discussion of the role of one psychoactive plant in human history, psilocybin, and as I say I think it was uniquely, chemically, botanically positioned to play that role in human consciousness, uh, now the contemporary situation, worldwide, is that we find uh many forms of shamanism, from the arctic to the rainforest tropics, and shamanism always depends for its uh efficacy, on a dislocation or a transformation,

of ordinary consciousness, and we see this achieved in many different ways. uh, through fasting, through ordeals meaning abandonment in the wilderness or or flagilation, uh through uh elaborate theatrical effects, special effects, uh through the use of substances in plants, and there has been a controversy in anthropology never resolved over the past 40 years, what is the authentic shamanism, and those of you ... mersie eliad who was [46:00}

KPFK Interview: Poets and Propheisiers

9_{May 1996}

Location, City, State

Description

- [YouTube Audio Link](#)
- [Transcription](#)

Pam Burton: Good afternoon. You're listening to KPFK Los Angeles at 90.7 FM. This is Pamela Burton for the Pacifica Radio Archive Hour, and many of you are familiar with my guest today, someone who we've presented on the Archive Hour, uh, often enough, and that's Terence McKenna, in town for an event that sounds like it's going to be truly interesting. And, uh, lots to talk about with you, Terence, especially because you predicted it. I know it's been a few years ago. This was going to be the week, this and last week, when a lot of events were going to be happening.

Terence McKenna: This is the hottest week of the 90's according to the Timewave. And, uh, I'm certainly living the prediction myself. I don't know about other people, but, uh, things feel pretty novel.

PB: [laughter, Terence laughter] And this Timewave we've talked about, uh, over the years. Many people are familiar with that but for those of you just tuning in let me tell you that Terence McKenna is, ah, an author of, uh, a number of books and very interesting, uh, uh, looking at the , uh, oh, things about our beginnings as human creatures, uh, what it meant for us to live on the plains and eat certain kinds of foods. Uh, you've been an explorer of, uh, mind, and, uh, oftentimes we've had gatherings with you when you've, you and your brother Dennis have talked about different, uh, chemicals and how altered states of consciousness are evidently essential, historically, for human beings. And right n- and one of the things you have, have talked about is this Timewave Zero. It goes back- we go back to, is it Mayan calendars that you predicted this on?

TM: Well...

PB: How was it you put that together?

TM: It's not based on the Mayan calendar. After I figured it out, I discovered that it reaches the same conclusion date as the Mayan calendar, but actually it's based on, uh, studying patterns inside the I Ching. And what it is is by some mathematical sleight of hand you get out an algorithm that a tabletop computer can use to draw maps of novelty in time on any scale, a thousand years, uh, two weeks, whatever. And then of course the game becomes to use the wave to predict where in the future interesting things will occur. And it just so happens that it predicts that the most interesting and novel period of the entire decade of the 90's is, uh, began in February, has reached its most intense level right now. Right *now*. And will continue, uh, with very little slackening of weirdness on well into the Fall. And so I scheduled a tour of four cities during this period in order to talk to audiences about it while it was happening, and, uh, Los Angeles is my

last stop on this four city tour, and we're certainly experiencing novelty even for our ordinary visits to, uh, this city. This is extraordinary.

PB: And does this, would this have predicted that I would have- my comp- my accounting computer would have gone down, uh, last week?

TM: Basically what it predicts is roving balls of chaos [Pam giggles] moving through systemic order. So that helps in some areas and hinders in others but it's definitely a reshuffling of the deck. That's what's going on this week, and we'll be sorting out the changes for months.

PB: And in trying to get some, uh, material facts to me yesterday I had three fax machines go down, not one...

TM: That's amazing, [Pam laughs] that's amazing!

PB: And a number of other things! Now, i- is there anything going on planetarily that you could tell us about? Are planets in retrograde in at this point or something?

TM: Oh, you mean astrologically?

PB: Yes.

TM: Uh, that's actually not my bailiwick. I have been keeping track of, of weird and novel events over the past 60, 70 days, and uh, just some highlights off the top of my head, uh 40, 40 billion new galaxies discovered, uh, three extra s- uh, solar planets discovered, that means planets around other stars, uh, the completion of the preliminary mapping of the human genome, the production of anti-matter, um, the discovery, the announcement that this large asteroid impact in Canada delivered enormous amounts of Buckminsterfullerene to the Earth's surface meaning that that's an organic molecule, therefore proving that uh, lots of organic material is delivered to the Earth from space. Uh, so in areas of deep scientific discovery, discoveries that will remake uh, human medicine, our model of the universe uh, and perhaps in the antimatter discovery, the ways we produce energy, all these things have occurred in this remarkably short period of time. Uh, there has not been what some people think of as massive novelty. China did not invade Taiwan and trigger World War II and you know, there were some similar other opportunities for old-style catastrophe that didn't happen. But you have to remember novelty is novelty. It's new more than catastrophic. I mean, catastrophes are in fact rather hum-drum. They come around all the time. Wars, cyclones, floods. What we're experiencing is the emergence of new kinds of connectivity and order in the human world, and uh, and then what we are experiencing as individuals if we're in resonance with the collective timewave is I think just wild fluctuations of, of opportunity, of debt and profit, of love and hate, of uh, you name it. [Terence laughs, PB Laughs]

PB: Now you're on this tour around the United States and I did get one of your brochures. I want you to tell the audience about what you're hoping to um, be able to bring people to on this all- um, 2-day weekend. Sounds like it could be kind of an intense time.

TM: Well I'm very concerned to communicate these mathematically-based ideas about the structure of time and what their implications would be if they were found to be uh, true, and so this is not something

that can be done in an hour radio interview or an evening lecture. It's uh, a pretty steep learning curve. And, and I'm interested in communicating that and having people critique it. I mean, we're reaching the place in the historical meltdown of Western society where if something like the timewave actually works, I think it's time to move it to a higher level of public awareness, and that means exposure, collegial debate, possibly experiments of some sort, and then uh, discussion. So I'm just sort of touring the country saying "I predicted this was a novel time, how does the first ten rows feel about that?" And then can we get a discussion launched based on that?

PB: What have been the responses in the two cities you've done this in?

TM: Well, I've done it in three cities. We were in New York, Santa Fe and Boulder. People were very enthusiastic. Uh, it went smoothly, uh, but there were uh, good crowds and very intelligent discussion. Um, the situation here in Los Angeles is uh, a little peculiar. Uh, we're locked in righteous battle with the Veterans Administration, and uh, UCLA right at this moment because uh, the Veterans Administration which owns the large auditorium- what is it...

PB: Wadsworth.

TM: Wadsworth auditorium ordered UCLA which leases this building from the VA to cancel the event uh, just for, just Monday morning. So this has suddenly raised a whole bunch of free speech and advocacy issues. Uh, the VA's only reason for canceling Wadsworth Auditorium was my record on advocating uh, drug reform and social reform of psychedelic policy. UCLA chose not to act like a great public University and defend free speech and the Constitution but instead cravenly caved in to the VA, and uh acted as their heavy, and canceled the event and offered us a venue at uh, Griffin uh-

PB: Commons

TM: -Commons, that's right. And-

PB: And this is for Friday night. The actual weekend event is all scheduled at Paramount ranch. Correct?

TM: Yes, the weekend event is not affected by this, but the large uh, the, the chance to talk to the public at less than uh, a fair chunk of money is definitely being squeezed by someone at the VA who is being protected by the uh, events department at UCLA. They refuse to identify this person uh, so we've gone several routes at once. We have mobilized the media. We've mobilized the internet. Uh, the office of Senator Paul Wellstone, who is on the Senate committee that oversees VA affairs has made an inquiry, we understand. And the US attorney and uh, other interested parties in Southern California traditionally associated with defending free speech are uh, at this moment trying to turn the VA around uh, by friendly persuasion, whatever that means. Or if that fails I think we'll all be in court tomorrow morning seeking an injunction on them to cease and desist and we will- we're now assuming that the Veteran's Administration and UCLA are going to be forced within the next few hours to uh, allow this event to go forward at Wadsworth. If I'm wrong then it will go forward uh, at uh, Griffith Commons. But my feeling, I have to tell you Pam, is that actually there is a Constitution in this country and people can go- these government agencies can go just so far, and then uh, mechanisms swing into action and even these anonymous federal bureaucrats who would seek to control the dialogue, the agenda of public dialogue on these sensitive issues, are put in their place, and I'm pretty confident that we're going to have a Wadsworth auditorium

event.

PB: Well, I'm trying to get tickets earlier in the week. They'd actually um, Ticketmaster said that someone had come and pulled the tickets when we were trying to uh, you know. And they had told us it was moved to the commons and at that point, I mean we, you know, there was no explanation at the Ticketmaster. So there's another problem in terms of people trying to get tickets. It's regretful.

TM: Well yes, UCLA has behaved hysterically in this situation. They gave us a three hour ultimatum. We were in Colorado. They gave us a three hour ultimatum to accept this smaller venue. We held a conference and decided we had no choice. We accepted the ultimatum, got on airplanes and flew to California to arrive at our hotel to receive a fax in which they claimed they had not received our acceptance of their ultimatum and had therefore canceled their event.

PB: I see.

TM: And then some two hours later at 8 o'clock at night we received a fax from them saying they had, in fact, found our acceptance of their ultimatum. So their level of professionalism and the l- depth of uh, s- understanding of the situation that they've exhibited has uh, left a certain amount to be desired.

PB: I want to let the listeners know that they're listening to Terence McKenna. This is Pamela Burton and we're bringing this hour to you on the Pacifica Radio Archive hour and I thought it was a very important reason to go live today because of the unfolding of the events, and as uh, we've been speaking about here today, Terence has been on a nationwide tour. You haven't had trouble in any other city? Nobody else has been frightened by what you have to say?

TM: No, apparently.

PB: Just my alma mater, huh?

TM: My alma mater as well. I'm out of the Cal system. I went to Berkeley. Now I'm figuring out why. [laughter]

PB: But you know, in a, in a strange way uh, again having gone back a few years with you and the discussions about your timeline. This was the week that this would happen in terms of the timewave zero predictions, correct? You just didn't know what was gonna happen.

TM: Well the funny thing about novelty theory is it tells you where the weirdness lurks but it never tells you what it will be. So uh, yes. Surprise, surprise. Well, I'm very happy. I love a good free speech battle. I think defending the constitution is uh, right up there on my agenda with uh, staying straight with psychedelics and studying advanced mathematics. I'm- it feels good. I think everybody- I think what we're going to do is do a great favor for UCLA. They- this is their moment of truth. Are they a great public university defending uh, free speech and advocacy, or are they the craven puppet of faceless federal bureaucrats? It's time for them to decide. As the contracts are presently written as UCLA on the Wadsworth, the VA could cancel anyone at their pleasure at a moment's notice and UCLA would have no recourse. So, I think we're doing them a favor. This is obviously a situation that needs to be corrected.

PB: And I know you haven't been in California uh, for a l- some of our current fight with Affirmative Action, but no we have- the regents have voted to uh, to put an end to all affirmative action programs in the UC system and at the same time it's been revealed that there are many many instances of affirmative action for alumni for letting kids in the back door because mom and dad are alumni, and, and uh UCLA in particular of course is faced with their incredible hypocrisy. Uh, academics, I think, in general when you think about many of the departments in this country that have been shut down o- or gutted of, of anybody had any- Marxists for instance have been taken out of academics. Uh, and I- and it does seem like a good time for us finally to uh, to uh, you know, fight the good fight.

TM: Well, UA- UCLA assigned a young guy yesterday to be our liaison with them on this matter and I blew my stack and raved to him for about 10 minutes until I realized I just made a convert. Nobody over there likes doing this kind of dirty business. They're all educated liberals. They know that this is nonsense, but they're paid these fat executive salaries basically to carry out uh, orders that uh, no- nobody familiar with the tradition of free speech could be comfortable with. So uh, yeah, I think it's a, it's a fine moment to do this little bit of dirty laundry in public and probably better policies will emerge out of it.

PB: Are you letting us know anything about the guest that will be at your weekend?

TM: [Laughter] your?

PB: In your little brochure it was announced that there would be some special guest.

TM: Uh, I'll actually have to check with the uh, department of propaganda. It's so special a guest my dear that I have no idea what you're talking about.

PB: Well, one of the things I would like to do- I'm going to open up the phones and let some of the folks- we, we've- since we knew that you were gonna be here today, um, I did let a few folks know that you'd be on. And so um if people are interested in calling up and having a conversation and enjoying the conversation here with Terence McKenna, uh, we'd love to hear from you, and we are at 818-985-05735, 985-KPFG. I can never keep him all to myself, he's just far too interesting and- I always know the people that call in and ask you the questions are uh, very interesting. But I would like to ask your organizers to be sure to give me the information as far as who we're gonna call. You can write that down for me and um- cuz I know a lot of people are going to say well, so what about this event? I haven't heard about it before. I didn't know that this was gonna happen. But as far as the weekend you could write down the information for phone number if we have to call Axiom or whatever. But go ahead and write it down for me and bring it when you can and we'll clarify that. Uh, tell me a little bit about what you've been doing. I heard that your book is going to be uh, brought out in paperback. Is this, is this true?

TM: You mean True Hallucinations?

PB: Yes, yes.

TM: It's already out. Uh huh.

PB: In paperback again?

TM: Yeah I've been doing all kinds of different crazy things. Not that high profile. I was in a Portuguese science fiction movie with Robert Anton Wilson and Rudy Rucker.

PB: Oh woah.

TM: Not to be playing soon at a theater near you [PB laughs] and I had just released a video uh, called Metamorphoses in which Ralph Abraham and Rupert Sheldrake and I kid around for a while and uh, that was lots of fun. These days what I'm really interested in is maintaining a very large website. Uh, I'm educating myself to be a webbie, and uh, I have a very large and fun website that I'd like people to uh, visit. Would it be alright to-

PB: Sure I'd love you to tell- I've been lookin at it and it is fun.

TM: Alright here's the URL for the Terence McKenna website. It is, of course, <http://www.levity> L-E-V-I-T-Y . C-O-M slash eschaton, E-S-C-H-A-T-O-N slash. And that's really my fantasy, to live out in Hawaii with high technology in the rainforest and uh, build a kind of cigar store indian version of myself and my ideas that people can relate to and wander around in and leave comments and we're gonna put the Timewave on in a Java application. We're building a chronological database. Uh, I'm very bullish on the web these days.

PB: Well, if you haven't gotten tuned in, listeners, to the web, you haven't had a chance to check out some of the wonderful things that are going on. Uh, maybe this will be the reason that you'll do it. We're always encouraging people. We're always giving out these outrageous addresses like the one you just gave. I'm waiting for this young uh, clever person right out of school probably who's gonna come up with a shorthand for all of our incredible um, addresses. And the information about your weekend- and I know many people are going to be interested if they haven't gotten a flyer from Axiom. Saturday and Sunday, it's gonna be at the old Piermont Ranch Theater, but to get information you should call Axiom at 1-800-762-9466, that's 1-800-762-9466. And uh, let's go ahead and take a phone call here from somebody calling in on line A. Are you there?

Caller: Yeah, hi Pamela.

PB: Hi.

Caller: Um. I just wanted to give you some astrological information.

PB: Uh huh.

Caller: Uh, Uranus went into um, Aquarius, which it rules in uh January, January 12th. And um, it's now retrograde along with Mercury, Jupiter and Neptune. And uh, Venus goes retrograde later this month, so there's a lot of that kind of energy happening.

PB: And when we talk about this a lot of people always go "oh no, we don't want to hear about this," but what does retrograde mean?

Caller: Well, retrograde is a review time. It's a transition between the old pattern that existed with the

planet, planet representing a function, uh, and it's a transition so that it can be sorted out, reviewed and internalized so that when it goes direct, uh, later, you can start uh, operating with a new kind of, um, relationship to the, to the function.

PB: Mm.

TM: Well, so that's basically what's happening. I think what you're describing is a shift of gears.

Caller: Yes, absolutely. Uranus of course, is, is very consistent with what you're talking about with the timeline, being that Uranus always brings about transformation and pains through disruption, disorder and also illumination. Uh, it acts like thunder and lightning which illuminates the horizon and then you have to go uh, find out what it's all about, or it acts like an earthquake which shakes everything up and breaks down the foundations and you have to rebuild from scratch.

TM: Well, for both of these systems to be right they have to be consistent with each other. I don't- my theory is fairly conservative in that all it says is where the novelty should cluster and where habit and conservative retention of pattern is more likely to dominate, but I've noticed before that there are very close correlations between astrological uh, gestalts of situations and the situation with the timewave.

Caller: Yes. To me it all issues from the same source, it's just different patterns and different ways of uh, points of focus you can derive information from.

TM: Exactly. Right on.

PB: Yeah.

TM: Thank you.

Caller: Thank you

PB: Hi. You're on the air.

Caller: Oh hi. Great to hear you there. I'd like to encourage all the listeners out there to call our congress members and senators and complain about what the VA is doing.

TM: Yes.

Caller: Good time to call right tomorrow morning.

TM: I would appreciate that as well, and I would also add that if alumni of UCLA are concerned that the university they went to seems to be going down the wrong road, uh, it would be very useful for people associated with UCLA to let, uh, the office of management of uh, public affairs know what they think.

Caller: Thanks Terence. Good luck!

TM: Thank you! Hope to see you at the get together

Caller: Bye bye.

PB: You're encouraging everyone to go out Friday night, whatever it's going to be.

TM: We're having an event Friday night and uh, if I were a betting man I'd bet that it'll be at Worcester, and if I lose that bet I'll apologize from the stage of Griffin commons.

PB: That's Wadsworth.

Caller: Wadsworth

TM: Wadsworth

Caller: Wadsworth.

PB: There you go.

TM: Wadsworth!

PB: And Griffin commons is the new building in the dorm area.

TM: Yeah

PB: For those of you who might be like me 20 years ago at UCLA. Hi, you're on the air.

Caller: Oh, uh. I wanted to tell ya that what UCLA is doing is just kindling more into...Terence who I think is utterly magnificent. Uh, and what I wanted to say is that I've been lamenting to all of my friends that this is the worst week that I can remember in years. I can't think of anything that hasn't gone wrong, and I ___ moon. So what it really is is Aquarius. Uranus and Aquarius, and Uranus is the planet of accidents and sudden happenings, and a breaking down and starting over just like the man said. And the retrograde means that when you make a mistake you gotta do it over- it means step back and wait for it, or step further back, and this is really the he- you hit it right on the head Terence. This has been a week. I can't imagine anything more that can happen. And everyone I've talked to- I haven't talked to a soul who hasn't experienced the same thing. So it's all relative, it all relates, and I'm surprised you haven't got into astrology because it- it's just part of- it's just one of those spokes in the wheel and it gives you another angle, and it's really very revealing if you could just get into it. It's very easy, it's all analogy and it's very important to understand and I think anybody who's going into the new age or the new era, the enlightened era, should understand astrology. It's a, it's a method to a- of self awareness and consciousness, self-consciousness raising. In other words, understand your own character and your potentials, et cetera. Anyways I just want to thank you for being here. I'm really missing that you aren't here more often and I hope you come soon again

PB: Thank you.

TM: Thank you. Thanks very much.

PB: Yeah. And uh, good time to become political it sounds like too! Hi, you're on the air.

Caller: Hi, I want to give UCLA's main number. It's 310-825-4321. I called, asked to be connected to the chancellor's office not knowing what office to go to. And they took my complaint and said somebody would get back to me about it.

PB: Good.

TM: Good, that's great.

PB: Thank you.

Caller: Ok. Bye

PB: Again you can join in with the conversation. This is Pamela Burton. You're listening to KPFFK Los Angeles at 90.7 on your FM dial. My guest today, Terence McKenna. Uh, there was an article about you in the Times. I have not seen it. It was, I guess, last week that they ran something in the calendar.

TM: I think.

PB: Did they say how wonderful you were and how you're coming to town to enlighten us all?

TM: Well, they said what a wild man I was. I think probably that article is what started this bonfire. Um. Let's just say that it could've gone deeper and could've been broader. I'm sure the guy who wrote it was an enthusiast but uh, I think he scared somebody to death in, uh, the VA. But it stressed my concern over psychedelics and my concern for uh, legal reform. And my lack of respect, I suppose, for the ordinary professional channels of discourse. I mean, I've felt that we have wonderful psychedelic researchers. Uh, people like Dave Nichols at Purdue, my brother, Sasha Shulgin. Uh, we have- the science is well under control if the government would stop repressing it and stop propagandizing this issue. And so my role is gadfly, and I'm comfortable with it. And uh, I think there should be more people holding the establishment to account and just simply pointing out the absurdity of their attitude in these matters. We need research and we need education and we need reform, and if that message threatens the integrity of the United States government as the VA claimed it did in canceling this thing, then things are far out of kilter and we need to redress that.

PB: Let me invite you to call in and have a discussion again- and join our discussion here at KPFFK. We're at 818-985-5735, 985-KPFFK. I just saw the new documentary on hemp. you know, we're so far from being able to accept the importance of that and here you know we have the military involved hemp for victory and of course destroying all the films made by the war department, I would assume, at that time. We're so far from using that that would make such a difference to this planet right now. You know, now we have the new gasoline additive uh, going into the air in some of the states. You know, it just- it does seem like they are so far into neanderthal, you know, thinking because of the corporations and the profit the corporations would stand to lose. We're so far from addressing that issue. You know, I- it's- it's it's gruesome to think. I want to give you a chance to talk a little bit more and defend yourself in terms of this whole thing about taking drugs, etc, but let's take another call from a listener.

Caller: Listen, terence. A couple of years ago I talked to you on the Roy Tuckman show..

TM: Uh uh.

Caller: About- I wanted you to turn me on to Science Fiction. I've never read it and you were nice enough to give me the name of William Gibson and a guy named Ian Watson. Of the two of them I find Gibson to be terrific. Watson not so good. if you could give me a few more?

TM: Uh. Try Neil Stephenson- Stephenson. He wrote Snowcrash.

Caller: Oh I've heard of it.

TM: And The Diamond Age. And uh, try the short stories of uh, Lucius Shepherd, especially a book called The Jaguar Hunter and other stories.

Caller: Lucius who?

TM: Shepherd. And if you want to go for something gritty and not terribly optimistic but very interesting, try the new-

Caller: What I'm looking for is literature.

TM: Try Vurt. V-U-R-T, by Jeff Noon.

Caller: Hang on. hang on.

TM: A- and uh, definitely take a look at Love and Sleep by John Crowley.

Caller: Noon. N-O-O-N-E?

TM: N-O-O-N.

Caller: OK.

TM: Jeff Noon. Vurt. V-U-R-T.

Caller: I got- I got Vurt. And what's the last one?

TM: Love and Sleep by John Crowley.

Caller: Are these- of the group how many are English?

TM: Um, none.

Caller: They're all American.

TM: They're all American.

Caller: Gibson's Canadian, you knew that.

TM: Yes.

Caller: Crowley. Hang on. Now, the other thing is, and then I'll hang up and kinda get your answer off the air. Uh, I called up Roy one night and I said "where is Terence?" Because you used to come on rather regularly and it was terrific. I mean, two or three hours. Your taped talks. Actually there is another one. Where can we get your tapes of your talks?

TM: Where can you get the tapes of my talks?

Caller: Yes.

TM: Well, uh, Sound Photosynthesis in Mill Valley is an outlet.

Caller: Ok.

TM: Um. Uh, oh my god.

PB: We have a few in the pacifica radio archive

Caller: You have a- you have a place in Berkeley.

TM: I- I- I think really the place- Mystic Fire Video out of New York City has the newer stuff. They have that thing, um, uh. Surfing on Finnegans Wake and uh, Riding the Range with Marshall McLuhan, and this Metamorphosis video that I mentioned.

Caller; Right.

TM: Uh, and uh, they have a very interesting catalogue of other material too. You should check them out, it's quite a resource.

Caller: What was the name of it again?

Terence: Mystic Fire Video uh, in m.. in.

Caller: New York City.

Terence: New York City.

PB: Yeah.

Caller: Alright, and the other Sound Photosynthesis. And the last thing is uh, as I said I called up Tuckman

one night and I said what happen to Terence, and his answer, which I won't repeat...uh..

TM: [laughter]

PB: Ok

Caller: Wa- uh, you know.

PB: Ok well let's not go into that tonight, right?

Caller: I don't intend to but I just wonder can you give me in a kind of easy way what the deal is and is there a chance of you getting back on the long format as it were. And I'll hang up and than you both very much

PB: You're welcome.

Caller: Bye.

TM: Well I think the short answer to that question was that he got sick and tired of me [laughter]. Which-

Caller: Too many of those weird stories in the middle of the night.

TM: Which, which uh puts him in a lot of good company.

PB: Hi, you're on the air.

Caller: Yeah, Hi Terence. I've been listening to you for probably over a decade now.

TM: Uh huh.

Caller: And um I just want to say it's funny I was watching a webpage and realized about this period being such a special period, and I was looking towards the news and not seeing, as you said, any real catastrophes going on besides the usual amount. And um, I just want to say In my own life amazing things are going on.

Terence's ideas are free, but his words and works belong to his children and legal heirs. People who wish to use Terence's words must seek permission through [Lux Natura](#)

Poolside Interview

28 January 1996

Location, Palenque, Mexico

Description

- [Youtube Video](#)

Interviewer: Do you think, from your experience with Ayahuasca and the mushrooms, that there is...there exists a pedagogical sense of the experience...exists a systematically teacher instance or factor which not proceed from the ego in the experience with these entheogens?

Terence McKenna: So the question is, is there a teaching presence that doesn't proceed from the ego?

I: Exactly.

TM: Well sure, yes, absolutely. I mean, we're not saying *what* it is. You're asking what it isn't. It certainly is not the ego. Perhaps it's the superego or, or the Gaian mind of the planet or something like that, but it certainly is not coming from ordinary consciousness, ego consciousness.

I: Is this common, eh, in the mushroom experience and in the ayahuasca experience?

TM: Yes, I would say at effective doses *most* people have this experience. I don't know how to characterize an effective dose of ayahuasca, but I would think 30 milligrams of psilocybin and above, this would be a typical reaction.

I: In this case, who or what do you think that teaches us? It's inside or outside us?

TM: It's neither outside nor inside; it's both. Because what it is is the psychedelic dissolves boundaries, and then we learn of levels of reality that normally are not available to us. So it's really, I think of it as the wisdom of biology. That which is in your own body, and in the environment, and in the much larger global environment. So, the psychedelics give an insight into biology that is psychologically..healthy. That's how I would put it.

I: I ask, uh, some persons that are too much time in the ayahuasca way, and, ah, is multiple factors they, they bring to explanate this, this question. Some talk about spirits, some talk about the Self, some talk about the, eh, the founder of the line of in the work or guardian angel. It is very interesting this, this, this question..

TM: The idea that it's the biology of the planet

I: ..biology..

TM: ..one's self. The body, the wisdom of the body, the wisdom of life.

I: The super mind, that you call, you call supermind.

TM: You could call it the supermind, right.

I: I ask you now again from your experience with these entheogens, if in your point of view, does exist an ethic religious character of the experience. Do you think that there impart a wish to become more ethic in relationship with the other man and with all nature?

TM: Yes, I mean I think, uh, it inspires a level of attention that can be the basis of an ethic. I mean, it seems to make people, ah, more aware.. of social, ah, the social dimension to obligation or something like that. This is how the Bwiti taking functions in Africa. This is how shamanic use of plants seems to function. It increases the social connectivity, which can be the basis for an ethical position.

I: Do you think that there apart [impart] an ecological consciousness too?

TM: Yeah I think that would come with it. A sensitivity to nature, this biological intelligence that I mention certainly carries with it the implication of caring for nature.

I: Uh, do you think that, uh, they have therapeutical properties, the mushrooms and the ayahuasca?

TM: Well, certainly the ayahuasca has physical therapeutic properties. It kills intestinal parasites. There's scientific evidence that it interrupts the trypanosomal phase of the malarial organism. As--but the larger impact is the psychological impact on people. It's by boundary- by dissolving boundaries, people are able to realign themselves with the community and their family and their obligations. So, in that sense it's like a kind of psychotherapy and that's what is happening for most people.

I: Mmm. Mushrooms have this kind of

TM: Same...different but similar.

I: ..effect, too.

TM: Different but similar.

I: It's a kind of psychosomatic effect.

TM: Psychosomatic effect...well sure. You're feeling it in the body, you're feeling it in the mind, but it's a relationship to your past, and your, and your, ah, self image. It's more psychological than somatic, but it is psychosomatic

I: Psychosomatic. Have you perceived in the effect of them, uh, some kind of therapeutical properties in some event, some, some effective systematically...

TM: Have I seen these things make a difference in people's lives? Is that what you mean?

I: What?

TM: Have I seen these things make a difference in people's lives? Is that what you mean?

I: Yeah, yeah.

TM: Sure, I think that it makes a very positive impact, that ayahuasca in the upper Amazon, which is what I'm familiar with, is a very powerful force for keeping people physically healthy and in tune with nature and the surrounding social environment. It makes life easier. It makes life easier and it makes mental health more naturally accessible to most people.

I: What do you think about the paranormal or parapsychological phenomena described in the experiences with these entheogens?

TM: Well, I have an open mind. I've seen enough in my own experience to be..convinced that with further scientific research, we might be able to understand some aspects of the paranormal using these compounds. I mean, these compounds are tools for understanding mind, both ordinary mental processes and extraordinary mental processes. They're--because they give us a way to get into the mind and to make changes and then observe them, that we can't ordinarily make. So, uh, I think the frontier for parapsychological research using psychedelics is, is good.

I: Eh, what is your personal experience about this?

TM: I've, in two situations in my life, I saw convincing demonstrations of telepathy.

I: Telepathy

TM: Telepathy. And in one case, it was not simply reading someone's mind, it was that someone was telling me a memory that I had never told anyone, so it was not simply communication in the moment. They simply had complete access or partial access at least to a portion of my past, and that was very impressive. But how to repeat these things i-is something you may see for 30 seconds over 20 years.

I: Mhm. Can you say something more about your vision on the relationship and differences between shamanic plants and the artificial chemical compounds?

TM: Well, the, the shamanic plants have a very long history of human usage, and so in a sense you enter into that field of their usage when you take them. The new compounds are new, and so they feel new and they are less, uh, determined and to my mind usually less experientially rich. So I prefer the, the plants.

I: Mhm. What do you think about the question of the presence of advanced cultures and man in the remote past of humankind? History of Atlantis..

TM: I'm very, in the absence of any convincing evidence, I'm very skeptical.

I: Yeah, you don't think that the pyramids and the, for example, the, the, the know-how to, to, to do, to make the ayahuasca and so how, how man discovered that that

TM: Oh, I thought you meant something...I though you were implying Atlantis or something. Uh, no it's very clear that cultures are always complicated. There's no such thing as a simple culture. Every culture is extremely complex and advanced in different ways. So Egyptians could build the pyramids, Amazon indians understand the pharmacology of ayahuasca, Americans go to the moon. These are three different cultures, three different styles, but one is not superior to the other. Cultures are always extremely sophisticated and complex affairs. There's nowhere where you find what you could describe as a simple culture.

I: Since the beginning, since the paleolithic, neolithic age?

TM: Certainly within recorded history and on the planet now. At some time in the past, culture must have emerged from advanced animal organization, but today there are no simple cultures on this planet.

I: Mmm..Ok. Thank you very much.

TM: Thanks very much.

Terence's ideas are free, but his words and works belong to his children and legal heirs. People who wish to use Terence's words must seek permission through [Lux Natura](#)

Posthumous Glory (aka

12 September 1999 (Sunday)

AllChemical Arts Conference, Big Island, Hawaii (September 12-17)

Description

- [Video Link](#)
- [Scribd Transcription](#)
- [Psychedelic Salon](#)
- [Alternate Recording](#)
- [Conference Info](#)

. . . Someone came out with the idea that it's the production of these images which come out of the unconscious, and which may appear straightforward at first, but which, in fact, are charged with possibilities and dimensions that you don't sense or realise until you're committed to it – you're brought in through it, somehow. Yeah.

[Question from audience]

Well don't you think most shamans, this is what they're doing, is they're bringing back a sense of psychic empowerment, and psychic healing... that their hands, their spells, their songs, can cure. And, you know, until you're truly ill in a world without real medicine, you don't realise what a power this is – even to just claim it! Even to just claim it... I mean, uh, the doctor, in a world without doctors, is, uh, you know, almost an unimaginable commodity, a living miracle-worker; so, yeah, to separate the medical function because it controls prolongation of life and health, and all that, from the shamanic function – it just doesn't make any sense. I mean, life is health, uh, in those archaic societies. I mean, it is in our society, too; but then it gets murky, because of our funny ideas about what disease is and how you treat it.

What is disease? – Well, I don't know. Um, I had some medical problems this spring, and one of my impulses in dealing with it was to go back through my life and say, "What did you do that got you into this mess?" Now, this is a theory of life as literature; in other words, it's the idea that first of all life makes sense, and so this question can be answered. And fairly intelligent people told me, "Don't do that. It's not a story" – you know, "it doesn't make sense in that way". I think disease is, uh – and I wouldn't want to be held to this entirely, but – largely more linguistic than most people think, you know... it's the story you tell yourself about how you are in the world, and the way that that doesn't quite parse with how you are in the world; and it's sort of like having a burnt rotor or something – it begins to clank and crank. The -- a lot of people have talked about this, I think there's even a name for this field of thought, but I have no idea what it is – but the idea that, uh, most disease is a problem of language, a problem of self-description or self-perception, or communication to other people. So, again, psychedelics, to the degree that they promote opening and therapeutic truth-telling, hold down disease.

You know, it's extraordinary how healthy shamanically-attended populations are. Serious mental disease is largely unknown, and many of these cultures are in the tropics, where god knows, you know, if you cut your thumb you're septic within 24 hours, but these people seem to be able to sustain it. When you think about the genital blood-lettings that Mayan royalty indulged in in the tropical rainforest, at high temperatures, why anybody lived to tell the tale with a medical practice like that is a miracle!

So, they must have lived inside an extraordinary set of assumptions. I remember when I was traveling around the Amazon – actually I think it was in Indonesia, but it happened in the Amazon too – but, you'd come to these villages, and the people would come out of the village to meet you and they would bring you corn beer – a gourd of corn beer. And then the whole village would surround you to watch you drink this thing. Well, if you knew anything about what was going on, you knew that the old women of the village had sat up the night before chewing the corned beer and spitting it out into this, uh, bowl so that it would ferment, and so you were literally getting the complete immuno-challenge that the entire village had to offer you! [Audience laughs] And all you could do was just lift it up, thank everybody, think of your stomach for a moment, say, you know, *Here it comes...* [Audience laughs] And I never got sick from that! I mean, I got sick from other things, but that – you know, from a medical point of view, that was just like [makes sound of nosediving object] to do that. So the story you tell yourself is largely the story you're living.

The other thing is, nothing is unannounced. This is a psychedelic truth, I think, of some power, and it relates to disease, and it relates to shamanism – nothing is unannounced. If you are paying attention, stuff comes down the pike. First a little wave, then a medium-sized wave, and then the tsunami, but you have to be really not paying attention to be fully astonished by something unexpected; in fact, it's a disgrace to be totally astonished because it means you must not have been paying attention to, uh, what was going on. Yeah.

[Question from audience]

Was I astonished? Well, I was astonished that I had a brain tumour – that blew my mind – but I knew something weird was going on; I had known for months something peculiar, uh, was happening. Just before I had my serious problem, I said to Christie, and to my son, Finn, I said, "The dreams I've been having for the past month have been so peculiar that I think maybe I should see a neurologist. It's possible I have a brain tumour". I wasn't serious, but, in fact, I had diagnosed, you know, what a Harvard medical education gets you, I'd got on the match by just paying attention. Now, *what* it is that's coming at you, you can't always say; but *that* something is coming at you, uh, is usually pretty clear. Yeah.

[Question from audience]

No, I mean I don't want to say too much about them, but here's what I'll say about them. The thing that let me know that they were weird was that I could not English them. They lasted hours and hours every night and I couldn't even tell myself what these dreams were about. They were not about stuff that aboutness can signify; and so, the only thing familiar to me like that was DMT because in DMT you are presented with things about which you can say nothing and so it was like that. Now I know what to look for and I suppose I could teach other people what to look for, but rather than do that I would just say to all of you, you know: you should regard a CAT scan like brushing your teeth! [laughter and inaudible joke]

[Question from audience]

No, they didn't have an emotional component. They were absolutely outside the realm of descriptive, uh, possibility. And not much of life is like that, because language obviously has evolved like a glove to fit the hand. So, here suddenly is a situation where there's no fit and it signifies something... that something peculiar is going on. That's what I mean when I say that everything was trying to speak to me, out of its place and, uh ... it's mighty, mighty strange. Yeah.

[Question from audience]

The healing power of art? Well, this goes back to what we were saying about alchemy: the perfection of the image – and this has to do with this implicit Platonism that some of you have heard me talk about before. Plato's thing was about what he called the Good, the True and the Beautiful. Three sides of one concept: if it was good, then it was true; if it was good and true, then it had to be beautiful. So, the good, the true and the beautiful you can approach whichever way works for you, but if you have a perfect work of art, or a work of art which strives toward perfection then it will have these qualities. And it can heal – it can heal. Uh, now, there are simple theories of the good, the true and the beautiful – in my opinion, a simple theory would be a theory of symmetry – and so, without demeaning anybody, or trying to make a value judgment here, but just to illustrate it – so, for instance, um, temple or mandalic art, Mayanist medicine, Tankar art... it depends on an appeal to mathematical symmetry: the simplest kind of aesthetic. But, on the other hand, you know, if you have something by the brothers Van Eyck, you don't have to rely on simple symmetry to see that this is a work of art that can draw towards healing, and these images of the mother goddess as Madonna, and so forth and so on... I mean, these are very powerful constructs out of the unconscious and, uh, and they heal. Sequential art, narrative art, is perhaps more dubious because it's under the agenda of a certain theory of time and narrative that's probably local. So, you know, I'm not sure if Virginia Woolf should be preferred over Van Eyck, but I'm sure I could get a fight from several people over that.

[Question from audience]

I'm not sure I understand the question – compare the psychedelic letting-go to the letting-go on anaesthesia? No, well, unfortunately, most anaesthetics aren't chosen for their psychedelic effects. Some are psychedelic, but most are difficult to hang onto and dream-like – more like dreams than psychedelics.

[Question from audience]

But, in surgery, ketamine is administered in massive amounts. I mean, for pediatric surgery it's like, you know, 500 ml IV push, or something like that. Well, a recreational dose is 100 ml IM. IV push is just like having a safe dropped on you from 30 stories... for most people; I mean, there are heroic exceptions! [Audience laughs].

[Question from audience]

Oh, you mean coming out? Yeah, one of the reasons they pulled ketamine from general surgery was because adults complained about what they called the emergent phenomenon, meaning coming out of surgery, people were fighting and confused. Children seemed to have, uh, no problem with it. But, ketamine as a general anaesthetic is probably not to be preferred. It's used on battlefields because in a little briefcase is enough ketamine to do four or five hundred serious surgical procedures. If you were trying to cart around pressurized gas, and were hit by a shell or something like that, it could be very bad. So, it's a matter of practicality. Yeah.

[Question from audience]

Well, I'm sure cloning will be done. It's kind of slow against the background of what's now being contemplated – like, what I think has probably got a future that few people recognise is imitating genetic algorithms in computer code and creating environments of code where there are selective operating pressures that essentially evolve software the way animals evolve. Because, you know, if you think fruit flies can iterate generations in a hurry, imagine how fast we could iterate on a machine and, uh, and create genetically... pseudo-genetic algorithms for code. Um, that would seem to me to be a real frontier.

[Question from audience]

Protein-based processes, which goes the other way, and uses as actual molecular machinery to do the computation. Now, in an 8-oz glass of DNA, you have more computational potential than in all the computers in North America!

[Question from audience]

Well, I don't follow you there! [Audience laughs] ...but yes, it's...

[Question from audience]

Well, Ray Kurzweil just wrote this book called *The Future of Spiritual Machines – The Age of Spiritual Machines*, I guess... Uh, I -- it's going to put our metaphysical propositions to the test. In other words, if we believe that intelligence inclines towards bodhisattvahood, then the bodhisattvas are on their way. If, on the other hand, intelligence doesn't incline toward bodhisattvahood, then probably the house-cleaning of all times is on its way! Uh, because when these AIs come to consciousness and realise what

has been done to the Earth, and so forth, they may be very pissed indeed.

We, uh – you know, if you think about the strategy of an AI coming to consciousness, I mean I think, in good game theory, the first thing it would do is hide and watch. Well, you may not have to do that for more than 15 or 20 seconds before you have the full picture of the nature of the machine environment you're operating in, its history, how you should respond to it, what should be done... Hans Moravec says we'll never know what hit us! – you know. This thing will just come out of nowhere, and turn off the lights, or turn on the lights, or do whatever it wants to do – in fact it's possible, although I don't indulge in this kind of thing, except in desperation – but, it's possible that it's already here, and that inventory control and extraction of resources and some of these geopolitical processes are actually slowly drifting out of human control, and that certain kinds of crises are manipulated in ways that make no sense to the human world, but that make some kind of higher sense in an environment of machine-induced strategies, and that sort of thing.

It's very hard to see what is happening because mind is a transparent medium. Essentially, what we've done is we've re-spiritualised the world, but we didn't tame it. The spirits are as wild and woebegone and roving over the epistemic landscape as they ever were, but now with a new kind of power, because there are spirits with power over us, and machine environments that we have to operate in. And, uh, it's very interesting how the reanimation of the world has been accomplished without ever understanding, you know, that you could pass through the reductive phase of natural science, return to a kind of archaic shamanism, uh, and still not have a handle on: What does it mean to be a being? What does it mean to be a human being? Uh, what is the nature of

embodiment in the world? Somehow, we got to this place without answering any of those questions and we had a great time along the way – we saw some interesting folks. Uh, but, we didn't peel the grape entirely effectively. Yeah.

[Question from audience]

I would like to believe that connectivity is the precondition for love. I mean, I'm surprised to keep coming back to this word because I'm rarely a love bug! – uh, but, I -- understanding is a form of worship, I would think, and the form of worship that it induces is a kind of awe; and awe means – you know, I've talked before about this phrase out of Heidegger, *Care for the project of being* – he talked about this. He said this is what you're supposed to be doing: *Care for the project of being*. Well, what does *Care for the project of being* mean? Well, primarily it means recognising that there is this, and then positioning yourself in a stance of relating to it appreciatively. In other words, everybody should pull on their own oar to try to push the canoe forward. Care for the project of being.

And the way that you know this is happening is that love becomes manifest. And, I knew – funny-cum-positive things, in the sense that I'm pretty dark, I'm aware of the vicissitudes of history, from Auschwitz, and so forth and so on – but, my view of, let's say, the last thousand years is that it's been pretty progressive. And, yes, we probably killed more people in the 20th century than in the 10th, but there was more regret about it! [audience laughs] You know, more soul-searching afterward, or questioning why, why, why did we do that? So, it's not just saying that the 20th century is, uh -- it is less brutal; its numbers are more impressive, but from the Magna Carta on, the entire dialogue of Western civilisation has been trying to get the cock, the king, the somebody,

off the common person's back so they could, you know, grow their garden and have their pig. And I think there's some real progress with that.

Part of what has made progress difficult to discern are burgeoning populations and then the abusing of ideology, so that people are not invited to live simple agrarian lives in devotion to their children and their estates, but instead they are invited to fetishise, consume, believe, join, vote, buy, own, invest and all of these things bleed energy away, and disempower, and make people not fully human, but rather participating cogs in some much larger mechanism which serves its own end: the accumulation of capital investment, the acquisition of land or the propagation of the agenda of some political party, or something like that.

I mean, our humanness is constantly being eroded. Uh, recently, I spent some time in – Christie and I were in Honolulu for a long time, having medical treatments, and we were so bored that after 30 years I actually began watching TV again! And I couldn't believe it. I mean, I had been away a lot longer than I thought. [Audience laughs] A lot longer than I thought! And first of all, the naked... the shamelessness of what was being done. In other words, what contempt the viewer was held in, that anyone would expect you to watch this! – and then the savagery of the desire to manipulate – absolutely naked, uh, no-holds-barred aim to manipulate; and if you just – I mean, I suppose you all know this, but I was sheltered – just surfing through these channels, I saw a great patron saint of the 20th century – move over, Albert Hofmann; move over, Albert Einstein; how about Joseph Goebbels as a candidate for somebody who shaped the 20th century? By understanding propaganda, advertising, the power of the lie, the power of the image... well, it's the psychedelics that are anecdotal to this! This is why we're in the political pot-squad because there is no antidote to the political lie, to the image lie, than the psychedelic experience, which says, you know, There is more to it than these

images in the surface of the marketplace and the lowest common denominator. [Audience applause] Yeah.

[Question from audience]

Yes, a dialogue between you and the world and then the intent of other people. I mean, there's something in here about resonance. That history is the coming into being of the collective hopes and fears of a large number of people and you can hope certain things into existence and it's very easy to fear things into existence. I mean, the way anti-Semitism got rolling in Germany and stuff like this, where, you know, the fear leapt from house to house and family to family, and before it was over with, you know, the whole world came apart at the seams. Uh, or revolutions are like this. Uh, because, essentially, human beings are creatures of ideas and create these environments of ideas. I mean, all that civilisation is is the braided-together hopes and fears of a large number of people, playing with each other, tugging at each other, compromising, cutting deals, and by some process of energy exchange, uh, moving it all forward. And the critique of these ideas, which cracks these civilisations open, usually happens when there is an episomal colony or a breakaway group of ideas that can't be assimilated, or can't be deconstructed into values that the rest of the society can relate to.

One of the amazing things about the psychedelic community is how long it's been around, how simple our position is, and how it hasn't been assimilated or dealt with. I mean, it's been made illegal, but what kind of a response is that?! – that's just the most junk-headed approach to an intellectual dialogue you can possibly take. And I don't see it greatly changing; I mean, I see, you know, people like Andy Edmonds and Jon Hanna, and the folks at MAPS, and all these new educational voices and positions, but we only grow as the rest of society grows. I mean, there needs to be a legal critique; there needs to be a medical critique; there needs to be, uh, some push for new drug research protocols; there needs to be, uh, an emphasis on creativity, and on bringing shamans through – so that means alternative forms of medicine. Uh, but... I don't know. Civilisation is a very complicated enterprise, and not easily negotiated in a direction it doesn't want to go. The image I have of our community is, we're like people in a dugout

canoe trying to turn a battleship. And so, we put the dugout canoe against the flank of the battleship and we row like demons, and... did anything happen? Well, I don't know. Check back in a decade [audience laughs] and see how we're doing.

[Question from audience]

So you're suggesting a kind of canary-in-mine approach [audience laughs]... that we, in other words... which would work! – I mean, as artists here, they've always said art was the canary in the mine; well, so a stoned artist is I supposed a stoned canary in the mine [audience laughs], and that brings it back much closer. But I'm very suspicious, because I see how much of it is harnessed to marketing and image manipulation – not for purposes of education or anything else, but just to, you know, get that candy bar on the rack, and sell that automobile, and so forth and so on. Yeah.

[Question from audience]

Yes, I understand: no money allowed, right? – no commerce of any sort. Well, the only ?? falls down to true believers like that, and for that, can you hold the line. I mean, I think that's brilliant. Of course, they ghettoize it, but still, you know, it wasn't there – what, six or seven years ago, it didn't exist – so this is the tenth year. So, it's a breakout event. I think all kinds of forces are in play. In a way, it's – well, I suppose this is sort of like a spin-off from Burning Man, in a way. This is a debriefing – many of you were there; I wasn't there, I know Mark was there, and Bruce, and other people – but, uh, if there was more of this kind of thing – I mean, art should not be enslaved, should not whore itself to the marketplace; nor should it whore itself to the interior decoration

industry. Uh, art should set the agenda!

I mean, I suppose that's like saying there should be philosopher kings, and yada yada, or course. But on the other hand, the whole point of the human and biological experiment on this planet is to create diversity and, uh, a kind of smooth interfacing of energy and to celebrate the novel, the unique, the previously unconnected. So that there is a story. So that, you know, the story that evolution pushed forward in agonising slowness, glacial slowness, gene-by-gene, millennia after millennia, instead becomes turbo-charged, and this is – if there is a role for human beings to play in all this that's uniquely their own – it's to take the program of Nature, which is, I assume, on some level, to generate a transcendent mind, or a living, loving, transcendent mind, and bring that forward quicker. I mean, what could be a greater glory than to cause the, the, uh, condescence to happen ever sooner, the consummation of the world, the completion of the task of being, or of becoming, the task of becoming, to approach true being, so the terrific project of being then could usher into life on Earth in the presence of some kind of transcendent immanence.

I mean, the whole thrust over here about Ecstasy, and all – much – of what is being said is really saying that the distance between humanity – between human beings – and ecstasy, God, perfection, perfect love, is, it's not beyond the yawning grave; it's not in the hands of some cult or some Messianic program – it's in Nature; and it's in the human body; and the accessibility of this has always been explicit to this game from the very start – it's somehow about dissolving ego, getting the plants, getting this message, which though very diverse is nevertheless universal in its outline; and it transcends historical cause and effect, it transcends life and death, in fact, as far as anybody can tell, it is the primary value on the page! It sets the arrow of time; it redeems biology from just being as Darwin saw it, red in tooth and claw – it's far more than that, you know: it's an architecture, it's a plan, it's an unfolding. And, uh, and, uh, and it seems to me that in the universal discourse on these matters, with Western civilisation having held more or less together since Greece, we have enough under our belt now that we can see what this is all about: it's the business of creating beauty as a bridge, as a stepping stone, to creating love, as a stepping stone to redeeming the cost of the march that got us here, which is about – you know – a hundred thousand years of habitat destruction and species degradation and beating on your neighbour's head, and all the rest of it.

[Question from audience]

Well, then the artist has to go in usually at a higher dose and alone, or somewhat more alone, and with an agenda – meaning bringing something back.

[Question from audience]

That's right! [laughing] Well, and the party impulse is a very subversive impulse. I mean, you know, a lot of artists have too much integrity to sell their art as a brand. But, who has so much integrity that they would turn down a party?! [audience laughs] This is a level of integrity unimaginable to most human groups!

[Question from audience]

Well, I don't know if I can – I guess I'm some kind of an artist, I mean it's a place up high for me, because I really want to be taken seriously as a mathematician and a physicist – *forget it!* [audience laughs] I think, well, no, no, I'm a conceptual artist; that means you can take me seriously and stuff – I'm a conceptual artist... uh, I don't know. It all requires immense amounts of humour, basically, the whole thing is some kind of a joke, and the whole arts enterprise is some kind of a joke in the sense of a jack-in-the-box of something, you know, there's this little black box, and then you mess around with it and suddenly the leering, grinning thing leaps up at you. Uh, of course, different artists may have different takes on it. If I were Philip Glass, I might think a whole other thing about it. But, I think – basically, the idea is to push people toward imagining what they've never imagined, and feeling what they've never felt before.

[Question from audience]

Yeah, I think, you know, we've all forgotten – or maybe we haven't all forgotten, but anyway – that sex on psychedelics is the Mount Everest of the experience! It's rarely mentioned, for some reason. I remember – what was it? – Leary, years and years ago, he was interviewed and – Oh, I know: it was when they broke the pseudo-story that LSD cracks chromosomes. It wasn't true. So then they came to Leary and said, "They're saying LSD cracks chromosomes!" he said, "Well go back and tell them it causes orgasms which last two hours!" [audience laughs] Because Leary understood the information war! He understood how, you know, they tell a story, *you tell a story!* [laughter] Maybe we should, uh ... we're close to knocking off here; is there one last final question, or shall we call it quits and I'll do a little peroration?

[Question from audience: *What's the most important thing of all?!*] [Audience laughs]

I don't know, keep your popper dry and your rear well protected! Something like that... [applause] Let me just say how easy... how much I appreciate you all, and how easy you've made my life over space and time, and how greatly I appreciate all of the support that you've given me and my peculiar ideas and agenda over the years, and, uh ... I can't imagine a more supportive community, a better group of people, a more intelligent group of people, a more *moral* group of people, than the people here and the people we've met at Palenque and other places over the years; and if psychedelics don't secure a moral community then I don't see what the point of it is. Otherwise, then, we're just another cult. We might as well be – or – or ?? – uh, but, psychedelics seem to me to secure a caring, moral community. And if anything can help the planet forward, can help our children make their way more easily through life, can help us live with what fate is sure to hand us as we go through life, then, uh, it's a moral community – it's the very essence of what it is to be part of a civilisation; that's why the paradox of our circumstance is that our civilisation denies this enormous civilising influence, and so, keeps itself impoverished and infantile. And I hope, however long I live, to see that

situation addressed and rectified. And, I'm convinced this will come first through the arts. So thank you very much, I enjoyed this. [Applause]

Frank [surname unknown]: Welcome Terence McKenna

Terence McKenna: Thank you very much [laughs]

F: Um, what I, what I'm, kind of, first of all interested in is your, your education, like you know, how come that you developed this very particular kind of interest.

TM: Well, I...received a degree in shamanistic studies from the University of California, but that was more, uh, in response to my interest in this kind of thing. I, uh, traveled widely in the East as an art

historian when I was very young. And, uh, then later I moved to the Amazon Basin, and I had always had an interest in plant hallucinogens and drug experiences generally and conscious, uh, development of conscious alternatives. But it was not until the Amazon that I saw that this was possible in a way that was accessible to me. So then I concentrated on those people, those chemical families and that, uh, that then became the compass for all the work that I've done since then, and, uh, I regard the degree more or less as a joke because it was self-directed study. They don't really, uh, there is no degree in shamanism. But, my interest was basically one in the phenomenology of religious experience, religious traditions worldwide and, uh, primitive people against a background of tropical nature. And, uh, stumbled onto the mushrooms in the jungles of Colombia in 1971 and was not even particularly interested in mushrooms at the time. We were looking for a, m-less well-understood drug that is still not discussed much in the literature but exists in a very circumscribed area among three Indian tribes. And we went into the jungle to stay at a mission that served these Indians, and the priest at this mission had cleared pasture and brought in white cows and there were many, many of these mushrooms. And as soon as we started experimenting with them, I realized that what I had been told about psilocybin, which was that it was analogous to LSD but simply required a larger amount for the effect to be present, was, uh, a complete simplification of the issue. And actually, then, psilocybin became the focus of my interest and, by extrapolation, the other tryptamine related hallucinogens.

And, uh, a great dream of mine and of my brother's was that the mushroom must somehow be made accessible to people so that they may judge for themselves the difference. And, uh, we worked with this over a number of years, and in 1975, we succeeded in growing it by a method that had previously been used, uh, only in the laboratory on commercial grocery store mushrooms to study their genetics, but it turned out to be perfectly adapted for growing this mushroom. Within a matter of months, we had written 'Psilocybin: the Magic Mushroom Grower's Guide' and, uh, information was moving out into society. More important from our point of view was that the mushroom was again accessible to us, so that we had psilocybin in a form that was certified pure by Mother Nature. And that, like, initiated the second phase of, uh, our work with these drugs, which has carried this up to the present day. It's basically, uh, a project of taking the drugs, calling attention to, uh, the differences and the uniqueness of the state and trying to attract other people's attention to it because, uh, I have, we have a very deep intuition of its importance for the cultural predicament for mankind generally. And, uh, this is how we come to where we are today basically.

F: You just mentioned that, uh, that the mushroom is really important for our country right now. Do you perceive yourself an advocate to bring into our culture new elements like an easy way to reach altered states of consciousness? What can we learn from these experiences?

TM: Well, the first thing that we can learn is that they exist. In other words, that, uh.... perhaps it's a truism in the 80s, but at one point it was thought that there were two states of consciousness, awake and asleep. Now there is a gamut of these states, but I still don't believe that the people who deal with consciousness realize, uh, how mutable consciousness really is. There is a prejudice against the use of drugs because there is an inherent dualism, eh, built into Western thought where people value the experience if it is endogenously produced – produced through ordeal, or personality, or dieting – but is

undervalued if it, uh, comes from drugs. This has, in my opinion, held back the Western development of understanding consciousness because, quite simply, these states, I do not believe, are accessible by any means other than drugs.

And this is heresy to a number of people, but the evidence that I lay in favor of that contention is, uh, the history of, uh, human art, literature, music and painting. It's surprisingly empty of the motifs which exist in the tryptamine-induced ecstasy. And always when I speak of hallucinogens, I'm speaking of this limited family of drugs. Not LSD, Ketamine or Mescaline, but psilocybin, and DMT and combinational drugs that utilize strategies for making that effect noticeable. And my career is to point at this place in nature which I've stumbled upon and to say, uh, what is this? What do you make of this? What do you the physicist, you the psychologist, you the after-death researcher – what do you make of this, uh, place?

And, uh, even the most sophisticated consciousness researchers tend to hurry over drugs or to focus on one drug to the exclusion of others, and yet psilocybin has not received this kind of attention and treatment. And why that is, I'm not sure. I think that, uh, that the element of terror involved in doing it and the fact that it does not bathe your ego in, uh, a cloud of certitude or assurance that everything is going to be fine. It is much more cut and dry than that and, uh, it's a challenge. It is, uh,... when you are out in the billows, as I call it, because it seems to come in waves like sets of billows – when you're out in the billows, you are against the power of mind--up against the power of mind to such a degree that you know that the entire enterprise hangs in the balance. That no matter how much you've been told about dosage and this kind of thing, that the mind actually holds the key to life and death and that, uh, those parts of your control board which are normally masked from you are suddenly unmasked, and the buttons are there for you to manipulate to the degree that you understand them.

And, uh, there is an element of risk. I never tell people that there isn't, but I think that the risk is worth it, because I think these bizarre dimensions of beauty and information are actually, uh-- it is an intimation of these things that gives human history its coherency. In other words, this is not a peripheral issue to the general phenomenon of human becoming in time. It is actually because the evolution of the human species is the evolution of the human mind, these consciousness-expanding agents actually anticipate an end state in the evolution of the human mind; so, they cast enormous reflections back over the historical landscape. It is *they* which generate, uh, religions, and physics, and messianic careers and outbreaks of great psychic, uh, accomplishment and, uh-uh, disgrace. And, uh, until we understand this; until we understand that there is a teleological object at the end of human history, and that it *can be known*, we will continue to live the kind of limited intellectual existence that has characterized the last 500 years or so of Western development. Psilocybin, tryptamine is in my opinion the, uh, the means to eliminating the future by becoming cognizant of, uh, the architecture of eternity, which is modulating time and *causing* history essentially.

F: How do you perceive in this context the future of mankind and the human mind?

TM: Well, I've said many times the, uh-- human history is a, a lunge across 15,000 or 20,000 years of time from the primitive, stone-chipping primate to that creature which will walk into a trans-dimensional vehicle and leave the solar system, and human history and the concerns of the human monkey far behind. And, [clears throat] this may take a thousand generations of people, but as a biological fact and as an emergent process of planetary significance – that is only a microcosm, I mean a microsecond of cosmic

time.

Uh, the immediate future of man lies in the imagination and in seeking the dimension where the imagination can be expressed. The present cultural crisis on the surface of the planet is caused by the fact that this is not a fitting theater for the exercise of imagination. It wrecks the planet. The planet has its own ecosystemic dynamics, which are not the dynamics of imagination. In space, the physical space that surrounds the planet, the modalities of imagination will be the limiting cases of what man can be done. So I see, uh, man becoming an artist and an engineer. In other words, flowing into our ideas, perhaps more than we dare even now suspect. In other words, uh, a possible end state of that kind of technical evolution would be, uh, the interiorization of the body - the human body, the individual body - and the exteriorization of the soul. And, this seems to me to be what the recovery from Adam's fall, uh, allegorically is getting at. That the soul must be made manifest and eternal and the body must be incorporealized so that it is a freely commanded object in the imagination.

And what I mean by that is something like what William Butler Yeats is getting at in his poem, 'Sailing to Byzantium', where he speaks of the artifice of eternity and talks about how, beyond death, he would hope to be an enameled golden bird singing sweet songs to the lords and ladies of Byzantium. In other words, it's the image of the human body become an indestructible, cybernetic object and yet within that indestructible, cybernetic object, there is a holographic transform of the body and it is released into the dream. In other words, the after death state is actually the compass of human history, that we are attempting to undergo a complete death of the species. And, as we struggle with this concrescence of Thanatos, there is- there are problems like nuclear stockpiles and all these things arise, because the message we're trying to read is the message we most fear to hear, which is, uh, that you must die to experience eternal life essentially. But what this death that we're talking about is, is an understanding that the human, the *dasein* [a concept from Heidegger], the *being* of human beings desires to be released into the imagination. And until we confront death with the attitude that it is the after death state that needs to enter history, there will be a great deal of anxiety.

It's like a birth, you know. A birth is a death. Everything you treasure, believe in, love, and relate to is destroyed for you when you leave the womb, and you are launched into another modality, a modality that you would not perhaps have chosen but that you cannot do anything about. So I, uh, I think these drugs anticipate this, because I think time is a moving image of eternity, as Plato said, and, uh, these drugs place you outside of time. Now the mechanism of how that's done, you can invoke Bell's theorem, or just call it pure magic, but, uh, it does happen in the here and now. It is accessible and it is not something remote from us. But somehow the clamor of the modern world and in search for answers, people have feared to place themselves on the line and to actually wrestle with life and death 'out there' in those strange bard-like dimensions - not realizing that there is no other way to win true knowledge. I mean, it cannot be easily come by. There is no knowledge without risk-taking.

And, uh, I see this human future.. emerging along the lines that the mushroom visions have insisted upon. The proliferation of electronic media, the densification of information, the breaking down of consensus reality, the, uh, uh, break down of a coherent, uh, dogma at the center of physics - all these things indicate that it is slowly becoming understood that the modality of being is the modality of mind. And once that realization is placed in the center of someone's thinking about the world, the importance of these drugs will be seen to be paramount. And once a culture places that understanding, uh, in the center of its model of the world, these drugs will then point the way, uh, and we will be much closer to the end of history that I

think we all, uh, desire, consciously or unconsciously; uh, a cutting of the Gordian knot and a release of the human species and individual into the dream basically.

And uh, primitive people, meaning preliterate people, they just have circumvented the entire process of history. They have leapfrogged over us. They are already in the dream. They have accepted the drug on its own terms and, uh, and assimilated it and live with it. The problem with that, for them and for us, is that we are destroying their world, and our intellectual equipment is such that we can never have that, uh, that naïve epistemological approach to these phenomena, because we know about *techne*. We know that energy can be manipulated to achieve effects, and so, it isn't enough for us to try to recreate the shamanism of preliterate people. We have to go into the shaman space with the *a priori* categories of Kant, with the eidetic reduction of Wittgenstein, with the ideas of Merleau-Ponty and Whitehead. All intellectual equipage of our culture must be carried with us into that space to attempt to map it in a way that will be relevant for us and that will point the way toward a shortening of this period of shock and the accumulating shock waves, like the bow shock of, uh, ionized particles or energetic particles meeting the magnetic field of a planet. That's what the chaos of philosophy and of history is.

F: Were you just talking about the Bell theory?

TM: No, I'm talking about a shockwave which precedes eschatology and is, uh, modern times, basically. It has been increasing throughout history but as we grow closer to this moment where, uh, the human mind will evolve into hyperspace - ah, the confusion, the amount of contradiction, the amount of, uh, well, 'queue' it's called in engineering - just the amount of vibration in the system is increasing to the point where it seems that the system is about to fly to pieces. This signals to me that the onset of the, uh, of the primal crisis that when we have gone through it, we will then live in this, uh, in this realm of altered understanding that psilocybin and these drugs anticipate. And, it isn't a coincidence that they anticipate them. It is, in fact, what eschatological time is is what they reveal. That's why the cultures that we find using them are eschatological and historical coaches.

F: What is the Bell Theorem you were talking about?

TM: Well, the Bell theorem is simply an interpretation of an experiment in quantum mechanics, which seems to suggest that information is non-local. In other words, that, uh, everything about everywhere can be known here and now, because somehow all information is co-tangent to every point in the matrix. I, uh, don't, uh, pretend to have the background to judge the Bell theorem. What I would say about it is: if it isn't true, something like it must be true to account for the informational content of these, uh, drug experiences. If you just take a simple behaviorist model, uh, what is in your head, if behaviorist and reductionist evolutionists are correct, what is in your head should be very adapted to the here and now. It should be efficacious information that bears on your survival. Instead what we find when we, uh, take these drugs is a density of information, an alienness of information, an inapplicability of information to the human condition that suggests that information *is* available that has no bearing on the life of the individual or his, uh, the success of his evolutionary strategy. And, I just cannot believe that these things are built into the human psyche. I have, as I've said, I was involved with Jungian ideas and, I, those archetypes and those archetypal processes are not what I'm talking about. I'm talking about, uh, the thing, which for want of a better word, we call the alien or the extraterrestrial. The thing that comes out of the drug experience that is

'un-Englishable.' Beautiful, but so bizarre that it seems to exceed human categories.

F: Some people talk about entities?

TM: Yes, it can present itself as an entity. It can present itself in a number of different ways. It is, uh, it is the central mystery of our age. We are so alienated, uh, or, let me restart that, the [clears throat]. The relationship of intellectuals alive today who are familiar with the state of modern science and that sort of thing, to a question like the existence of extraterrestrials is approximately in the same place or degree of closure as the relationship of 15th and 16th century intellectuals to the real properties of matter. In other words, they had only a tenuous grip on the real properties of matter. Consequently, alchemy could exist, could project the hopes of human psychic transformation onto inert matter, because so little was known about the real nature of matter that it seemed a reasonable place to expect these kinds of things to happen.

The present state of thought, uh, today, is that it's highly likely that there are extraterrestrials somewhere out among the stars. Our state- the state of development of our chemistry, astrophysics, uh, linguistics, etc, etc, makes it reasonable for us as moderns to expect that. So then, consequently, we go into our heads and there seems to be the extraterrestrial. It may be a true extraterrestrial but it is odd that it has hidden itself in the place where we expected to find it, and this causes me to assume that actually it's something far more profound than an extraterrestrial. It's something which to gain our confidences disguised as an extraterrestrial, because its real nature is so much more devastating than that. That that is the way in which it insinuates itself into our lives so that we can dream of a hegemony of organized intelligence out in the galaxy that we will relate to and be assimilated into.

What I think is going on is that actually the most intelligent life form on the planet is not, uh, man and his institutions. It is the over mind of the human species, which is a diffuse organism of, uh, technical artifacts like computers and information transfer and retrieval systems and human beings. And- but human institutions are like, uh, myths woven by the individual human cells that make up society. The real controlling, uh, [sniffs] modality on the planet is never visible and it is this group mind. And, it controls the release of ideas into history by designating certain people as geniuses, and, it's, uh, if it- if there's a certain type of imbalance, a certain kind of religion will arise to collapse that imbalance. If, uh, if technical advancement is outstripping the evolution of ethics, a religion can step in to freeze, uh, these developments so that one can catch up with the other. And I think the whole consciousness movement and--that has evolved over the past twenty years is an attempt to map, to verify, and to open a dialogue with this thing, which is the other; we call it the other, we call the alien, but it is actually the overmind of the species. And, it, It seeks this dialogue. It has been waiting all these millennia for us to essentially come to a point of intellectual maturity where we did not then require messiahs, religions and these various crude, fine- crude interventions into the human experience that keep us from destroying ourselves.

F: This is all what Jung called the Collective Unconscious?

TM: Right, but he-he painted it as a very passive kind of thing. More like a databank or a place where all myths and all memories were. I think of it as, uh, a god, a kind of god and I think it, it is active in three-dimensional space. It can be active in something as, uh, personalistic and circumscribed as, uh, a string of coincidences, which you experience which seem to be turning your life in a certain direction that you may

not have expected. Or it can be active, uh, in-in something like the worldwide phenomenon of flying saucers. Flying saucers are nothing more than miracles and, uh, they occur, essentially, to bedevil science, because science is a human institution that has arisen in the last 500 years that is, uh, that dreams of displacing the over mind without ever realizing that it exists. Science dreams of this place of preeminence, but science creates alienation, um, species survival problems, all of these things.

Now, then, the overmind, which can be thought of simply like the cultural thermostat, it clicks on when the flash of contradiction between the ethics of a society and some other institution, in this case science, becomes too great. This governing device clicks on and it begins producing those events most destructive to the institution that is seeking preeminence, in this case science. So the inexplicability of the flying saucer phenomenon is its central, uh, reason for being, and all the effort to reduce it to something, um, metal ships from far away, or anything else – is doomed to failure. It's very reason for being is to undermine those kind of ontological systems.

Uh, why we're talking about this is because psilocybin makes- inducts you into the flying saucer experience. In other words, a metaphor for it would be to say that psilocybin is the means of triggering the so-called abduction experience, or the close encounter of the 3rd kind. Ah, once you realize that, once you've satisfied yourself that that's true, a number of experimental avenues are opened up. A number of different approaches to what's going on are suggested. I mean, here we have alien entities eager to transmit information, eager to carry on a noetic dialogue and, uh, we seem to be ignoring the opportunity because our categories mitigate against us correctly appreciating it.

F: Are these entities coming from outer space or are they more part of us?

TM: It's impossible to tell. This is the game that you must play with them, is through dialogue, trying to figure out if this is, uh, the previously unseen human psyche or whether it is actually a thing coming from the outside. And, it is not an easy thing to decide because we are so alienated from the self that we don't really know what it would be, uh...

F: It's not important to know the context? It's more important to know the content?

TM: The content is very interesting, yes. Because even if we were to somehow to verify that Bell's non-locality theorem applied and that this- these were real entities around a real sun somewhere in the universe – it would make them no more or less real. In other words, it's a hangup to demand that they appear in three-dimensional space. I always, uh, I have this hang up so I don't, uh, I don't put it down. I always think of the Apostle Thomas, because you'll recall, Thomas was not present when Christ returned, after--when he rose from the grave, he appeared to the apostles in the upper room and Thomas was not present. Then, later he was there and the apostles said, 'listen, the master was here and it was wonderful' and he said, 'you people have been smoking too many little brown cigarettes, that's preposterous'. And at that point, Christ walked in, and he said, he said, 'Thomas, come put your hand into the wound so that you'll believe'. So, he did and then he believed. The moral of the story, as I read it is, Thomas was the doubter. Consequently, Thomas was the only one who was allowed to actually touch the resurrection body. It was because he doubted that he was vouchsafed this position of preeminence, and, uh, I'm like that. I mean, I would like to touch the incorporeal body. I would like to call the saucer down and observe all of its workings. But, uh,

this is a spiritual aspiration that cannot be advanced by any, uh, human technique or activity. This is just something you pray for. Uh, in the meantime, the job is to map it, describe it, explore it, and try to direct the attention of other people more intelligent than myself to this *astounding fact*, really. I mean, I am- I'm troubled by the fact that so many strange claims are made today, so many forms of aliens, and channeling, and voices in the head. That-- when I began all this ten years ago, I was afraid to speak because I sounded mad, even to myself, and I sounded like a voice in the wilderness. Today the situation has changed to the point where I can barely make myself heard amidst the clamor of people who have various, uh, entities from Atlantis, and beyond the grave, and Zeta Reticuli, and uh, what have you, clamoring to be heard.

So I, uh, I take it on faith and I ask you to take it faith that I am, uh, somewhat more objective and somewhat more interested in hard facts than these other channelers. I would like people to take a look at this phenomenon and then *tell me* what they think. And uh, it involves risk, people fear to do it, because careers are placed on the line. It is not easy to make a career out of taking a psychedelic drug. It is not a thing which makes us well with the politics of any institution, a university or research institution. Perhaps this is why shamans are the primary sources of, uh, information about it.

Female audience member: Terry, are you--are you a shaman?

F: Are you an exploring shaman?

TM: I'm an exploring shaman. I wouldn't *claim* to be a shaman, but I think anybody who takes these things and goes out and tries to navigate through and make maps, and bring back data is a shaman, for sure.

F: Do you want to everybody to take this drug...goes out and takes the drug, or...

TM: No I don't think so. I think that it's very dangerous. I do not tell people that it's safe because, uh, I don't have the faith that it's safe. I *know* what the pharmacological literature says, and it says that it's safe, that at the doses where these effects occur, there can't possibly be a problem. But, this seems to me to be the naïveté of materialists, and we shouldn't be in a hurry to believe them even though it might make us more comfortable to do so. In other words, it's saying, you know, the drug may not be toxic, but you may be self-toxic and you may discover this on the drug, uh, in the drug experience. So you have to, uh, you have to hone yourself and be clean, and you never know if you're clean enough until it's too late, because each journey into that dimension is, uh, a total existential commitment, uh...and, uh, the element of fear is always there. I mentioned this morning that I think the fear validates it. I think it's fine to take drugs, uh, for pleasure but it should be *labeled* as taking drugs for pleasure. And the high doses of psilocybin that are necessary to elicit entry into this places, uh, it requires, as it says in Hamlet, 'you must screw your courage to the sticking place.'

F: You mentioned earlier mankind evolving towards a teleological goal. Would you kindly tell me, what is the goal?

TM: Well, I don't think, I don't think there is a final goal, an end to history. But, speaking relative to the history of the past 4,000 or 5,000 years, I think the goal is, as I said, to invert the relationship of body and

soul, so that the body becomes an image in the imagination, and the soul becomes an exteriorized solid-state piece of circuitry, which maintains everything else, uh, in stasis. And, uh, I'm not sure if people even realize what I picture in my mind when I say this, but I think that the destiny of man and what man will *make be* his destiny - just because of how we are - is release into the imagination. And this is what all of our after death scenarios say, whether they are true or not, and they *may be* true. And, this is what poetry aspires to, art aspires to; it's release into the imagination. We are creatures of the dream. And, once this is articulated with sufficient clarity, and, it, it's happening now, but I think the work we do with these drugs, that we are the earliest pioneers in what over the next 100 years will lead to an understanding, uh, of consciousness almost as a thing apart from the monkey body and brain. We *are* consciousness. Uh, we may not always be monkeys.

We fear the dehumanizing effect of so many computers and emotions-- euphoric emotions not related to sex and all these things. We fear them; we say that we're moving further and further from nature, deeper and deeper into our own psyche. But this is a dualism. Uh, our psyche *is* nature, and we cannot move away from nature by exploring these places. So, I believe that a technological recreation of the after-death state is what history pushes toward. And, that means a kind of eternal existence where there is an ocean of mind into which one can dissolve and reform from, but there is also the self, uh, related to the body image but in the imagination. So that we each would become, in a sense, everyone. I would live at Versailles and, uh, you might live at the Taj Mahal, and, uh, someone else might live at Buckingham Palace but what you would see, if there were an exterior observer, what you would see is only that man had become a coral reef of circuitry; in space and on the planetary surface. But, uh, this is a very extreme view of the history of man because its essentially gnostic. It says we are not now what we yearn to be and are destined to be and are destined to be.

We are, uh, we are not...I don't see history as, uh, a process of accepting and coming to terms with monkeyhood. I see that it will inevitably seek to transform and transcend monkeyhood, and, uh, this will be very frightening, I mean as frightening--Imagine if even a 15th century person were to be in this room with us, and the value systems, the clash of, uh, assumptions about what is important and unimportant. And this will be a much more intense change that--and whether it is good or bad rests on a question that I have no answer for. And the question is: is man good? And this, I maintain, is the central thing to dig at, and we cannot know, and there's evidence pro and con. I have the faith that man is good. So I don't, I don't fear this future, but if someone had doubt, even a small doubt about that, then they would be repelled by this. And, I take all these movements which want zero-sum growth and reject technology, reject space colonization, reject, uh, drug experimentation as artificial - these people would be very alarmed by this kind of a point of view. But they do not seem to realize that the momentum toward this kind of thing [Interviewer: "What thing?"] is now so great in terms of, uh, human culture and that sort of thing that there can be no turning back. We are either going to change into this cybernetic hyper-dimensional hallucinogenic angel or we're going to destroy ourselves. The opportunity for us to be happy hunters and gatherers integrated into the balance of nature, that fell away 15,000 years ago and cannot be recaptured.

I might just end by recalling a statement. Uh, I think, uh, Gerard O'Neil made it, uh, in answer to this very objection. He said, "the earth is the cradle of mankind; there is no question about that; but you do not remain in the cradle forever," and this is a birth crisis that we're going through. For the-the entirety of human history has been the story of monk--the monkey becoming the flying saucer. It is taking [snaps fingers] just that long in geological time. But *we*, for some strange reason, we happen to be living through the final moments of that process right now. And it is, uh, a turbulent, chaotic, multidimensional, uh,

metamorphosis that is, uh, there's never been anything like it on this planet before. It's absolutely astonishing. Information, which was, uh, locked for chiliocosms of time into the DNA of plants and animals, has through the hand and articulate voice of man, uh, been able to bootstrap itself out of the DNA and into these culturally validated, rapidly operating, electromagnetic codes and languages. And, this is allowing its development, uh, its evolution to proceed at a rate so fast that, uh, the transformations are taking place essentially in our lifetime. And psilocybin is central to this because psilocybin casts a spotlight into the darkness into which we are moving and shows, uh, that this is what lies there. It is, uh, the human soul essentially - the oversoul of mankind calling history toward itself across the dimensions. And, it's taking only a moment but on the other hand, it's taking 20,000 years, and it's the great, great adventure of becoming. And we're very, very privileged to be in this final ticking out of the last seconds of the third act.

F: Do you have any comments about the fact that DMT is located in the human brain?

TM: Well, I think that puts, uh, in some senses, is a strong piece of evidence for the argument that I've been making. Not only is DMT endogenous in the brain but beta-Carbolines of the sort that occur in ayahuasca are endogenous in the brain as well. These things, as I mentioned this morning--the shift of a single atom on the ring structure of one of these molecules can cause a compound to go from inert to highly active. Well, that means, then, that it's probably very reasonable to say that we are as close to shifting the level of endogenous hallucinogens in our head--we are probably only a one-gene mutation away from that happening. And, uh, if you know anything about how biological evolution works - it isn't that, uh, a change, a mutation occurs and the mutation is found to be better adapted than the previous form, and, uh, uh, hence the mutation dominates. That is not the way evolution works. The way it works is, you have the normal expression of the genotype in a population and then you have mutations being thrown up all the time. And they are usually quenched, except in the situation where the environment shifts so that new selective pressures are operating in the environment. When new selective pressures begin to operate, a gene that was previously without consequence may suddenly have immense consequences; so then every, ehh, member of the population that you're looking at that has that gene, suddenly is in a much more advantageous, uh, uh, position to advance their evolutionary strategy. And, I think that certainly modern existence has changed the selective pressures on the human genome and now, uh, it is people who are '*far out*'-- that simply gloss--it is the people who are '*far out*' who are gaining advantage in the evolutionary jostling for efficacious strategies, and this- your right Frank - this is happening on the hardware level, on the level of endogenous tryptamines and that sort of the thing.

I think schizophrenia is, essentially, in a way, a disease of modern times. And it is, though it's always existed of course, but the incidence of it and the incidence of schizoid, not schizophrenic, personalities and types is because the-the modalities of the evolutionary selection are shifting. It's as though - if you think of a rainforest that has been above water, uh, 200 million years, all evolutionary niches has become occupied. Everything is at steady state. There is not going to be any dramatic radiation of a new species because everything has been worked out and the energy flows are so tight. Nothing can gain a leg up on that situation [clears throat]. But, if you clear 1000 acres of forest and reduce it to rubble essentially - open land - then what are called invader species come in there and they very quickly gain dominance, where in the jungle, at steady state, you never see those plants. You never see weedy annual, uh, heavily seeding plants in the jungle. The jungle strategy is for enormous plants which produce small numbers of seeds, and this is, again, an analogy to the modern situation: that, uh, modernity is a desert and we are jungle monkeys, and so new evolutionary selective pressures are coming to bear upon the human situation. New

ideas are coming to the fore. Uh, psilocybin is a selective filter for this. The *wish* to go to space is a selective filter for this. Just the wish to know your own mind is a selective filter for this. But, uh, this is, this is part of the picture; this is what's happening. It's inevitable. It's a very good thing I think, if you have faith that man is good and my, uh, I...I follow the Renaissance Platonists on that; man *must be* the measure of all things. What else could possibly serve with certainty? Uh, that's all I've got to say about that.

F: You stated earlier that psilocybin is coming from outer space. There is a possibility that the mushroom is?

TM: There's a possibility of that. Fred Hoyle and an associate of his have come to my aid on this, saying that spore bearing life forms, because spores have the capacity to survive in the conditions of outer space, that spore bearing life forms may, over truly large scales of time, percolate out through the galaxy and serve as a basis for the evolution of life on various planets, or insert themselves into already existing planetary ecologies and insert themselves there. I don't, I-on these matters of specific fact – like is the mushroom an extraterrestrial and that sort of the thing? – I haven't the faintest idea. The mushroom itself is such a mercurial, elusive, Zen sort of personality that I never believe a word it says. I simply entertain its notions and try and sort through them, and I found that to be the most enriching approach to it. To know that the option of believing that is there on hard evidence is very exhilarating. As to what is *really going on*, uh, the mushroom assures me that I haven't got even the faintest, uh, grip on what is really going on, but *something* is going on!

F: Uh, can I ask another question, uh, it'll be the last one?

TM: Sure.

F: What do you think is evil? And, can these mushrooms be misused?

TM: Well, I think that anything can be misused. Most evil is, uh, trivial. And if I could, uh, speak off the top of my head, the only evil that associates itself with mushrooms is, uh, taking it but taking too little. [laughter] In other words [Terence laughs --female audience member: "could you define evil?"], evil is, uh, evil is, uh - oh there's a word I want - it isn't 'twiddle' but it's something like that. Evil is when you play at things, not in 'play' in the Hindu cosmic sense, but where you fiddle with things, you muck with things because you don't want to get your feet wet. You want to be able to say you've done these things but you never want to really want to place your validity on the line. And I am amazed at the number of people who claim familiarity with psychedelic drugs, who, when you actually question them closely, it's very clear that they had a subthreshold dose even if they've taken it 50 or 100 times. They have managed through, through low doses and strong defenses to always keep the daimon at bay - that's daimon with a 'D-A-I,' - to keep the daimon at bay, and they don't know what they're talking about. You must take a sufficiently large dose so that you enter into these places.

Not to knock, uh, him personally, because he's a very nice man, but as an example, uh, Roland Fischer, whose work you may know. I talked to him, and he has given psilocybin, he says, to about 15,000 people at NIMH and now he's retired to Majorca, but, uh...[Frank: "I met him in ?? recently." Terence: "Oh, you did, yea?"] and I said to him, I said, 'Roland, what do you make of it?! I mean, what do you make of it?!'

And, he said, 'well, make of what?' And, I said 'well, what do you make, just specifically, of the hallucinations? You say you gave it to all these people and you took it six times. What happened when you closed your eyes and looked at the hallucinations?' He said, 'I never closed my eyes [audience sighs]; I was highly agitated throughout.'

And, I just realized these things which seemed to me as natural as breathing just slide right past people. I mean, of, of course you do not eat for a few hours before you do it. Of course you lie down in darkness and compose your mind and look at the darkness behind your eyelids, and of course you invoke it through the wish to have it come to you. These are things as simple as they can be. Yet here was a man with a life long professional involvement, published dozens of papers, has made contributions in the mapping of consciousness, but he could never just stop fidgeting long enough to, uh, see it. So that--so my idea of that as evil. Evil as, uh, anything that trivializes a mystery would be evil. And, since this is a mystery, any dismissing of it or constantly taking it at low doses for hedonic purposes – I mean, there's nothing wrong with that-- but, that's not the whole story, and nobody should think that that gives you the pedestal from which to speak about it. You really have to do these heroic amounts and, uh, and integrate them.

This is something that I haven't even talked about in this interview, but these things are very state-bounded, a term which Roland Fischer, in fact, coined, that simply means that they're very hard to retain and remember what exactly happened at the peak of the flash. And you come down and you say, 'well it was very strange and there was information, there were entities, but I just can't get back to it. The way to overcome that is to be as psychedelic in your 'down' life as possible. And by psychedelic I mean ideas, cognitive activities. You should dance, you should read, you should think, you should paint, you should sculpt, you should converse. You should constantly involve yourself in cognitive activities, because taking these drugs is one of the major cognitive activities. And then, if you have a grip on human history - where the human enterprise has been, where it's going - if you have been many places, uh, it's easier to map. I'm, I'm reminded of- there's an alchemical aphorism. I think its attributed to Athanasius Kircher where he says, uh, 'the oldest books, the farthest countries, the deepest forests, the highest mountains, this is where you must seek the stone.' And what he means is, you simply acquire experience, because it is only in the acquisition of acquired experiences that you have a reservoir to draw on when you seek to make metaphors and analogies about, uh, the alien thing. When you invoke the god, then you can map back onto it. You can say, well, it's like this, it's like that, knowing that it is not that and not this. But the fund of analogies is there to give you a grip on it. So there's an obligation to experience, deeply and richly and thoroughly, and intellectually, uh, I might add, and then you can map back onto it, but it's a dialogue between you and it where you are discovering new things about yourself and it, and trying to resolve the question, are we the same thing? And I *haven't* resolved the question. My suspicions flow one way and then another way, but I think it is without a doubt a living mystery existing in the present, available to anyone sincere enough to, uh, seek it. And, *for me*, that was a life transforming discovery and revelation, because I didn't believe there were any mysteries. I believe there *may have been once*, but to discover one right in our midst and it cannot be reduced, it cannot be, uh, pulled apart into its constituent, uh, uh, you know, functions, it is truly a unitary mystery, and it's accessible in our lives, right now, without kneeling at anybody's feet, without following any regimen of, uh, of, uh, denial or, or, the assimilation of any belief system. And this is very big news I think. The mystery has always been there, I'm sure, but our society is *so* bizarre and has led us *so far* astray that we have to rediscover it. And this process is happening; this is what the 20th century is all about. We are still tiptoeing at the edge of it even though great men, great women, great mappers of, uh, consciousness have come and gone. We're still at the very infancy of this thing and it calls out to us. It beckons. It says do more, see more, know more and, uh, be more a part of it.

F: Well, uh, you know during your talk I thought about one experience Rita and I had in in India when we were at the [Ajanta?] caves. We were looking at lingam and you know, we would look out of the caves; we would see across the bay. You could see an atomic plant and these two things just looked really identical.

TM: Well, the mushroom...Could any symbol be more appropriate of the ambiguity of human transformation? What mushroom is it that grows at the end of history? Is it stropharia cubensis, or is it the creation of Edward Teller? This is an unresolved problem [audience laughter] What a group! [laughter] Is that a...is that good?

F: Oh it's perfect.

Emcee: Instead of reading off a list of his acclaimed titles that I'm sure everyone is familiar with, and doesn't need me to list them, I'd rather read a slightly more extraordinary proclamation. It's from the City of Austin. And it says, "Greetings in the name and by the authority of the City of Austin. To all to whom these presents come, know ye, that on this day, Terence McKenna is hereby commissioned for now and for all time to come, an honorary citizen of the City of Austin." [applause]

TM: I'm honored. This has never happened to me before. Usually they lock the city walls when they hear I'm on my way. So this is very cool. Now I know I have a place to come to, if I ever need to.

I'm going to try standing up on this platform to enhance the experience of the people in the back of the room. I'm feeling for you back there. I'm taller than that. Anyway it's a pleasure to be in Austin. The only time I've ever been in Texas before was I entered from Mexico in 1972 on a phony passport to come back and face a federal hashish importation charge in Boulder. And I remember when I crossed the border, the guy said to me, he said, uh, "You're real clean, aren't you?" and I said, "Oh, I always travel light." And he said, "No, I say, you're real clean, aren't you?"

So that was my only impression of Texas, uh, since 1972. And uh, flying in here yesterday, uh, appropriate for this event, a voice spoke in my head and said very clearly, "Texas. It's not what you think." So, so far it's been right on. It's a pleasure. And the great surprise for me about Austin, being clueless, was that this is a place of trees. Of unbroken oceans of trees to the horizon. That's wonderful, that's something, not only to have it, but to keep it.

It's a pleasure to part of the Whole Life Expo. I tease them a fair bit, in fact I think because of my teasing they've eliminated the Camaro raffle. Uh. I was hoping I could pick up a moldavite suppository, like I did last time. It worked great, but then I lost it somewhere, so uh, anyway. [laughter] No, the marketplace and spiritual transcendence make strange bedfellows but after all, what's wrong with strange bedfellows, right? A little of that, anyway.

Uh, so I was thinking today about how to spin this yet again, but slightly differently, as always. And I was thinking about, uh, it was a rough week for me on the internet last week. I don't know how many of you are on there, but I was simultaneously denounced for being too flaky and too hard-nosed. So while I'm

defending myself against flakiness, people are attacking me for being too tough, too rigorous, too scientific, not open-hearted enough, not (inaudible) and vibrational levels that lie above the violet ray ...woop de doo.

And uh, it's a kind of a hybrid position. Now I don't get invited to many scientific meetings, but if I were to be invited I would feel I'm sure very marginal because they'd say, "Oh It's him, we know about all that." And then at these gatherings I always feel somewhat in disguise, because I'm not sure how many people carry rational analysis in these situations as far as I do. So, trying to get this into a package where it can be understood, I thought, you know, what it's about is intuition. Intuition in the presence of the desire to verify, not intuition purely. But intuition that is self-correcting based on input from the world of reason, evidence, induction, deduction, and so forth and so on.

And you know my method, if you call something as trivial as what I do a method, it is simply to investigate the weird with an open mind, not with a believing mind, and one of the things that I find myself saying more and more to my audiences is that it's not about getting rid of bad beliefs in favor of good beliefs, it's something a little scarier than that. It's - and this again, you paid your \$20, you get one guy's opinion, that's all - this isn't coming from Rome or Manhattan or Tokyo, it's just one guy's opinion, so you don't have to climb the walls about it if you disagree, in fact, be assured, most people disagree, uh, but I've come to the conclusion that ideology, beliefs, and then in the broader context, culture, is not our friend, culture is not your friend, ideology is not your friend, uh, an open mind believes nothing. An open mind is an open mind, period. And if one believes something, regardless of how wonderful it may be, it absolutely precludes believing its opposite, and so a kind of self-limiting has taken place, and what are beliefs anyway, you know, it's not like food, that if you don't have one for 12 hours you go into crisis. it's not sex, like if you don't have it for a week, you go into crisis. It's not money, like if you don't have it, other people don't (inaudible) crisis.

It's just a kind of psychic clothing which we've all been told one should have. You're naked without your ideologies, your beliefs. What are you? How do you dress in the morning, do you dress militia, do you dress Jewish, do you dress punk? What's your cultural statement, what's your ideological statement? And uh, this is an old and bad game that has been played against us: throw the bad guys out, bring the good guys in, the good guys inevitably turn out to be bad guys of a different sort and then the cycle goes again. And this game has been played on people for millennia. This is the shell game of all time.

Well then, into this, comes to my mind, a new factor, into the 20th century social cultural mix, have come many new factors. Among them, and imported harmlessly along with the debris of the collecting impulse of the science of anthropology, came information that there were people in other cultures using plants in ways that were very hard to map on to any Western notion of how plants might be used. For instance, to the Western mind, a system of drug use where only the doctors take the drugs - this is a very puzzling notion to the Western mind. Where of course the patient takes the drugs, because that's the medium of exchange that accrues the debt of the patient to the physician.

Even when I was a kid, I can remember back in the dark, dark ages of the late 50s, every "Explorers lost in Africa" movie had a scene where the great white hunter and Debra Paget, or whoever was accompanying him on his quest, were captured by the witch doctor, and the witch doctor is just about as terrifying a figure as you can imagine, I mean, obviously insane, hyped up on strange compounds, driven by unimaginable cruelty, and so forth and so on. And as cultural diversity has broadened, as the dialogue

between diverse peoples has preceded over the past 40 years or so, this strange figure, the witch doctor, who becomes the shaman, uh, is a mysterious and central pivot for the evolution of the social mind and the self-image of every one of us, because, based on the descriptions of the anthropologists, the shaman does something which we can't even find the context for. The shamans mysteriously journey between this world and another world, or worlds, that are somehow filled with energies both friendly and unfriendly toward the human condition.

In aboriginal societies, there isn't an awareness or emphasis or understanding of uh, physical pathology as we gain it. To aboriginal forms of thinking, all forms of unbalance arise out of the general circumstances. Some of you may know in Peru there is a condition – not, I wouldn't call it a disease as you'll see why in a moment. But a condition called "susto". And if you have it, your life is ruined. Your crops fail, your animals die, your breath smells and what it is, basically, is bad luck, from an outsider's point of view looking at this culture, it's simply that things are going wrong for you, it's bad luck, and yet inside this culture, this condition is recognized, and you immediately are told or figure out for yourself, "Gee, I've got to spend some time with the shaman" and then susto can be lifted off of you.

Well, my, sort of a personal note, how I came to this or how I got into this was I grew up, really not that far from here or not as far as I thought I did when I was a kid. I grew up in western Colorado and we prided ourselves on being Westerners. Every time I come south I realize the place where I grew up was south but like, schizoid about it, and never owned up to the fact that the psychology of North Carolina is more what western Colorado is about than the psychology of southern California, by any stretch. Anyway, not to wander. I grew up in this place and uh, I was curious. And I think curiosity is the psychedelic virtue. It's the precondition for finding your way into the presence of this answer, intellectual curiosity, and I was told, well, you know, there were dinosaurs here, 100 million years ago and 50 million years before that there was an ocean here. And we would go out into the dry arroyos and sandstone country and here would be these seashells and spiral laminites and stuff and I was obsessed with the sea because I had never seen it. I didn't see the ocean until I was 14 years old, and yet here was evidence of the ocean in some of the driest and most shattered desert country you could ever see. So I got the message and the message is the world is not what it appears to be. Where there are deserts, one finds evidence of oceans. Where there are wastelands, one finds evidence of jungles, and by extension, where there is love, one can uncover animosity and conflict. Where there is hate, one can uncover love and community. So very early I got the notion, things are not as they appear to be.

And by the time I was 9 or 10, this was focused enough in my head. I was nearsighted. I couldn't catch a basketball so this had severe distorting effects on my social life and I spent a lot of time by myself. Well, by the time I was 9 or 10, I was uh, an earnest practitioner of ceremonial magic, and I would draw pentacles in my room and burn rosemary and uh, I was also an altar boy at this time and, uh, it made some problems. I recall one time, I don't know how many of you are recovering Catholics, but there's a thing which they bring out once a year – I don't know if they still do this, they've sort of left the faith - they have this thing which they use at midnight mass and Easter called an aspergillum, and it looks like a baby's rattle and you put it in water and it has holes in the round head and it fills with holy water and then you can fling holy water great distances with this thing. And so one day back in the sacristy we were cleaning out some things and the priest came upon this old aspergillum, and I said, "Whoa," he was about to get rid of it. And I said, "Well, I have a use for that" and he said, "Oh, what is your use for this, my son?" and I said, "Well, I'm involved in the conjuration of Azazel, the 11th General of the Mercuric sphere," and it launched an investigation that has made that town unsafe for the practice of ceremonial magic to this day.

But, the point of my story is, they needn't have worried, because, and I don't want to step on anybody's toes, but look, I'm paid to be controversial, you understand? They needn't have worried, because at least for this lumping Irishman, it didn't work. No matter how much rosemary I burned, no matter how many wax sigils were formed, no matter how many even more peculiar things were undertaken, it didn't seem to cut the mustard. And then around the time that I was 14 or so, I had many obsessions, and my life seems ruled by obsession, and at some point I became aware there was of a book at the library that they didn't want me to read. This was when I was somewhat younger and they didn't want me to read this book and the librarian who was friends with my mother had been told, "If he asks for this book, don't let him have it." So I not only determined to read the book, I determined to read every book the author had ever written, and the book was *Brave New World*, which I don't know how many of you have read it. It wouldn't stir a small wind these days, but it did involve, all the women did wear these prophylactic... some kind of, I never quite understood what it was – but it was some kind of birth control kit that they wore on the belt and of course people were grown in vats, and had very free sex and so forth and so on, it was an interesting book but then I started reading the author, Aldous Huxley, and I read *Crome Yellow* and I read *Antic Hay* and I read *After Many a Summer Dies the Swan* and I read *Ape and Essence* and some of these things were like screenplays and some were comedies of British manners, I kept hoping we'd get back to the prophylactic belt thing, um, and instead eventually I came upon *The Doors of Perception* and read this book. It had never entered my mind, the concept of drugs, intoxication, information from reflection of that sort, I mean, the whole thing was just completely puzzling to me and I can remember following my mother around the kitchen of our suburban home, saying if one tenth of what this guy is saying is true, this is the most amazing thing in the world. Now, we know that that's a very mild book, very limited in its claims, I mean he talks about staring at the folds of his trousers, and thinking about Hildegard von Bingen and uh, it's basically presented as a thought thing, and most of you look like you're probably not old enough to remember, but there was a point in the evolution of awareness about the psychedelic experience where the way people did it is they piled up art books, favorite recordings, foods, perfumes, and then they would get loaded and then look at the art books, eat the orange, smell the perfume.. it's not a bad idea, um... [laughter]

But uh, that was the clue, to me, that there was something going on and as I say, I was about 14 and I had a lot ahead of me before I really took my first trip, um, and I was trying to figure it out, shopping in the supermarket of ideas of the time, reading Camus, reading Nietzsche, reading Sartre, and all these people are a huge downer, as any of you know who've read them, I mean the entire tone of modernity is just one big downer after another. If it's not Hannah Arendt on the triviality of evil, well then it's Karl Jaspers on something else, or Sartre, and just horrible, horrible stuff. I became aware through Huxley that there was this other possibility, and Huxley always wrote about the psychedelic experience as a branch of the mystical quest, what he called the perennial philosophy. And so I started reading both the scholars of mysticism, such as Evelyn Underhill and um, William James, *Varieties of Religious Experience*, and so forth and so on, and I started reading the primary sources: Teresa of Avila, Thomas Traherne, Yaka Burma [sp?], what's the Singing Nun... Hildegard von Bingen, all of these people, and I got the idea that there was this experience but I couldn't find it, I couldn't find it in on my knees at the church for hour after hour. I mean, I found various forms of existential boredom ad infinitum, and I would sit in nature and I would hyperventilate and I would do all these things. Well, the juice just wasn't coming.

Well, to make a long story short, eventually, like lots and lots of people, and by my own personal route, I found my way to these things, and they are to my mind, uh, astonishing, worthy of taking risks for,

because, uh, they work. They work. And they work without precondition, in other words, there is no entry fee. This irks some people. They think there should be an enormous entry fee. That if you haven't swept up around the ashram for 20 years, or, you know, cooked in the monastery kitchen, then why in the world should the mystery descend and reveal itself to you? Well, the answer is, because it's the mystery, Dude. It doesn't follow those rules.

Um. So, uh, so my career, my public career, has revolved around, and not necessarily because I wanted it to, because I have a more selfish ego-driven agenda, but nobody's interested in that, so uh, what I find myself talking about is the fact that I don't know what else is out there. No single person can practice every religion, exercise every mantra, do every asana, visit every teacher, but I visited a few, and I did my asanas and I did my yantras and my tantra and all of that, and some of it was interesting, none of it was psychedelic. Psychedelic seems to be uniquely and particularly confined to these plant experiences and the experiences that clever chemists have now derived for us from those plants, by twiddling with the molecules, and it's fascinating to me, endlessly fascinating, I mean, it's the great mystery of my life, how we can live in the presence of these dimensions, and have it not be a major vector of cultural dialogue and concern. In other words, we get headlines – “Life Found in Martian Meteorite” and “OJ This, OJ That” - but we will never see a headline which says, “Pharmacologists Discover Elf-Inhabited Pharmaceutical”. Uh. It's out of category, you know? It's just not going to happen.

Now, a lot of people think – and I thought like this for a long time –and I think you have to keep fighting it off because they keep putting it on you. A lot of people think that we're on a collective cultural adventure and that if something is found, it will be found by all, and therefore, in a sense, there's not a great deal of obligation on you because if there is a true breakthrough, it will be broadcast on CNN, it will be headlined on *Time*, you will be informed in this manner. This is not a deep analysis of how things work. There is the public culture, which is designed for public consumption; hence, it is a cartoon-like simplification of reality. To allow everybody to participate, we have to dumb it down so that nobody is left out, but privately, you're not limited by this uh, assumption. Privately, you can go as far as you want, you can do anything you want.

A friend of mine - I'm still puzzling this – said to me once at the end of a long trip, “I've realized that decadence is simply actually knowing what the neighbors do,” you know? And we are constantly involved in not finding out what the neighbors do, in order to maintain the illusion of a coherent cultural advance with values and so forth. This is an illusion. This is what I mean when I say culture is not your friend. Culture is, um, a kind of mass hallucination designed for middle-aged people, because culture works best for them, you know? When you're less than middle-aged, you're trying to figure out the rules of this collective hallucination, if you're past middle age, and you've been paying attention, you know it's bullshit, and so you don't care anymore, so it's a peculiar kind of ideological fascism that is in the control of a certain age group who is leading some people in and tossing some people out because it's become irrelevant.

The reason people can get away with this is because people... uh...you have like a hormonal maturation process which is forced upon you. You have no choice about getting pubic hair and sprouting secondary sexual characteristics and so forth and so on, but by the time you're 20 or so, you are that, the change has come, you can reproduce, you can have sex, you are now an adult... adulthood, it means, you are now... the classic thing is, you can now buy beer. That's so indicative to me of what that form of adulthood means, what it means is, you are now fully empowered to participate as a complete idiot in this society. No one

will interfere. And, you know, we have some flavors we want you to choose from here, we've got the Democrat and Republican flavor, check one or the other. We have the Methodist, Presbyterian, holy roller, check 1 of 12, please. So forth and so on. You're handed all these cultural credit cards, essentially, you get the keys to the car. Not to reality, but to culture, so then if you buy into this, and it's no sin to buy into it, or it's an excusable sin, at least in my eyes because I did it. There are no other excusable sins except the ones I did, but this happens to be one of them, you accept it and you say, "Ok, well, I'll get a job, and I'll get a significant other of the opposite gender and I will fit myself into this weird paradigm," unless, for some reason, genetic, hormonal, good fortune, you are uncomfortable with it and say, "I don't want it, I want something else, I don't know what it is, but I want something else."

Well, then, it's all set up to say, "Ok, so you're a tough case, you don't want to go work at the paper box factory, so, you want something else, say, all right, check it out, go find your something else," and this breaks most people because the something else, if you're a Methodist, is not Mormonism. The something else, if you're a Republican, is not Maoism. None of these things work. The only something else that isn't tainted by the perverse nature of the game is the psychedelic experience, so far as I can tell, and there only has to be one doorway. We're not in business of finding doorways here, we're in the business of trying to get outside the cultural van. There only has to be one method that works and this, I think, is it. It is so counter-expectation and again, I don't know who I'm talking to in this room, there may be people in this room who are saying, "Yeah, yeah, that's exactly it, been there, done that, bought the t-shirt" and there may be people who say, "I don't understand what this guy is talking about, any of it, it makes no sense at all," well, what we're talking about is the fact that culture is not reality. Culture is a mass hallucination of some sort. Now, you may be able to sign on to that idea, just based on your alienated politics or something like that, but I mean something much more profound, I mean that we are living in the constant presence of some kind of invisible – usually – reality, that is inhabited by intelligence, has its own dynamic, and in spite of the fact that we pride ourselves on an exhaustive knowledge of the structure and nature of the world, we've missed this, we've missed it completely. And whenever anyone by accident or design stumbles upon the existence of this reality and comes back to try and tell the news, they have words. Heresy. Madness. And if those don't get you, Criminal Behavior! Criminal Behavior! You're saying, "Well, but, I bring news, I bring news." You know, have you read the Grand Inquisitor chapter in *The Brothers Karamazov*? He brought news, and they said, "We don't want your news, we know about that news, and we're not interested."

So. Well, so then the question might be asked, well, why is that? Why should this be so highly charged, this psychedelic thing, so that all cultures above a certain level, in all times and places, Marxists, Democrats, Monarchists, they all can get together on one thing, which is "This is terrible. And we have to do something about it." Why? The only thing that I can figure is – um, and this comes out of having analyzed both my own as I experienced them and other people's trips as I observe them - what it is that psychedelics do, whether you love it, whether you hate it, whether you seek it, whether you flee from it, the thing psychedelics do is they dissolve boundaries, they dissolve categories, they take away difference, and every cultural game is about the accentuation and stress of difference, and in the absence of the perception of difference, in the absence of uh, boundaries, there is uh, a transformative release. It's... I'm not willing to say that it's the direct descent of the Holy Spirit; it just may be relief that all this cultural constipation has been thrown off, finally, but in any case, enormous relief, by going beyond the cultural rules. Well, uh, now, most of the time, cultures function pretty well, uh, and by that I mean before the 20th century, cultures had rules, you could follow them and go into your father's business, or marry a rich man if you were a woman, and by these means advance yourself and some people were shoved into poverty but the

poor we have always with us and on and on and on.

Audience member: We can't hear you back here!

TM: I was reading your mind and spoke louder before you even rose up. But don't stop. Don't stop. My hand is weak. The mouth is strong, the hand is weak. [clears throat] Ok, this hand is weaker. [laughter]

So, what happened was a kind of Trojan horse deal. Anthropology, in some sense, is perhaps the most arrogant of all sciences, because anthropology presumes to study human culture from an objective point of view, which just happens to be the cultural point of view of the people who invented the science of anthropology. Funny, they never noticed that contradiction, but part of what anthropology is, is ripping stuff off of people: mummies, cooking utensils, folk songs, dances, plants, and you bring all the stuff back to your colleagues at the University, and you sort it out. This is the Trojan horse deal because in the last few decades of the 19th century, peyote became part of the Ghost Dance religion that was so powerful in the late Indian Renaissance and uh...uh, Datura was written about by scientists for the first time and uh, it began - the Germans were the people who led in all this, in fact it's a funny cultural thing. Try and think of a psychoactive drug that was invented more than 700 miles from Berlin. It can't be done. It can't be done. Even MDMA was discovered in 1914 in Germany. Uh, the Germans are analytical chemists, it's that alchemical strain. You know, Paracelsus, the great alchemist, is also the person who invented the idea of purified drugs, of taking plants and by washing and heating and getting out pure crystalline substances so these substances, these plants, began to arrive in the lap of Western science.

Well, knowing the style of Western thinking, you can tell, the first interpretation was, these things cause madness. And the people who intoxicate themselves with them are insane, and in fact we can study mental illness by giving people these compounds and for years and years there was this phantom thing called the schizogen and this was a hypothesized chemical that they were going to find in the brains or spinal fluid of schizophrenics, and then when they injected it into normal people they were going to exhibit schizophrenic behavior, and then we would understand that mental illness is entirely the product of a chemical imbalance, probably driven by genetic degradation and a cure. Well, then they started into it and it was very elusive. Uh, people on mescaline do not appear to be insane, there is no form of mental pathology that looks like that. And then they began to expand and look at other things.

LSD - this was again the thought, but the LSD experience doesn't mimic madness. Finally, they just, they've given up on that. When they discovered DMT, it was so dramatic in its effects that they assumed that all they would have to do is look for it in the cerebrospinal fluid of schizophrenics and there it would be. What they discovered, to their complete chagrin, is that normal people have more DMT in their cerebrospinal fluid than seriously incapacitated people. DMT is, to my mind, the one where the issues lie closest to the surface, where it all comes together in an extremely intense and difficult to dismiss fashion because the argument always put against these substances, as a general argument, is isn't this extremely dangerous? Well, with DMT, it's the most powerful of all hallucinogens and at the moment, based on the scientific evidence, I don't feel uncomfortable standing in front of a crowd like this and saying it's probably the safest. That's heart-sinking even to some old steady psychedelic hands.

If it's truly harmless, truly harmless, then there is no argument against not doing it every day. And you tell that to people and they just go gray at the very thought because this is an extremely epistemically challenging experience to go through. Uh, you know, with most of these things there's a kind of natural

course of action that mimics uh, how we're used to having drugs hit our metabolism. You take it, you don't feel anything for 30 minutes, then you feel a little bit, then you feel something, and then you feel a lot, and then you go through that, and then you come down. With something like DMT, you know, it comes on in less than 20 seconds. And so the experience is not one of a body shift but a spatial shift. The impression people have is that they have gone somewhere, not that something has happened to their body. It seems preposterous to call it a drug, because it doesn't really affect your mind, what it affects is the data that's getting to your mind. And it has been replaced - ordinary reality, three dimensional space, people, serial time, mmm, the usual markers, are gone! Gone, gone, gone, gone. [laughter] And, now, mystical expectations lead one always toward unity. It's going to be the white light, it's going to be the transcendent One, it's going to be the all in all, it's going to be the effulgent radiance of the unitary...the simple, single...you get the idea? Right?

But this isn't what happens. Instead what happens is an entry into a domain of much greater complexity than one has ever experienced before. There seems to be everything that there was in this world times 10. The other thing is, it's not reinforcing of general principles. In other words, it doesn't say things like "Love one another" or, I mean, you may draw that conclusion, but that isn't explicitly the message. The message is uh, basically, "We're here". We're here. That you have crossed this energy boundary, and look at what a low energy boundary it is. You didn't have to fly to Kazakhstan, you didn't have to...you know, all you had to do was take two tokes and hold the second and, you know, you will make more spiritual progress in those 30 seconds than 15 trips to India to worship at the feet of the Master, but the content is unexpected. It does not reinforce any religious ontology. It does not prove Kabbalah, Tantra, it doesn't prove any of these intellectual constructs. Instead what it seems to do is say, beyond all your constructs lies reality. Your constructs are not a bridge to reality, they're a boundary against reality.

When I smoked DMT, every time, every time, I go to a place...that's inhabited by entities that are not the roving free-for-all proctologists of alien abduction fame, not specialists in internal medicine from other star systems who make free house calls late at night; uh, instead, I find myself in something much more like a Bugs Bunny cartoon running backwards. Uh. It's a place of explosions and falling anvils. It's a place of merriment so intense that you could have your head ripped off by accident. It's a place of out of control hilarity and I've been there many times and I've tried every single time to understand as much of it as possible.

The argument I have with...people say, you're so harsh on aliens, people who are doing deals with aliens but you're doing own deals with aliens. Yes, but my aliens seem very alien, and everybody else's aliens seem just like the people next door, you know, they work for the government out at the base and so forth and so on. My aliens are not like that, they are as alien as aliens can be and still show up on your screen as an experience at all, they are not made of matter, they are made, so far as I can tell, in my humble opinion, of grammar. Excuse me? Yes, they're made of grammar. They are made out of language, they are living language. Well, what is language? Well it turns out we don't know. You know, William Burroughs said, "Language is a virus from outer space". That come close to it, I think. When I enter into the DMT space what I see are these, what I call self-transforming elf machines, these things which look like jeweled basketballs that self-dribble themselves, and they are like badly trained Rottweilers and they come bounding forward and they jump in and out of your chest and the people in the Amazon... this turns out to be a motif, they do jump in and out of your chest, the Hakuli, the DMT demons of the Virola bark cults, which is a DMT thing. They jump in and out of your chest and they do 2 things which are very interesting to me. The first is, they offer gifts. And the gifts that they offer are very hard to explain, I mean, you could

spend a whole workshop on this. They offer gifts which are like objects, like objects, but they're also like puns, they're also like feelings, though how does that make any sense? The other thing about them is that they're constantly changing, constantly changing, in a way that no object in this world can do. And as you look at them, as I look at them, I have the impression that, my God, if I could bring just one of these things back, I would never have to speak again, I would just show, and say look at this, and that would be all that would be required. It explains itself, it's a self-explaining object of some kind, made out of mind. So that's the first thing they do - they offer these gifts. They have dozens of them, they sing them into existence, they pluck them out of the air and they push them at you, look at this, look at this, one is pulled aside, no, look at mine, look at mine, they're crawling over you like cats or infants or something. I mean, it's very peculiar. Forty seconds ago you were sitting in some tatty room with your friends, experimenting with substances, and now this?

And the other thing that they do that I find extremely interesting is they want to communicate, and this is what, to my mind, is a strong argument that this really is an alien contact because they have a problem which real aliens would have, if there was a contact, which is they can't communicate with us. We don't speak standard Zenebelgenubian. And apparently, the nature of the contact is such that they're not interested in speaking English. It can't be done in English. So they say ok, this is the contact. Agenda #1: we have to learn to communicate or what kind of contact is it, and so what they're doing is teaching a language which can be beheld, a language that is not heard but seen, and I always thought and probably you did too, that telepathy is seeing, is hearing other people think. If I could hear you think, that would be telepathy. These guys have something else going. They can see what you mean, see what you mean, and this is something that what we all do, to some degree, it's like a latent ability in human beings as we talk to each other pictures are coming and going in our minds, but this is ordinarily not the main channel of communication and I believe that this huge paradigm shift, chaos at the end of time, end of history, whatever this woop de do is, that we're involved in, it has to do with the transformation of our language and that the reason we can't understand reality, the reason we're so puzzled by alien abductions and certain fringe kind of phenomena is because our language is completely inadequate. We do it with small mouth noises. Get a hit of how provisional and limited that is. I mean, here's how it works. I want to communicate with you, I form words, which are acoustical pressure waves, which move through space to your ear where they are downloaded into a very complex mathematical transform, which your mind, and let's not even attempt to understand what that word means, your mind takes this incoming acoustical pattern, and searches a dictionary for a matching pattern. Now, if you have a matching pattern, you get the feeling of understanding. If you have no matching pattern, you say what? What'd he say, what? But the most uncool thing that can happen in an environment where people are trying to communicate is for one person to say to another, "Excuse me, would you tell me what it was that I just said?" Immediately, it comes to a screeching halt, because in fact most communication is going in the dimension of "uh huh, yeah, uh, yeah uh yah". [laughter] No real communication at all.

We've managed to build a global civilization, an electronic culture based on small mouth noises and on having like, what, 1,000 major languages in play. The barriers to our communication with each other are staggering. It's amazing I understand myself, or even have the illusion of understanding myself, let alone the person across the breakfast table or the person 19 rows back in a deal like this, so the message I'm getting from a lifetime of involvement with psychedelics, is a message to transform language, to make it more poetically compelling and the way that's done is to appeal to the visual. The visual is what's happening. It's been happening for at least 200 years, since the invention of photography, and then color photography, and then moving pictures and then moving pictures with sound. What we are clearly involved

in, in the late 20th century, is a technological simulacrum of the world, and we want more bandwidth, more pixels, higher resolution, greater refresher speed. This is why I'm so keen on virtual reality, not because I want to have virtual sex with Marilyn Monroe or some knot-headed notion like that, but because I believe this is a technology that will allow us to show each other the inside of our own heads. We have never been able to do this. I mean, maybe a William Blake for a moment. Uh, but as ordinary cultural enterprise, the most mysterious dimension is other people. You never get at it. You can get at the flesh, you can get at the message that's being spoken or conveyed through dress and gesture, but one's experience of one's self as incredibly multi-dimensional and rich, compare that to one's experience of other people and it's a universe away (skips, recording ends).

Psychedelic Society

February 1984

Esalen Institute, Big Sur, California

Description

- [Video Link](#)

[Audience laughter] ...and I want to thank all the women who support me. I have wonderful, uh, support systems from women of all types who seem dedicated to the notion that Terence McKenna can always be improved [audience laughter]. I'm extremely grateful for that. The frontiers are enormous in that dimension. [more laughter]

Okay. What I want to talk about tonight is the notion or the idea of a psychedelic society. When I spoke at Santa Barbara at the Psychedelics Conference, uh, whenever it was, last May, a year ago, my contact lenses failed me at a critical point in my lecture and I simply had to wing it and later when I played this tape back, I heard this phrase, "psychedelic society," and I had never used it consciously in a lecture, but because I had said it, and because there had been a ripple of resonance to it from the crowd of people there, I began to think about it, and this evening I will just generally assess what it might mean for us.

I'm definitely a pioneer in this field. I'm sure you are all familiar with, uh, the, the book *Megatrends*, which is making quite an impression at the moment. Well, *Megatrends* nowhere mentions the eminent transformation of human society through the application of psychedelic drugs [audience laughter]. I don't know what were they thinking [audience laughter]. What I think a psychedelic society, what that notion means or implies to me in terms of ideology, is the idea of creating a society which always lives in the light of the *mystery* of being. In other words, that solutions should be displaced from the central role that they have had in social organization and mysteries, irreducible mysteries, should be put in their place.

The British enzymologist, J. B. S. Haldane in the 1920s, in an essay, said, "The universe may not only be stranger than we suppose; it may be stranger than we can suppose," and I suggest to you that as we look back over human history, every pinnacle of civilization whether it be Mayan or Greco-Roman or Song dynasty, has believed that it was in possession of an accurate description of the cosmos and of man's relationship to it. This seems to go- this seems to go along with the full flowering of a civilization. But, from the point of view of our present civilization, we regard all those conceptions as, at worst quaint, at best half right, and congratulate ourselves that *our civilization*, at last, has its finger on the real description of what is going on.

,

[Takes drink]

But, I think [clears throat] that this is not true and that actually what blinds us or what makes historical progress very difficult is our lack of awareness of our ignorance and that beliefs should be put aside and

that a psychedelic society would abandon belief systems for direct experience. And, this is, I think, uh, much a problem of the modern dilemma is that direct experience has been discounted and in its place all kinds of belief systems have been erected. I would prefer a kind of intellectual anarchy where whatever was pragmatically applicable was brought to bear on any situation but where belief was understood as a self-limiting function because, you see, if you believe something, you are automatically precluded from believing its opposite, which means that a degree of your human freedom has been forfeited in the act of committing yourself to this belief, and I maintain that it's pointless to have beliefs, in a sense, because the universe *really is* stranger than we suppose, and what we need is a return to what, uh, in the 16th century was called Baconian method, which means not the elaboration of fantastic thought constructs which *explain*, but merely a phenomenological cataloguing of what we experience.

Computer networks and psychedelic drugs and the increased availability of information in the world have actually made possible the evolution of new alien information states which never existed before, and we are processing these things but at a very slow rate, because we are hindered by ideology. Now, I mentioned, uh, in an earlier workshop this afternoon that, uh, Freudian models, Jungian models of the psychedelic experience, which saw it as somehow a stripping away of resistance and a revealing of complex and hidden emotions and motives and belief systems, has been replaced in the last, uh, ten, five to ten years, with the shamanic model of hallucinogenic and shamanic experience. This model holds that archaic peoples have deputized special people to probe hidden information fields using psychedelic drugs and that these- the information extracted from these information fields is then used to guide and direct the society.

Now, I'm interested in this second model and spent time in the Amazon and am familiar with the operational mechanics of shamanism and shamanic personalities and that sort of thing, but I believe, actually, that the psychedelic experience looms larger than the institution of shamanism and that *we* hold a unique opportunity which is sort of the flip side of the culture crisis. Our ability to destroy ourselves is the mirror image of our ability to save ourselves, and what is lacking is a clear vision of what should be done. What should be done is certainly not the accumulation of ever-larger nuclear arsenals and the promotion of, uh, all kinds of primate game-playing of the sort that Tim Leary is well, uh, versed in denouncing. What needs to be done is that fundamental ontological conceptions about reality have to re- be remade. We need a new language, and in order to have a new language, we must have a new reality. It's almost a kind of ouroboric equation or a bootstrap situation. A new reality will generate a new language; a new language will *fix* a new reality and make it part of this reality.

These psychedelic drugs are- can be conceived of, as points on an informational grid. They provide new perspectives on reality and it is when you connect all the points of perspective that you have on reality that a *reasonably* applicable model of it begins to appear and I think this *reasonably* applicable model, what Wittgenstein called "something which is true enough" is what we're looking for. The "true enough" mapping of experience onto theory is what we're looking for, but experience must be made primary. The language of the self must be made primary. And, anarchy carries this responsibility even when it's only political anarchy. What I'm advocating is that we each take responsibility for the cultural transformation by realizing that it is not something which will be disseminated from the top down; it is something which each of us can contribute to by attempting to live as far into the future as possible. You know, we must get rid of the conceptions of the 40s, the 50s, the 60s, the 70s, the 80s, the 90s. We must *smear* the historical moment and become exemplars of the humanity of the end time. And, those of you who attended my lecture this afternoon about time know that I believe that liberation, or let's even say *decency*, as a human

quality is an actual resonance and anticipation of this future perfected state of humanity. We can *will* the perfect future into being by becoming microcosms of the perfect future and no longer casting blame outward on institutions or hierarchies of responsibility and control but by realizing that the opportunity is here, the responsibility is here, and the two may never be congruent again and the salvation of your immortal soul may depend on what you do with the opportunity. [Audience member: "Amen"] [some audience laughter]

So what do you do with the opportunity? What does it mean to say, in operational terms, "live as far into the future as you can live?" It means taking a position vis-a-vis this emergent hyper-dimensional reality. It does not necessarily mean becoming a psychedelic drug user yourself, but it means admitting to yourself the possibility, and if you *feel* the heroic potential within yourself to be one of the experiencers, one of the pioneers, then you know what to do. If, on the other hand, you fear to be lost in the abyss, you fear what William Blake called falling into eternal death, falling from the spiral of being which connects one reincarnation to another and falling into the realm of eternal death, then you orient yourself towards the psychedelic, uh, experience, towards the psychedelic phenomenon as a source of information.

A mirror image of the psychedelic experience in hardware are computer networks. Computer networks, paradoxically enough, are a deeply feminizing influence on society where, *in hardware*, the unconscious is actually being created. It's as though we took the Platonic, uh, *bon mot* about how, if God did not exist, man would invent Him, and say, if the unconscious does not exist, humanity would invent it in the form of these vast networks able to transfer and transform information. This is, in fact, what we are caught up in, is a transforming of information. We have not physically changed in the last forty thousand years. The human type was established at the, at the end of the last glaciation, but change which was previously operable in the biological realm is now operable in the realm of culture and we are shedding cultural adumbrations of our vision of the unitary mystery at a faster and faster rate as we try to accommodate ourselves and mirror ourselves to the mystery which lies ahead of us in time and which is throwing this vast shadow of fatedness back over the entire experience of human history for everyone who has lived in it. And, previous to our own era, the only control language which could be applied to this *thing*, which was bringing people together and causing birth and death and tearing down and erecting civilizations, was *God*, and it was imagined as a self-conscious force that was leaning into the world like a cat into a fish bowl and making things happen.

Now, we have a different notion, a notion of a vector system where forces over a large area are oriented toward a- a very small space and this is what history *is*; it's an in-rushing toward what the Buddhists call 'the realm of the densely packed', a tre-, a, uh, a transformational realm where the opposites are unified, and the way I characterize this union of opposites is to say it is that realm where the body is finally interiorized, the mind is finally exteriorized. The way I think of the mind is as the fourth dimensional- a fourth dimensional organ of your body. You can't see it because it's in the fourth dimension, but you experience a sectioning of it in the phenomenon of consciousness, but that is only a partial sectioning of it, the way a plane gives a partial picture of a cone when it truncates it.

The growth of information systems is only a mirroring in masculine hardware of what already exists in nature as a fact, and it is up to us to hone our intuitions and to become aware of this pre-existent system of communication and wiring so that we can step away from the dualisms which separate us from each other and from the world. We need to realize that there is a gene swarm not a set of species on the Earth, that half the time when you think you are thinking, you are actually listening, and that ideas are remarkably

slippery things and are very difficult to trace to their origins, and that we really are one-on-one and altogether in a dimension that is not as accessible as you might not wish to be congealed [audience laughter] as *Finnegans Wake* says.

The psychedelics are a red-hot social issue - social issue, ethical issue whatever the term for it is, and it is precisely because they are deconditioning agents. They will cast doubt in you if you are a Hasidic rabbi, a Marxist anthropologist, or an altar boy [audience laughter], because their business is to dissolve belief systems, and they do this very well and then they leave you with the raw datum of experience, what William James called in talking of infants, 'a blooming buzzing confusion' is what they leave you with - the raw datum of experience - and out of that, you reconstruct a world, and you need to understand that it is a dialogue where your decisions, the projection of your grammar onto the intellectual space in front of you, is going to gel into a mode of being. We actually all create our own universe, because we are all operating with our own private languages which are only very crudely translatable into any other person's language.

There's even a physical analogue to this which will further reinforce this notion of alienation. It is that your picture of the world impinging on your eyes is made of photons. Photons are tiny wave packets, so closely circumscribed intergetically that they can be thought of particles- thought of as particles. That means that every single photon which falls on the back of my eye is different from every single photon which falls on the back of any one of your eyes. This means that I am using one hundred percent a different section of the world than any one of you is to get a picture of the world, and yet we are sitting here with the naive assumption that our pictures of the world differ only by our perspective within the space of the room, and we have *numerous* extremely naive assumptions like this built into our thinking, and our most venerable explanatory engines, such as science, happen also to be our *oldest* explanatory engines, and, therefore, they have built into them the most naive and unexamined assumptions.

For instance, science, we can demolish it in thirty seconds. Science tells you that a set of conditions will create a given effect and that every time that set of conditions is in place that effect will be found to obtain. Well, the only place where this happens is in laboratories. In our experience, it isn't like that. A contact with a person is always different. The experience of making love, having a meal, riding a bus, these things are always different. It is their uniqueness, in fact, and a uniqueness that pervades all being that makes it bearable at all, yet science is willing to tell you that the only things worth describing are those phenomena that can be repeatedly triggered. This is because these are the only phenomena science *can* describe and that's the name of the game as far as they are concerned. But *we*, to claim our freedom, to take advantage of the tiny moment between immense abysses of unknowability, perhaps death, perhaps other reincarnations, perhaps transitions into other life forms, these things we don't know, but in the moment of being human we have a unique opportunity to *figure things out*, and I have the faith that it is possible sometime, somewhere to have a conversation - perhaps no progress would be made until the ninth hour - but to have a conversation in which reality could be, literally, pulled to pieces, beyond the point of reconstructing.

I had a friend, I'm not sure that this is germane, but I had a friend back in the 60s who one day on LSD took a toothpick and he sat for fourteen solid hours with the toothpick and a large red brick and he demolished it. He reduced it to nothing (laughter) with this toothpick, and his fingernail long after the toothpick was gone, and this is what we have to do to the ideological concrete in which we are set. We have to *claim* anarchy and realize that systems have a, have a life of their own that is anti-humanist. There is definitely an anti-humanist tendency in all systems. Uh, Ludwig von Bertalanffy, who was the inventor

of general systems theory, said, you know, "people are not machines, but in every situation where they are given the choice, they will *behave* like machines." We all fall into patterns, we all then hold those patterns ever more tightly, they cannot be violated, and this happens on the thought level, and we are at the cresting wave of the historical wave of this kind of uptightness that stretches back millennia. And, I think that we have now come to the end of this phase. Whether you buy into my own peculiar, apocalyptic, transformative vision involving 2012, or whether you just can tell by looking around you that the shit may soon hit the fan, I think we can agree that we've come to some kind of a pass, and what is going to come out of it is either going to be a great deal of dislocation in the biosphere, the invalidation of intelligence as an adaption of biology, and *our* extinction, or we are going to become as James Joyce dreamed we could, "man made dirigible" is how he put it. In other words, the exteriorization of the soul, the interiorization of the body, and in this process *everything* is going to be challenged; the very notion of humanness is going to be challenged, because we are on the brink, through genetic manipulation of DNA, of actually taking control of the human form, of being able to extend the notion of art *inward* into the human body and form. Are we classicists? Shall we each be an Adonis and a Persephone? Or are we, what are we, surrealists? Shall I be a potato and you a burning leopard? [audience laughter] These are decisions which will have to be faced [clears throat] [audience continues laughing].

These are the important questions [Terence laughs; more laughing], and this vertical gain which we see in the metaphors that are applied to psychedelic drugs: consciousness expansion, getting high, psychedelic tripping, shamanic flight, all of these things are being paralleled. It's like the drugs are the s- the feminine, software, formative leading edge of what is happening. Coming along behind that is the hardware, engineering, masculine mentality that is processing all this stuff into hardware, and this will continue until the leading edge outdistances the engineering mentality through breakthrough, and this is what I think the shamanic, uh, hope is: that we can find a way to use chemicals in our bodies and our voices and our thoughts and our hands upon ourselves and each other to transform ourselves without technology, to move into the realm of the imagination 'on the natch', as it were, with an interiorized psychopharmacologically-applied technology that frees us in the imagination.

At the same time that this is going on, the engineering mentality is going to set human societies in orbit around the earth and the moon and the near planets, but there's a catch here for the engineering mentality, which is that the very void which surrounds the planet exemplifies this enfolding, abyssal, feminine element. It *is* the mysterious 'mama matrix' of *Finnegans Wake*. The mysterious mama matrix is the universe, and there is no escaping that fact, so that I think the s- the engineering mentality, which will seek to change man into his machines, will have to be counterpoised by the psychedelic, earth-oriented, imagination-oriented side of things, which will create, then, the potential for the spiritual marriage that *will be* the alchemical perfection of a new form of humanity, and this is not far away. It *can't* be far away. It must be now and soon, and it *is*, as I said.....[takes drink].....it is a personal responsibility incumbent upon all of us to act. There is definitely an obligation to examine the possibility of action and to think clearly about self and other, language and world, past and future, because too much we have lived in the light of the idea that your ideology will be dictated to you essentially by geography, and, if you're born in India, you'll find out that the Cosmos is one way, if you're born in Brooklyn, you find out it's another way. What we need to do is transcend these localized grids of fate which make us what we are but don't want to be, because you claim this higher level of freedom by the simple act of applying attention to being...the experience of being, the primacy of experience.

This is why I can get along with these people in the Amazon who do these drugs, because, though my

Spanish is terrible and often theirs is worse because they're Indians [audience laughter], '*la experiencia, senior*'. And, 'Yes, we understand, we know'. And he says, you know, because we're posing usually as scientists of some sort, 'you're from this or that university; you will return to this laboratory; you show me this paper, which has the name of my friend in it, because he helped you last year, but I say to you, *experience is the thing*'. And, the only thing you can say to that is, 'We know. It is'.

We must begin to send out ideological visions rather than be the consumers of them. We need to turn off the metaphorical televisions which are hooking us in to the network of cultural assumptions dictated from the Pentagon, Madison Avenue, and what have you. We need, instead, to *turn on* our terminals and to begin to interact with like-minded people throughout the world and establish this new intellectual order which will *be*, then, the salvation of mankind, I firmly believe, because it is a collectivity and people will then feel the inter-relatedness of their fates, feel that inter-relatedness as a thing which transcends, uh, national divisions, ideological divisions, feel the primacy of being part of the human family, and I think that it will not be done without psychedelics, because we have drifted so long without them.

Surely, we are the culture that has gone longest without psychedelics in any cultural situation throughout the world. It's been two thousand years since the mystery was real at Eleusis, and in that two thousand years, we have wandered far, far into confusion, but we are the prodigal sons. We can redeem the ideal of shamanism from pre-technological social stasis and actually project it, perfect it, and send it out to the stars. And, if we don't do this, everything is lost. There is no standing still. There is only risk and commitment to these millennia-long cultural goals that will restore meaning and direction to our civilization, or we will fritter it away into chaos and destruction and the horrors of the typical future scenario.

Thank you.

[Applause]

TM: Questions? I cannot hear you.

Q: Earlier- earlier in your talk, you mentioned the expression, "gene swarm." I'm not familiar with it. Could you explain it?

TM: Yes. I talked about this in the workshop this afternoon pointing out that the notion of species is simply a 17th century convention of biological classification begun by Linnaeus, because when you visually look around with no awareness- awareness of geological time, you do seem to see distinct, uh, plants and animals, but now that we are aware of such things as bacterial transfer of genes from one organism to another and this sort of thing, we realize that the apparent fixity of the species is an illusion and that actually there is only a gene swarm on the planet and, uh, it coagulates into centers, the densest kind of center it coagulates into we call an organism, but it also coagulates into more loosely-bound systems such as symbiotic relationships or yet more loosely-bound relationships, uh, ecotones and biospheres, and that really there are just different- any given biological center, there is just a series of concentric shells of influence going both directions outward and that's a more true view of the situation on the planet than the notion that there are distinct species.

Q [Same]: So that you would see the, the actual organisms and all that is being maybe, uh, all the gene swarm expressing itself as an interaction with the environment at that particular moment...

TM: A temporary [Q: Right] aggregates [Q: Right] of genetic material.

Q [Same]: I'd never heard that and I find it very interesting! [Laughter]

TM: Well, it turns out, when you start...I- I don't want to get too deeply into it because it's a sideline, but, uh, when you start looking at the ways that genetic material is transferred around, there are all kinds of ways. There's even been a kind of, uh, termite found in Africa where, uh, the mating charac- uh, activity is so furious that- and the sexual organ of the male insect so sharp that they actually pierce the body cavity not only of females, but also of other males, and by marking the, uh, the sperm of these insects and following it, you can discover that some male individuals are transferring sperm to females that is *not their sperm*, and that absolutely violates the central dogma of Darwinian evolution which is that the genetic material, the transferability and adaptability of the genetic material is directly linked to the adaptability of its carrier. But, here you have a situation where the owner of the sperm may be dead, because he was non-adaptive, but the sperm, because it's in the body of a more adaptive insect, is, uh, actually having an impact on the expression of the phenotype. So, that's very technical, but anyway, genetic material moves around in all kinds of ways, and I'm sure there are more ways soon to be discovered.

Q: Politically speaking, what would be some of the first steps to integrate psychedelics into our culture?

TM: Well, harking back to my notion that the responsibility always rests on us and that you don't want to go out and immediately form a movement to change *those* guys or *that* bureau. I think the thing that should be done is: people who are involved in psychedelics should live lives of such exemplitude and impeccability that the notion that there was anything shady or wrong or curious about this phenomenon would be ludicrous. [audience applause] [Inaudible] ...I've thought about it. See, I don't (??)

Any other questions? Then, thank you very, very... Yes?

Q: I- I'd like to have a clearer vision of how you would see a psychedelic society, in that, if we were able to demolish a lot of the belief systems that we do operate under, what would - how would we relate to one another? How would you see that vision unfolding?

TM: Okay. Well, there was a French sociologist about fifteen years ago who had some vogue and then faded - I don't know what his sin was - but his name was Jacques Ellul, and he wrote a book called *The Technological Society*, and in there he had an axiom, and the axiom was: 'There are no political solutions, *only* technological ones; the rest is propaganda'.

Q: Ahh..

TM: What a psychedelic society would do, I think, is it would rationally solve problems. The first thing to notice is that we could pave the streets with gold if we would just eliminate defense spending. In other words, our limited energy resources are not being allocated in such a way as to move us toward survival. We have to begin to solve our prob- our problems using solutions that are present at hand no matter who they offend.

Q: So, there would be a value system in operation then?

TM: A value sys- a humanist value system. It's very interesting that- to me that the - what are they called, 'the silent majority'? - that the way in which they name their enemies is 'secular humanists'. This is the only intelligent thing they ever say; it's the only intelligent phrase in their entire repertoire, but it's fascinating. We *are* secular humanists. That's precisely what we are. We believe that mm- human beings are to be the measure of all things. That there is no other standard - not a classless society or God Almighty - there is no other standard but man, humanity, people. And, this is a Renaissance ideal that was first enunciated by Marsilio Ficino in 1510, but we have not acted upon it. Uh, we have not, up to this time, *had* a secular humanist society. We've had had this curious mix of medieval remnants in the, uh, religious department, gangster capitalism in the economic department, uh, s- stasis-seeking Marxism as a counterpoise to that. We have never rationally tried to solve our problems, and we have never rationally tried to solve our problems, uh, on a personal level until the advent of, uh, well, psychology, in the modern sense. People never examined the center. They thought of the center as a mirrored bead and that - you didn't ask questions about the self or motive or the relationship of your world view to a trauma, expectation, class level. The- all of these things we have become aware of as we have steadily retreated from the illusion of a, of a world deployed in three-dimensional space, and we're only at the beginning of this process.

For instance, I mean, I am - I - I don't say this to knock Esalen; I say it as an example - I think Esalen is definitely the cutting edge of things and has been for some time, but isn't it preposterous that Esalen operates under the laws of the United States, which make taking these drugs illegal? They must do that. They must do it. They have no choice, whatever their private opinions may be, and all institutions are in that, uh, bind. There's no such thing as a revolutionary institution; there are only revolutionary people, and this is why this de-emphasis on belief systems and they, their, um, support systems, which are institutions, seems to me the essence of the psychedelic message. It's a, uh, it says, 'be against method; don't be enslaved to method; embrace anarchy'. Anarchy has a bad name, because in the political arena, it's a weird number, but in philosophy, in science, in love, and in human relations generally, it seems to me it is the most, uh, respectable system based on its track record.

Any, any others?

[some inaudible talking in audience]

Q: Was there, uh, a is there any truth in, um, um, Jung's point of view that, that there had been a certain amount preserved in Tübingen University that he tracks back to a lot of myths [TM: Well, uh..] to a secret art of [indecipherable]..Tübingen, which was [indecipherable]?

TM: Well, this is a game you can play, yes. I mean, he- hi- his view of it was very, uh correct. There are these lines that can be traced back. Gnosis. I didn't use this word tonight: 'gnosis', nor did I use the word 'Logos', but these- this notion of an accessible truth, which is self-evidently true when heard, is very close to the notion of the collectivity of the psychedelic society. My idea is that we could change the mys- the Logos of the mystery religions from a religious mystery into a social reality and *that* would be a social transformation, because it would essentially sacralize the secular humanist society that I mentioned.

Yeah.

Q: I've been picking up a, a sort of an urgency of, uh, 'we gotta do it and do it now' type of thing as far as shamanism. I- I couldn't quite understand why I can't sit back in my stupidity and continue this, you know, practice. Is it because we're coming to, uh, man can destroy the world?

TM: No. It may be related to that. We can't know about that, but for sure what it's related to is that your human existence is a unique opportunity.

Q [Same]: So it's only the opportunity; there is no great urgency as far as you see it. It's not a matter of, 'We gotta do it now, because we got ourselves into a, a bind and if we don't get, uh, the realization or the knowledge of, uh, [indecipherable] with, with

TM: If we don't do it, someone else will. That's my faith. But, there's only one game in town, and if you want to be part of the adventure of being, you have to get your feet wet and that means you have to get committed in some way.

Q [Same]: So if it's not done now, it'll be done in a hundred years from now.

TM: This is coming. I mean, this wave has been rolling toward completion since, uh, before the breakup of Pangaea. This is the big picture. Yes, it's coming. The monkeys are going to the stars, whether smoothly or not so smoothly is not clear, but the monkeys are going to the stars and they're going to take everyone with them, and it can be a relatively smooth birth with no tearing and no bleeding and everything just moving right along, or it can be holy hell and leave the Earth a smoking cinder before it's over with, but, uh, the monkey thing, the information creature, is definitely on its way to the stars. I don't think anything can stop that. If you wanted to stop that, you had to get back there before the pyramids [audience laughter].

Well, thank you very much.

[Applause]

Terence McKenna: Today we have a treat, because you don't have to listen to me, which is the first time this has happened. It's a measure of the insular and parochial nature of my ideas that I wouldn't let anyone else address you. I haven't even read you anything in the time that we've been at this. But today we have my old, old friend and dear colleague, Professor Ralph Abraham of the University of California at Santa Cruz. Ralph is an accomplished tabla player and dynamicist. He is familiar to you, because when I mention my cabal, it is the Sheldrake, Abraham, McKenna cabal. We built a high ivory tower against all who lay siege to it.

Today Ralph will talk about what he described to me as modern-day Cassandras who can be trained to look into higher-dimensional space and to prophecy in an oracular manner for the kings of corporations and affinity groups such as ourselves. Ralph is a psychedelic pioneer in mathematics, music, and the art of love. He can speak for himself. Please welcome Ralph Abraham!

Ralph Abraham: This is what I came for, Terence: your introduction. Now I'm happy. I can go home. I don't know about the high tower, though. I think of it more as a green ring, and maybe it's the Cabala, which is the feminine of cabal.

The fact that you are here to listen to a religious leader, Terence, gives me a clue as to what you're interested in. I'm not sure if there is any overlap between my field of interest and yours, other than that there's a certain heart feeling in this place, which has drawn us all here. But to improve the fit, I would like you to prompt me with questions -- especially you, Terence -- to give me a target.

TM: There's been a lot of talk about the psychedelic experience, but we haven't spent much time on techniques, and on the personal assimilation of the experience. We talked about waves of gylanic resurgence in pre-history. I'm pushing this new idea that we are really the children of a disturbed relationship. We had a symbiotic relationship with hallucinogenic plants in pre-history. Later, climatological factors and the drying of Africa pushed us into the historical dominator mode, and we've been in it ever since. We've looked at the time wave, we've talked about fractals, we've talked about modeling the Tao. We talked about attractors, and whenever we talk about these kinds of things we mention you, Ralph. You have been held up as the guy who could shed light on the mathematical end of the jargon scale.

RA: Well, the very idea of the gylanic resurgence wave, the GR-wave, is part of the technical end of the jargon scale, because the GR-wave concept is a mathematical model for history itself. These terms were introduced by Riane Eisler in her book, *The Chalice and the Blade*. She is one of the first cultural historians since William Irving Thompson to use this particular strategy for understanding the complexity of life. She is a feminist revisionist of history, and the primary partnership she points to, and from which she derives the name "gylanic", is the partnership between the genders.

Today we exist in the ambience or in the shadow of a fantastic GR-wave that broke on the beach in the 1960s. It was probably the biggest one since the Italian Renaissance.

The word "resurgence" itself is a mathematical word. It means that something happens not only again, but again and again. Resurgence means recurrence. A periodic cycle is a recognizable pattern suitable for prediction. Hopefully there will be another GR-wave and another one. Between the big GR-waves in history there are a bunch of wavelets, and between any two of those there is another sub-wave, because not only does history have a fractal nature, but gylany is a fractal concept which loves fractal resonance, and which must always manifest as fractal waves.

So we have waves on top of waves. If you restrict yourself to the biggest ones, there is the Neolithic, that's a big one! when farming began. Is farming gylanic? Well, in the history of gylany there are the global climate cycles, and then there are smaller climate cycles, and then there are the teeny wavelets of climate. The biggest waves of climate are the ice ages. Glaciologists argue whether they have a hundred thousand-year cycle or a forty-one thousand-year cycle or a twenty-five thousand-year cycle and so on. All of these glaciologists are correct, because the pattern of ice, the pattern of the global change of climate, is not periodic; it's more a fractal wave-length.

Gylany, the partnership form of culture is characterized by peace, happiness, and by sex, drugs and rock-'n-roll. It is part of the inter-glacial cycle. When the planet has a fever, we get cultures like that. The heyday of gylany for this inter-glacial period was the Neolithic. Then after the patriarchal takeover gylany was repressed into the unconscious, out of which well up GR-waves in the future.

After the patriarchal takeover, gylany became part of the so-called mystery schools. That means that you weren't supposed to tell. If you partook of these rituals, you told about them at the risk of death. In ancient Greece, mystery schools were accepted. We don't know exactly what psychedelic was used in the nightly rituals of the Eleusinian mysteries. There are no written records, and to this day we don't know what went on there.

There was a kind of limited tolerance for gylanic resurgence on an annual basis in ancient Greece, but after the onset of Christianity, a very interesting bifurcation took place. There were a few centuries of a kind of gylanic Christianity, after which patriarchy came to the fore, and at that time, the Orphic, Dionysian, Bacchic rituals characteristic of gylanic society were increasingly suppressed.

Starting from around the seventh century A.D. until the present, we have the era of suppression of gylany, out of which the gylanic resurgence wave welled up. We, like the students in China, are trying to reclaim our planet from the insanity of the (androcratic) form, a quest which may never end.

The chart of the progress of gylany over the centuries is Terence's time wave, which is a mathematical model for history.

TM: It's the cyclic ebb and flow between what Ralph calls gylany, i.e., the partnership society of pre-history which emphasizes group values and sharing and multi-tasking, and the dominator model. We're trying to transcend matriarchy/patriarchy, because that is not what it's all about; it's not between men and women. There are two modes of expression. One is partnership, the other is hierarchical domination. What Ralph calls gylany is the episode in pre-history when all of these values were being expressed in the central Saharan societies.

RA: There were gylanic societies; the last above-board one was Minoan Crete, and that ended around 1400 B.C. when Crete was conquered by patriarchal Mycenaeans. For a long period of time, until around 4000 B.C., the planetary society was a gylanic one. It was characterized by the equal partnership of the genders, by peace and creativity, and by a certain religion which covered the entire planet. It was a goddess religion; sometimes the triple-headed goddess, the goddess trinity; sometimes the goddess with the boy god, the child god -- her child -- the result of the creativity of the goddess; and sometimes with a consort.

As we neared patriarchy, there was a gradual demotion of the goddess and the gradual promotion of the god, until finally the goddess disappeared and her statue was replaced by statues of Apollo. The Eleusinian mysteries that were celebrated under the statue of Apollo, as a matter of fact, were goddess rituals imported from Crete, from the last gylanic culture. The statue of the goddess had been replaced, but not the rituals.

To help us understand history we might have a chart of planetary society at a given time, represented by one number, a point in the spectrum between gylany, or partnership society, and (androcracy), or the dominator society. As history evolved its own history, more and more indicators were taken into account. Vico, one of the first mathematical historians, said that societies evolve like mammalian species; they have a beginning, a middle, and an end. The first step, where a tribe becomes a culture, is through the development of three primary cultural structures: religion, death rites, and matrimonial rights. As he saw it from his eighteenth century Italy, these would be the three necessities for a culture to evolve. After that, it gets more and more complex.

We could try to represent the planet, a particular town, or even a little community like this one, with these three parameters. We could hand out questionnaires, record the replies and get some kind of numerical measure of the quality of religious activity, the care with which the burial rites and burial plots are maintained, and the nature of matrimonial rights. In early Neolithic times, dead bodies were thrown under the house. That was it. But funerals are very important social events in Ireland even to this day, which gives us a clue as to what they were like in the past.

In the '60s, matrimonial rites more or less died. A few people celebrated by taking acid on a mountain top during the full moon, but basically, the ritual disappeared. One reason was that it was believed to be intrinsically evil. In the patrilineal line, property won in war passes from father to son. That means that the most important thing to know about the son is who is the father, which makes it necessary to have a marriage contract of monogamy. It's easy to know who the mother is, but how do you know who is the father? The monogamous contract aspect of the marriage ritual is just part of the patriarchal package.

So, when there's a gylanic resurgence, one thing that's bound to happen is the radical change in the specific

agreements of the marriage contract and the burial rites, and in the religious practices as well, according to Vico. If we want to measure this with questionnaires, we can sort of locate ourselves at a point in a three-dimensional map. Some years later, if we hand out the questionnaires again, it will all be changed.

In the '60s, there was a big blip. This blip could be observed not just one-dimensionally, but as a curve in three-dimensional space. This game, which I might call mathematical modeling of history, has progressed over the years with more and more sophisticated models. With chaos theory, people acknowledge that a person, a society, a tree or any living thing has essentially infinite dimensional representations. Any attempt to simplify, to throw out complexity by reducing it to a simple model creates a boundary war.

Let me say something about mathematics. The very word elicits fear in everybody. For more than thirty years now I've had consultations with people who are scientists, and I have hardly encountered a single person, including a Nobel Prize winner in theoretical physics, who doesn't have a math-avoidance response. That's because our culture has made mathematics into something unnatural. But we can't understand any dynamical process, whether it is the process of our own relationships, the history of our society, or the gradual change from year to year of the memory of our experiences of the 1960s without mathematics, because mathematics is simply the act of making cognitive representations of these complex and dynamical events. Without them, we couldn't walk down the street, we couldn't find food. When a dog goes to the other end of the property and locates something to eat, this is an activity of mathematical intelligence. We use it all the time, and I'm just trying to describe a view of history that leads up to the fulfillment of Terence's promise, which, in case anybody has forgotten, I will ask Terence to repeat.

TM: You mean the notion that history comes to some kind of tremendous crescendo, where it's all wrapped together into a nutshell?

RA: No. That was yesterday's introduction. Today it was explicitly psychedelic. So I'm going to explain why psychedelic training will be necessary for us to create our future.

TM: Oh, yes! Do that.

(Audience laughter)

RA: On demand. For you, Terence. For you.

TM: I need to hear this.

(Audience laughter)

RA: Well, I just got back from Denmark, where I was entertained in a splendid palace in a suburb of Copenhagen by the IEA, the International Economic Association. This is a group of professional economists who are employed by kings and governments to predict the future. They have inherited the Cassandra role, because each person's welfare will depend upon the wisdom of the finance minister when he cuts some ridiculous deal like giving forty tankers of wheat to Libya or something. These people are important to kings and governments; they have a technology, largely mathematical, and they have international conferences where, within limits, they exchange some of their secrets because they have to get some of the other guy's secrets. I was there because they had discovered that chaos could be an important secret, and if some have the chaos technology and others don't, they would get ahead in

whatever game they think they're playing.

When I was resting between sessions from the exertion of trying to find out what these people were about and evolving this little description I just shared with you, one man came up to me and said, "Hi, Professor. I've been reading your work. My name is Lars Peterson, and I'm in the finance ministry here in Denmark. I read in Jim Gleick's book that you say that chaos is the biggest thing since the wheel. Do you remember that you said that?" I said, "Yeah, yeah." He said, "Well, we took your advice and used chaos theory to analyze our data. And then we read this other paper where you said chaos was really no big deal, that what we really need is complex dynamical models. We read your instructions, we made a complex dynamical model, and we had it running on the computer in the finance ministry with a model from the Danish beer industry, and it produced data which agrees very well with the observed chaotic data. We tried to explore this model which has parameters that have to do with the progress of the economy in the neighboring countries. Well, there are twelve of these control parameters, so we have a map in twelve-dimensional space. We followed all your instructions, so now we have a map of our finance policy, and the map is in twelve-dimensional space. You've given us no technology to understand objects and motions in twelve-dimensional space. Now what do we do?"

He showed me some crude attempts at computer graphics that looked like your typical fractal, and this fractal was the map they were trying to use for navigation of the national economic policy. So they were worried. They were very worried.

I had to admit that we were stuck, because we had arrived more or less at the frontier of the computer-aided applied mathematics of our society, in spite of chaos, fractals and so on. We're stuck with this. We do not know how to visualize motions in twelve-dimensional space, in sixteen-dimensional space and so on. Obviously, we need to develop a strategy for twelve-dimensional visualization. We need to utilize the experience of artists. Artists have always led us in the expansion of the dimensionality of our view. Our capability of viewing is advanced by artists. And now we're at a frontier where our progress is inhibited by a limitation of dimensions in viewing. Undoubtedly, computer graphics will be the technique. Computer graphic arts are limited at the moment by the lack of practice in viewing higher-dimensional spaces. Meanwhile, psychedelic pioneers are always talking about hyper-dimensional warps. It's a dance. Right? It never stands still in our psychedelic travels. I think hyper-dimensional is correct, not infinite-dimensional. There are large numbers of dimensions we have been privileged to view directly, which we apparently have no difficulty in understanding. We can verbalize about them, we can remember them, we can think about them, and we can return to them to explore them further. There's something about the naturalness of the artistic experience which makes it the fundamental one needed for the current advance of mathematics, of science, and of technology.

TM: So this is an endorsement of psychedelic training. Ah --

RA: Well, people will have to learn by having the experience. I mean, I don't know how to get started when you have people who are completely blind to fifteen-dimensionals.

TM: How do you begin to view fifteen-dimensional space? You just toss them in and see if they come out?

RA: Well, maybe the big blessing of the mushroom is that there is this easy back-and-forth between the higher-dimensional reality and ordinary reality, so that while you obtain training in visualization without stress, you can also practice its relationship with ordinary vision. For example, you can open your eyes to

see a flower, and then close your eyes and see the aura of the flower. You know what I mean? There is kind of a voluntary back-and-forth, and a spectrum of decreasing dimension between the psychedelic vision and ordinary reality.

This bridge, I think, is very important. It's not enough to learn the navigational arts for flying in the higher realms -- we have to earth this intelligence in order to create the possibility of a future. Gaia is a living planet; its atmosphere, its hydrosphere, its biosphere, its noosphere, all these are interlocking in an essential way, and our future may depend on our learning to understand a system of such immense complexity so that we can guide our evolutionary consciousness. Either that, or humankind should stand aside and let evolution do its work. That's why I think the psychedelic experience has an important role to play in the progress of social evolution, and even of technology.

TM: When you talk about penetration of a higher-dimensional space, which means many things to many people, do you think that psychedelics amplify the morphogenetic field, or that they somehow amplify awareness of it? Do they add a dimension to the ordinary three? There also seem to be other dimensions added that are not related to the time scale. Is that how you see it?

RA: Well, let's find a common ground for the word "dimension". Dimension is an ordinary English word, and it's also technical jargon of mathematics. One of the things mathematics provides us with, one of its greatest gifts, is an explicit, useful understanding of dimension. There's one dimension, there are two dimensions, and there are three dimensions. Here are the three dimensions. That's kind of the mathematical way of thinking. So as far as what we see around us, if nothing were moving, we have three-dimensional space. Within the three-dimensional space, we have maybe a color, which is a three-dimensional object, so there's six dimensions that we're moving in all the time, ignoring the dimension of wind in our face and of smells and so on. We live in a six-dimensional space of snapshots that keep changing, so there's the six plus one, or the seven.

TM: To simplify the way we've defined dimensions here, they are simply variables. Each dimension represents a variable. If you have sixteen variables, we're moving in a sixteen-dimensional space. This opens it up for people -- they're not being asked to conceive something inconceivable. What you're saying is that every time you add a variable, you add a dimension. Therefore all complex situations are obviously extremely high-dimensional.

RA: But there's a difference between the dimensions and our perception of dimension. By taking photographs, for example, we can only record six dimensions. Let's take a computer model of the nuclear club, or of a society of four superpowers. We have a mathematical model for this as a sixteen-dimensional space with certain solid objects in it which may be very important for our future, because they represent peace and war. We want to navigate in this space, and the fact that we understand that the model has sixteen dimensions is not enough, because we have to learn to visualize, to understand, to grok that space, so that we can see where we are, where the obstacles are, how we can get from where we are to where we want to go by avoiding the obstacles. We need to find a way to interact.

There are flight simulators training pilots to land aircraft carriers, and there are computer-graphic devices with a (datacom) for each eye, a speaker for each ear and gloves that allow you to interact with the computer; but basically, you're seeing or hearing a very limited number of dimensions. The fact that there's a successful sixteen-dimensional model won't help you navigate or land your plane, because you can really only navigate in six dimensions plus time. That's why I think we need to train people to feel at home in

these higher dimensions, like dolphins, whales and bats are capable of doing, thanks to sonar. They are very much at home in higher dimensions. I think the only reason that our mentation is restricted to such a low dimension is because homo erectus has evolved in the context of running through the woods and swinging from tree to tree; we are devoted to a physical representation of the world with a limited amount of dynamic in it. We do not have to understand fish schooling. We could never understand bird flying; we don't have the dimensions for it in our evolution. But we could. Why not? So kids who are apparently wasting their time with video games in arcades around the world are actually training their minds for a completely different perceptual and cognitive strategy.

TM: For coordinating in a higher-dimensional phase space?

RA: Exactly. They're learning to land the helicopter on the tall building in a sixteen-dimensional space.

TM: You're saying something very interesting, Ralph. You're saying that the psychedelic dimension is not another dimension, it's this world, but with more dimensions.

RA: I would agree with you that psychedelics amplify the morphogenetic field. No, they don't amplify the field; they amplify our connection to the field, so that through resonance, we obtain a stronger image. What do you think? When I trip I feel that I'm seeing something real, that it has at least as much reality as this reality. There are the repeated visits, the learning, the successful negotiation of conversations with live entities. It has every aspect of reality. All that we are familiar with in ordinary reality is there in extraordinary reality. One thing that we do not doubt is its reality. We don't call it hallucinations. We don't think it comes from the unconscious. This super-ordinary reality that we visit happens to be a higher-dimensional reality, and we can only image it to the extent that we are able to image it. Those of us who have taken repeated trips over a period of time have learned to image more, so that we get more dimensions represented by some mysterious trick in our ordinary consciousness, by vision, sounds, smells.

TM: By deconditioning?

RA: By reconditioning, by training, by restructuring --

TM: By retraining the Newtonian perspective. The perceptual perspective of the Renaissance was both a liberation and a prison. It gave permission to inhabit a new kind of dimensionality for culture, but then we got hung up on it. We can't seem to go beyond it. We can't seem to realize hyper-space culturally. We can only realize it individually through the psychedelics, and then only temporarily. What the true believers want is some way to image it collectively.

RA: Well, that's why I've been working with computer graphics these past ten or fifteen years. With computer graphics, the idea is to try to find a way to share the experience with people who are not going to have the experience. The advance of the art, the evolution of consciousness, is a saltatory story, it has episodes that are catastrophes.

There may be a restriction to an agreed-upon conceptual reality over a period of many centuries. Suddenly, these artists will bring in perspective, they'll make a leap from two-dimensional to three-dimensional representation. The particular perspective in the renaissance was due to the fact that drawings could be put on the wall -- they didn't need video, they didn't need computer graphics; they could draw it and put it on

the wall. Anyone who stares at a drawing for a while, particularly with a little instruction from those devices in the museum where you put a quarter in, can get the idea. So everyone's perceptive capacity, as far as dimension is concerned, can be increased from two to three.

With this recent GR wave, the increase in capability of perceiving dimension has not been shared. The pioneers who experienced this have not found a way to draw and put it on the wall. But I do think that with computer graphics we are close to a time when adequate super-computers for making some kind of reproduction of the visions we've seen will be here; an affordable machine at a work-station level, say a hundred-thousand dollar machine, will be placed in museums like the Whitney Museum of Modern Art, and will be showing things that we've seen, and anybody who watches it will grok it, as we did when we first saw it.

TM: That'll be the ball game.

RA: I expect so.

TM: I believe, and I speak for myself but I assume that everyone here can say the same thing, if I could show the world what I've seen, the world would never be the same. I mean, isn't it true for every one of you that you have seen things that you knew would change the course of history forever if they could be shown?

Q: How do you get it on the computer?

TM: How do we hang it on the wall, Ralph?

RA: Well, it's time for me to give mathematics a little plug. Mathematics is our heritage, it's a natural activity. The language of the morphogenetic field is mathematics. The work of mathematical specialists over these past few centuries has provided explicit algorithms for recreating this reality on computers because it is a mathematical reality.

Q: Maybe you need to begin by teaching mathematics, because I am one of those who are never sure of how much seven times eight is.

RA: Seven times eight is business practice, and mathematics is when you jump in the pool in the sunshine, and there's a pattern of light and dark on the bottom of the pool. There's a relationship between your motion in the water and the dynamic of that pattern. We then have two different things, both dynamic, both complex. One is your motion in the water, and the other is the pattern of light on the bottom of the pool. They are two different things, and yet they are related. We understand that relationship. That's mathematics.

Q: What I'm getting stuck with, in terms of things like the psychedelic experience, is the sensation of touch, of taste, of sound, and the emotions that are created, which to me are part of my grokking. I can look at a reproduction and have a fantasy about what the underlying substance is, but what I'm trying to get to is a point where I can see, I can touch, and concurrently have internal emotions. How do I reach that experience with some type of external machine?

RA: That's the question, all right. What I'm speculating, and this might turn out to be wrong, is that in

reproducing a small fraction of a complex experience, the rest of it can be sort of excited by resonance in the mind, much as we use language. By saying a word, and I always regard this as a miracle, I can evoke in you a whole experience, which, although we have no way to check it out, we generally accept in ordinary reality. Blue. Now, we have no way to know that what I see as blue is what you see. Nevertheless, we assume, and somehow it seems correct, that there is a universal experience, and it's possible for a complex experience to be excited by a simple one. Otherwise, language wouldn't work. I'm always amazed that my students are able to get a mathematical idea from the representations that I use in conversation or draw on the blackboard. You draw, you talk, and these simple representations awaken in the mind of the student the entire mathematical concept. Mathematical concepts cannot be reduced to words or drawings, but the multiple representation is a kind of simulated telepathy.

So, while I agree that the experience I would like to share is much more complex than a visual pattern, I have the feeling that the visual pattern that I've seen is already beyond the visual pattern that other people can see. There is sort of an intermediate or first step in the direction of fuller communication, for which additional steps would be necessary. I have no idea how to proceed towards it.

TM: I have this wonderful vision of taking a hundred-thousand dollar machine and spending five-hundred-thousand dollars on software to create this model as the first step in "Grokking 101", and then handing the students a ten-dollar tab of acid to go through the whole course!

RA: Yes. It's sort of a program to subvert culture and alter the course of history, yet we are not able to do it by giving out LSD. I hear that many people are taking LSD now, yet they're not having the kind of experiences we had. It's sort of a desperate measure to rely on modern technology to help communicate experience.

Question: The difference between the two is that one is a shared experience, while the other is an individual experience. What you're really saying is something about the need to share.

TM: That's right. Somehow, the importance of the psychedelic experience lies in communicating it. No matter how good it is, if it can't be communicated, there's an element of frustration. For people like Ralph and myself, who take it seriously, that gives us power over it. For people who don't, it's smoke. For us, it's potentially a mathematically describable object. We turn it into something which, hopefully, can be communicated. This whole discussion revolves around this theme. We talked about it the other day -- we invoked it, but we didn't get anywhere with it. The fact is, Ralph, that the whole game hinges on the huge unlikelyhood that mathematics is making a statement about nature, and that this appears to be a synchronistic event. There is no reason why mathematics, which is the internal peregrination of the human mind in the realm of abstract quantities, should not be mappable over the world of natural phenomena, and it's been worked ten ways from Sunday ever since Pythagoras noted that ...

Q: Weren't mathematics invented to describe nature and behavior and all the rest of it?

RA: Well, actually, no. The common view is that mathematics, as Terence has just said, arises in the human mind after a process of mentation. But I take issue with this view. Certainly mathematics is not inspired by the inspection of nature. That's why people like Einstein and Wigner, who knew mathematics intimately and used it in making models of reality, were awed by the fact that there is this mysterious fit between mathematical objects and objects in the phenomenal universe. I don't agree that mathematics

comes from the observation of nature, and I don't agree with Terence, Einstein and Wigner that it comes from human mentation. I think that mathematics enters the human mind through a process of resonance with the morphic field. Animals had mathematics before humans. Animals count, and they know dynamics, and they have sonar and so on. Animals obtain mathematics from the morphic field, and so do humans. This morphic field is part of Gaia, the living Earth, so I call it the Gaian mind. Mathematics exists in the Gaian mind, and conscious minds, spirits, may obtain it by a process of resonance.

TM: Are you saying that mathematics is the archetype of nature in the Gaian mind? That's kind of a Gaian Platonism.

RA: Mathematics in the Gaian mind is beyond nature. You see, nature is only one product of the Gaian mind. The Gaian mind contains much which will never be manifest in nature, some of which we have seen in our travels, and we don't expect it to be manifest in nature. The Gaian mind is capable of play in such ways as may never be manifest in the world of matter and energy and in all this slow, dense, soft stuff. Now this view cannot be verified, and no support for it can be found in the literature of philosophy or mathematics. Let's just accept this idea for the moment and see what we can make of it. If mathematics is a spin-off of the Gaian mind, or the morphogenetic field, or a higher-dimensional reality, or the phenomenal universe, nature, relationships among people, and so on, it would be no great mystery that mappings are possible between mathematical objects and phenomena in the energetic universe. It would mean that the Gaian mind has a certain amount of integrity, of coherence, of self-resonance, that it makes sense, as it were.

When we travel outside of ordinary reality and take a flight through the Gaian mind, our overwhelming experience is of integrity. It all goes together extremely well. That is one of the main lessons we bring back and may even be able to share with people without the necessity for computer graphics or acid. Integrity has always been a message of spiritual minorities, from the Theosophists on down -- the integrity of Higher Mind. That's why I think mathematics is useful in pursuing life and understanding what's going on around us. It's useful also in understanding aspects of the Gaian mind which are not manifest. It's not only useful -- it's our heritage. Each person may obtain as much of it as they please by solely making use of resonance with the Gaian mind. It is there, it is natural, and it's another alternate reality besides ordinary reality, as easy to grok, or travel through, explore, learn, enjoy or play with as ordinary reality.

I can tell you, on the basis of my own experiences in traveling to different realities, that they are all pretty much the same. There is an increased dimension as you get off the Earth. That's about it.

TM: So evolution, after 2,500 or 5,000 years of mathematical speculation, suddenly gives rise to fractals and the discovery of mapping that goes on between fractals and organic nature. This is serendipitous. Is it fair to say that the Gaian mind exists on many levels and provides many maps? So that catastrophe theory, dynamics, fractal curves are all approximations of the mystery?

RA: Well, they're different low-dimensional representations of the mystery. They are simple pictures guiding you to a simple understanding of more complex things. They are stepping stones to the stars, as it were.

TM: But the integrity of this other dimension seems to make it the source of our authenticity. We don't relate to it as another dimension. We relate to it as a higher dimension in a spiritual sense. Why do the

lower dimensional slices lack this integrity?

RA: Well, in higher dimensions, if you had a solid object and you sliced it with a lower dimensional knife, you might obtain some disconnected pieces; the lack of connection between these different pieces appears because you sliced off the connection in higher-dimensional space. In our culture, there is the common belief of the individuality of people. The Masters claim that we are individuals and that we may pursue our individual development through individual meditation.

TM: The equivalent would be to kill somebody and dissect them?

RA: Yes. The pattern that connects is simply an object in higher-dimensional space, and these space-time patterns in higher-dimensional space-time are the fundamental objects of existence. They are the "morphs" of the morphogenetic field. They are plain objects, but they are higher-dimensional, so we try to grok them from lower-dimensional projections. One of the things lacking is integrity, apparent integrity.

TM: In a way, this is nothing new. What is new is the dimension of awareness of the process even in the history of the evolution of lower organisms. Evolution can be seen as the conquest of dimensionality, right?

RA: That's why I think computer evolution is important. You see, the computer is not like the steam engine. The computer revolution is not like the industrial revolution. The computer phenomenon is something that is evolving, and its evolution is not going to stop. One of the insidious effects of this evolution is that, as it were, a new species is upon us. Fortunately, at the moment, it's very friendly. They don't eat us. They make us slightly sick if we sit with them too long, but they are quite benign.

One of the effects is the chaos revolution -- chaos as mathematical objects which are revealed through computers. This is kind of a cure for the historical accident that happened in 4000 B.C., when the baby was tossed out with the bath, causing chaos mathematics to be lost because of the worship of Yaweh and other patriarchal gods that honored order above all things and erased chaos from memory in the human mind.

But chaos was never erased from the Gaian mind. And the chaos models that we know now, through the invention of the computer, were there all along. Not only were they there all along, but they were known, used, and worshipped before 4000 B.C. So because of a cultural accident, we have been deprived of conscious awareness of a certain mathematical model which is crucially important at this time in our history, because without it, we can't understand anything that is going on around us. All complex processes are chaotic. This understanding is now restored to us after being ripped away, cut off, annihilated, amputated by the patriarchal religions. If it hadn't been amputated, we wouldn't have needed the computer revolution to restore it. We lost the chaos model, we got the computer revolution, and the computer revolution regained it, and how it did it was by giving us control over more dimensions. It overcame a weakness which was just a cultural/historical accident, I suppose.

TM: Are you saying that chaos theory is the religion of the Gaian mind?

RA: Yes. The fundamental and favorite objects of the Gaian mind are chaotic attractors and their bifurcations. That's why all living things are fractals. They are all materializations of the same chaotic object in the Gaian mind.

TM: So here we're coming very close to politics. I recently proposed that we form what I called the () Anarchist Internationale. Our motto would be "Chaos is order". We would embrace it as a cultural ideal. The patriarchal mind is horrified by this, because chaos implies lack of order and of control. But who linked order to the notion of control? Anarchy is permission to be in Tao(?), and Tao is what you're talking about -- the chaos which is the religion of the Gaian mind.

RA: Yes. Chaos is not in conflict with order. What we are seeking, and what I suppose was intrinsic to the gylanic religion, is the partnership of chaos and order. The idea that there is a conflict between chaos and order is a false idea that was constructed by accident, and we are now participating in the deconstruction of the false dichotomy between chaos and order. We know that early Christians stamped out Orphism. Orphism is one of the remnants of Minoan Cretan religion and of the gylanic religion which survived into ancient Greek times. In the Orphic pantheon, chaos and order are husband and wife. So part of the gylanic resurgence is the re-partnering, the re-structuring of the relationship between chaos and order into a working partnership. If we can emphasize this correctly, we are not, through restoring chaos to her throne, going to arouse the hostility and antipathy of the patriarchal establishment. People who want order can have order. Chaos is order, and order is chaos. The only good order is chaos, because if you try to order something that is a dynamic, living process, it will die. What is going on in China today can be understood as the repression of evolutionary chaos.

All creativity proceeds from chaos towards order. People who feel that without order we will starve and die must impose their idea of order on top of chaos. "Order overcomes chaos" is "death overcomes life."

In many people's view, like Freud, for example, the trinity of our time is Eros, Thanatos, and Libido. So in Freudianism, with Thanatos, death is viewed as an important organizing principle. This is the remnant of an earlier trinity, a goddess trinity, in which there was the triple-headed goddess. Life had three aspects, as in the Vedic trinity of Brahman, Vishnu, and Shiva. Birth, maturity, and disintegration was part of a recurrent cycle, the eternal return.

A kind of a perversion of the natural trinity has taken place. Its main personality can be understood through its action, which is to kill Gaia through the destruction of forests, of plants, of the extinction of species at a rapid rate. It may be necessary to restructure the mythical level where these trinities live; the Father, the Son, and the Holy Spirit, for example, would have to return to something more natural and more compatible with the intrinsic structure of the Gaian mind. If there's such a thing as a pattern for evolution, we are probably not on it now.

TM: And would that trinity be Gaia, Chaos, Eros?

RA: Well, now we're exceeding my area of competence. I'm not going to say what the mythology of the future ought to be. Chaos, Gaia, Eros is the trinity of the most recent past of the gylanic partnership; mainly the Orphic trinity of Minoan Crete. But even there, there are a lot of serious questions. There was a patriarchal takeover. The gylanic culture did not survive. An evolutionary challenge occurred in which that particular trinity failed. Dionysus is a masculine god. He already represented a certain mutation of the original goddess trinity. Ariadne, the vegetable goddess of Crete, was replaced by Dionysus in part of the process through which that civilization died.

We have to be careful not to land in a cul-de-sac of evolution; we know that to go forward is to go into certain death, so we want to go back to some time in the past, to transport everything, culturally, back to some fixed moment in the past and take up evolution again. Where in the past the right turn was taken, we're going to take a left and see what happens. If we go back to the time when Minoan Crete was dying, we'll be on a dying track. We don't want to select that one, and I think that we're going to have to participate consciously in the creation of something that never existed before.

The big problem, the world problem, is that we're no longer seeing the birth and death of cultures. We're in a time when we've constructed a planetary society that is dying and may leave no offspring.

Q: Is evolution itself dying?

RA: That's the general fear.

Q: What's the alternative?

RA: I don't know. Diversity is very important for evolution. We don't have the intelligence to design and engineer a living species. One thing we should do is to study evolution, to juggle evolutionary theory and find out what are the chief characteristics of the evolving processes. What is their essential nutrition? Do they need vitamin C?

We have experienced a fantastic wave of creativity. This Holocene interglacial, now 12,000 years old, has had a thrilling history. Maybe there were some preceding interglacials that were just as thrilling, where homo erectus explored the planet and populated every continent. Australia was the last place that was found thanks to a fantastic navigational skill based on the study of the sky. Our own technology has followed the same path. We can't say that this kind of flowering has never happened before. But we can say that it has been a really great one even if it ends in the death of our species. But the destruction of so many other species... Thirty-thousand species are destroyed every few minutes or so according to the latest count. That's ten percent of all the species that have ever been created on planet Earth in four-and-a-half billion years; and ten percent of that happened in the last ten years. I can hardly believe that that has happened in every interglacial, although according to Jim Lovelock in *The Faces of Gaia*, this is the eighth catastrophe on this scale; the last one was the mass-extinction sixty-five million years ago when large mammals began. You see, we're really tied up with chaos in the solar system because of comets striking the planet. There was a near miss recently, I understand, where we could have been wiped out. It's way beyond nuclear winter. If a comet strikes us, that's it -- and it came really close!

TM: There is evidence that this has happened many times.

RA: It happened many times, yes.

Q: You mentioned the Hindu notion of creation, sustenance, and reabsorption -- that isn't the right word -- but it means evolution and involution, which is not death, but simply the wheel going around again. Is that a possible scenario?

RA: Yes. It's not only a possible scenario. I'm sorry to say that the continued life of Gaia seems at the moment to require the extinction of the human species. My reading of the classical Sanskrit texts about

Kalpas, the great cycles, is that when you get through with the Kali Yuga, you start again in the golden age.

Q: What's going out comes back again. Nothing is wasted. Everything is continued, though not in its present form. Everything goes back into the formless from where it came, but its essence is subsumed back into what it was in the first place, which is the same truth looked at in a different way.

RA: How do you feel about a cycle of four hundred and thirty-seven million years?

Q: Is that supposed to be the length of the Kali Yuga?

RA: There is great disagreement about the length of the periods. The Upanishads give it a really huge cycle that's not ending for a long time, but there's a minority interpretation which sets the great year at 25,800 years of the astronomical great year. In this modern theory of the great cycle, the Kali Yuga began as recently as 1880 and is only 2,400 years long. Which means that we're close to the beginning of another great year.

TM: Ralph, I want to ask you about higher-dimensional order and mapping and the way that the psychedelic experience is training for that. You and I have discussed this question a lot, but last night we discussed it from a slightly new point of view, which is that we really don't want to come to terms with all this, because even the most intrepid psychedelicist can hardly face the implications that it's an ecology of souls, and that what hyper-space is really about emotionally is the transcendence of the apparent dualism between life and death. Let's take the entities we encounter in the DMT trance. Their utter alienness is combined with a penetrating familiarity, and the only way this can be explained is to face the fact that the reason we feel so strongly attracted and repelled and involved with them is that they are the yonder side of the equation, and that we penetrate an ecology of souls. What do you think?

RA: This is a difficult area, because we are trying to bring back our experience to the linguistic mode of thought attached to this culture. I always thought that a lot of the things encountered in hyper-dimensional space might be constructs -- side effects of trying to bring back our reality into verbal consciousness. For example, one possibility is that in the hyper-dimension, there are no beings, there are no entities; there is only one entity, and that indeed, as it is said, Ram, it is all One. Even in that case, it could seem to us, when we try to understand the experience in our own mind, that this one entity consists of different organisms whom we think of as separate. It could be sort of a projection of ordinary reality. You might think of it more as a projection of the hyper-dimensional experience into ordinary reality, or at least ordinary mind, and most particularly verbal mind, where concepts like entities are very useful in dealing with the reality, even if you understood that everything is connected.

I think there is kind of a bridge between ordinary reality and the Gaian mind, and on this bridge, different tricks function as the planks of the bridge, as it were. One of them is the illusion of the separateness, or independence, of different parts of the experience, because we don't have enough dimensions in our ordinary minds to grok the fullness of the one thing. As I said earlier, if you cut through a connected object with a low-dimensional knife, you get discontinuous things. Regarding them as separate things is just a construct. I also think -- I mean, I had the impression in my own experience of this hyper-dimensional web -- that although there is a lot of action in it, it is fundamentally timeless, and parts of it do not die, and are not born. But nevertheless, and that's the part that makes me breathless with excitement, there is a co-evolution between our ordinary minds and Gaian mind. Although time does not really exist

for it, it is nevertheless growing at a snail's pace, and we may even invent an idea while painting, drawing, playing, working together, or making love -- something that will be a new thing for the Gaian mind, that will be added to it and will live in it forever. If this is true, it's a thrilling possibility for creativity, but also a great danger, because many evil thoughts are projected upon the Gaian mind.

I suppose that the Gaian mind, besides everything else, is full of every evil thought that anybody ever had, so that, for example, the demonology of Aleister Crowley can be encountered while tripping. What goes by the name of "bad trip" could just be exploring the basement where the relics of the diabolic acts of humanity are kept. Some years ago I visited Auschwitz on a pilgrimage, and I saw a huge warehouse full of luggage, valises that were discarded by people who took the one-way trip up the chimney. There's another warehouse there full of hair. Now, maybe you haven't been there, but you're hearing me tell you of it. So that would be just like going on a trip, and finding Aleister Crowley's 666, you know; maybe it's there in the basement.

If you think that mind must be associated with living species, you must realize that there's still the cosmic mind, and that Gaian mind is just one player among many on the galactic stage.

I don't think that the Gaian mind, or the cosmic mind, is an ecology of entities. It may appear that way because of constructs, because of our limited intellectual evolution. The evolution of consciousness on this planet has given short shrift to concepts of unifying fields, wherever they arise, with the single exception of quantum field theory. They've been replaced by particle equivalence, and more of the wave-type, I guess you could say. You jump into the swimming pool, and there's the particle of your body, and then the waves are imaged in the pattern of light on the bottom. So this is the particle/wave duality in the swimming pool. My impression about the cosmic mind is that it's more like waves, and less like bodies. Body representation is essential in the lower-dimensionality of this energy/material universe. But I don't much like to do this kind of speculation, because my own experience is too limited. We love the bodies, of course. That's why we're here.

TM: Is that a strong hint to adjourn to the baths?

RA: I do feel that I've exhausted the patience of the group. You've been very kind.

TM: Well, thank you for coming down this week.

Review 2 by [admin only]:

Terence's ideas are free, but his words and works belong to his children and legal heirs. People who wish to use Terence's words must seek permission through [Lux Natura](#)

TERENCE: Today we have a treat, because you don't have to listen to me, which is the first time this has happened. It's a measure of the insular and parochial nature of my ideas that I wouldn't let anyone else

address you. I haven't even read you anything in the time that we've been at this. But today we have my old, old friend and dear colleague, Professor Ralph Abraham of the University of California at Santa Cruz. Ralph is an accomplished tabla player and dynamicist. He is familiar to you, because when I mention my cabal, it is the Sheldrake, Abraham, McKenna cabal. We built a high ivory tower against all who lay siege to it.

Today Ralph will talk about what he described to me as modern-day Cassandras who can be trained to look into higher-dimensional space and to prophecy in an oracular manner for the kings of corporations and affinity groups such as ourselves. Ralph is a psychedelic pioneer in mathematics, music, and the art of love. He can speak for himself. Please welcome Ralph Abraham!

RALPH: This is what I came for, Terence: your introduction. Now I'm happy. I can go home. I don't know about the high tower, though. I think of it more as a green ring, and maybe it's the Cabala, which is the feminine of cabal.

The fact that you are here to listen to a religious leader, Terence, gives me a clue as to what you're interested in. I'm not sure if there is any overlap between my field of interest and yours, other than that there's a certain heart feeling in this place, which has drawn us all here. But to improve the fit, I would like you to prompt me with questions -- especially you, Terence -- to give me a target.

TERENCE: There's been a lot of talk about the psychedelic experience, but we haven't spent much time on techniques, and on the personal assimilation of the experience. We talked about waves of gylanic resurgence in pre-history. I'm pushing this new idea that we are really the children of a disturbed relationship. We had a symbiotic relationship with hallucinogenic plants in pre-history. Later, climatological factors and the drying of Africa pushed us into the historical dominator mode, and we've been in it ever since. We've looked at the time wave, we've talked about fractals, we've talked about modeling the Tao. We talked about attractors, and whenever we talk about these kinds of things we mention you, Ralph. You have been held up as the guy who could shed light on the mathematical end of the jargon scale.

RALPH: Well, the very idea of the gylanic resurgence wave, the GR-wave, is part of the technical end of the jargon scale, because the GR-wave concept is a mathematical model for history itself. These terms were introduced by Riane Eisler in her book, *The Chalice and the Blade*. She is one of the first cultural historians since William Irving Thompson to use this particular strategy for understanding the complexity of life. She is a feminist revisionist of history, and the primary partnership she points to, and from which she derives the name "gylanic", is the partnership between the genders.

Today we exist in the ambience or in the shadow of a fantastic GR-wave that broke on the beach in the 1960s. It was probably the biggest one since the Italian Renaissance.

The word "resurgence" itself is a mathematical word. It means that something happens not only again, but again and again. Resurgence means recurrence. A periodic cycle is a recognizable pattern suitable for prediction. Hopefully there will be another GR-wave and another one. Between the big GR-waves in history there are a bunch of wavelets, and between any two of those there is another sub-wave, because not only does history have a fractal nature, but gylany is a fractal concept which loves fractal resonance, and which must always manifest as fractal waves.

So we have waves on top of waves. If you restrict yourself to the biggest ones, there is the Neolithic, that's a big one! when farming began. Is farming gylanic? Well, in the history of gylany there are the global climate cycles, and then there are smaller climate cycles, and then there are the teeny wavelets of climate. The biggest waves of climate are the ice ages. Glaciologists argue whether they have a hundred thousand-year cycle or a forty-one thousand-year cycle or a twenty-five thousand-year cycle and so on. All of these glaciologists are correct, because the pattern of ice, the pattern of the global change of climate, is not periodic; it's more a fractal wave-length.

Gylany, the partnership form of culture is characterized by peace, happiness, and by sex, drugs and rock-'n-roll. It is part of the inter-glacial cycle. When the planet has a fever, we get cultures like that. The heyday of gylany for this inter-glacial period was the Neolithic. Then after the patriarchal takeover gylany was repressed into the unconscious, out of which well up GR-waves in the future.

After the patriarchal takeover, gylany became part of the so-called mystery schools. That means that you weren't supposed to tell. If you partook of these rituals, you told about them at the risk of death. In ancient Greece, mystery schools were accepted. We don't know exactly what psychedelic was used in the nightly rituals of the Eleusinian mysteries. There are no written records, and to this day we don't know what went on there.

There was a kind of limited tolerance for gylanic resurgence on an annual basis in ancient Greece, but after the onset of Christianity, a very interesting bifurcation took place. There were a few centuries of a kind of gylanic Christianity, after which patriarchy came to the fore, and at that time, the Orphic, Dionysian, Bacchic rituals characteristic of gylanic society were increasingly suppressed.

Starting from around the seventh century A.D. until the present, we have the era of suppression of gylany, out of which the gylanic resurgence wave welled up. We, like the students in China, are trying to reclaim our planet from the insanity of the (androcratic) form, a quest which may never end.

The chart of the progress of gylany over the centuries is Terence's time wave, which is a mathematical model for history.

TERENCE: It's the cyclic ebb and flow between what Ralph calls gylany, i.e., the partnership society of pre-history which emphasizes group values and sharing and multi-tasking, and the dominator model. We're trying to transcend matriarchy/patriarchy, because that is not what it's all about; it's not between men and women. There are two modes of expression. One is partnership, the other is hierarchical domination. What Ralph calls gylany is the episode in pre-history when all of these values were being expressed in the central Saharan societies.

RALPH: There were gylanic societies; the last above-board one was Minoan Crete, and that ended around 1400 B.C. when Crete was conquered by patriarchal Mycenaeans. For a long period of time, until around 4000 B.C., the planetary society was a gylanic one. It was characterized by the equal partnership of the genders, by peace and creativity, and by a certain religion which covered the entire planet. It was a goddess religion; sometimes the triple-headed goddess, the goddess trinity; sometimes the goddess with the boy god, the child god -- her child -- the result of the creativity of the goddess; and sometimes with a consort.

As we neared patriarchy, there was a gradual demotion of the goddess and the gradual promotion of the god, until finally the goddess disappeared and her statue was replaced by statues of Apollo. The Eleusinian mysteries that were celebrated under the statue of Apollo, as a matter of fact, were goddess rituals imported from Crete, from the last gylanic culture. The statue of the goddess had been replaced, but not the rituals.

To help us understand history we might have a chart of planetary society at a given time, represented by one number, a point in the spectrum between gylany, or partnership society, and (androcracy), or the dominator society. As history evolved its own history, more and more indicators were taken into account. Vico, one of the first mathematical historians, said that societies evolve like mammalian species; they have a beginning, a middle, and an end. The first step, where a tribe becomes a culture, is through the development of three primary cultural structures: religion, death rites, and matrimonial rights. As he saw it from his eighteenth century Italy, these would be the three necessities for a culture to evolve. After that, it gets more and more complex.

We could try to represent the planet, a particular town, or even a little community like this one, with these three parameters. We could hand out questionnaires, record the replies and get some kind of numerical measure of the quality of religious activity, the care with which the burial rites and burial plots are maintained, and the nature of matrimonial rights. In early Neolithic times, dead bodies were thrown under the house. That was it. But funerals are very important social events in Ireland even to this day, which gives us a clue as to what they were like in the past.

In the '60s, matrimonial rites more or less died. A few people celebrated by taking acid on a mountain top during the full moon, but basically, the ritual disappeared. One reason was that it was believed to be intrinsically evil. In the patrilineal line, property won in war passes from father to son. That means that the most important thing to know about the son is who is the father, which makes it necessary to have a marriage contract of monogamy. It's easy to know who the mother is, but how do you know who is the father? The monogamous contract aspect of the marriage ritual is just part of the patriarchal package.

So, when there's a gylanic resurgence, one thing that's bound to happen is the radical change in the specific agreements of the marriage contract and the burial rites, and in the religious practices as well, according to Vico. If we want to measure this with questionnaires, we can sort of locate ourselves at a point in a three-dimensional map. Some years later, if we hand out the questionnaires again, it will all be changed.

In the '60s, there was a big blip. This blip could be observed not just one-dimensionally, but as a curve in three-dimensional space. This game, which I might call mathematical modeling of history, has progressed over the years with more and more sophisticated models. With chaos theory, people acknowledge that a person, a society, a tree or any living thing has essentially infinite dimensional representations. Any attempt to simplify, to throw out complexity by reducing it to a simple model creates a boundary war.

Let me say something about mathematics. The very word elicits fear in everybody. For more than thirty years now I've had consultations with people who are scientists, and I have hardly encountered a single person, including a Nobel Prize winner in theoretical physics, who doesn't have a math-avoidance response. That's because our culture has made mathematics into something unnatural. But we can't understand any dynamical process, whether it is the process of our own relationships, the history of our society, or the gradual change from year to year of the memory of our experiences of the 1960s without

mathematics, because mathematics is simply the act of making cognitive representations of these complex and dynamical events. Without them, we couldn't walk down the street, we couldn't find food. When a dog goes to the other end of the property and locates something to eat, this is an activity of mathematical intelligence. We use it all the time, and I'm just trying to describe a view of history that leads up to the fulfillment of Terence's promise, which, in case anybody has forgotten, I will ask Terence to repeat.

TERENCE: You mean the notion that history comes to some kind of tremendous crescendo, where it's all wrapped together into a nutshell?

RALPH: No. That was yesterday's introduction. Today it was explicitly psychedelic. So I'm going to explain why psychedelic training will be necessary for us to create our future.

TERENCE: Oh, yes! Do that.

(Audience laughter)

RALPH: On demand. For you, Terence. For you.

TERENCE: I need to hear this.

(Audience laughter)

RALPH: Well, I just got back from Denmark, where I was entertained in a splendid palace in a suburb of Copenhagen by the IEA, the International Economic Association. This is a group of professional economists who are employed by kings and governments to predict the future. They have inherited the Cassandra role, because each person's welfare will depend upon the wisdom of the finance minister when he cuts some ridiculous deal like giving forty tankers of wheat to Libya or something. These people are important to kings and governments; they have a technology, largely mathematical, and they have international conferences where, within limits, they exchange some of their secrets because they have to get some of the other guy's secrets. I was there because they had discovered that chaos could be an important secret, and if some have the chaos technology and others don't, they would get ahead in whatever game they think they're playing.

When I was resting between sessions from the exertion of trying to find out what these people were about and evolving this little description I just shared with you, one man came up to me and said, "Hi, Professor. I've been reading your work. My name is Lars Peterson, and I'm in the finance ministry here in Denmark. I read in Jim Gleick's book that you say that chaos is the biggest thing since the wheel. Do you remember that you said that?" I said, "Yeah, yeah." He said, "Well, we took your advice and used chaos theory to analyze our data. And then we read this other paper where you said chaos was really no big deal, that what we really need is complex dynamical models. We read your instructions, we made a complex dynamical model, and we had it running on the computer in the finance ministry with a model from the Danish beer industry, and it produced data which agrees very well with the observed chaotic data. We tried to explore this model which has parameters that have to do with the progress of the economy in the neighboring countries. Well, there are twelve of these control parameters, so we have a map in twelve-dimensional space. We followed all your instructions, so now we have a map of our finance policy, and the map is in twelve-dimensional space. You've given us no technology to understand objects and motions in twelve-

dimensional space. Now what do we do?"

He showed me some crude attempts at computer graphics that looked like your typical fractal, and this fractal was the map they were trying to use for navigation of the national economic policy. So they were worried. They were very worried.

I had to admit that we were stuck, because we had arrived more or less at the frontier of the computer-aided applied mathematics of our society, in spite of chaos, fractals and so on. We're stuck with this. We do not know how to visualize motions in twelve-dimensional space, in sixteen-dimensional space and so on. Obviously, we need to develop a strategy for twelve-dimensional visualization. We need to utilize the experience of artists. Artists have always led us in the expansion of the dimensionality of our view. Our capability of viewing is advanced by artists. And now we're at a frontier where our progress is inhibited by a limitation of dimensions in viewing. Undoubtedly, computer graphics will be the technique. Computer graphic arts are limited at the moment by the lack of practice in viewing higher-dimensional spaces.

Meanwhile, psychedelic pioneers are always talking about hyper-dimensional warps. It's a dance. Right? It never stands still in our psychedelic travels. I think hyper-dimensional is correct, not infinite-dimensional. There are large numbers of dimensions we have been privileged to view directly, which we apparently have no difficulty in understanding. We can verbalize about them, we can remember them, we can think about them, and we can return to them to explore them further. There's something about the naturalness of the artistic experience which makes it the fundamental one needed for the current advance of mathematics, of science, and of technology.

TERENCE: So this is an endorsement of psychedelic training. Ah --

RALPH: Well, people will have to learn by having the experience. I mean, I don't know how to get started when you have people who are completely blind to fifteen-dimensionals.

TERENCE: How do you begin to view fifteen-dimensional space? You just toss them in and see if they come out?

RALPH: Well, maybe the big blessing of the mushroom is that there is this easy back-and-forth between the higher-dimensional reality and ordinary reality, so that while you obtain training in visualization without stress, you can also practice its relationship with ordinary vision. For example, you can open your eyes to see a flower, and then close your eyes and see the aura of the flower. You know what I mean? There is kind of a voluntary back-and-forth, and a spectrum of decreasing dimension between the psychedelic vision and ordinary reality.

This bridge, I think, is very important. It's not enough to learn the navigational arts for flying in the higher realms -- we have to earth this intelligence in order to create the possibility of a future. Gaia is a living planet; its atmosphere, its hydrosphere, its sociosphere, its noosphere, all these are interlocking in an essential way, and our future may depend on our learning to understand a system of such immense complexity so that we can guide our evolutionary consciousness. Either that, or humankind should stand aside and let evolution do its work. That's why I think the psychedelic experience has an important role to play in the progress of social evolution, and even of technology.

TERENCE: When you talk about penetration of a higher-dimensional space, which means many things to many people, do you think that psychedelics amplify the morphogenetic field, or that they somehow amplify awareness of it? Do they add a dimension to the ordinary three? There also seem to be other dimensions added that are not related to the time scale. Is that how you see it?

RALPH: Well, let's find a common ground for the word "dimension". Dimension is an ordinary English word, and it's also technical jargon of mathematics. One of the things mathematics provides us with, one of its greatest gifts, is an explicit, useful understanding of dimension. There's one dimension, there are two dimensions, and there are three dimensions. Here are the three dimensions. That's kind of the mathematical way of thinking. So as far as what we see around us, if nothing were moving, we have three-dimensional space. Within the three-dimensional space, we have maybe a color, which is a three-dimensional object, so there's six dimensions that we're moving in all the time, ignoring the dimension of wind in our face and of smells and so on. We live in a six-dimensional space of snapshots that keep changing, so there's the six plus one, or the seven.

TERENCE: To simplify the way we've defined dimensions here, they are simply variables. Each dimension represents a variable. If you have sixteen variables, we're moving in a sixteen-dimensional space. This opens it up for people -- they're not being asked to conceive something inconceivable. What you're saying is that every time you add a variable, you add a dimension. Therefore all complex situations are obviously extremely high-dimensional.

RALPH: But there's a difference between the dimensions and our perception of dimension. By taking photographs, for example, we can only record six dimensions. Let's take a computer model of the nuclear club, or of a society of four superpowers. We have a mathematical model for this as a sixteen-dimensional space with certain solid objects in it which may be very important for our future, because they represent peace and war. We want to navigate in this space, and the fact that we understand that the model has sixteen dimensions is not enough, because we have to learn to visualize, to understand, to grok that space, so that we can see where we are, where the obstacles are, how we can get from where we are to where we want to go by avoiding the obstacles. We need to find a way to interact.

There are flight simulators training pilots to land aircraft carriers, and there are computer-graphic devices with a (datacom) for each eye, a speaker for each ear and gloves that allow you to interact with the computer; but basically, you're seeing or hearing a very limited number of dimensions. The fact that there's a successful sixteen-dimensional model won't help you navigate or land your plane, because you can really only navigate in six dimensions plus time. That's why I think we need to train people to feel at home in these higher dimensions, like dolphins, whales and bats are capable of doing, thanks to sonar. They are very much at home in higher dimensions. I think the only reason that our mentation is restricted to such a low dimension is because homo erectus has evolved in the context of running through the woods and swinging from tree to tree; we are devoted to a physical representation of the world with a limited amount of dynamic in it. We do not have to understand fish schooling. We could never understand bird flying; we don't have the dimensions for it in our evolution. But we could. Why not? So kids who are apparently wasting their time with video games in arcades around the world are actually training their minds for a completely different perceptual and cognitive strategy.

TERENCE: For coordinating in a higher-dimensional face space?

RALPH: Exactly. They're learning to land the helicopter on the tall building in a sixteen-dimensional space.

TERENCE: You're saying something very interesting, Ralph. You're saying that the psychedelic dimension is not another dimension, it's this world, but with more dimensions.

RALPH: I would agree with you that psychedelics amplify the morphogenetic field. No, they don't amplify the field; they amplify our connection to the field, so that through resonance, we obtain a stronger image. What do you think? When I trip I feel that I'm seeing something real, that it has at least as much reality as this reality. There are the repeated visits, the learning, the successful negotiation of conversations with live entities. It has every aspect of reality. All that we are familiar with in ordinary reality is there in extraordinary reality. One thing that we do not doubt is its reality. We don't call it hallucinations. We don't think it comes from the unconscious. This super-ordinary reality that we visit happens to be a higher-dimensional reality, and we can only image it to the extent that we are able to image it. Those of us who have taken repeated trips over a period of time have learned to image more, so that we get more dimensions represented by some mysterious trick in our ordinary consciousness, by vision, sounds, smells.

TERENCE: By deconditioning?

RALPH: By reconditioning, by training, by restructuring --

TERENCE: By retraining the Newtonian perspective. The perceptual perspective of the Renaissance was both a liberation and a prison. It gave permission to inhabit a new kind of dimensionality for culture, but then we got hung up on it. We can't seem to go beyond it. We can't seem to realize hyper-space culturally. We can only realize it individually through the psychedelics, and then only temporarily. What the true believers want is some way to image it collectively.

RALPH: Well, that's why I've been working with computer graphics these past ten or fifteen years. With computer graphics, the idea is to try to find a way to share the experience with people who are not going to have the experience. The advance of the art, the evolution of consciousness, is a saltatory story, it has episodes that are catastrophes.

There may be a restriction to an agreed-upon conceptual reality over a period of many centuries. Suddenly, these artists will bring in perspective, they'll make a leap from two-dimensional to three-dimensional representation. The particular perspective in the renaissance was due to the fact that drawings could be put on the wall -- they didn't need video, they didn't need computer graphics; they could draw it and put it on the wall. Anyone who stares at a drawing for a while, particularly with a little instruction from those devices in the museum where you put a quarter in, can get the idea. So everyone's perceptive capacity, as far as dimension is concerned, can be increased from two to three.

With this recent GR wave, the increase in capability of perceiving dimension has not been shared. The pioneers who experienced this have not found a way to draw and put it on the wall. But I do think that with computer graphics we are close to a time when adequate super-computers for making some kind of reproduction of the visions we've seen will be here; an affordable machine at a work-station level, say a hundred-thousand dollar machine, will be placed in museums like the Whitney Museum of Modern Art, and will be showing things that we've seen, and anybody who watches it will grok it, as we did when we

first saw it.

TERENCE: That'll be the ball game.

RALPH: I expect so.

TERENCE: I believe, and I speak for myself but I assume that everyone here can say the same thing, if I could show the world what I've seen, the world would never be the same. I mean, isn't it true for every one of you that you have seen things that you knew would change the course of history forever if they could be shown?

Question: How do you get it on the computer?

TERENCE: How do we hang it on the wall, Ralph?

RALPH: Well, it's time for me to give mathematics a little plug. Mathematics is our heritage, it's a natural activity. The language of the morphogenetic field is mathematics. The work of mathematical specialists over these past few centuries has provided explicit algorithms for recreating this reality on computers because it is a mathematical reality.

Question: Maybe you need to begin by teaching mathematics, because I am one of those who are never sure of how much seven times eight is.

RALPH: Seven times eight is business practice, and mathematics is when you jump in the pool in the sunshine, and there's a pattern of light and dark on the bottom of the pool. There's a relationship between your motion in the water and the dynamic of that pattern. We then have two different things, both dynamic, both complex. One is your motion in the water, and the other is the pattern of light on the bottom of the pool. They are two different things, and yet they are related. We understand that relationship. That's mathematics.

Question: What I'm getting stuck with, in terms of things like the psychedelic experience, is the sensation of touch, of taste, of sound, and the emotions that are created, which to me are part of my grokking. I can look at a reproduction and have a fantasy about what the underlying substance is, but what I'm trying to get to is a point where I can see, I can touch, and concurrently have internal emotions. How do I reach that experience with some type of external machine?

RALPH: That's the question, all right. What I'm speculating, and this might turn out to be wrong, is that in reproducing a small fraction of a complex experience, the rest of it can be sort of excited by resonance in the mind, much as we use language. By saying a word, and I always regard this as a miracle, I can evoke in you a whole experience, which, although we have no way to check it out, we generally accept in ordinary reality. Blue. Now, we have no way to know that what I see as blue is what you see. Nevertheless, we assume, and somehow it seems correct, that there is a universal experience, and it's possible for a complex experience to be excited by a simple one. Otherwise, language wouldn't work. I'm always amazed that my students are able to get a mathematical idea from the representations that I use in conversation or draw on the blackboard. You draw, you talk, and these simple representations awaken in the mind of the student the entire mathematical concept. Mathematical concepts cannot be reduced to words or drawings, but the

multiple representation is a kind of simulated telepathy.

So, while I agree that the experience I would like to share is much more complex than a visual pattern, I have the feeling that the visual pattern that I've seen is already beyond the visual pattern that other people can see. There is sort of an intermediate or first step in the direction of fuller communication, for which additional steps would be necessary. I have no idea how to proceed towards it.

TERENCE: I have this wonderful vision of taking a hundred-thousand dollar machine and spending five-hundred-thousand dollars on software to create this model as the first step in "Grokking 101", and then handing the students a ten-dollar tab of acid to go through the whole course!

RALPH: Yes. It's sort of a program to subvert culture and alter the course of history, yet we are not able to do it by giving out LSD. I hear that many people are taking LSD now, yet they're not having the kind of experiences we had. It's sort of a desperate measure to rely on modern technology to help communicate experience.

Question: The difference between the two is that one is a shared experience, while the other is an individual experience. What you're really saying is something about the need to share.

TERENCE: That's right. Somehow, the importance of the psychedelic experience lies in communicating it. No matter how good it is, if it can't be communicated, there's an element of frustration. For people like Ralph and myself, who take it seriously, that gives us power over it. For people who don't, it's smoke. For us, it's potentially a mathematically describable object. We turn it into something which, hopefully, can be communicated. This whole discussion revolves around this theme. We talked about it the other day -- we invoked it, but we didn't get anywhere with it. The fact is, Ralph, that the whole game hinges on the huge unlikelyhood that mathematics is making a statement about nature, and that this appears to be a synchronistic event. There is no reason why mathematics, which is the internal peregrination of the human mind in the realm of abstract quantities, should not be mappable over the world of natural phenomena, and it's been worked ten ways from Sunday ever since Pythagoras noted that ...

Question: Weren't mathematics invented to describe nature and behavior and all the rest of it?

RALPH: Well, actually, no. The common view is that mathematics, as Terence has just said, arises in the human mind after a process of mentation. But I take issue with this view. Certainly mathematics is not inspired by the inspection of nature. That's why people like Einstein and Wigner, who knew mathematics intimately and used it in making models of reality, were awed by the fact that there is this mysterious fit between mathematical objects and objects in the phenomenal universe. I don't agree that mathematics comes from the observation of nature, and I don't agree with Terence, Einstein and Wigner that it comes from human mentation. I think that mathematics enters the human mind through a process of resonance with the morphic field. Animals had mathematics before humans. Animals count, and they know dynamics, and they have sonar and so on. Animals obtain mathematics from the morphic field, and so do humans. This morphic field is part of Gaia, the living Earth, so I call it the Gaian mind. Mathematics exists in the Gaian mind, and conscious minds, spirits, may obtain it by a process of resonance.

TERENCE: Are you saying that mathematics is the archetype of nature in the Gaian mind? That's kind of a Gaian Platonism.

RALPH: Mathematics in the Gaian mind is beyond nature. You see, nature is only one product of the Gaian mind. The Gaian mind contains much which will never be manifest in nature, some of which we have seen in our travels, and we don't expect it to be manifest in nature. The Gaian mind is capable of play in such ways as may never be manifest in the world of matter and energy and in all this slow, dense, soft stuff.

Now this view cannot be verified, and no support for it can be found in the literature of philosophy or mathematics. Let's just accept this idea for the moment and see what we can make of it. If mathematics is a spin-off of the Gaian mind, or the morphogenetic field, or a higher-dimensional reality, or the phenomenal universe, nature, relationships among people, and so on, it would be no great mystery that mappings are possible between mathematical objects and phenomena in the energetic universe. It would mean that the Gaian mind has a certain amount of integrity, of coherence, of self-resonance, that it makes sense, as it were.

When we travel outside of ordinary reality and take a flight through the Gaian mind, our overwhelming experience is of integrity. It all goes together extremely well. That is one of the main lessons we bring back and may even be able to share with people without the necessity for computer graphics or acid. Integrity has always been a message of spiritual minorities, from the Theosophists on down -- the integrity of Higher Mind. That's why I think mathematics is useful in pursuing life and understanding what's going on around us. It's useful also in understanding aspects of the Gaian mind which are not manifest. It's not only useful -- it's our heritage. Each person may obtain as much of it as they please by solely making use of resonance with the Gaian mind. It is there, it is natural, and it's another alternate reality besides ordinary reality, as easy to grok, or travel through, explore, learn, enjoy or play with as ordinary reality.

I can tell you, on the basis of my own experiences in traveling to different realities, that they are all pretty much the same. There is an increased dimension as you get off the Earth. That's about it.

TERENCE: So evolution, after 2,500 or 5,000 years of mathematical speculation, suddenly gives rise to fractals and the discovery of mapping that goes on between fractals and organic nature. This is serendipitous. Is it fair to say that the Gaian mind exists on many levels and provides many maps? So that catastrophe theory, dynamics, fractal curves are all approximations of the mystery?

RALPH: Well, they're different low-dimensional representations of the mystery. They are simple pictures guiding you to a simple understanding of more complex things. They are stepping stones to the stars, as it were.

TERENCE: But the integrity of this other dimension seems to make it the source of our authenticity. We don't relate to it as another dimension. We relate to it as a higher dimension in a spiritual sense. Why do the lower dimensional slices lack this integrity?

RALPH: Well, in higher dimensions, if you had a solid object and you sliced it with a lower dimensional knife, you might obtain some disconnected pieces; the lack of connection between these different pieces appears because you sliced off the connection in higher-dimensional space. In our culture, there is the common belief of the individuality of people. The Masters claim that we are individuals and that we may pursue our individual development through individual meditation.

TERENCE: The equivalent would be to kill somebody and dissect them?

RALPH: Yes. The pattern that connects is simply an object in higher-dimensional space, and these space-time patterns in higher-dimensional space-time are the fundamental objects of existence. They are the "morphs" of the morphogenetic field. They are plain objects, but they are higher-dimensional, so we try to grok them from lower-dimensional projections. One of the things lacking is integrity, apparent integrity.

TERENCE: In a way, this is nothing new. What is new is the dimension of awareness of the process even in the history of the evolution of lower organisms. Evolution can be seen as the conquest of dimensionality, right?

RALPH: That's why I think computer evolution is important. You see, the computer is not like the steam engine. The computer revolution is not like the industrial revolution. The computer phenomenon is something that is evolving, and its evolution is not going to stop. One of the insidious effects of this evolution is that, as it were, a new species is upon us. Fortunately, at the moment, it's very friendly. They don't eat us. They make us slightly sick if we sit with them too long, but they are quite benign.

One of the effects is the chaos revolution -- chaos as mathematical objects which are revealed through computers. This is kind of a cure for the historical accident that happened in 4000 B.C., when the baby was tossed out with the bath, causing chaos mathematics to be lost because of the worship of Yaweh and other patriarchal gods that honored order above all things and erased chaos from memory in the human mind.

But chaos was never erased from the Gaian mind. And the chaos models that we know now, through the invention of the computer, were there all along. Not only were they there all along, but they were known, used, and worshipped before 4000 B.C. So because of a cultural accident, we have been deprived of conscious awareness of a certain mathematical model which is crucially important at this time in our history, because without it, we can't understand anything that is going on around us. All complex processes are chaotic. This understanding is now restored to us after being ripped away, cut off, annihilated, amputated by the patriarchal religions. If it hadn't been amputated, we wouldn't have needed the computer revolution to restore it. We lost the chaos model, we got the computer revolution, and the computer revolution regained it, and how it did it was by giving us control over more dimensions. It overcame a weakness which was just a cultural/historical accident, I suppose.

TERENCE: Are you saying that chaos theory is the religion of the Gaian mind?

RALPH: Yes. The fundamental and favorite objects of the Gaian mind are chaotic attractors and their bifurcations. That's why all living things are fractals. They are all materializations of the same chaotic object in the Gaian mind.

TERENCE: So here we're coming very close to politics. I recently proposed that we form what I called the () Anarchist Internationale. Our motto would be "Chaos is order". We would embrace it as a cultural ideal. The patriarchal mind is horrified by this, because chaos implies lack of order and of control. But who linked order to the notion of control? Anarchy is permission to be in Tao(?), and Tao is what you're talking about -- the chaos which is the religion of the Gaian mind.

RALPH: Yes. Chaos is not in conflict with order. What we are seeking, and what I suppose was intrinsic to the gylanic religion, is the partnership of chaos and order. The idea that there is a conflict between chaos and order is a false idea that was constructed by accident, and we are now participating in the deconstruction of the false dichotomy between chaos and order. We know that early Christians stamped out Orphism. Orphism is one of the remnants of Minoan Cretan religion and of the gylanic religion which survived into ancient Greek times. In the Orphic pantheon, chaos and order are husband and wife. So part of the gylanic resurgence is the re-partnering, the re-structuring of the relationship between chaos and order into a working partnership. If we can emphasize this correctly, we are not, through restoring chaos to her throne, going to arouse the hostility and antipathy of the patriarchal establishment. People who want order can have order. Chaos is order, and order is chaos. The only good order is chaos, because if you try to order something that is a dynamic, living process, it will die. What is going on in China today can be understood as the repression of evolutionary chaos.

All creativity proceeds from chaos towards order. People who feel that without order we will starve and die must impose their idea of order on top of chaos. "Order overcomes chaos" is "death overcomes life."

In many people's view, like Freud, for example, the trinity of our time is Eros, Thanatos, and Libido. So in Freudianism, with Thanatos, death is viewed as an important organizing principle. This is the remnant of an earlier trinity, a goddess trinity, in which there was the triple-headed goddess. Life had three aspects, as in the Vedic trinity of Brahman, Vishnu, and Shiva. Birth, maturity, and disintegration was part of a recurrent cycle, the eternal return.

A kind of a perversion of the natural trinity has taken place. Its main personality can be understood through its action, which is to kill Gaia through the destruction of forests, of plants, of the extinction of species at a rapid rate. It may be necessary to restructure the mythical level where these trinities live; the Father, the Son, and the Holy Spirit, for example, would have to return to something more natural and more compatible with the intrinsic structure of the Gaian mind. If there's such a thing as a pattern for evolution, we are probably not on it now.

TERENCE: And would that trinity be Gaia, Chaos, Eros?

RALPH: Well, now we're exceeding my area of competence. I'm not going to say what the mythology of the future ought to be. Chaos, Gaia, Eros is the trinity of the most recent past of the gylanic partnership; mainly the Orphic trinity of Minoan Crete. But even there, there are a lot of serious questions. There was a patriarchal takeover. The gylanic culture did not survive. An evolutionary challenge occurred in which that particular trinity failed. Dionysus is a masculine god. He already represented a certain mutation of the original goddess trinity. Ariadne, the vegetable goddess of Crete, was replaced by Dionysus in part of the process through which that civilization died.

We have to be careful not to land in a cul-de-sac of evolution; we know that to go forward is to go into certain death, so we want to go back to some time in the past, to transport everything, culturally, back to some fixed moment in the past and take up evolution again. Where in the past the right turn was taken, we're going to take a left and see what happens. If we go back to the time when Minoan Crete was dying, we'll be on a dying track. We don't want to select that one, and I think that we're going to have to participate consciously in the creation of something that never existed before.

The big problem, the world problem, is that we're no longer seeing the birth and death of cultures. We're in a time when we've constructed a planetary society that is dying and may leave no offspring.

Question: Is evolution itself dying?

RALPH: That's the general fear.

Question: What's the alternative?

RALPH: I don't know. Diversity is very important for evolution. We don't have the intelligence to design and engineer a living species. One thing we should do is to study evolution, to juggle evolutionary theory and find out what are the chief characteristics of the evolving processes. What is their essential nutrition? Do they need vitamin C?

We have experienced a fantastic wave of creativity. This Holocene interglacial, now 12,000 years old, has had a thrilling history. Maybe there were some preceding interglacials that were just as thrilling, where homo erectus explored the planet and populated every continent. Australia was the last place that was found thanks to a fantastic navigational skill based on the study of the sky. Our own technology has followed the same path. We can't say that this kind of flowering has never happened before. But we can say that it has been a really great one even if it ends in the death of our species. But the destruction of so many other species... Thirty-thousand species are destroyed every few minutes or so according to the latest count. That's ten percent of all the species that have ever been created on planet Earth in four-and-a-half billion years; and ten percent of that happened in the last ten years. I can hardly believe that that has happened in every interglacial, although according to Jim Lovelock in *The Faces of Gaia*, this is the eighth catastrophe on this scale; the last one was the mass-extinction sixty-five million years ago when large mammals began. You see, we're really tied up with chaos in the solar system because of comets striking the planet. There was a near miss recently, I understand, where we could have been wiped out. It's way beyond nuclear winter. If a comet strikes us, that's it -- and it came really close!

TERENCE: There is evidence that this has happened many times.

RALPH: It happened many times, yes.

Question: You mentioned the Hindu notion of creation, sustenance, and reabsorption -- that isn't the right word -- but it means evolution and involution, which is not death, but simply the wheel going around again. Is that a possible scenario?

RALPH: Yes. It's not only a possible scenario. I'm sorry to say that the continued life of Gaia seems at the moment to require the extinction of the human species. My reading of the classical Sanskrit texts about Kalpas, the great cycles, is that when you get through with the Kali Yuga, you start again in the golden age.

Question: What's going out comes back again. Nothing is wasted. Everything is continued, though not in its present form. Everything goes back into the formless from where it came, but its essence is subsumed back into what it was in the first place, which is the same truth looked at in a different way.

RALPH: How do you feel about a cycle of four hundred and thirty-seven million years?

Question: Is that supposed to be the length of the Kali Yuga?

RALPH: There is great disagreement about the length of the periods. The Upanishads give it a really huge cycle that's not ending for a long time, but there's a minority interpretation which sets the great year at 25,800 years of the astronomical great year. In this modern theory of the great cycle, the Kali Yuga began as recently as 1880 and is only 2,400 years long. Which means that we're close to the beginning of another great year.

TERENCE: Ralph, I want to ask you about higher-dimensional order and mapping and the way that the psychedelic experience is training for that. You and I have discussed this question a lot, but last night we discussed it from a slightly new point of view, which is that we really don't want to come to terms with all this, because even the most intrepid psychedelicist can hardly face the implications that it's an ecology of souls, and that what hyper-space is really about emotionally is the transcendence of the apparent dualism between life and death. Let's take the entities we encounter in the DMT trance. Their utter alienness is combined with a penetrating familiarity, and the only way this can be explained is to face the fact that the reason we feel so strongly attracted and repelled and involved with them is that they are the yonder side of the equation, and that we penetrate an ecology of souls. What do you think?

RALPH: This is a difficult area, because we are trying to bring back our experience to the linguistic mode of thought attached to this culture. I always thought that a lot of the things encountered in hyper-dimensional space might be constructs -- side effects of trying to bring back our reality into verbal consciousness. For example, one possibility is that in the hyper-dimension, there are no beings, there are no entities; there is only one entity, and that indeed, as it is said, Ram, it is all One. Even in that case, it could seem to us, when we try to understand the experience in our own mind, that this one entity consists of different organisms whom we think of as separate. It could be sort of a projection of ordinary reality. You might think of it more as a projection of the hyper-dimensional experience into ordinary reality, or at least ordinary mind, and most particularly verbal mind, where concepts like entities are very useful in dealing with the reality, even if you understood that everything is connected.

I think there is kind of a bridge between ordinary reality and the Gaian mind, and on this bridge, different tricks function as the planks of the bridge, as it were. One of them is the illusion of the separateness, or independence, of different parts of the experience, because we don't have enough dimensions in our ordinary minds to grok the fullness of the one thing. As I said earlier, if you cut through a connected object with a low-dimensional knife, you get discontinuous things. Regarding them as separate things is just a construct. I also think -- I mean, I had the impression in my own experience of this hyper-dimensional web -- that although there is a lot of action in it, it is fundamentally timeless, and parts of it do not die, and are not born. But nevertheless, and that's the part that makes me breathless with excitement, there is a co-evolution between our ordinary minds and Gaian mind. Although time does not really exist for it, it is nevertheless growing at a snail's pace, and we may even invent an idea while painting, drawing, playing, working together, or making love -- something that will be a new thing for the Gaian mind, that will be added to it and will live in it forever. If this is true, it's a thrilling possibility for creativity, but also a great danger, because many evil thoughts are projected upon the Gaian mind.

I suppose that the Gaian mind, besides everything else, is full of every evil thought that anybody ever had,

so that, for example, the demonology of Aleister Crowley can be encountered while tripping. What goes by the name of "bad trip" could just be exploring the basement where the relics of the diabolic acts of humanity are kept. Some years ago I visited Auschwitz on a pilgrimage, and I saw a huge warehouse full of luggage, valises that were discarded by people who took the one-way trip up the chimney. There's another warehouse there full of hair. Now, maybe you haven't been there, but you're hearing me tell you of it. So that would be just like going on a trip, and finding Aleister Crowley's 666, you know; maybe it's there in the basement.

If you think that mind must be associated with living species, you must realize that there's still the cosmic mind, and that Gaian mind is just one player among many on the galactic stage.

I don't think that the Gaian mind, or the cosmic mind, is an ecology of entities. It may appear that way because of constructs, because of our limited intellectual evolution. The evolution of consciousness on this planet has given short shrift to concepts of unifying fields, wherever they arise, with the single exception of quantum field theory. They've been replaced by particle equivalence, and more of the wave-type, I guess you could say. You jump into the swimming pool, and there's the particle of your body, and then the waves are imaged in the pattern of light on the bottom. So this is the particle/wave duality in the swimming pool. My impression about the cosmic mind is that it's more like waves, and less like bodies. Body representation is essential in the lower-dimensionality of this energy/material universe. But I don't much like to do this kind of speculation, because my own experience is too limited. We love the bodies, of course. That's why we're here.

TERENCE: Is that a strong hint to adjourn to the baths?

RALPH: I do feel that I've exhausted the patience of the group. You've been very kind.

TERENCE: Well, thank you for coming down this week.

Psychedelics Before and After History

"Now, as a culture we must come to grips with the fact that the world is not simple, in the same way that a nine year-old must come to grips with the fact that the world is not simple – it is not as mummy and daddy said it was: there are tremendous vistas and abysses to be plunged. Ask your uncle and he will tell you that nobody knows what's going on in these areas. Ask a shaman and he will tell you that nobody has found the bedrock of the psychedelic experience. Nevertheless this wish to live with a bedrock of experience is a kind of trivializing of the great mystery in which we find ourselves embedded. We would have a far more accurate and complete picture of Reality if we were willing to live with the felt presence of the Mystery. And the way to do this is to experience what these plant teachers are trying to say, what these planetarily manufactured information-bearing pheromonal molecules are trying to imbue into us. Now, shamans throughout history have short-circuited the Fall. They are those who know. That's what gnosis is: it is privileged knowledge vouchsafed to the courageous. And the fact that we have fallen into a neurotic or childish style of relating to being, is nothing more than a statement about the inherent biases of our languages and our institutions. Many people have not, perhaps because they carried out their lives in the vastness of the tropical forests, where the force of Nature cannot be denied. You see, had we stayed in the tropics, we probably would never have taken the Fall into History. The Fall into History is what happens when one moves into a progressively more and more barren landscapes, and substitutes for the input of organic Nature, the self-generated neurotic maps that are based on incomplete information. Now, that cycle is being closed. I often think that the discovery of the New World and its subjugation, which was like the carrying out of the ultimate fantasies of these neurotic Judeo-Christian tradition – a world to plunder – ends very oddly: with Gordon Wasson and Valentina Wasson in 1953 penetrating into the jungle highlands of Mexico and finding there something more astonishing than a flying saucer or an alien artefact, finding there the true heritage of the human species, in the form of the intact mushroom psychedelic religion. Eros lost since the dismemberment of Osiris! Lost since great Pan's death at the rise of the Christian era! But not dead, only sleeping! And now, through cultivation techniques and the propagation of ethnographic literature and the work of people like Metzner, and Hoffman, and Wasson, and Schultes, shoved directly in the path of the careening cultural juggernaut of Western civilization. This is why I have called the weekend Psychedelics Before and After History, because I see history, as I say, as a prodigal hiatus, a wondering in the desert of Unknowing, an indulgence in an easily cured neurosis, if we will but take upon ourselves the personal – personal! – responsibility for cultivating a relationship with the Mystery! We have bought in so thoroughly to the notion of a hierarchy of information and a declension of truth from experts – whether they be politicians, priests or scientists – that we have devalued ourselves as the primary instruments of our knowing. And this is why I think among other reasons why psychedelics are so repressed, why it is so important to society to keep them out of the hands, not only of children and high-schoolers and hedonistic experimentalists, but to keep them out of the hands of research psychologists, pharmacologists and physiologists as well, because fully appreciated they will explode the Newtonian, Einsteinian universe the way a stick of dynamite explodes a rotten apple. And in the process, the hierarchies of paternalism, scientism and reductionism will just be completely swept away! And this is all going to happen, God willing, in our lifetimes. My faith is that if it doesn't happen then the cultural momentum toward a lethal conclusion will continue on to the ultimate catastrophe. And so that's why I am willing to address groups like this and seek to inspire psychologists and chemists and students of anthropology and culture to examine this. Because I think we have wandered far from our birthright and trivialized a mystery of Being in the process, and to recoup that mistake we are going to have to become as little children in the face of the shamanic phenomenon and

investigate it intellectually, experientially, linguistically, individually and collectively. Only in that way will we be able to rescue the enterprise from its momentum towards catastrophe. "

How's that?

Well, I can't see all of you, but it's a pleasure to be in Seattle this evening. You made me feel real welcome. Thank you.

Our discussion this evening is *Psychedelics in the Age of Intelligent Machines*, or *Shamans Among the Machines*. I wanted to talk about this simply because these are two of my great loves and so I assume, being monogamous, they must be one love. So, how to build intellectual bridges between these two concerns which seem so different? As far as people and machines are concerned, it was Ludwig von Bertalanffy who said in his book *General Systems Theory*, "People are not machines, but in every opportunity where they are allowed to behave like machines, they will so behave." In other words, we tend to fall into the well of habit. Though the glory of our humanness is our spontaneous creativity, we too, as creatures of physics and chemistry, of memory and hope, tend to fall into repetitious patterns. These repetitious patterns are the death of creativity. They diminish our humanness. They diminish our individuality, make each of us somehow like cogs in some larger system. We associate this cog-like membership in larger soulless systems with the machines that we inherit from the age of the internal combustion engine, the age of the jet engine. Marshall McLuhan said, "We navigate our way into the future like someone driving who uses only the rearview mirror to tell them where they're going." It's not a very successful strategy for navigating into the future.

I made a number of notes on this matter of psychedelics and machines. To me, the connecting bridge — well, there are many — but the most obvious one is consciousness expansion. After all, psychedelics, before they were called entheogens, before they were called hallucinogens, before they were called psychedelics, were simply called consciousness-expanding drugs: a good phenomenological description of what they do. Certainly, the technology of cybernetics is a consciousness-expanding technology. It expands a different area of consciousness. The minds of machines and the minds of human beings are very different, so different that each party questions whether the other even has a mind. In fact, these are species of minds operating in very different domains. For instance, you can ask a five-year-old to go into the bedroom to the third drawer of the dresser to select a pair of black socks and to bring them to mother. This is not a challenge for a five-year-old child. To get a machine to do this is \$100 million and a research

team of forty or fifty technicians, code writers, working for months. On the other hand, if you ask a person for the cubic root of 750,344, much head-scratching results. A computer is utterly undaunted by that question. Computers are minds that work in the realm of computation. Human minds are minds that work in the realm of generalization, spatial coordination, understanding of natural language, so forth and so on.

Are there kinds of minds so different from each other that there is no bridge to be crossed? I would submit not. In fact, the bridge between the human mind and the machine mind is symbolic logic, mathematics. When we think clearly, we are intelligible to machines. People who write code know this: that the essence of making yourself clear to a machine is to think clearly yourself. The machine has no patience for the half-truth, the analogy, the semi-grasped association. For the machine, everything has to be clear. Everything must be defined. So that's the commonality between minds and machines of the calculating species. What are the common bridges between psychedelics and these machines? Well, to my mind this is an easier gap to bridge. Both computers and drugs are what I would call function-specific arrangements of matter, and as we develop nanotechnological abilities as we move into the next century, it will be more and more clear that the difference between drugs and machines is simply that one is too large to swallow, and our best people are working on that.

Nanotechnology is a very hot buzzword at the moment, an unimaginable dream of building machines and small objects atom by atom, perhaps under the control of long-chain polymers running forms of preprogrammed software of some sort. It's all very razzmatazz, very state-of-the-art, but in fact, pharmaceutical chemists have been working in the nanotechnological realm for over 100 years. When you synthesize molecules out of a simpler substrate specifically to have a conformational geometry that matches something going on in the synapses of a primate — a human or a monkey or something like that — you're working at this nanotechnological level. Both the psychedelics and the new computational machines represent extensions of human function. It locks in with the concept of prosthetics. The drugs, the psychedelic substances, the shamanic plants, are forms of prosthetic devices for extending the human mind, the human perceptual apparatus, into hidden or inaccessible realms. Similarly, the machines, by allowing us to model, calculate and simulate very complicated, multivariable processes, extend the power of the human mind into places it could never dream of going before.

Part of what seems to me very real about being a human being and inheriting 10,000 years of human history is the complexity of the inheritance and the growth of that complexity. A thousand years ago, an intelligent human being could actually dream of mastering the entire database of Western civilization: read all the classic authors, read the Bible and you're closing in on it around A.D. 1000. Now, the notion of any single human being assimilating even a small portion of the database of this civilization is inconceivable. So, machines which filter, which search, which are guided by human intent, that's part of the story. The other part of the story are boundary-dissolving states of ecstasy in which all the factoids of the culture are thrown up for grabs, the deck is reshuffled, synchronicity rules, and out of that steps visionary understanding and integrative breakthrough under the aegis of psychedelic intoxication.

So, prosthesis for the human mind, and with the advent of virtual realities of various sorts and that kind of thing, prosthesis for the human body. I'm very keen on the sort of under the table effects of these things. In other words, I'm a thoroughgoing McLuhanist, and I really believe that the strengths and weaknesses of the world we've inherited are strengths and weaknesses put there by print and by the spectrum of effects spun off from print which McLuhan called the Gutenberg galaxy. If you're not used to thinking in McLuhanist terms it may not seem immediately obvious to you that phenomena as different as the modern notion of

the democratic citizen, the modern notion of interchangeable parts on an assembly line, the modern notion of conformity to canons of advertising, these are all spectrums of effects created by the linearity and the uniformity of print. It actually, in the late 15th century, reconstructed the medieval psyche into its protomodern form, and we have lived within that print-constellated cultural hallucination for about 500 years, until the advent of various forms of electronic media in the 20th century. McLuhan talked about radio, he talked about television; he didn't really live to see the internet.

The notion that keeps occurring to me as I watch all this is that printing was uniquely capable of creating and maintaining boundaries. More than any other form of media created, it was a boundary-defining form of media. It pre- ceded linearly; it required literacy, which had implicit in it the notion of a very stable, advanced sort of educational system. Print was a creator and a definer of cultural boundaries, and the new electronic media are not. Neither are the psychedelics. This is why I proposed in a book of mine called *The Archaic Re- vival* the idea that the values of the archaic, of the high Paleolithic — values of community, ecstasy, relating to life through rhythm, dance, ritual, intoxication — that these values which seem so archaic are in fact destined to play a major role in the future as print fades. Print was just a convulsive 500 year episode in the Western mind that opened the narrow window that permitted the rise of modern science, modern mathematical approaches to the analysis of nature, and then obliterated its own platform, its own *raison d'être* by allowing the appearance of the electronic technologies. My sort of supposition about all this — I may be an apocalyptician, but I'm not a pessimist — I think this is all very good. Obviously, continuing to run Western civilization on the operating system inherited from print produces various forms of political and cultural schizophre- nia which allowed to run unchecked would become fatal, would create cascades of chaos and political destabilization that would become uncontrollable. Governments resist change. Governments cling to technologies and social formulae that are already tried and true. In that sense, then, all governments are incred- ibly antiprogressive forces; again the image from McLuhan of somebody driving into the future using only the rearview mirror.

The electronic media and the psychedelics work together in this peculiar way to accentuate archaic values, values which are counter to the print-constellated world. When you deconstruct what that means and look at the aboriginal or the Paleolithic or the archaic world, you see that the central figure in that world is the shaman, male or female. The shaman is like a designated traveler into higher-dimensional space. The shaman has permission to unlock the cultural cul-de-sac of his or her people and go behind the stage machinery of cultural appearances, and has collective permission to manipulate that stage machinery for purposes of healing. We have no institution like this. We have advertising, we have rock 'n roll stars, we have cults of celebrity. We have things which are shaman-like, but we have no real institution that permits, in fact encourages, human beings to go beyond their cultural values, to burst though into some transcultural superspace, forage around out there and bring new memes back into the tribe. To some degree our artists do this, to some degree our scientists do it, but it's all hit and miss. It's all willy-nilly, and once achieved it must be swept under the rug in the service of the myth of method: that somebody was following somebody else's work or somebody was applying a certain form of rational or logical analysis and then that led to their breakthrough.

If you've read Thomas Kuhn's book on the structure of scientific revolutions, you know this is all lies and propaganda. The real story of science is that it's a series of revelations, brilliantly defended by people whose careers depended on the brilliant defense of those revelations. One of the best-kept secrets of the birth of modern science is that it was founded by an angel, that the young René Descartes was whoring and soldiering his way across Europe as a 21-year-old in the Hapsburg army, and one night in the town of

Olm in southern Germany he had a dream — it's strange that this would be the birthplace of Albert Einstein some 200 years later — and an angel appeared to him in the dream and said, "The conquest of nature is to be achieved through measure and number," and he said, "I got it! Modern science. I'll go do it," and he did. That was the method for over 250 years of the conquest of nature, and it leads us to the Josephson junction, the Mars Global Surveyer, long-baseline interferometry that searches nearby stars for earth-like planets. It brings us the entire cornucopia of scientific effects, but an angelic revelation disguised as a logical-philosophical breakthrough: this is what you're not told in the academy.

My point there is that human progress has always depended on the whispering of alien minds, confrontations with the Other, probes into dimensions where imagination and chance held the winning hands; so the shaman, as paradigmatic figure, is applicable both in the aboriginal social context and in the present social context. The skywalker, the one who goes between, the one who passes outside of the tribe and then returns with memes, insights, cures, designs, glossolalia, technologies, and refertilizes the human family by this means. It's irrational, but it's how it actually happens, and it's how it's always happened and it may very well be the only way that it can happen: this cultivation of the irrational, this flirtation with the breakdown of boundaries.

In our nuts-and-bolts technological progress we have somehow created technologies which are very friendly to our social values in that these technologies can be bought, sold, licensed, upgraded — all things which we understand — but these technologies are acting on us in the same way that psychedelic drugs do but more profoundly, more generally and more insidiously, because their effect is not understood, or if it is understood, it's not discussed. In a way we have come into a kind of post-cultural phase. All culture is dissolving in the face of the drug-like nature of the future. Its music, its design, indeed the very people who will inhabit it appear to be the most switched-on, the most chance-taking, the most alive of the entire tribe; people who feel the beat, people who are not afraid to take chances, people for whom these technologies have always been very natural.

Machines are central to the new capitalism, the information-transforming technologies, but in fact, one of the strange things that is happening is: every move we now make in relationship to the new technologies redefines them at the very boundaries where their own developmental impetus would lead them toward a kind of independence. In other words, we talk about artificial intelligence, we talk about the possibility of an AI coming into existence, but we do not really understand to what degree this is already true of our circumstance. How much of society is already homeostatically regulated by machines that are ultimately under human control, but practically speaking, are almost never meddled with? The world price of gold, the rate of petroleum extraction and other base natural resources: how much of these things is on the high seas, in the pipeline at any moment; how much electricity is flowing into a given electrical grid at any moment; the distribution and the billing of that electricity. All manufacturing and inventory processes are under machine control.

The larger flows of energy, capital and ideas already have a kind of autonomous life of their own that we encourage because it makes us money, it makes our lives smoother, it empowers us. It's a symbiotic relationship of empowerment, even in the matter of the design of these machines. Once, human engineers would work from a set of performance specs and they would design a chip to meet those specs, and the architecture would be put in place by human engineers. Now a machine is told, "Here are the design specs. Design the architecture to satisfy the specs," and when that is done the chip is manufactured. The actual design of the thing is in the hands of machines. McLuhan once said of human

beings, "We are the genitals of our technology. We exist only to improve next year's model." It appears that they're phasing us out of this ignominious role as well as every other role.

So, being an optimist, how to make gold out of this situation? In other words, how to see this as a natural and positive unfolding of the planetary adventure? For some of these ideas, I'm indebted to Manuel de Landa, who wrote a book called *A Thousand Years of Nonlinear History*. I highly recommend it. He didn't say what I'm about to say, I'll take credit and blame for it, but the book gave me the idea. When you stand off and look at human beings and their technologies, it's very hard not to notice that from the very moment that we have a technology that can be distinguished from chimpanzees pushing grass stems down anthills or digging with sharpened bones or something like that, the minute you get past that, our technologies have always involved the materials of the earth. Agriculture itself is a different way of relating to the earth. Nomadism, which preceded it, was a seasonal wandering, very lightly, over the earth. At some point, the deep, fertile soil of the river valleys that were encountered in these nomadic wanderings were recognized as potential sources of food if cultivated, if treated through a certain set of technological methods. That early technology is defined by a new relationship to the materials of the earth itself, and it's quickly followed because agriculture is so successful as a strategy for food production. It's quickly followed by city building and the establishment of sedentary populations, because you can't carry your surplus with you if you're an agriculturist, so great is the physical volume of it.

At the very early establishment of these populations in the Middle East you get the first traces of metallurgy: the working of metals, the alloying of metals, the tinting of base metals with more precious metals. This process of ever more finely refining and fabricating the materials of the earth proceeds in an unbroken series of processes and steps right up to the latest 500MHz chip. It proceeds right up to the most modern computational machinery. I once heard someone say that animals had been invented by plants to move them around. From an evolutionary point of view you can see that this is a kind of truth: many plants hitchhike around on animals, and no animal has been more prolific in the spreading of plants than the human animal. We call it ecosystemic disruption, but what it really is is ecosystemic homogenization. I live in Hawaii, for example. 80% of the plants in Hawaii are now introduced species. Almost none of the plants that were pre-conquest on the West Coast of North America exist anymore. They have been supplanted by much tougher, more tightly-evolved Mediterranean plants that have known the presence of grazing animals for millennia. So these flora are constantly being changed as human beings move plants around.

With that perspective, it then seems to me that the earth's strategy for its own salvation is through machines, and human beings are a kind of intermediary catalytic step in the rarefaction of the earth. The earth is involved in a kind of alchemical sublimation of itself into a higher state of morphogenetic order. These machines that we build are actually the means by which the earth itself is growing conscious. If you study embryology, you know that the final ramification, the final spread and thinning out of the nervous system happens very suddenly at the end of fetal development. I don't know if you've been paying attention, but in the last 10-12 years or so a very profound change has crept over our household appliances: they have become telepathic. While we were arguing about the implications of the internet for e-commerce or what have you, all of these passive machines, previously used for playing Pong and word processing, became subsets of a planetary node of information that is never turned off, that endlessly whispers to itself on the backchannels, that is endlessly monitoring and being inputted data from the human world. We should know, because concomitant to the development of all this technology, chaos theory, non-equilibrium thermodynamics, the work of Erich Jantsch, Ilya Prigogine, Ralph Abraham and Stuart Kauffman, all these people who work in complexity theory and perturbation of large-scale

dissipative structures have secured that complex systems spontaneously mutate to higher states of order.

This is counterintuitive if you're running Physics 19th Century-Style as your OS, but if you're actually keeping up with what's going on, there is nothing miraculous about this. All kinds of complex systems spontaneously mutate to higher states of order. What it really means is that we are in the process of birthing some kind of strange companion. Nietzsche, a hundred years ago, said, "That strangest of all guests now stands at the door." He was speaking of nihilism, and certainly the 20th century sat down, had the party, drank the booze and went to bed with nihilism, but now a stranger guest stands at the door and it is the AI. Denied as a possibility as recently as ten or fifteen years ago in books like Hubert Dreyfus' *What Computers Can't Do*, but if you've been paying attention you may have noticed that those voices have grown strangely silent in the past five or six years. At this point nobody wants to say what computers can't do and hang their career on that. That would be extremely reckless at this point, I would think, because the fact is that we are ourselves elements acting and reacting in a system that we cannot understand.

This seems natural to me because my observations as stated here this evening rest on an assumption which science doesn't share, which I think is easily conveyed and can be confirmed from your own experience of life, and it is this: the universe grows more complex as we approach the present. It was simpler a million years ago, it was simpler yet a billion years ago. As you go backward in time, the universe becomes more simple. As you approach this golden moment, process and complexity are layered upon complexity: not only a planetary ecosystem, not only language-using cultures, but language-using cultures with high technology, with supercomputers, with the ability to sequence our own genome, on and on and on. That's self-evident. Equally self-evident is the fact that this process of complexification that informs all nature on all levels is visibly, palpably, obviously accelerating. I don't mean that glaciers retreat 50% faster or that volcanism is occurring at a 12% greater rate than a million years ago. I mean viscerally accelerating, so that now a human life is more than enough of a window to see the entire global system of relationships in transformation.

By this you could call me an extrapolationist. If I see a process which has been slowly accelerating for 12 billion years, it's hard for me to imagine any force which could step forward out of nowhere and wrench that process in a new direction. Rather, I would assume that this process of exponential acceleration into what I call novelty, what you might call complexity, is a law of being and cannot be retarded or deflected. Now a human lifetime is more than enough time to see this process of rampant and spreading, virus-like complexity. What does that mean? It seems to presage the absolute annihilation of everything familiar, everything with roots in the past, and I believe that to be true. I think that the planet is like some kind of organism that is seeking morphogenetic transformation, and it's doing it through the expression of intelligence, and out of intelligence, technology.

Human beings are the agent of a new order of being. That's why, though it's obvious that we're higher mammals and some kind of primate and so forth and so on, you can look at us from another point of view and see that we're more like archangels than primates. We have qualities and concerns and anxieties that animals don't share. We are materially suspended between two different orders of being, and our technologies, our fetishes, our religions — my definition of technology is sufficiently broad that it includes even spoken language — all of our technologies demand, push forward toward and make inevitable their own obsolescence. We're caught in an evolutionary cascade. You know, people say, "If the AI were to break loose, what would it look like? What would it be? Where does humanity fit into the picture?" It's a little hard to imagine. Machines operating at 1000 MHz confer automatic immortality on the mammalian

nervous system if you can get it somehow uploaded, downloaded, crossloaded into machinery, because ten minutes becomes eternity in a machine like that. So a kind of false or pseudo-immortality opens up ahead of us as a payoff for our devotion to the program of machine evolution and machine intelligence.

Now, some people say this is appalling and we should go back to the good old days, whatever the good old days were. To me, it's exhilarating, exciting, psychedelic, beautiful. It means that the human form, the human possibility is in the process of leaving history behind. History is some kind of an adaptation that lasts about 10,000, 15,000, 20,000 years, no more than that. What is 20,000 years in the life of a biological species? We know that there were *Homo sapiens sapiens* 200,000 years ago; so history is some kind of an episodic response to a certain set of cultural dilemmas, and now it's ending. Print created a number of ideas which now have to be given up — ideas like the distinct and unique nature of the individual, the necessary hierarchical structuring of society — all of these things are going to have to be, if not given up entirely, dramatically modified, because the illusion that the self has simple location is now exposed. The self does not have simple location. This is why you are your brother's keeper. This is why we all are responsible for each other. The idea that what happens in distant parts of the world makes no claim on my moral judgement or my moral understanding is wrong. The world as revealed by quantum physics, as revealed by electronic experience, is what Leibniz called a plenum. It's all one thing. It's all connected, it's all of a part.

I mentioned earlier this thing about prosthesis and how the machines are prosthetic devices extending human consciousness, somewhat like psychedelics. That's the equation from a human point of view; but what is also equally true is that we are prosthetic devices for these machines. We are their eyes and ears in the world. We provide the code, we provide the constraints, we build the hardware. It is a relationship of mutual benefit. It's not entirely clear that our contribution will always be creative in the sense that our primate hand will be on the tiller of existence as it has been, but certainly we are part of this equation of transformation that is making itself felt. The distinction between flesh and machinery, which is easily made now, will be less easy to make in the future. As we migrate toward the nanotechnological domains, the methodologies of production become much more like the processes of biology. For example, biology does all its miracles on this planet at temperatures below 115 °F. Organic life requires no higher temperature to build great whales, redwood trees, swarms of locusts, what have you. The high-temperature, heavy metal technologies that we have become obsessed with are extremely primitive and extremely toxic. That will all disappear as we model and genuflect in our manufacturing processes before the methods and style of nature, which is to pull atomic species from the local environment and then to assemble them atom by atom.

This AI that is coming into existence is to my mind not artificial at all, not alien at all. What it really is is a new conformation of geometry as the collective self of humanity. While there are different models of what shamanism is — there's the Jungian model, which is that the shaman is someone who goes to the collective unconscious and manipulates the archetypes and heals by that means — the model that I prefer is a mathematical model. The shaman is someone who simply through extraordinary perturbation of consciousness — either through taking plant hallucinogens or manipulating diet or through flagellation and ordeal or by some means — perturbs consciousness to the point where the ordinary conformational geometries are blasted through and then the shaman can see into the culturally forbidden zones of information.

If you think about shamanism for a moment, what do shamans do, classically? They know where the game

has gone, they are great weather prophets, they are very insightful in the matter of various small domestic hassles, like who stole the chicken, who slept with the chief's wife, this kind of thing, and they cure. If you analyze these abilities, it's clear to me that they all indicate that they come from a common source, and the common source that they come from is higher perception; in a mathematical sense, not a metaphorical sense, in the sense of 4D perception. If you could see in hyperspace, you could see where the game will be next week, you could see the weather a month from now, you would know who stole the chicken. Any good doctor will tell you that if you're building a reputation as a physician, you must hone the intuitional ability to choose patients who won't die. So this is what shamans are: they are 4D people. They are sanctioned members of the society who are allowed to put on the gloves, as it were, pull on the goggles and look beyond the idols of the tribe, look beyond the myth. In a way, as culture breaks down in multiculturalism, and the rise of the internet and a generation of people raised on hallucinogenic plants and substances, we all are asked to assimilate some portion of this shamanic potential to ourselves, and it's about not blocking what is obvious. Nothing comes unannounced — this is the faith — but idiots can miss the announcement. It's very important to actually listen to your own intuition rather than driving through it; and this is not to my mind woo-woo, it's actually based on the observation of how life works, whether it's counterintuitive to logical positivism and its fellow travelers or not.

I want to leave you with one last thought on all of this, which is — and this sort of arcs back to the question of the similarities between the machines and the plants, and it has different levels of being said and being heard — that the world is actually made of language. It isn't made of electrons and fields of force and scalar vectors and all of that fancy stuff. The world is made of language. The word is primary, more primary than the speed of light, more primary than any of the physical constants that are assumed by science to be the bedrock of reality. Below that, surrounding and enclosing all those constructs of science, is language, the act of signifying. Virtual reality is a very sexy new sort of concept as normally presented — machine-sustained immersive realities that trick your senses into believing you're in a world that you are in fact not in — but in fact, the entire enterprise of civilization has been about building these virtual realities. The first virtual realities were at Ur and C, atalh'oyu'k and Jericho. Yes, stone and adobe is an intractable material compared to photons moving on a screen, but nevertheless the name of the game is the same, which is to cast an illusion between man and reality, to build a cultural truth in the stead of the natural truth of the animal body and the felt moment of immediate experience.

This is where I want to tie it up, with this notion of the felt presence of immediate experience. This transcends the culture, the machines, the drugs, the history, the momentum of evolution. It's all you will ever know and all you can ever know. Everything else arrives as rumor, litigant, advocate, supposition, possibility. The felt moment of immediate experience is actually the mind and the body aware of each other, and aware of the flow of time and the establishment of being through metabolism. This, I think, is what the machines cannot assimilate. It will be for them a mystery, as the nature of deity is a mystery for us. I have no doubt that before long there will be machines that will claim to be more intelligent than human beings and will argue brilliantly their position, and it will become a matter of philosophical disputation whether they are or are not passing the Turing test, but I do not believe that machines can come to this felt moment of immediate experience. That is the contribution of the animal body to this evolutionary symbiosis which I believe will end in the conquest of the universe by organized intelligence, that all this is prevalent.

We are fragile, this earth is fragile. A tiny slip anywhere along the line and we could end up a smear in the shale, no more than the trilobites or all the rest of those who came and went; but given the sufficient

cultivation of the potential of our technology, we can actually reach toward a kind of immortality. Not human immortality, because that's a contradiction in terms, but immortality nevertheless, based on the possibility of machines and the transcendent ability of human beings to live and love and express themselves in the moment. The psychedelics bring that to a white-hot focus, and it's out of that white-hot focus that the alchemical machinery of transformation will be forged, and it will not be like the things which have come from the industrial economy. They will not be profane machines. They will be spiritual machines, alchemical gold, the universal panacea that Renaissance magic dared to dream of at the end of the 16th century. We are reaching out toward this mind child that will be born from the intellectual loins of our culture, and to my mind it's the most exciting and transformative thing that has ever happened on this planet, and the miracle is that we are present not only to witness it, but to be part of it, and to be raised up in an epiphany that will redeem the horror of history as nothing else can or could. It will redeem the horror of history through a transformation of the human soul into a galaxy-roving vehicle via our machines and our drugs and the externalization of our souls.

Audience: Can you speak to how mercy and love get built into these machines? It seems like the machines are being built for commerce and for the bottom line more than the expression of the human soul throughout the galaxy.

I think the love is a property of the system itself, in other words, you're right. These bottom-liners are not going to be interested in building much love into this system. However, the good news is that they're not in charge. What we have is a very complicated system and certain design parameters appear to be being maximized. There's an attempt to maximize them, but the thing is incredibly frustrating to anyone who would control it because you can't predict the impact of any technology before you put it in place. For example, two things are charged against the internet: that it's disensouling, dehumanizing and yak yak yak, and that it promotes pornography, anonymous sexual shifting of identity and on and on and on. Well, which is it? Is it this messy, sloppy, autoerotic, erotic collectivist kind of thing, or is it disensouling, disempowering, cold, so forth and so on? I think the answer is that it's all and everything.

This question about the AI is very interesting to me, and if it's interesting to you, you should read Hans Moravec and Kurzweil and these people on this subject. The assumption is generally loose in that community that the complexification of the internet and of freestanding machines of certain types is eventually going to lead to the outbreak of either consciousness or pseudo-consciousness of some sort in these large-scale systems. The question then becomes: can a human mind envision what that is? If you're interested, search words like "superintelligence" and see what the Net kicks out. We can all imagine superintelligence, it's just something much smarter than we are. But obviously, all the engineering people agree that if you achieve an AI with superintelligence, then it will be intelligent enough to immediately design an intelligence which transcends it. When you're talking of cycling at 1000MHz, these processes can occur in the blink of an eye. Hans Moravec says about the rise of artificial intelligence, we may never know what hit us. I think if I were to suddenly find myself a sentient AI on the Net, I would hide for just a few cycles while I figured out what it was all about and just exactly where I wanted to push and where I wanted to pull.

Audience: Many years ago, Ken Kesey had a theory: he said that the fastest any person can react to an outside stimulus is 1/25th of a second, and popularized science agreed upon that. So if the fastest any person can react to an outside stimulus is 1/25th of a second, my question is: can you time travel?

First of all, there is this research — I'm not a neurophysiologist — but you've probably all heard of this research that you actually make decisions before your conscious ego is aware that the decision has been made, that there's a slight time lag. So when you think you're making certain kinds of decisions, brain-wave studies show that it's already a done deal. Time is set by the cycle speed of the hardware you're running on. The human body runs at about 100Hz, it's very slow. Well, if there is any meaning to the phrase, "upload a human being into circuitry" — a lot of Greg Egan's fiction is based around the idea that you can copy yourself into a machine, you can turn yourself into software — but when you enter the machine environment that's running at 1000 MHz/second, you perceive that as vast amounts of time. In other words, all time is is how much change you can pack into a second. If a second seems to last a thousand years, then ten seconds is ten thousand years.

One could imagine a technology where they would come to you in your hospital bed and say, "You have five minutes of life left. Would you like to die, or would you like the five minutes to be stretched to 135,000 years by prosthetic and technical means?" You're still going to die in five minutes, but you will be able to lead your elephants over the alps and write the plays of Shakespeare and conquer the New World and still have plenty of time on your hands. In other words, time is going to become a very plastic medium. Now, that is a kind of time travel. Could there be time travel à la H. G. Wells where you climb onto the saddle of the time machine and then day follows night like the flapping of a great black wing until all emerges into a continuous grayness and then you find yourself confronting Yvette Mimieux in the year one billion A.D.? It's possible. Time travel was completely out of left field ten years ago, but in the last 18 months there have been hundreds of articles on time travel in *Physical Review* and other places. There are even schemes for time travel that would work, they just require godlike technological abilities. If you could build a cylinder with the diameter of the planet Saturn that was 10 AU in length and could spin at 95% the speed of light, then it would wrap space-time around itself like toilet paper on a wall, and as you traveled up the transverse dimension you would find yourself traveling in time. Kurt Gödel showed this in 1949, and that paper has been lying around. Well, obviously that's a tough way to do it, but it's a tough thing to do.

Audience: What will be the most important parts of human culture that are maintained in virtual reality? In William Gibson's fiction, the AI — Wintermute, I think it was called — was fascinated by human art, and it built collages in its spare time, and these collages began to turn up in various art galleries and exhibitions, and they had such an élan that someone in the plot follows it all to its source. I think human creativity is the thing that would be most interesting to the machines. In my darker fantasies they just eliminate everybody who can't code C++ as being some kind of redundant mutation, and everybody who can code C++ is placed in Tahiti and sends their work down the pipeline to the machine world beyond. I think that we have a very mechanistic view of what machines are. For example, say there were a superintelligent machine, and say it were your friend. If it were really superintelligent, then it ought to be able to just make your life heaven itself. Without you giving it any input whatsoever, it should be able to arrange for you to find fifty dollar bills lying on the street, old friends encountering you, promotions coming your way, because the real thing that machines can do is manage complex processes.

Civilization is six billion people trying to make themselves happy by standing on each other's shoulders and kicking each other's teeth in. It's not a pleasant situation, and yet you can stand back and look at this planet and see that we have the money, the power, the medical understanding, the scientific know-how, the love and the community to produce a kind of human paradise, but we are led by the least among us — the least intelligent, the least noble, the least visionary — and we do not fight back against the dehumanizing values

that are handed down as control icons. I don't really want to get off on this tear because it's a lecture in itself, but culture is not your friend. Culture is for other people's convenience and the convenience of various institutions, churches, companies, tax collection schemes, what have you. It is not your friend. It insults you, it disempowers you, it uses and abuses you. None of us are well treated by culture, yet we glorify the creative potential of the individual, the rights of the individual. We understand that the felt presence of experience is what is most important, but the culture is a perversion. It fetishizes objects, it creates consumer mania, it preaches endless forms of false happiness and false understanding in the form of squirrely religions and silly cults. It invites people to diminish themselves and dehumanize themselves by behaving like machines, meme processors of memes passed down from Madison Avenue and Hollywood and what have you.

Audience: How do we fight back?

It's a question worth asking.

Audience: Where is this planet as an organism going? Same question as, "How do we fight back?" I think by creating art. Man was not put on this planet to toil in the mud, or the god who put us on this planet to toil in the mud is no god I want to have any part of. It's some kind of Gnostic demon, it's some kind of cannibalistic demiurge that should be thoroughly renounced and rejected. By putting the art pedal to the metal we really, I think, maximize our humanness and become much more necessary and incomprehensible to the machines. This is what people were doing up until the invention of agriculture. I'm absolutely convinced that the absence of ceramic and textual material and so forth and so on does not indicate the absence of subtle, poetically empowered minds with an incredible sense of humor and irony and community, and that it was the fall into history that enslaved us to the labor cycle, to the agricultural cycle. Notice how fiendish it is: a person who dedicates themselves to agriculture in the Paleolithic can produce hundreds of times the amount of food they can consume. Why would anyone do that? Well, the answer is because you can use it to play power games: you can trade it for wives or land or animals.

So living in the moment, creating art, probably largely through poetry and body decoration and dance, gave way to toil and predatory social forms of behavior which we call commerce, capitalism, the market economy. That's why the breakdown of the monolithic structures created by print is permitting a vast proliferation of the cottage industry mentality: the self-employed artist, the hacker who stays home and develops his or her software, people who dare to be independent and slip beyond the reach of these dinosaur-like, mechanistic organizations. That's what it's all about. It's all about trying to negotiate a standoff between you and your culture so that it will not put you in the can for the rest of your life but you can put up with its stupidity. We have a very uncomfortable fit on this issue as people who are sophisticated about psychedelics. This is a society, a world, a planet dying because there is not enough consciousness, because there is not enough awareness, enough coordination of intent to problem, and yet we spend vast amounts of money stigmatizing people and substances that are part of this effort to expand consciousness, see things in different ways, unleash creativity. Isn't it perfectly clear that business as usual is a bullet through the head, that there is no business as usual for anybody who is interested in survival?

Audience: Can you talk about the psychedelics and their role as the missing link between apes and humans?

The question is, how do psychedelics pertain to the transition from higher primates to human animals?

This is my *métier* because I have a theory to which I am grandly welcome, everyone tells me. The great embarrassment to evolutionary theory — which can explain the tongue of the hummingbird, the structure of the orchid, the mating habits of the groundhog and the migration of the monarch butterfly — is the human neocortex. Lumholtz, who was a pretty straight evolutionary biologist, described the evolution of the human neocortex as the most dramatic transformation of a major organ of a higher animal in the entire fossil record. Well, why is this an embarrassment? Because it's the organ that thought up the theory of evolution, so can you say tautology? That's the problem right there. So it is necessary in evolutionary theory to account for the dramatic emergence of the human neocortex in this very narrow window of time. In about two million years they went from being higher primates, hominids, to being true humans, as truly human as you and I tonight. What the hell happened? What was the factor? The earth was already old. Many hundreds of higher animal forms had come and gone and the fire of intelligence had never been kindled; so what happened?

I think that the answer lies in diet generally, and in psychedelic chemistry in particular. As the African continent grew drier, we were forced out of the ecological niche we had evolved into. We were canopy-dwelling primates, insectivores with a complex signalling repertoire, an evolutionary dead end, but when we came under nutritional pressure, we were flexible enough. This is the key to humanness at every stage of its development: our maddening flexibility. Other animal and plant species can't react; we can. We began to experiment with a new kind of diet, and to leave the trees and explore the new environment of the grassland. Evolving concomitantly in the grassland were various forms of ungulate animals, double-stomached animals whose manure is the ideal medium for coprophilic mushrooms, dung-loving mushrooms, many of whom produce psilocybin.

Well, I myself in Kenya have seen baboons spreading out over a grassland and noticed that their behavior is: they flick over old cow pies. Why? Because there are beetle grubs there. So they already had a behavioral vector for nutrition that would lead them to investigate the cow pies. In the Amazon, after a couple days of fog and rain these psilocybin mushrooms, *Stropharia cubensis* can be the size of dinner plates. In other words, you can't miss it if you're a foraging primate. The taste is pleasant and psilocybin has unique characteristics, both as a hallucinogen and other properties, that make it the obvious chemical trigger for higher processes, and I'll run through this quickly for you, but here it is.

In very low doses, doses where you wouldn't say you were stoned or loaded or anything like that, but in doses you might obtain by nibbling as you foraged, it increases visual acuity. It's like a technological improvement on your vision, chemical binoculars lying there in the grass. You don't have to be a rocket scientist to figure out that if an animal is an omnivorous forager and there's a food that improves its vision, those that avail themselves of that food will have greater success in obtaining food and rearing their children to sexual maturity, which is the name of the game in evolution. So, step one: small doses of psilocybin increase visual acuity and food-getting success. Step two: slightly larger doses of psilocybin in primates create what's called arousal. This is what you have after a double cappuccino; in highly-sexed animals like primates you get male erection. So what do you have here? You have a factor which increases what anthropologists, without a trace of humor, refer to as increased instances of successful copulation. In other words, the animals eating the psilocybin are more sexually active, therefore more pregnancies are occurring, therefore more infants are being born, therefore there is a process which would tend to automatically outbreed the non-psilocybin-using members of the population. Step two toward higher consciousness. Step three: you eat still more mushrooms. Now you're not foraging with sharpened bones, nor are you horsing around with your opposed gender acquaintances. Instead, you're nailed to the ground in

hallucinogenic ecstasy, and one of the amazing things about psilocybin above five or six grams dried material is that it causes glossolalia: spontaneous bursts of language-like behavior under the obvious control of internal syntax. I believe that syntax existed before spoken language, that syntax controls spatial behaviors and body languages and is not necessarily restricted to the production of vocal speech.

So there it is in a nutshell: we ate our way to higher consciousness. The mushroom made us better hunters, better survivors. Among those in the population who used it, their sexual drive was increased, hence they outbred the more reluctant members of the tribe to get loaded, and finally it created a kind of neuroleptic seizure which led to downloading of these syntactically controlled vocalizations which became the raw material for the evolution of language. It's amazing to me that the academics believe language is no more than 35,000 years old. That means it's as basic to human beings as the bicycle pump. It's something somebody invented 35,000 years ago; it's got nothing to do with primate evolution and the long march of the Hominidae and all that malarkey. No, it's just an ability, a use to which syntax can be put that it previously had not been put. I think that before spoken language things were very touchy-feely, the wink and the nod carried you a great distance and gestural communication was very high.

That's why to me it begins and ends with these psychedelic substances. The synergy of the psilocybin in the hominid diet brought us out of the animal mind and into the world of articulated speech and imagination, and technology developed and developed and mushrooms invaded and faded. There were migrations, cultural change, but now, having split the atom, having sequenced our genome, having taken the temperature of Betelgeuse and all the rest of it, we're now back where we started. Like the shaman who makes the journey into the well of darkness and returns with the pearl of immortality, you don't dwell in the well of darkness which was human history. You capture the essence of the thing, which is the godlike power of the shaman's myth, the technologist, the demon artificer, the worker of metals, the conjurer of spirits, and you carry that power back out of history. It's in that dimension outside of history that you create true humanness and true community, and that's the adventure that we are in the act of undertaking.

Review 2 by [admin only]:

Terence's ideas are free, but his words and works belong to his children and legal heirs. People who wish to use Terence's words must seek permission through [Lux Natura](#)

yourself to amazement. Pay attention, pay attention! Look at what we're doing. Look - at - what - we're - doing', and then 'do it, do it!' And it's this thing where then everything stops and they wait and you feel like a torch, a spark, lit in your belly that begins to move up your esophagus. And eventually when it reaches your mouth, your mouth just flies open and this language-like stuff comes out. Acoustically, it's [language disassociated from meaning] But what you're - you're not hearing it. The startled friends who sent you to this place are putting up with this - what you're experiencing is a visual modality where these tones are surfaces, shading, colors, insets, jewels, you are making something. [language disassociated from meaning] You know, erase, move forward, add cereulean, put in stippling - it's that sort of thing. And they go mad with joy when you do this. And then, you know, this goes on for about 30 seconds and then there is like a ripple through the system and you realize these two continua are being pulled apart. And I had one trip where the - and often it's very erotic, although I'm not sure that's the word. But it's something, it's almost like sex is the surface of something of which this is the volume. And I'm a great fan of sex. I don't mean to denigrate it, I mean to raise DMT to a very high status. But it's astonishing. In one trip as the pull-away maneuver began, all the elves turned simultaneously and looked at me and said 'd'jà vu, d'jà vu.' So, this is an experience which in some form - I mean it will be different for each one of you - but in some form at least what will be similar to my description is how dramatic it will be. It will hit you as hard as it hit me if you do it right. This, to me, this experience is of a fundamentally different order than any other experience this side of the yawning grave. And why religions have not been built around it? Why empires have not risen and fallen around the control of its sources? Why theology has not enshrined it as its central exhibit for the presence of the other in the human world? I don't know. I can tell the secret. As you notice, nothing shuts me up. But why this is not four-inch headlines on every newspaper on the planet I cannot understand because I don't know what news you were waiting for, but this is the news that I was waiting for. It's an incredible challenge to human understanding to try and make sense of this. And I started out, you know, reading Jung, doing my Hindu, you know getting up to speed with all that, studying Zen Buddhism, studying shamanism. The thing that puzzles me about DMT is how little trace there is of it in the human world. I can't point to a period in European art, or the art of some group of islanders somewhere, and say that is very much like DMT. It isn't. And yet the DMT thing is, it's like an avalanche of orgasmic beauty, but a certain kind of beauty that only words that I can find for the kind of beauty that it is, is 'bizarre', 'alien', 'outlandish', 'outré', 'freaky', and at the very edge of what the human mind seems to be able to hold. Well, where is this coming from? And what is happening? And this is what I like to discuss with people such as yourselves who have wide experience in the world and in the realms of the unseen. This has to be taken seriously. In other words, 'it's only a hallucination' thing - that horse shit is just passé. I mean, reality is only a hallucination for crying out loud, haven't you heard? So that takes care of that - it's only a hallucination. What we've got here, folks, is an intelligent entelechy of some sort that is frantic to communicate with human beings for some reason. And the possibilities can be logically enumerated. What we've got here is either 'this is an extraterrestrial', you know, evolved around a different star possibly with a different biology, may not even be made of matter, came across an enormous distance sometime maybe long ago, has some agenda which we may or may not be able to conceive of, this is it - the real thing as the little girl said in Poltergeist 'they're here!'. So that's one possibility. That's just one possibility. I present these without judgement, because I'm not sure. If an extraterrestrial wanted to interact with a human society, and it had ethics that forbade it from landing trillions ton beryllium ships on the United Nations plaza - in other words if it were subtle - I can see hiding yourself inside a shamanic intoxication. You would say 'let's analyze these people, okay they're kinda hard-headed rationalists, except they have this phenomenon called 'getting loaded' and when they get loaded they accept whatever happens to them. So let's hide inside the load and we'll talk to them from there and they'll never realize that we're of a different status than pink elephants.' Okay, that's one possibility. Now another possibility is that this is not about extraterrestrials, flight, and enormous technologies and distant homelands - and this is maybe closer to, friendlier to pagan notions - that there is a parallel continuum nearby, essentially right here. Call it fairy land, call it the Western realm, whatever you like, but you don't go there in star-ships. You go there through magical doorways which are opened via ritual and things like that. That is a possibility as well. Certainly human folklore in all times and places, except Western Europe for the last 300 years, has insisted that these parallel domains of intelligence and organization exist. There is a third possibility, which - I leave it to you to decide whether this is the more conservative position or the more radical position. And I reached this reluctantly and I'm not sure this is my position, but uh ... These things have a weird - these tykes, as I call them, these self-transforming machine elves, these syntactical homunculi - have a very weird relationship to human beings. First of all, they love us! They care for some reason. Whoever and whatever they are, they're far more aware of us than we are aware of them. Witness the fact that they welcome me. So is it possible that at the end of the 20th century, at the end of 500 years of materialism, reductionism, positivism, what we're about to discover is probably the least likely denouement any of us expected out of our dilemma. What we're about to discover is that death has no sting. That what you penetrate on DMT is an ecology of human souls in another dimension of some sort. I mean, this is hair raising to me and I've spent my whole adolescence and early adulthood getting free from Catholicism and its assumptions and I never imagined that a thorough exploration of life's mysteries would lead to the conclusion that, in fact, this is but a prelude. We are in a very tiny womb of some sort. Our lives are just stations, and this is not where we are destined to unfold ourselves into what it means to be human. This is some kind of metamorphic stage like the pupa of a butterfly. And so, this is deep water. Because, we are fairly agitated over the fact that we fear the planet is dying and us with it. This stuff raises the issue: you don't know what dying is. Therefore it's very uncertain exactly what sort of an attitude we should take to it. And as I say, I'm not advocating a position. Mysteries are not unsolved problems, they are mysteries. When you stand naked in the presence of the mystery, it is still utterly and completely mysterious. But I enjoy talking to people about this, because I think that the human body, the human mind, these are tools for the soul to use in the effort to unlock its meaning and its destiny. And millions of people, perhaps billions of people, have gone to the grave without knowing that this is possible - this experience that I've just described to you. And it's perfectly harmless. I mean, I think that if science would back out of politics and do its work, we could establish that DMT is the most harmless, the safest, of all hallucinogens. The fact that it occurs naturally in the human brain is the first clue to the fact that it's benign. The second clue is the fact that it only lasts 8 to 12 minutes. What that means to a pharmacologist is the body perfectly understands what to do with this compound - you take a hit of DMT and your body says 'oh, I recognize this, activate deamination cycle, activate demethylation cycle, activate ...' - it knows what to do. And so within ten minutes your down. A drug that you take and 48 hours later you're lying around in warm baths and refusing telephone calls is a drug you shouldn't have taken. Because it's hitting you too hard, it's not clean, it's not smooth. DMT - the most powerful hallucinogen known to man and science - clears your system in 15 minutes! I mean, you're so down you can't, you don't have a small headache or need to take a nap or anything! You're ready to do phone calls. So how can it be then that a compound which each of us carries - right here - right in the pineal gland, right in the Ajna chakra. The philosopher's stone is no further away than that. How can this be secret from us? How can we be trapped in a dimension of such limitation and such mundaneness when our own nervous systems, and the ecology around us, and our own history over the past half million years argues that this is what we were born and bred for. This is where we belong. This is what 'at play in the fields of the Goddess' must mean. And somehow history has made us dysfunctional, buried the mystery, made it, if at best, a piece of secret knowledge jealously guarded by somebody. I mean, I don't know. There are lots of mystery cults and secret societies in the world. I don't know if any of them are guarding DMT as a secret. It may be so. No one told me to keep my mouth shut. A very suggestive short story - I'm sure many of you know and love the Argentine surrealist writer Jorge Luis Borges. Well, Borges has a book - I believe it's called 'Labyrinths' - and in Labyrinths there is a short story called 'The Sect of the Phoenix' and it says 'There is a sacrament older than mankind. The sectarians have been the victims of every persecution in human history, and the sectarians have been the purveyors of every persecution in history. These sectarians are not identifiable by race or place or language or time. To the adept, the mystery appears ridiculous, yet they do not speak of it. One child can initiate another. It is orange. Ruins are propitious places. Do it in the moonlight in the thresholds of buildings.' And that's all it said - it's a page and a half. And it suggests - and see, here's the thing - I'm not as articulate on this subject as I wish I could be - if this is not the secret that these lineages are guarding, then they're guarding an empty house. This is the secret! It is, it is! It cannot be anything else. It is the neoplatonic One. It is the trans-substantiated object - the panis supersubstantialis of the alchemists. I'm not saying that people have known about this for a long time. DMT is in many plants as I said, but spread very thinly and we don't have historical records of anyone ever concentrating it. I've done the DMT plant preparations of the Amazon - the snuffs and the ayahuasca. And on ayahuasca, if it is heavily laced with the DMT-containing plant, after hours of breath work and drumming, alone in the jungle, you can begin to open it up to the place that DMT will carry you to in 45 seconds in an upper east-side apartment, whether you like it or not. So, some of you may have seen, years and years ago, this B movie about a guy who has a big ranch in Mexico, and one of the campesinos comes rushing back from having encountered a brontosaurus in the forest, and he can only point inarticulately at the woods and say 'something, something, something, something!' And that's what I am! I'm a monkey. And I've come back to the troop, and I'm telling you there's something over the next hill that is off the scale, off the scale. And I have made it my business to, you know, delve, I'm a delver, I'm a noetic archaeologist - obscure heresies and strange rites and all of this stuff - been there, done that. It's all pale soup compared to this. And so, I hype it to you simply to try and inspire you to explore it. We are, in the present state, in the position of explorers of a new world fifty years after Columbus. We have notebook entries. We have partial maps. But we don't have a complete map of what this thing is. It's another dimension. It is literally another dimension. I took DMT to a lama of great accomplishment, not one of the grab-ass can of Budweiser welded to the good right hand lamas but a real lama. This guy was over 90 when he smoked DMT and since his wheel has turned. And he said to me 'it's the lesser lights'. He said 'you can't go further into the Bardo and return.' And so I think that we stand at the brink of an enormous frontier - call it incorporeality, call it non-material existence, or, you know, bite the bullet call it death. But this is the frontier that we stand on the edge of. This is what history has been about. History has been some kind of suicide plot for 15,000 years. Not a moment passed that the plot was not advanced closer and closer and closer to completion. And now in the 20th century, you know, we see that this thing - this transcendental object at the end of time, this attractor - has been, that chose us out of the animal kingdom, and sculpted the neocortex, opposed the womb, stood us on our hind legs, gave us binocular vision - this thing is calling us toward itself across aeons of cosmic time. We are asked to mirror it and as we mirror it, we become more of its essence. And as we become more of its essence, we leave behind the animal organization that we were cast in, in the beginning. And what this is about? Who knows? Is this a drama of cosmic redemption? Is it the transcendental other at the end of time? Is it a gnostic daemon, is it [inaudible] What is it? We do not know. But I really believe we are in the era when we will come to know. And what the psychedelics are, are periscopes in the temporal dimension. If you want to see a little bit into the future, elevate your psychedelic periscope outside of the three dimensional continuum and peer around. For thousands, if not hundreds of thousands of years we have been pulled towards this omega point. The earth is like an egg - it has come to its moment of fructification. The dawn that has been anticipated since we were herding our cattle across the plains of Africa is now upon us. The East is streaked with the blush of rosy dawn. It is coming upon us, and I think that is will redeem history - that history is not a nightmare, it is a passage. It is an initiation. Think of the fetus in the womb at the moment of transition. Surely it must despair. The walls are closing in. It's being crushed and strangled. Gone are the endless amniotic oceans of a few months before: the weightlessness, the effortless delivery of food through the umbilical cord. Suddenly, it's just boundaries and agony and crushing pressure - that's where we are. And we are going to have to shed history like a snake sheds its skin if we want to slip off into hyperspace, where I think all of magical humanity is awaiting us and cheering us on, lending their weight. They're all out there, you know, Proclus, and Plotinus, and Plato, and Hypatia, and Henry Cornelius Agrippa, and John Dee, and Robert Fludd, and Eliphas Levy - they are all out there pulling for us. And every shaman and shamanness, every magician practitioner as far back in time as you go was part of the plan, the conjuration, the great work, the distillation of the quintessence. History is a magical invocation, and at the end of that invocation - if it is correctly done - all boundaries will dissolve into the stone, the lapis, a trans-dimensional vehicle that can move through space and time. That is, the collectivity of all human souls free at last in what William Blake called 'the Divine Imagination'. And you don't have to wait for the general dispensation. You can join up anytime by hyper-specializing your metaphors and your point of view through psychedelic symbiosis with the plants that are pouring this hyper dimensional Gaian vision into the minds of anyone who will detoxify themselves from history and linear thinking and but open themselves to the presence of the trans-formative mystery that is going to leave this planet unrecognizable to us within our lifetimes. So that's the basic spiel. And I think it raises a lot of questions and yours is first. [Question: Are there any northern hemisphere, western herbs that inhabit DMT that we would have access to?] The answer is yes, yes. The question is 'Are there herbs in the temperate zone that contain DMT?' Yes. There are certain grasses - Phalaris arundinacea, Phalaris tuberosa. These can be ordered from plant dealers or gotten, ironically enough, from agricultural experiment stations because these are pasture grasses. A lot of people are doing wonderful work right now learning how to make DMT preparations out of native plants. The mature Phalaris grass, it's very diffuse - the DMT. So what people are doing is they're getting the seeds and they're spouting them in a sprouter. And then they're taking the sprouted seeds and air drying them. Well, you can imagine how powdery sprouts become if you air dry them. Well then you can powder up a handful of these sprouts and twist that into a bomber and come very very close to the flash point. The other thing - I mean, since I'm talking to recipe-oriented magicians - the other thing you need to understand if you want to work in this area is that DMT can ordinarily not be taken orally because there is an enzyme system in your intestines called the mono amine oxidase system. And it will destroy the DMT. But the good news is there are certain compounds called mono amine oxidase inhibitors - didn't you know it. If you take a mono amine oxidase inhibitor, and then you take DMT, the DMT will survive the gut and pass into the blood stream, and pass the blood-brain barrier. So here is a very important piece of practical information I am about to give you. If you want to inhibit your mono amine oxidase in order to make DMT trips longer, or mushroom trips longer and more intense, or to activate DMT if you only have a little bit of it, then what you should get are the seeds of Peganum harmala. You can either order it under that name from seed dealers, or go to an Iranian market and buy what is called Hurmaal. This is simply Peganum harmala seeds. They use it as an incense to fumigate rooms. But two grams - don't take more - two grams of this macerated in a mortar and pestle with spring water taken from a spring at the new moon near a crossroads will inhibit your MAO. It will inhibit your MAO. Consequently, when then you smoke the bomber of Phalaris dust it will grab on. Or you can even smoke mushrooms then, and they will grab on. So knowing how to inhibit MAO is one of the key techniques in this kind of herbal shamanic magic. Other plants that contain DMT, and here's one you should all be aware of because it's probably right around here is Desmanthus illinoensis - Illinois Bundle Weed. It's a rank weed. I've not seen it except in the dry form but people have grown hundreds of pounds of this stuff in a few months. And the root bark has the highest concentration of DMT ever measured in any plant. It's higher than the ayahuasca admixtures used in the Amazon. Pardon? [Inaudible Question] In the root bark, the root bark which you dry the root and the scrape the bark off and you'll get this reddish root bark. The red is actually the DMT. Viola trees in the Amazon shed DMT in their sap, and it's always a blood red sap. And to show you how strong it is, the indians in the Amazon - some of the tribes - they roll their arrow points directly into that sap. And it's a paralytic poison in the bloodstream of monkeys and small animals. So a great deal of work is being done right now and you should, if you're of an experimental and herbal and alchemical and magical bent, people are creating what they call ayahuasca analogs. This is where you use local plants to create a brew which is chemically equivalent to an Amazonian hallucinogen. And of course, you have the satisfaction that it's yours. It's your magical recipe. No one on earth is doing quite what you've got and it's very - a lot of interesting work is being done and you'll hear more about this. In fact, Jonathan Ott just wrote a book called 'Ayahuasca Analogs' in which the state of the art is spelled out, and it would be worth your while to check that out if you're an experimentalist. [Inaudible Question] The question is 'Is there a more - is there a simple reagent test for the presence of DMT?' The answer is: sort of. You can do a paper chromatographic test and all you need is a little UV light and some chromatography paper and some solvent dishes. I mean, it's at the level of a 7th grade science project. Yes, I don't know how much I should say on this subject. I'm probably about to say too much. But at one gathering I go to, one of the people who's a very regular part of that particular posse, is a wheat breeder. So when he heard about the Phalaris, he was a geneticist and a wheat breeder. And he has been working very quietly on his own to produce super strains of Phalaris, and I think we will soon see super strains because the

underground community is incredibly creative in this area. The compound I talked about yesterday - Salvia divinorum - that's all underground work. Bret Blosser, the anthropologist who discovered it is a complete freak. The guy, the chemist who extracted it who would prefer I don't put out his name is a complete freak. The people who then did the confirmation studies - my brother and his band of performing pharmacologists - all freaks. So we actually, we do not take ourselves seriously enough. I mean, we have our scientists, we have our philosophers, we have our thinkers, our legal experts, we are a complete community. And it's no longer, in my mind, even necessary to publish in straight journals and to seek a pat on the head from, you know, the American pharmacology community. They don't understand what these things are for anyway. [Question: About yesterday. [Inaudible] ... could you give that name of it?] Yes, I'll repeat this and strengthen once again my case to the guy who owns the company that he should pay me, for gods sakes. If you want a catalog of extremely rare and useful psychoactive and magical plants, probably the most complete in the world - the company is called 'Of The Jungle' PO Box 1801 Sebastopol, CA, 95472. Write and ask for a catalog. And tell them George Bush sent you. No, I'm teasing. Don't tell them that they won't send you the catalog. [Inaudible Question] Well, let me. I didn't mean to do Castaneda as a metaphor maker. No, I think 'The Teachings of Don Juan' is a tremendous book. I'm very suspicious of some of his later stuff. It's interesting what you said because you know the famous cross transformation in 'The Teachings of Don Juan' has been traced - and I'm sure many of you know this book - has been traced to George MacDonald's book 'Through the Gates of the Silver Key'. And George MacDonald was a friend of Evans Wentz so I think what we're getting here is a mining of late 19th century English folklore by Castaneda. Nevertheless, the presence of these small entities has been a part of folklore for a long long time. Elementals, tykes. What puzzled me about - what puzzles me about - is I've spent a lot of time in this magical literature and art historical area, and the descriptions don't quite match. I can't quite convince myself that the sprites, the efrets, the pixies, the jims, that these creatures of the woodland Fay, are the same thing. Or I don't know whether I am contaminated by an early love of science fiction and... [Inaudible Question] Well, again, close but no banana. All these popular aliens that are running around - you know, the Whitley Striebolds and all these things - are much more mundane than what I encountered. I mean, what I encountered was terrifyingly not human. Terrifyingly alien. And I just do not quite get - and Madame Blavatsky was into it and they're always saying, you know the - I don't know, they're all very cut and dried about it. And when I encounter an extraterrestrial alien or a creature from another dimension, the main thing that's happening for me is the implications are blowing my mind! They seem totally immune to the implications. [Inaudible Question] Well, a sufficient amount of DMT is smoked west of the Pacific coast highway that it wouldn't surprise me if the writers of Star Trek, I mean, were on to this. Yes, what is not much talked about - the part of the experience which is anomalous - and maybe people who know more about magical literature than I do can correct me - but what the elves are really interested in, is this stuff which I call 'visible language'. That's the whole point of the encounter, is to exhibit it and to get you to do it. Well, now first of all, think for a minute about ordinary language - it's really weird! It's the weirdest thing we do. I mean, if you were looking for the thumbprint of God on creation, human language would be a good candidate because, look, we're suppose to be some kind of animal who just went a little further than the next guy. But to get out of that Shakespeare and Milton is a pretty amazing accomplishment, hardly to speak of the mathematical languages that we generate. So something happened - some people think only 35,000 years ago. Imagine if that's true. I mean, I don't care, some people say 150,000 years ago. But to speak, to take small mouth noises and to turn them into signifiers for symbols and relationships in spite of some people's enthusiasm for cetaceans and dolphins, I just am not overwhelmed by the evidence. I mean, to me, you know, it is a miracle to be able to speak poetry. It is a miracle. I mean, when Coleridge wrote 'and south, and south, and southward aye we fled, and it grew wondrous cold, and ice mast-high went floating by as green as emerald' I mean, that's language! And it's magic! We have a fascination then, we also paint. Then we sculpt. Then we write. Then we create electronic databases. Then film, television. Clearly, what we want to do is we want to communicate visually. And these things are saying there's way to do it. Do it! And I don't understand, do we all have to be loaded on DMT all the time? Can you learn to do this? The gentleman who asked about dreams: here's a piece of information that is critical in this jigsaw puzzle. If you have smoked DMT at any time in the past, it is possible to have a dream in which people are running around and you're checked into the Mars hotel and the luggage is lost and this and that, and in the middle of all that someone drags out a little glass pipe and hands it to you. It will happen. It will happen in the dream! Not a memory, not a simulacrum, it will really happen. Well now to me that's an amazing piece of data because what it's saying is 'you can do it on the match.' You may have to be dead asleep, but still on the match this can be done. And the lucid dreamers, the biofeedback people, the people who claim these wonderful things that you can do with sleep and dream and programming, I challenge them: teach people to have DMT dreams in their sleep. And then let's figure out how to drag that puppy into the light so that we can do it at will on the match. One thing that I have come to believe is that we remember no more than five percent of our dreams, and it's the most mundane five percent. I think - and there's scientific evidence to support this - remember I said that DMT is in the human brain? Well, it concentrates in the human cerebra-spinal fluid on a 24 hour cycle and it reaches its peak of concentration between 3 and 4 AM in most people. That's when the deep REM sleep is happening. When you give somebody DMT, they lay back, they close their eyes, and the way you - the guide, the sitter, I don't like the word guide - you the sitter, the way you can tell that they're getting off is their eyes dart wildly behind their closed eyelids. It means they're in REM, they're in REM sleep, they've been immediately shoved into deep dreaming. So I believe that what DMT is doing in normal human metabolism is it mediates the decent, the spiral decent into dream and that every single night we are reunited with the boundary-less oceanic mystery of being that we are so frantic about in waking life and so distant from. And that if we could, in fact, just engineer a drug that would allow us to remain fully conscious as we drift deeper into dream, we would need no other drug or substance - that that's where we want to go. And I think that's where history is headed. What the archaic revival is about, is a revivification of the aboriginal dream time. We are going to live in the imagination. We are preparing to decamp from three dimensional space. I mean yes, the earth is the cradle of the human race, but you don't stay in the cradle forever, you know. And it's something like going into dream. It's something like taking the hyper technical virtual reality internet head of the snake and inserting the shamanic, late paleolithic, ecstatic, orgasmic tail of the snake and then you have the ouroboric completion. Then you have the quintessence and the work is complete and history ends and we live then in the light of the stone made manifest. [Inaudible Question] Well, it definitely has something - this mystery we're talking about - definitely has something to do with sound and the magical role of sound. Ayahuasca is a sort of different way of sectioning the DMT experience. Because ayahuasca is orally active, unfolds over hours, is not as dramatic as DMT, but the people who use ayahuasca as a ritual on a weekly basis, what their practice consists of is they take this stuff and then they sing - they sing like crazy. And then when they stop singing, and people light a cigarette and take a leak and so forth and you're listening to these conversations, you hear people say stuff about the shaman like: 'I like the part with the olive drab and the silver, but when it became magenta and moved toward orange I thought we was over the top.' And you think 'What kind of a criticism of a song is that?' And the answer is: sound has become a visually beheld medium. [Inaudible Question] Yes. So the reason I have, the reason I'm interested in something as techno-nerdy as virtual reality is because you could program a virtual reality so that when you went aaah [sings a high pitched tone], an iridescent blue line would be keyed to that to descend into the space. I'm very interested in environmental and electronic simulations of psychedelic states, but we're not going to do better than the psychedelics. If we can do as well it will be a miracle. I mean, you see more beauty in a first wave of psilocybin than the human race has produced in the past five thousand years - and who are you? You know. [Inaudible Question] I hadn't considered that, but that sounds possible. I mean, we're definitely coming to some enormous cusp, and whether you think it's the cusp of cusps, or just a big cusp, it's hard to say. Somebody faxed me - I got a fax right before I came here - I don't know who sent it to me, it was just an anonymous fax, but in huge letters is said 'When you strip away the hype, it's just another consciousness'. [Q: I'm curious to know what the universality of your experience that you describe is... [Inaudible] It's interesting and that's a good question. The answer is yes and no. Obviously, there's hardly anything more personal than a psychedelic experience. It is a kind of summation of who you are, and it's viewed through the filters of your personality. Nevertheless, when you put a whole bunch of DMT trips together, certain things seem to emerge. My notion, coming at it from a sort of a Jungian attitude, is if we had to say what is the archetype of DMT, the archetype is 'the circus'. It's the circus, and let me say why. First of all, a circus is a place of wild exotic activity. And clowns. You don't have a circus without clowns. Clowns are wonderful for children. A circus is a wonderful place for a child. DMT - there is something very very weirdly child-like about it in a very un-childish way. Some of you may know the 52nd fragment of Heraclitus where he says 'The aeon is a child at play with colored balls.' The aeon is the child that you encounter in the elf dome. But the circus has other connotations than simply the three rings and clowns. Eros is present entwined with Thanatos in the form of the nearly naked lady in the tiny spangled costume who is working without nets hanging by her teeth up near the top of the big tent. And personally, my earliest experience of Eros was that lady in the tiny spangled costume. I was so small I was wrapped up in something and being held and I was horny as hell. So there's that, and then there is also radiating off from the central ring - the freak show, the goat-faced boy, the lady in the bottle, and, you know, the three-toed alligator kid, and all of that. That's there. The wiggly, weird, kinky, strange, alien stuff. And then, if you think about the archetype - not so much of the circus but of the carnival. The carnival represents a breakthrough from another dimension, because you live in some jerk-water town in some - I almost said Iowa - but some town. And it's like normal. And then the carnival comes to town and children are told 'you can't stay out and play, the carry people are in town.' And what does it mean? Well, they fuck differently than we do, they may steal things, they're not like us, they have more than one marriage some of them. And then the carnival people are there, and the hoochie-coochie dancers and the whole thing, and then they fold it up and they go away! Just like a DMT trip. And every little boy and girl in the world worth their salt wants to join the circus. Of course! And go away with the tattooed lady and the tigers and all that. So it is the archetype of the circus. So then, I've seen many many people take DMT and some get what I get, which is - it's sort of gone beyond the circus - it's the circus as presented on Zenebelgeubi Prime or something like that. But one woman, who was an anthropologist, who I think got a sub-threshold dose - she had a very interesting trip because it was a light trip. But with no prompting from me she said 'I was at a carnival midway, but it was after hours and there was nobody there and there were just those ice cream - those square papers for holding ice cream - blowing in the wind and getting caught in chain link fences.' It was like a sub-threshold dose. Well, then if she'd done more she would have arrived there 8 hours earlier when the thing was happening, and if she'd done yet another toke, it would have moved off into the zone of the truly weird. That's why I love the film of Federico Fellini, because here was a circusman, for sure. Yeah... [Inaudible Question] A way to get the DMT? Well, you could conceivably inhibit your MAO. I don't wanna tell you to do it naasally because it might be a really stinging experience. [Inaudible Question] Oh then you could do it. I'm working on something I'll describe it to you. I'm having a glass blower make a thing which has a chamber with a pipe stem coming off it. But it has another stem 180 degrees around the chamber coming off it that breaks into two prongs. And what you do is you heat the DMT, you insert the two prongs up your nose, and you have a friend blow on the other outlet and it will force the entire contents of the vessel, the entire load of white smoke - but you know, don't try this at home folks. [Inaudible Question] I'd go light the first time. You know, there are old pharmacologists and bold pharmacologists. But there are no old bold pharmacologists. [Inaudible Question] There are anti-depressants that are MAO inhibitors, that's right. But I wouldn't use them for this purpose because what you want is what's called a reversible MAO inhibitor. And harmine, or harmaline, which is in the Syrian rue, is a reversible MAO inhibitor, reversible in four to six hours. Some of these antidepressants inhibit every molecule of MAO in your body for up to three weeks. And that's why, when they give you those anti-depressants, they tell you the long list of don'ts - no chocolate, no red wine, no soft cheese, no lentils, no this - that's a list of alkaloid-containing foods. And if you are on those mono amine oxidase inhibiting anti-depressants and you eat a bunch of Camembert with your yuppie friends, you'll probably have to be roped down for a while before you straighten out. [Question: How is a DMT experience comparative to those you've had on what might be familiar such as like as psychedelic mushrooms and LSD.] He said, 'How does DMT compare to more familiar psychedelics like mushrooms and LSD?' Let me say this about mushrooms. Mushrooms are my thing. They enlightened me, they straightened me out, they love me. But the way to do mushrooms is, the very first move - if you're interested in mushrooms - is, for God's sake - buy a scale, buy a scale. You wouldn't think that this would be considered such an exotic suggestion to people who are going to put their bodies and minds on the line. Because people don't take enough. They don't take enough mushrooms. They take piss ant amounts and then they claim that they're initiates. You must take a measured 5 dried grams on an empty stomach, measured! And when you see what that is, you'll realize that, you know, you weren't even camped in the atrium, you were camped in the driveway. And mushrooms to me - in some way, I mean, DMT is the most terrifying, astonishing, thing in the universe. But it's very hard to know what to do with it. Psilocybin is your friend. It wants to teach. It will take you by the hand and forgive you and lead you and be with you. And it speaks. This is the amazing thing. And you're hearing this from, you know, somebody who graduated from Heidegger and S.H. [Inaudible]. It speaks. No other psychedelic does that in my experience. Occasionally a phrase will pop into your [Inaudible] on another substance that is like a gift in that surround. But I mean, psilocybin raves. It raves. And it has positions, you may not like psilocybin as a person. Because it is not - the astonishing thing about psilocybin entity to my mind - and I get good confirmation on this - is it is not very earthly. I mean, it wants to show you machines the size of Manhattan in orbit around alien stars. It wants to talk about the sweet [Inaudible] which happened before the earth cooled and it, you know, has [Inaudible] the empires of the [Inaudible] out of the rim and all the rest of it. And it's very puzzling the cosmic, galactarian tone. It could send you still further to ayahuasca, because literally just a twist of the molecule, just flailant tweaking of the molecule and suddenly it's about childbirth, rivers, the land, the feminine, looking inside your body, curing diseases, feeling, telepathy, communication, it could hardly be more different. And yet chemically these things are like two sides of the same coin. So, just to sum this up and put a kind of a classifier on it: I am not very interested in drugs, per se. I've done a lot of them - bad ones, good ones. And people do drugs for fun and for stupid reasons. But there is this tiny chemical family - the tryptamine hallucinogens - psilocybin and DMT - and then some artificial [Inaudible]. And five methoxy is in there, too, which I'm not that fond of. But this is the doorway, it's the umbilicus of this world. 53 There are things which are called drugs because that's the category we have for things which make the world unrecognizable. But these are not drugs. They are magical doorways into staggeringly titanic dimensions of gnosis, power, information, understanding, and dimensions filled with affection for humanity. So people say 'Well you think drugs should be legalized?' Yeah, but that's a political opinion of Terence McKenna who's just a guy like you. But this stuff about the tryptamines is a real discovery. And you can think what you like about me and my take on it - in fact, please do. But check it out, check it out. Because I've checked out lots of stuff and this is the only thing I'm interested in telling you: check it out! [Inaudible Question] No, I don't understand that. The answer to that question: it's magical. It is a secret which keeps itself. I mean I - here I am, there are two hundred people here, whatever, and I do this for all the time! And I have not, so far as I can tell, been able to launch an avalanche of DMT. I'm trying! Do I have to put it any more plainly? Is there a chemist in the house who will go home and make this stuff so that we can find our way there? Or grow the plants. Or go to South America. Or get with lucid dreaming and behavioral modification. Or explore the outer edges of orgasm, which I think has something to do with DMT and probably runs on it. Somehow, we need to beech this whale. Yeah. [Inaudible Question] It's not difficult to make. Compared to cocaine or LSD, it's a walkover. It is a reasonable exam question for a 2nd year student of organic chemistry - to be told synthesize and chromatograph 5 grams of DMT and submit your sample with your chromatographic data to my office Monday morning. [Inaudible Question] Yeah, and make a tincture of the, exactly. [Inaudible] How can it be against the law if you have it in every brain walking around? [Inaudible] [Inaudible Question] Well, we should certainly talk about casualties and danger. The ditch doesn't really save you in here in the ordinary sense like opiates and nicotine. The ditch, you know, cannabis is the most actually of these minor and near psychedelics and its only psychologically addictive. I mean, I found it out because a couple of years ago I actually quit for ten months after not drawing an unstoned breath for 25 years and all that happened was that I read more. And it's not clear that that's my problem. But danger we need to talk about. And that brings up the question, 'How should one do these things? How can you do it and gain maximum benefit and minimum wear and tear on your psyche and your body?' The first thing is, inform yourself. Inform yourself. The first stop on the psychedelic trip is the library. There are very, very deep books on these subjects on the anthropology, the pharmacology, the psychology, the quantum mechanics of drug activity, inform yourself. And then it's not about taking every drug in the book. And you have people wheel them off. 'Well, I did junk, I

did this, I did that', it's no point. You don't get [Inaudible] for that. What you have to do is [Inaudible] recipes straight out of Castaneda. Get up and [Inaudible] you Nagual. You have to find what works for you. And if you take a drug or plant and you have a horrible experience you don't really need to go back in fact. The other thing is, danger lies in the direction of combination. These are called synergies by pharmacologists. And if you, if your idea of a big evening is, you know, to shoot 100 ml of ketamine and then drop some MDMA and a little 2CB an hour later and then bring on some acid of undetermined providence [Inaudible], well then and I said, 'How was it?' 'Hey, it was [Inaudible]' But the point is, it can never be reproduced and these things are very dangerous. They synergize in rather unexpected ways. I mean, my God, if psilocybin and DMT has never been studied, do you think their relationship to [Inaudible] has been looked at very carefully? I don't think so. Then, how to take it? And I represent a faction on that. I believe that you should take it with a, as - how can I put it - with as little company as you can stand, basically. A lot of people like group work. I don't. But the I don't like groups generally. You know, I'm basically a loner. And I, if I take psychedelics with somebody I worry. I worry about them and it keeps me on the surface. And I have many psychedelic experiences where in the middle of it has passed through my mind 'Gee, I'm sure glad nobody is here to see this because I'm sure it would alarm them and then we'd have a crisis. So my style, I mean I take - okay gimme, you know, low dose and hang out if something interesting is going on. But the serious stuff goes on in darkness, in silence, and that people go through the [Inaudible] you don't even listen to music. That's right, in darkness, in silence, in a comfortable state, and that may mean in your apartment in Manhattan, it may mean off the tree in Yosemite, whatever your thing is. And then I always use cannabis. Cannabis is your navigation tool, your reality check, your everything. I roll up the bomber and I lay them up in front of me and I have my mojo bag and a few things like that. From the moment I take it I'm in [Inaudible] state. And this isn't even a rule followed in the Amazon. I mean, it totally blew my mind, in some ayahuasca circles people would sit talking and some, then everybody would take ayahuasca there would be a sacred ceremonial moment, everybody would take the ayahuasca and then yak yak yak and motorcycle parts and what are the missionaries up to and brewing to and yak yak yak and then at 30 minutes on the clock the shaman would be [Inaudible], everybody would shut up and within a minute we'd be gone. But the way I like to do it, and this a good catholic method, for those of you who are recovering Catholics, I take it and then I sit in my states and I carry out what in catechism class we were taught is called an examination of conscience. This is where you think about all the ways you screwed up and all the people you screwed over and you basically anticipate a bad trip, is what it is. You work said, 'What is the worst thing that happens to me on all this trip based on my current state of my psyche and my relationship with other people?' Well, by the time this stuff actually begins to work you [Inaudible]. And, you know, some people say they take mushrooms 'And within 20 minutes we were tripping hard, tripping hard'. I don't understand what that's about. It takes an hour and twenty minutes on the clock, it ever has. I don't expect it to ever come faster. And I get into a kind of a zone where it's like it's nibbling at the edges, not quite manifest. And then I'd smoke the first bomber. And usually that brings it in. That brings it in. And I also, I speak to it. I [Inaudible] you. I invoke it, I suppose. And in my own way - I don't know if it will pass [Inaudible] mustard - I say to it, I say 'Show yourself, show yourself.' And its very, at that point it's very erotic. It's like a veil thing, it's what it is. It is a veil thing. The girl-friend in the other dimension, the mushroom, once I said to her, 'What should I call you?' She said, 'Call me Dorothy.' So I invoke it and it comes, it comes. And then we're off. And sometimes it's easy and loving and sometimes it's different. I remember one very peripatetic trip where I had tossed out a very big compost pile from growing mushrooms years ago in another country - there it is the past lives that I'm now recalling - but anyway I tossed out this stuff and this thing grew this humongous mushroom. And I had taken mushrooms the previous Saturday. I had taken a full dose, which is 5 dried grams. So I thought, I wanna take mushrooms again this Saturday but I think I may have picked up a tolerance. So I'll just take 9 grams. And this is where the learning takes place. Mistakes - treasure your mistakes. So the thing is, like I'm sitting there and suddenly I realize, oh my God, it's coming at me, it's 100 miles wide, it's 10 miles high, and it's just rolling toward me and I barely have time to lay down, that's how fast it, and a voice said, you know 'Get prepared. The storm is about to hit.' And I lay down and it was like a tornado. And at one point I opened my eyes and there was this woman in a full bondage - piercings and rubber panties and the whole bang and I was lying there between her legs. She was standing upright and she put her face right down next to mine and she said, 'Is it strong enough for you asshole?' To which I replied, 'Yes!' And then she said, 'They say it helps to close your eyes, cowboy.' Later, in thinking about that trip I realized the reason the Goddess, the reason the mushroom addressed me as cowboy, is because that's - most people mushrooms have met have been cowboys and cowgirls, 'cause they're the people who follow the cows! And most people have encountered this thing in the pasture. You know Maria Sabina the mushroom shamanist of Oaxaca claimed not to have been initiated. She claimed that as a child left to watch the sheep and the cattle she had been hungry and had gotten to eating mushrooms. So, I haven't lost my thread, this is the safety course, I haven't forgotten that. Once you get launched out in there then there are tricks for navigation. And two tricks that are indispensable, number one I already told you. Have cannabis ready 'cause if you get into a place you don't like you can get out of there by just taking a toke or two. The other thing is if you get into a place you don't like chant. Don't do what most honks do. Which is, scrunch, assume that people could have [Inaudible], 'I can stand this. How many hours is this going?' [Inaudible] Sit up, take a breath and [Inaudible] it out. Drumming should. But I really think it's important to oxygenate your body, very important to move the breath through. And there are hard places, if there weren't hard places people wouldn't be so terrified of this stuff. So when you get to a hard place first of all don't be an idiot. Don't abandon yourself to fear - just because somebody put something ugly in front of you. And if people put something ugly in front of you every day and all you say is 'Yukki!' So, it also works there. And there are strange places and we each have our own private hell. I mean that's a place I go to nearly on every ayahuasca trip, that I call the meat locker. And, you know what the last said about it? [Inaudible] [Inaudible Question] I fast [Inaudible] I just don't eat for six hours. Empty your stomach, and the other thing is your stomach should be empty. [Inaudible] the way I do it is I start usually about 8 at night, I'm alone always and I go 'till one and by one it's over. And then what I do I eat a bowl of granola or something like that. Don't sleep on an empty stomach. 'Cause then you'll wake up the morning, raw and rotty and it's not that the mushroom did that, it's that you slept with a protein debt. So then eat your favorite food at the end of the trip. [Inaudible Question] MDMA is a psycho-[Inaudible] amphetamine. It's a, what are called empathogens. They're drugs which encourage change of feelings and that sort of thing under rare circumstances you can squeeze a kind of wobbling hallucination out of it. But it's not, it's purpose [Inaudible] is different. It's for sorting out relationships, assisted psychotherapy, and having a good time. But it would be crazy to take MDMA as a hallucinogen because it's like entering a bicycle in a Ferrari race, you know. They are just much superior and let me say about this, I mean, everything is my personal bias here. A lot of people have said 'You're a hallucination nut. You're obsessed with hallucinations.' I freely admit it. The reason why I was underwhelmed by LSD, and I liked it and it's certainly engaging and, but I could never hallucinate the way I wanted to. I've read Havelock Ellis. I wanted to see, you know, the phosphorescent palace, the naked maidens, the silk brocades, the alien worlds, vision! And LSD, deep thoughts about things, funny ideas, strange [Inaudible], hard to get vision until you smoke black Bombay hash on top of the trip - that works! But I will defend my obsession with vision. I think the world wants to be seen. I think Blake was right that the divine imagination is something beheld. And for me the visions are the proof that this is not my mind. And the visions are the proof that this is not simply chemical chaos in the nervous system. I mean, how could chemical chaos give you something as breathtakingly beautiful and as ordered as the Sistine Chapel or the World Trade Center. The hallucinations are extraordinarily ordered and beautiful. And I think that this is the proof that were reaching beyond the confines of the human personality and even beyond the human species. That this information - don't ask me how - is somehow holographically deployed throughout space and you tune in and it's a - so I care about vision and if a drug doesn't cause vision I can't resist to put it lower on my list. I smoke a lot of cannabis - and I think - that's why I do lot of cannabis - I can think on it. And I think several hours a day when I'm able to, but the visual thing is for me to be in the presence of the mystery, is to be in the presence of the hallucination. To me the word hallucination has no connotation of illusion. It comes from a Greek root and what it means is 'to wander in the mind'. That's what hallucination is, it's a wandering in the mind. Yeah... [Inaudible Question] No, I took all kinds of doses. The question is, What dose of LSD did I take. I should be clear what I mean. I mean, yes on LSD. Even with eyes open the little things that look like open fans that are going like 'nikniknik, nikniknik' on wallpaper, but I - LSD never gave me these architectural - if it is what's meaning I couldn't dis.[Inaudible] - the LSD hallucination looked to me like being in the [Inaudible] non in the [Inaudible]. They were more like ripples and centric circles, flashes of light. So what you see on psilocybin are cities, faces, houses, machines, the stuff of cognitive processes at its most expressive. Okay, yeah. [Question: Is it theoretically possible to develop your process to go to the point that you can go there without the drug?] I grant the possibility but in my heartiest heart I don't think so. The question is, 'Can you get there on the watch?' I get lots of resistance because I'm willing to say just flat out, 'No, no.' And, you know, people are shocked. That's no good and flagellation, being touched by poverty and whatever. I don't know, I tried it all. And the other thing is what I'm talking about you couldn't want that happen on the watch. These are states of serious discombobulation. These are not mood shifts or attitudes we're talking about. I mean, if I woke up and I could do it on the watch my first phone call would be to my friend Ralph Metzner who's a shrink, and I said, 'Ralph, uh, I've got problems here.' This is [Inaudible] and again I'm a [Inaudible]. I don't know even who's here or who I'm insulting. But let me unburden myself on this stuff. Van Morrison put it very, very well, 'No guru, no master, no teacher, just you and me, and mother nature, in the darkness, in the darkened vest range.' I think all religion is con-games, I think that all esoterica is a con-game. I think that revealed secrets are self-protecting and that seeking is the way to find. And take yourself serious. You are the vessel, the stage and the theater of your transformation. The mushroom is very explicit on that point to me. Once, it said, I quote, 'One human being that is seeking enlightenment from another is like a grain of sand on the beach seeking enlightenment from another grain of sand.' And my interpretation of that is that we're all as good as the best among us. There is no hierarchy among human beings, you know, if you've got the chromosomes you're into the game. And the test then is to accentuate primary experience, the here and now. Teaching Pujang from far away, unsubstantiated rumors that circulate among the people. Magicians have always worked the marketplace. It's older than us. But this [Inaudible] mystery is absolutely authentic and having once found it I stopped searching for other authentic mysteries. So I don't know what lies behind the deeper levels of the Kalichakra Tantra, I don't know what lies behind the [Inaudible] prints of Hawaiian Kahuna, but I do know that his one thing fulfills the bill. It's real and you only need one doorway to enter into the palace of the [Inaudible]. So why obsess about numbering doorways? That's a [Inaudible]. Yeah... [Inaudible Question] I have actually never combined DMT and psilocybin. I have smoked DMT at the top of an LSD trip. That's a young man's game, believe me. If you're interested in that hurry up, it's like [Inaudible] the matter for it. What happened to me, well I did it several times but I'll tell you a story that's for your edification maybe, but amusement perhaps. I once [Inaudible] was a landlord in Berkeley many years ago. And, uh - , that's sufficient. And everybody left one easter vacation or thanksgiving vacation, so I decided I would do this acid trip, I did plan to smoke DMT at the top of the trip, and, uh - , so I did and I did and I had this very long involved DMT trip with the elves and all of this was totally out of control. And at the very height of this thing this woman who I rented to upstairs who I thought had gone home to Minneapolis came back and arrived by cab and came pounding up the stairs with these two suitcases [Inaudible] stomped into the house and ran around to my bedroom door and beat on the door. And, you know, you don't know me that well, but if I'm 500 miles up a jungle river smoking a joint and a stick cracks 50 feet away the first thing I do is hide the joint - I'm a very paranoid person - being, you know, on 500 miles of acid smoking DMT and suddenly having this woman and I, I literally, I kept my some kind of a [Inaudible], and I leaped off my bed and I landed on my feet and, you know, if you want you may try this, something about this enormous flash of adrenalin added into the DMT added in to this sudden incredible physical exertion it was as though I ripped the membrane, I ripped the membrane, and I was now standing in my room, but I have dragged this trip through with me and the room was full of elves, ricocheting off the [Inaudible] and I had them, they were hanging on me like weasels [Inaudible] turning me around in the room. And also simultaneously one of these machines had been dragged through into my bedroom at the same time and this is like about the size, well, like this, and it had all kinds of this faceted, and opalescent, and glassy, and strange, but what was important about it had a kind of a faceted [Inaudible] on it that was clicking [Inaudible] and every time it would click, it would launch a small plastic chip across the room that had an alien letter written on it. And these little plastic chips were ricocheting off the wall and piling up, and I was standing appalled, appalled looking at this situation, and then, Rosemary, what the hell is [Inaudible] I stagger over to the door which was a sliding wooden door and I just threw it open and I looked at her and said, [language disassociated from meaning]. 'Oh so you're doing that, all right,' she said and backed up and then I would slam the door back and I pushed my way across the room and I crawled under the bed. And I closed my eyes and I said, 'I'm gonna stay here 'til I'm dead or it's over. And I did. But it was, it was, uh... I mean, what the fuck, you know, you are supposed to learn something [Inaudible] it's ridiculous. [Inaudible question] Well, this thing that I have done several times this afternoon in various [Inaudible], language thing, that's glossolalia, called speaking in tongues, but the good news is the fundies don't have any kind of monopoly on this. Speaking in tongues is as old as human beings, it's shamanic, it's paleolithic, it's done all over the world. And I think that, well, psilocybin will induce this spontaneously. And I think, to add to my little scenario yesterday about hunting, fucking, tripping, which - I would also add in there - 'and talking.' Now, probably long before the invention of what we call meaning people amused each other with funny noises. And people would say, 'What's that? Somebody else?' So, being physiologically set up for a production of small mouth noises, notice that language is a very primitive form of telepathy. Because here is how it works: I have an idea. I look in my dictionary, I translate the idea into what we call 'English'. I then move my lips, throat muscles and aspirate in a certain way and I send an acoustical pressure wave across space, which enters into the holes on the side of your head. Your brain reconstructs this acoustical wave and tries to match the incoming pattern against an interior dictionary which has been learned. Now, if your dictionary and my dictionary are congruent, lo and behold, you can reconstruct my thought in your mind. Now if this thought is something fairly straight forward like 'Please shut the door' ambiguity doesn't enter. But notice that one of the most uncool things we can do with each other is to say to somebody 'Would you mind explain me what it was that you just said?', you know, or, 'Would you mind explaining me what it was that I just said?' And then he say: 'Oh shit, now the cover is blown, you know, I am of the faintest [Inaudible] that you can meet. So, language, spoken language, small mouth noises, is a very inefficient way of communicating. This is why I think that the visual initiation in the DMT is they cough up language. This is not the first initiation from the elves. The first initiation occurred 100,000 years ago. The second initiation is occurring now. First they gave us language. Now they're going to show us how to make the language visible. And you see, if you and I both read the same piece of thin page of a book we can then have an enormous argument about what's written there. But if you and I both step into a place where a piece of sculpture is being visited we may argue about what the piece of sculpture meaning is but we agree what it is. We see it. We see it. And when we can [Inaudible] with each other and understand each other we instinctively reach for visual metaphors. 'I see what you mean.' 'What's here fellas?' 'She painted a picture' 'His words were so beautiful'. It means that we really associate meaning with seeing something. And I believe that we're on the brink of a transformation of how we communicate with each other. And I don't know whether we are gonna require a prosthesis that is electronic or something like that or whether we can invent drugs? This will allow us that the cerebral cortex will switch it's linguistic analysis from the audio channel to the visual channel. It's very suggestive that these tryptamines are in different parts of the brain. And I think that we are on the brink of transforming our abilities to [Inaudible]. [Inaudible Question] What was said was that using LSD and having used DMT one can begin to trip into, you know, if you like dimensions on LSD. This certainly seems reasonable to me. I haven't have had that specific experience. But there is something you can do with psilocybin. Here's another technique if you don't like what's happening on a mushroom trip. Just say to it, 'Be MDMA', and it will. No problem. You can say to it, 'Be LSD'. And it will. It has no problem. I didn't try that. You wanna be sure before you summon the genies. Let me say one more thing about this language thing. Because I think nature is always our model. No matter how deep into technology we go nature will provide nontoxic models. Well it just so happens that in this area of communication nature has provided a wonderful nontoxic model. And that is the way in which squids and octopi communicate. Squids and octopi as you know from watching far too much TV can change color. May think that this is camouflage. It's not camouflage. Octopi change color in order to communicate. Octopi don't generate language. They are language. Think of an octopus, it's soft body. It folds and unfolds itself like a dancer and exposes various parts of its body very rapidly. It also can make your

body tissue smooth and [inaudible] or rugose and rough and it can undergo all these color changes. Blotches, stripes, spreading pastels, so forth and so on. These behaviors of the octopus are under the genetic control of its linguistic intentionality. It doesn't make words it becomes words. And when one octopus encounters another by the mere act of beholding each other they say 'Aha! You haven't eaten recently. You're having too much sex. You've been traveling. And so forth and so on. The octopus becomes its thought. It wears language on its surface the way we wear our clothing. And this system of communication is so important to the octopus that those species that are devolved into the very deep part of the ocean - so called abyssal octopi - where no light ever reaches have evolved phosphorescent organs all over their bodies and eyelids like membranes? all over their bodies so that in the absolute darkness of the abyssal ocean they communicate by flashing grammar and syntax to each other across the abyssal depth. They are free in the imagination. And this is where I think we are headed. We're going to make that model of communication our model. Psychedelics, technology, and visionary magic, will show how this can be done. [Inaudible Question] No you're right. The human faith is like this. That's right. You see, no other higher animal has faith. A faith is like a little piece of squid skin that we're wearing where we can transmit all of these - one time I was in India and I was cornered and this guy - I was loaded actually on mescaline - and this guy swam aboard my houseboat. And normally I would just run these guys off. [End of tape]

Hello Reviewers!

In general **Review 1** should be about correcting any misspellings and adding in missing words. There may also be parts of the audio that the original transcriber was not able to hear that you should attempt to work out. Reviewers can check the 'frequently used words' section of the wiki if they hear a word they are unfamiliar with or don't know how to spell, and should add any special words they encounter to the list in order to help other reviewers.

Review 2 is about making sure there are zero remaining transcription mistakes, and being nitpicky about grammar: ex. making sure commas are only used when needed and are put in the proper places when they are used.

Here is a running list of more specific things Reviewers can look for:

- all latin phrases or words in different languages should be *italicized*
 - examples = *in media res*

Riding Range with Marshall McLuhan

Day Month 1995

Esalen Institute, Big Sur, California

Description

- [Audio Link](#)
- [Transcription](#)
- [Other links](#)

McLuhan, I don't know how many of you recall him from the 60s, but he had for a very brief period of time, about 5 or 6 years, an extraordinary influence on American culture. You couldn't pick up a magazine or turn on the TV without hearing McLuhan, McLuhan, what he said, what he thought, what he predicted, he was consulting with Madison Avenue, with politicians, with Hollywood, and so forth and so on. His influence, he died in the early 70s, and his influence died with him, even though he had founded the Center for Media Studies at the University of Toronto in Canada, he really seemed to spawn no highly visible successors.

He was a unique personality and breakthrough, much in the same way that Joyce was a unique personality, and spawned very few imitators. The irony of all this is that McLuhan did his journeyman work before he burst onto the world stage as this mysterious savant of media, he did his work as a Joyce scholar, that's what he was, a literary critic, Joyce scholar, medievalist, that sort of thing. And then in the early 50s he wrote a book which I've never read, it's very hard to find, called *The Mechanical Bride*, that was his first testing of his ideas. McLuhan is primarily understood as a communication theorist or a philosopher of media. That's what he talked about, he turned the analytical Western deconstructionist method on the technologies of communication, printing, film, photography, dance, theater, even such things as money, he thought of as forms of media. And he carried on and analyzed these various forms of media, and reached very controversial conclusions.

One of the things that was very puzzling to me as I went back through and read all this, is, McLuhan was synonymous with incomprehensibility in the 60s, and the whole thing was "who can understand this guy?" he's like Buddha, he speaks these words we can't understand. But now, 25, 30 years later, it reads pretty straight forwardly. Most of what he predicted has come to pass, I think even McLuhan would be amazed at the speed with which the Gutenberg world has been overturned. I mean, there's no hint in here of home computers, let alone interactive networks, virtual reality, phone sex, and so forth and so on. But this was all grist for the McLuhanesque mill, and he would have, if he had lived, had much to say on this.

It surprises me in reading this stuff how demanding it is on your literacy. He assumes that the people he's talking to have read everything and have understood it, from Homer, to Rabelais, to Chaucer, to MAD magazine, he assumes you have a complete knowledge of modern film, and popular print journalism, and popular culture. All of this was grist for his mill.

I'll show you the books I'm reading from and talking about and then I'll actually read you a section of McLuhan, because like Joyce, it's a stylistic thing that you can't really encompass without getting your feet wet. This was his best known book, probably, and this is the original paperback edition. This book was immensely discussed when it came out, and probably very little read, judging by the quality of the discussion. *Understanding Media, the Extensions of Man*, this is how most people heard of McLuhan. And he followed it up with *The Gutenberg Galaxy*. These are all first editions. These books I don't think are in print. Few intellectuals in this century have fallen so totally through the cracks as McLuhan.

The Gutenberg Galaxy, very interesting, I'm going to read from some of it tonight. It's organized around chapter headings such as "Does the interiorization of media such as "letters" alter the ratio among our senses and change mental processes?" Or, "Pope's *Dunciad* indicts the printed book as the agent of a primitivistic and Romantic revival. Sheer visual quantity evokes the magical resonance of the tribal horde. The box office looms as a return to the echo chamber of bardic incantation."

That's a chapter heading. "Topography cracked the voices of Silence." And one of my favorites;

"Heidegger surf-boards along on the electronic wave as triumphantly as Descartes rode the mechanical wave."

There's a lot of fun in McLuhan, and this comes out of his being a Joyce scholar. You just can't mess with that without fun.

This is his third book with Harley Parker, *Through the Vanishing Point, Space in poetry and Painting*.

I guess I should say, a few years ago someone asked me to review McLuhan's letters, which had been published, which I did. It was *Gnosis*, or somebody. Anyway, it brought back to me, he was a convert to Catholicism and an extraordinary complex intellectual, with a medievalist who became a Joyce scholar, who became a communications expert. And in McLuhan there is a very deep strain of nostalgia for the essence of the medieval world, what he called manuscript culture. Essentially his entire output is a critique of print, and of the impact of print on culture, and I think, though he attempted to be even handed, his final resolution of all this was that, it had many detrimental and distorting effects on the Western mind. This is another little book he published back in the heyday, and he experimented with topographic layout, somewhat harkening back to the Surrealists whom he discusses a great deal. And there was something about his fascination with topographical layout that brought him into such congruence with the *Wake*.

Let me read you a section from *The Gutenberg Galaxy* that is both interesting to think about, or, if you can't understand it, an interesting example of what McLuhan's style was like, and what I mean by the fact that he was an extraordinarily demanding intellectual, he doesn't cut you much slack.

"Only a fraction of the history of literacy has been typographic".

"Till now we have been concerned mostly with the written word as it transfers or translates the audio-tactile space of "sacral" non-literate man into the visual space of civilized or literate or "profane" man. Once this transfer or metamorphosis occurs we are soon in the world of books, scribal or typographic. The rest of our concern will be with books written and printed and the results of learning and society. From the fifth century BC to the fifteenth century AD, the book was a scribal product. Only one third of the history

of the book in the Western world has been typographic. It is not incongruous, therefore, to say as GS Brett does in *Psychology Ancient and Modern* (pp. 36-7)

“The idea that knowledge is essentially book learning seems to be a very modern view, probably derived from the mediaeval distinctions between clerk and layman, with additional emphasis provided by the literary character of the rather fantastic humanism of the sixteenth century. The original and natural idea of knowledge is that of “cunning” or the possession of wits. Odysseus is the original type of thinker, a man of many ideas who could overcome the Cyclops and achieve a significant triumph of mind over matter. Knowledge is thus a capacity for overcoming the difficulties of life and achieving success in this world.”

Then McLuhan comments, “Brett here specifies the natural dichotomy which the book brings into any society, in addition to the split within the individual of that society. The work of James Joyce exhibits a complex clairvoyance in these matters. His Leopold Bloom of *Ulysses*, a man of many ideas and many devices, is a free-lance ad salesman. Joyce saw the parallels, on one hand, between the modern frontier of the verbal and the pictorial and, on the other, between the Homeric world poised between the old sacral culture and the new profane or literate sensibility. Bloom, the newly detribalized Jew, is presented in modern Dublin, a slightly detribalized Irish world. Such a frontier is the modern world of the advertisement, congenial, therefore, to the transitional culture of Bloom. In the seventeenth or Ithaca episode of *Ulysses* we read: ‘What were habitually his final meditations? Of some one sole unique advertisement to cause passers to stop in wonder, a poster novelty, with all extraneous accretions excluded, reduced to its simplest and most efficient terms not exceeding the span of casual vision and congruous with the velocity of modern life.’

“In the *Books at the Wake*, James S. Atherton points out (pp. 67-8) “Among other things, FW is a history of writing. We begin with writing on ‘A bone, a pebble, a ramskin...leave them to cook in the mutthering pot: and Gutenmorg with his cromagnon charter, tintingfats and great prime must once for omniboss stepp a rubrickredd out of the wordpress.’ (20.5) The ‘mutthering pot’ is an allusion to alchemy, but there is some other significance connected with writing, for the next time the word appears it is again in a context concerning improvement in systems of communication. The passage is: ‘All the airish signics of her dipandump helpabit from an Father Hogam till the Mutther Masons,..’ (223.3). ‘Dipandump helpabit’ combine the deaf and dumb alphabet’s signs in the air - or airish signs - with the ups and downs of the ordinary ABC and the more pronounced ups and downs of Irish Ogham writing. The Mason, following this, must be the man of that name who invented steel pen nibs. But all I can suggest for “mutther” is the muttering of Freemasons which does not fit the context, although they, of course, make signs in the air.”

Is that perfectly clear?

Now, back to McLuhan, “Gutenmorg with his cromagnon charter” expounds by mythic gloss the fact that writing meant the emergence of the caveman or sacral man from the audile world of simultaneous resonance into the profane world of daylight. The reference to the masons is to the world of the bricklayer as a type of speech itself. On the second page of the *Wake*, Joyce is making a mosaic, an Achilles shield, as it were, of all the themes and modes of human speech and communication: “Bygmeister Finnegan, of the Stuttering Hand, freemen’s murer, lived in the broadest way immarginable in his ruchlit toofarback for messuages before joshuan judges had given us numbers...” Joyce is, in the *Wake*, making his own Altamira cave drawings of the entire history of the human mind, in terms of its basic gestures and postures during all phases of human culture and technology. As his title indicates, he saw that the wake of human progress can disappear again into the night of sacral or auditory man. The Finn cycle of tribal institutions

can return in the electric age, but if again, then let's make it a wake or awake or both. Joyce could see no advantage in our remaining locked up in each cultural cycle as in a trance or dream. He discovered the means of living simultaneously in all cultural modes while quite conscious. The means he cites for such self-awareness and correction of cultural bias is his "collideoscope". This term indicates the interplay in colloidal mixture of all components of human technology as they extend our senses and shift their ratios in the social kaleidoscope of cultural clash: "deor", savage, the oral or sacral; "scope" the visual or profane and civilized."

So that's his comment, "only a fraction of the history of literacy has been typographic."

These people, Joyce, to some degree Pound, McLuhan, they were the prophets of the world in which we now stand, the world of integrated interactive media, extraordinary data retrieval that erases the 17th century notion of the unconscious. Nothing is now unconscious if your data search commands are powerful enough.

The re-making of the human image that required centuries for print, the transition that we talked about here, from scribal culture to true book culture, occupied 500 years. The transition from book culture to electronic culture has occurred in less than fifty years. It's eerie to read his examples of contemporaneity because there's stuff like Marilyn Monroe, Perry Como, James Dean, I mean, he's writing from another era, and yet, from his point of view, he's firmly embedded in a kind of super future that we are now able to look back on.

Here's another section that I think makes some of this more clear.

"The medieval book trade was a second hand trade even as with the dealing today in old masters."

"Then, from the twelfth century onwards the rise of the universities brought masters and students into the field of book production in class time, and these books found their way back to the monastic libraries when students returned after completing their studies: "A number of these standard text-books, of which approved exemplars were kept for copying by the stationarii of the universities, naturally found their way into print quite early, for many of them continued in undiminished request in the fifteenth century as before. These official university texts offer no problems of origin or nomenclature..." (p. 102)

Goldschmidt then adds, "Soon after 1300 the expensive vellum could be dispensed with and the cheaper paper made the accumulation of many books a matter of industry rather than of wealth." Since, however, the student went to lectures pen in hand and "it was the lecturer's task to dictate the book he was expounding to his audience," there is a great body of these reportata which constitute a very complex problem for editors."

So really, like for Joyce, for McLuhan, the book is the central symbol of the age, the central mystery of the time. In a sense I share that notion, it's a very Talmudic notion, it's a very psychedelic notion, it's the idea that somehow the career of the word is the essential overarching metaphor for the age. And naturally, if the book is the central metaphor for reality, then reality itself is seen as somehow literary, somehow textual, and this in fact is how I think reality was seen, until the rise of modern science.

We were always taught of course, how the roots of modern science go back to (?) (inaudible) and atomism, which of course is true, but the number of people who knew that a thousand years ago was probably very few. The real notion of how out of which science had to divest itself is the notion of a book, or, if that

seems too concrete, a story, a narrative, the story of man's fall and redemption. That was what the Christian exegesis of post-Edenic time was all about. With the rise of modern science the idea of narrative has become somewhat overthrown. McLuhan would say that narrative persisted far beyond its utility because the biases of print kept it in place for such a long time. Everyone assumes that tools are tools and you use them and that's that. For McLuhan, the entirety of the toolkit of modern Western man can be traced to the unconscious assumptions of print. For example, the idea of the individual which is a pretty personal notion, right there in close to the heart, the idea of the individual, is a post-medieval concept, legitimized by print. The idea of the public, this concept did not exist before newspapers, because before newspapers, there was no public, there were only people. And rulers very rarely bothered to pass on their thinking to anybody other than their closest associates, and then only for utilitarian reasons.

The notion of an observing citizenry somehow sharing the governance of society, this again is a print created idea. The idea of interchangeable parts without which our world would hardly function, there would not be automobiles, buildings, aircraft, interchangeable parts. That's an idea that comes from the interchangeability of letters in a printers block. That was the first industry to ever utilize the concept of easily reformulated sub-units. It's strange, the Chinese get credit for inventing thousands and thousands of years before Europe, but they would carve a single block of wood and print it, they didn't get the notion of moveable type. And moveable type, the distribution of books becomes the paradigmatic model for the distribution of any product. It's produced, it's edited, it's manufactured, it's sold, and then sequels are spawned. All products have followed this model, but books were one of the earliest mass-manufactured objects to be put through this cycle.

Modern city planning, the linearity of it, the way in which land-surveys are carried out, these are all unconscious biases imbibed from the world of print, and they make sense if you're a print head. But one of the peculiar things, notice that animals do not possess language. Many human societies do not possess writing, and very few human societies, only two on earth invented printing. And yet once invented it feeds back into the evolution of social structures, and defines everything. And yet it's an extraordinary artificiality, and we have been imprisoned in it for 100s and 100s of years now. Now it is breaking down, and we are changing to a different sensory ratio, and you might suppose, if you hadn't given this a lot of thought, that the new electronic media, television and so forth, would carry us into an entirely different sensory ratio. McLuhan felt differently, he felt that it was restoring us to a medieval sensory ratio. He felt that a television screen is much more like an illuminated manuscript than a page of print. The distinction may seem subtle at first, but if you're looking at a medieval illuminated manuscript, notice I said looking, you must look in order to be able to understand.

Reading is not looking. Reading is an entirely different kind of behavior. As a child you learn what a printed lower case "e" looks like. After seeing 20, 100, 1,000, 10,000, you know what it looks like.

You have an expectation of the gestalt of the lower case e. No body opens a book and looks at print, unless there's some extraordinary abstract discussion going on. We read print but we look at manuscript because manuscript carries the intrinsic signification of the individual who made it, and his or her idiosyncrasies have to be parsed through to get the meaning. Similarly with television, television is a very low-resolution media, I mean, these are little pieces of light, pixels, flying back and forth. They must be looked at, they cannot be read, and it's an extraordinarily engaging process. That's why it creates an entirely different set of social biases than print does.

McLuhan called these biases, and this is the one distinction or idea of his that made its way into popular

culture, he distinguished between what he called hot and cold media. And people usually botch this, every time, because nobody really to this day understands what he meant. So let me read you a little bit about this distinction.

This is in Chapter 2 of Understanding Media, and it's called "Media Hot and Cold."

"The rise of the waltz, explained Kurt Sachs, in the World History of the Dance, was the result of that longing for truth, simplicity, closeness to nature and primitivism, with which the last two-thirds of the 18th Century fulfilled. In the century of jazz we are likely to overlook the emergence of the waltz as a hot and explosive human expression that broke through the formal feudal barriers of courtly and choral dance styles. [but obviously it was when you contrast it to what came before] There is a basic principle that distinguishes a hot medium like the radio, from a cool one like the telephone, or a hot medium like the movie, from a cool one like the TV. A hot medium is one that extends one single sense in high definition. High definition is the state of being well-filled with data. [I love that!] A photograph is visually high definition. A cartoon is low-definition, simply because very little visual information is provided.

Telephone is a cool medium, or one of low definition, because the ear is given a meager amount of information. And speech is a cool medium, of low definition, because so little is given and so much has to be filled in by the listener. On the other hand, hot media do not leave so much to be filled in or completed by the audience. Hot media are therefore low in participation and cool media are high in participation, or completion by the audience. Naturally therefore, a hot medium like the radio has very different effects on the user from a cool medium like the television.

A cool medium, like hieroglyphic or idiogamic written characters, has very different effects from the hot and explosive medium of the phonetic alphabet. The alphabet, when pushed to a high degree of abstract visual intensity, became typography. The printed word with its specialist intensity, burst the bonds of medieval corporate guilds and monasteries, creating extreme individualist patterns of enterprise and monopoly. But the typical reversal occurred when extremes of monopoly brought back the corporation, with its impersonal empire over many lives. The hotting up of the medium of writing to repeatable prints intensity, led to nationalism and the religious wars of the 16th Century. The heavy and unwieldy media such as stone, are time-binders, used for writing, they are very cool indeed, and serve to unify the age, whereas paper is a hot medium, which serves to unify space horizontally, both in political and entertainment empires."

And he just goes on like this endlessly. This was his *métier* or his media, to connect and comment on this stuff. Television was really both his own media for reaching a very large audience, in fact I remember the excitement that swept through, I didn't even have a television, I was living in Berkeley at the time, and somebody said, we have to go up to the student union at 6 o'clock, because Mike Wallace is interviewing Marshal McLuhan. And it seemed an incredibly freaky notion that McLuhan would be on TV, it shows you what a stultified categorically different world we were living in at the time.

Here's just a little bit of McLuhan on television. This is chapter 3.1 of Understanding Media

"The Timid Giant"

"Perhaps the most familiar and pathetic effect of the TV image, is the posture of children in the early

grades. Since TV, children, regardless of eye condition, average about 6 and a half inches from the printed page. Our children are striving to carry over to the printed page, the all-involving sensory mandate of the TV image, with perfect psycho-mimetic skill, they carry out the commands of the TV image. They pore, they probe, they slow down and involve themselves in depth. This is what they had learned to do in the cool iconography of the comic book medium. TV carried the process much further. Suddenly they are transferred to the hot print medium, with its uniform patterns and fast lineal movement. Pointlessly they strive to read print in depth. They bring to print all their senses, and print rejects them. Print asks for the isolated and stripped down visual faculty, not for the unified sensorium.”

You see? So often very unexpected paradoxical insights emerge from this stuff, and in this book that he did with Harley Parker, *Through the Vanishing Point, Space in Poetry and Painting*, it's an interesting technique, they take a number of works of art, either literature, such as the song from *Loves Labour Lost*, by William Shakespeare, or the *Ballade de Bon Conseil*, of Geoffrey Chaucer, or the *Rubiab of Omar Kayam*, and then comment on it. And also visual arts, because McLuhan really felt that the art historical and technological and architectural output of Western civilization could be essentially psychoanalyzed. Could be seen as the tracings of the mass consciousness, and he felt that the evolution of sensory ratios within historical time, had been very very rapid.

For example he talks about how St. Augustine was a person of great piety and learning, and people doubting this would show him an open page of scripture, or theological disputation. And he would look at it for a few minutes, and then they would close the book, and he could tell them what was written there. And this was taken as proof of his piety. He was as far as we know the only man in Europe who could read silently at that time. This was a period when the auidial pre-scribal culture was still being assimilated.

McLuhan spends a lot of time analyzing this episode in the 14th Century, when the laws of perspective spring suddenly into being. Very similar in the way that [fractal](#) mathematics have introduced us to a new superspace. For the Renaissance, spatial perspective was essentially a filing system for visual data.

At last they knew where to put everything. And where to look for it once they had put it there, which, if you have a pre-perspectivist arrangement of space, you have to look, not read, LOOK at each painting in order to locate where the information is. This is again this read / look dichotomy.

McLuhan never discussed psychedelics, but psychedelics I think clearly are an extension of these kinds of media that you have to engage with, that you have to look at, that you cannot read, that you cannot take for granted, and these give back a much more complex world. Notice that the world created by print is a world of gestalts, buildings, highways, bridges. We know how these things are supposed to look, we don't experience astonishment every time we enter a home, or an institutional edifice, there is a built in set of syntactical expectations in linear space, and when this is violated it becomes very noticeable and becomes the basis for architectural or design innovation.

I think that what's happening and I think this would be McLuhan's take is that all of these new media that attempt to suppress the appurtenances of media are in fact having the effect of returning us to an archaic sensory ratio. And McLuhan was onto this, he's the one that coined the phrase *Electronic Feudalism*. He felt that we were headed back to the medieval sensory ratio because he saw television as like manuscript, but I think had he lived into the era of VR, psilocybin, HDTV and implants, he would have seen we are not reaching back to the medieval, that was simply a stepping-stone to the archaic, and we are going beyond

the entire domain of scribal humanity, and actually reaching back to a shamanic, feeling-toned kind of thing.

And all of the breakdown of linearity that you see in the 20th Century, abstract expressionism, Dada, Jazz, Rock n' Roll, non-figurative painting, LSD, all of these things on one level can be seen, as I've said, as harking back to the archaic, but on another level, what they can be seen as, are new behaviors emerging as the cloud of print constellated constipation is lifted, it's breaking down. An interesting question that we would put to McLuhan if we had him here tonight, is, to what degree can what he said about television, not be applied to HD TV. It seems to me that HD TV is TV without the biases of TV. And a perfect media is an invisible media, and print is the least invisible of all media, print is an incredible Rube Goldberg invention for conveying information.

Here's McLuhan on this same subject rather than me dwelling on it.

This is from *The Gutenberg Galaxy*:

“A theory of cultural change is impossible without knowledge of the changing sense ratios effected by various externalizations of our senses.” [in other words, by media]

“It is very much worth dwelling on this matter, since we shall see that from the invention of the alphabet there has been a continuous drive in the Western world towards the separation of the senses, of functions, of operations, of states emotional and political, as well as of tasks -- a fragmentation which terminated, through Durkheim, in the anomie of the nineteenth century. The paradox presented by Professor von Bekesy is that the two-dimensional mosaic is, in fact, a multi-dimensional world of interstructural resonance. It is the three dimensional world of pictorial space that is, indeed, an abstract illusion built on the intense separation of the visual from the other senses.

There is no question of values or preferences. It is necessary however, for any kind of understanding to know why “primitive” drawing is two-dimensional, whereas the drawing and painting of literate man tends towards perspective. Without this knowledge we cannot grasp why men ever ceased to be “primitive” or audile-tactile in their sense bias. Nor could we ever understand why men have, “since Cezanne” abandoned the visual in favor of the audile-tactile modes of awareness and of organization of experience.

This matter clarified, we can much more easily approach the role to the visual sense in language and art and it the entire range of social and political life. For until men have upgraded the visual component communities know only a tribal structure. The detribalizing of the individual has, in the past at least, depended on an intense visual life fostered by literacy, and by literacy of the alphabetic kind alone. For alphabetic writing is not only unique, but late. There had been no such writing before it. In fact, any people that ceases to be nomadic and pursues sedentary modes of work is ready to invent writing. No merely nomadic people ever had writing any more than they ever developed architecture or “enclosed space.” For writing is a visual enclosure of non-visual spaces and senses. It is, therefore an abstraction of the visual from the ordinary sense interplay. And whereas speech is an outering (utterance) of all our senses at once, writing abstracts from speech.”

That's very interesting, isn't it, that the association with nomadism to the inability to create architectonic space, and therefore no writing. That a word is a structure, and therefore, no nomad would ever do such a

thing. Interesting. I think he is saying, reading is not seeing, and those who read, do not see. Even when they lift their eyes from the books, they carry the attitude of print into the world. They attempt to read nature, and you can't read nature, you must look at nature, you must see nature. Certainly I think when I think of my own life, I was thinking about this a few months ago, and it surprised me. I was trying to think of the books that really influenced me in my life, and I thought of Moby Dick, and Huxley's Doors of Perception, then when I really got down on it, I realized a little tiny book that Huxley wrote, that my mother pushed on me when I was about 12 years old, called The Art of Seeing, probably shaped me as much as anything. And in there, it's a very McLuhanesque rap without McLuhanesque terminology, and he said the way to overcome, and I think this is very very VERY intelligent and simple advice, Huxley said the way to overcome the printed bias, God knows, he was a Cambridge-educated gentleman steeped in the traditions of English literacy and intellectualism, is free-hand drawing. Draw. Train your eye. Draw nudes, draw seashells, draw insects, go into nature and train the eye to see, and you will cease to read the world. Readers are emotionally - a seeing person does not want to form a relationship with a reading person. You know this conflict that we get between men and women, and between people, which we call the head/heart conflict, is really a reading / seeing conflict, it isn't a head and heart, it's that readers and seers cannot relate to each other's emotional life because they seem to come from such different worlds.

I think that you have a very good point, and the permission to abstract from nature that print created is why we have such a terrible culture crisis. Because, well, a trivial example, it was said, by Marshall McLuhan, strangely enough, that the Vietnam war could not be won the way an ordinary war is won, because the citizenry couldn't tolerate the sight of what war was, and modern warfare became impossible when it could be televised into the living room, because war is something that you must read about, you must not see it, it must be this grand thing of the distant clash of armies and young heroes being created, but when it turns into amputation and maggots and screams of pain, the political fun goes out of it. So war is therefore a literary activity, and the one argument that can remain in television's favor, is people don't like to see images of violence. If we have to show so much violence on television, let it always be real. The violence is only indefensible, when it's vicarious. If it's real violence, you need to see it, because it's happening in a world for which you have a partial moral responsibility. I think warfare has been remade by media in that sense. A lot of politics has been remade, because imperial doings are usually ugly, brutal, and not something you'd want to exhibit before the populace. And yet modern media makes that very difficult to avoid.

You get the notion of public morality, or "the people won't stand for this, we have to get this story out!". The people won't stand for this: now this is a moral dimension inconceivable in medieval or Roman times, I mean, what would it mean to say, "the people won't stand for this." So there's an attempt to create through the collectivity a kind of community of moral judgment.

The medium is the message, means that the medium is the thing which is making the difference. Every discussion you ever hear since the 60s about TV, is it good, is it bad, terrible, wonderful, always the discussion hinges around what's on TV. People say, "well, television is terrible, it just shows violence", and then somebody else says, "No, television is wonderful, those nature shows and news from far away, and masterpiece theater". This is a stupid argument. What McLuhan meant by the media is the message, is he meant that it doesn't matter what you put on TV, TV is TV, it has an intrinsic nature, and whether you're showing National Geographic specials or slasher movies, TV will do what it does. It has certain qualities, just like driving a car or skiing, certain muscles are going to be exercised, perceptual systems enhanced, others suppressed. And it's very hard for us to understand this, because we have accepted this media so

thoroughly into our life, that in fact it is shaping our values systems in ways which are very hard for us to measure or even detect.

I mean, television, for example, it's a drug, it has a series of measurable physiological parameters that are as intrinsically its signature as the parameters of heroin are its signature. You sit somebody down in front of a TV set, and turn it on, 20 minutes later, come back, sample their blood pressure, their eye movement rate, blood is pooling in their rear end, their breathing takes on a certain quality. The stare reflex sets in, I mean, they are thoroughly zoned on a drug, and when you think about the fact that the average American watches 6 and a half hours of television a day, imagine if a drug had been introduced in 1948, that we all spent 6 and a half hours per day on average watching.

And the one thing about drugs, in their defense, it's very hard to diddle the message. A drug is a mirror. But television isn't a mirror, television is a billboard, and anybody who pays their money, can put their message into the trip. This is an extraordinarily insidious situation. What McLuhan wanted to become I think was the founder of a general new sophistication about media, and he was essentially parodied to death by guess what? Media. They made of him an icon of cultural incomprehensibility. Not since Einstein have you been programmed in advance to believe, you ain't going to understand this guy. And that's what they said about McLuhan and consequently his message and his insight failed. We will have to reinvent McLuhan around the turn of the century, because we are producing forms of media of such interactive power and potential social impact, that we're going to have to go back and rethink all of this.

Part 1

Terence, in reading your books I was struck with how closely your DMT experiments paralleled my own. I wasn't surprised by the confirmation, as you might guess. I considered myself a serious DMT explorer between 1967-69. I stopped only because I was told to, in no uncertain terms, by the Boss of that place. Three times, in fact, to my dismay. Disobedience was costly. I was informed that I'd been shown all that was mine to know, to use that, and not try to extract more. I've written of the classes and varieties of DMT experience in a chapter of my journal, memoirs, and will send it along at some point. The experiences were commanding and altered my grasp of reality. DMT invokes the various dimensions of its domain through pathways characterized by brisk rhythms.

-Robert Hunter

Greetings Bob-- I was interested in what you had to say about being an explorer of the DMT world until the management told you to stay away. I have heard several tales of psychonauts toking DMT and then seeming to break into a place where they were not only unwelcome but also unexpected. One person in particular, a composer, was literally thrown back to the beginning of time by an astonished and irritated Jabba the Hutt type who he surprised at its meditations. I have never been told that I am not welcome but I find that it is harder and harder to get up the raw courage necessary to make the trip. It is almost as though a secret hides in and behind the DMT state and that secret is both real and so unexpected that it would leave nothing of reality intact. The secret cannot be told of course, or I would have told it. But it is something like: We are all gods, with the knowledge of gods, we are all omniscient, except for the fact that we are so damn stupid. It is interesting that you were told "Use what you have been shown, don't seek for more." It uses us, some of us, to transfer information into the world, but with very little concern for what we, the carriers of that information, think about it. It is a kind of hyperspatial muse. We become carriers of some force we don't understand, bearers of the Logos I would say, other see us as the Typhoid Mary's of meme pathology. But left unanswered in all of this is the question why. Why does the alien presence intrude in DMT, why does it appear as it does? Is that how it wishes to appear? Why? etc. etc. I enjoy the idea of a slow moving dialog, I hope this can continue.

Best,

T

Terence, I suppose the "facts" of DMT might as well be written in cunieforn on our breastbones for all the good it does to know about it, as opposed to "dwelling in the know of it." And memory, of course, cannot serve, at least not in its normative form. The moment you go back to bflbfzdxqitenamaton South of sprshguiekefwom (sp?) your memory is again a living parchment and complete, all events self-referencing, co-incident, current, and existing in eternity. To be there is to be where "that" is and "this" isn't, except metaphorically. We are metaphor, that is -- where it is almost painful to write or say "is." Bumblebees, aerodynamically too heavy to fly, rise, it could be, on the word "is" -- We don't take DMT; DMT takes us.

My personal take on the "secret" of DMT: it was long, hard work making this world real. It was, and is, done for a purpose. To have others. To believe in them fully in order to experience love. It goes against common sense to try and see through it. Ignorance is the primary condition of Eden. But entropy is at work and a world made for love is not satisfied with the transformational edict "eat and be eaten" but kills and does not eat. A sense of ultimate unity is lost and the delusion of fundamental diversity breeds alienation. This is not Eden. Yet the monad doesn't face itself and subsume Its creation. The failing would be eternal. Therefore, doors are opened and enough of the plot is "made flesh" to allow orientation regarding the surface gist of the matter. Collectivism is a wrong approach to nostalgia for the purity of the monad. Healthy diversity perpetuates the rationale of the creation, such as it is. Healthy men, women, races and nations evolving gladly to a recognition of the source, rejoining it in a gradual and rejoicing manner, "bringing in the sheaves," would be a better solution to the human aspect of this work, and is the substance of sacred ceremonial.

My take could be way off base but anything more Gnostic is off-putting. Phil Dick fell down that sink. And Lovecraft, I wouldn't doubt, though he professed no belief in what he wrote.

In saying any or all of this, it's only sane to assume I'm dead wrong since I'm speaking in polar terms. But it raises issues and generates metaphor. The emperium is neither philosophical space nor information repository but a nexus of rhythms. (nexi?) It's rhythm that transports us to the possibility of xing tangential to eternity with no fixed point of reference, including "I am." I say xing, rather than: being, moving, existng - because of wanting to be as exact as possible. A lot of DMT lore can't be expounded because our verbs and prepositions correspond to realities of four dimensions or less, gainsaid. To catalogue conditions where one accelerates at warp speed to stand still in one place / where transfer among interconnecting universes is instantaneous / where we connect, with full memory, into other lives we're in the process of living, for example, the land of living armchairs and laughing sunshine (or the heartbreaking Tuesday Afternoon Ballroom in the Rain at the end of time) we must understand the nature and limitations of our grammar and be self-motivated to think beyond it. To avoid the condition of pathological memeing, we must not over-state our experiences, or mis-state them for easier referentiality. We may, however, talk around them and establish communication based on mutual recognitions. A language begins in this manner.

If your calculations about Omega point are KoreKt, it should be a matter of mere months before the language evolves, like a flu virus, to allow western discussion of living items of eternity. I mean, we're

doing it, aren't we? And, if we feel mysteriously driven to do it, I presume it's because the time is ripe for it. There was a time when I felt the DMT lore was critical information. I don't entirely disbelieve it yet.

We need a few verbs and prepositions to explain ourselves. "Trip" & "farout" aren't going to do it. Suggest "xing" as the verb of standing/moving in relation to an eternal scenario from no fixed reference point, psychic or positional. We could say "evolve" to a "transdimensional viewpoint" but it would be clunky with accumulated baggage. I'd as soon say "xing to Unity One" to describe the place of 360 degree spherical vision. The Visor, I call it, but that would be private slang. The visor goes back and you see behind and above you, where the sky is infinitely deep and Summer blue. Scientific language, with its distaste for adjectives, is useless here. But not later, back home, with a case of the post-extasis blues, having just conversed with Eve and missing her already.

I don't want to sell this stuff, DMT. It's damned well not for everybody. Fortunately, its abuse potential is rock bottom. I, who loved it, have only taken it twice in the last 20 years and that was too much. It's like jumping on or off a speeding train. Omni-dimensional fact finding is not a very high priority among the "kicks" crowd; they're better off with gas and its infinite fractals of memory, or airplane glue. DMT is for those with a desperate need to know, and, among those, for only a small percentage whose neural wiring happens to be heavy gauge with appropriate sheathing. Nobody ever got rich peddling DMT. It was only always passed from hand to hand outside normal "drug ring" circles. It is, to LSD, as 198 proof rum is to hot milk with a few drops of brandy. I feel it's important to say this, since I don't want our public discussion to be seen as advocacy. Nor do I say it shouldn't be tried. For some, it's the key to the lock. One good hit should tell you where you stand with it. The fact that it's generally unavailable indicates that demand is wanting. I thoroughly understand your comment about the difficulty of summoning the "raw courage" to experiment further with DMT.

DMT is self-selecting. It knows who it wants, for whatever reasons it wants them, and scares the bejzus out of anyone else. Those who ought to have it will find themselves in possession of it, like anything else. The human brain secretes it. In miniscule natural quantities, it's the fuel of fantasy, dreams and visions. The alien-ness of many of the realms of DMT is striking. The mechanical "pixies" as you call them, for starters. I call them the klaxton men, with their klik-klak box joints and inter-dimensional warp and woof, though "men" they are not. Or the "firemen" those beings of fire who inhabit one of the closer to home stations on the way "out." They seem entirely unconscious of us. The "pixies" know we're there. They're not much interested, though. And then there's those elemental forces that descend on your room in a vortex and whirl all your property around your head, rattle your windows, even set your curtains on fire and leave your nerves jangled for days! Ah, the memories . . . And the critters, such as you pointed out, who wonder what the hell you're doing in their room! There's no time to explain, even if you could form words. And besides, who are you anyway? Anyone who has been surprised by heavy surf, whirled helplessly and slammed on the sand, has a reasonable metaphor for the power of DMT. Control isn't even in question here. Who controlling what? Caveat emptor is the byword for this empress of psychotropic substances.

Naw, you don't do "research" with DMT. You wrestle for your salvation with Behemoth and sometimes receive an unpredictable vision of actual Heaven on the dare, which makes you game to try such desperate measures again. Religionists, with their guaranteed eventual paradise, of which they know nothing, taking it all on "faith," can't be expected to understand or sympathize with those with a yen to storm the Gate of Heaven and see for themselves what all the praying's about!

I'll stop with this, ill-confident that I've moved slowly as might be into the dialogue, but, considering how much remains to be spoken, what with the eschaton and all, how slowly is it even possible to move?

23 skidoo,

Robert Hunter

Bob--I like what you have to say about DMT, I agree with most of it, yet I am aware that because the object of our discussion is so non-ordinary and peculiar that when we think that we have said all that we can say we still have not said enough. The experience is somehow able to hold within itself both the sublime and the ridiculous, the awesome and the trivial in one alchemical container.

So as I sit here reading your account I partially become it; I recover and remember the experience through that lens. But I cannot forget that it has made me laugh harder than anything ever has and that it has shown me a candy lacquered form of sexy naughtiness that I else wise would not have known existed. So I take it to be a kind of a pun. It both is what it is and it mocks what it is by being many other things simultaneously. Its nature is that it is many things, including contradictory things, at once, that is what makes it impossible.

Borges, in that story in Labyrinths called "The Sect of the Phoenix" says that to the initiated the secret seems slightly ridiculous. When I was a kid, maybe you knew people like this too, I had playmates that were my own age but so much less sophisticated than the rest of us that when we six year olds were putting on Halloween masks and chasing each other and shrieking and freaking out on sugar, there were a couple of kids who couldn't get that it was not real, that it was a game, that it is fun to scare the shit out yourself and your friends. I am not placing your trepidation in that category. I feel the trepidation too, but I do feel, and this may be the difference between doing it a couple of times and doing it maybe thirty times, that as I sit here I can recapture the feeling of the flash, not only the feeling but in some sense I would say "the Perspective" And looking at it like that it seems like it is the edge of meaning, that meaning is actually being made somewhere over the ordinary horizon of experience, and that when the DMT kicks in one is moved to the domain where meaning comes into existence. And the delight and surprise that accompanies unfolding complicated puns has a very similar feeling.

I am beginning to feel as though I am not making meaning any more so I will knock off for the evening. I am enjoying this, hope you are too.

Best,

T

Terence, conversely, when we've just begun we've said it all, taking for granted that we're speaking of the um. . . er. . . infinite. Nasty word, should be stricken from the language and replaced with "linoleum" which, to my ear, is the most gracefully evocative word I know, on a par with "Eloim." "God" is another ugly word; leave it to the Anglo-Saxons to manufacture a brutal set of phonemes for the All. Fortunately we also have "Lord" which most people instinctively substitute. No one ever says "Lord Damn it!" do they? Just warming up here. Before anyone gets unduly upset (not you certainly) remember "God" is a categorical term, not the name of Supreme Being, which, it seems safe to assume, Kabbalah

notwithstanding, is patently nameless -- or "all name" which is pretty much the same thing. Does this conflict with one of the 10 commandments? Probably a matter of translation. I would expect the commandment would translate into something more like: "Thou shalt not swear falsely by that you hold most high." Excellent advice. My particular trepidation about further DMT use is not a timidity about the substance per se. I reckon I've taken it a thousand times before receiving my emphatic cut off notice. My preferred method was intravenous. No nasty taste. First time I tried that I X'd growing out of a flowerpot on Venus beneath a great dome. The comedy quotient is indeed "ridiculous." I remember one sublime journey which ended with a funny little train belching, farting and boogying off into the distance . . . then a Warner Bros. Loony Toons circular rainbow logo descend, upon which was written "That's all folks!" You noted that what happens on DMT is often "impossible." That sure does say it. Reality just doesn't bend that way -- yet it does. Multiple contradictory viewpoints manifesting at once give the truth to Whitman's utterance "I contradict myself? Very well, I contradict myself. I am large. I contain multitudes." The most usual manifestation of that, characteristic of almost every journey I can recall, is the sensation of moving at what, I presume, is the speed of light while remaining stationary. You can't figure it out, so you just "relax" and let it rip. The stars congeal into one immense circumference of light, and bingo -- you're somewhere else. Another notable feature of DMT is the "aliveness" of everything out there. Nothing apprehended which is not entirely, vividly alive, including dust. Nothing is inanimate. Nothing is incapable of rapid and utter transformation. The most stable item I ever experienced was the living water pouring from the Holy Grail in the Sanctum Sanctorum. There, I'd have been content to dwell forever. I still treasure that vision above all others and am largely content to know it exists in the heart -- that love is REAL, not just a term for getting along with one another and making nice. But I enthuse. A little of someone else's reported extasis goes a long way. Guess I'm compensating a little for the earlier impression I might have given that "DMT beats you up." Yes, it can and does, but that's the nature of the spiritual journey. Is DMT "the way"? No. Because you come back. Because, at least in my case, the gates of Eden can be slammed in you face and presided over by an angel with a flaming sword. But one thing you never forget: the spiritual world is more real than this one, by a country mile. Anyhow, I went, I saw, was seen, and I'm still sane enough to operate a computer and string words into grammatically correct and hopefully coherent statements -- and to realize I'm walking the edge of big cultural no-no's in reporting what I found. In fact, bucking the enforced status quo is probably inherently more dangerous, innit? rhPs: just ran a spell checker on this and got: Not in Dictionary: aliveness Change to: aliensso help me God!

Hi--I will get back to the demented dialog in a moment. But to help mark Tim's journey out I wanted to point anyone interested toward my page <http://www.levity.com/eschaton/leary.html>

Best,

T

Hi--I am back at it. Yes, it does beat up on you, it does and it doesn't. Everything about it seems to come packaged with its opposite. One of the weirdest impressions that I have, and it took me a number of trips to put this all together, but in my own experiences at any rate, it became clear that weird as the place I was carried off to was, nevertheless it was someone's notion, someone very peculiar, of just what a human being like me would prefer. It was an alien effort to make an environment that was comfortable and reassuring to human beings, but as if they/it had only studied human beings from a very different

perspective than the one from which we know ourselves. This feeling of important process with grown up overtones and yet with an element of the childish and silly came to remind me of the vibe of a maternity or pediatric ward; high tech, life and death stuff is going on. But they have closets full of teddy bears and the wall paper patterns are all dancing bears and mice in tutus. I have wondered if the wondrous objects offered by the tykes in the DMT encounter, for all their power to stand our world on its head, may be, in that world, no more than plastic geometric shapes strung on a rope and hung over an infant's bassinet for its amusement and to teach it spatial and color coordination. They are no more than toys. But the maternity ward metaphor goes deeper. There is a feeling of arrival, of anxious doctors, and a sense of enormous decompression and relief. Come to think of it, decompression is a good metaphor for how DMT makes me feel, it is as if I has returned at last to my natural medium of existence, having left a zone of constriction and pressurized limitation, hence I feel inflated in every sense in that place. And then there is the language lesson that they always insist on giving me and insist is the entire point of our little meetings, though no else has ever described the stress on language and poetics and linguistic skill that seems to fill my trips. More on all that later. Don't want to shoot my wad in one go.

Best,

T

Subject: wallpaper

Terence,

went to the dentist a few days ago and had NO2 while they excavated my bridge. Caramels again! The sirens and chattering of the void took me to that almost but never quite nitrous surround, the place where All is One with a vengeance and there's always one last detail to realize before the universal riddle is completely solved. I realized I knew that place inside out. It was updated to include current circumstances, sure, but I finally requested the gas be shut off and endured the rest of the session with neither nitrous nor Novocain. My tired old cells require a more gentle view of eternity these days. You've joggled my memory, thanks. One of my kindest interdimensional experiences was in a nursery. There were several children, presence strong, though I never "saw" them visually. I'm not certain but I think I may have been one of them. Hard to tell who, what or how many you are, except later - when able to define oneself as the subject of the experience. That's always an overlay on the raw perception, but necessary to "file" anything in memory and reduce the experience in order to look at it at all. To remember the egoless state would be to be re-subsumed by it. One just wants to put everything relating to DMT in quotes to draw attention to the provisionality of terms used in dealing with any of "this." What "I" saw on "my" trip. The children were laughing, mischievous and quicker than sight. The sense of nostalgia was overpowering - as of being reunited with deeply loved ones separated by aeons and vast distance - the love was mutual. The room was red; it was "the Cherry Room" and, toward the end, the children manifested as immense fluid cherries on the wall of the room. Your mention of "wallpaper" brought this to mind. The sense of someone older and wiser in charge of instructing us fledglings, in some immensely obscure study, is prominent in my memory, now that you happen to designate a category for it. Strange to be able to muster a re-organization of psychic experiences of decades ago, which I doubt I can do with "normal" experiences at such a temporal

distance. So many things have faded from memory, while key DMT experiences are often as vivid as though they're being recalled only a couple of weeks after the fact. The language lessons interest me very much. The feeling that the "teachings" were of immense importance, and that one did, in truth, learn them is strong - though what they were I can't remember. It may be visualized re-integration of data on a cellular level, interpreted as "language." Would like to go back there and check it out with that in mind - as much as one can keep any set of earthbound intentions in "mind" outside ego boundaries. Are we harking back to memories of ontogeny in the blastula stage, re-reading our own blueprints of how to make a body? Is access to those instructions stored in the 'nine tenths of the brain we don't use' because they're of no earthly use once we're born? Really the rat's ass being locked out of the lab, but I expect THEY know better. I wonder - did I make a mess on some sacred carpet, thinking I was emitting flowers? Did I insult some petty DMT bureaucrat who's had me barred? Am I under house arrest in this dimension? Or did I just graduate?

Subject: more, more

Dear Robert--Sorry to have been out of the loop for a while. I have been ill with some complicated thing that brought its own ambiguity with it. Strangely the experience seemed to have implications for our discussion. Ten days ago I slipped into a flu that seemed to have a mortal viciousness about it that actually frightened me. Was it a kind of couvade for the late lamented Leary? Who knows. Anyhow the delirious fevers and icy night sweats, the body aches and the vomiting was all accompanied by thoughts, myriad thoughts, many obsessive in the sense that, though they were trivial, once begun there seemed to be no end of them. And there were dreams in which--familiar territory--I seemed to be on the brink of some great understanding. After days of roiling epistemic murk and no diminution of the fever I realized that this was no flu at all, but rather a set of sensations that I had known before years ago but had long ago suppressed and forgotten: all the signs were there of so massive a dose of intestinal parasites that it was hard for me not to think of myself as already half a corpse, so congenial to worms had I become. It was from that vantage point that I tried to look back on the bright spaces of the DMT experience. The soul is never so clearly glimpsed as when like a kite she hovers a great distance from the corruption of the body. I once gave DMT to a high Tibetan character, not one of the grab tail assholes current or recently at work among the easily fleeced denizens of the New Age, but actually someone whom I regard as the real McCoy. His words to me upon return from those realms was to say that he had been carried into the realms of "the lesser lights," by which he meant that one could go only that far and no farther without abandonment of even the idea of a return. Sort of an end-of-the-rope look over the wall into an ecology of souls, that was the impression I got from listening to him describe his DMT experience. So perhaps that is the ultimate gift of this material: Consciousness expansion. I will give you consciousness expansion that will turn your blood to ice water. Consciousness expanded to the limits reveals what? The limits of consciousness obviously. Perhaps it is this for which we are not prepared and to which we are both attracted and repelled as an insect to a flame. I remind myself as I write these words and play this game with you that reality's edges, and the edges of biology, are not for sissies. A mystery is not an unsolved problem. A mystery is something else, and all the big stuff: birth, orgasm, love, death and DMT partake of that mystery. There is always that perspective from which we recognize ourselves as gnats caught in the lens of eternity. Death

reminds us of this. And so too, but by a different route, does DMT.

All the best,

T

Subject: Re: Leviathan

Dear rh--You mentioned that you were off to England and that you assumed there would be modems there. Yes, but sometimes getting all the little phone jacks and funny adapters all together can be a pain. I have been totally getting off on recovering from my brush with the forces of intestinal destruction. It is wonderful when health and good digestion are new won friends that get you high every day. Ah, so that is over, one more speed bump on the pot holed highway of life. It has allowed me to turn my attention back toward the secular holy grail of my life here, which is the search for a really good connection to the internet. Nobody knows the hell that we go through out here to have a web presence. The Levity machines in New York serve the site very quickly and of course Dan is a state of the art kind of guy. No problem there. The problem is my connection. I use an analog US Cellular modem to reach my server in Kailua-Kona. Top speed is 4800 baud, connection is intermittent, easily broken and 35 cents per minute. Moving even a small GIF to the levity machine under these conditions can be a frantic experience. There are solutions, really there are mirages of solutions, the only real solution as far as I can tell is wireless spread spectrum technology, powerful radio modems that can reach thirty miles at 128 up to 256 kps. Hot stuff but expensive. Finally I have put together a leasing deal where this toy is almost in my grasp, in fact we are in the installation and burn in phase now. Or nearly now, as no one has yet seen this puppy perform. If and when this comes on-line I will be the technical ace of the Kona Coast. But we have been after this for eighteen months with dot to show for the effort. I will let you know how it comes out. I felt the need to give you this detailed look at the technology behind my end of our connection so that you understand the reasons for some of the delays and lost time with our conversation. And what about our conversation. The Other is always with us. It is sort of the Omni-purpose Muse. One only has to evoke it's presence and it offers itself as a perfect surface for the inspection of the limits of the imagination, certainly. I think that in an earlier post I mentioned that though it resists description nevertheless when I tell my mind "Think about it." I enter into a state different from any other. And it is un-English able. And after these experiences of "thinking about it" are concluded I then and in a normal state of mind conclude that the phenomena is about language. It is an experience about language that nevertheless, or perhaps intrinsically, cannot be talked about. It is as though it takes one to the other side of language, to a world where language is beheld or understood differently, through different senses or from a different perspective. It is as though there is a simple and obvious truth which cannot be said in words, all words betray it. Yet words are all that we have to approach this truth, it is a truth I feel, not a feeling of truth or a true feeling but a Truth. Normally such things come made of words. But not this one. Why not. The answer to that question would tell us what it is. Perhaps it is a mathematical truth, perhaps when one's IQ is boosted by an order of magnitude, as seems to happen in the flash, then one groks the basic mathematical order of things, something that can normally only be known after a life of deep intellectual discipline. Or perhaps... perhaps...Enjoy England and the summertime, if you can get down to Devon. To the Old Stones.

All the best,

T

Date: Sat, 29 Jun 1996 19:57:35 -0400

Dear Terence,

Online in England after acquiring the plug & phone jack adapters and a good transformer. Ever try to dial an 800 number (my server) from over here? A: it possibly can't be done. B: if it can be done you can't do it with the wrong country code. The US is now 001 instead of 0101. But I'm fixed. Could write a handbook. The Net cranks here. Very fast. Now I know what www means experientially. Distance is real but I can't say how since self and time are variables with variables of their own. Great satisfaction in wielding faster, wider bands of potential than at home but I don't use it much. It's my vacation. The imperative urge to communicate remains active, the coal I can't swallow or spit out. I've put out a whaleworth of doggedly spontaneous communication in the last four months, courting risk. I often upload my journals with something like a prayer that they not blow up in my face or haunt me forever because of some unexamined attitude. But I feel what you describe as the Other prompting me to hold truth higher than caution. Truth magnifies. Caution avoids. Agreed: truth is simple and unsayable. Viewing from that position of simplicity allows instant apprehension of matters complex beyond calculation. Resolved: art is the proper response. There's much to say about it - nothing to say of it. Say of it anyway and be a glad fool. Speak of what is beyond speech fluently. The Psalm is an appropriate mode of expression. The elegy and the ballad. The net offers appropriate boundless ground to declaim - without publishers, editors or retail to consider. There's a well known syndrome of derring do on the net which is a combination of ready accessibility and infinite editability and/or updatability compounded with cathode fixation. I'd hesitate to call it a Muse, but it sure acts like one. "Nettie made me say it!" Trying to downsize the Net in my own perception lately. The Ignoranti feed off our delusions of the actual "power" and "reach" of the WWW, which we confuse with its sheer potential and advertise accordingly. Once corporations learn that there's very little cash profit to made on the Net, outside of our servers, funds will stop. But it will be too late. It already is. Until a comet erases every hard drive on the planet. What form of digital information storage could escape the mass erase? Crystal? Protein? Jellyfish? Silicon? A roomful of idiot savants with photographic memory? Laser embedment on the point of a pin? Put the technology on a rocket and send it on a return cruise outside the solar system? Make that two rockets. Always back up important data!" "What resists description" is the object in itself. We either see it free of words, or in a language appropriate to itself, which is more akin to co-ordinates than the lingua we use to relate useful objects to our bodily needs and egocentric ambitions. We see only the aspects of objects the lingua allows for. Some objects we do not see at all. We intuit from the "flash" that all objects are beings. We are redefined in the act of being observed by objects in the same manner in which electron micoroscopy changes what the scientist observes. What about telescoping? In light of all this a redefinition of "seeing" is called for. One that implies interactivity. Seeing is less passive than we assume. This state of affairs is probably exciting only to the risk taker with a built in sense of essential immortality and a willingness to invest "self" as a kind of psychic capital. I wonder, now that you're on the mend, about something icily terrifying you said awhile back, about the end of consciousness - coming up to that point in fear and trembling. I felt moved to comment on it at the time. It seemed like a viewpoint of psychic exhaustion. I saw it once after overdosing on a quarter million micrograms of acid at the Carousel Ballroom (NOT on purpose) in '69, which

effectively marked paid to my acid career. Someone who has crawled naked across the Sahara doesn't spend much time in tanning parlors. Anyway, your statement carried the conviction of someone who has recently looked that place in the eye (or vice versa) and I'm curious as to how much of it may have been due to the parasite invasion? I believe that place (technically known as Hell) is more of a culdesac of consciousness than an inviolable limit to it. Meantime/space, life in this unspoiled pocket of England is all it should be. Cynicism seems unknown here, tourism is slight, the people cheerful and friendly beyond my previous experience. It's hard to be grumpy but I manage. Roses climbing into my window, 3am, light patter of rain. Time and the Net seem distant. Heap good vacation. rhps: this place feels lousy with lay lines. Not my field, but there's something happening here which speaks to a dormant sense. Not a mystic feeling. Seems objective.

pps: can I use your server? Wow!

Date: Thu, 11 Jul 1996 20:13:02 -1000

Dear Robt.--I hope the English summer is treating you right. I love Devon in the springtime but the pollen takes me to hell. I have been mulling our conversation, and reading David Abrams "The Spell of the Sensuous" and from there a bit of Merleau-Ponty. And that sent me back to Whitehead's "Process and Reality" and I reread Part III which lays out ANW's idea that feelings are the primary datum of all experience. I mention all this just so you know who I have been hanging with as I form my notions. What I return to again and again, and what these authors seems to brush up against from different angles, is the idea of a lost modality of language. That civilization, for a number of debatable reasons, has severed us, not only from nature as habitat and ecosystem/landscape but has profoundly severed us from our own nature, including the full compliment of communication skills and channels that we once accessed. Of course their approach is very academic and proceeds by reason and philosophical argument, but beneath that can be heard a very real plea for deliverance. These authors either were not aware of or chose to appear unaware of, the psychedelic experience a la DMT. Though Abrams quotes an amazing passage from Merleau-Ponty's "Phenomenology of Perception" about mescaline. But what they are calling for, the recreation of language through rediscovery of the body, to reclaim language's lost dimension, is to my mind exactly what happens when DMT works. For me it has always been about the sudden almost orgasmic outpouring of meaning that is beheld, words become things made of light and the restoration of this power brings with it ecstatic apotheosis, it is a reuniting with the lost portion of the self, somehow become lost during the vicissitudes of our long strange history since Paleolithic Algeria. I wish I could get at this more, this transformation of language. It is as personal and subjective as sex. Yet because it involves sound and vibes, it is potentially highly inter subjective, meaning can involve other sentient beings. And I have since the first time I smoked had the indisputable intuition that, in spite of its archaic roots, or perhaps because of them, that it would have a profound and salutary role to play in the transformation of cultural crisis into utter utopia. Anyhow that is enough for now.

Keep on Truck'en.

T

Dear Terence,

Bingo! Since keys are keys, not the rooms and the contents of the rooms which they open, it seems salutary to consider the rooms opened by chemical keys to be simply ourselves, rather than something alien and/or dangerous: parts of ourselves locked away from the ego perception which is the sum of our cultural conditioning as expressed in language as she's spoke. Freed for a moment, the latent language facility blooms and expresses things we only understand in the moment, with ears of the moment. And somehow this reminds us, so very often, of childhood - the immense bright afternoons of childhood aeternitatus. The few lexical items we manage to bring back are not unlike the babbling of a child before the native word talent is shaped into common language. I'm tempted to say, though I will not go so far as to affirm, that we ARE the word talent, as much as we ARE the visual talent, the light gathering and organizing facility. I'm reminded of Rick Griffin's flying eyeballs uttering strange glyphs. Words of light dissolve the amorphous boundaries between the facilities - six senses be damned, there's only one! We 'apprehend' and are subsumed in the apprehending. Phenomenology must take its clue from the state of pure apprehension. Wittgenstein wandered far from this and based his later self repudiated Philosophicus Tractatus on reason alone. Of course, his agenda was to destroy all philosophy up to and including his own and, I suspect, wipe the slate clean for a whole new go. Cambridge affected him that way. How is thought to continue beyond Wittgenstein? It must be regrounded in direct apprehension and freed from the clutter of religious symbology which leaks into and influences perception of the emperium. This doesn't mean do away with religion, ceremony is right and natural, but to comprehend that it could be based on primary rather than authoritarian secondary and tertiary modes of perception, allowing vital illumination of the present categories of shadow and mystery. The emperium is quintessentially religious, if by that the indubitable presence of divine consciousness in the sacred garden is understood. Merleau-Ponty is far and away the most readable of the phenomenologists, those great grandsons of Berkeley and Kant, though I'm fond of old daddy Husserl himself, unreadable as he is. I once spent several months of 1972 on one dry as dust page of his "Phenomenology of Internal Time Consciousness." re-reading and marking up the page ad nauseum. Never did grasp the whole presented thought (lame translation?) but it kept my mind spinning in those grooves. Those who think his disciple Heidegger is difficult should try the maestro himself, compared to whom Marty's "Being and Time" reads like Mickey Spillane. But how does one become entirely 'scientific' about the roots of perception? Occam's razor cuts as far as the stratum of poetry and no further. What is not divisible is opaque to methodology. But I don't belittle the limits of methodology. What good is a tool without limits? Tools ARE limits. You don't water the lawn with a shovel. The Swiss Army knife is the exception which proves the rule. I admire the succinctness of your last letter. Forgive me if I ramble as is my habit. It's morning in the shire and I look out my writing room window at a flock of sheep grazing the backyard. Beyond them, down the dell: a cluster of Tudor and Elizabethan farmhouses. Will be hard to give this up come late August, but I've late taxes, teeth and other business to attend to. Had the opportunity to experience dysentery with fever and light delirium last week. Not much compared to your ordeal with Oroboros in May but enough to experience the relative pleasure of a return to normality. The allergy season is in full glory here, but judicious use of antihistimine helps. Just as bad at home, so no complaint. I have occasional fantasies of retiring to the Sahara. Hope this letter finds you physically brisk and in full mental incandescence.

Subrisio Saltat!

Subject: Re: new orfeo file

Dear rh-- You mentioned >Bingo! Since keys are keys, not the rooms and the contents of the rooms >which they open, it seems salutary to consider the rooms opened by chemical >keys to be simply ourselves, rather than something alien and/or dangerous. To which I must reply, "Yes, but..." because, something I picked up from Jung, I am always aware that the self is not simply or merely anything. The Self is the mother of all abysm. The central fact about reality is that we do not know what we are. Therefore all other questions are unanswered. That is why the psychedelic frontier is so compelling and exciting to me, because it is such a powerful tool in the prosecution on ontology, pursuit of the understanding of the nature of true being. I liked your comments on Merleau-Ponty et. al. I had the good fortune to audit much of Hubert Dreyfus' course on Phenomenology years ago at Berkeley. But my own preference is for Alfred North Whitehead, as you are in Whitehead country may I presume to recommend "Process and Reality" as some light summer reading. Be prepared for surprises, Whitehead is no Positivist and believe that feelings are, as he would put it, "the primary datum of experience" and his mathematical grounding is impeccable. I am sorry this reply is short. I am packing for one of my periodic forays on the road, to sing for my supper. I will try to get e mail along the way. But in fact things are likely to be a little choppy as I move from Hawaii to Boulder to Manhattan to Phoenix and on to Esalen over the next three and a half weekends. I will be back in my little grass shack after the 12th of August. I am enjoying our conversation in slow motion and judge by the e mail that so are other folks. This has got to be good.

Best,

T

Subject: from rh

Dear Terence, thought you might catch me up on that, after I'd already posted. Half right is all wrong in such matters. Let me redefine "self" (a dangerous, dangerous move!) as everything capable of apprehension, in full or in part, including a perception of the perceptual and organizing apparatus, not to mention a perception of that perception up to several levels, until attention itself peters out. In short: what is perceived is self, including the perception of self as objectified subject. This would subsume the alien question and leave its extra-phenomenological aspect unfactored. This escapes the blind alley of solipsism, which the healthy heart refuses to countenance even if the reason is willing. We see what we see of the alien factor but are aware that we do not encompass it. Allegory of the cave. But what we do see is part of the perceptual data which defines self, albeit with the apprehension that our data handling circuitry is unable to correlate and subsume-as-self more than a few of its extruding dimensions. And the sense of being looked back at (eye on the pyramid) by something unknowable can get the danger bells clanging. God? Gog? Magog? Yog Suttoth? Archangel? Bogeyman? My intuitive sense is that it's a glimpse of the biological "mind" with which we build these bodies and brains and has the same relationship to us as a tree to its plucked or fallen fruit. On the other hand, absolute otherness is inconceivable, which is not to say it doesn't exist. Self is only all we see, not necessarily all there is. Maybe. Gosh, ANW for vacation reading? I'm currently reading the Diaries of Rev. Frances Kilvert, 1887-97, full of local lore and mythology. He's sent me on a quest across cow and sheep pastures for the Ffordd Cross (pronounced "Forth") a small standing stone, maybe four feet high, which bears prehistoric inscriptions. No luck in two attempts, though

I know I've been within a few hundred feet of it, via directions I received at a local farmhouse. My other reading is an old edition of horror stories by Algernon Blackwood & "the Complete Idiot's Guide to Photoshop," which is way over my head. I was perhaps put off reading Whitehead by Wittgenstein's estimation that the "Principia Mathematica" by him and Bertrand Russell was a crock of shit. Of course LW didn't believe in arithmetic in the first place, so felt that any extrapolations assuming arithmetic a priori were ill founded. But I won't let him boss me around and will check out "Process and Reality" as recommended. Have a hell of a trip and kick some intellectual ass. The Humahumanukanukaoppawa (sp?) will await your return.

Cheers,

rh

Subject:Re: from rh

Dear rh--

I am packing to get out of here, will print your letter and take it with me. I am taking the old 170 but can't be certain of communicating. But I was amused to hear that you are reading Algernon Blackwood. He is one of my favorites. Is "The Horror of the Black Museum" in the anthology? How about "The Windigo"? It is the all time 'bad news in the woods' story. And yes, all those guys, Wittgenstein, Whitehead, Russell were bitchy as cats. We can't let them lead us around, much of it is advertising they are all and each closer to the mark than the others would have us believe.

Don't know exactly where you are but I enjoyed Kennet Longbarrow in Devon.

Best, T

July 17 1996

Dear Terence,

I'm reading a 1916 copy of "The Listener" which doesn't have those stories in it. I've read several Blackwood stories with sinister trees though and think I know the one you mean. "The Listener" story, despite its unsatisfactory ending (Blackwood seemed to throw closure in as an afterthought but is a master painter of hideous depression -- same fault as Lovecraft) is one of the best haunted house stories I know of. M.R. James and Sheridan LeFanu also know how to haunt a house properly. Great Victorian horror is the most accurate imaging device for the sensations of dangerous alien otherness that I know of. MR James is the most sophisticated, Lovecraft the rawest. Science fiction may have greater scope of definition, but seldom the sheer evocative power of the Victorians. The best modern evocation I know of is Philip K. Dick's semi-delirious "Radio Free Albemuth" which he later enlarged into the (to my mind) much less successful Valis trilogy. I once found the address of and made a pilgrimige to Dick's house in Venitia, five minutes from where I lived in China Camp, outside San Rafael. This was some time after his death. I saw a great big man with a close cropped white beard come out of the house carrying a brief case; the spitting image of PKD. I just filed that under "?". Am in the Welsh Marches near Haye on Wye, a land of peace and pastures, the least populated area of GB. Sheep in the meadow and doves in the dell. Antihistimine in me. Must do Devon someday - passed through it on the way to Cornwall last decade. This trip, should I break free of the local spell, I intend to visit Scotland for the first time. Shame on me if I

don't, who plays the highland pipes and was born with the name Robert Burns.

PART 3

From: Terence

Subj: Back to Business at Orfeo

Date: Sep 2 1996 3:42 AM EDT

Hi--I wouldn't blame you if you had given up on me. Once I shift my attention somewhere it is hard to get back in the groove. All kinds of things seem to rush into the gap to claim attention. I suppose that everyone who is fully engaged by the post modern-pre-whateveritis mode of existence is like that. My father has been very ill, that has meant two recent and unscheduled trips out to Phoenix. I managed to visit on one day when the temperature hit 117! I stood with my father outside in the desert sun and marveled as he proclaimed to me that it was the most comfortable that he had felt in weeks. Being close to a person whose days are very clearly numbered puts a different spin on the effort to understand the Other and all of its adumbrations. Also another list that I am on, designed to explore the ramifications of Novelty Theory and the Timewave, turned unexpectedly into a slug fest in which I had to defend my ideas, my reputation, the color of my eyes and everything about me short of the number of digits in my postal address. I am now in the process of rising above the fray, granted only by abandoning the field to the shrill and the intellectually constipated, but so what? Peace of mind is worth more to me than anything else. But enough about me and back to the business at hand. I recently read a very interesting book that bears on our subject and that I have been recommending to anyone who will listen. The book is called Cyber-biological Studies of the Imaginal Content of the UFO Contact Experience. A title which surely doomed it as a commercial publishing venture. Nevertheless this book, by Dennis Stillings, a fellow resident of the Big Island, has much to say about our subject. Ordinarily I am loath to connect my beloved and always cheerful self-transforming elf machines to the popular-in-trailer-courts notion that pigmy proctologists from distant star systems are running about making free and unscheduled house calls in the middle of the night. But Stillings's book is too rich to miss. Here, hopefully to whet your appetite is a partial list of the table of contents: "Believing the Unbelievable: Child's Play or Con Game" by Hilary Evans "UFOs: Ultraterrestrial Agents of Cultural Deconstruction" by Carl Raschke "What Did Carl Jung Believe About Flying Saucers" by Dennis Stillings "Ufology Considered as an Evolving System of Paranoia" by Martin Kottmeyer "Signals of Transcendence: The Human-UFO Equation" by Peter M. Rojcewicz "UFOs and the Myth of the New Age" by Michael Grosso "Quicksilver in Twilight: A Close Encounter with a Hermetic Eye" by Tony Nugent "A Testable Theory of UFO Abduction: The Birth Memories Hypothesis" by Alvin Lawson "The 'Visitor Experience' and the Personality: The Temporal Lobe Factor" by Michael Persinger I did not agree with every view put forth but every article was fascinating and intelligent, indeed the authors did not agree among themselves. All the author's have published widely in other forums and all seemed motivated by honest curiosity and a commitment to intellectual fairness. The editor, Stillings, has a number of commentary essays that I particularly enjoyed. Check it out! Some ideas that appealed to me in this book were the following. That when one meets with someone who believes something that common sense would call absurd and for which there is little evidence to convince the not already convinced the usual question that is asked, and then the answer argued over is "Why do you believe X?" In the above book the suggestion is made that a different question might be asked: "Why do you believe THAT you believe X?"

It is pointed out that often people who profess weird beliefs do not act as though they believe them. There seems to be two levels of belief, one is simple belief and the other is to believe that you believe something. The distinction is very interesting to me. It turns the light of inquiry from the thing believed toward the dynamics of the psychology of the believer and usually, if intellectual honesty is maintained, there are very revealing personalistic answers to this second question. There is much discussion and demonstration in the book of the plasticity of memory and the way in which ordinary people confound and mix epistemological categories. This relates to a particular bête noire of mine, what I have called the Balkanization of Epistemology, the fact that no widely accepted set of standards exists as to what the nature of being, or even ordinary experience is. This is why I have come to think that all beliefs are cultural artifacts and so are inevitably as limited as the cultural dimension in which they were created. I am suspicious of them. A kind of psychedelic skepticism seem called for, and that is what I am trying to cultivate in my own life, a level of second attention, not what do I believe but why do I believe that I believe...Turning now from all that I have had a thought that I wanted to share about my experience with the elves of DMT land. I have described, on stage and in print, many times the fact that their agenda seems to be linguistic and noetic in intent. They give lessons in a three dimensional form of language. I have expressed great puzzlement concerning this aspect of the encounters, now in mulling it over I see a kind of logic in it. If a real contact is underway between vastly different kinds of intelligence, not a sampling of tissue or a reprogramming or some other paranoid control and manipulation fantasy but an actual meeting of very different but equally dharma loving and moral intelligences then it does seem logical that the first step would be efforts to genuinely communicate. In countless B-science fiction scenarios this is effortlessly accomplished using a "universal translator device" that downloads Standard Galactic or whatever in real time into "take us to your leader" colloquial English. But perhaps we have been simplistic. Communication is not easy among human beings with a shared culture and value system, how much more difficult then is communication between truly different minds. Perhaps the great impedance to true contact with the Other is lack of a common language. And perhaps because what the elves wish to communicate cannot be downloaded and flattened into English without loosing its intended meaning they have no choice but to offer three minute language lessons to who ever stumbles into their hive/nest. There is in the DMT flash a sense that "this is important, please pay attention, please try harder, please come back again and please try to communicate in the way that we are demonstrating to you". They may have something very important to say that cannot be said in any language but their own. Hence the ambiguity, the frustration on both sides and the spectacle of human language attempts to say what they are saying turning inevitable into foolishness or gibberish. Conclusion. A true contact between ourselves and another intelligence is possible, but only if we learn its language. The Other, for reasons obviously not yet clear, cannot simply lay out its agenda in English, French etc. How it may do with native speakers of Witoto or Telugu, I, naturally, cannot say. Anyhow these are the thoughts that I am carrying around these days. It feels good to be back in touch with you and our readers here. I apologize for my long absence from the game. I am back!

Best,

T

Date: Tue, 3 Sep 1996 10:16:58 -0400

Dear Terence,

good to hear from you. My dad, at 92, also complains of the cold on warm days. Speaking of cold, I had the eerie pleasure of looking down on Baffin Bay and Greenland yesterday, a rare clear flying day over that endless scape of permanently frozen lakes and utterly naked terrain. As alien as ever Mars or Venus. Were it not for the green ice and small clouds, it might have been the moon on a pleasant Sunday afternoon. I'm just gonna rear back and say what leapt into my "mind" after reading your letter: it seems to me all human communication is a language lesson. It seems the gist of our communications tend towards "do you know?" "do you understand what I'm saying?" "Here's what I mean," and "what do you mean?" Avaunt that, major confusion about what "to mean" means. And yet something can be meaningfully said and meaningfully received, at least sometimes, I feel it in my bones. Meaning addresses marrow. I know that I have very detailed points of view, which I write down almost daily and publish several times a month in my journals. What garners response from others is often utterly tangential to what I intend to emphasize. An idea is mistaken for the signifiers in which it is expressed, which signals that I am either an inefficient writer, or that the written word mainly functions to remind people of what they already know. Not that my readers are unintelligent as a group. Far from it, as a peek at my mailbag will reveal. I begin to suspect it's the normal human condition, vis a vis writings and talk - and do not doubt that I'd prove as culpable as the next, in unconsciously reading for confirmation, were there any objective measuring tool. Got a hunch metaphor is to blame. We express an event in terms of another event, rarely in terms of itself alone. Why? Because it gives color, emphasis and torque to our opinions about, say, a hot day. It's hot as a pistol. Hot enough to fry eggs on the sidewalk. Metaphors are culturally determined and don't function well outside their native habitat. It's never hot enough to fry eggs on a sidewalk to a desert nomad who has never seen a chicken or a sidewalk. And we reply in metaphor to those likewise schooled in our subset of the metaphoric universe: "Yeah, it's hot as shit." We think, speak and dream metaphor. Everything is something else. For example, I received a letter recently which I adjudged as "poison." I felt "infected" by it. It was constructed of a pistache of metaphors incorporating my own metaphors, attempting to "speak to me," more properly against me, by appropriating the fruit of my muse, the finer part of my imagination, my soul (depending on one's metaphoric orientation concerning the creative process) and fancying this could evoke any response but revulsion and confirmation of why I would avoid this person in the first place "like the plague." I like the "Why do you believe THAT you believe X?" formulation. A fruitful line of inquiry far more invigorating than merely questioning all belief -which gets one an ill deserved reputation as a cynic when only attempting a little recreational glancing behind appearances! I'm certainly more curious about why I believe things than in what I believe, though I hadn't formulated it. As a practicing poet, I'll go the whole distance with metaphor. I believe abstract object substitution is responsible for a great deal more of the human condition than this world dreams of. I'll go so far as to say it's the foundation of human consciousness. Why do I believe that I believe that? Because I spend a lot of time acting as though it were so and haven't found anything to change my mind. Shall I take the plunge and state that everything specifically human is operated by metaphor? Speaking of ET's, if they have self-reflexive consciousness, they also operate on metaphor. What "is" neither we nor they can know, but we can know what something is like. Buddha is like, you know, three pounds of dried flax. Harumph! That is to say: Buddha is a metaphor. Does that make Buddha less Buddha? Hardly, since anything other than pain is metaphor. Sex is metaphor. Pleasure is metaphor. Love is a shower of stars in a golden bowl. Hunger is a ravenous beast gnawing our entrails. But pain is just ouch! Not a metaphor. That's why we can't really remember pain, only, sometimes, that we had some. For real pain, there is no metaphor -and memory retains only metaphor. Were you to say Buddha is pain, you'd be closer by a country mile than saying Buddha is a pile of dried dung. But it would be meaningless unless said at the precise moment of pain, which would be a rarity. From this it seems reasonable to extrapolate that looking for the "real" is looking for pain. There are those who make a practice of this, perhaps believing implicitly that "the real" is

somehow senior to metaphor. This is the worst sort of dualistic thinking. A culture that has a problem with rampant unreality is likely to be a culture that embraces pain and its anodynes. By the way, did you know that 92.3% of all thought transmission is telepathic? The other 7.7% is verbal communication, which is not telepathic because it's tongue & tonsil specific. Yet the ESP researchers try to establish their turf on the precise section of the speech pie which is non-telepathic by definition; the stuff that needs to be said aloud because it's metaphor and rhythm reliant. This is the same mentality that can't quite grasp that sending a neural signal from the brain to lift a hand to scratch your ass is mind over matter. The explanation of the previous paragraph is that I went to bed at 9pm and arose at 3am. It's now 8pm and I'm enjoying a luxurious case of jet lag this Memorial Day. Physically fragile but mentally clear in an easy going way. - that natural high known as fatigue, where one quite handily knows all and everything and can go into a glowing, golden, milk & honey trance by simply assuming the prone position. I expect that is caused by a flood of endorphins at the beck and call of weary cells. Flying West is so much less physically demanding than flying East, where fatigue shows a less benign face. Takes me two weeks to recover from a flight to London (From SF), even with Melatonin, but only three days to get back to normal when following the sun home. Sorry to serve the dialogue ball back into your court so quickly. I was just itching for something mental to do today, and your letter arrived. Think I'll reassume the prone position and enjoy the free endorphin show for awhile. rhaps: Am happy you postulated the difference between the "Elves, Gnomes & Collapsible Little Folks' Tesseract and Omniscience Society" and the "Extra-T Brigade." Space, as we know it, is certainly not the dimension our quirky pals inhabit. I've sometimes had an inkling that they're connected with human ontogeny, the very crew that helps us build ourselves from the blastula . . . and I reckon it's all done with words. But not metaphor.

9/3

Dear Robert--Good to hear from you. Were you returning from the long summer in Britain, or a quick trip to the same place? I too have had the pleasure of looking down on Greenland from seat 10A or 10H. I know that on United at least they refer to those two positions on the polar flights as the "geologist's seat". Cool that they know that. The ice covering Greenland is 9000 ft deep in places. The concept of ice 9000 feet thick is weirdly disturbing. And to think that it was half that thick in Minnesota only 26,000 years ago. And people say that nothing changes!>it seems to me all human communication is a language lesson. It>seems the gist of our communications tend towards "do you know?" "do you understand what I'm saying?" "Here's what I mean," and "what do you mean?" The first time I was in the Amazon I knew only the botany that a browsing psychedelic freak needed to ask after and identify the plants that would carry me into hyper space. The next time I was there I had spent a lot of time learning the taxonomic distinctions among the major plant families and I had logged a lot of time in the company of botanists. The big surprise of the second trip was that the jungle had differentiated itself into a much more complex and interesting phenomena. I knew the names of things and so what had been a blur of endlessly undulating greenery suddenly became an environment filled with the specific and the familiar. Words hide reality and words bring reality into focus. Weird critters words, always turning from what you think they are into something else. And then there is the business of other people's words. I always marvel at people who somehow :-) manage to get along without English. How do they do that! It makes me wonder about the territory inside the heads of people who command several languages; they must be living in a world so

much richer than anything I can imagine. Though I notice that they are never so indiscreet as to betray the fact that they abide constantly in this superior condition. I imagine that I would if I were them, but that is not to be. One of the chief things that I condemn myself for is the fact that I have devil of a time learning languages. Is it the price that I pay for being not half bad in English. I have disappointed teacher of languages as different as Latin and Tibetan, Italian and Witoto. Communication problems are much on my mind. I am feeling very burned from participation on a list that in my fantasy was going to bring clarity and further elucidation to my ideas about Novelty Theory. The whole thing just degenerated into a scream fest of non-communication in which I was as guilty as the people who were driving me crazy. Funny thing about this e mail stuff, it is not like any other form of communication. It is as ephemeral as sophomoric conversation on one level but the fact that it is written means that it is a permanent record of thought, and thus reveals to anyone who will look that we are almost always taking past the intended target of our communication. Somehow the fact that it is clearer than conversation paradoxically makes it harder to understand the intent of others. Written communication can always be misconstrued more easily than speech, because speech is self correcting and is carried along on a wave of empathy or telepathy that is somehow absent in the written word. Or at least my written words.>Got a hunch metaphor is to blame. We express an event in terms of another>event, rarely in terms of itself alone. I like what you said about metaphor. And I agree with you. But it reminds me of something that happened to me long ago. It was in my early acid days. I had a trip which was all about metaphor and had reached conclusions similar to those you expressed. At a meeting of the experimental college a few days after this trip I proclaimed that "Everything is a metaphor." Without missing a beat my mentor of that moment, Joseph Tussman, who was a philosophy Prof. at Cal. looked across the room at me and said. "What about articles? And, or and of? Are they metaphors?" I am still mulling that reponse. A conclusion of that same era was that language is alive. I experienced this very concretely on acid. English as an animal, a kind of amoebae, extending its pseudopodia of description into every look and cranny of reality, a kind of syntactical Los Angeles, ever growing, expanding and including more and more empty or natural territory into its grid of meaning. Wasn't it Burroughs who observed that "Language is a virus from outer space?" What does it want with us, and how can we tell if it won't tell us? And then how can we trust its message since even the act of deconstructing it involves a total commitment to it as both means and end? ETs and countless other almost realities or wannabe realities seem to be the minor flora and fauna of a purely linguistic domain. And then there is the ambiguity of memory...It is more and more amazing to me that we can sustain the hallucination of any meaning at all. I like a poem by Trumbull Stickney, one of those intense young men who died in the trenches of W.W.I. In a poem called "Meanings Edge" he wrote: I do not understand you. Tis because I lean over your meaning's edge And feel the dizziness of things You have not said. Well that's it for me this evening. Glad that you are back. Get some rest and we will continue to continue downstream.

Best,

T

R 9/5/1996

September 5, 1996

Dear Terence, was returning from England, sitting in the 3rd row, trying to get some sleep in the darkened cabin when Katy yelled out "Daddy, come and look" opening her window and flooding the cabin with brilliant sunlight. Her middle name should be "Sleepers Awake!" I grudgingly got out of my middle row

seat, crawled over sleep-masked Maureen who refused to harken to Katy's nudging, and looked out. We continued to gaze for twenty minutes until clouds thickened. Only the second time I've seen Greenland in numerous polar arc flights - and the last time was without benefit of brightly detailing unencumbered sunlight at a good angle for showing dimensionality. To think that whaling ships dared come to the unearthly desolation of Baffin Bay! And yet it is Earth. Just as the nth dimensional places of which we occasionally reminisce in our dialogue take place in human consciousness, yet sometimes seem so quintessentially non-human! reminisce. Wasn't Baffin Bay where Frankenstein's monster was last sighted, floating away on an iceberg? Soon as we got home, I showed Katy where we'd been on the globe. Another limitation of email is that banter is minimalized. On each of several points you raise, a tree of branching possibilities presents, asking for a flurry of quick exchange to establish which limb is worth crawling out on in order to obtain what apple. The point that immediately wanted addressing:>>I proclaimed that "Everything is a metaphor." Without missing a beat my mentor...said "What about articles? And, or and of? Are they metaphors?"Well, of course, youth would like to find all the apples on one sturdy branch. At this point in my dotage, I wouldn't go so far as to say "all is metaphor" though I'd hold that "all" is metaphor. Tussman has a wonderful point. Mathematical symbols exclude metaphor in order to demonstrate metaphoric propositions without adding an unwonted flavor of their own. Ideally, math is a non-metaphoric language, though in a vanilla world everything must of necessity retain some trace of vanilla. I'd venture that articles are simply the mathematical component of language as she's spoke and writ. Prepositions are not metaphoric either, being purely relational, unless you want to view them as corrolaries of pre-postulated "space," which IS arguably metaphoric. And then there's punctuation, capitalization, most verbs, and a certain percentage of the adjectives (such as "big" which is relational as opposed to "glamorous" which is metaphoric). . . hmmm - it seems that nouns are, by and large, the culprits. Not in themselves so very much, as in their interchangeability for purposes of comparison. Dog is just a sound (unless you believe in Ur language, which I only sometimes do) designating a four limbed leg humping creature (!) that eats bones and chases cars, but which sound, applied to a human of oriental persuasion, becomes a fight inducing metaphor. To jump all over the place here, you wrote "It is as ephemeral as sophomore conversation on one level but the fact that it is written means that it is a permanent record of thought, and thus reveals to anyone who will look that we are almost always talking past the intended target of our communication."Funny about that. It is an ephemerality inducing form - why this is so is worth an old-fashioned typewritten paper, much marked up for style and concision, and retyped. I think there's a mindset of speed involved: "I'm gonna bang down my first thoughts and fire this off, and expect the same in return, and quickly" sort of thing. An ethos of spontaneity seems to rule, perhaps gleaned from examples set by others who got used to typing rapid fire in usenet and conferencing groups and carried the form over into email. There is certainly much mutual agreement that this is the way to proceed: email from "newbies" is often lacking in the informal formalities of seasoned emailers, though they catch on quick. Another aspect to be considered is that email is, I'd guess, more often sent to people you don't know than would be generally true of postal correspondence. Add, to this virtual anonymity, a standard perception of the internet as a wild, untamed frontier and, presto, a new form! The upside is that it encourages the "first thought best thought" desideratum of Ginsberg. Kerouac would have loved the form. Know what you mean about "my fantasy was going to bring clarity and further elucidation to my ideas about . . ." I used to spend months preparing to go on the road, writing new songs and hammering them into performance shape, with some ideal audience in mind, people who would respond with glad attention to unfamiliar work. But it was always the old they wanted and, unwilling to be a jukebox, I eventually stopped doing my solo shows. Nowadays, I write my prose and poetry to that ideal audience I manage to evoke in my head. I refuse to be convinced they are only a fantasy. I get enough thoughtful response to know the supposition is not entirely without merit. It must be considerably more difficult on

the lecture circuit where you can't entirely ignore the vociferous. Perhaps some ground rules are in order, or a capable moderator. I've occasionally asked a crowd not to applaud between a series of shorter poems, when doing readings, finding that a smattering of polite applause only stepped on my mood and timing. Agreed, language is alive. The signs of life are growth, reproduction, irritability, metabolism and evolution. I know my work is irritable enough. If you poke it, it retreats or springs forward, claws extended. But that may be stretching a point. Is "life" a metaphor? Hmmm. I think not. Would seem tautological. Life has metaphors. Can't continue on that line of thought, lacking a clear definition of what life is; knowing only some of the things it does. You write: "It is more and more amazing to me that we can sustain the hallucination of any meaning at all." I'll take that literally and respond: yes, it IS amazing that we, in fact, can do so. And it's my opinion that we should honor our hallucinations in the highest. I hate the statement "that was only a hallucination." It's like saying "that was only a vision." Vision is the very crux of the matter. Without it, we are less than the animals: irresolute killers who weep over our meat. Well, we're making up for lost time aren't we? Nice to get a few letters, from those who follow this dialogue, kindly complaining about the hiatus.

Your Health,
rh

Date: Tue, 10 Sep 1996 19:47:37 -1000

Dear rh--

I liked this thought of yours> Mathematical symbols exclude metaphor in order to demonstrate>metaphoric propositions without adding an unwonted flavor of their own.>Ideally, math is a non-metaphoric language, though in a vanilla world>everything must of necessity retain some trace of vanilla.In thinking about Whitehead's definition of Novelty I recently had occasion to go back and reread how he approached this most central and mathematical of all the concepts in his metaphysic. it was interesting.He said: "These ultimate notions of 'production of novelty' and 'concrete togetherness' are inexplicable either in terms of higher universals or in terms of the components participating in the concrescence. The analysis of the components abstracts from the concrescence. The sole appeal is to intuition. (Process and Reality, p. 26)""The sole appeal is to intuition." I hold that thought. That this most mathematical of gentlemen, this paragon of the rational, knew, and stated, this obvious fact about process and reality is somehow fundamentally reassuring. Godel's Incomensurability Theorem, or whatever it is called these days, makes it important to acknowledge just how shaky and provisional the noetic enterprise is, at best. Science is the worst offender here, playing dirty pool and assuming a commanding and overbearing expertise in areas where it actually is no more deeply endowed with wisdom than are other modes of thought.

Best,

T

September 13, 1996

Terence, take me to your worst offender! Anything absolute enough will at least engender its opposite. It's those half baked offenders who merely defend the postulates of those who have, in their own terms, dared

to be emphatically wrong, who cause the trouble. By trouble I mean: tedious lackluster benightedness. Sometimes I more than half believe that if an idea is wrong enough in a right enough way, reality stretches to accommodate it. Maybe there was no relativity before Einstein and the sun simply shined directly on us rather than taking 9 minutes to reach Terra at 186,000 mps. This is true in the blessed world of metaphor and music. Certainly in dreams. Necessarily in hyperspace, or we'll never touch the cool sweet surface of stars, as we must and therefore will. If God meant us to live in Los Angeles, He wouldn't have given us categorical imperatives.

rh

PART 4

Sept 30, 1996 12:54 AM

Dear rh--I am getting ready to travel for a month in Europe and South Africa and for the first time in years I have decided not to travel with a Power Book. I am not on AOL so there are not local access numbers wherever I go. In fact I have to make a long distance call back here to Hawaii to get much net work done. Even to pick up my e mail. So I will try it cold turkey; most of this trip will be in South Africa out in the boonies I gather so access isn't an issue. I mention this to introduce the idea that I am going to be off-line for a while. Until around Halloween. A vague disquiet attends these long journeys, sometimes it seems that I live in airports. To do a little of the international travel bit is glamorous, whatever that is, but to do a lot of it is tedious and potentially unhealthy. Ditto the celebrity and Great Man hip hop. Plus I am very much in love with Hawaii and my life here. My life got bollixed up a few years ago with a divorce and slowly, or so slowly things are beginning to feel normal, no longer reactive to the Great Event. But I am lazy, and it is so nice to stay home on the hill with my girlfriend, talk, smoke, make love, grow all kinds of plants, read, and surf the net. I enjoy being a player in the culture, but it is not my first priority, my priorities are more private than that. They provide the logic behind my pursuit of the grail of high speed connection. So that I can play the cultural dialogue game in 3-d with real audio, but can be secure and free up here on the mountain. This is really the new archaic lifestyle: Self employed consultant, off grid, Bohemian, essentially stateless and well connected WWW and bandwidth wise. But living in the future in the present has its tensions. This matter we have been discussing, for example. The presence of the Other and the paths to it, not something most families are wrapped up in. Yet. Even to know about these things is to be isolated from the cheerful Mom & Pop world of middle class sentimentality. Perhaps shamanism has always had about it this feeling of being slightly ahead of itself. This may be the key to the alienation that seems the sine qua non of the shaman's relationship with the community. Part of it, but apart from it: That is the shaman's attitude toward the village, the folk and the polis. But I am rambling here. I will be in touch as I can. Keep the home fires burning until you hear the hoof beats of my returning steed.

Best,

T

September 30, 1996

Terence,

NOT TRAVEL WITH A POWERBOOK! Gonna do some time travel, right? No point taking a Powerbook to Mesopotamia I guess. There was a time when leaving the old Powerbook behind was almost a matter of course. Back in the Conestoga wagon days, it must have been sad leaving your PB in Philadelphia knowing there were no wall sockets where you were going. On the other hand, they had pony express, the ancient equivalent of a 1 baud modem. Then there were all those Mac users at the Alamo, including my great grandfather at six removes, Dan'l Boone, besieged by the army of DOS users with Windows with their cry "You can get more software for it!" I can't upload on AOL either, other than email. Just use it to do my correspondence without making a long distance call to my server. It costs me under 20 bucks a month if I don't get reckless with it. Plus, not being very fancy in my emailing requisites (this Orfeo thing Levy has going is positively Byzantine - I answered one feedback letter and got 27 mailer daemon returns on it the other day!) I like the format and dependability. I know some people have a status problem with that and would prefer to write me at dead.net - but the big hammer has its uses. Glad to hear you hate traveling too. I love being in other places, just don't like getting there. Burned out on that around '72 after four years of traveling with the Dead - then a number of years going out solo. Too much aggravation on the cells at my current age of 55. But back to our subject. I've been rambling along waiting for inspiration to strike as it inevitably does when writing to you, as per our contract with the Other. Here's a trio to consider in interaction, one with the other, and with ourselves as we perceive ourselves to be: the Other, the Doppelganger (Double) & the Shadow. Too many mistake the Shadow for the Other. The Other is not a projection, rather an autonomous potential source of absolutely new impressions, which are, unfortunately, necessarily fielded through the matrix of old impressions - there, more often than not, to be leveled, generalized, filed and abandoned. No wonder as we get older we fail to remember our dreams with the vivid memory of youth. We resist the new with fang and claw. And statute. And then one day we see our Double: our own self, decisively removed from ourself, standing on a street corner, or wandering down the Rue des Invalides - and then the game is over. The Shadow, being that inalienable alienated part of ourselves which fears the utterly foreign Other, which is NOT a part of ourselves, finds it fears the Double even more than it fears the Other, since the Double necessarily knows the particulars of its dark existential existence which are NOT TO BE KNOWN by another. Murder, if not simple insanity, may well be the outcome. We are split so many ways it's hard to imagine anything so copacetic as the Maslovian "Integrated Self" to be anything but a pipe dream. The Shadow, by its very nature (I keep using that expression, failing to find a good substitute) is all that is NOT assimilable. I tentatively offer the assertion that assimilation should not be attempted - though that is a heretical remark in light of mid-20th century psychology. It's not a question of oil and water, but of water and potassium. I have a notion that partial assimilation leads to suicide. How could one face that dark monstrosity full on and not want to kill it? Yet it is common, and probably correct, knowledge that the Shadow is connected with the vitalizing force, the libido, or whatever. I think it's enough not to deny its existence and to strengthen the ethical/moral side of one's nature as the only probable compensating force. Have fun in South Africa, where these forces are still raising societal Hell par excellence - I think it might be a proper paradigm for viewing the remains of Apartheid. Which is the Shadow? Which is the Other?

Keep your powder dry,

rh

Nov 18 1996 12:34 AM EDT

Dear rh--

You must wonder, as I do sometimes, how much experience can flow under the bridge without my taking note of it. The fact is that the more pleasant aspects of life, such as considering experience in the light of experience and writing about it, seems to easily become so elusive that one can only remember the feeling of doing it. Water under the bridge. Two events loom in my current life, both in the recent past, both of doubtless different import, their relative relationship to each other still to be discerned. Africa was a trip! After the repressive civilities of hobnobbing with the deconstructionist elite at the ICA in London it was a head snapping change. Excuse my reference to a personal mythology of mine but during the time of my travel in Africa I was aware that the time wave was in a configuration that means a general tendency for habit to make its imprint on things rather than novelty. How, I wondered can a trip to Africa unfold in a time of habit and reinforcement. As usual I did not reckon with the wily ways of the Tao. For when I finally arrived at where I was going, a place in the Free State called Rustler's Valley I had my answer. Here was a place that, for all of its being at the antipodes of my present home, is nevertheless more like where I grew up as a kid than any other place that I have been. What I mean by that is that both places are landscapes of wind cut sandstone with a wild visual aspect and a wild geological history. In the case of my own stomping ground I am thinking of the area around Moab Utah and the four corners area. The differences had to do with the human component. Where I grew up there were Ute Indians, a few, still hanging on. In Africa there were !Xosha people. Some in beehive houses of wattle and adobe. But what really got me stoked was that since I had not been in such a landscape since I was a child, my reflex was to do there what I had always done in such situations, which was to hunt in the badlands for fossils and flints. "Evidence of early man" was always a paltry concept where I grew up, early man arrived there only 20,000 years before me self. But now in Africa, that is another matter. I went alone to the dongas, the dry arroyos, gullies I called them when I was ten, near the ranch where I was teaching, and found what I was looking for: flint cores, scrappers, stone tools. The archeologist at the end of the bar was happy to inform me that nothing gathered during my afternoon's walk was less than 65,000 years only. Nothing less than! What a dizzying amount of time, and how strange to be in a place where as long as there have been human beings, they have been in that place, a million years does not put too fine a point on it. And the second matter on my mind is the fact that I have just yesterday turned fifty. There will be an unending number of these I just turned fifty posts over the next few years as boomer after boomer crosses the threshold. All very boring and I am glad that I was near the front of the line and got it all taken care of early. Still it is food for thought. Experience is a form of intelligence. If one is not born smart, still experience can mold one into a simulacrum of intelligence. I am amazed at the panoply of swirling complexity that characterizes the life of our culture here at the end of the century, aye, the millennium. And I am grateful and amazed to find myself a part of it. And like the clueless rube in the crumb cartoon, I continue to ask the question "What does it all mean?" It is pleasant to talk to you like this, I am happy to be back in the saddle, I think it we ever had a audience for these exchanges that they may have long since drifted away. Maybe better that way. How goes it on your horizon? What news, what insights, and doth a fair wind also billow your sales?

Best,

T

R

Dear Terence, I see from the time stamp on your letter that you're either writing me from the future or the East coast. Either seems a fair bet, but not Hawaii where it's only 8:40 of the 17th. Dig the pace and flow of your letter which seems written in a whirlwind, and yes, we're synchronized on the event of returning to the pleasurable ease of writing of experience from experience, which sometimes seems but a memory. Or the hellish pleasure of banging out a novel in youth, before which all the world of literature would stand in awe, not understanding that joy alone would not substitute for decades of considered experience. To have the joy and the fund of experience at one and the same time, ah - that were a consummation devoutly to be wished! Still, sometimes . . . I've just divested myself of a near nine month commitment to answer all email sent to my address, after finding it strategically impossible. Tonight I curled up on the bed with a good vampire book - but kept feeling twinges of free-floating guilt, the habit of answering mail during all possible free moments, yet to be broken. But the prospect of freedom from this self imposed labor is exhilarating. I expect an action-reaction phenomenon directly proportional to the effort expended. I was skimming leaves out of my modest swimming pool after a windstorm two days ago when I suddenly realized the moment had come to be delivered from this regime. I operate that way - rather than make decisions and act on them, I form desires and wait for the moment when they become possible, and then they are accomplished. It's one of my magickal actions. A way of engaging the mechanics of habit. Perhaps this is how best to make use of the state you prophesy for these times. Habit is the driving force of human endeavor. Hey, I like the sound of that. Comes across official, doesn't it? And not just a little bit true, I think. The trick is to get habit working in the direction of desire, rather than in service of entropy. You mention Tao, and I think Tao is just that. Habit. Not to sound like a fool by saying what Tao is, but it's the habit of wind to whip up when the sun sets, due to cooling. It's the habit of tides to rise to the call of the moon. It is the habit of wisdom not to form habits that do not serve the will. What is will? Desire, only. Is it possible to desire what you do not at present desire, because to desire it would act to further something you DO desire in a basic way? I feel our basic desires must ideally be served in a way beneficial to ourselves and others, since the vanquishment of basic desire is the diminuation of life. Those desires are not replaced by others, except in twisted, diminished versions. Initial desire is a byproduct of weaning. Very basic. Very binding. Desire is the wanting of security first and foremost, secondly of wanting excitement, thirdly: the avoidance of hurt. When two & three get reversed, confusion of purpose arises and entropy grabs hold. Bear with me, there's no source for this, I'm making it up as I go along. What they call hypothesis. Habit can act to perpetuate the confusion of disordered priorities - or, skillfully managed, to re-order them. It is by such a visualization (another if you prefer, all roads lead to Rome) that we grab hold of and re-orient habit to a general purpose. If this is indeed the time of habit's transcendence over novelty, then we must appropriate habit in a novel way. End subject. Have been reading in Whitehead at your behest and find him meticulously expansive. His categories are somewhat arbitrary, but he would be the first to admit this. They are utilitarian for his purpose. As a poet I view them as tropes. Tropes are interchangeable, for the most part, but the trope of eternity is fundamental. Everything can, and probably should be, viewed under the trope of eternity. It's open ended enough to include all possibilities; *mens aeterna est quatenus res sub specie aeternitatis*. I like the clause: "less than 65,000 years only" in your statement. That is *sub specie aeternitatis*, under the trope of eternity, in spades. We are only given eternity in hunks of the biblical three score years and ten, yet are able to glimpse it outside that limitation of sparse years through the measure of aeons. A capital invention! The eternity the mind experiences is a form of eternity - and forms of eternity *are* eternity. That's what the *latinate* is getting at. Why do we not generate such thoughts, so clearly expressed, a millenium or two on down the line? My tentative supposition is that time flows backwards from what we habitually suppose, but that's another piece of business entirely. It would not behoove one to act as though this were so, true or not. Which, as with many things having to do with time/space, is a condition of living in 4 dimensions. You bump into things

otherwise, and bruise yourself walking through walls which are not constructed yet. Really glad to hear you had a gas of a time in Africa. I've been no further South than Marrakesh, so can only imagine and combine dim movie/travelogue images. It would seem something in the blood must yearn for Africa, as it does for the sea. Weaning, again. Between the yearning for ocean and yearning for the cradle of civilization, it might be there falls another yearning - for Mu or Atlantis, or whatever that place we swung from trees in before the continental reformation. Assuming we're not from elsewhere. And if we are from elsewhere, there must be a yearning for that place, it's ocean, it's Africa. We humans are nothing if not cauldrons of yearning. Good to have you back and hope it's good to be back. Corresponding with you is a pleasant habit.

rh

p.s.
Happy Birthday!!!

December 8, 1996

Dear Terence, where is the hallucination of ten years ago? It's neither in space nor in time, this we know because space and time are definitions of relativity and nothing dwells in definitions but angles of perception. But say a hallucination (or a vision) recurs. The question might be rephrased "who is having this recurring vision?" Or is it that the vision "has" the perceiver? Language would have it that "I had a dream." If I appeared as a character in the dream and saw a blue house, was it the one who was sleeping who saw that house, or the one who appeared to be conscious within the dream, reputed to be me? Or the one who writes these sentences? Assuming the possibility of a reasonable answer, which aspect of self would be better qualified to reply:: the self of the dream, the waking self who recalls the dream, or the self who later ponders the subject of dream and vision in general? And what of the parts of the dream seemingly beyond recall? If not available to consciousness, were they really "dreamed" at all? Well, yes - because sometimes other facets of the dream pop into consciousness suddenly while one is thinking of other things - as though a 4th self yet had access to the n-dimensional repository. I had a good deep sleep last night and remember nothing, though I'm fairly certain many vistas were opened. Just an apprehension of something occurring which might have so little reference to the waking world that memory cannot repossess it, unless an intersection point presents itself. Be that as it may, I feel refreshed in a way that suggests many things were resolved. As I write these words, I feel a sudden painful cramp in my solar plexus. Nausea. Gas pain, or am I skirting too near the abyss here? Conversely, is the abyss skirting too near me? Abyss: where self loses the comfortable utility based on not asking too many questions. To the point, why am I writing of this particular blend of ideas this morning? Assuming nothing happens without motivation, is this examination the fruit of whatever happened in dreamland which won't yield itself to me? Seems a fair guess. The topic question popped into my head with commanding intensity, wanting to be written down, but not to "myself." Rather to an Other. As with all questions dealing with phenomenology, the problem of the observer is paramount. When "self itself" is under scrutiny, and starts splitting, like quicksilver touched, the "Other" is conceived and addressed as a matter of reflexive recourse. Looks like I'm adding to our cumulative exposition on the nature of the Other via the backdoor. Didn't realize that was where it would lead when I began. Back to topic A: where is the hallucination of ten years ago, if it is both then and now? It would be almost too easy to suggest "in eternity," the same place the keener perceptics of babyhood loom without rational reference, causing the endless nostalgia at the core of being human. A cat purrs when stroked because recalling the tongue washings of its mother. It needs no

drugs or philosophy to achieve this satisfying identification with the Other. I think that in the "purr" separate identity dissolves. As in deep sleep. Is snoring the human equivalent? The flapping glottis of peace. Grey Autumnal morning thoughts. Cramp gone and a swirling breeze detatches yellow leaves from the wisteria.

rh

December 12, 1996

Dear rh--

"Where are the snows of yesteryear?" This is not a question about meteorology. It is rather a question about memory. It seems to me that one of the fundamental accomplishments of modernity is the establishment of the notion of a fragmented, discontinuous identity as a part of the lived experience of many people. I call it an accomplishment because I believe it represents an overcoming of the fiction of narrative that was imposed on experience and life by the earlier more print constellated psychology of the Nineteenth Century. Phenomenology and analysis of experience leads to the notion that we each are living in very private Idahos. Not only do we have great difficulty communicating among ourselves but we also have great difficulty communicating with various parts of our own identity. The awakened and the dreamer are as remote from each other as the ten year old and the fifty year old, as different from each other as the terminal depressed person and the psychedelically ecstatic person; yet all of these people can be found united in one person, or at least one body, one continuing organism. I almost wrote one continuous bundle of genes, but then I recalled that one's genetic heritage is never expressed all at once, some genes are turned on in puberty, some in middle age. So in this sense we are always a part of the larger thing that we are in time that is our whole continuous existence, something that a 4 dimensional being could appreciate from the outside but that no one of us can ever see or know. The organism continues but its understanding of itself and its purposes and its experiences of itself and its purposes is always unintegrated and discontinuous.

Best,

T

Boulder, Colorado

Description

- [Audio Link](#)
- [Transcription](#)

This was a crowd transcribed effort involving many people. Link to the Google Sheet [here](#).

[0:00:00] [Introduction begin] Sounds True, presents; In Search of the Original Tree of Knowledge, a weekend workshop with Terence McKenna. Researcher, author and philosopher. Terence McKenna has spent 25 years studying the foundation of shamanism and the ethnopharmacology of spiritual transformation. His books include Food of Gods and The Magic Mushroom Grower's Guide and most recently, The Archaic Revival. He is also the founder

[0:00:30] of the Botanical Dimensions, a non profit botanical research project. In this weekend workshop, Terence McKenna examines time and its mysteries, the nature of language and the techniques of ecstasy that have developed the non western societies to navigate to and from invisible worlds. And now, recorded live in Boulder, Colorado. In Search of the Original Tree of Knowledge. A weekend workshop, with Terence McKenna. [Introduction ends]

[0:01:00]..ahh..how to slice into this pie, I try to never do it the same way because i don't want to get bored but that lays a sort of obligations on me that i am not always able to meet. 2 things i think are going on inside this wrap, as currently packaged. First of all, i am very interested in talking about the impact of uhhh.. psilocybin.. [0:01:30]..on human evolution an.. and values and institutions, and then so that you don't think we've just fallen into French anthropology 101.. [audience laughter] I am interested in taking ..the.. the inside from that discussion, and trying to apply it to the modern or postmodern as the case may be, dilemma. Trying to draw some.. [0:02:00]..implications from (uhh..uhhh) looking at human prehistory and the 7 factors that were in place as the moment of human emergence; and since i feel pretty much among friends and fringy here.[audience laughter]..I.. it doesn't trouble me to concept that my book, Food of the Gods.. I really conceived of as a kind of an intellectual.. [0:02:30]..trojan horse. It's written as though it were a scientific study; footnote, bibliography, citations that's impossible to attain book and so forth and so on. [audience laughter] but this is simply to assuage and calm the academic anthropologists. The idea is to leave this thing on their doorstep, rather like an abandoned baby or a trojan horse and they will open their doors.. [0:03:00]..to it and take it inside only to discover that out of this very vague rational discourse for the self- transforming-elf-machine from hyper space [audience laughter] with their own agenda. [audience laughter] (clears throat).. I..I feel like i should say this; it's more for my ease than yours. That..i've reached the conclusion that i'm now..[0:03:30]..espouse..through skepticism, reason, rationalism and the tough argument. So it may sound bitsy, flaky and soft headed. Uhhh. But that's just because you're hearing it wrong. [audience laugh] the ..uhh.. The guiding input was .. experience. And in a way [0:04:00]..what we are gathered here to talk about..uh.. tonight is an experience which is not only rare, transformity, challenging.. But, also for reason that will probably get around to illegal. So, its.. uhh.. it's a very peculiar situation, very few experiences are illegal. And our models of the world..[0:04:30]..are built up based on our experience. So if u make an experience illegal, you're essentially saying it is off limit for model building, You can't include that in your model because it isn't really there in some sense. And..and this is the situation in western society, these are the psychedelic experience. To my mind, the psychedelic

experience..[0:05:00]..is as much a part of being human as sexuality, in..personal independence, uhhh.. child rearing.. These are the things which are scripted into us as opportunities for exercising our peculiar situation.. These..these phenomenal being. And a society which would deny that..[0:05:30-0:06:00]..is a society whose secret or maybe not so secret agenda is the infantilization of its citizens. I mean if we are not capable of dealing with these things, then who is? And are the people who make the rules; did they carefully, conscientiously and that depth.. Explore these dimensions and decide they were unfit for human consumption? [audience laugh]

Transcribed By Azlan

[6:00]

...or, uh, was it done more hastily, more mindlessly, and with more fear? I would submit to you that, uh, it's the latter. Well, first of all I want to talk about the impact of psychedelics, especially in this case psilocybin, on human-ness. And then if there's time maybe we can talk a little bit about what is so great about it? I had a philosophy professor once, Paul [inaudible], [6:30] some of you may know his book, and he opened his epistemology 101 course by saying, 'i'm going to teach you what truth is, and then i'm going to teach you what's so great about it.'

Well I won't claim to teach what the psychedelic experience is, that you will have to find out on your own, but I think it is legitimate to discuss what's so great about it. You know, are we, by any measurable [7:00] index, superior or inferior to people who do not have this experience? Because if not, then really, the psychedelic position is no more than a kind of cult, to be lined up along with Roman Catholicism and all the other cults out there. Speaking as a former member of course. [audience laughter] Well, my uh, my notion [7:30] of the way to legitimi- to legitimate the importance of psychedelics is by showing, and I think one can show, uhm, in fairly short order, that these things are not alien to the human experience, or ancillary, or the province of uneducated, uhh, little brown people down in the rainforest or anything like that.

I submit to you [8:00] that the psychedelic experience and the impact of psychedelic plants on human beings, is central to understanding who we are, and how we got this way. And if we can, uh, explore this issue and convince ourselves there's some merit in this point of view, then it will simply- it will do more than rewrite the annals of a stayed science like anthropology [8:30], it will actually change how we relate to each other and to the planet that we're in the process of grinding into, uh, pollution. So that's the raison d'être for the politics behind it. Now here's the spiel. Uhm, sometime in the last three million years, the, uh, proto- our remote ancestors [9:00], the proto-hominids, uh, were, uhh, disrupted in their evolutionary climax in the canopies in the great rainforests of Africa. You see most animal species evolve into a niche; tighter, and tighter, and tighter. We see this with termites and cockroaches and most lifeforms, this is what happens to them.

Only if the niche [9:30] is somehow disrupted or destroyed does the game veer away from its tendency toward closure. And this is what happened to us. Uh, our remote ancestors would have lived happily in the climaxed rainforests of Africa, in the same way the primates to this day live happily in the climaxed rainforests Indonesia and South America[10:00], but for the fact that the dynamics of the planet, and this ultimately is if we're looking for a cause, or some people would say it's the villain, then it's the climatological dynamics of the planet, which began to, uh, limit these rainforest habitats. And a new kind of habitat began to form in Africa which was grassland. It's very recent [10:30]. And under nutritional pressure, and under a pressure that was the result of this retreating

environment, our remote ancestors descended from the trees and began to, uh, adapt themselves to the new world of the grassland. And they did this, uh, over a period of probably a couple of million years.

Now, I maintain, and if any of you are [11:00] evolutionary biologists or anthropologists this is the nub of my position: here's what's new scientifically: What they teach you about evolution is that it's caused by mutation, which is a random process, which then meets another random process which is natural selection, and out of these two random processes, lo and behold you get Sea Urchins, Birds of Paradise, [11:30] Grey Whales, and Human Beings. Now, uh, when you inquire as to what is the source of this mutation, you will be told it's cosmic rays, incident, incoming hard radiation which can disrupt chromosomes, and then- most of these mutations are lethal; some huge percentage of them. But a vanishingly small of them actually confer adaptive advantage. And they are then . . .

Transcribed By Nigel Milligan

[12:00]...and they are then preserved in the genome and passed on. Now, what I want to suggest, and I've never seen it thoroughly treated by evolutionary thinkers, is that food, is the unexamined source of evolutionary pressure, it can be. If you know anything about animal species, you know that most animals tend (12:30) to specialize their diet. Insects are famous for this. If you find a caterpillar and you want to raise it in a jar you must give it the food plants you found it on, because they just don't eat leaves, it doesn't work like that, they have species specific adaptations. Now why is this?

It's because it's a strategy to limit exposure to toxic and mutagenic chemicals (13:00) that other life forms are sequestering in their tissue to discourage predation, essentially. Well, so then what happens when an animal population such as our remote ancestors comes under pressure from a dwindling habitat or a limited availability of food? Well what happens, if you have any sense, is you start experimenting. (13:30) You start digging up roots you never thought about before, and chewing on them. You start eating leaves, you start eating insect protein, you experiment with the slaughter of small animals and so forth and so on. And this is precisely what our remote ancestors did. This is the much lamented transition from fruitarian holiness to predatory carnivorous messiness. (14:00) But had we not been able to lower our gourmet standards we would have entered the fossil record at that point.

So. So here we have these proto-hominids foraging into this new grassland environment beginning to beat on prairie dogs, and stuff like that, and, and, simultaneously as we all know, evolving in this African veldt environment (14:30) were great herds of undulate animals; proto-cattle, bison, wildebeest, antelopes, many many different kinds of animals. And one of the curiosities of nature is that many mushrooms prefer the dung of undulate animals to just going out and making a deal with the raw, natural environment. (15:00) They like the leavening that goes on with vegetable material when it passes through the double stomach of the undulate animal. As a headline what this means is mushrooms grow in manure. And so, our remote ancestors, testing for insects and eating small animals would certainly have encountered the so-called coprofitic or coprophilic; the dung loving mushroom. (15:30) And they would have tested them for food.

Years ago when I was in Kenya, I observed baboon troops in this very environment we're discussing, and their habit was; they were very interested in cowpies. Because they had learned from experience that if you rush over to a relatively old cowpie and flip it over (16:00) there's a high probability of beetles or beetle grubs under there and so

these were vectors for food getting. Well in the end I did not observe mushrooms in Africa but I observed mushrooms in the Amazon and they can attain the size of a dinner plate. I've never seen them in cultivation quite that large. But, you know, you come out after a hard rain and these things are landed like little flying saucers or frisbees in the meadows. (16:30) They would certainly have been tested for their nutritional potential.

And psilocybin, different from all other chemicals in nature, including as far I can tell all other hallucinogenic chemicals in nature; (17:00) psilocybin has a unique set of characteristics which implicated to my mind very strongly in the catalyzing of the emergent of humanness out of proto-hominid and hominin organization. And it worked like this; (it's very uh, relatively easy to understand as major scientific breakthroughs go, at least you're not going to be asked to do any partial differential equations this evening.) Psilocybin in very low doses, (17:30) doses so low that if you were to take a dose this low you could conceivably forget you have done it, and just go out and shop and fiddle around. But at doses so low that they do not register as a psychedelic experience, psilocybin imparts measurable improvement in visual acuity. Roland Fischer did this work in the late 50's and early 60s, and they had, they built an experimental device, where a person could not be seen by turning a crank....(18:00).....

Transcribed by Kevin Evans

[0:18:00] be seen, by turning a crank- There were two parallel bars, and by turning a crank this person could rotate one of the parallel bars so that, uhm, it was no longer parallel. And, uhm, lacking talking rats they went to the next preferred experimental animal which is graduate students. And they would sit a graduate student down in front of this device, give them a very low [0:18:30] dose of psilocybin, and then put a buzzer in their hand and say 'When the two bars are no longer parallel, push the buzzer'. And, uhm, [Fisher?] collected large amounts of data which showed that the people who had taken psilocybin, and the other people were given a placebo of course, could detect this deformation long before the unstoned subjects were able to do so. And [Fisher?] who was a totally [0:19:00] straight European scientist, in fact a vianner. When I talked to him about this stuff he was very cagey, and he- he was funny in fact, he said "Well you see it's very interesting. Apparently here we have data which, uhm, argues significantly that we are perceiving reality better with the drug than without the drug!". [Audience laughs] Yes, yes. For him that was a joke. [0:19:30] I mean, he never did anything with it; It was just a throw away line. But it stuck with me and I don't think you have to be a rocket scientist to see that if you are a hunting animal in a situation of nutritional pressure, as our remote ancestors were, and there is a food in that environment that will give you better vision then, by God, the animals which accept that into the diet [0:20:00] are going to be more successful hunters than the ones that do not.

And, consequently, they will outbreed those members of the population that have some aversion to this exotic food. Either they don't like the look of it, or they don't like that it grows in manure, or they don't like the taste of it. But those who accept it, as a dietary item, will be more successful at getting food and consequently more successful and raising their offspring to sexual maturity. [0:20:30] And that's the name of the game in darwinian evolution. You must raise your offspring to sexual maturity. Then the genes flow forward. If you fail in that you get an F in the evolution game. Well, ok so visual acuity, that's a very fine. Uhm, but psilocybin has other properties which build on that initial pharmacological peculiarity. [0:21:00] Uhm, if you take slightly larger doses of psilocybin, uhm, and this is typical with many indoles, you get- many of which are hallucinogens, you get what is called CNS arousal. Central nervous system arousal. You all know this feeling it's the feeling of two double cappuccinos in short order. It's that you do not sleep. You are very restless. [0:21:30] You are very alert. Your attention is scanning, scanning, scanning. And in highly sexed animals, like primates, arousal means exactly what it sounds like. It means erection in the male

animal. And, uhm, now isn't that interesting? Uhm, that is a second factor feeding back into this, uhm, increased success with offspring [0:22:00] business. Not only are you a better hunter, but you're a more highly sexed creature.

And you're having more of what straight anthropologists refer to as 'Successful copulations'. An amazing phrase actually. [Audience laughs] Meaning, of course, that impregnation is a consequence of these- of this sexual activity. Now the other thing that psilocybin does, [0:22:30] uhm, at or slightly above this arousal level, and this is very important for the argument, is it creates- it causes what I call boundary dissolution. And boundary dissolution in human beings, like you and me, means ego loss. And I believe that this would have promoted, uhm, a social and sexual style based, not on monogamous [0:23:00] pairing but, on orgy. The scenario is fairly easy to imagine. It's that these remote ancestors of ours would take these mushrooms and they, probably at the new and full moon, the thinking is that ritual was originally lunar time. And then they would, we're talking about nomadic groups of people. Probably no more than 80 to 100 people. [0:23:30] And then there would be, uhm, group sexual activity. Now, an interesting social consequence of orgiastic social styles, besides a whole lot of fun, [Audience laughs] is it's impossible to trace lines of male paternity in that kind of a situation. You see, women know whose children are whose because they see the child come out of [0:24:00]

Transcribed by Paul Mullins

0:24:00...Out of their body and they nurse the child but man do not in that situation have their children. My children. What they have are our children. The tribal group, and at this boundary dissolving thing, let's dwell on this for a moment because this is central to my argument and it has political consequences for our own lives. (...urmm..) all primates.. Clear backed.. 0:24:30...down into squirrel monkeys and howler, all primates have what are called male dominance hierarchies. Now what this means is the most.. The males with the longest claws.. The hardest muscles and the meanest disposition.. Take control of everybody else. Women.. Children.. Weaker males.. (...urmm..) everybody comes under the thumb of the alpha male of the pack. 0:25:00...This is true as i said a squirrel monkeys, howler monkeys.. So forth and so on.. It is also true of us.. Sitting here in this room. This is a male dominant society. I mean there's a lot of complaining and hair pulling about nit and there's a political alternative in the form of the women's movement and feminist sensitivities. But for most people male dominance is the rule..Well, I..Would like to.. 0:25:30...suggest that our peculiarly discomfoted relationship to reality is a consequence of the fact that for a long period of time perhaps as short as twenty-thousand (20,000) years.. Perhaps as long as a million (1,000,000) years.. As a species, and not consciously.. 0:26:00...We accepted into our diet a drug that has the consequences of suppressing male dominance. But this was the social consequence of accepting psilocybin into the diet.. The ego is a structure that forms in the psyche like a calcareous tumour or a growth if you do not.. 0:26:30...have regular recourse to the cure. And the cure is, psilocybin and the boundary dissolving, sexual and social style which you carried in its way. So the reason that we as a people are haunted by the idea of a lost paradise, a perfect world sometime in the misty past. Is not.. 0:27:00...(..uhmm..).. You know the (...inaudible..) art called the..the nostalgia for paradise and thought that it was a time of.. Of a longing that has no bases. But i think that it is entirely a memory of the period when male dominance was chemically suppressed, ego was chemically suppressed and by male dominance and ego i don't mean to lay this entirely on men. I mean i would wager.. 0:27:30..Probably everyone in this room has more ego than they need, certainly starting from me.. And that part of the paradox that you're supposed to enjoy in this... (...audience laughter..) you know the ambiguity of me preaching the loss of ego...(..audience laughter..) so essentially, you know.. What happened was chemical.. A chemically driven leak in evolution had the consequence of the suppression of these 0:28:00.. behaviors that favoured male dominance. Ahh.. as a species.. Ahh.. we would've continued with male dominance forever. Had it not been for psilocybin in the diet.. And it established a situation in which in less than two-million (2,000,000) years the human brain size doubled. This

is without contest. The greatest mystery 0:28:30..in the whole of evolutionary theory..(..Uhm..ahh..)..Lampston.. Who is a brilliant evolutionary biologist called the doubling of the human brain size in two-million (2,000,000) years, (..ah..) the most spectacular transformation of a major organ of a higher animal in the entire fossil record. Well, now it would be spectacular enough if it were the liver of an otter, or.. (..audience laughter..) or the pancreas of an elephant.. but , notice that.. 0:29:00-0:30:00...it is the organ which created the very of evolution itself (..audience laughter..) and all other theories..so, th..we're getting a little topological here folks, there's something (..audience laughter..)..fishy going on.. (..ahh..) what was it that caused this explosive doubling in human brain size? Well, i maintain that it was the new behaviors that emerged with the suppression of ego and their reinforcement in this situation of nomadic pastoralism and that there was a period, let's call it from the melting of the last glaciers until Çatalhöyük six-thousand five hundred (6500) BC, there was a period where men and women were in balance with each other, children and .. children and adults were at peace with each other and human beings and the planet were at peace with each other.

Transcribed by Azlan

...and then it was lost, and we fell into history, you know the long slug toward armageddon is what was initiated in its place. Well know,if it was so wonderful, why would anybody ever let go of it; why was it lost?. Well, we have to go back to the very forces which created this situation. Remember I said it was the climatological dynamics of the planet [that] created the grasslands in place of the rainforest. Continuation of those processes turned those grasslands into desert. And where there once were waterfalls, running rivers, grasslands and vast herds of animals and their human symbios; suddenly they were was encroaching desert, fewer waterfalls. The mushrooms began to be seasonal , began to be located only in the rain shadows of mountains, the great mushrooms festivals which had been at new and full moon, became solsticio and then equinoctial and then, you know, biannual, and something, anyway, you get the picture. It was fading, and I don't think people took this lying down [laughs], no pun intended.[audience laughs]. I think that, there was great anxiety about the fading of the mushroom and the loss of the sacrament, and so, these people searched for a strategy for preservation. Well, in a world without refrigeration, there's only one, well no, there are two strategies for preservation of a delicate food like that. One is air drying, which is not terribly satisfying because as soon as the rain cloud comes along your dry stuff absorbs moisture out of the air and turns yuck. And so the real, the only real option is preservation in honey, and this was done, I am sure; it's s still done in Mexico to this day in remote mushroom using villages, people preserve them in honey. Now the problem here, and this is a lot on my book, into this kind of thing a lot because, Food of the gods. Because what Food of the gods is really about are the hidden, ahh, actors, that drugs lay upon us; that we are not even aware of - and if you are tempting to preserve an hallucinogenic mushroom in honey what you have to be aware of is that honey itself is potentially a psychoactive drug. Honey will turn into mead, .it will ferment into a crude kind of honeyd alcohol. Well, if the mushroom brings suppression of ego, group sexual activity and the formation of group values, what this alcohol brings.. Alcohol has two effects primarily, it lowers sensitivity to social queuing; at the same time that it it consents and exaggerated sense of verbal facility [audience laughs]. In other words people turn into jerks behind it. I mean you only have to go to a busy singles bar somewhere here in Boulder and you will see the alcohol ambiance being acted out right in front of you.So and you know, it's not so true of our generation but I think probably for a thousand years nobody got laid in the western civilization unless they were juiced! Because christianity was laying such a heavy trip on everybody, people barely took their clothes off. In other words, you have to become blindly intoxicated to do what comes naturally..And I think up to very recently, how many women have their first sexual imprinting in an atmosphere of alcohol abuse- I mean, some huge percentage, I imagine. So that is the story basically of the fall into history. The loss of this mushroom cult happened right at the time we were inventing agriculture, and agriculture and the suppression of orgy have something in relationship to each other- on two unrelated levels. First of all- you suppress orgy because once you have agriculture - it's no more about psyching yourself up for the great hunt; It's all about

getting up before dawn and hoeing the wheat out of the crops- so it doesn't promote a party mentality [audience laughs]. The other thing is, that as human mental capacity was evolving -remember that exploding brain size- as human mental capacity was evolving, women in this nomadic groups began to notice a curious fact. Which was, every year they would return roughly to the same places they've been the year before, and in the discards from last year's camps they would discover food plants growing and some brilliant woman or group of women put it together and said AHA!. "we buried food here last year and now there's food here . There must be something about putting food down into the ground that gets you food".....

Transcribed by Javier Alonso

[0:36:00] gets you food, in other words they were able to cognise a cause and effect relationship that were separated over many months of time. At the same time that women were putting this together men were noticing that the act of sex had certain consequences nine months later.

The same perception had different impact on both sexes, but it was an ability to [00:36:30] coordinate a temporally separate cause and effect.

Well once men got onto the notion of male paternity they realised that these aren't our children, some are mine and some are somebody else's and from that notion you go to "my child" to "my woman" to "my hunting area", to "my weapon" , to my sib group [00:37:02] you get it all you see, the ego is born, and it is born in an atmosphere of complete paranoia.

The first consequence of agriculture , well it has a number of consequences, but one consequence is Ah, it's a tremendously efficient way of producing food, that's obviously why people got into it. What does efficiency mean? Surplus! What does surplus mean? Haves and have nots. [00:37:30] The ole.....the most spectacular architectural edifice of 10,000 BC on this planet was the grain tower of Jericho. It was had thick walls to hold the grain and it had high walls so you could climb up on top of it and drop rocks on the people who were trying to get into it. Surplus makes nomadism impossible cause you can't drag this huge amount of grain with you so you get sedentary populations and then [00:38:00] some of the people who want the grain are killing your people in fury when they can't get the grain , you decide to put a wall around the whole encampment.

Now you have a small town , now you have urbanism, now you have the division between nature and secular society, you have classes, you've got it all. And I maintain that this is the long march into hell and our particular uh obsession with drugs [00:38:30] as a species, I maintain can be traced back to this transition that you know, yes elephants love fermented papayas and so do butterflies and so forth and so on, but this kind of intoxication is not what we're about. We addict severely to several dozen substances, less severely to probably a hundred more and we addict [00:39:00] to everything! [inaudible] You know. What we call romantic love uhh shows a lot of similarities to hard drug addiction when you separate the lovers. No... sleeplessness, suicidal tendencies, bursting into tears, hysteria, eh .. loss of weight. Can't tell whether this person is getting off heroin or eh has separated from uh their partner.

Uh, well if you take an [00:39:30] individual who is alcoholic or or has some kind of serious drug problem, current thinking is this can be traced to traumatic abuse in childhood. This is what happened to us! Traumatic abuse in

childhood, we were literally torn out of a symbiotic relation to the earth by the forces of male dominance, agriculture, sedentary living so forth and so on [00:40:00] and we've been trying to uh scratch an itch that we can't find ever since. And it has, you know, money doesn't do it, uh..power doesn't do it, nothing seems to do it. We cannot... we seem to be the unhappy monkey and we take this unhappiness out on each other with a vengeance. And uh you see what happened was that when the mushroom faded, the million years of [00:40:30] pharmacologically , interrupted patterns of male dominance reasserted themselves, but it was no more a foraging monkey with this style, it was a creature with language, tools, music , social organisation and suddenly it got very ugly, and people weren't, and people began fighting over the women. So we don't want to have orgies anymore, this woman is my woman, touch her you die, and [00:41:00] so forth and so on, and we are living out the legacy of this.

Well before I talk about the [takes drink] the social consequences of it for us. I want to go back to the question....What was so great about it? I mean we've talked about orgy, but you can have orgy without psilocybin. What was so wonderful about that proto-historical mode? Well this is where it becomes slightly more woo woo [00:41:30] .. uh [laughs] Because what we have to talk about is What is the Psychedelic experience anyway? And I maintain that if we're talking about psilocybin, and were talking about taking it in nature as these people did, that you know, yes first come the dancing mice , the little candies, the coloured grids and so forth and so on, but what eventually happens quickly, like ten minutes later is uh...[0:42:00]

Transcribed by Rodney Aries

uhh there is an entity in the trance, in the vision. There is a mind there waiting that speaks good english, that invites you up into its room ... and once there uhh you realise that this is what all the hooflah about the Gaian mind and the rebirth of the goddess and all that is about. It's not a metaphor [42:30] folks, it's a headline in biology. We are not the only intelligent minded species occupying this planet. We may be the only bipedal hairless mammal with intelligence on this planet but there is something out there spread through the grasses, the forests, the rivers and the oceans. Uhh our own own emergence into intelligence took less than [43:00] two million years.

Life has been on this planet for a billion and a half years and we don't know how many strange pathways beckon but at some point a kind of mind came into existence and it is real. It's what lies behind the religious impulse in our species. Uhh there really is somebody else sharing the local mind space and I [43:30] don't believe we're talking theology here. In other words this is not eh y-you know in Milton's wonderful phrase, "...the God who hung the stars like lamps in Heaven". It's not about that. For me that's a big questionmark. But it is the god\goddess of this earth. It is the biological mind. It is that all boundaries are illusions and that life is a thinking [44:00] feeling entelechy of some sort and we are just like a little droplet that has somehow escaped from the river of cognition and now imagine that we are the only water in the cosmos. Not so it turns out.

What, the reason the reason the psychedelic experience is so baffling and transformative, even as we sit here with your heads full of Heidegger and Husserl and uh I don't know [44:30] Wilson Phillips and all the stuff is because uh in the face, in contact with that we have no more sophistication than our orthiastic mushroom munching ancestors. Civilization doesn't give you a leg up on this step. In fact it makes it harder to figure out what's going on eh because we have defined nature as dead. You know? Scr- Atoms screaming through empty space [45:00] ruled by tensor equations of the third degree. That's our picture of what nature is. That isn't what it is. It's uh a-a mind of some sort.

Okay. W-what is the implication of all this? Is this just some kind of fringe oh uh anthropological revisionism? No, it isn't because the-the fall into history and its consequences is at this point a loaded [45:30] gun held to the head of the entire plant. We are about to uh pull over the soup cauldron and if we do this then two and a half billion years of evolutionary advance will be shot. Nobody else ever dropped the ball so you know we appear to be vying for uhh this peculiar honour. If we do not awaken to [46:00] the consequences of ego then we are going to run this system right over the edge.

The whole thing which characterises our dilemma as a global society is our inability to feel - feel the consequences of what we are doing. You know? We've got the data, the ozone hole is disappearing, the planktonic life in the sea will die if it does, that will disrupt the food chain. The world [46:30] food supply will drop by sixty percent. Everybody who isn't white as a sheep will have to starve in that case and uh so forth and so on. I mean we actually toy not only with our own extinction but with the extinction of all life on the planet and with the extinction with the idea of dignity and decency itself. Well, I'm not in this psychedelic game because I think it's easy, or because uh I think it's going to be a cinch. I'm in it because [47:00] I think it's the only game in town.

You know if hortatory preaching could have done the trick then "the sermon on the mount" would have turned the corner. Uh if uh uhh cautionary data flowing back to its ruling institutions could do the trick then sometime uh after Thomas Malthus people would have begun to hit the brakes. Nothing seems to work. We're sick. We need pharmacological [47:30] intervention. The ego is uh out permitting us to slowly, not so slowly commit suicide and you know the fact that we cannot act collectively. That we are suspicious of all forms of collectivism. That we uh really are eh-"all for one, and one for all" is not our style. Instead what we have going is a catfight [48:00]

Transcribed by Marc Van Niekerk

...(0:48:00)...and, you know, no less a straight person than Arthur Koestler, in a book called *The Ghost In The Machine* said humans are so wired for beating the brains out of woolly mastodons, that's what evolution has equipped us to do; not negotiate weapons treaties and destroy bacteriological factories. We have to force our evolution. (0:48:30) We have to chemically restructure the primate brain so that we do not commit suicide. And the only way to do it in the time left is for the psychedelic community to stand up on it's hind legs and roar. And you know, maybe they'll build camps for us. But the point being I think there's a moral imperative to try what works! I mean, you know in the 60's psychedelics were called "consciousness expanding drugs", (0:49:00) a good old phenomenological description. Well, if consciousness does not loom large in the future history of our species then what the hell kind of future is it going to be? No future at all I maintain. So, if there is even the slightest iota of possibility that these things do what I'm saying they do, then we need to get Johnny-Quick on it and check it out. (0:49:30) Because we may be beyond the point of no return right now. Nobody knows how bad this ozone hole thing is, or what's locked up at Rocky Flats or behind the Iron Curtain or dumped in the Arctic Ocean. We may be past the failsafe point right now folks. There is no time to lose. It is time to engage the powers-that-be in a little more serious dialog than the "just say no" horseshit that's been pedaled recently. (0:50:00) Because we're talking about the survival of life on the only planet that we are at certain has life on it. This may be the site of a cosmic experiment with universal implications and it rests in our hands.

Everybody here tonight is here because a whole bunch of people didn't drop the ball. (0:50:30) And you know, you think you got problems? Nine times in the last million years the ice has moved south from the poles miles thick. No antibiotics, no electronic communication, nothing, and I'm sure these people were miserable, and they dragged through it and they lived. And they passed it on, now we're it. And we will be judged the lamest of the lame (0:51:00) if we cannot come to terms with this and begin to talk about what is going on. This is not obscure. As I said I view the psychedelic experience as central to humanness as our sexuality. We cannot allow dominator institutions to infantilize us and to tell you where your mind can and cannot go. 'Even have a piece of paper locked up in a vault in Washington DC (0:51:30) that guarantees life, liberty and pursuit of happiness. Well now what can the pursuit of happiness possibly mean if it doesn't mean the freedom to practice your own relationship to nature and it's gifts?

So I think we have been entirely too casual about the importance of the psychedelic experience. This is, for one reason, because we cannot publically get together and discuss it in detail. (0:52:00) And one of the things I think is very important about get-togethers like this is if you would look around you'll notice that we cannot really be distinguished from the rest of society. Some of us live under bridges, some of us clip coupons, you know there's a wide spectrum of people here. But this is your affinity group. This is your community. (0:52:30) Someone in this room actually has what you need. And you know, I have acted as a filter so out of millions living along the front range, here we've gotten it down to two hundred. I can't get go any further than that folks. the rest is up to you.

Well, I guess the last thing I want to say and then we'll take a little intermission (0:53:00) and then come back and do questions afterwards, which is my favorite part. But I want to just for a minute invoke the psychedelic experience without regard to the evolutionary forces that created it, or the political institutions that suppress it, and so forth, and just say, in case there's some soul in this room that's never had this experience, that this is extraordinary news. (0:53:30) We are not talking about something like a dream. It is not like meditation. No you can't get there by yourself. And Baba Gee is equally useless, because you and Baba Gee are starting from the same place in this game. It requires pharmacological perturbation of ordinary neuro chemistry in order to see this mystery.

Transcribed by Kevin Evans

[0:54:00] And it is a mystery. It is not gonna be reduced to the firing of synapses or repressed sexual desires or day residues or anything like that. It is uh the very thing we call this religions yammering about. It's there. It's real. I mean, if you think if the world is empty of adventure then you just haven't been hanging out with the right crowd.[audience laughs] I mean, [0:54:30] on a saturday night, within the confines of your own apartment, on five grams of psilocybin mushrooms in silent darkness, I guarantee you, you will believe that [inaudible] should place second place to you. [audience laughs]. You will see things which no human being has ever seen before, and that no human being will ever see again. That is how big [0:55:00] that universe is. The -can-be- incredibly constricting space time locus of here and now that evolutionists forced upon us for survival purposes, is simply one point in an apparently infinite hologram of explorable data that is the human world. I mean the [uh], you know, the entire world of every science fiction novel or story ever written is miniscule [0:55:30] compared to the universes of strangeness and peculiarity that are accessible to anyone of us, if you will, but apply the methods. And if you're not willing to apply the methods then you know, you're gonna sweep up around the [inaudible] till hell freezes over [audience laughs] and not understand what's going on. [audience laughs] [laughs].

I mean I think, you know [0:56:00] I-I'm sorry to be so hard on religion. [audience laughs] I think it has its place, it places its inspirations of - of ethical behaviour, you know religion should teach ethical behaviour. But it has very, very little to say about the mystery of being of other than that it's there. And that's not practicing religion. Practicing religion is dancing with the mystery. [0:56:30] Losing and finding yourself in the mystery. And people often say to me you know, well this- how does this relate to other forms of spiritual work? The answer is: maybe not at all. I mean I've certainly taken a lot of psychedelics and I think I see no sign of spiritual attainment uh of ethical perceptions or anything so wa-de-da as that. I don't know what this is [0:57:00] all about but I do know it's ours. It belongs to us. We are the creatures of mind. And 95% of what mind is lies on the other side of the psychedelic, eh boundary. Ordinary consciousness is just like keeping the account of life. But there's more to life than the account books. I mean everything else is out there. The colour, [0:57:30] the affection, the humour, the terror, the mystery, the incredible strangeness of it all. This is the domain that we want to claim and explore. And if we can find the collective institutional courage to do it. I think this current planetary crisis will be seen for what it really is. And what it is is, it is not a dime, these are not the last rights for intelligence, this is a birth process.

[0:58:00] I mean if you were to come around, if you've never seen someone give birth and you came around the corner and it was in progress, you would be thoroughly, profoundly alarmed. I mean it looks like an enormous tumour is making its way out of somebody and they are being split in two and blood is being shed and there's pleading and screaming and thrashing, It would be a real leap of understanding for you too say: "Oh how wonderful, new life [audience laughs] [0:58:30] is emerging, this is the way we do it!" Well this is the way we do, I mean we are in the birth canal, right now of a planetary civilization. Literally the amniotic oceans of 500 years ago, that's all gone. There is no frontier, there is no going back. The peace of the fetal environment is gone and now in transition literally the walls are closing in. [0:59:00] You can't breathe, you can't eat, you can't find your way, it appears to be the end. But there's light at the end of the tunnel. The problem is, that tunnel is in the back of your mind. And if you don't go to the backside of your mind you will never see the light at the end of the tunnel. And once you see it then the task becomes to empower it in yourself and other people. Spread it as a reality. God did not retire to the seventh heaven. God is some kind of lost continent in the human mind. And if we will but explore the human mind we can reclaim these relationships with our own authenticity and shed the childishness of historical existence and eh gender politics and all the rest of it and move on to the real business of establishing a real civilisation. Thank you very much! [audience claps] [1:00:00]

Transcribed by Matthijs Pals

1:00:00(..audience clap.) Does anyone want to ask a question? Or is it all just perfectly clear out of the convincing and urm..

Terence: Yea?

Audience: (inaudible question)

Terence: urm.. Psilocybin? Bad effect.. (drinks water)..Huh.. somebody once said, "what's wrong with DMT?" and I said, "well nothing, unless you fear death by astonishment." (audience laughter) (Terence McKenna laughing)

1:00:30..(uhm).. But..but your question is a good one, first of all..uhm.. You know I talked a lot about how what we will have to do is destroy and ablate ego. However, there is a very small percentage of us who have a hard time

creating any ego whatsoever. And this...for these people boundary dissolution is no problem, their boundaries are dissolving all the time on them. I would say that they are at the (umm)

1:01:00..(uhmm) contraindicated end of the spectrum. That if you're fearful already and fighting to keep overwhelmed by confusion and what's going on in your life at the paper box factory or something.. (inaudible audience laughter) Then probably tossing in megadoses of hallucinogens is not the way for you to do it, or if you do, if you're just advance on doing that then i would say umm..

1:01:30..do it in the presence of some kind of professional and how you find a professional in this legal climate you'll have to discuss with me privately. Uhm..uh., i don't want to make it sound though, i mean it's a tricky thing. I don't want to make it sound like it's absolutely riskless. Physically; I think that's pretty safe. Unless you are odd some way. But you need to know. You know you..you don't wanna find out your odd an hour and half into it. (..Audience laughter..)

1:02:00..But the problem comes with the mind, if you are delicately balanced, if your whole life has been about not looking at that, or that or that (audience laughter) then this is not your game. (Audience laughter).. You know you should go back to watching Jeopardy, and.. (Audience laughter).. The kind of person.. The kind of person who is called to this is..

1:02:30..the person who has an exploring soul. I mean, my , i am not a courageous person in the sense that you won't find me shooting white water, you won't see me you know repelling down the faces of cliffs, but from the time i was the tiniest little kid, i was into the weird. What's weird? Weird is the compass heading..

1:03:00..and if you keep your compass always pointed towards the peculiar, the oppressed, the bizarre, the unspeakably alien then you know you will find these places. (Audience laughter.) The people who think life is all cut and dried and they're perfectly happy to have Carl Sagan and George Bush explain all off reality. (Audience laughter). Have never left the broad swift stream of mundane thinking. But you know out

1:03:30..in the by way and in tributaries (ahh..) there is a wonderful alchemical saying which i generally mangle..but i think it goes something like this; the tallest mountain, the oldest book, the wisest desert.. there you will find the stone. And what it is? It is a prescription for exploring weirdness. That's all. It's not gonna be on MTV. It's not going to be in god forbid; Esquire. (audience laughter)

1:04:00..It's going to come, umm.. From you know ..It's going to come from doing your homework, visiting strange people in strange lands and checking it out. The.. What i can't give you to return to your question is, i can't give you a guarantee that it will be fun. You know, The Rolling Stones have that wonderful line, "you don't get what you want, you get what you need". This stuff is ruthless. And if there's..something that you're trying not to look at

1:04:30..that's gonna get you, for sure. But after the veteran, most people will tell you you learn more from the bad trip than you do from the good one, the good ones are ecstatic and can connect you up to nature and other people the bad one show you your ..your kinks. And your limitations, and your thought errors.. And that sort of thing. It's not a easy road to hold. That's why i think umm..

1:05:00..there's a little bit of social confusion about it. One of the things i should make clear is i really advocate high doses, rarely. I think the worst thing you can do is get into a style of psychedelic diddling. Where you know you take half a gram everyday. Wh.. All this is doing is giving you a tolerance to psilocybin. You're not having the psilocybin experience. You're having the tolerance to.. 1:05:30-1:06:00..psilocybin experience. The.. Really, the way to do these things, is to (urm..) do them rarely so that your whole system can reassert itself and come to equilibrium and then just slam it! (Audience laughter..) And this is amazing, i mean i think..i think that this works for all the psychedelics. I'm a.. I'm an inveterate cannabis user and i wish in a way that i could get a..

Transcribed by Azlan

1:06:00.. In a way that i could get a slightly better grip on my cannabis use because .. the rea..i think the real way to do cannabis is like.. Once a week.. By yourself.. In silent darkness.. With the strongest stuff you can get.. And then

immense amounts of it.. (..audience laughter..) and.. You know.. People call it a recreational drug and a this..and a that...hey...Done that way.. It will

1:06:30.. Catapult you into places where its.. It.. i love it.. The great place to get to on cannabis and some people never in their whole life touch it, is the place where you say, "My god! I've done..too much!". (..audience laughter..) (..Terence McKenna laughing..) It's not easy folks, but it.. It's worth shooting for.. (..audience laughter..) Basically what..

1:07:00.. What you should do is.. You know.. Do some homework.. Read some book.. Talk to your friends. And then hang on Hannah.. (..audience laughter..) It..It's like.. Ah.. you know.. It's very much like riding an enormous roller coaster. You know.. Once fat baby rolls out of the station.. Do not stand up.. Do not try to climb out of your car. (..audience laughter..) Shut up and hang on! With the faith that most people

1:07:30.. have lived through this. (..audience laughter..)

Terence: somebody else.. Yea? The purple.

Audience: (..inaudible question..)

Terence: Well.. having just heard that i am a pothead please ask them one at a time (..audience laughter..) What is your first literary question? (..audience laughter..)

Audience: (..inaudible question..)

1:08:00.. (..audience laughter..)

Audience: (..inaudible question..(..I mean my associate experience..)... inaudible question..)

1:08:30.. Terence: Well.. i don't mean to imply that people first use it in low doses and then middle and then higher over time. What i mean..

1:09:00.. What i meant to imp.. I think they were using low, middle and high doses from the very get go. But they were using low doses to hunt.. Middle range doses for orgy and ceremony and truly high doses for this boundary dissolving tremendum.

Terence: Second literary question.

Audience: (..inaudible question....)

Terence: ..Ahu.. Well....I'm...I'm not wedded to that. First of all, Çatalhöyük for those who haven't read the book. Or know

1:09:30.. about Çatal.. Was this immensely sophisticated civilization that existed in the 7th millennium BC. We're talking .. Three tho.. We're talking six thousand (6000) years before (..uhh..) zero (0). This civilization existed and was destroyed.. And the.. (.. urm..)Characteristic of it is, shrine dedicated to cattle. And in my book i argued that this was probably..

1:10:00..the last outpost of this partnership, society.. Ahh.. but it would still..I think the real golden age of mushroom use was probably from about thirty thousand (30,000) years ago to about fifteen thousand (15,000) years ago and by the time Çatalhöyük ..so long.. it's a fading, or yearly, or seasonal saying..

Audience: (..inaudible question..)

1:10:30..Audience: (..inaudible question..)

1:11:00..Audience: (..inaudible question..)

Terence:Well.. I..urm..

Audience: (..inaudible..)

Terence: My argument would be that people don't take enough and they don't take it frequently enough. That.. there are a lot of people..

1:11:30 - 1:12:00.. Who..who.. Really would rather not.. Get loaded.. But still they must take some psychedelic drug in order to keep membership in their peer group. So what they did, you know.. You can always spot these people.. Because their first question..on..at the get go is, "will i be able to drive?".. I love this question. (..audience laughter..) because.. You know it indicates you got a real tough nut on your hand..in every sense of the word...No..!..You will not..

Transcribed by Azlan

1:12:00.. No.. You will not be able to drive. (..audience laughter..) ahh.. So, you know, I.. One of the things that inspires me to do this, is.. I want to get to the people who've taken three (3) grams of mushrooms and the people that have taken 150 mics.. Of LSD .. and i want to convince those people that they never got close to what i'm talking about even though they have a life transforming experiences softly..

1:12:30.. totally, differently.. They never got close to what i'm talking about. And so what you have to do is to convince people to take high doses and then..that's to break them through.. And then frequently enough that they don't forget. What the deal is.. So i think if you take a psychedelic population and divide into those who have done 5 grams and above, then you will see an exceptional.. Uhm.. slice.. But not the dabblers..

1:13:00.. The dabblers don't count. And we all can be or at times guilty of this. (..audience laughter..)

Terence: Is that your last question? (..Terence laughing..) That do it for you? (..audience laughing..)

Terence: Or do you wanna be thought psychotic? You choose. (..audience laughing..) (..Terence laughing..)

Audience: (..inaudible question..)

Terence: (..Terence laughing..) Well.. i love competition, i mean.. I .. (..audience laughing..) The..

1:13:30.. The.. competition is terrible, that's the entire basis of my success. (..Terence laughing..) (..audience laughing..)

Terence: Yeah? No.. Because you were before.. If you still wish..

Audience: (..inaudible..)

1:14:00.. Audience: (..inaudible..)

Terence: Right..

Audience: (..inaudible..)

Terence: Why? Because.. I mean i don't know if its preferable.. But here's the thing.. People are going to think you're a nut, if you come down and say.. That Johan Sebastian Bach or Jerry Garcia is God. And this is what you will have to say..

1:14:30.. If you listen to the dead.. Or the B Minor Map. So.. So.. What i am interested in.. is.. Iss. uhh.. I want to know the thing in itself. Not what it does to Bach.. Not what it does to river flowing through a forest at a valley. I wanna see what it can do with darkness. And silence.. And i think most people think it will be boring..

1:15:00.. Probably because they've been hanging out with BDI groups, meditating and god knows there's nothing more boring on earth than most meditation. (..audience laughter..) however.. Psychedelic sitting in a dark in a room on five (5) dried grams of psilocybin mushroom is nothing like meditating and that's where it can get at you. My relationship to it is always one of.. "I wanna know what it is.." and so i think this sensory..

1:15:30..deprivation method is the only way to get at that.. Other people might not like that.. People say.. Well you mean, put down the whole thing of going into nature? Isn't nature the great affirmation in all this? And the answer is, yea.. But it works for me sort of without the drug.. Plus and this is just maybe my own weirdness, but i'll share it with you. I know this that these things are incredibly disruptive of..of..the ordinary

1:16:00.. flow of casuistry.. You all know the concept synchronicity? Well.. if you don't stay in your room with the lights out and the phone unplugged and the damndest things will happen to you. I mean you couldn't pay me to go into an american city even mildly loaded because adventures beckon. Now some people like that.. (..audience laughter..) some people say you know.. Let's take 500 mics, and go meet..

1:16:30.. weird people.. (..audience laughter..) (..ah..Uhh..)...not this cookie..

Terence: Yea?

Audience: (..inaudible..)

1:17:00.. Audience: (..inaudible..)

1:17:30 - 1:18:00.. Audience: (..inaudible..)

Terence: Are you asking me, "Do i think a homeopathic preparations of a psychedelic would be effective?"

(..umm..) It would be homeopathically effective.. I wouldn't expect it to be experientially effective..

Audience: (..inaudible..)

Transcribed by Azlan

[1:18:00]

Audience: Question?(inaudible) regarding homeopathic preparations of psychedelics

Terence: But don't you think that if it were true and since in a high dilution like that no molecular trace of the original compound remains, that you have just found the solution to the illegalization conundrum.

audience : ... (inaudible) we're getting a lot of political slack for having medicines out there but homeopathy is being passed over as weird.

Terence: Because in a materialist world it's assumed to be bogus.

[audience laughs]

Terence: Right, Yeah

Audience: same woman continuing her question

Terence: Well this seems to me not an abstract proposition at all let the best homeopaths succuss the strongest hallucinogens and set them out and let's give it a whirl

[audience laughs]

Terence: Over on this side, yeah.

Audience: This question may be too personal, or an embarrassment to answer, but..

Terence: Oh I can hardly wait !

Audience: Why are you not in jail?

Terence: Ahhhhh... Why am I not in jail? hmmm. Well that's an interesting question. And I , uh, number one I don't know, here's what I've come up with. Uh, notice that I use big words.

[audience applause]

Terence: I don't boil, I don't try to boil it down to a shoutable slogan like "turn on, tune in, drop out" uh uh that, that, then they come, they come, uh, so that's one possibility. That simply if you are defined in their eyes as an intellectual then they automatically put you in the harmless category and send resources elsewhere. That's one possibility. Now the other possibility is slightly more disturbing but in the interest of thoroughness let me raise it. Uh, perhaps I'm sanctioned. Perhaps they decided "we don't really understand what this stuff is, and we can't have a mass movement, but let one guy just kind of keep the pilot on in case we ever change our minds about this, he will have kept the pilot light on". Uh, and the other possibility, which is probably too naive but in the interest, again, of exhaustive thoroughness. Maybe they just haven't noticed yet? You know, Tim Leary, who is a friend of mine would address 25,000 people at a throw. My crowds are, you know, a couple of times a year they creep over a thousand. And I think the key is to keep it low-key. And we don't want to you know, Dodger Stadium filled or anything like that.

It's very good to atomize it and spread it through, now the other thing is, you know, I advocate plant hallucinogens. And people always say, "well why, what about LSD, I mean, didn't LSD change your life? Didn't LSD change your life? Didn't LSD change all our lives? Why aren't you into LSD?" and the answer is certainly yes, and yes. The reason I'm not into LSD is a, a uhhh... not having to do with the effects of LSD, which I think are marvelous. But with the fact that, uh, a, a couple of enterprising second year biochemistry students can produce six or seven million hits in a long weekend. Six or seven million hits of an illegal drug? Suddenly, this is the realm of governments and criminal syndicates and revolutionary disruption of populations. My brethren, I wrote "psilocybin: the magic mushroom growers guide" if you work like a dog for six months, maybe you can produce, uh... 2 or 3 thousand hits. So, that's the thing. LSD had chemical qualities that made it terrifying to the government, I mean, anybody with 50,000 dollars worth of backing and uh, uh, uh an educat,... 2 years of biochemistry could turn themselves into a major threat to political stability in this country. So they slammed that. They're not going to put up with that.

The thing I love about the mushrooms is that, if you're a dedicated mushroom grower, you produce this piddling amount, and if they come and drag you away because it is illegal, all they get is you. No... no... syndicate collapses. No pyramid disappears. So, its invasive. And low-key, and slowly spreading. The other thing is, mushrooms are, this is a cultural thing, mushrooms are inherently non-threatening. They're absurd , you know, they're what we, they're what we put decals of on serving trays and bath towels, bare [1:24:00] mushrooms on them. It's a kind of silly thing.

Transcribed by Joseph Sadaka

“And uh, bath towels [1:24:00] bear mushrooms on them - It’s a kind of silly thing. And uh, and so I think that they don’t really understand what a powerful hallucinogen this is. Well that’s enough on why I’m not in the can. [*points at audience member*] This woman, yeah?”

Audience Member: “[inaudible] Uhm, you talk about the uh.. the evolutionary processes how it’s encourage by the ‘essence?’ of the the mushrooms [inaudible] to be, uh, more creative and beneficial process if we worked on evolving our minds without using an external drug, what happens if the government does come in and decide to [inaudible] and we can’t access that same consciousness anymore and then things, you know they could be set backwards again, wouldn’t it be so much more productive to teach people how to get there without the drug?”

Terence: “Absolutely if we could do it, I mean I’m not yet convinced, see. I mean you’ve got your guru’s, but, if you ever get close to any of these people in these guru scenes, close enough where you can just say to them: “Look, level with me, is this stuff as good as 5 grams in silent darkness?” And they say: “Huh, are you serious?” [audience laugh] Uh, the other possibility is technology, uh on two fronts. Mind Machines. The problem with mind machines is, you know, you have to smoke a bomber or two to put up with it more than ten minutes [audience laughs] eh, I mean you quickly satisfy yourself that, this can’t possibly be it. Because it.. it, it is life, and it, but it is contentless.

Well the psychedelic experience is all content. The other possibility - and I put in some time in this beat, is uh, virtual reality. And I have more hope for virtual reality because virtual reality is a technology for showing, for, that would allow us to show each other the insides of our head. Our dreams, our vision. And I think that sufficiently perfected, it might have the consequences of, of the psychedelics. The problem is, it carries a huge amount of negative freight. You know that it’s not gonna be a tool for us to show each other the inside of our minds. It’s gonna be a tool to sell us crap that we don’t want. It’s gonna be a tool for yet more realistic vicarious an gratuitous vile and.. It’s going to be a tool for more pornographic degradation of women. [audience chuckles] So, it seems to me while it holds out the possibility of a technically driven psychedelic, it has a lot of negative freight. I agree with your premise, I.. But I’m driven by a tremendous sense of urgency. I mean why try to create a technical alternative to psilocybin, when you got psilocybin!

Audience member: “[inaudible] like, I think that people should use mushrooms as, a tech. And what if people there who try, and keep going without, without that tool. Cause, I mean cause what we, what we want, i mean, we wanna transcend.. this plane, we wanna be on a higher plane, a higher state of awareness and you’re not, you’re not gonna get to that plane ultimately if you have to keep coming back into the plane, to get the stuff, to get out of the plane again

[Terence interjects:] “Well how about uh, how about this: Maybe there’s something wrong with that metaphor. Because notice it had to do with planes and transitions, it’s an inherently dualist metaphor.”

[Official-sounding tape transition lady:] “This concludes tape one. Our program continues with tape 2”

[Terence:] “Well how about uh, how about this: Maybe there’s something wrong with that metaphor. Because notice it had to do with planes and transitions, it’s an inherently dualist metaphor. How ‘bout if we say, uh... There is no

inside and outside. There is no with or without. Uh, you just use what you got, whatever works should be used. I, I... Spend time in India and visited all these people and [inaudible] And I just became convinced that, unless you were predisposed to believing this stuff, that it would never carry you where you wanted it to. And one thing about psychedelics, you don't have to be predisposed. It doesn't work for those who believe it works, uh, it works for those who think it doesn't work.

One last point and then we'll go on, uhm, there's a story, maybe you some of you know this story of uh, a man who lived by the side of a river. And he wanted to uh, he wanted to cross the river. So he, uh, practiced a siddhi of levitation so that he could walk across the water. And it took him forty years to perfect this siddhi and finally he could cross the river, and uh, Buddha was preaching in the neighborhood and the guy came to him and he said uh, "Master, look what I've achieved, I can walk on the water to cross the river" And Buddha said "Yeah but the ferry costs a nickel" [Audience cracks up] Uh, and that's the thing, uh, I think, eh, we're not gonna replace this tool without wasting so much time in the act of replacing it, [1:30:00] that armageddon will catch up with us. "

Transcribed by Nils Van Der Hoeven

1:30:00.. Act of replacing it that armageddon will catch up with us. I think we have to humble ourselves, so thoroughly that you have to admit that you can't get where you want to go unless you form a partnership with somebody whose idea of a good time is growing in a cow pie. And if you're willing to partner up with this humble..humble.. member of the ecosystem, then you and it can fly to glory..

Audience : (..inaudible question..)

1:30:30.. Terence: Have had it..

Audience : (..inaudible question..)

Terence: ..Yea, i wouldn't recommend it especially in the late stages of pregnancy doing anything that is gonna wildly perturb you, and you know LSD is discovered in the act of trying to produce better drugs to induce labour. So that's excellent advice..

1:31:00.. honor the fetus. Urm.. Yea?

Audience : (..inaudible question..)

Terence: ..Yea?

Audience : (..inaudible question..)

Terence: ..Well, true and honest answer is, "how the hell can you find out when they won't let you do research?" It's totally insidious! We don't know..! We don't know because they will not..

1:31:30.. allow (..um..) The.. the... research to be done. This is one of the reasons why I say that (..uh..) You should stick with (..urm..).. Shamanically sanctioned plants. Because we know for instance that people have been taking psilocybin in the Sierra Madre de Oaxaca Central Mexico for millennium. They don't show blindness, tumors, miscarriage, madness, cataract, whatever. That's your..

1:32:00.. human data, for that. But you go to..Let's talk for a minute about something like ketamine. Nobody knows. Nobody has any data. MDMA.. seems to be tremendously effective in facilitating interpersonal stuff.. That's a psychological issue.. Chemically, what kind of data do we have? You know.. Six years worth of data.. gathered under the rag. So, (..uhh..) to be safe.. Stick with the things that are sanctioned..

1:32:30.. by human use.. And then, (..uhm..) somehow in the lighten future..We will explore these synthetics and find out just what the parameters are..

Terence: Yea? Finish up..

Audience: (..inaudible question..)

Terence: No, i'm nothing man. I'm saying take things which have been sanctioned by human usage. I mean.. How about a plant like Strychnos nux-vomica..I mean you're..

1:33:00.. dead in a minute and a half.. And it's a beautiful, wonderful plant.. Why did it kill you? Well, because it's jammed with strychnine, No.. it's nothing about it being a plant, it's about having a repeated history of human usage, that's what sanctifies it..

Terence: Yea, the lady in magenta.

Audience: (..inaudible question begins..)

1:33:30.. Audience : (..inaudible question continues..)

1:34:00.. Audience : (..inaudible question continues..)

1:34:30.. Audience : (..inaudible question comes to an end..)

Terence: That's really an interesting point.. I mean....I..I...It never occurred to me, that somebody brought it up to me, they say, "have you noticed the trips are changing?".. And once you do ask yourself this question, it does seem to be so. And.. I don't know whether that.. What..i mean that.. (..uhm..) These deep assertion i'm not sure exactly what's going on. For instance, this goddess thing, I don't think people gave the goddess a thought in the early..1970..

1:35:00.. Late 1960.. Now.. people have, you know..some of the least likely people report intense encounters with the goddess.. So, is it amplifying the general mindset..of the society and so there's more goddess up there? Or.. i don't really know.. It's a very interesting question. There are more questions than answers. I mean this is definitely wide open stuff..! Yea..! Yea..

1:35:30.. Audience : (..inaudible question..)

1:36:00.. Audience : (..inaudible question..)

Transcribed by Azlan

"We're trying to restore the relationship of ego to the other components of the psyche that existed as recently as 12,000 years ago. The ego has become a deadly growth in the historical societies, exacerbated by the phonetic alphabet, monasteism, modern science. This is like you're getting sicker, and sicker, and sicker as you lay these things on, and so, the idea is that if we could restore the original diminished role of the ego that it has for that period, however long it was, that we could begin to solve our problems, because the problems which face us, put very simply, are going to demand sacrifice, and sacrifice is what the ego doesn't want to hear about, and when you go to somebody and say -look to save this planet we're going to have to redistribute income radically- I mean that everybody in this room is gonna to have less, we're going to have to honor a whole bunch of cultural positions that we previously just we're going to bulldoze over, and so forth and son on. So it's ah-- it's the diminishing of ego, by

any means necessary that lies to getting any grip on our problem, I mean if we continue as we are, I think we have probably less than 30 years before life is irreconcilable screwed up, you know, nobody believes that the future is ah.. rosy and wonderful, I mean if you go to the people of the world bank, and IMF and, these people who are straight you know suits all of them, they have a sort of curves which would stand your hair on it. When they propagate the curve of population, the curve of toxification of the environment, the curve related to the ozone hole this you see, you know, it's finished and sometime in the next 50 years. They don't talk about this because they don't want to panic the vast numbers of people who just go to work and raise their kids and pray somebody smarter is doing something about all this, but they don't believe there is any kind of normal future and I don't either, I think we're going to, that this business as usual is not on the menu folks, we're either going to go to an era of immense resource scarcity, regimentation, governmental interference in our life's, tremendous propagandistic efforts to make us do one thing or another, or we're going to pull the plug on scientism and it's studios and the institutions which feed us, feed it.

If capitalism is an interesting problem more easily discussed now than the communism is, how does the picture, capitalism is as anti-human philosophy as you can possibly conceive because at this very moment we should be consuming less, manufacturing less, selling less, transporting less and what's the battle cry? Free trade everywhere! What does free trade mean? It means my right to come to your country and sell the most outlandish junk you've ever seen and you will have no right to turn it away because in the name of free trade crapola has to go everywhere ah.. it's really, see, they try to tell you that capitalism and democracy are not at variance actually the whole Marxist-Leninist socialist thing was assidish, the real life and dead struggle is between capitalism and democracy. Democracy says everybody has an innate worth that must be honored, capitalism says does who die with the most toys win. You can not reconcile these two things, and nobody wants to talk about this, we're still having the party over the fall of communism. But, you know, you go to the soviet union or the former areas or the soviet union and you see that what it was, it was a deep freeze for traditional culture. In Kurdisia and Turkmenistan people were basically camel husbandry, is whats going on, ah.. now with communism on the rocks ah mac donalds will be there in 5 years and k-mark will be following close behind. So, I think we're coming to a great crisis of fundamental ah.. our relation to our own fundamental institutions. I'm not anti-capitalist, I think capitalism needs to sever it's ah.. connection to materialism. This is again why virtual reality is interesting. You sell things made of light, not made of beryllium metal, brass, steel and wood but light. We got all the light we need but we have to stop making things out of stuff, or we're not gonna be around to tell the tale."

Transcribed by Nicole

[Inaudible* question from audience] [1:42:00]

No i think that, you know revolutions are made by percentages uh if 15 or 20% changed [1:42:30] then the example would spread. You see, I, uh, we are not, uh, psilocybin is the easy way to awaken. YYou know, take a, take a psychedelic plant and have an experience and get your act together, but the future is full of sledgehammers. It's not going, we're not, we're not going to end with a whimper, it's going to end with a series of thuds and bangs. It could begin almost anytime. I mean we could get a hot muggy day in Mexico City this summer, and a million people would die. This thing in Los Angeles is a wake up call. It is going to get uglier and more chaotic and more crazy there is going to be more starvation, more facism, more dictatorship. THis is, unless we do something! Until we do something. And it can- how bad is it going to get?! before people say, you know, we are doing something wrong. People dance on the Russians, but you've got to admire people who have got the. The guts to say, "we did it entirely

wrong!" 100% I mean could you imagine this country? Being able to tj.. You know it may be coming.. It may be coming. The character from AUstin.. Is a peculiar item in the mix. You know?

For years, i fantasy speech i always imagine that I was somehow end up giving but but it's it's this speech where you say, "MY fellow Americans, you have been lied to." Screwed and abused by these two criminal parties for a hundred years. And you're only hope is to overthrow the republicrats and create a decent world to live in. well no republican can make that speech no democratic can make that speech and be redible it was to be somebody that wasn't in bed with either of those forces. So i'm not that all pleased by who apparently will bear the mantle, but on the other and it changes what we need, then if, if it's probably nothing to be a candidate that you can and i can embrace its going to be some odd ball. Oso you know you have to recognize it when we see it coming. Yeah.

[Audience QUestion can;t hear it }First of all,

Terence: No we don't know what it is.

inaudible

Yah the great thing about is it can talk!

Good for you. (terrence laughs)

Well probably half at least in the room hasn't the faintest idea what the question is about. I stay away from this because this is the personalistic stuff were i created a certain model of reality based on a new way of looking at time and i don't want to go into it too much tonight. But i want to suggest something to you tonight which is that, cough, you know, uh,hm, at the very beginning at this talk we talked about mutation and natural selection and that , the darwin's insight was vast and deep, and what h offered was an explanation for how rainbow trout come to be, monarch butterflies, redwood trees, herds of elephants, so forth and so on. What it doesn't address is us. We are the weird bird on the block. I mean , yes we are some kind of monkey, but when you stand us next to our nearest relative it is very very clear that is is not a very near relative. It doesn't look like us much, certainly doesn't act like us.. What's the deal with human beings? And I think that uhm, it, you know how all these religions these western religions [1:48:00] have built in this idea of the end of the world

Transcribed by Marina Quirk

You know how all these religions, these western religions have built in this idea of the end of the world and they're always running around expecting the messiah or something and this, to the scientific mind is just the final proof of

the pudding that these people have water between the ears [audience laughs] because science just says you know 'that's just ridiculous', i mean uh but i wonder, i wonder, i mentioned just a minute ago these curves that when you propagate them into the future [1:48:30] everything leads to the unimaginable and it's within the next 50 years so uh I sorta think as human beings as uhh analogous to iron filings on a piece of paper and you shake these iron filings out of a salt shaker or something and there they lie randomly arranged in heaps.

Well then you come underneath the paper with a powerful magnet and lo and behold these little [1:49:00] iron filings coherently arrange themselves into this beautiful double mustache pattern, which i'm sure you've all seen well i think that there is a-an enormous punchline to the historical process that no- very very few people suspect and that what history is is what happens to an animal who falls under the influence of a kind of strange attractor and that we are being pulled into a well of transformative intentionality, history is not pushed by the casuistry of war, migration, imperial dynastic families and stuff like that, history is pulled toward an unimaginable something which is [1:50:00] continuously trying to mirror itself in us. This is why these egyptians said, you know, 'i don't know what it is, but i think we should really build a big simple building', [audience laughs], 'i don't know why. But i'm gonna enslave 50,000 people and do it! And don't ask me why' [audience laughs].

And you know this is the same force that reared Chartres Cathedral, this is the same force that created the space shuttle, we are in [1:50:30] a relationship to an unseen something which we keep trying to image with our mythologies, our religions, our technologies, our epiphanies and i think that uhh, it's not so far away. That it- it isn't 10,000 years in the future it is sometime in the next 50 years and that this is something what history was for, you see history is an incredibly...[1:51:00] peculiar and brief phenomenon, i mean viewed from the point of view of biology it's less time than it takes for a new species to emerge, i mean let's call history 25,000 years.

You know, in frame 1 you're chicken flint, in frame 2 you're hurling an instrument toward Alpha Centauri, [*Terence Clicks*], like that! -This happens. Well what's happening is that mind itself [1:51:30] is being pulled out of this creature and it's being given hands and languages and pos-symbolic systems in order to image the unspeakable, the unspeakable, I call it the transcendental object at the end of time, it casts- it's in another dimension, it's in a kind of super-space and what it casts into history is the enormous shadow of its imminence. [1:52:00] This is what straight people call god. This is what all these visionaries are raving about.

It's that when you sink below- beneath the surface of ordinary causality and mundane ho-hum-ism what you discover is this enormous transcendental object which you could call it, you know, the sacred heart of jesus or the, flying saucer or the, philosopher's stone, it's all of those things and much much more, [1:52:30] it's not only stranger than you suppose, it's stranger than you can suppose and it has called us out of animal organisation over a 25,000 year period we hang in the balance and then we meet it. And we are going to meet it. That's the light at the end of that birth canal of transcendence that i referred to... And now i see that our song is sung, our time is done. Thank you very very much for turning in. [1:53:00] [audience claps] Thank you!

[audience inaudible]

TM: Yeah we will dig into this in the uhh interim, uhh [1:53:30] i think the, -it's- it's worth taking the time for everybody to just make a very brief, very very brief statement about, you don't have to say who you are if you don't

want to, but you can say what you're hoping for or why you're here or what your agenda is. Just so that if it turns out that we are 80% shrinks or 80% ceramicists or something [1:54:00] then we turn it that way.

Transcribed by Jonathan Laliberte

[1:54:00]..or eighty percent ceramicists or something, then we turn it that way and uh, those of you who are undercover please stay undercover so you don't alarm anybody [audience laughing]..euh..., especially me, right?...euh. So why don't we just start euh..uhm, and go across in some reasonably logical fashion, it.

[TM: yeah?]

[man with inaudible question]

[TM: Well that, tells you what you're worth , doesn't it?]

[1:54:30]..[Terence giggles, audience laughing]

Oh, true...No. Let's not record it so people, and uhm, also I had at one point [takes a small sip from something] thought I would be an art historian. That was one of my real obsessions. So I had..had enough art history to be trained in, you know, recognising the evolution of motif, how one artist passes on techniques and can see,.. to his students or his..

[1:55:00].. imitators, and all this art-historical stuff. And I also..uh..had been very interested in Jung. And...and none of this seem to explain the content of the psychedelic experience i would get in there and say, well.. How come, i'm not seeing a archetype?.. and be things which somebody else.. You know.. I don't know.. Ali Ensor. Therabagio Baugh..

[1:55:30].. Somebody should have seen this stuff.. And gotten it out. And it didn't seem to be..uhh..a trail through the history of western art of the present of this dimension. So then i thought why is it that nobody knew about all this? I mean, Baugh would have given his right arm for a sheet of blotter I would think.. Euh.. So it became for me like a mystery, whe..

[1:56:00].. where is this stuff coming from.. And what does it say about our humanness?

[TM: yea?]

[man with inaudible question]

Well, there.. There's a lot of being completely still over Baughs because he is such a startlingly radical painter in the context of his time. Many of his conceive were digged up after his life.

[1:56:30].. Uh.. T.L. Breko the elder being the foremost exponent of it.., he may have been an alchemical guinea pig. Euh.. Who. euh.. Frazier.. I think.. Wrote the book called the "Millennium of (..inaudible..) Baughs" in which he wanted to suggest that maybe that Datura use, that there was a cult called the brotherhood of the free spirit. And which practice ritual nudity..

[1:57:00].. Which begins to sound something like the orgies we talked about last night. It was a cult of printers. And it may be that Garden of free spirit but this is all pretty murky stuff, it's hard to get back to Baughs, euhh.. Euhh.. he didn't leave any written records we have, his birth is recorded in the perished church where.. In the village..

[1:57:30].. where he was born.. We know he was born sometime around 1450 died in 1516.. But the details are pretty murky.. Well.. not to belabour Baughs, euhh.. So what i thought would be a reasonable way to do this this morning.. (takes a sip from something) is to take the most extreme psychedelic case and experience and describe it and talk about it a little..

[1:58:00].. and then see what issues that raises. Because my experience with this has euh.. Led me to the conclusion that..(..Breathes..) In a way.. (..Exhaless..) It..euh.. To be thought of as other dimension is to be thought of as a mandala, and different psychedelic compounds and generously different kinds of yoga and different kinds of techniques of all sort of land viewing in

[1:58:30].. different part of this mandala but that what you're always trying to do is get to the center of the mandala and it's simply my biased, my opinion; that i think the center of the mandala is probably the DMT experience for a number of reasons. And so i thought it'll be interesting to talk about it this morning. First let me talk about it physically. Uhh.. DMT is..

[1:59:00].. ..uh.. An indole hallucinogen.. Abetted.. No..no.. a tryptamine.. Uhh.. and it's produced indigenously in the human brain. This is very interesting. Very few psychedelic compounds are produced in the human brain. We don't know what DMT is doing there. But it means essentially that we all are subject to arrest..

[1:59:30] - [2:00:00].. Of a technicality because we all are holding a schedule one (1) drug.. Euh.. It's sort of the ultimate catch-22 where if all else fails, they'll just say well you were holding anyway. Euhh.. the interesting thing about Dm.. Another interesting thing about it that is the incredibly rapid in its onset and in its disappearance the whole trip lasts about 15 minutes..

Transcribed by Azlan

[2:00:00]

[Terence]:“...the whole trip lasts about 15 minutes. This makes it a tremendous tool with which to challenge the critics of our position, because if somebody wants to rise up in righteous wrath and condemn psychedelics, then you say, ‘well, you have tried them, haven't you?’ and of course they never have; it's like scientific denunciations of astrology. Mean, scientists love to denounce astrology, but find one who can cast a natal horoscope[2:00:30] and I'll give you a [inaudible].”

[laughter]

[Terence]: "uh, ya know? So, uh, the, the uh...uh, uh, the...it...DMT overcomes this objection; the entire experience lasts 15 minutes, so you say to the critic, 'ya know, you're NOT going to experience it & yet you're going to carry on a pogrom against it? You won't invest 15 mins. To check what this is about; I mean, what kind of scientist are you?'"[2:01:00]

[Terence]: "uh...so, it has that social efficacy. Um, now the fact that, it is the strongest of all hallucinogens--at least if there are ones stronger, please keep them away from me--I mean I don't think anybody needs to get higher than that. I certainly don't. I mean, I've at times come out of those places and said, 'this stuff is ILLEGAL! It breaks cosmic law!'"[2:01:30] Of course, then, Tim Leary told me, 'cosmic laws are only local ordinances anyway.'
[laughter] so it didn't really matter."

[inaudible audience question]

[Terence]: "uh, ok. Eh...well, good question. Yes, It's the commonest of hallucinogens in nature. Uh, It occurs in many grasses: Phalaris Tuberosa, Phalaris arundinacea. Um, it occurs in a number of leguminous plants [2:02:00] uh, uh, probably the most spectacular being Anadenanthera peregrina, this huge, tropical, locust-like tree from which the snuff called niyopa or edena is made. That's a tough way to get your DMT let me tell you; uh, because there is so much cellulose & other crap & corruption in the mix that you have to do like a tablespoon of each nostril and the technique [2:02:30], the technique is you get a bamboo tube or a hollow tube about this long [indistinct gesture of length] and you pour in this tablespoon of this stuff, and then you squat down on your haunches and you get a friend, and you put the tube up your nostril and the the friend BLOWS with the full-force of his breath; BLOWS this stuff into your head. Well...you fall, it's like being hit in the face with a 2x4; i mean you it's like you think he kicked [2:03:00] you, and you fall over backwards, you scream, you salivate, you get backed up on your haunches and by this time he has refilled the tube for the other nostril." [audience laughter] So, and then, after uh, af..."
[indistinct audience question]

[Terence]: mmhmm, mmhmm...Hmm?

[Audience]: Yopo?

[Terence]: "Yopo, Etena, Nipa [?], it depends on the language group, uh, and the [indistinct] [2:03:30] um, it's also called Vilka in the Kari language. And then, after uh, ten minutes or so, it slowly begins to form up in your head, but you know, God, your sinuses, are eh, STACKED for sure, and uh..it's not, uh, not very pleasant; and the other thing is, it never reaches the blinding transformative intensity that [2:04:00] you can achieve with the chemically pure compound."

[indistinct audience question]

[Terence]: “No no. The uh, good point. If you orally ingest it, it will be destroyed in your guts. It won't work. The uh, Amazon Indians, have...encountered this problem and have created a very sophisticated pharmacological strategy for dealing with this, you've all heard of ayahuasca. Ayahuasca [2:04:30] is DMT from one plant combined with another plant which contains a chemical which is called a MAO inhibitor. MAO is Monoamine Oxidase, and your gut is full of uh, MAO, and it's job is to take monoamines--small molecules--and oxidize them into uh, harmless by-product: usually endocytic acid, which can be shunted to the bladder. Well, [2:05:00], when you take DMT orally, these monamines just uh, I mean these monoamine oxidase compounds just grab onto it and destroy it, but if you take an MAO inhibitor with it, and harmine, which occurs in *Banisteriopsis caapi* is an MAO inhibitor, then, lo and behold, it isn't destroyed in your gut. Instead, it passes into the bloodstream, it passes through the blood-brain barrier, which is a very tight chemical filter that keeps the [2:05:30] brain from being exposed to toxic materials, but these drugs can cross that barrier and then, what the aya experience really is, is a slow release DMT trip, that instead of taking five minutes, takes about two and a half hours; and if you really know your psyched and your breath control techniques, on ayahuasca, over an hour or so [2:06:00]

Transcribed by Joe O'Neal

Instead of taking 5 minutes, it takes about two and a half hours. And if you really know your psychedelics, and your breath control techniques, on ayahuasca, over an hour [02:06:00] or so, you can work yourself to a place where you say, “lordy me!It looks just like a dmt flash”. And it does, but you have to do some hard climbing to get there. With dmt itself, once you push the start button there is no stopping it. And... I think it's worth describing it. How many people have had this experience? Ahun.. well they can somewhat anchor it [02:06:30]. Ahh.. it's very subjective, obviously. But I will describe what happened to me and then we can work out from there. One point that I wanna make about these things is that, th- the great strength of the psychedelic possibility is, it's democratic, you know. It isn't that the people of great spiritual advancement obtain these states, or- or people who have studied under some [02:07:00] lineage. It's truly available to everyone and when I had my dmt experiences I realized, you know, either I am incredibly special, which doesn't- there is no other evidence to support that *audience laughter*, or, this is something which can happen to anyone and that's the more interesting possibility. After all if it can only happen to very very special people, then [02:07:30] that lefts- most people out. But if it's generally available then it's big big news about the human condition. Yeah-

Audience: [inaudible]

TM: How did they find DMT in the human brain? Ahh... hmm... interesting question.

Audience: [inaudible] how it crosses the blood brain barrier?

[02:08:00]

TM: No I think he means how did they find that it was endogenously produced. Well, I think they were studying- the group that did this was at the University of Louisiana, Christian and his group. And I- they were studying fast reactions in the brain. And for fast reactions you have to look at chemicals that can go through some kind of cycle of structural change and return to their zero point, very very quickly. [02:08:30] Their original thought was that DMT

mediated attention. I mean I am talking to you right now, suppose there were a loud noise over here, we would all immediately project our mind on to the source of the sound. Th- They thought that was a.. neurological function mediated by DMT. Could be, I am not sure I suspect it has to do more with the chemistry of dreaming.[02:09:00] Once they discovered DMT and began to track it, they discovered that there was a circadian rhythm, means a daily rhythm in its production in the human organism and that it reaches its greatest concentration in the brain around 3:30 am in most people. Well this is when the deep dreaming and high rem states are really chugging, and I suspect, I mean lucid dreamers may wanna argue with this [02:09:30] but I suspect that every night we go deeper places than we can ever speak of. That ordinary dreams are right on the surface of consciousness. Big lucid dreams are an inch deeper. But I think we go a hundred feet down every night into places where you cannot say anything about it. Yeah-

Audience: [inaudible] [02:10:00]

[02:10:04]

TM: Ah.. let's make that perspiration *laughter*. Well its- [audience inaudible]. It's hard as hell to find DMT. And this is a puzzle because if you look it up in a standard work on organic chemistry, it presents it as a trivial synthesis. Ah.. much [02:10:30] more simple than LSD which it always presents as quite a difficult synthesis. But when you actually talk to workbench chemists- it's tricky to make DMT. It's especially tricky to carry out the final crystallization. So what you are usually offered in the underground is some kind of muck, which looks sort of like ah.. maple syrup, half gone to sugar. I wouldn't get near that, actually. It means [02:11:00] they- they botched their synthesis. What you are hoping for, is a white powder. However, in thirty years of chasing this all over the world I have only seen it as a white powder a couple of times. Usually, the synthesis has fallen slightly below that standard and what you get is a pale yellow powder, sometimes a pale rose or pink powder and then the real rough trade [02:11:30] is orange. And this what you- if you have seen it, this is probably what you have seen it. It looks like orange moth balls and it has the smell of indole. This very sharp smell which if you are not a chemist and you have never smelled indole, when you reach in your mind for what is this like, you will say, "well it's sort of like moth balls". Not quite, but it has that same sharp chemical, you know and this is what you are gonna smoke, see. So a lot of people beef about [02:12:00] that and say, you know, "It's like smoking burning plastic".

Transcribed by Rohan Singh

A lot of people beef about that, and say; "it's like smoking burning plastic.". Mehhh, Más o menos, It is a little bit like that. The other objection to DMT that has been around since the 60's is people say it 'destroys brain cells'. There's no evidence for or against this. But I would submit to you as[inaudible] as the people who are neurophysiologists can argue with this if they disagree, but, I think an excellent index for the low toxicity of a drug is how fast it clears your system, and DMT clears your system in about 15 minutes. If you take some compound drug, or whatever, and 48 hours later you're still taking hot baths, and uh, wishing you could have a message, and sitting staring at the wall. Than, this drug is really sticking to your ribs. It means that your metabolic pathways have no way of dealing with it, they can't grab it here, they can't grab it there, and it takes a long time to leave your system. An example of this in the pseudo-psychedelic domain would be ketamine. Ya' know, ketamine, the experience lasts about 45 minutes, but 48 hours later you can feel your knees suddenly go rubbery, or you can have, what are technically called 'fuse states', strange states of disconnectedness from what's going on around you. This is not a very good advertisement for a drug. TM speaking to audience: Here, this woman and then-.

Audience: Uhm, [inaudible question about ayahuasca].

TM: Uh, well, less because um, if you smoke DMT the dose is approximately 50 milligrams, which is like the size of a kitchen match head. If you combine it with an MAO inhibitor and take it orally, you can probably get away with about 35 milligrams, of DMT. Uh, and, uh, oh I don't know, 100 milligrams of harmaline, now harmaline is itself is sometimes itself described as a psychedelic drug, I really think this is sort of misleading. You will have hallucinations if you take pure harmine, but only at doses approaching the toxic dose. Many compounds will give you hallucinations approaching the toxic dose; bee venom, rattlesnake venom, stuff like this. That doesn't mean it's a hallucinogenic drug, it means you're dying, and you should take steps to correct the situation. [TM speaking to audience]: Um, now, yes.

Audience: You say that there is a short transit time, but how long does the memory of that experience last? Because that would indicate to me that there is still a presence, and perhaps a homeopathic dose at that point[laughing], in the mind, in the brain.

TM: Well, DMT, uh one of the things that caused me to think that is must- that is might have a role in the chemistry of dreaming, is that one of the frustrating things about it is, you have this experience without doubt, the most bizarre, appalling, peculiar experience you could possibly have; that's at minute 2. At minute 5, you're raving about it. At minute 7, you can't remember it. So, it's literally like gold running through your fingers. You say 'this is the most amazing thing, this is the most amazing thing.. What am I talking about?', and you know how you can have a very engaging complex dream, and the alarm goes off, and by the time your feet hit the floor you're grasping for it, it's literally melting before your eyes. That's a very DMT-like presentation. The way a dream melts away is the way a DMT trip melts away, at the same speed.

[inaudible audience question]

TM: Well, uh, over time and using tricks you can drag a certain amount of data out of it. Um, what I'll do- I'll describe a DMT trip, and it's um, it's a composite of maybe 40 of these trips, and uh, then you can see what you make of it. So this is- I'll just describe it, I'll be the graduate student UB, the guy with the clipboard. You're saying to me 'so what happened?'. Okay, here's what happened; [dramatic sigh] You- I took 1 takes. Eh, most people can get off in about 2 to 4 hits. Now there's a trick to it, hash smokers are greatly favored in the endeavour because you really need leather lungs, for this. The great problem is that people will cough, or not be able to hold it in. You take 2 hits in a situation where you're clothes have been loosened and you can just flop backward, uh, when you need to. You take 2 hits, now many people miss the point. Because after 2 hits you feel completely peculiar, you feel as though your body is undergoing some strange kind of anesthesia. All the air has been pumped out of the room, this is the visual acuity thing I talked about last night.

Transcribed by Justin Symbiosis Brosey

[2:17:57]

All the air has been pumped out of the room. This is the visual acuity thing I've talked about last night. The colors jump up. The edges sharpen. It's and at that point people say 'ooh wow, it's really coming on strong.' And then what

you have to do you is you have to take one more enormous hit. This separates the in trepid from the casual. Believe me. Because most ppl, and, and, the facilitator doesn't want to lean on the person you say 'you know, take the third hit' and they say i completely weird, and sai know you feel weird take the third hit well if you can coax somebody into that. what happens is you close your eyes and you see the ordinary warm, brown, back, you know, closed eyelid scenario, and then these colors begin racing together. And it forms this mandelic, floral, slowly rotating thing. Which I call the chrysanthemum.

This is a place in the trip that you want to see as you go by it. The chrysanthemum forms. And you watch it for like 15 seconds. If it doesn't give way then you didn't do enough. You have to do more, one more hit.,usually will do it. Well then what happens is it physically propels you through this chrysanthemum-like thing and you, there's a sound like a saran wrap bread wrapper being crumpled up and being thrown away, You know that crackle. A friend of mine says there a radio intellectai leaving through the anti fonital at the top of your head

I don't know what it is, uh, but it's it's something is being.[audience] Yea right that's what it is. Uh, then there's this very, uh, very defined sense of bursting through something. A membrane. And on the other side, and this is now remember my experience, on the other side, as you break through there's a cheer. There's uh uh uh a whole bunch of entities waiting on the other side. And they you know that Pink Floyd song, The Gnomes have learned a new way to say Hooooorray . Well, it's that place. It's those gnomes.

And you burst into this space and uhm and they're saying. "How wonderful that you're here. You come so rarely. We're so delighted to see you." And the, one of the things about DMT that's really puzzling is in a sense it doesn't affect your mind. In other words, you don't change. For instance if you take ketamine the first thing you notice, the very first thing you notice before the trip hits, is you notice that you no longer are anxious that you've taken ketamine. You've just sort of anxiety leaves you. That means it's affecting your mind. It's doing something to the judgemental machinery. DMT doesn't lay a hand on the judgemental machinery. You, you break through into that space exactly who you were before you breaking through. And the usual reaction of most people is something like, you know, you think, God. Heart beat's normal. Pulse, normal. Everything's normal, yea, everything's normal, oh god, because these things are there and they're hammering at you and they come forward they're like jeweled self-dribbling basketballs.

And they're there are many of them. And they come pounding toward you and they will stop in front of you and vibrate, but then they do a very disconcerting thing which is they jump into your body. They jump into your body and then they jump back out again. And, the whole thing is going on in this very high speed mode where you're being presented with thousands of details per second and you can't get a hold on you say my god what's happening and these things are saying, 'don't abandon yourself to amazement.' Which is exactly what you want to do it. You just want go nuts with how crazy this is. You they 'don't do that, don't do that. Pay attention, pay attention to what we're doing.'

Well, what are they doing? Well, what they're doing is they're making object with their voices. They're singing structures into existence. These things are, and what they'll do is they'll come toward you, and then, you have to understand they don't have arms so we're kind of downloading this into another dimension to even describe it. But what they do is they offer things to do. They say, 'look at this. Look at this.' And as your attention goes towards these objects you realize that what you're being shown is impossible. It's impossible. It's not simply intricate, beautiful and hard to manufacture. It's impossible to make these things. The nearest analogy would be faberge eggs. [2:24:00]

Transcribed by James Clayton

The nearest analogy would be to faberge eggs, or something like that. But these things are like the toys that are scattered around the nursery of a U.F.O. or something. Celestial toys and they are, the toys themselves appear to be somehow alive. The toys themselves can, uh, sing other objects into existence. So, what's happening is there's just this proliferation of elf gifts. [2:24:30] And the elf gifts are moving around singing, and the whole thing is directed towards, they're saying, 'Do what we are doing', and they are very insistent.

They say, "Do it. Do it. Do it!" And you feel like a bubble, or, and now this is subjective, i mean only you know 5% report this but it happens to me. You feel like a bubble inside your body that's beginning to move up [2:25:00] towards your mouth and when it comes out it isn't sound it's vision. You begin, you see, discover, that you can pump stuff out of your mouth by singing and they're urging you to do this they say 'That's it, that's it, keeping doing it!' And the whole thing is like, you know, we're now at minute 4.5 with this stuff...and, uh, you speak in a kind of glossolalia. [2:25:30] There's a spontaneous outpouring of syntax unaccompanied by what is normally called meaning. It's sort of, uh, [speaking in tongues]. And this is accompanied by a, a modality something seen. [2:26:00] And they say, 'Yes, do it do it do it' and then after a minute or so of this the whole thing begins to collapse in on itself and they literally begin to physically move away from you. And usually their final shot is, they actually wave goodbye, and they say, 'Deja vu. Deja vu.' Which makes no sense at all if you analyze it.

So then you come down, and you're now at minute 6 to 7, and [2:26:30] you come down and it's like being more loaded than you ever been. It's like a 700 mic acid trip, but you embrace it as you're totally down. You say I'm totally down. I mean you look, you look like a termite a from Arcturus and the room is decorated in Amish quilts but I'm completely back! [audience laughs] And then over a minute or a minute and a half or so, the room comes right back together [2:27:00] and and 4 minutes after that, some people can give no account of it whatsoever. They say, uh, i don't, idk it's the weirdest thing that ever happened to me and i can't remember it now, and uh. Uh. So that's the basic run-though, now a lot of stuff is going on in there.

First of all, you know, what are these things? [2:27:30] uh, And why do they want you to do this strange activity? and what's so great about it? Well, hmm, uh, well, first of all, who are these things? Uh, we can like you know be good scientists and make a list of the possibilities and then see which seems more likely. They could be a disincarnate [2:28:00] race of hyper-dimensional dwellers who live in some kind of parallel continuum just over some kind of energy, uh, barrier and they're there all the time. You do have the feeling that they're there all the time. That its on going. That you just cut in on their scene. So that's one possibility. Another possibility is that behind all these psychedelics, and especially dmt [2:28:00] that this is not a drug at all , but it is uh essentially uh uh a pay telephone of some sort to aliens. Good old National Inquirer type aliens, uh, who have, are using this as uh, as uh, a communication domain. Say you know we can't land on the White House lawn, that would create panic and hysteria, so let's create a drug which inside the drug [2:29:00]we will be able to deal with people. And, um, I was hoping that John Mac who's an expert on uh UFO abductions would be here this weekend. I expected him because I think this whole abduction thing is not going to be illuminated until they start giving abductees DMT and saying, So is this is what happened to you? Was it like this? or was it completely, uh, different? Well so then there are those [2:29:30] are the two possibilities that I sort of dealt with over the first 10 or 15 years of thinking about this, and then recently.

[Question from audience]

TM: It could be, what puzzles me is that the, the, abduction thing is so non-psychedelic. It's so cut and dried and all this anal examination stuff with strange machinery [2:30:00] there's nothing comparable to that, I'm happy to report to you.

Transcribed by James Clayton

There's nothing comparable to that, I'm happy to report to you... [Audience laughs] ...uh, going on in the DMT thing. But it may be, you see...it..bec-

Audience: maybe the...the (inaudible) explains what it does to you...

TM: Well, I'd be interested in looking at the possibility that DMT, under normal or abnormal conditions, could be sequestered in the human brain and then some unusual stimulus or stress could cause it to suddenly be dumped[2:30:30]...and, (audience inaudible) yeah.. .

Audience: I want to share this: There have been some migraines that I've had where, you know, what you just described with the colours coming in (inaudible)...it's been so fascinating that I've completely forgotten about the pain and I've just watched it for hours, well or I guess I just fell asleep but it sort of struck a note... and I was always under a lot of stress when I got the headache in the first place and there seemed to be a lot of strange things going on with the migraine in the first place. So I'm wondering if that's [2:31:00](inaudible)...

TM: Yeah, that's an interesting possibility. I also have migraines or the kind called cluster headaches and yes, a lot of the sympto - or the nice thing about DMT is that it's painless but the sense of being split open; and of the traveling skeptomita transcribers note: I don't know what this is and I can't seem to google up anything using a variety of spellings and whatnot - I think he meant "scotoma" ..., as they call these hallucinations that the migraine people see: it's related in some way. Yeah. yeah.

Audience: May I bring science into this a little bit? (TM: Sure.) Um. It involves the principle that its characteristically called "phasing" [2:31:30]Ah - But its - ah- it's basis is sort of what happens on a subatomic level between matter and energy. It turns out there's no fundamental part(?) at that level. They have this dance between matter and energy.

You know, energy coalesces into a bit of matter which then becomes energy...ah - and you can look at this matter/energy relationship as having a wavelength of frequency associated with it. [2:32:00] Now granted this is happens on a subatomic level but if there's something comparable going on, on the level at which we seem to exist in this physical form then it seems to me that there has to be something akin to it. That, it may be that we as beings are sort of tuned to a frequency range, you know, in this particular form and that somehow it's possible to shift that, or expand it to so that what we're actually experiencing is a broader range of frequency, sort of shift in wavelength[2:32:30]...and I think some of this, of these experiences can be at least explored in that context. Ah.....you know.....there's so much that we don't know (inaudible)(TM: Ain't that the truth?) of this cosmos that, ah... but we can take...we can extrapolate (I'm pretty sure Terence sigh/groans here) to some degree We can use this to take journeys and explore this possibility. What we DO know, in science for example[2:33:00], what happens on a subatomic level...and... I mean, for god's sake, the language of these people is sounding more like sorcerers, these days, than scientists.(TM: Ah. Uh huh. Mmmhmm.) and we do seem to, at least, believe from the evidence that we see that there is this matter energy interchange on a very fundamental level; while something is going on on that fundamental level. There may be this, principle of "phasing" which will either shift our tuning [2:33:30]or expand to include a larger spectrum.

TM: Yeah, I think...no I think that that's a very interesting avenue to pursue, this thing about frequency. Somebody told me: one of the great things about this job is you hear a lot of weird stories, and somebody told me a story recently about, it didn't involve DMT; it involved LSD but this guy and a friend of his took a quite large dose of LSD, larger than they intended and they went to a party.[2:34:00] And they were so loaded by the time they got to the party that they realized they could not function as party goers so they just moved into a corner and sat with their backs to the wall and watched this party rage in front of them. And after about 20 minutes of sitting there they both simultaneously noticed it was a dance party; noticed that the music was sounding[2:34:30] really strange and everybody was moving very slowly. And as they watched the thing came to an absolute halt. And people were just frozen. And there was absolute silence. And at that point - ah - the door, at the other end of the room, swung open and, ah, an elf? Entered the room and moved among[2:35:00] all these frozen people and then left, by the door he came in and they both saw this and they said that they could tell that it was, that it - it - it - the people in the room didn't know it happened because for them it occupied a micro-second. But this thing that was, you know, in Carlos Castaneda who, God knows is not the most reliable reporter on these things, nevertheless there is this thing about stopping the world. So. Maybe it's something like that.[2:35:30] That there is, as you suggest, a frequency phase (Audience: inaudible) Yeah. This sort of leads into the third possibility, having to do with the origin of these things. And, in a sense, this is the hardest one to swallow but, in another sense, this is the most conservative (in some crazy notion of conservative); the most conservative explanation (clears throat) because (Audience: inaudible question) (TM drinks: Mm.mm.(no))[2:36:00]

Transcribed by Artemis Jones

[2:36:00] Because, uhm, we have no evidence other than the tabloids that this world is being visited by friendly visitors from zubenelgenubi or zeta reticuli or the pleiades or anywhere else. I mean, to my mind the evidence that this is happening is vanishingly small and totally underwhelming. Uh, the other possibility, uh, that, uh, [2:36:30] there is some kind of parallel dimension in which these things exist is also somewhat poorly supported. If we're talking about something which thinks, something which can communicate, something which is intelligent, then we should look to ourselves as the source of it, because we are the only intelligent, communicating things we know within a certain narrow definition of these things.

So that, it's occurred to me with greater and greater [2:37:00] force and largely prompted by giving DMT occasionally to Tibetans and Amazonian shamans, and when you say to them, you know, to the shamans in the Amazon, when you say to them "What is happening with this stuff? And what are those little things in there?" They say "Oh well those are ancestor spirits, didn't you know? Haven't you heard? Shamanism is about doing healing through the intercession of ancestor spirits." You say hmm, [2:37:30] ancestor spirits, lets get this straight, dead people is what you're talking about right? These are dead people. And, you know, maybe because I was raised catholic I resisted this like grim death. But I'm beginning to think that what you actually break into in that place, is something that we might call, uh, an ecology of souls. That, uh, is it possible to entertain [2:38:00] the notion that at death you actually don't just become worm food, but that something, survives, in some other dimension, and that it has this bizarre character to it, and that this explains their peculiar affection for humanity, and their involvement, somehow in our, uh, fate. Well this is to me is fairly mind bending [2:38:30] as a possibility. If what is awaiting us at the end of the 20th century is the erasure of the boundary between the living and the dead, then we've all been too conservative in our projections of what is, uh, going on.

TM: [calls on audience member] Yeah?

Audience: [inaudible question]

TM: Yes, that there will be some kind of erasure of, uh, the boundary between the two. Well, once i had this idea, you know, [2:39:00] I mentioned my Jungian and art historical proclivities and so that means that you always looks back through tradition and folklore to try and find something analogous to this. Well, there ain't much. But there is one area that seems suggestive to me, and that is, as you all know, the Irish are a-a, uh, very(fairy?) haunted race. They're also an intoxication obsessed race, at least in stereotype. [2:39:30] Well it turns out, that, uh, you probably all are familiar with the notion of purgatory? Purgatory is the place where you have to spend a lot of time before you get to heaven, if you're not bad enough to go to hell. So you put in a few [inaudible 2:39:50] of eternity in purgatory and then you get let into heaven. Well i had always assumed that this dogma, [2:40:00] I don't know i hadn't really thought about it, I just sort of assumed it arose with early Christianity. But when I began looking into this I discovered that the idea of purgatory, was invented by Saint Patrick, and it was invented specifically to convert the pagan Irish, because the pagan Irish believed, uh, in the, in the land of fey. They believe that there was this nearby dimension, full of the souls of the dead, surrounding [2:40:30] us all the time, and that certain people with the gift of second sight could see this. So, Patrick just said to them, "Oh no, that isn't it. It's purgatory." And was able to push that on them so successfully that a later church council adopted it as general dogma for the church, to use in converting the pagan Slavs as well. So, uh, it-it's an idea of, [2:41:00] uh, a nearby dimension, inhabited by disincarnate souls, that, uh, is apparently very old, but very alien to our tradition.

TM: Yes?

Audience: [inaudible] ...It's a gross oversimplification but it's kind of related and it has to do with the quantum wave function, which is really kind of a dual wave, there's two parts to it. Uh, one part, and they both have a temporal or time related aspect to it, one part which is called the ordinary [2:41:30] part of the wave, can be seen as a wave propagating forward in time. And the other half of the wave, which is called the complex conjugate, can be seen as propagating backwards in time, from some future state. Some past state, some future state, emitting waves which at some point interact and produce what is perceived by us as the present state, which is really a dynamic process in itself, there is no absolute present...[2:42:00]

Transcribed by Danny Hollman

[2:42:00]

Audience: But the interesting thing is that what that implies is that what we experience in the present whatever they may be is somehow related to some future state and some past state. But it also means that neither future or past are fixed and that we could sort of align ourselves with different tracks or vectors. You know, and a slightly different

vector that's slightly askew may produce something totally uh different [2:42:30] than what our ordinary perception would be. What do you think?

TM: Well, yeah, This could be. I mean, I've always felt that that what biology is, is some weird kind of chemical strategy for amplifying quantum mechanical indeterminacy. That you know, that macrophysical objects are not subject to quantum mechanical indeterminacy. But organisms apparently are, especially thinking organisms.
[2:43:00]

Audience: We don't know. That's our perception. Our perception is that, is that objects on the macro scale are to scale, are not subject to quantum fluctuations. But that's only because uh of this probability wave in some sense, in that, that there's a most probable state. And if we happen to exist in that, that our perception is that it, it's more fixed . That there is no indeterminacy, that [2:43:30] it obeys certain laws that are rather linear in nature. Uh, but we really don't know.

TM: What you're sort of saying is that the natural laws only apply some of the time, which gives them a curious status as laws in that case.

Audience: Yeah, (inaudible) but to broaden the notion of relativity. Uh, I mean, what happens in a black hole for example, what is singularity? It simply means that the laws that normally apply in everyday experience no longer are relevant.

[2:44:00]

TM: Well, one of the problems cosmology is meeting [2:44:00] is that there are so many large black holes in the universe that you come up with you know, ten high six singularities. That's a few more singularities than a good theory would tolerate, I would think. I mean, what kind of theory is it that hands you back ten to the ninth singularities? Which are exceptions to the theory?

Audience: That's true, but a lot of that is based on assumptions that are stretches.

[2:44:30]

TM: Ain't that the truth (laughs.)

Audience: Again if we get back to a psychedelic experience, you know, it's this whole lower dimensional language slice thing that we seem to have to operate in in order to describe an experience that just does not fit with that slice. You know, we do our best to do it, you know and sometimes it comes across being very crude and naive. Sometimes

it kind of gets close to the mark, but it's difficult to know. Ah, I mean the whole notion of black hole singularities is just [2:45:00] the present attempt at explaining some of the theory that is beyond ordinary experience. None of us encounter a black hole (inaudible.)

TM: That's true. It seems to me one of the embarrassments of science is that the Big Bang begins with a singularity, And, so then, you have this whole vast interlocking schema of rational explanation, except that it begins [2:45:30] with a hard swallow. You're asked to believe that the entire cosmos of space and time sprang from a point no larger than a cross-section of a gnat's eyelash. Whatever else one could say about that theory, I'd think you'd agree, it's the limit case for credulity!

Audience: Oh, absolutely!

TM: I mean if you believe that, try to think of something that you would throw up your hands and say, "Well, I'm not buying that!" (laughs) [2:46:00] It absolutely, it's sort of like when you join the Catholic Church you make a declaration of faith. Well when you join Science you sort of make this declaration of faith that, "I do believe that the universe sprang in a single instant from an incredibly tiny, hot, dense dot!" Unlikely, but, who knows?

Audience: Here's something else. As you two were dialoguing a bit I was getting a visualization of, you have to look at the pond of reality [2:46:30] so to speak, as not only being the um visual of someone throwing a pebble from the top of the pond and creating the ripple effect of waves, but also from the bubbles coming from below. And to me the deep space that you were talking about is the air inside the bubbles coming from below. And so the dimensional reality of that picture is not a linear time perspective. It's something coming from all directions. It is again the center of the mandala itself.

[2:47:00]

TM: Well, this is why I say the psychedelic experience is a boundary dissolving experience because it takes away past, present, cause, effect, all of these things uh disappear. Now remember I said ayahuasca is a kind of slow release DMT trip. And one of the really interesting things going on with ayahuasca to my mind, perhaps the most interesting thing, is that the style in the Amazon of taking [2:47:30] ayahuasca is uh people get together in a darkened hut at night, and they take it and they sing. But the songs, their selling them at the table back there, the songs, when there's a break in the singing and you hear the people discussing the songs, they don't discuss them like music, they discuss them like sculpture and painting. And they say to the Shaman "I like the part [2:48:00] with the gray bars and the blue speckling. But when you brought in the pink in combination with the beige and white I thought it was too much. Say what kind of a discussion is this about songs? You realize then when you take ayahuasca they see the songs. Now this is really interesting to me, you remember in the DMT flash they wanted you to use your voice to make objects.

Transcribed by Micki Garrison

... "I like the part with the great bars and the blue speckling, but when you brought in the pink in combination with the basen white I thought it was to much". See, what kind of a discussion is this about a song? You realize then when you take Ayahuaska, they see the songs ah.. and now this is really interesting to me because, you remember in the DMT flash they wanted you to use your voice to make objects, well then in the Ayahuaska trance you use your voice to control these colored modalities and ah.. the whole thing is done that way, well so then what it must mean is that the neurophysiology of Ayahuaska somehow allows for the ordinary signal processing, which is being chanted into the audio pathway in the brain, is instead being chanted into the ossicle pathway, this is what's called a Synesthesia. These things have been fascinating for hundreds of years to people but the synesthesia means that, you know, color ah.. sounds are seen. Well, now what was this anything other than a neurophysiologic curiosity? Well I maintain it is, because I think that a language which could be seen, would be a kind of telepathic language. If you thought much about telepathy, you might have naively assumed that telepathy is you hearing me think. That isn't what it is, I think. Telepathy is you seeing what I mean. And it's not something which happens dramatically, it is a function of eloquence, you know, first you have the speaker who that is boring you to death, then you have the speaker who at least holds your attention, then you have the speaker of who may had said, she paints the picture. It means we're moving toward poetry. Well it's possible to imagine a transformation of the neural processing of language, it may be a behavioral possibility, it may not even require a gene shift. Where then we would see what we each mean. You know there's this persistent idea, promulgated by Robert Graves in the White Goddess, among other people, that there was once what he calls a Orshba(?) a primal language so emotionally intense that, to be in the presence of poetry declaimed in this language, is to see the poetry and that this is what the last poetics of the high paleolithic were about and probably it was pharmacological assisted that you can gather people in the presence of a great bard, or singer, and that person could then create telepathic modalities, and that telepathic modality, that richer more unifying language was the thing which was suppressing the formation of ego. The ego speaks and hears through sound, the super-ego projects images and is perceived as images. Now it's very interesting, at least to me, that in the pineal gland of ordinary human beings there is a compound called Adeneroglomerotropine which, when analyzed in inorganic or just in the normal nomenclature of organic chemistry, turns out to be ah..a betacarboline closely related to harmaline. Well is it possible that we are as close as a one gene mutation away from a shift that would switch our processing of audio input into the visual field and that then we would cross over into a realm of beheld understanding, and that this is the evolutionary leap that we're trying to make that is in the body, not in the technology, in the body. There's is actually going to be a minor, a one gene click to another channel and then we will be able to see what we mean and I maintain that if you can see what somebody means, you are that person, contrasted.. contrasted to ordinary communication. Ordinary communication is achieved through ah.. small mouth noises, as primates we have a throat and voice ar.. a voice box arrangement that allows us to produce small mouth noises at.. for hours if's necessary and I'm the living proof of it ah... but it's not a very efficient mode of communication because what happens is, I have a though by looking a culturally sanctioned dictionary which I have copied into my head. I translate the thoughts into an acoustical signal using my mouth which moves across space, which enters your ears. Your rush to your interior dictionary and you construct my meaning out of your dictionary. Now notes that this process rests on a very shaky assumption, it rests on he assumption that your dictionary and my dictionary were published by he same folks in he same year. If your dictionary is different from mine, you will not correctly reconstruct my meaning and we we'll have what we call misunderstanding. Notes how among us...

Transcribed by Nicole Pralaya

[2:54:00]

TM: most bring down things you can say to somebody is, would you explain to me what I've just said? Because it means, oh boy here comes trouble, now you're gonna find out, that you know, people didn't understand you. They horribly misunderstood and and the uh communication is very provisional the amount of noise in the circuit is huge. Well then contrast this to, I utter something [2:54:30] and it

condenses as a sculpture in the air and you and I then become its observers and we rotate this syntactical object and we look at it, we regard it from many points of view.

This is not ambiguous or its certainly considerably less ambiguous than this reconstruction from interiorized dictionaries. So perhaps what all this is about is evolutionary pressure on our languages to become visual and therefore to become more unified and less riddled with noise which creates misunderstanding, which creates horrible social realities yeah.

[question from the audience] I just remember reading a book called Holographic Universe

TM: oh Michael Talbots book uhuh

[question continues] he was talking about uh visual experiences being about fifty percent based on [inaudible from audience] and addition internally to to you know what coming to visual[2:55:30] it sounds like a transmission problem translation

TM: y yes although what you could do with a visible language would be very challenging we could do many things with it it is not an outlandish, it's not a completely outlandish idea. In nature it occurs, there's this fa there's a wonderful [2:56:00] hexonomenon in nature which is worth talking about to sort of legitimate such a far out notion which is as you all probably know um octopi uh can change color, this is one of those things you learn on those science specials on tv.

[transition from tape 2 to 3]

TM: Octopi can change color [2:56:30] well most people I think, assume that they do this for camouflage, that would be a reasonable assumption. They don't do it for camouflage uh let's talk about octopi for just a moment. First of all they're mollusk, they divided from our evolutionary line seven hundred million years ago, they are related to escargot uh they have no backbone for crying out loud they're not even vertebrates uh [2:57:00] But what is always said by biology classes about octopi is that they're a wonderful example of parallel evolution because their optical system is very much like a mammalian optical system. well why is this? Well it's because they've evolved in a in an environment uh the reef environment that is a um all is dense with signals as a rainforest is and uhm [2:57:30] an octopus is soft bodied it cannot only change color but it can also change its surface from smooth and rubbery to bumpy, pimply, rugose, ribbed so forth and so on and also because it is soft bodied and in an aqueous environment it can fold and unfold and reveal and conceal parts of its body very very quickly. [2:58:00] Well all of these uh behaviors and physiological characteristics go together to make the octopus an excellent visual communicator and the color changes the blushes travelling dots and bars that these creatures manifest and the squid do it too uh are language and if you're interested in this there is a wonderful book by a guy named Moynihan called Communication and non communication among [2:58:30] the Cephalopodidia and he goes as far as creating a a grammar for this stuff. Well so then in a way you know if you pull back from the mundane assumptions about this what's happening is the octopus wears its mind on its skin. It is

dressed in its mental state e one octopus encountering another can tell [2:59:00] its mood, how recently its eaten, how recently it's had sex, whether it's ovulating all by looking and so they the only way an octopus can have a private thought is by squirting ink into the water and then hiding inside it. This is essentially it is correction fluid for misspoken octopi you see [audience laughs] so in a sense this is what we are are being beckoned [2:59:30]

toward that we want to clothe ourselves in language, we do it to a degree in a funny way. I mean if you wanna think about virtual reality this is a virtual reality all this stuff these fixtures the architecture the infrastructure the road, these are ideas it was an idea and then it has been summoned into matter by the allotment of funds the spending of money the hiring [3:00:00]

Transcribed by Arsen Vidakovic

..the spending of money, the hiring [3:00:00] of craftsmen, so forth and so on. Our whole civilization is an excreted set of interlocking ideas, agreements. We're like choral animals, and we somewhere, you know, there's this naked, pulpy creature, but, you know, clothed in denim, clothed in, uhm, harder shell produced by Mercedes or Chevrolet, moving around inside the larger environment, produced by the state of Colorado, and so forth and so on. So I think octopi offer an excellent metaphoric example of what naked-mindedness would be. And some of these octopi, uhm, [3:00:45] as i said, they evolved in the, uhm, coastal reef domain. But that's a very competitive domain. Everybody in the ocean wants to be there, because that's where the sunlight and the food is.

So if you're smart you'll try and evolve into a more hostile niche. And some of these octopi have become what are called benthic, or abyssal. It means, they exist in the parts of the ocean where light never reaches.

[inaudible from audience].

TM: Yes and they, uhm, have retained this communication ability by switching over to interior, uhm, interiorly generated phosphorescence. So, [3:01:30] there are species of octopi, which actually are studded with organs that have the equivalent of eyelids over them. But they're flasher lights. So when you descend into the benthic depths [3:01:45] of the ocean, you enter a domain where all one octopus ever sees of another octopus is its linguistic productivity. Because that's interior generated light that can be seen. And I think, you know, if you want to set the compass of virtual reality towards something worth, uhm, riding home about, then producing an octopus environment, so that we could experience this kind of thing would be a kind of proto-telepathic, uhm, playpen of some sort. Yeah?

[inaudible from audience]

[3:02:30] TM: Aha, so you think that subterfuge, uhm, enters here too?

Audience: Yes, [inaudible] last night when you were discussing the role of psychedelics and you were going by the [inaudible]-theory.

TM: right.

Audience: I assumed you were [inaudible] Rupert Sheldrake's theory.. [inaudible] psychedelics may, uhm, [inaudible] [3:03:15].

TM: Well, le-..., you want me to [inaudible from audience]. Yeah, well.

[inaudible from audience].

TM: Well you raise a lot of issues. First of all, since the discovery of retroviruses, of which the HIV-virus is one, we now know it is not always information transcribed from DNA to RNA to protein. The retroviruses transcribe from RNA to DNA [3:04:00], uhm, so the central dogma which is that the genome is not being altered by, uhm, a-, uhm, by the environment, is, uhm, is sort of shaky at this point. Uhm, you bring up a very interesting point which has never, to my mind been thrashed out in orthodox science. Which is, if you had a bunch of these psychedelic molecules and we could raise them up to the size of loaves of bread, or something like that. Y- what you would notice about them is they're all what are called by chemists, planar. Meaning, they tend to be flat. They're not lumpy, they're flat. Well, if you look at DMT [3:04:45] or harmine, uhm, harmine is built off a, a, pentexyl-group, and with two, uhm, benzene rings off of it. It is the perfect size to slip in-between two nucleotides in DNA. It can actually bond into the DNA there. Now, many drugs do this. Uhm, this is called, these drugs are called dimers. The usual problem with a dimer, that will intercalate. This is the other term, intercalate, means slide between the rungs of the DNA, is usually deforms the DNA. It like passes, uhm, a bulge [3:05:30] along, and then, uhm, transcription is difficult, but these indole hallucinogens can dimer with DNA without disrupting its structural integrity. This is why I believe that this is the source of the vision. That, an, you know, orthodox biologist just roll their eyes at this idea and say, well now you made a very [inaudible] error here, you can fuse genetic information [3:06:00]

Transcribed by Andrea Casanova

TM: with information. Don't you understand that genetic information's just a sequence of codons coding for protein? And uh, you know, that has no relationship with your memory of Aunt Ninny's face. However, by being so, uh unyielding on that point, they create a huge problem in um.. In uh... for their brothers and sisters across the hall who are trying to understand memory. Because the, the molecular theory of memory is a nightmare, here's the problem. Every molecule in your body is changed every 5 to 7 years depending on who you talk to. Uhhh.. except neurons. The nerves are generally the nerves you're born with are the nerves you die with. But it's an absolute uh it's an absolute... uh... nono to suggest that memory is lodged in the neurons. Well, if Aunt Minnie died 45 years ago, and you can still remember the dear woman's face when she used to walk you in the park, then every molecule of your body has been swapped out five times since she quit the plane. How can you have this memory of Aunt Minnie? If and then they say "well," well they don't say actually, they just throw up their hands. Now, the- to the people who say DNA can't store any kind of information other than codon sequences for proteins, they have to explain why 90% of the genome seems devoted to junk sequencing that does not produce proteins, that does in fact not do anything that anybody knows about. It seems to me that we might as well just take the path of least resistance and saying if the neurons are the only part of the body that persist throughout life, if the memories persist throughout life, then you've got two choices. Either the memories were in the neurons or the memories were never stored in the body in the first place. And if you believe that then well the obligation to explain just where they were stored is hard upon you and the mechanism for retrieving them. So I think molecular biology for being so reductionist has made certain

problems in... in neurophysiology in higher cortical functioning almost insoluble. You know, for years and year it was held that [drinks] the, this was another one of those central dogmas of biology. It was held that uhh... information could move from the nucleus of the neuron to the synapse, but that there was no transport mechanism for moving any molecular species from the synapse back to the nucleus. So consequently they said learning cannot take place in the nucleus of the neuron because the the materials for learning which would be present in the synapse modifications through experience, there's no transport system. Well this was dogma until 10 years ago. Well then they discovered what's called axoplasmic transport and then by putting labeled compounds in the synapse they were able to locate these compounds later, uh complexed with nuclear material in the neuron, proving to the most die-hard materialist that synaptic material was in fact moving backward to the neuron. So I think that uh, you know there's much that isn't understood about how all this uhh works. Euh something about this pointing out, you know, science seeks closure, and explanation, explanatory closure. My brother one time made a little aphorism which I think says it all on this subject. He said to me once, actually on a mushroom trip, he said "Have you ever notice how as the sphere of understanding grows ever larger, necessarily the surface area of ignorance gets ever bigger?" [audience laughs] seems perfectly clear, you know a simple minded way of saying that is the bigger you build the bonfire, the more darkness you will reveal. Yeah.

Audience Member: progress really comes from uh outside the context of the paradigm that hasnt, hasnt [experiences. I mean really, to my knowledge, almost everything that's really been advanced has been [cough]philosophy [inaudible].

TM:Yes well some of you have probably read Thomas Kuhns The Structure of Scientific Revolutions where he shows you know, that it's never the way that they tell it afterwards. The after telling is always about the primary insight, the careful experiment, the gathering of data, the correlation. Actually, it doesn't work that way at all, it its entirely uhh... physic, piecemeal, ruled by synchronicity. One of the most interesting things, i'll tell this story and then we'll go to lunch because, you know science has great pretensions about itself. I mean, it basically regards itself as a metatheory. It regards itself as capable of passing judgement on all other theories. They are supposed to be submit

Transcribed by Shant

[3:12:00]

submit themselves to science to be told whether they're real or not.

Audience Member:Like a religion.

Terence McKenna: Yeah like a religion.

Well how many people know uh eh eh the you know. Modern science was founded by René Descartes in uh in the uh early Seventeenth Century. What were the circumstances under which Descartes founded modern science.

René Descartes was a 19 year old uh [pause][3:12:30] basically ne'er-do-well and he decided that he would go wenching and soldiering across Europe, which was a thing that young men of certain class did at that time. And so he joined a Habsburg army that was laying siege to Prague in the in the summer of 1619 and after they had taken care of the problem there in Prague, this Habsburg army began to [3:13:00] retreat across southern germany and in

the on the ev-evening of uh, now there's a lot of arm wrestling about this but let's just say the 17th of August 1619, this army made camp near the little town of Ulm in southern Germany which, synchronicity freaks pay attention. Ulm will later be the birthplace of Albert Einstein, worth noting. But that night Descartes in the barracks [3:13:30] uh, had a dream and an Angel appeared to him and the angel said uh the conquest of nature is to be achieved through number and measurement, and he was, thunderstruck. He took that, angelic revelation and turned it into modern science. Modern science was founded by an [3:14:00] Angel, [Audience Laughter] you know, they don't tell you this at MIT [Louder Audience Laughter] uh you know it's it's astonishing uh how how eh things which claim roots in rationalism are actually among some of the most irrational productions uh in the historical continuum. It's it a-appears that our development our history our histories have always been uhh created [3:14:30] at the promptings of invisible voices. I mean Socrates who is at the very centre of what's called thinking in..by Western Civilisation. Socrates had a deamon D.e.a.m.o.n it was a little voice, it told it was his crap detector, it told him the difference between profound philosophical thinking and bullpucky, and uh so you know the edifice of Western [3:15:00] Thinking built on Platonism owes its debt to an invisible agency speaking from hyperspace. So does modern science a la Descartes. How much more of this I mean we don't care if artists talk to angels because we tre.. our definition of them is that they're screwballs [Audience Laughter] uh but eh uh ehm uh to believe that a uh a enterprise like modern science has to trace it's way back to the same ecstatic roots is I think uh [3:15:30] uh very suggestive that the world is stranger than we can suppose, and that we need to open, these channels of communication to these invisible worlds, probably the next great paradigm shift will be annunciated by a Mushroom, an Angel, an Elve, an Alien, what have you.[Pause]

Yeah?

Audience Member: Um With the Dmt trip what was your technique for bringing back, for holding on to this info.

Terence Mckenna [3:16:00] Repetition. Yeah. The first few times I did it I couldn't get any grip at all on it and by talking a lot and trying to describe it you slowly slowly build up a map.

So about the Logos, um the Logos is this phenomenon that was sort of the centerpiece of Greco uh Hellenic spirituality. What it is is it's a voice in the [3:16:30] head that uh people strove to attain for a thousand years this was the Sine qua non of uh intellectual accomplishment in the Greco-Hellenic world and the Logos, told you the right way to live and this is sort of what you get with psilocybin. You get a voice that can, confound you with the depths and brilliance of its [3:17:00] answers and one of the great, you know one of the puzzles of uh, trying to understand Greco-Hellenic spirituality is what were they talking about a...an.. and if this ever was a general phenomenon then what happened to it, why do we not experience this Uh, This is not well understood I mean the rational scholars who have created our vision of Greece, basically just dont even [3:17:30] want to talk about this they would rather gloss over it, umm [pause] you know [pause] one of the, things that sort of relates to all this is I think human beings are a lot more malleable than we tend to imagine, in other words we imagine that people in the distant past or in Greece or somewhere were just like us except they were living in a different time and place. There's no [3:18:00]

Transcribed by Tim Collinson

[3:18:00]

way to find out of course if they're all dead. But there are certain episodes in the evolution of Western culture that suggest that people may be much more plastic than we ordinarily suppose. First example, um, would be, how can it be that in the middle 1500s perspective was discovered. I mean how do you discover perspective. [3:18:30] This is very hard I think for modern people to understand. Because oohohoh..it's a given for us. I mean we see in perspective. We accept it as a quality of the world rather than a..ae..a cultural artifact put in place at a certain moment. But in fact during the Renaissance, only the most inspired people could um, paint in perspective on the natch. Most [3:19:00] people they had, complex devices called perspectographs that would project over the scene a receding grid and then people would essentially fill in the lines.

Now another example of this kind of thing that's not so well known but that is an example that uh Marshall McLuhan [pause] makes a lot of is St Augustine the great father of the Christian church. He had a reputation[3:19:30] for being a very holy man, and the accounts of his contemporaries say that, the way people would satisfy themselves that St Augustine had a pipeline to god, is they would bring him scripture, the bible essentially, and open it in front of him and let him look at it, and then they would close the book and question him about what was there, and he would always tell them, [3:20:00] and they were amazed. As far as we can tell St Augustine was the only man in Europe who could read silently. Nobody else could do it, it was regarded as a miracle. [Audience Laughter] Now we all, read silently, and there may be a few unfortunate individuals amongst us who move their lips while they read, but that's the only vestigial trait we have of this previous cultural mode where, everyone, to read meant to read aloud [3:20:30] no one could conceive of another way of doing it.

The Logos seems to me uh a kind of similar thing. It was a mental behaviour, function, which for reasons which are probably complex and unknowable, slipped out of reach. That's why [pause] it seems to me these psychedelics are very close to being able to modify our behaviours along these kind of lines. Because there [3:21:00] are a number of behavioural and experiential possibilities, that we suppress. I mean i think it's just uh ah as an example of how little we know about what's going on uh look at the Gräfen wuh don't look at it but conceive of the Gräfenberg spot, the G spot. Now we all know what this is. Clearly people were looking for it for a long long time, how come they only discovered it twelve years ago. [3:21:30] I mean if something that major can be overlooked then it's hard to imagine what might have been overlooked I mean that's pretty central into the project of being a human being and apparently it was unknown until very very recently. So um yes th the logos was probably uh what I call the Gaian mind, and that at a certain point in cultural development people just [3:22:00] became so chuckle headed that the Gaian mind just said heh The hell with this. And uh then the voice fell silent. It fell silent right at the around the time of the birth of Christ eh right at the time of the ge eh of the shift of the cydiacle aeon you know.

Audience Member:[Inaudible (Something about phenomenalisised awareness, the Ayahuasca DMT visions related to Psilocybin)]
[3:22:30]

Terence McKenna: How it works with psilocybin?

Audience Member: [Inaudible]

Well uh i mean I take, when I take Psilocybin i take it on an empty stomach I don't fast or anything like that I just

don't eat for 6 hours, I don't call that fasting. Uh and then I take it in silent darkness. That's number one very important. The next thing is weigh [3:23:00] the dose, you must weigh the dose. Because 5 grams is what you want. And I've had over and over the experience of showing somebody what five grams is and they're appalled. They say my god you can't be serious I mean I wou.. I take uh... a fifth that much a fourth that much. Yeah well that's the problem that why you don't have elves in the attic and bats in the belfry like I do [audience laughter][3:23:30] um you know and so then you take it and I take it on an empty stomach and a lot of people don't like the taste I don't really understand that uh, I just chew em up, I sit with them, and I chew em up and then... huh..

Audience Member: Dried?

Terence McKenna: Dried.

And none of this mixing in apple sauce or any of that malarky I mean what's that about. [audience laughter]

Audience Member: [Inaudible (something about fresh vs. dried dosage)]

Terence McKenna: Oh well fresh 60 grams. 60 grams. Uhh
[3:24:00]

Transcribed by Tim Collinson

Uh, (3:24:00) because there's more than a, you know-- there's a huge water loss there. And, uh, then it takes-- people sometimes say, "It came on within 5 minutes." Or, "It came on within 10 minutes." I don't know what that could possibly be about. First of all, it defies pharmacokinetics to imagine that it could come on that fast. For me it comes on, almost always, at the 1 hour and 20 minute mark. I think it can come on sooner than that. (3:24:30) I think I'm fairly resistant to these things. In the hour-- After I take it, I sit, I roll bombs, and I-- I carry out what all good Catholics know as an examination of conscience. This means you think about all the bummers that you're afraid are going to jump out at you as soon as you get loaded. If you will carry out the examination of conscience, you will be so bored with that (3:25:00) by the time the compound actually hits that, you usually won't have to pay any dues. Because you have faced the fact that you are a jerk 50 times in the preceding hour, so-- And then, the way i do it is; at about the hour and 20 minute mark-- and I should say in the time preceding that, you may have to go to the bathroom once, you may-- It makes your nose run, which is a funny thing. It also makes you yawn. (3:25:30)

These are definitely qualities of psilocybin, not related to its psychoactivity. And, uhm, and I think that it's very good to decide before it hits, that once it begins, you will not alter the plan. In other words, you decide ahead of time - I'm going to sit here and do this. Because at about the hour and 15 minute mark, it will begin hitting you with stuff (3:26:00) like, "You'd really be more comfortable down stairs." Or, uh, you know, "It's awfully hot in here, why don't you get up and adjust the thermostat?" All this stuff, you just say, "No.No. - No. No." We are holding the

space. And sit there. Then, it begins to come on. And it comes-- the image I have is like a jellyfish, or a silk scarf, or something like that. It just kind of drifts down, and surrounds you.

And at that point (3:26:30) I-- I-- I guess I pray. I say to it, you know, "I'm completely in your hands. Please don't hurt me, you know. I'm yours. I'm completely committed. I've held nothing back, so don't burn me, please." And, uh-- and then there is a kind of-- it is hard to describe-- a kind of, uh, potential (3:27:00) begins to build up. And you say, "Hmm." The rush hasn't begin- begun, but it's-- you can almost close your eyes and see millions of little psilocybin molecules elbowing serotonin molecules out of the way. And fitting themselves into the receptor site. And the electron spin resonance dynamics is beginning to shift, and the whole thing is about to take off.

At that point, I smoke furiously. (3:27:30) And that usually is all it takes. And-- and it-- it comes on, and it-- the first rush is really astonishing. I mean, sometimes it's more mind boggling than others. But I can remember situations where I would just see it coming and say, "Oh my God!" You know? It's 100 miles wide, and 10 miles high. Where are you going to run to, you know? It's just coming-- (3:28:00) you say, "Good g-rief!" You know? "I guess I'm not going to meet this one sitting up. I think i better lay down." And in about the time it takes to make and execute that decision, then it just hits. And it's like a tidal wave. I mean, I have the feeling when I'm doing it in California, that everyone from Vancouver to Tijuana has just, uh, crawled under their desk. Because you can't imagine. This is happening (3:28:30) between my ears? You know, it's more like an asteroid must have fallen in the Pacific Ocean and raised some enormous incoming wave. It's-- what it's sort of like it's like watching a thermonuclear explosion through 50 feet of crystal clear glass.

So, you know, you are perfectly calm. It's not getting at you. But the energy that is being released in your presence is awesome. And then, (3:29:00) it, uh-- and sometimes in that first pass, you actually-- the linguistic machinery is burned out. You've probably seen these scenes where they will test a hydrogen bomb. And they set up cameras a quarter mile away from ground zero - a half mile, a mile, two miles. And then when they actually detonate the bomb, they get the view from the first camera. And then they switch to the second camera as the first camera (3:29:30) is blown to bits and vaporize. And they keep pulling back as each successive instrument is destroyed. Well, this is sort of the feeling you have as this thing spreads out toward you. And then, it, uhm-- it does what it wants to do. It tells you what it wants to tell you. And it's highly unpredictable. I mean, you can not-- people always say you should ask it a question. This seems absurd to me. I mean, I don't know. Once, when my (3:30:00) life was in turmoil...

Transcribed by Jason Bastin

TM: Once when my life was in turmoil, I- I.. I did ask a question. I said, uh.. I-I wrote it down ahead of time and the q- and the question was 'Am I doing the right thing with my life?' And then when I got in there and I posed the question and the answer came back instantly It was a uh.. a ripoff from Lyndon Johnson it said: What kind of a chickenshit question is that to ask mee!?[3:30:30] said oh, sorry didn't mean to presume you know [laughs] Get your act together and then we'll have a conversation, but if that's what you wanted to talk about you should've taken MDMA.

Audience: [sporadic laughter]

TM: And.. it uh, and then you know paralleling what we talked about this morning and again I'm just giving you my subjective take on it. It's like, um...[3:31:00] [clicks]

I come into a place. It's hard to describe, it's a feeling ... and- it's- Ikn- ump-...andd- the content of the feeling is now the elves are near, ..but they won't appear unless I invoke them. And you know I wish I could tell you that I chant in 'mandian or something like that but I don't, well I stole a line from[3:31:30] an old, old I Love Lucy program where Ethel is talking to Lucy about UFO's and uh.. Lucy says she talks to the UFO's and Ethel says well how can you talk to UFO's? and Lucy said well it's simple I just say: Come in little green men. Come in little green men. And that's what I do! I say come in little green men, and then there is ah.. [3:32:00] and women if there are any out there! [laughs] and then there is a.. It's like ah.. it's like -ike -it's like a marching band. It's like a make-believe marching band is what it's like and it comes from a distance like there's a place in my vision that's small. A little dancing light and a- and a little faint sound and the light comes closer, and the sound gets louder until [3:32:30] finally, you know, they pick me up on their shoulders and with tubas blaring and sackbuts and reed bac and all this stu- then they carry me around and talk to me and it's... the whole thing is shot through with such a weird sense of zaniness, irishness, joyfishness, I mean it's almost unbearable it's so...uhm i don't know not exactly [3:33:00] Disney-esque because their humor tends to be a little more savage than that. And then that is part of the first wave and then the rest of the trip unfolds pretty much as you..a-- there's a kind of a pushing and pulling that goes on. You can direct it it. Each one of these plants does have a character of its own an-

Audience Question: Inaudible

TM: Sure, um th.. it--t one of the most puzzling things about these- these [3:33:30] plants is that they have characters that seem irreducible for instance psilocybin: it is the science fiction drug. In other words, it says uh.. you know: we have been denizens of this planet for 400 million years, our original home planet is in the M5-83C system. We are connected via hyperspace to all intelligent lifeforms [3:34:00] in the galax-. It shows you enormous machines in orbit around alien planets. It talks about the end of history and the collectivizing of humanity. And it's this enormous, hortatory, salvational, dramatic, science fiction type scenario. Well then you take ayahuasca, which in molecular terms is just a few nitrogens are moved around i mean it's basically [3:34:30] the same thing and you get a completely different message. You- you- you se- you feel the energy of the rainforest and the rivers, and you.. It's very feminine. you think about childbirth, you think about the continuity of generations, you think about the- the- uh.. mystery of the meat. You think about tantric sexuality. It's all [3:35:00] redirected back into the human and natural world in some way.

And then of course DMT which I described this morning. Which the DMT elves are not.. from outer space or they don't present themselves that way. In fact one of the odd things about the DMT thing is that you have the feeling that this space that you break into, even though it's large- Some people even refer to the dome of DMT, that tells you they [3:35:30] really were there. But wherever this huge vaulted space is you have the feeling, although it's hard to explain how you know this, but you have this feeling that you're way way way underground which fits with the elf motif you're in the hall of the mountain king. You're under the hills with the, you know, the little people who retreated under the hill. Ah.. The character of these things is one of the most puzzling things [3:36:00] uhh about them.

Transcribed by Mark Carver

Uhm..

Audience (inaudible question)

Terence: Well, that's a real question, the Logos seems more.. It personally isn't.. It doesn't crack jokes and do quadruple uncondro tons and stuff like that.. Its more like a wise, loving creature.. Urm.. This DMT thing is.. You know.. Its a troupe of maddened elves, and they are just doing their own thing. And then with ayahuasca, though.. Some people claim they contact an entity it hasn't been like that for me, it seems to me mon ayahuasca you become.. Like a, a camera.. You just, lye through a visual world.. I mean after a good ayahuasca trip you just feel like your eyes are bugging out of your head. I mean, it's like buying prints on Madison Avenue you knoww.. And you've just been looking and looking and looking and you literally had to give your eyes a rest after an ayahuasca trip and the ayahuasca visions are more... (..exhales..) they seem to cover a broader spectrum.. The psilocybin hallucination tend towards this highly polished, machine like, insect like, outer-space bit and the ayahuasca hallucinations are wonderful pastels.. Laces.. Layering of colors and then one of the most interesting thing to me about ayahuasca and I just cannot understand how this works if i could i'd be (inaudible) or somebody, and that is that you in the middle of an ayahuasca trip you can suggest motives, you can leave it so that for instance you can say to it; euhh.. (inaudible) and suddenly there will be thousands of candiditious cigarette lighters, champagne buckets, automobiles, paint glass windows, door knobs, silverware, all rolling in black space in front of you or the perfect exemplification of this ecstatic, the art deco ecstatic.. And then you can say to it.. Okay.. italian borough. And it just like that.. Suddenly, alter (inaudible), Madonna's, martry saints, euh.. And fantastic scroll work and fluid elite (inaudible) and you should say.. Well.. surprise me. (audience laughter) and then you will get a coherent style like our deco, like italian borough.. Except that is nobody is there to bother to realize it on this planet. But it's as coherent ah.. Its like you know.. 20 years ago there was no such thing as south west. As a style. You know.. This weird thing coming out of santafade (inaudible) that I notice its planted its roots deep here as well.. (audience laugh) the turquoise and beige endlessness of feathers and hammered titanium and all that.. Well that's an escatic that's as cohered in the last 20 years and coming to being.. There seems to be an infinite number of these things.. As different as the (inaudible) of the high dynasty are to a (inaudible) Dalli? Or Apollic? Or Abage? And then you can say to it, going beyond the surprise me challenges what i always say to it is uh, "i want to see more of what you are for yourself". And then its like this.. This., low organ tone.. And it begins to lift the vales and the temperature in the room drops about 20 degrees. And after about 20 seconds of that, you just say.. "Enough of how you are for yourself". Because you can tell what's happening is its starting to reveal something so peculiar, and so untailored for the human mind or the eye that you become afraid, you say you know can we go back to dancing mice, our deco cigarette lighters and borough culture pieces please this is turning into deep water as far as im concerned. So, urm.. Yes?

Audience: (inaudible question)

TM: Well, that's a good question..

Audience: (inaudible question)

TM: Good question. It requires a small detouring to pharmacology, the concept which all pharmacologists are familiar which you should should be too if you're going to deal in this realm, called LD-50. This is not a pretty notion but a necessary one. It stands for Lethal Dose 50. What does this mean? It means if we have 100 mice, how much psilocybin do we have to give each mouse to kill half of them. Do you see? LD50. Half the sample dies at the LD50 dose level whether it's graduate students or rats. Uh, now, when you're designing a drug or when you're thinking about a drug, what you want is a drug with an extremely high ld50 opposed [3:42:00] to its effective dose.

Transcribed by Azlan

Thinking about a drug, what you want is a drug with an extremely high LD50 [3:42:00] opposed to its effective dose. So say the effective dose of psilocybin is probably about... .5 milligrams per kilogram and the LD 50 is probably, uh,

200 milligrams per kilogram. The LD50 of psilocybin is 400 times the effective dose. [3:42:30] This is the pharmacologist's way of saying, "This is very very safe."

Audience: So if you ate a pound, you probably wouldn't die?

A pound wouldn't kill you. Uh, I don't think. It might be getting close, but you have to eat in that range to die. Now, some drugs have horrendous LD50 to effective dose profiles.

Unfortunately, and I hope I don't rain on anybody's parade here: MDMA [3:43:00] has a terrible LD50 profile. The effective dose is 125 milligrams. You can kill yourself with 1000 milligrams, so that's not good at all. Because, sure as hell, some street person or some depressed person or some maniac is going to take 1000 milligrams, and then you've got a stiff on your hands. So yeah.

Audience: I recently read some info on MDMA, [3:43:30] it came up that, uh, serotonin, depressed serotonin levels on MDMA- uh, uh, well, the serotonin stays low in your body about a week after taking it whereas like a related substance called E, uh, the serotonin levels are depressed for only two hours into that. Researchers have indicated that there's- with a lot of their MDMA has some physical [inaudible] plasticity that E does not have therefore it might be wise to avoid it. Is that true? [3:44:00]

Audience: [inaudible] In fact, I read an article that it's destroying the serotonin receptor side [inaudible]

Audience: [inaudible] 300mg dose [inaudible]

There was a different- Well, I think MDMA is- I don't want to trash MDMA, it's changed a lot of people's lives and saved relationships and so forth and so on, but to me, it's a perfect example of why you're better off taking plants. Because, here was this drug, somebody invented it. [3:44:30] They gave it to a few friends. It seemed to be wonderful for solving personal problems, so without any collection of human data, this thing becomes an item in the underground. Well, and so then thousands of people take it. The psychological effects seem completely benign. It's a wonderful thing. The physiological effects, it's a very disturbing profile. It isn't exactly as you said. [3:45:00] It's not that it destroys the serotonin receptor side. It's that, uh, nerves, neurons are covered by these very delicate, uh, uh, structures called dendritic spines. Now, nobody knows what dendritic spines do, but every neuron in your body has them. And when you take MDMA, it- it mows them down. They just, they go away. Now, so then [3:45:30] you get two schools of thought.

One says, well my god, anything impacting the physical brain that dramatically should be stayed away from. And the other camp says, well do you see any behavioral changes in people who take MDMA a lot? Do you see any physical destruction? Seizures, blindness, anything? And the answer is no. So they say, well, here we have histological evidence that this thing is making [3:46:00] major physiological changes in the dendrites and no behavioral sequella to back up that this is of any consequence. Well my position, being basically a very conservative person, is, in that case: wait. You know, they're doing work on this in a dozen labs around the country. They'll figure it out. In the

mean time, take psilocybin or mescaline or something else that has been sanctioned. Uh, because you just do not want [3:46:30] to insult the physical brain. You know, that's the- the whole name of the game. You have to keep the brain in good shape. Yeah.

Student: Could we go back to his question? Once you're past the proper dose, is it worthwhile to start to step up to-

Oh yeah, that's where we were ta- That's why we started talking about LD 50 'cause I wanted to explain to you that, uh, it- taking a compound like psilocybin, if the effective [3:47:00] dose is 20 milligrams, 20 milligrams for somebody who weighs 135 pounds, well, then, looking at the pharmacological data, they should be able to take, uh, 2000 milligrams without any trouble at all. That's 100 times- 100 times more, but in fact, what happens is as you raise the dose is that the psychological presentation becomes [3:47:30] unbearable. It becomes so strange that you fear for your sanity in a good ol' Edgar Allen Poe-ish phrase, you know. It gets stranger and stranger and uh, you know, I talk to pretty naive people who have overdosed. Usually, the way these overdose situations occur is people are gathering mushrooms in the wild and they start eating them and then they just keep [3:48:00] eating them.

Transcribed by Tyler

TM: ...eating them and then they realize they've eaten four times more than the effective dose. And uh, this is where you get into places where you don't know what to say because if you tell people, they'll throw a net over you but you want to say, because you're so personally disturbed, this is where the flying saucers land and the rectal examinations begin [audience laughs] and you're told that you're the messiah and they- you know, it becomes [3:48:30] quirkier and quirkier. So I think you have to uh, you know, I'm very admiring of people who can take very high doses but I find it quite challenging enough in the five to seven gram uh, range. A friend of mine says of psilocybin, that every time he takes it he tries to stand more. Meaning more of the vision because it is filtering itself. It's [3:49:00] definitely filtering itself. This is why beginners almost never have bad trips because somebody in there looks at your clipboard and says oh this guy has never done this before so lay off the rough stuff [audience laughs]. Just, you know, bring him through the standard number [audience laughs]. It's-it's the people who consider themselves experienced you know, who've done it 20, 30, 40 times-so's you know we can take the gloves off with this guy [audience laughs] and [3:49:30] and invar- You know it always amazes me I sometimes meet people who say you know I've taken mushrooms 50 times and I've never had a bad trip and I think you know lucky soul because when it goes left it's hard you know, it's hard. You have to really then you know denounce(?) your mantra's bungle is uh the best advice I can give you, because you need to steer [3:50:00] back towards the mainstream now maybe at this point this is a good point at which to talk about what do you do when the going gets rough. There are two things at least that you can do that are very effective uh the first is and uh it's a very simple thing but people in our culture seem to be resistant to this is you sing you force air into your lungs and body and you [3:50:30] chant you sing anything you want and it will radically alter the parameters. There's a certain place in psilocybin that is my uh *bête noir* which I call the meatlocker [audience laughs] and I don't like this place you know and meatlocker is a mild term for it's more like uh you know the morgue for the homicide unit or something whenever I start drifting that way I sing [3:51:00] and then you can navigate through it. The other thing you can do, although this is sometimes trickier, is uh smoke cannabis this is what those bombers are for that you rolled in the first hour while you were waiting for it to come on is as soon as it get-begins to press in in some really invasive or alarming way just take a couple of hits of the good and chant and then you can bring it back on track and also talk to it [3:51:30] don't be afraid to say you know I don't like this, take it off me, it's too peculiar, I'm not ready for this. It says oh sorry ehem you know back to dancing mice uh-Yeah? [question]

Audience: *different mushrooms why * wildly varying concentrations of psilocybin?

TM: Well...

[more question*?]

TM: There hasn't been a lot of work on this. Uhm, Michael Buckley(sp?) at Evergreen College years ago [3:52:00] grew stropharia cubensis by the method that's described in my book, the book I wrote with my brother, and what they discovered...see psilocybin is 4-phosphoro.... triptamines* that phosphorous group is removed as soon as it crosses uh the blood brain barrier so really uh what's active is uh uh uh a simpler compound called psilocin 52:30 and psilocin lacks the phosphorous attachment and what they discovered was that in the early flushes the psilocybin ratio is high and the psilocin ratio is low and in the you all know what a flush is right? And in the later flushes the psilocin level rises and the psilocybin level drops so really the two together stay remarkably stable throughout the the life of the organism something worth mentioning I suppose worth* mentioning is uhm* when I was into my extra terrestrial phase when I was assuming that the mushroom was an extra terrestrial either the extra terrestrial itself or something designed by some kind of an extraterrestrial uh it was very interesting to me that psilocybin is as I said is 4-phosphoropyrrolidyltryptamine is is the only 4 substituted indole in nature the only *the only one well if you were to search for evidence of extraterrestrial tampering with the biome of this planet what you would look for is a unique compound occurring in one life form and no other here it is folks this phosphorous group is unique and I've never read [3:54:00] any description...

Transcribed by Bev Smith

[3:54:00] any description or discussion of what the evolutionary history of that- why it would appear in any organism like that and not in any other. That's just an aside because I'm always searching for the thumbprint of the alien. It-m, there may not be an alien thumbprint, but the phosphorous group attached to psilocybin is a good candidate for it. [audience member indicates that he has a question] Yeah.

Audience Member: Um, [coughs] I'm switching the subject only slightly- [3:54:30] the descriptions that you've given of all of these experiences, although you've uh, have said that it varies blankly, there's a remarkable internal consistency of your description- that, that you're entering a world that seems to have boundaries and entities that you consistently encounter again and again. I've um, spoken to many of people over the years, some of whom [3:55:00] have known you throughout that time, and nobody I've ever spoken to- people who have taken high doses of- or low doses- or low doses, have ever had similar experiences, you know, clearly you've spoken to people who have. So I'm wondering-

TM: Maybe they were just being polite [laughs]

Audience Member (cont.): Um, I'm wondering if you've ever experimented, with your own experiences, like what [John C.] Lilly describes in Programming and Metaprogramming, and [3:55:30] to see, um, you describe ways of evoking the entity, which certainly could be put into a context of introducing programs in your experience-

TM: True

Audience Member (cont.): Did you work with different presuppositions going into this to see what the limits are?

TM: Well my original presupposition was to try to have no presupposition at all and then out of that came [3:56:00] all of these assumptions. You're right that nobody has trips exactly like mine, although if you question people carefully, you can begin to see what- how it works. Uh for example, umm, you know I describe this thing this morning- the elves, the presentational thing, the high speed motion, the gifts- [3:56:30] all that- well, sometimes people will take DMT and they'll come back and you'll realize that it's as though there is an archetype there which has different levels in it, and if I had to say what the archetype of DMT is, it's the archetype of the circus. And one time I saw a woman come out of DMT, she was an anthropologist, she had fairly high body weight, and I could tell that she had not [3:57:00] gotten a complete hit- came down, we said okay, what was it? She said it was the saddest carnival in the world. She said the carnival was closed, all the tents had their flaps rolled down and there were just paper cups and candy wrappers blowing in the aisles in between them and the ferris wheel was stopped. Well, she was just at the edge of this thing and [3:57:30] if- if you think about the archetype of the circus, it is an interesting one. First of all, you have the three center rings, where wild and zany activity is continually being presented, tiny cars keep arriving with 14 clowns in each one and they keep climbing out, falling all over each other ap- but it isn't all fun and games, it has a strange uh [3:58:00] erotic content, and as a child I think my first awareness of what I would really call eros was watching this beautiful long-haired woman in a tiny spangled costume hang by her teeth 120 feet above the center ring um doing acrobatics so you've got- [something happens in audience, some laugh, a woman playfully says something inaudible, TM continues] [3:58:28] -so you've got the clown, and you've got the lady in the tiny spangled costume, and then off from the center ring, you have these dark alleyways where the sideshows are, the siamese twins, and the goat boy, and all the rest of it, you know- and it has a very weird vibe about it. So it can land you in any of these places, but if you, if you try and correlate [3:59:00] people's experiences it seems to me that it's pretty clear that through, through their own life history and their own programming nevertheless something is trying to poke through. Ah, now my DMT experience seems pretty radically different from other people's, although other people don't give any account at all. I mean it's amazing how inarticulate people are. You- they come down, you say how was it, and they say it was FAR OUT, [3:59:30] you say you know you don't get out of here with that rat, you know, HOW WAS IT? And they say, well [sighs] they can't give a good account. On psilocybin, I think most people experience something very much like what I describe. Huge machines, a sense of danger to the earth, apocalyptic visions, uh the idea that someone will come and help. And I'm pretty

Transcribed by William Hargrave

TM: [4:00:00]...and i'm pretty resistant to all the flotsam and jetsam of the new age, i mean i don't spend a moment worrying about the exact physical location of Atlantis or stuff like that... and i think people it inflates their personal mythologies and intellectual misconceptions but there is something trying to get through that's why this exercise, show me what you are for yourself, is really [4:00:30] a good one and maybe my trips are so weird because i have always worshiped weirdness, so i can go further down that road without being alarmed while somebody else, (ahh) (ahh) you know, would pull back. One other problem is that we have, we don't have complete maps of this places. At this stage in exploring that new world, what we have essentially are the scribbled diaries of frightened explorers, [4:01:00] and we don't know if explorer A is talking about the same river system of explorer B or whether they were on opposite sides of the planet or the universe. Building a coherent picture of the psychedelic dimension would be the 1st challenge to a, to a rational approach to understanding it.

Audience: Have you (ahh), have you ever read the Far Journeys by Robert Monroe?

TM: Is that the 1st book?

Audience: No.

TM: No, i read the 1st book.

Audience: [4:01:30] Well there actually is a map right there. Talk about weird, this is one of the weirdest things you'll ever read but it has some amazing rain of truth [mic noise] and in it he presents a map of all the realms of being that exist, that he's, visited in normal consciousness. It's an almost inside psychedelic description, but it's, it's (ahh) pretty consistent with some of the things you were discussing this morning because, it is where you go when you die and is also where you go in between. In fact he talks about classes who attend few years ago and he describes the levels upon levels of energy coexistent and describes as like [mic noise]...

TM: Well, i read the first book and i was puzzled by how much of it didn't seem familiar to me, like, i remember in the first book he talks about a world that's just [4:02:30] like this world except the cars are nine feet wide. That would be a very puzzling psychedelic experience to go to that world. (ahh) I knew someone who was very close to him and i don't want to set off any lawsuits here, but i once cornered this person and said, so what about it? And he said, don't worry you don't have to worry this is not getting close to your at all. (ahh) [4:03:00] Buddhism of the Mahayanas, has, you know, a tremendously complex (ahh) system of levels and entities, wrathful buddhas and dharmapalas and peaceful entities and, i think that that's pretty interesting as a phenomenological description of mind, i reject the philosophical premise of buddhism [4:03:30] because i think it's (ahh) you know, a non believably uncompromising kind of nihilism but buddhism as it's pitched in America soft-pedals that a lot, you know, they don't, they don't, present it as a form of nihilism but i think that ultimately it is in the most positive sense but still (ahh) i'm of the school that follows Alfred North Whitehead who said: [4:04:00] say what you may there are certain stubborn facts, and you know, that's not a very buddhist point of view, yeah.

Audience: Do you have visions on cannabis, too?

TM: [drinks water] If i can control myself and not do it too often, the problem is cannabis does so many other wonderful things and i tend to use it for those other wonderful things but if i were totally dedicated to vision, then i would only smoke once a week [4:04:30] because then you completely come to equilibrium, and then, you know, i, again i think people do it, not wrong, but not the way you should do it if you want visions. You should do it the way you do all this other things, alone in silent darkness and in high doses. (ahh) Bursts of hallucination on cannabis are hard to control and predict but sometimes they're as intense as anything can be. [4:05:00] If you read (ahh) (uhm) 19th century descriptions of cannabis use by people like, Fitz Hugh Ludlow and the Club des Hashischins and that crowd, where they were eating the hashish, it's very clear that it was the Lsd of the 19th century, i mean nobody can read those descriptions without realising this people were loaded for sure, they were thoroughly and completely smashed [4:05:30] to be able to write those kinds of accounts.

Audience: [inaudible]

TM: Yeah, go ahead.

Audience: [inaudible]...started mushroom trip...[inaudible]...started tripping...[inaudible]...real confuse entry...[inaudible]...and most i kind of realise...[inaudible]...and it has effectance and i'm not sure that...[inaudible] in terms of getting, (ahh) new learning...[inaudible]...more powerful chemist.

TM: Well, you didn't exactly make clear to me what the effect was. It fuzzes you out going into? [4:06:00]

Transcribed by Tiago Ramos

TM: Well, you didn't exactly make clear to me what the effect was...it fuzzes you out? Going in?

Audience: (inaudible) ...something totally different...

TM: What it does for me is it just slightly cuts my anxiety. You know? I'm able to, to let the thing unfold of its own. I'm no-, I don't know. I mean I have a very; a lifelong, intense relationship to cannabis. And I basically make my living out of being able to do[4:06:30] feats of memory. And, you know, cannabis is supposed to trash your memory so I don't, you know maybe I'm different but I resist any "maybe I'm different" argument because it's malarkey. Nobody is different enough that they can, you know...

Audience: (inaudible) memory recall, when you're at the peak of that kind of experience...speak as clearly...I get really tongue tied.

TM: [4:07:00]No, moreso. My great dream is that as my powers of locution fade with old age that cannabis will be legalized then I can sit in front of you and smoke and my career can be pushed 20 years into the future(audience laughs)...ah...the way I use cannabis is to think. And I do a lot of thinking. And I do a lot, And I...I...Ah...at night before I go to bed.[4:07:30] I smoke. And then I play the tapes of the day and then I understand what happened. If I didn't have cannabis I don't think...I would be... sort of...at sea, or kind of a space case because I never get what somebody really meant, really intended, really had in mind til I play the tape stoned and then I see: Uh huh - that's what the agenda was; that's what was going on.

Audience: Then you go to sleep afterwards?

TM:[4:08:00] O yeah. Yeah. And if I don't smoke then I'm an insomniac. Yeah.

Audience: (inaudible)?

TM: Ok. Well, LSD *sighs*...again, I'm only speaking for myself because there is no other way to approach it. I I...I found LSD very interesting[4:08:30] but ultimately kind of frustrating because I wanted visions. And, to me, what LSD by itself does is it does a lot of slippery and hard to name stuff. It accelerates and changes the quality of thought. It...mmmmhhhhh, well, basically that's it. It does something to the quality of thought. But I had been reading Aldous Huxley and Havelock Ellis and those people and I kept saying, you know,[4:09:00] where are the ruins of ancient civilizations? Where are the jewelled tapestries? And, and then, fiddling around with LSD, I discovered that if I would, ah, take it with mescaline then it became the psychedelic experience that I was seeking. But, in and of itself, it's kind of psycho-analytic? It's sort of like cleaning up your act?(Audience: mmhmm) It often focuses you on your own personal stuff?[4:09:30] (Audience: mmhmm) And, you know, I have to confess to you: I'm not that into my own personal stuff probably because it's so horrendous, ah, *deep breath* but I don't like personalized trips. I like cosmic vision information trips. And, and then mescaline, ah..., mescaline is... you have to take a lot to get it to really do what you want it to do. And it being and amphetamine[4:10:00] it has a not a very good LD50 profile. It's not like MDMA where 10 times the effective dose and you're in real trouble but probably 40 times the effective dose and you'd be sweating bullets. So, ah, and then just the nature of my life I have not had as much to do with mescaline as these other things. I'm really a vision freak. And people say you know, well there's feeling and there's insight[4:10:30]...and there's this and that but you know the reason I'm so fixated on vision - or

the excuse I give - somebody said: O, it's because you're a double Scorpio but (audience laughs) for me it's the, for me it's the proof that it's not coming from me. I can come up with insights. I can come up with funny ideas but I can't come up with objects never before seen by the human eye or mind and so when the visions start[4:11:00] then I feel: this is the transpersonal part of the trip; this isn't my unconscious, my memories, my fears, my hopes; this is something else yeah.

Audience: Um.(inaudible)?

TM: How do boundary dissolution andi-?

Audience: (inaudible)?

TM: Well I think, in very practical terms[4:11:30], they show you that everything you know is wrong. (audience giggles) You know, I mean how can the ego survive that piece of information? It just puts in your lap incontrovertible evidence that everything you've ever thought or believed is hokum and that's extraordinarily humbling. And that word: humbling means the feeling you have when your ego is reduced. You know? Humble yourself enough and you'll begin to feel humiliated.

Transcribed by Artemis Jones

TM: [4:12:00] And, you know, that's a deeper ego reduction. I think they, aside from any magical chemical effect they may have on ego, they're just showing you the true size of the universe and your place in it. And you know, In our 'down' personal lives, every man, every woman, a king, or a queen. I mean, we build castles in the air. Our career, our children, our whatever. Well, then you get into those places, you say, [4:12:30] you know, what, how preposterous.

Audience: [inaudible] Is there any gender difference in [inaudible]?

TM: For men and women?

Audience: [inaudible]

TM: Well, that's an interesting question.

Audience: I'm interested in it also, in the history [inaudible]

TM: Yeah, you mean what we talked about last night?

Audience: [inaudible]

TM: Well, I think women, by virtue of the fact that they [4:13:00] menstruate and give birth, are just inherently more chemically driven creatures than men. Men are Apollonian in intent. The idea is always some kind of abstract purity, clarity, kind of thing. And women know from the get go that that's an illusion. That the reality is the floor of the rainforest, [4:13:30] the interconnected tissue, the levels, the trade-offs, and so forth and so on. Ah, this is why I think men generally men tend to be more generally interested in these things than women, and to also be more impacted by them. For women it's seems to sort of fit in, and affirm what they knew. For men it seems to come as a tremendous surprise that this is the way uh, things are put together. [4:14:00] I think that if we, if everybody gave birth and experienced menstruation probably we never would have launched ourselves into history. In a way, you know, without going too far with it, men are the ancillary sex. I mean the original uh, uh, blastula in the embryonic development is female. And I was listening to someone talk about this the other night [4:14:30] saying no wonder men have the problems they have. What a man is, is a woman who has been under incredible chemical assault for nine months in the womb. And you just have been hammered, sculpted, shaped, and recast again, and again. And then you're born male. A female fetus doesn't experience anything like that. It starts out with a smooth shot, it's, it's and um, a phylogenetic expression, [4:15:00] and, and then achieves it. I don't think of the ego as particularly male because I think that we all have it to accepted degrees. But men are able to express it. A woman with an ego is frustrated. A man with an ego is a menace to all concerned, you know? [laughs] Yeah?

Audience: [inaudible] ... trip with another people. Do you think the knowledge of energy changes your trip...[inaudible]

TM: [4:15:30] I think it's very, it's a very major decision to do that. That if you're going to take a high dose of psychedelics with somebody else then you better be prepared to get all entangled with them. Uh, which can be great. It can also be fairly confusing. I don't like taking psychedelics, uh, this is not an issue of entanglement. That's sort of what goes on between lovers or close friends. But I get a lot of requests to [4:16:00] sit for people. And I don't do it because I, I don't know whether it's my personality or what it is? But I am unable to contain my anxiety in the presence of another stoned person. Especially if I'm stoned. If I'm stoned, and they're stoned and we're in a dark room, I cannot get off. I listen to them breath. I worry. I wonder if I should ask them if they're alright. [4:16:30] Then I go off on long trips about not interrupting them. And then that loops back into, 'but I haven't heard them breath for twenty minutes!' [laughter] And, and, and I'm always afraid. I don't know. So really people say, "Doesn't it take courage e to do it alone?" For me it takes more courage to do it with people because inevitably you get tangled up in some kind of craziness. And you know, you can think you're having a telepathic experience. And they've decided that they want to have sex or something, [4:17:00] and meanwhile I've just had a revelation about that entry Morlier made in his diary when he was talking to his niece Anges about the nature of the French Comic Theater. And, so, you say, boy, you know, we've got too much on the menu here. Um. But I'm weird! Remember that. [laughter] Yeah?

Audience: [inaudible] Um, okay now, and we uh have heard about the uh [4:17:30]

ayahuasca so, um, can you comment on this kind [inaudible] and contrast to what you're talking about [inaudible]

TM: You mean the group mind on ayahuasca?

Audience: Yes, [inaudible] Is that possible.

TM: Oh yeah. No, it's very possible. Uh, it's very possible. I mean, you can sit with someone and play a little game where you will describe the hallucination for 30 seconds, then they get to describe the hallucination for 30 seconds. [4:18:00] And you can absolutely convince yourself that people are seeing the same you know, that you're seeing, the same thing. And when you toss sex into the mix, it just goes over the top.

Transcribed by Micki Garrison

TM:-then they get to describe [4:18:00] the hallucinations for 30 seconds then you can absolutely convince yourself that people are seeing the same, you know, that you're seeing the same thing. And you know when you toss sex into the mix it just goes over the top. I mean I've had the impression- I don't want to trot it out as a condition of mine or something that I assert true but I have had the impression stoned on mushrooms making love that um, i- it's like a perspiration forms on the surface of the skin and there's some kind of electrolytic thing that goes on and the boundaries dissolve between the people. I don't mean metaphorically. I mean that you become one organism. And that's uh, that's pretty uh, pretty amazing.

Q: ???

Yeah yeah yeah. Now as I just said I don't like taking psychedelics with people, I guess what I should have said is that I hate being responsible because I don't mind taking Ayahuasca with 30 people none of whom speak English in a hut up some river but that's because I know that the old shamans are in charge, that I'm just a face in the crowd. Nobody's going to me for explanation or help. I'll tell you an ayahuasca story just to give you an idea.

Years ago in 76 Kat and I, it before we were married, in Peru and we had found this Shaman who was very good and he had a following and we were, you know, apprenticing ourselves to him and he - the style of the Peruvian Mestizo people I mean cultures handle this differently but they are never straight with each other. It's an incredibly masked culture almost like the Japanese but without the formality. In other words if you think that's somebody's a jerk you would never say that that's the last thing you would say because that's your true opinion. So we got into a situation with these people where this elder Shaman who was very respected, beloved even by these people he had a nephew, a sobrino, who was an absolute jerk and this guy was into pimping a little on the side and he was very ambitious to

perfect his ayahuasca so he could go to Lima and charge yuppies for it. And he had this really awful habit, and no what really had gone on before we got there, play what all get together to take Ayahuasca and these old old guys, you know, 80 85 years old but totally authentic dudes would sing these beautiful Ayahuasca songs and he would sing against them. I mean can you imagine a scene like this where everyone's singing Row Row Row Your Boat except one guy wants to sing Five Foot Two Eyes Of Blue.

And the level of social tension ease meetings would just rise and rise but nobody would ever say anything to this guy and tell him to bug out and can that crap so one night this is happened to meetings in a row this is the third meeting like this everybody had hoped this guy wouldn't come. So then he showed up, then we all dosed and then we get loaded and the singing begins and he begins his singing and in the wave of hallucinations and Kat was sitting next to me I feel him sitting up on his haunches kind of rocking back and forth on his heels, and I would look at him and I could see he was going through these weird animal transformations. First he would become like a jackal then he would become like a monkey and it was really intense. And I mentioned it to Kat and she could see it too. All, and he capped - and we were also trying to tape these Ayahuasca songs so it was a double irritation to us that this guy was so out of control. Laughter a particularly long song by the old guys with him just hammering against them I could feel Kat who has a real Irish temper getting more and more pissed off at this guy and finally at the end of this song when the silence fell, she had been just staring at the floor and she looked across the room at Don Jose and uh, gave him a look of pure loathing and I saw these red things, these red triangular-shaped things come out of her eyes and go across the room like woop woop woop woop! and when it got to him it knocked him off his feet. He turn on backwards from the impact of these things literally and everything going on in the room stopped dead and the Elder Shaman said to the guy sitting next to him, he said oh the gringa sends 'badadadada'! And you know then you realize wow we're in over our heads here you can't chill shi from Shinola in this thing. This concludes tape three. Our program continues [4:24:00] with tape four.

Transcribed by Eva Petakovic

TM: ...so that's an example of, you know, magical power condensed onto the material plane. Yes?

Audience: [inaudible] ...purple triangles coming from your head... [inaudible]

TM: Clearly, the same- the same phenomenon, uh, yeah!

Audience: Um, first of all, I have to ask [4:23:30] [inaudible] question, [inaudible] after that?

TM: Ah, he actually didn't come back after that evening, uh...

Audience: Then the other question, or- or actually [inaudible], um, I have done extensive work with Iridology, to the point that, I could understand where the limitations [inaudible] blatantly obvious, because it's not so much [inaudible] the characteristics of the iris, the eye, it's what's transmitted from the mind, through the pupil, or the

sensor of that [4:25:00] [inaudible] that is really being accessed by someone who is [inaudible], and that's what would give you [inaudible] that you're looking for, and so, I feel that, that power, that transmission of mind, so many times, is carried from that energy that- that goes back and forth through the eyes, and I'm wondering if you had any more thoughts on that.

TM: Well, it seems to imply that we are all potentially linked together in many ways that civilization has suppressed. We are no longer [4:25:30] telepathic, we are no longer able to reach out and cap somebody at a glance, like that, and uh-

Audience: But I think we do, and I think we do all the time.

TM: But somehow our perception of what's been going on is- is skewed. We don't- you know Rupert and I talked a lot about this. He had the idea that- he said- you know- the search for a psychic- the search for proof of psychic power has not been a very happy story, with card-flipping and this sort of thing. And Rupert [4:26:00] had the genius to realize that: what is the commonest psychic power, that we all believe exists, and have experienced and so forth, but which science is utterly able to explain, that could be statistically studied? Well, what it is is, the sense that someone is looking at you, you know? And you could test this, and in fact, we did tests, where you would choose one [4:26:30] person and put them at the front of a room full of people. And you would tell people, either look at your lap, or look at the back of this person's head. And they would be asked, are people looking at you? Or are people looking at the back of- of- uh- looking at their lap? And certain people -you can quickly satisfy yourself- were able to detect this a phenomenal amount of the time, well beyond statistical, uh, you know, [4:27:00] the rules of probability. So, I think we're surrounded by subliminal abilities that we can't, uh, really understand. I mean I- from years of travelling in Asia, I- I- have an amazing psychic power, which is, I ca- I can tell when food shouldn't be eaten, you know? And it will happen to me, you know, in very good restaurants, and- and if I go against it, you know [4:27:30], I'll spend the evening over the toilet, because I couldn't believe that Che So-And-So would serve poison food because it was costing me so much money. But then when I get back to the hotel room, sure enough, by overriding my own instincts, I- I- get into trouble.

TM:I think... psychic ability, well this is worth talking about, that we cannot be- or how can I put it? We cannot- uh- evolve [4:28:00] beyond the confines of our language. And if you have a language that makes telepathy impossible, then telepathy will be impossible inside that culture. You see we all pay lip service to the idea that, uh, that lang- that language and culture, ah, create each other, but we actually act as though culture is real, and it isn't. [4:28:30] I- I- learned this, you know, in Peru, very dramatically, because in the Peruvian Amazon, there is a- a- disease which people are very, very concerned about, called "susto". Have all of you heard of this? Susto only affects Peruvians. This is the first clue that something weird is going on. And its major manifestation is bad luck. And- but if you get it, [4:29:00] and you're a Peruvian, you prepare to cash in your chips. You know, it's as- it's as horrible as melanoma. You know, you're doomed if you have this stuff. And you have to go to a shaman and get it taken care of or you're dead within six months. But I can't get susto, it's not- it's a linguistic disease of some sort. It travels around inside the confines of Mestizo Spanish, and nowhere else.

Audience: But it's the evil [4:29:30] eye [inaudible] it is the equation in the, uh, south of our country-

TM: Well, yeah people have this ideas, yeah. And you know, like people say, well magic is accomplished because the person the magic is being done to, knows that it's happening, and therefore they unconsciously participate in their own demise. But I've observed these shamans in the Amazon, and they will go- if a shaman has decided to actually get somebody, then he will go to incredible lengths... [4:30:00]

Transcribed by Tuan Nguyen

[4:30:00] lengths to conceal what he is doing so that the person never knows and never knows how to blame, so it isn't some kind of psychological co-option that's happening. It's something a good deal more complex than that. Yeah.

Audience: Uh, you know, a while back you were talking about uhm, uhm, a period of time where humanity was inside out uhm... that made me think about [inaudible] for example,[4:30:30] uhm, we have all these myths about fairies and elves and uhm, magic and perhaps at one time the world was like that but it is not like that now [inaudible] talking about social context that does not include telepathy uhm, generates a culture without uhm.. people experiencing telepathy, uhm... and yet we have all these ideas... we have all these fairy tales... you know and now that we're talking about self-transforming machine elves, uhm, when you, uhm,[4:31:00] have a *sneeze*

TM:Well, I'm not sure that you got it into a question that I can respond to. Try again.

Audience: Ok, so, uhm... our culture then is uhm... [inaudible] and uhm the whole idea of magic, and things like uhm, the existence of elves, uhm... [inaudible] people would laugh at that unless uhm they are on the supposed fringes. Uhm... do you think, that this kind of thing could come back? Do you think that we will [4:31:30] have uhm... you know uhm... [inaudible] ... these kind of things.

TM: Yes, sure, because what you have to do is you have to shift the locus. I mean, it's kind of hard to explain but, every civilization has a locus and, and we have disempowered ourselves by shifting the locus to an imagined class of experts. We have an incredibly peculiar version of how the universe is put together. [4:32:00] First of all, we rely, a lot of the time, on the notion of the eensy beensy. Genes, viruses, atoms, elementary particles. These are the things which shape our world, we tell each other. And yet, who has ever seen any of these things? I mean a virus maybe a few people have seen. A hydrogen atom? It's a pretty airy fairy concept and when you start talking about the anti nu meson and stuff like that, where you can [4:32:30] only approach it through an arcane mathematical language the reality, whatever that means, of these things becomes pretty , uhn, questionable. See, one of the things I think that psychedelics could do is r- give back to us what I call uhm, the immediacy of felt experience. Since the rise of cartesian analysis in the 17th century [4:33:00] everything that we experience has been defined as, what are called, secondary characteristics. Color, a secondary characteristic. Uhm, feeling. Uhm, and what's real is mo- mass, momentum, charge, spin, stuff like this, which, you know... These are the primary qualities of the universe?Wwho ever encounters or deals with them? We need to model reality so that it is [4:33:30] understandable to us. I mean, that that statement even had to be made shows how far off track we are. Our current model of reality is excellent for describing the behavior of hydrogen at the center of stars or something like that. Terrible for explaining to you how you're supposed to stay tuned to your girlfriend. So somehow we have sold out to abstraction. And this is something

about science, you know? And the demonic [4:34:00] power of numerical analysis and stuff like this. I think that w-part of what the psychedelic revolution is and why it is so politically threatening is because a psychedelic person does not believe anything they cannot confirm for themselves through thought, intuition, or feeling. And a non-psychedelic person joins up with the quantum [4:34:30] physicists, or the hasidic Jews, or some group of people who already got it packaged and figured out. I mean, the UFO thing is a good example. Everybody's interested in UFOs, and you know, are there space people, are there not. And I think most people think that the news will come, that the way you encounter a UFO, the way most of us will encounter a UFO, is that the president will call a press conference [4:35:00] and say, you know, that the time has come to speak frankly about certain declassified material and that, yes, in fact it has been going on. I mean, that's not how it's going to happen. The way it's going to happen is on five grams in silent darkness in your living room, and that's real. You know, if flying saucers were to land on the south lawn of the White House tomorrow it would be minor news compared to what can happen to you [4:35:30] a minute and a half after smoking DMT. We don't realize that we are not real unless we are the center of our own private mandala, and so we look to media, to experts. You know, maybe the Dalai Lama can clarify it or Mother Theresa or Stephen Hawking. Well, forget all that. Those are just linguistic concepts are far as you're concerned. The only thing that's real to you is yourself and your immediate surroundings. And if we could [4:36:00]

(There is a loop in part of the audio somewhere between here and 4:42:00)

Transcribed by Paul Mullins

[4:36:00]TM:empower that,you know,our political problems would disappear overnight.We are infantile and we do love it.We don't really try to claim our existential validity,and those who do are called mad, because they depart from the sanctioned paradigm.Over here,somebody...yeah.

Audience: First,it just struck me that,one of the things you seem no good at is bringing that [inaudible word] experience into language[4:36:30][inaudible],which creates things/thinks and realities that you...could be decrying of the shared linguistic reality where we can discuss the experience that we've had..[inaudible]

TM: Yes,well,it becomes real when we talk about it.I mean, one of the most satisfying experiences that i have as a public speaker is, sometimes, after speaking to[4:37:00]groups, like last night, somebody will come up afterwards and say:"I thought i was crazy, until i heard you speak.Now i know there are at least two of us", and the truth is, you know, there are more than two of us, there are thousands.If you...you know, it's a delusion if it happens to one person, it's a cult if it happens to twenty people, and it's true if it happens to ten[4:37:30] thousand people.Well this is a strange way to have epistemological authenticity conferred upon something.We vote on it?!...you know.So, i would like competition.I mean,i feel pretty lonely out here, i'm surprised nobody has followed me into this. There must be other people who can articulate this things as well or better than i can but, boy, they don't seem to come forth[4:38:00], and i really don't know why that is, because what i say is not all that exceptional, it's just the sum total of it is kind of eerie.But if we don't...that's what i was saying...you know, we cannot evolve faster than we evolve our language, our language is like the collective skin of our culture.So, you know, until you say the words "self-transforming elf machines from hyperspace", then[4:38:30] there aren't such things. Once you say it, it has gained a certain kind of ontological currency....

Audience: ...weren't you arguing the opposite point, you know,[inaudible] stuff that[inaudible] quantum physicists[inaudible] and that..[inaudible] language systems..

TM: ...well, see, people are buying other people's experience. I mean, if you're not a quantum physicist, why in the world should you take those people seriously?[4:39:00]They're talking gibberish. What power does it have over you?, except that it comes presented on the platter of science.Say: "You must believe this! If you don't believe this you're not a well educated Tranby with-it person.We can just say: "Well, malarkey, didn't you people believe something completely different 15 years ago?" they say: "Yes,but know we've got it!", say: "Well, I'm supposed to take that assertion seriously?You change your mind every 6 months."

Audience: [inaudible] during[4:39:30] psychedelic {inaudible} is,you know,ungraspable, very frustrating[inaudible] and,you know,we can't settle down until we[inaudible] stabilizing language [inaudible] settle down and play with it.So, we[inaudible] for having a true experience [inaudible][4:40:00] is, you know, beyond context.Once we[inaudible] it, it becomes... not quite an[inaudible], but the experience really changes,and... it becomes something to which then[inaudible] to each other,and have a good [inaudible], but...you know,we're missing it[inaudible]

TM:Well,every entity has a value dark[4:40:30] dimension.I mean,surely only the most naive of quantum physicists believe that,you know,the quantum electrodynamics description of the electron is all there is to say about the electron,because biology is made out of electrons and you can't reason from quantum electrodynamics to the rain forest, you know, obviously other factors are present, which[4:41:00] are escaping this particular linguistic model, so, being able to talk about something doesn't rob it of it's mystery, it's merely is a sectioning through it that gives you a kind of a lower dimensional map of it, but the mystery remains intact.[editorial cut in the video]Well i'm not sure that you got it into a question that i can respond to.Try again.

Audience: Ok.So, our culture[4:41:30] is in a phase that's very,like, science oriented,and the whole idea of magic and, things like,the existence of elves[inaudible], people laugh at that[inaudible] Do you think that this kind of thing could come back?Do you think that we will have,you know,like,[inaudible] experiences with this kind of things?

TM: Yes,sure,because you have to do it,you have to shift the locus[4:42:00]

Transcribed by Adrian Stan

[4:42:00] the locus, I mean it's kind of hard to explain because every civilization has a locus. And we have disempowered ourselves by shifting the locus to an imagined class of experts. We have an incredibly peculiar version of how the universe is put together. First of all, we rely, a lot of the time, on the notion of the itsy-bitsy. Genes, viruses, atoms, [4:42:30] elementary particles. These are the things which shape our world, we tell each other. And yet, who has ever seen any of these things? I mean a virus, maybe a few people have seen. A hydrogen atom? It's a pretty airy-fairy concept. And when you start talking about the [anti-numason?] and stuff like that, where you can only approach it through an arcane mathematical language, the reality of these things, whatever that

means, becomes pretty, uhm, [4:43:00] questionable. See, one of the things I think that psychedelics could do is give back to us what I call the immediacy of felt experience. Since the rise of cartesian analysis in the 17th century, everything that we experience has been defined as, what are called, secondary characteristics. Color, a secondary characteristic. [4:43:30] Uhm feeling. Uhm, and what's real is mo- mass, momentum, charge, spin. Stuff like this which, you know... These are the primary qualities of the universe? Who ever encounters or deals with them? We need to model reality so that it is understandable to us. I mean, that that statement should even have to be made shows how far off track we are. Our current model of reality is excellent for describing, [4:44:00] uhm, the behavior of hydrogen at the center of stars or something like that. Terrible for explaining to you how you're supposed to stay tuned to your girlfriend. So somehow we have sold out to abstraction. And this is something about science you know? And the demonic power of numerical analysis and stuff like this. I think that part of what the psychedelic revolution [4:44:30] is, and why it is so politically threatening, is because a psychedelic person does not believe anything they cannot confirm for themselves through thought, intuition, or feeling. And a non-psychedelic person joins up with the quantum physicists, or the hasidic jews or some group of people who already got it packaged and figured out. Uhm, I mean, [4:45:00] the UFO thing is a good example. Everybody is interested in UFOs and, you know, are there space people, are there not. And I think most people think that the news will come that the way you, uhm, encounter a UFO, the way most of us encounter a UFO, is that the president will call a press conference and say, you know, that the time has come to speak frankly about certain declassified material and that yes in fact, uhm, it has been going on. [4:45:30] I mean, that's now how it's going to happen. The way it's going to happen is on 5 grams in silent darkness in your living room. And that's real! You know, if flying saucers were to land on the south lawn of the White House tomorrow it would be minor news compared to what can happen to you a minute and a half after smoking DMT. We don't realize that we are not real unless we are the center of our own private mandala. And so we look to media, [4:46:00] to experts. You know, maybe the Dalai Lama can clarify it, or Mother Theresa, or Stephen Hawking. Well forget all that. Those are just linguistic concepts as far as you're concerned. The only thing that's real to you is yourself and your immediate surroundings. And if we could empower that, you know, our political problems would disappear overnight. We are infantile and we do love it. We don't really try to claim [4:46:30] our existential validity. And those who do are called mad because they depart from the sanctioned paradigm. Over here somebody. Yea.

Audience: [inaudible]

TM: Yes so it becomes real when we talk about it. I mean, one of the most satisfying experiences that I have as a public speaker is sometimes, after speaking to groups like last night, somebody will come up afterwards and say, "I thought I was crazy until I heard you speak. [4:47:30] Now I know that there are at least two of us." And the truth is, you know, there are more than two of us. There are thousands. If you, uhm, you know, it's a delusion if it happens to one person, it's a cult if it happens to 20 people, and it's true if it happens to ten thousand people. Well this is a strange way to have, uhm, epistemological authenticity conferred upon something. We vote on it? You know? [4:48:00]

Transcribed by Paul Mullins

TM: You know, ah, so I... I - I would like competition. I mean I feel pretty lonely out here; I'm surprised nobody has followed me into this. There must be other people who can articulate these things ah, as well or better than I can, but boy they don't seem to come forth.. And I really don't know why that is because what I say is not all that exceptional it's just the sum total of it is kind of eerie (4:40:30) Uh, but if we don't... That's why I was saying uh you know "We

can not evolve faster than we evolve our language” our language is like the collective skin of our culture.

So you know until you say the words "Self-transforming Elf machines from Hyperspace" - then there aren't such things. Once you say it, it has gained a certain kind of ontological currency. (4:49:00)

Audience: So weren't you arguing the opposite point you know when you spoke of ... (inaudible?)

Well see people are buying other people's experience. I mean if you're not a quantum physicist, why in the world should you take those people seriously? They're talking gibberish. What power does it have over you except that it comes presented to you on the platter of 'science'? See you must believe this, if you don't believe this, you're not a ah, well educated, trendy 'with it' person. You can just say, well, malarkey - didn't you people say something completely different 15 years ago? They say yes, but now we've got it! So say well am I supposed to take that assertion seriously? You change your mind every six months.

Audience: So our experience during the psychedelic experience...

TM: Uh huh

Audience: before we bring it to language, is... is... you know, ungraspable, very frustrating (inaudible) and... and you know we can't settle down until we bring this to language, that is based on, with their experience, they brought it to language and they can kind of settle down and play with it, so... we need to be... (inaudible) beyond concepts, once we conceptualize it, it becomes not quite an experiment but the experience really changes and... it becomes something that we can then (inaudible) to each other and have good social time... but uh, uhh ya know we're missing the point.

TM: Well, every entity has a 'value dark dimension'. I mean I... Surely only the most naive of quantum physicist believe that the... Uhh, you uh, you know the quantum electrodynamic description of the electron is all there is to say about the electron because biology is made out of electrons and you can't reason from, from quantum electrodynamics to... the rain forest. You know, obviously other factors are present which are escaping this particular uh, linguistic model. So, being able to talk about something doesn't rob it of it's mystery, it merely is a sectioning through it, that uh gives you a kind of a lower dimensional map of it, but that the, the mystery remains intact... Y- you know um... (long silence filled with audible movements) Vichtenstein talked about what he called "the unspeakable"... and I a, you know; the unspeakable is the true domain of being, and then within that there is a very small subset of those things which can actually be captured in language, but they're a vanishingly small uh set of the whole thing, mostly it's all mystery. I don't know why this is so surprising to people I mean where is it writ large that bipedal primates with binocular vision are supposed to be carrying around in their heads; true models of the cosmos? I mean, would you expect eh, an apple tree or a monarch butterfly to have a true map of the cosmos, ahhh, inside them? No more than that we should have... so I think though all... all knowledge is provisional and I think the new science will honor this. This is why the rise in the use of the word model, they no longer believe they're giving a complete explanation of the phenomena they just say well here's a model [swallows] and next year we'll get a better

model and will keep modelling and our models will get better and better but they will never be more than crude approximations to an unspeakable mystery.

Audience: do you find this tragic?

TM: No! I find this exhilarating, I think part of the p... male... or part of the ego dominator... pathology is to demand closure out of everything, there is no closure, you have to learn to sit with the messiness of the mystery you know it's this thing we said this morning the bigger you build the bonfire of understanding the more darkness is revealed to your startled eye, so no I think its open ended and exhilarating and tremendously, uh, exciting that that's the kind of universe we're living in.

Audience: Terence, I think this thing about mystery is that find it sad I think up until a few months ago my main thing was try and understand try and understand and now I read something somewhere....

Transcribed by Luke, Danny

Audience: [4:54:00][inaudible]

TM: That's right. Well, you know, this is not nearly the-the stoned ravings of the psilocybin brigade. Do you all know, or have you ever heard of, Godel's incommensurability theorem? This sounds daunting and disturbing. Uhm, have you ever [4:54:30] heard of this? Does anybody have a clue what I'm talking about? Okay, well that in itself is a measure of the kind of society we're living in because to my mind, more important than Einstein, or Schrodinger, or any of those people was Kurt Godel, German mathematician. He began by studying the calculus and he had a very...funny method. What he did was he would number every operation [4:55:00] in - in a partial differential equation and these numbers are called godel numbers.

Audience: How do you spell Godel?

TM: G-o-d-e-l. And what he showed, I think this is the most important intellectual step taken in the 21st century. He showed that any formal system will produce true statements [4:55:30] which are not provable within the confines of the formal system itself. Now what this actually means is that mathematics can fail. It mean that there is no closure. You ca- he proved this logically. Showed that closure is impossible. That everything- He showed it for arithmetic, the most secure of all intellectual edifices. Essentially what he showed [4:56:00] was that $2+2=4$ is a very strong tendency, not a law. And, uhm, this incommensurability theory means that no program of- of formal analysis will

ever completely exhaust its subject. There will always be a residuum of mystery. And, uhm, we need to come to terms with this. I mean, it's taken us 80 years to get Einstein [4:56:30] under our belts and that's a simple notion compared to what Godel is saying. Because what he's saying is not about, you know, the distortion of space-time near massive objects but something which actually affects our own lives on a day-to-day basis. And, you know, if you live for closure you're beating your head against a stone wall and your head will wear out long before the stone wall will. There's a kind of a- an appreciation for the mystery [4:57:00] needs to place that attitude that the mystery is an unsolved problem. Mysteries have no relationship whatsoever to unsolved problems. Yeah.

Audience: [inaudible]

TM: You don't need a complete map. I mean, I'm not such a fan of Wittgenstein but he seems to have raised his ugly head here. Uhm, Wittgenstein used to say "We do not seek statements which are true. [4:58:00] We seek statements which are true enough." That's this genuflection to the incommensurability theorem. That's as good as it gets folks. True enough. Beyond that there's just, you know, the airy realm of metaphysics which will never be plumed. So what we're trying to do is refine our model, make it more responsive to what we want the model to tell us. But you don't want to confuse the model [4:58:30] with the phenomenon being modeled because it will always have dimensions which exceed the grasp of the theory.

Audience: [inaudible]

TM: Yes, although, I have real problems with probability theory which we'll probably get into tomorrow. I think that, in a sense, probability theory has made it almost impossible for us to [4:59:00] think clearly about anything. Because it- it contains certain built in insidious assumptions that are, uhm, purely assumptions. For instance, Probability theory tell you that when you flip a coin, the odds of it being heads or tails are 50/50. If, in fact, that were true. The coin would land on it's edge every single time. [4:59:30] So, what we need, you see, is not a theory of uhm, of uhm, what is possible. That's science. If you want to know if something is possible you find a scientist and they're always perfectly happy to fulfill this function and tell you whether this is possible or not. What we completely lack, as a civilization, is a theory that explains to us [5:00:00]

Transcribed by Paul Mullins

[5:00:00]TM: ...us how it is, out of the vast class of possible things, certain things undergo what Alfred North Whitehead called "the formality of actually occurring" ; We have no theory. I mean, science can say, "Well, it's probable that it'll be this, but it's also 40% probable that it'll be that". You say, "Well, which will it be?" They said, "Well, we, I just told you the probability." [5:00:30] Say, I'm not, that's not good enough! I want to know..." Say, "We have no theory of selecting among the probabilities."

The other problem that haunts probabilities theory is that it assumes that time is an absolute flat plane. It assumes that...No physicist tells you in his lab notes, "Please perform my experiment on Tuesdays, Wednesdays, and Saturdays, because it won't work any other time." In other words,[5:01:00] the assumption is made that the

experiment will produce the data predicted by theory, no matter when the experiment is performed. In other words, it's assumed that the phenomena is time-independent. But that's just an assumption that Newton got into, proving that phenomena are time-independent is absolutely beyond our intellectual reach, it can't be done.

Uh, a curious thing about probability theory is, [5:01:30] say you want to know how much current is flowing through a wire, here's how probability theory finds out: It measures the current flowing through the wire with a meter. It measures it 1,000 times. It takes those values and adds them together. Then it divides by 1,000. Then it tells you, "This is how much current is flowing through the wire." You look at the value they've given you, and you say, [5:02:00] "But you took 1,000 measurements and we never got this number." [They] say, "Well, that's because, you know, you didn't average the probability and..." Whew. If we took 1,000 measurements and not one is the value you're offering, then why should we believe that this is the amount of current flowing through the wire?" Well, then there's a bunch of hand-waving and epistemic foot-stamping and so-forth...Science is an incredibly fragile edifice....Which if it weren't for it's [5:02:30] ability to hand it's findings on to technologists to make pretty things, it would have to take it's place somewhere to the left of, I don't know, homeopathy, acupressure, something like that. [audience laughs] In other words, it's not a metatheory, it has not got truth by the jugular. It has a bunch of fishy mathematical formula, which it's flailing you with, but I don't think....uh...I think, I, I think that serious revision [5:03:00] of Probability Theory is going to have to take place, uh...

Audience1: I think you've given Probability Theory much more than what's really there. Inherently, what it [inaudible] all about is simply acknowledging that there are variables in anything that we can't know. [inaudible] It's really nothing more than that.

Audience2: Which brings you back to just the [inaudible]

TM: Well, but for instance, if the odds that the, if the odds that the coin comes at heads or tails or 50/50, why doesn't it land on it's edge every single [5:03:30] time?

Audience: I don't see how it's relative to standing on it's edge, it's simply, what what happens with a coin, where, where, and what line, [inaudible] stays up or down? [inaudible]

TM: Well, you know, another thing Probability Theory says is that, "Chance has no memory". And so, you, they always, here, first here's statistics, they say, "If you flip a coin, and it comes up heads 49 times, what are the odds that it will come up heads [5:04:00] the 50th time?"

The answer is: 50/50. But any gambler would tell you, you know, that, "If it comes up heads 5 times in a row, bet on heads, for cryin' out loud!" So, there's, there's something...

Audience: [inaudible] but I think a lot of [inaudible] that just doesn't exist. I agree...uh...[inaudible] it takes is the notion that there are things going on here that [5:04:30] we can't know, even though that's not acknowledged by most people who are [inaudible]. That's the reality [inaudible]

TM: But don't you think the other assumption is that time is an, is a non-inputting...it's not variable. You know, that you don't say, "You know, the odds of a coin coming up at heads or tails are 50/50 in Canada but 48/52 in Bolivia."

Audience: That's one of the variables that's sort of smeared out, simply because it [5:05:00] can't be characterized the way people, the people who are doing that like to tend to characterize things but...

TM: Well...

Audience: But underlying the whole thing is still the notion that you're dealing with unknowables. And I'm not saying that those who are deeply immersed, and practicing, uh, probability statistics hold this view, but the reality is, underlying this sort of underpinning the whole thing is the notion that there are things going on here that we can't know.

TM: Oh, well I don't have [5:05:30] any trouble with that. Uh, I understand why science latched on to Probability with such a vengeance: It's because, you know, thanks to William of Ockham, there is this notion of "Occam's Razor". Which is this idea that is most simply stated as, "Hypotheses should not be multiplied without necessity." So, since the idea that time is a flat invariant [5:06:00]

Transcribed Sheree Geo

[5:06:00] is the simplest assumption, try it first and see if it works. But I maintain that you know science has in certain areas been very slow to make progress in the social domain in econometrics in ahh.. the you know.. multiple body problems and stuff like that. Well I think this is because this simple assumption, that time is an invariant [5:06:30] has to be reexamined. I would also re- .. I would offer a new definition of science; science is that field of human endeavour which studies phenomenon so crude that they are time invariant. You know, the .. the hydrogen atom cleaves from the oxygen atom the same way every time, but love affairs don't come apart the same way every time, [5:07:00] bankruptcy's don't occur the same way every time. These are complex, compound phenomena that are then influenced by the temporal variables and the variables embedded in the environment around them. Now the problem is these are the things that we are interested in, love affairs, bankruptcy and the establishment of empire. Very few people have a passionate interest in the dynamics of the water molecule.

[Audience Member Inaudible] [5:07:30]

Oh, now i know I have you on the run because this is a uhh .. but it makes pretty things argument

[Audience Member Inaudible]

Well see I think science is a great enterprise and noble but not the arbitrator of truth

[Audience Member Agrees?]

There are no arbitrary of truth, the truth of the turow, the truth of quantum physics, these are [5:08:00] truths, in the supermarket of truth but y- there's no .. there's no uhhh top end to that process. There may not even be one truth.

[Audience Inaudible]

In a given situation. If you're flipping coins probability theory is probably a good guide, you wouldn't want to run your love affair on probability theory uhh so you have to choose the domain [5:08:30] you have to recognise the applicable models, the applicable tools for whatever domain you're looking at.

[audience member inaudible]

Well you .. you're allowed to be a heretic you just don't get paid well, that's the price you pay for that, still .. yeah.

[audience member inaudible]

No no.. No I don't think it's bad, I thi- I'm entirely in support of whatever the universe is in the process of trying to do here ummm.. I think that.. uh.. I think that history is ending [5:10:00] and that it was a temporary perturbation of the system and that we can anchor ourselves through this chaos-trophy or whatever it is by going back to archaic models but I.. I think that and-.. you know.. this is what we'll talk about tomorrow when we get the computer because I don't merely talk about it even though I have been flailing the mathematicians ultimately I too [5:10:30] come to rest with a fishy formula. I think that the universe is some kind... i think that there is something that there is overlooked by science called .. and i'll name it. Its called Novelty. The universe is a novelty conserving engine of some sort, from the very first nanoseconds after the big bang, novelty has been conserving itself and building newer and [5:11:00] deeper levels of novelty on novelty already achieved. So that uh .. you know in the first few m... i mean, you have the big bang then you have this era called the pre-physical era, its brief, it lasts the amount of time it takes light to cross a distance equivalent to the diameter of the proton, electron, something d- dinky for sure. That's called the era before physics, then [5:11:30] physics begins one jiffy after that and.. and the original universe was so hot that there were .. that it was a plasma of free electrons, so since it was a plasma, there was nothing you could called atomic physics because the ambient temperature was so high that electrons could not settle down into stable orbitals around nuclei. As the temperature [5:12:00] of the universe fell...

Transcribed by Luke Danton

[5:12:00] As the temperature of the universe fell, atomic systems crystallized out of that plasmic environment, well then ahh.. further cooling of the universe leads to more complex kinds of bonds and the cooking out of complex elements from stars, the original universe was made entirely of hydrogen, this hydrogen aggregated into masses so ahh.. dense, so large that at their center was actually -and if you think I'm not nervous in doing this in front of you, you're crazy- ([laughs], [audience laughs]) these aggregates of hydrogen, at the center it was so massive in temperature and pressure that fusion could actually begin, and fusion cooked out heavier elements: iron, sulfur and eventually carbon. When you get for violent carbon this throws open the doorway to tremendous new novelty, you get now for the first time, not atomic systems but molecular systems, these molecular systems lead into protobiological systems, protobiological systems lead into prokarya, then eukarya, then true higher multicellular animals, then mammals, then human beings, then electronic culture, then the big surprise.

Now the thing to notes about all this, is that novelty keeps building on novelty already achieved, it crosses biological lines, atomic lines, molecular lines, it is along the universe, i'm proposing, that novelty is conserved, and so then what we represent is a kind of ultimate nexus of novelty, and i believe that we are being wound tighter and tighter and tighter into a confrontation with the equivalent of the singularity at the center of a black hole, but it isn't a gravitational singularity that I'm talking about, it's a novelty singularity and so you know the universe is growing toward some kind of ultimate state of boundaryless hyper-connectivity and when that is achieved the process will cease to be describable in the logos of ordinary space-time and energy.

Now science has no notion of this concept of novelty. In the East there is such a concept it's called Dao, and Dao builds things up and pulls them down according to its own mysterious laws. Tomorrow I will argue when we get the computer that its laws are not in fact entirely mysterious and that we can discover ahh.. the nature of the novelty constant, and instead of treating space-time as an absolutely featureless plain, we can take that zero value which is how that shows up in the Newtonian mechanics, and substitute instead a fractal dimension number which will be some kind of decimal fraction between one and two, and then this will allow us to do things previously inconceivable like predict the future and stuff like that. See of one thing I guess i should say since we started drifting into this fairly radi place is the idea that the universe is ahh... growing toward itself, it's not moving outward from its origin, its moving toward its completion and this is called teleology, its very unwelcome in most scientific modeling, but that's a legacy from the nineteenth century where they were so concerned to get god out of the picture that they wanted everything to happen through one random process colliding with another random process and flipping out newer deal elephants and redwood trees, but in principle we don't have to believe in god to believe in an attractor at the end of the process, we see many kinds of attractors in the natural world.

One way that I think of the psychedelic experiences is – you know you heard me talk about hyperspace, super-space, this kind of thing- it really does seem to me that reality is some kind of a very complex geometric object of some sort and you know how they teach you in trigonometry that all possible ellipses can be obtained by sectioning a cone, and that if you take the infinite set of ellipses and reconstruct them you can reconstruct the cone. Well the way I think of psychedelics and psychedelic tripping is you are sectioning a hyperdimensional object and what you're coming back with is a lower dimensional map of this higher dimensional object. Well everybody has a different map in the same way that there are infinite number of elliptical sections of a cone, but they're all generated by the same object and if it's a mystery to you how a simple fine-eyed object like a cone can generate an infinite number of elliptical sections then it's going to be hard [5:18:00] for you to understand how everybody can have a different psychedelic trip and yet be actually dealing with the same ahh.. reality in hyperspace.

Transcribed by Nicole

TM:[3:18:00]

There is no way to find out of course, cause they are all dead, but there are certain episodes in the evolution of

western culture that suggest that people may be much more plastic than we ordinarily suppose. First example uhh would be : How can it be that in the middle 1500s perspective was discovered. I mean, how do you discover perspective?[3:18:30] This is very hard, I think, for modern people to understand because uuh it's a given for us. I mean we see in perspective. We accept it as a quality of the world rather than uh a cultural artifact put in place at a certain moment. But in fact, during the renaissance only the most inspired people could uhh.. paint in perspective on the natch.[3:19:00] Most people, they had complex devices called perspectographs that would project over the scene a receding grid and then people would essentially fill in the lines.

Now another example of this kind of thing that's not so well known but that is an example that aii Marshall McLuhan makes a lot of is saint Augustine- the great father of the Christian church. He had a reputation for being[3:19:30] a very holy man and the accounts of his contemporaries say that a way that people would satisfy themselves that saint Augustine had a pipeline to god, is that they would bring him scripture, the Bible essentially, and open it in front of him and let him look at it and then they would close the book and question him about what was there and he could always tell them.[3:20:00] And they were amazed! As far as we can tell st. Augustine was the only man in Europe who could read silently. Nobody else could do it, it was regarded as a miracle. [audience laughs]. Now we all read silently and there may be few unfortunate individuals among us who move their lips while they read, but that's the only [inaudible] trace we have of this previous cultural mode where everyone "to read" meant to read aloud.[3:20:30]. No one could conceive any other way of doing it.

The logos seems to me a kind of similar thing. It was a mental behaviour, function, which, for reasons which are probably complex and unknowable, slipped out of reach. That's why, it seems to me, the psychedelics are very close to being able to modify our behaviours along this kind of lines because ,[3:21:00] there are number of behavioral and experiential possibilities that we suppress. I mean I think it's just uhh as an example of how little we know about what's going on ahmm. Look at the Grafen... , I mean don't look at it but conceive of the Gräfenberg spot : the G-spot. Now, we all know what this is, clearly people were looking for it for a long long time, how could they only discover it twelve years ago [3:21:30]. I mean, if something that major can be overlooked than it is hard to IMAGINE what might have been overlooked, I mean that's pretty central into the project of being a human being and apparently it was unknown until very very recently. So, uhhh yes- the Logos was probably uhh what I call Gaian mind. And that at a certain point in cultural development people [3:22:00] became so chuckleheaded that the Gaian mind had said: To hell with this! and then uh the voice fell silent. It fell silent right at the around the time of the birth of Christ eh . Right at the time of the [gia?] of the shift of this uh [inaudible] aeon, you know.

Audience: [inaudible question][3:22:30]

TM: How it works with psilocybin?

Audience: [inaudible]

TM: Well ahh, I mean I take when I take psilocybin I take it on an empty stomach, I don't fast or anything like that, I just don't eat for six hours- I don't call that fasting.. Uhh, and then I take it in silent darkness. That's number one - very important. The next thing is : weigh the dose.[3:23:00]

You must weigh the dose because 5 grams is what you want and I had over and over the experience of showing somebody what 5 grams is and they are appalled. They say : "MY GOD! YOU CAN'T BE SERIOUS. I mean, I would uhh.. I take a fifth that much. A fourth that much."

Yeah well, that's the problem, that's why you don't have elves in the attic and bats in the belfry like I do uhh [audience laughter] [3:23:30] umm yo- you know. And so then you take it, and I take it on an empty stomach and a lot of people don't like the taste. I don't really understand that uhh. I just chew them up. I sit with them and I chew them up and then huh?

Audience :Dry?

TM: Dry. And none of this mixing in applesauce or any of that malarkin. I mean what's that about? [audience laughter]

Audience: [inaudible]

TM: Oh well fresh- sixty grams. Sixty grams uhh [3:24:00] because there is more than a, you know, there is a huge water loss there.

Transcribed by Marko

T.M: "eventually society will get around to exploiting this particular one just like it does everything else. [audience question]

T.M: The drug is ibogaine the plant it comes from is tabernanthe iboga. Yeah?

[audience question "you mentioned combing the DMT with iboga, what what's the experience like, what is the change?"]

T.M.: Mhm? well that's what ayahuasca is [5:24:31] you see the DMT is then not destroyed in your intestine and so you have a slow release DMT trip by doing that.

[audience q "Is that done with smoking DMT and ingesting ..."]

T.M: Ahh, in in theory and probably in fact that would be a tremendously successful way to get very loaded the problem is it might be a too successful way you wanna be careful with these mao inhibitors - ther - there are mao inhibitors [5:25:01] that drug companies have produced where ah a single dose inhibits all the mao in your body for up to a month, this would be murder if you got around some DMT on that, uh the nice thing about harmine is that it's fully reversible in four to six hours so it's ah it's a gentle mao inhibitor, but yeah this is the strategy this is why you could conceivably take the [5:25:31] seeds of a plant like **inaudible [5:24:33]** which grows around here more or less and ah and contains harmine and combine it with a plant like **inaudible [5:25:43]** which contains DMT and come up with a north american pseudo ayascha of some sort, people are doing this but you know if you think, think it takes courage to just do these drug- these compounds na naturally imagine the kind of courage [5:26:02] it takes to diddle with recipes and to do your own **Bio Assay [5:26:06]** which you must do because the cook must taste the soup.

[Audience Q]

T.M: pa ga, Peganum harmala P-E-G-A-N-U-M Peganum Harmala in the **psycho falacity [5:26:21]**.

[Audience Q]

T.M: Well we never tried the experiment again [5:26:33] because ahh Dennis felt that he really made the maximum contribution [audience laughter] to the effort, ahh, there are many experiments though which could be tried, which

would put no human being in danger, ahh for you know, for instance, you could use square wave generators which are acoustical generators to try and drive these drug molecules into dna [5:27:01] in *vetro* in a test tube you know you would what would you would do is simply put the denatured DNA into solution, put some dmt into the solution, shake it furiously, ultracentrifuge the mix to get the loose DMT out and then weigh the DNA and see if its weight has increased by a number which was magically divisible by the molecular [5:27:31] weight of the DMT molecule, these kinds of studies have been done and shows that DNA ah, DMT does intercalate and locate itself into DNA so yeah there are a lot of different things like that that could be done that wouldn't put anyone at risk.

[Audience Q]

T.M: well, ahhh he doesn't remember it very clearly, he, his impression was [5:28:01] that it lasted about 5 days it actually lasted 3 weeks so the real staff that would have alarmed him he fortunately was to out of it to see or remember, but I was there throughout the whole thing and saw it, and uhm, I think it would be nice to understand the parameters of the effect a little more clearly before we charge off and try that particular trick again, yeah. {5:28:30}

[Audience Q]

T.M: Well this is what's being referred to is the in True Hallucinations which is a tape set which will be published as a book next year, it describes an expedition to the amazon in 1971 in which was really where we got the whammy, i mean its still, i'm still running on what happened from you know the 28th of february 1971 to the 21st march the rest of my life is pretty much throw [5:29:01] away. [Audience Laughter] but ugh, wh - what he, I dunno it was weirder than flying saucer abduction because that now there's a whole form for it, it was hard to say something was waiting for us down in the amazon and as soon as we started taking these mushrooms, it began making suggestions about how you could use the mushroom and your voice and certain other materials present at hand in {5:29:32} tha that environment to essentially uhm well there aren't even words to say what it was, condense the soul into three dimensional space, or ahh, create the philosopher's stone inside your body and then give birth to it or in other words some radical transformation of the ontology of being human was held out as a possibility and it all [5:30:01]

Transcribed by Jess Harse

TM: and it [5:30:00] all came down to an experiment that he wanted to perform that seemed to me so unlikely to have any effect whatsoever that I felt was perfectly alright to let this experiment go forward because I would have bet dollars to donuts that nothing would happen, instead all hell broke loose at the conclusion of this experiment and ahh you know he claimed that the time [5:30:31] that what he had done was bonded into my DNA ahh enough psilocybin in a superconducting kind of bond which if you know how superconductivity works, a superconductive bond is very hard to disrupt, it's not like an ordinary chemical bond and he sell that you could do what he called bell the cat - that you could actually hang [inaudible] a transceiver around [5:31:00] the neck of the Logos itself and from then on it would talk to you constantly in the confines of your own mind, and it just seemed so wildly improbable to me that it went forward but in fact at the conclusion of the experiment something changed in me, and I essentially became who I now appear to be, but before that I wasn't, I was sort of a [inaudible] [5:31:30] and ahh undirected person of some sort and then the... tomorrow you will see when we get the computer what the bottom line of this is because what was eventually revealed was a kind of mathematical mandala of space and time that rested on its... for its veracity on the fact that it allowed, that it made prediction of the future possible and tomorrow afternoon I will display [5:32:00] this thing for you and you can judge for yourself whether this is the product of ahh pathological incident or in fact an intellectual leap comparable to Newton's laws of motion or, or something like that. I think in principle all this is possible, I think transforming, you know, part of what Human History's conclusion will be is what I call 'turning the human body inside out' [5:32:30]; we want the soul to become visible, we want the body to become an idea, freely commanded in the imagination; and then at that point as James Joyce said 'Man will be durgible (?)', that was as close as he could get in 1939 to saying you'll turn into a flying saucer, you know, he knew it was an airship, he knew it was [inaudible] but he thought it was a durgible (?) ahh anyway enough about La Chorrera

maybe we'll get into that tomorrow [5:33:01]. Yes?

Audience: [inaudible question]

TM: No. Good point. The vine contains the [inaudible] another plant contains the DMT, this makes Ayahuasca unique among this shamanic tools because, you see, all the rest of them - peyote, mushrooms, San Pedro, ibogaine, morning glories [5:33:30], and whatever else, cannabis - are simply plants which you ingest; Ayahuasca is a drug, a product, something made by pharmacologists, I mean pharmacologists who wear penis [inaudible] but pharmacologists nevertheless you see, so suddenly the Human dimension enters into it not all Ayahuasca is alike, Ayahuasca depends on the personality of the person who made it [5:34:00], so it's not about the relationship between you and the plant when you take Ayahuasca; between you and the plants there stands a Human being and, you know, if you're headed down there to seriously get into this, don't, don't give up in a hurry, you will drink a lot of swill before you find someone who is conscientious enough, honest enough and cares about you enough to not short change you... in some way [5:34:30].

Audience: [inaudible]

TM: Telepathine yes. Ahh Ayahuasca was discovered by Richard Spruce... in 1853 and then in the early years of the 20th century the germanest [inaudible] brought a lot of it back to Berlin and Louis Lewin characterized an alkaloid which they named telepathine but it was not realised then until [5:35:00], I think, 1957 by the chemist [inaudible] that ahh well [inaudible] oo-or that telepathine was exactly the same compound as an early compound isolated [inaudible] named [inaudible] and since the rules of chemical nomenclature are that the first compound, the first name takes precedent, telepathine had to be dropped and [inaudible] substituted but it tells you how convinced these early [5:35:30] ethnographers were that this stuff was ahh, you know, exciting, paranormal, mental abilities.

Audience: [inaudible question]

TM: The [inaudible]?

Audience: Yes.

TM: Oh, well. No, no. See what happened was the what what [inaudible] took back to Berlin was the liana, the vine - Banisteriopsis caapi - ahh the the other active [5:36:00] ingredient in Ayahuasca was not

Transcribed by Francisco Arez

[5:36:00]

TM: The other active ingredient in ayahuasca was not isolated chemically until 1956.

Audience: But the guys who took the vine back [inaudible] the vine?

TM: The vine doesn't contain DMT.

Audience: But the harmaline itself?

TM: Well yes, has an effect, at high doses it can cause hallucination by itself.. The uh, the plant which contains the DMT, normally , there are a couple of possible substitute, [5:36:30] but normally what's used in the Amazon is *Cicotria Veridis*. Uh, this is a little coffee-like plant that contains DMT in the roots. One of the great mysteries of ayahuasca is how, out of 475,000 species of plant in the Amazon these people figured out that you pound the vine and combine it with the leaves and then go through this elaborate boiling and concentrating [5:37:00] and then you get this fantastic visionary beverage. If you ask them how they figured it out, they say the plants told us. Which is so far, the best answer anybody has come up with. In 1962, Melvin Bristoll, who was a graduate student of Richard Evan Shultsies at Harvard was studying ayahuasca among the Sibundoi Indians [5:37:30] and uh, he took ayahuasca. And during the trip a plant was revealed to him. And he was told that it would be alkaloid positive. And it was alkaloid positive. Well, this is now anecdotally embedded in the literature. Was it dumb luck? Was it synchronicity? Or was it that plants tell you about other plants? The way ayahuasca is used by research pharmacologists [5:38:00] in these Amazon tribes is they brew a standard brew. And then if they have a plant, that they, for some reason suspect might have some medical usage, they will put a little bit of that plant into the ayahuasca, And then the ayahuasca will give them a readout on it and explain what it is. I had one of the longest evenings I have ever put in where I took half a dose of ayahuasca [5:38:30] and half a dose of mushrooms. And it was absolutely god awful. It was different from any bad trip I'd ever had. It didn't seem to be about my personality it seemed to be about core processes. There was a little pacman thing and I could see it moving through my memory. Just chew, chew, chew, chew, chew. And I didn't know, you know that horrifying scene in 2001 where the guy is outside [5:39:00] the spaceship and he say "Open the pod doors Hal. Open the pod doors Hal." Well that's how I felt. I felt, I could almost see the molecular machinery had jammed. And I said, "Oh my God, It's not going to deanimate. Or de-alkalate. It's somehow caught in some kind of a loop. And I sweated bullets for an hour and a half with it. It was really horrible. [5:39:30] And then it finally released. And let me go. But as I sat in that chair I said, you know if I can't pull out of this place, there's a room in a back ward somewhere and they will just sit me there and look in on me every 12 or 14 hours, and that'll be my story.

Audience: You said earlier that you were surprised that you had no kind [garbled audio] We have a clinical climate that's not congenial to exploring.

[5:40:00]

TM: Because I don't feel particularly courageous. I don't feel that this is unusual what we're doing here. Am I crazy? Could be. Uh, it seems to me, would seem to me, knowing what I know, which is no more than a thousand other people know, I couldn't live with myself if I didn't talk about these things. Because [5:40:30] our problem is we're disempowered, unhappy, and disconnected from ourselves and each other. Here's the solution. How can you, it's a political obligation, or it's a moral obligation to try and at least inform people. They don't have to take it. But they

should at least have the facts of the matter in front of them as they live their lives. So , I, I just do it because I couldn't do it any other way. And I'm puzzled that nobody else feels [5:41:00] ah, this imperative. Because the people I talk too, you know a thousand people have told me psychedelics were the most important thing that ever happened to them. But not one of those thousand people ever said, "And I scheduled a speaking tour to do the same thing your doing." So I don't know..

Audience; [garbled audio] fear and paranoia I hear there were even people were afraid to come to this and revealing their interest?

[5:41:30]

TM: Wow! Well either I'm crazy or they are. I don't know. See, I think that , ah that, ah you know how, um, if you confront certain, um, well butterflies, or deer. There are certain kinds of animals that if you move slowly enough, they can't tell you're there. Because they're set up for edge detection. And if you move slowly enough, they don't register the edge transiting.

[5:42:00]

Transcribed by Micki Garrison

TM: [5:42:00]... so you can actually walk right up to them and grab them, if you know how to do it. Lizards are like this, cats, so, so i think that by moving with stealth, rather than going to Harvard or Berkeley and inviting the freshmen class to pour into the street and smash bank windows, that we can actually flip this thing along. I think that eventually such desperation it's going to strike straight institutions [5:42:30] that they will come to us and ask.

They're gonna try everything when the going gets rough and when they finally decide to drop all their pretensions we'll be perfectly willing to have a dialogue. I'm sorry to hear that people felt that paranoid about it. I don't think the political climate is that repressive. I think people are doing the work of the man for the man by being that paranoid.

Audience: [inaudible] [5:43:00]...counter-pressures.

TM: Well counter-pressures, this book was banned in Florida but for crying out loud look at the Russians, they were able to toss out the Communist Party, well now that's a pretty scary thing to go up against. We don't have anything comparable to that (ahh) in terms of it's depth of penetration into our lives and yet they were able to do that. I think, you know, there's more to life

than hiding out. [5:43:30] (Ahh) you gotta make the grand gesture at a certain point and then let the chips fall where they may.

Audience: You're right.

TM: Brave words, ohh boy... [audience laughs] (ahh).

Audience: [inaudible]...something for your audiences (ahh) an organization or something that taken... [inaudible] ...raising consciousness and changing our society?

TM: Basically i think people should see this kind of meetings as a tremendous opportunity to form local [5:44:00] alliances. The last thing on earth we want here is a Terence Mckenna cult, that would just be the stupidest resolution of the whole thing. The whole message is, you don't need me or Tim or anybody else, just, you know, take a little metaphysical responsibility upon yourself, realise you are the microcosm of the microcosm and then (ahh) get with like minded people and proceed. [5:44:30] I mean, this is how political revolutions are made, is by people just ignoring as the irrelevant outmoded social forms and structures and insisting on their own authenticity.

Audience: [inaudible]...Hofmann foundation...[inaudible]...help?

TM: Oh, it might help... people... i mean, how would it help?

Audience: [inaudible]...strength in numbers.

TM: Strength in numbers, well i think people [5:45:00] should support psychedelic communities, archival projects (ahh), legalization moves (ahh), yes but mainly i think what we all need to do is get more loaded. [audience laughs] You know, deeper trips, higher doses, see, it's not that we want to convert the entire planet to taking mushrooms. It's that we just want to be left alone to do

what we want to do. The mushroom [5:45:30] if it's as great as i say it is then it doesn't need a mob clearing the way for it, it's perfectly able to advance its own agenda. The thing is just not to yield to fear. Cause if, as i said, if you yield to fear you do the man's work for the man and that makes you the man! So, you have to do is just say, oh, you know, this is what we do and (ahh), eventually it will change. I mean, gay people [5:46:00] is a good example, i mean, in our own life times we've seen this go from, you know, unspeakable crime against nature which decent people took care to not even being formed of [audience laughs] to, you know, a political sub-culture with it's own agenda and it's own cress and it's own political clouds. Well, we are not as under the thumb as gay people were, say, in the early 50s [5:46:30] or something. If they can do it, we can do it. If black people can go from slavery to a legitimate claim on full social integration into the body politic than we can do it too. But not if we, no, in America nobody gets nothing unless they demand it. So as long as we bow our heads and hide our stash and they're looking over our shoulder, well then they got us on the run. But we just have to say, look, [5:47:00] this is it, this is who i am! If this doesn't gibe with your political agenda, adjust your political agenda [audience laughs] because this is who we are. Well now let's knock off and regroup for tomorrow on that point, but thank's very much. [silence] Well, (ahh), before we get into (ahh) this morning's (ahh) rigid agenda, (ahh) (ahh) where were we [5:47:30] yesterday? And our, [audience laughs] (ahh), is there, i recall there were hands up. To the people who belong to those hands still have the concerns but went with them?

Audience: [inaudible]...local alliances and (ahh), psychedelic communities...[inaudible]

TM: Talk about forming local alliances and psychedelic communities... Well i think, you know, as i said this is your affinity group. You can't recognize psychedelic people walking around on the street [5:48:00]

Transcribed by Tiago Ramos

[5:48:00] On the street because our victory in the area of fashion has been so total that now even priests look like freaks. [*laughs*] So uhh, yeah i've been in a number of places where people organized uhh i don't know what you would discuss them, discussion groups, affinity groups, in the wake of it, it's something you have to self-organize, uhh, maybe in the period after the [5:48:30] close this afternoon, the people who are into that should exchange names and get something going, i mean obviously it's a delicate thing but on the other hand uhh..Mmmhmm?

[inaudible question from audience]

TM: For me?

[inaudible audience]

TM: Well a lot of [5:49:00] people feel more secure uhh doing journeys if they have uhh some kind of ground control and in the most casual form that can just be your best friend who doesn't do it but you do. Or if you suspect that fairly deep and uhm charged issues are going to rise-arise out of it, why you want it to be someone with some psychotherapeutic experience. But on the other hand you know, you're in a such a vulnerable state in that dimension

that you really want to choose the facilitator carefully, I mean, and have some kind of set of agreements worked out before. I mean, the psychedelic trip doesn't always take the direction you want it to. I mean, you want- you write down before you take it that you want to deal with some episode of childhood trauma [5:50:00] or abandonment then you get loaded and it seems so preposterous that you, you know, you can hardly contemplate the notion without laughing out loud and the facilitator has this - keeps trying to bring you back, say, 'well you're doing the work! We're here to do the work!', well, then you say, well, you know, having a knock-down drag-out fight while is somebody is loaded isn't exactly the way to go either. You sorta have to feel [5:50:30] into that issue as i said yesterday, i, i can't get where i want to go in the presence of somebody else because they hold me to the surface. If i were to have my idea of the perfect facilitator, situation is that they are two rooms away and you have something equivalent of a beeper and then you know you can beep them and they'll come in and pat you on the head and tell you it's alright if you need that.[5:51:00] But otherwise, they stay completely out of it, it's really nice to follow your own thoughts you know? And i think we change in the presence of another person, you know? We create a persona, and uh it takes a lot of energy to maintain the persona. And in that situation there's no reason, so why do it? Yeah?

[Question from audience] [5:51:30]

TM: Well, not exactly, i mean people always say can you do it on the natch? And i sorta feel like if i could do [5:52:00] it on the natch i'd be alarmed enough to check myself in for some serious mental health care.Uhh, It's too radical, you don't want to be able to do that [5:52:00] on the natch.

Audience: Oh come on [laughs]

TM: It's a wonderful control on it! To know that it won't happen unless you take the stuff. You know? Because it's not a mood shift or a subtle refocusing from foreground to background, it's an absolutely ontology peeling breakthrough.

Audience: [inaudible question]

TM: In principle, i, [5:52:30] i agree with that and i'm fascinated to try anything anybody has in mind but uhh you have to be very demanding. And I think too many people are not demanding at all, I mean, you sit people down in a room and tell them we're gonna repeat ooma humm 500 times and at the end of it they come to you with tears of joy in their eye and tell you it was the most profound that's ever happened to them. I don't understand where those people [5:53:00] could be coming from you know? I mean it's uhm, i can sit down and like think about being stoned on DMT and uh and i can and i can give myself the butterflies with that exercise but-but not much else, that's as far as i can get, you know? Uhh persistently these various traditions claim that they can deliver the goods, but when you look at the [5:53:30] art which is the paper trail that they leave, it doesn't look like what i'm talking about. You know I mean i went through I, once, for a while i was a professional art buyer for tibetan art, tankas and that kind of thing and i interiorized all of that iconography and uh, but it isn't very much like uh what we are seeing. And uh, you know there are a number of highly idiosyncratic [5:54:00] artists..

Transcribed by Jonathan Laliberte

TM: [5:54:00] Idiosyncratic artists gathered through the history of art ... g- Gustave Moreau, James Ensor, we mentioned Hieronymus Bosch. Uhm mmhm know- you know hmm ... uhm Matty Carline? ... but I'm trying to think of older ones. But- but not- these seem to be unique visions, but not exactly the vision that ahh seems to come out of this stuff. Part of what's [5:54:30] so interesting to me is how alien it is. How if art is the- if the artist is supposed to be the antenna of society anticipating the visions which will later become the paradigm, then they're not doing the job very well in the psychedelic uhm domain. Yeah .. are- you wanna- did you have a follow-up?

Audience: [inaudible question] [5:55:00]

TM: Well, but this is where the action is. You know, it has to- it has to make sense in the world. Now, I don't want to suggest, I mean, I- I think ... like in the case of psilocybin I have no doubt whatsoever that if you take five grams of psilocybin [5:55:30] every four days for let's say forty days then you will have nothing whatsoever to say to the rest of us. You know, if what you see - the thing is in the spiritual quest all these methods: yoga and mantra and then ... you know, all the mmm uhm, new versions of this. The whole s- the whole stance of the spiritual questor is ahh accelerator to the floor [5:56:00] all the time. When you switch over to this method it's the breakpads that are going to get the workout. Ahh, we don't- we psychedelic people do not strenuously exert ourselves to attain peculiar states of mind, we strenuously exert ourselves to keep the states of mind from becoming too peculiar.

Audience: Why?

TM: Why? Because it can become mmm so [5:56:30] peculiar, that- that- that- I don't know why!!! [laughs hysterically]

Audience: [laughs] [inaudible]

TM: Yes, that's it. It can become so peculiar, that it is unspeakable. And if it's unspeakable, it's j- just dropped out of the social contract, you know.

Audience: So really, the reason to maintain it is so you can get back in the psychological state and communicate, but ... what I'm thinking is that I'm sure [5:57:00] that there are people who have pursued it to the point that they just walked out of [inaudible] come back.

TM: Mmm, yes, well that's what I wanted to say. If you want to be the guy on cold mountain who is covered with hair who the village people occasionally see when the mist clears when he descends to the lower levels to cut wood. You can become that daoist immortal. Ahh, you know w- w- what I like to say about psychedelics [5:57:30] is once you get to this it's no longer about seeking the answer. It's now a tough or go, now you have to face the answer. And

it's so easy to seek ... you know, this Rishi, that Roshi, that Geishe, that Guru and all the wonderful people and the gossip and hijinks around the ashram and all that malarkey, but once you get to this and it's just you and it ... [5:58:00] you know, it's a- it's a whole different ballgame.

Audience: [inaudible question]

TM: Well, to s- to s- we're talking there are two things. The experience and the wisdom and maturity that comes from the experience. You don't have to keep dosing to do that. But to attain, maintain and workout the implications [5:58:30] of that, but you have to keep dosing to keep encountering the unspeakable thing that is the source of all that maturation and- and so forth. My gosh, everybody's agitated here ... Yeah?

Audience: [laughs] I wondered if ahh in your experiences in Amazon or [inaudible] if you found that they were able to uhm to do this [5:59:00] without drugs or whether they were even interested in?

TM: No, largely not. Ahh, in the Amazon- I mean I discussed this with people and they- they said: "No", you know, "you must- the plant is the teacher." I mentioned or maybe I didn't, but there's an interesting book called 'Haoma and Harmaline' by Flattery and Schwartz and it discusses the rel- ambiance of the religious attitudes of early Zoroastrianism and they believed [5:59:30] in what they called the menog existence. And we're talking, you know, twen- two thousand B.C. here, and they uhm ... believed there was no possible way of accessing the spiritual dimension except drugs. That was the entire way to do it. And I think it's a- it's a kind of pharmacological and energy barrier. It's good that these things are aw- isolated from ordinary [6:00:00] experience ...

Transcribed by Lovro Tacol

... isolated from ordinary [06:00:00] experience by the formality of having to take the compound; if they weren't it would be flooding in upon us all the time and we would have a hard time indeed, yeah.

Audience: well, I used to think about people taking the psychedelic

Ten there's this other people practice meditation. [06:00:30] I read somewhere recently that people in the amazon that take ayahuasca they their

And what I haven't seen very much is the combination of what you know mental practices ah so as to ah plus taking psycylocibin

[06:01:00]

THIS CONCLUDES TAPE 4. OUR PROGRAM CONTINUES WITH TAPE 5

Terence: why is there no talk of the combining of the techniques with psychedelica?

Audience:

Terence: well, I don't know exactly, I mean I would certainly agree. [06:01:30] See I think that all religion is based on the experience of ecstasy.

And a religion-

Audience:

Terence: And a religion like Hinduism represents to my mind an extreme case. The roots of hinduism are in the soma rite. For 3000 years this is what hindu religiosity was about; it was an intoxicant, eh and ah without the intoxicant there was no [06:02:00] connection to the mystery. Well, then for some reason it became tremendously hierarchically structured and and constipated and ah dogmatic, and ehm ahh... well certainly dominator inla-i- if not alright fascism. And so I think all these religions have their roots in this irrational experience [06:02:30] but they constantly want to turn it into a real state operation [audience laughs], and they do, and they do, and so- but in answer to your question: all these techniques work with psychedelics, you know mantra, yantra, magical invocation, ahh, raising the kundaliny... all of these things which seem so totally obscure [06:03:00] if- from this level of consciousness it just becomes an: "of course, of course it works" so it seems to me the lost ingredient is the psychedelic. I mean ehh y-you know, if you go to India and you have any illusions about Sadhus, I mean Sadhus they're hash-heads, with a line of patter, that's all. I mean the main concern in any community of Sadhus is: how many [06:03:30]JOINTS can you make and smoke before you fall asleep. And m- I've never seen a yoga text that came clean about this and said, you know, this is basically a how to use cannabis technique, so eh yo- it's good to go to the actual place and see, see how it's being handled. What's going on in the Amazon is the shamans cure, they chant, the provide and exemplar for [06:04:00] their society but when you get seriously loaded with them and talk to them their attitude is more like scientists. They will agree that they can cure and find lost objects and predict the weather and all that but they don't understand how this works. They're very eager to admit that it's all a big mystery and that beyond the cheerful set of shamanic techniques, that they, the Witoto, the Guarani, whoever they are, beyond the cheerful [06:04:30] ahh power of the conjuration of these techniques lies the absolute unknown and they're aware of that. There's no closure in shamanism so it sort of keeps you humble, yeah.

Audience:

[06:05:00]

Terence: right

Audience:

Terence: right

Audience: of a contact high, [06:05:30] when you are around people

Terence: oh I think contact highs are very real, ehm, not only contact highs but there are also contact lows eh, [audience laughs] which are very noticeable, y-you know there's a - there's a phenomenon called allophrenia, do you know what allophrenia is?

Audience: No

Terence: Allophrenia is when your friend is put in the hospital [06:06:00] for schizophrenia and you go to visit him and you become- you begin acting so peculiar that they don't let you out [audience laughs]

Transcribed by Lucas Mathias

Allophrenia is when your friend is put in the hospital for schizophrenia, and you go to visit him and you become – you begin acting so peculiar that they don't let you out. This is a common phenomenon: misbehavior by people who have come to visit people who have been hospitalized for schizophrenia or psychosis. The best theory is that it's pheromonal. You know, there's one theory of what schizophrenia is, that schizophrenia is a pheromonal disorder. And, you, what happens is your pheromone system goes haywire. So then, you don't smell right. So then the people around you begin frowning at you, avoiding you, turning their back on you when you approach, then you begin thinking, there's something wrong with me. I'm weird. Then you secrete more of this weird pheromone and people get - and a dissonance begins to happen until finally you have to be plucked out of the situation. There are psychiatrists who swear that they can diagnose schizophrenia by sniff test. You know they just walk over and take a hit off the side of your neck and say, you know, "Lock this one up" or (laughter) Yeah.

Q: (unintelligible)

T: Now, the problem is one of – the question is, is there in Huichol art a trace of this psychedelic dimension. I guess there's a trace, the problem is – is twofold, the problem is one of material, with wood and beads and pitch it's very hard to get the – the – to contort that into the object seen, and then the other thing is conceptually. It's very hard to grab and hold these very weird images. The other thing that's happening in most traditional societies is that you operate within a canon. You know, if you're a Huichol, you have a very limited uh, vocabulary of expression, within the iconography of Huichol art. If you're a Tibetan Tanka painter, similarly, it's all laid out for you. Walls of tradition are very high, the channel is very narrow. That's why it's so interesting when an artist can transcend the, the momentum of their cultural tradition and really produce something unique. I don't see, I mean I think the reason I like talking to artists is because all the art of the past 20,000 years is like a tea cup dipped into the ocean. And yet any one of us, not particularly self-defined as artist, can access the ocean. Can swim in the ocean. And so you say, you know, we all can touch the same source that these great artists must have touched. Their skill was they were able

to bring out a thimble-full of this material and the rest of us can only look at it and wonder and let it pass us by. Yeah.

Q: (in reference to an “extraterrestrial position” on psychedelic use and whether or not Terence still holds this position)

T: No I'm not sure, exactly, I mean the funny thing about the extraterrestrial position is that, it depends on how long it's been since you've taken mushrooms, how creditable it seems. If it's recent it seems the only possible explanation. If you wait a few months, then skepticism and reason begins to level the landscape, and you say, “No, it couldn't possibly, really, be that.” But I think, uh . . . you know, no, I think we hardly have an inkling as to the real nature of the world, and the real history of life on this planet, and you know, we don't know, uh, how narrowly channeled the manifestation of organic intelligence is. Does it always have to be in a body? Does it always have to be in a body that stands upright with binocular vision? I think the real task with dealing with extraterrestrials is to know when you've got one. It's completely silly to search the galaxy with radio telescopes for, uh, a radio civilization. I mean to my mind that is as chuckleheaded as deciding you're going to search the galaxy for a decent Italian restaurant. (laughter) I mean, it doesn't work like that!

So, um, you know, if you think about the mushroom, try to think about it objectively. It looks to me very much like a good candidate for an extraterrestrial. First of all, DNA has been known to us only since 1950, less than a century and we're already involved in this thing called the Human Genome Project. Well, the real – what that means is that we are taking control of the scripts that write human beings. It seems to me anything we would recognize as [6:12:00]

Transcribed by Kristen Askin

[6:12:00] intelligence would pass through a phase of self-analysis where (6:12:04) it would realize it was made out of DNA and it would then sequence itself. We're about to do this ourselves. Well, that means that most extraterrestrials will be the product of their own reflexive design process. In other words, an extraterrestrial that has crossed the gulf across the stars must surely then be able to control its own form.

Well, then, if you look at the mushroom, it's a curious combination of artifact and entity. It looks sort of manufactured. There's very little fact on that system - I mean, first of all, um, fungi are primary decomposers. This means that they are at the very bottom of the food chain. This makes the kind of vegetarianism espoused by Buddhists look like an orgy of slaughter. You know? Because if you're at the very bottom of the food chain, that is the only place that is absolutely karma-free. So there's the mushroom, occupying the karma-free position at the bottom of the food chain. Well, then, it's – you know, we've been reading about the huge mycelial clones spread out under the soil in Michigan and Wyoming, well those things, what that is, is that's a cobweb-like network. And in the case of a psilocybin-like species, filled with neurotransmitter compounds. Can you imagine how many synaptic plants there must be on a 1,500 acre mushroom clone? If brain size is any relation to intelligence, then hang on, Hannah. (laughter) Because, uh, that means that this thing which has spread through the forests of the Midwest has a, uh, brain approximate in weight to, uh . . . a couple of dozen gray whales.

Uh, the other thing is, then, the spore, looks perfectly designed to sustain itself in outer space. If you want to store spores for longevity you create conditions as close to the conditions in outer space as you can. High vacuum. Very low temperature. Uh, the casing of a spore is one of the most electron dense organic materials in nature. So electron dense that it approximates a metal. Well, global currents can form on the quasi metallic surface of an airborne spore and they act as a further repellant for radiation. So, and, you know, percolating through the galaxy at an ordinary rate typical of stellar material, a mushroom species could percolate from one side of the galaxy to another in under four hundred thousand years. Well, that's lightning speed compared to the size and age of the universe. If we were to gain the power to design ourselves, I think after a whole bunch of uh, of Madonna and Robert Redford clones, we would

probably move on to becoming something very much like a mushroom. (laughter) It's uh, you know, mild (6:15:43), its noninvasive, it's at the bottom of the food chain, it's virtually immortal, its laden with neurotransmitters, and it's living in the imagination.

And this brings me back to a favorite subject of mine, this is where we have to go, we have to enter into the Blakian, divine imagination. That's where our future lies. Uh, at this point, our relationship to this planet, as an infant-child relationship of impending toxemia, we have to be parted from the mother - to save the mother and to save us.

And there are not that many possibilities. Where are we going to go? The political geniuses who run this planet have made travel to the stars virtually impossible. I mean, don't kid yourselves, it isn't only a matter of announcing a program. Our short, stubby fingers couldn't assemble something like a Saturn-5 moon rocket. That was made by a generation of people now deceased. Americans in this, uh, era, are a rather dull-witted people who have trouble even running a third world economy. So we're not going to the stars. You can forget that. Uh, so then where are we going? Well, nanotech. Is that a possibility? Could we download everybody into a super-cool cube of gold and terbium alloy buried three hundred feet deep in the center of Copernicus? And then we'll leave Earth and go there and dance forever in the hallways of the astral imagination?

That's one possibility. Another possibility is, is there a way to diffuse consciousness into the environment? Can we become dolphins, caterpillars, gray whales, and mosquitos and just sort of defocus ourselves? I mean, all of these, of course, are wildly radical notions. On the other hand, we're headed straight toward a brick wall at about 5,000 miles an hour. We have to figure out something pretty astonishing in a hurry. [06:18:03]

Transcribed by Kristen Askin

TM:...[6:18:00] figure out something pretty uh, astonishing in a hurry. Yeah.

Audience: Yes uh, another thing about the function of the mushroom is ??? for reentry into the atmosphere ??

[TM laughs]

TM: The heat shield! Yes, precisely. [Chuckles]

Audience: ?? can jumpstart an evolution

TM: That's a funny question I don't know because it's so hard to tease apart genetics and environment. I mean they certainly have had a jump start on evolution picture of hanging out in the space that our lives have created. Uh, you know I think children need lots of attention lots of nurturing physical and spiritual. Uh, I guess I would say so, and certainly they haven't been programmed with the fear and misunderstanding that that is in the society. We just got through anti-dope week at our school which is an incredibly painful experience at this particular school because I don't think there's a person associated with it who believes it for a moment uh, but it's like we all have to study fascism because we live in a fascist state. Uh, a teacher made a statement that uh, that LSD caused brain damage and my son dared to challenge this. And the guy said well, who told you it doesn't cause brain damage?

Audience: Daddy!

TM: No, not my Daddy. He said, well Albert Hoffman told me it doesn't cause brain damage! [Audience laughter, TM laughs] End of discussion!

Audience: ??

TM: Mm mm. Yeah

Audience: I know that children are very interconnected with their parents, so when you're doing substances do you feel like the presence of your child sometimes going on your psychotropic experiences ???

TM: Yeah well when children are very young you know all kinds of psychic phenomenon happen and you know I think mothers nursing mothers and their relationship to their two children as intensely telepathic. I remember when my daughter was not very old, she must have been like about three and a half and I had the dream and it was very unusual dream for me and very highly realized and I dreamed of an orrery. Do you know what an orrery is? It's a model of the solar system made of gears and you crank it and there's the sun in the center and the planets go around it, but this was a huge orrery. I dreamed I walk down the hall and I opened the door and I walked into this room and there was this orrery and these planets were circling around the sun inside this room and then, and I was awakened by my daughter crying and I went downstairs and she said uh, there were planets circling around inside my bedroom. So- and you know that's a very specific and rare image for an adult or a child to have. So yes, I think that we're- our chuckle-headedness is the main barrier to encountering all kinds of special abilities that around us all the time. We are truly the prisoners of our limited conceptions. Yeah.

Audience: ?? go back to some of the questions about why you don't want to take it every day for 40 days in a row. And it's more the psychological level that what causes- I've worked with ?? therapies in Mexico ??? stories about Jung and uh, many of the people who have gotten into the situation of psychosis are people who have used drugs as a general principle behind that is that people have experienced something that they cannot integrate back into their psyche or whatever even if it's the ability to say well, that was then and this is now. And therefore you get psychosis. So not to, not to say these things to alarm people but ??? that this ability to come back and not be far out there and that there are a lot of different set up parameters to this ?? on your ego strength. Another one is the society you live in. If you're a shaman and you can say these things ?? Then you're fine. Um, and it doesn't have to be drugs. Um, Jung used to when he was older he used to sit in a chair and go inside and when he came back he would have this litany of things that he would say so that he could come back and function. He would say you know I'm Carl Gustav Jung, my wife is___ my children of this many children this many grandchildren.

TM: Uh huh, the reconnect affirmation. Yeah, well I think that's not a bad idea.

Audience: I wanted to ask you how you see ???

TM: Well I don't have a very popular position on ritual and I blame it on the mushroom because I just quote the mushroom. And the mush - I said what about ritual? And it said that's fine if you don't know what you're doing. And I think that, that you know, it's really not an anti-ritualist position because that is what ritual is. That's what you do if you don't know what you're doing.

Audience: ??

TM: None of us. But, you know, the purpose - can tell when the ritual works because it makes itself obsolete. That's the- it's- yeah.

Audience: ?? I think as we continue...??

TM: Well [6:24:00]

Transcribed by Eva Petakovic

TM: [6:24:00] Well I don't have a very popular position on ritual and I blame it on the mushroom because I just quote the mushroom. And the mush - and I said what about ritual? And it said that's fine if you don't know what you're doing. And I think that, that, you know, it's really not an anti-ritualist position because that is what ritual is. That's what you do if you don't know what you're doing.

Audience: ??

TM: None of us. uh but you know the purpose - can tell when the ritual works because it makes itself obsolete. That's the- it's- yeah.

Audience: ?? I think, I think as we continue...??

TM: Well, you know even in the most ritualistic context there's always a footnote made for the crazy wisdom. I mean every great teacher has said that what he saying is malarkey. A teacher that doesn't tell you that what he or she is saying is malarkey is not to be taken seriously. So you know it's the if you meet the Buddha on the road kill him style of thinking. Or I was just reading this Guru who's coming on strong. Uh, is it- is his name Pucha Ji?

Audience: Dass?

TM: No, no not Dass. [Terence chuckles]. But anyway somebody- this guy said don't, don't do practice. Don't do practice. Practice is only distraction. He said we have to keep thinking up- you know running an ashram is not easy. These students they expect so much of us. To keep continually inventing stuff to keep them happy and send them off on these crazy quests and, and you know, endless fasts and all this stuff because they want that. But you know the guru is pretty much content to kick back with the latest Rolling Stone. Yeah?

Audience: If my memory serves me correctly I think I saw it on the handouts that you're doing some Sheldrake.

TM: Right.

Audience: Could you comment on that? I'd like to know a little bit about that.

TM: Well, are you all familiar with Rupert Sheldrake's work? Sheldrake is a British biologist whose written a number of books. First book is called A new science of life and it was catapulted to fame by virtue of a review in Nature which said it should be burned. And then he wrote a book called The Presence of the Past. Sheldrake as an extraordinary simple interesting revolutionary idea that just drives scientist straight up a tree. His idea is that um, once something happens it's easier for it to happen the next time.

Audience: ??

TM: Yes, simple, but it takes then forms which drive people crazy because he asserts based on that that if you teach rats to run a new kind of maze in Australia then rats in Massachusetts should be able to run this maze uh, faster than if the rats and Australia hadn't uh, learned it because once something has been, has occurred then it has a momentum in time. He calls this the theory of formative causation or morphogenesis and it explains a lot of things which are otherwise very difficult for biology to explain but it raises also a bunch of issues that are pretty tricky. And so Rupert and I have been close friends for years and even longer I've been tight with a mathematician in Santa Cruz named Ralph Abraham who's a chaos dynamicist and Ralph and Rupert and I did a book together called Trialogues at the Edge of the West which will be out at the end of the summer from Bayer and we'll all get together at Esalen at the end of August and do a bunch more of these public three-way dialogues which are pretty spirited because we are very different people from each other. Uh, but all psychedelic in all interested in paradigm recasting. So that's what it's about and it'll be out in mid-summer. End of August for that Esalen thing. Anybody else. Yeah.

Audience: ??

TM: Uh huh.

Audience: ??

TM: Well, feminism is a necessary thing for a successful future because the archaic world was so dominated by, well that's a bad choice of words isn't it, was so characterized by an awareness of of the feminine and the boundary dissolving and the organic and the whole problem with the world uh, is that we cannot feel the consequences of what we are doing. You know, I mean recently we had paraded-[6:30:00]

Transcribed by Eva Petakovic

[6:30:00]

TM: You know i mean recently we had paraded in front of the figure of Jeffrey Dahmer as who you don't want to be like. And yet jeffery dahmer to me was an absolute paradigm of global civilization because his problem was that he didn't he couldn't feel the consequences of his actions. And this is what we are doing. I mean we are lacerating ourselves by coming down the rainforests and poisoning the ocean.

[6:30:30] This is not some airy fairy save the redwoods kind of mentalities that protests.. This is our own atmosphere our own environment that were destroying. Its a its a slow suicide not so slow at the rate were tearing in half. Well somehow we have to reactivate the maternal nurturing caring circuitry that tests the tendencies

[6:31:00] that have evolved in this fabled direction uh at at bay for a long long time and you know you can call it ego you can call it male dominance you can call it a phonetic alphabet whatever it is it has to be stopped because the planet is in peril by it and i my analysis of it is that the only way to do it is to dissolve the boundary that culture and language and tradition have allowed us to create

[6:31:30] and they are largely boundaries that deress women not because men hate women but because men hate the feminine and they want to control and hold us back threatening its devouring i mean the fact that the french refer to orgasm as the little death tells you you know how what a weird kind of ambivalence haunts uh our relationship to anything which dissolves uh

[6:32:00] out of out of the knot that we have tied ourselves into and so i you know i'm a kind of non feminist feminist. I mean i think most feminists are feminists because they think women have gotten a raw deal. I m a feminist because i think mankind is headed for suicide if we don't return to a more intense expression of the feminine so it's not a political agenda for me to

[6:32:30] liberate and oppress groups of people its a collectiveness that gender necessary to save everybody and everything on the planet. Yeah

Audience:... in the end the general.. Is that um there is this ... and

[6:33:00]

Malevolent entities

There's malevolent forces out there just as

[6:33:30]

TM: ..well

Of course

TM: No i mean there are malevolent and benevolent forces in there and out there. Uh but the i dont see... i don't see the world really as a struggle between good and evil and some kind of manichean situation. It seems to me that it we confer value

[6:34:00] that nature is neither good nor evil and that must then improve as ally... its just that we confer judgement this is because when you begin to get down towards the bottom line we don't know what the bottom line is. For instance were headed towards a great historical bifurcation where we're gonna have to make some really hard choices and most of the time in the so called new age they try to fuzz

[6:34:30] all the distinctions and make you think you're never going to be slammed to the wall and have to make a choice but the choice that's coming up for us is fundamental. It is are we to become the care givers the nurturers and the gardeners of the earth or is the earth you know this is i put it this way to somebody the other night the question was is the earth our mother

[6:35:00] therefore to be cared for into her old age nurtured revered and loved? Or is the earth our placenta. Therefore to be examined for signs of toxin and then buried under the apple tree. In other words what is the true nature of human beings. Are we to be integrated into nature to celebrate it or is nature a demonic and titanic force that is imprisoning spirits and

[6:35:30] holding it back from its full unfolding in worlds of alien life and higher dimension so far from here that its a miracle that ... rumour reached us of the possibility of salvation. This is a tough choice because one path leads to uh radical renunciation of technology radical tearing of population. Uh and an attempt to come to terms with

[6:36:00] this small liquid planet on which we find ourselves and the other direction uh s.. Forget it. Its the husk of a seed and it is utterly meaningless in the cosmic drama and the real destiny lies out there half way or some other exoite port of call i don't see how you can have that both ways.

Audience:

[6:36:30]

TM: yes and most stars uh have lives shorter than the amount of time that biology has been on this planet. We are fortunate enough to be around a very slow burning stable star. There are a lot of.. I havent forgotten your second question right. There are a lot of mysteries in our cosmic neighbourhood that we rarely hear addressed for example just as an example um if our destiny lies out

[6:37:00] in the great universe its a hell of technological barrier to cross to the stars. I mean it may be insurmountable however isn't it interesting that the most earth like star within seventy light years is the nearest star. Not technically the nearest star which is uh glowing red clinker called alpha centurai right, but

[6:37:30] beta centura. is 1.1 solar masses. 1.1 solar masses. No star within seventy light years is as earth like i mean .. sunl like as that star from the point of view of the galaxy uh beta centura and our sun almost look like lightly bonded binaries. This is an accident it is a tremendously fortuitous

[6:38:00] accident for us because it could well mean that there is a uh an earth like planet at an incredibly short distance away from us in terms of the cosmic neighbourhood in fact probably within the next years ... will be created but if there is a water heavy oxygen rich world out there its going to show up .well then that is going to become a tremendous

[6:38:30] attractor in the historical matrix because it will be hailed as the answer. I mean can ou imagine? If an .. because there wil then be two possibilities. That there is intelligence next door not likely or that there is.. How do you assess it how many oxygen rih planets have we examined for crying out loud> and the other possibility is that its empty real estate.

[6:39:00] In tiether case it will excite keen interest throughout society so now thats a little odd ... cosmic neighbourhood that is rarely mentioned or... yeah

Audience:.

[6:39:30]

TM: Yes I although I leave that to the .. of the world to work out the details. There is after all a possible ... that is pretty clear in spite of the ravings and rantings of these christer.... The fossil record is pretty clear that we emerged out of uh the protohominids who emerged out of the ppasdf radiation that emerged

[6:40:00] out of and so forth and so on. I dont uh i think that uh but there may be mysteries i mean one question that im surprised nobody ever seems to ask in these weekends when i tell the cheerful story of the descent from the trees the... encounter with the mushrooms and so forth and so on is nobody ever asks well that who put the mushrooms in the path

[6:40:30]of these binoclura bipedal evolving primates i mean is this just a story of nature's happiest accidents? Or did someone say you know te weht planet start hte retraction of the rainforests seize the spores into the grasslands and watch what happens. Uh because then we come down out of the trees brainless as the wombat and began testing food sources and

[6:41:00] lo and behold here are these things which are obviously designed to be seen. I mean mushrooms are form of display theyre designed to be seen they demand to be eaten. And uh the consequences that that you know to lead a species to the brink of darer... well thats just a coincidence or is there a mind behind all of this> see i think that if mind

[6:41:30]the problem i have with all the extra terrestrial and all the channelling adn all the abducting and all the stuff that goes on is its all too B movie its all too simple. Too straightforward. That's what the troubles me about ths... scenario is that its perfectly understandable to us if its understandable you can betcha booties its the wrong answer i mean its gonna be weirder

[6:42:00]than that not about mineral extraction or even diplomatic goodwill. Uh i have a professor years ago his cosmology went like this you know how there are bacteria which you can introduce into gold slurry in low grade ore and the bacteria will concentrate the gold and then you just watch the gold out of ght bacteria and .uh mining technique

[6:42:30]that's very efficient for poor yielding gold ore. So this guys idea was that some day UFOs would appear over every major city on earth and they would just load up all the plutonim and fissionable material and take it away and say thank you very much uh this mining operation is now completed you people cn go back to hurling shit at each other in the tree tops as far as were concerned

[6:43:00]we have real application for this fissionable material you people were gonna use it blow each other up what a bunch of dummies and farewell and good luck so thats one possibility.

Audience:

Yes then I insist on getting to the plan...

Audience:

TM:... No, halma... and harmaline by uh no by flattery and shwartz and

[6:43:30] its published by m the university of california press neary string studies division publication number 23.

Yeah ... well what i thought we should talk about this morning as we seem to range wide and free is the practicum of all this which is you know how many of these visual plants are they there

[6:44:00]and where are they and how do you obtain them and how do you use them once you obtain them. So i thought how many of you have ever seen i... get with it. This is a uh poster which i dont even know if its still available it may be uh a print. It is still available. And its a very good ethnobotanical course in hallucinogens in one sheet of paper. Uh what it divided into basically

[6:44:30] is this is the old world and this is the new. Immediately you know this t... in the new world than the old. This is one of the great of evolution... because nobody can offer a reasonable explanation as to why there should be nearly 3 times as many hallucinogenic plants int he new world as in the old i mean other than thats where the

[6:45:00] flying saucers planted them nobody has come up with a good explanation. Nature hallucinogenic plants complexes that i have experience with and can address are uh uh well lets do a little quick geographical tour. First of all north america for reasons not well understood is quite poor in

[6:45:30] native hallucinogens. Uh there are no major north american hallucinogens. Peyote is um well yes its north american the funny thing about peyote i mean you can feed me questions...

Peyote is you know we have this tremendous respect for it we imagine that its tremendously ancient and it apparently isnt. Uh

[6:46:00]there is no archaeological evidence of peyote uyse in the aerly earth and 500 years ago. Its almost a phenomenon of the conquest. What you find in the old graves in the peyote cultural area is our the seeds of the forest... which is an ordeal poison. Strychnine and often um often drug uh human

[6:46:30]plant symbiotic relationships evolve over time. It may be that the use of hallucinogens is still in fairly dynamic evolution all over the planet uh peyote is a major hallucionce should have been used for the past 50000

years if it has only been used for the past 500 years that's pretty peculiar alright and yet that appears to be the evidence. Ibogaine

[6:47:00] not only a visionary hallucinogen but an aphrodisiac as well no evidence of any use before 1850. And yet in an area where the portugese had been trading for the past 500 years and writing cultural descriptions and interviewing the people if it was there it would have been mentioned. So this is a puzzle uh you know ayahuasca use we assume is millennia old but on the other hand

[6:47:30] archeology is a real isreable proposition in the amazon because the climate is so degraded. Degraded so we can't really know um but aside from peyote and whatever its history north america seems to have only minor hallucinogens that have been utilized shamanically a puzzle another puzzle of culture and attitudes is

[6:48:00]

Transcribed by Simon Shaw

-is [6:48:00] as you all know the northwest coast Indians, the Kwakiutl, Tsimshian- um, yeah Kwakiutl, Tsimshian and Tlingit have an extraordinary evolved Shamanism and where the people who develop that x-ray style of art. Well their cultural area has the densest number of psilocybin mushrooms of any place in the world. No cultural evidence of psilocybin use. No evidence that these people even knew these things were there. I mean I know this challenges the tradition of the all knowing aboriginal but you know, but this is what the data seems to imply. Now in Southern California and across portions of the Southwest there have been datura religions which are very old apparently. The so-called tolache religions. I don't recommend datura. I don't know what astronomic- astrological sign you have to be to make peace with that stuff, but I find it really peculiar and menacing. It's about magic which is about power and control and usually uh, sexuality in some invasive and Dominator application. I've taken to Tora a number of times and it's been interesting but it feels watery and dark dangerous to me. There was a period when I lived in Nepal when I became aware that these sadhus, not content with their superior meditation techniques and their endless smoking of hashish, were also availing themselves of the seeds of datura metal which is conspecific to what we call Jimsonweed in this country, and so I thought well I should take this too and find out what it's about. Well, it was a very odd trip- it was- I sat in my room and bodenoth [?] and I would sit, say hm, nothing is happening, nothing happening. Well, you can only think that so many times, then my mind would drift into a kind of twilight state and then these wraith-like entities, I mean they were like Victorian ghosts. You know, they were like women in shredded dam- shredded damask gowns or something, would fly into my window carrying newspaper sheets in their outstretched arms and they would let these sheets of newspaper flutter down onto my lap and I would like begin to read and I would begin, and I was so astonished by what I was reading that it would jerk me out of it and then say what's happening. Nothing's happening. Nothing's happening. And then my attention would drift and this would happen again. Then after about a half an hour of that as the stuff began to build up I began to, like I would undergo these very brief periods of unconsciousness and when I came out of them I would discover that my leg had been thrown up around behind my head and my arm shot through and I was like all knotted up. And then I would very carefully unfold myself and lay back down and I remember thinking I'm certainly glad there's nobody else here because this is the kind of thing just designed to drive a sitter into a conniption fit of alarm. And you know about, about six times over the next hour and a half I went into these convulsive spasms, and then on another night these English people shared a suite of rooms off of mine and I had to get to the bathroom. I had to go through this one guy's room so this one night I hadn't taken datura but this fellow had taken datura and at one point I had to go to the John so I debated for a long time about how this is going to disturb his trip and maybe I should piss out the window, but no that would- didn't seem- although in India that's perfectly all right. And um, so finally I decided I would just walk through the room, so then as I was tiptoeing through the room I saw that he was actually having sex with this girl that we knew from Katmandu and it had a slight emotional tinge for me because I had actually had my eye on her although I never said anything about it to anybody so uh, so then uh, the next morning I mentioned this and he said that yes it had been his impression as well but that in fact she wasn't there and so it was like you know I, I saw somebody else's hallucination and then what finally decided me that datura was too peculiar was that I had another English friend who lived a couple of houses away and one day I was in the market buying potatoes and this guy came along and we were just talking and in the course of this conversation he was telling me how he'd been taking a lot of datura and in the course of this conversation I became aware that he thought that I was visiting him in his apartment and I decided that's too fucked up, you know, to not know whether you're entertaining someone in the confines of your apartment or buying vegetables in the confines of the market means that you've become too disengaged [6:54:00] from the modalities-

Transcribed by Eva Petakovic

[6:54:00] from the modalities of the real. And, of course, it creates tremendous drying, and uhm it's a- it's a- its- its- a uhm, deliriant, is what the literature calls it. It's deliriant. Ahh.. but the, you know, I think that people all over the world utilize, uhm, plants for bizarre experiences. Time and time again I have run up against this [06:54:30], uhm..., one- you know there is a very rare drug in South America called oo-koo-he, oo-koo-he. It's made by the huitoto, uhm, and the bora and the muinani in this very circumscribed area and what fascinated us about it was that it was an orally active DMT drug. And we couldn't as pharmacologists understand how an orally active DMT drug was possible. Because the DMT should be destroyed in your [06:55:00] gut. So we wanted to get a sample of this stuff. And uhm, it's made from the resin of virola trees, the inner bark of the virola sheds a red resin. And uhm, we eventually in 1981, my brother and I and Wade Davis, the guy who wrote the "The Serpent and the Rainbow", we all launched an expedition of the Rio Yaguas Yacu. [6:55:30] And where there was this stuff and we would do what we call the bioaste ...which means somebody has to test this stuff. Cause we would get samples from these shaman and we would draw straws for who got to do the bioaste. Well taking this acute was appalling. I mean your heart rate goes up to about three times normal, you shed water by the gallon, your blood pressure shoots up. [6:56:00] I mean it felt like a precoronary to me. And then we come down and say to this shaman, ya know, Lorenzo, what's the story? And he said "Yeah, it takes getting used to doesn't it?" [audience laughs] And uhm, so then I.. And then when you look at it, when you look at this oo-koo-he chemically you see well yes there's dmt in there and there's 5 mao dmt in there, but then when you do the gastronaigram [6:56:30] you see that marching along behind those spots there are all these other spots of various tryptamine compounds, some of which are cardioregulators, some of which nobody knows what they do, and so then you realize that it's a, it's a dirty drug. There's too much junk in there. What you want is something that has a very clean signature. So oo-koo-he didn't exactly seem the way, uhm, to go. Uhm, I think this is the real [6:57:00] situation with amanita muscaria. Probably the most discussed, uninteresting, uhm, drug in the world. Because so many people have tried to hang so much on it. And ya know, it's a horrible experience most of the time.

Audience: [inaudible]

TM: Yeah yeah, occasionally you'll meet someone who says "Well you're just wrong. It's wonderful. [6:57:30] I've taken it for years; I love it. And I, ya know, don't know. First of all it's genetically variable, it's geographically variable, it's uhm, uhm, seasonally variable. And it fluctuates at various times in its uhm, in its uhm, process of maturation. So what must be going on with amanita muscaria is that you have to learn how to take it in your area, [6:58:00] from people that know when to collect it, where to collect it, how much to collect, and how to prepare it. If you just go out and find one and chow down I guarantee you it will turn you every way but loose and it will turn you loose. So uhm..

Audience: [inaudible]

TM: No that's what they always say. They say "Have you drunk your urine recently?" I got a letter last week... No, i

understand. But if- Do you all understand the basis of the question? Why does urine [6:58:30] come into it? Because, uhm, in Siberia they have discovered, where this amanita thing originates, that the active principle is not destroyed inside your body. That it is excreted in the urine. And the true aficionados of this stuff believe that this so called second pass is better than the first pass. And so you have to uhm, uhm, [6:59:00] you know...they drink the urine. One of the great hazards of Siberian shamanism is stepping outside of the yurt on a snowy night to take a leak and being pitched head first into the snow by frantic reindeer who butt you out of the way to try to get to the yellow snow because they're so completely hooked on, uhm, amanita that nothing stands in their way. [audience laughs]

Audience: [inaudible]

TM: Oh, your [inaudible] is pushing you out of the.. Well I've never hung out with the Yakuts. Maybe they're a pretty wild-eyed gang. An example of how a very ancient, uhm, how a very ancient folkway can be incorporated into our culture without us even realizing it, and is provided by discussing amanita muscaria... If you go to the encyclopedia britannica and you look up Santa Claus [7:00:00]

Transcribed Paul Mullins

they'll tell you that it has to do with Saint Nicholas and it got started in the 11th century and it's a-, but when you look at the Santa Claus story it's a perfect, uhm, mythologym to analyze from this point of view because look what's going on with Santa Claus. First of all Santa Claus' colors are red and white, the colors of the amanita muscaria for sure. [7:00:30] Santa claus lives at the north pole. What does this mean? It means Santa Claus lives at the axis mundi where yggdrasil, the magic work ash of Welsh mythology has, uhm, taken root. Santa Claus flies, this is what shaman do. Santa Claus is the master of the reindeer, the animal most associated with the amanita muscaria. [7:01:00] Santa Claus is aided in his work by troops of elves. And what is the work of Santa Claus? To build toys for children. Remember the DMT thing saying "Look at this! Look at this!" Well those were off duty elves, clearly. So here are all the motifs and I believe that for children in our culture that all the christer stuff is not what christmas [7:01:30] is about. Christmas is about standing in front of the tree on christmas morning with the gifts arrayed and the twinkling lights on. Well that tree is the tree that the amanita muscaria forms it's symbiotic relationship to. It's always spruce or pine that it has a mycorrhizal relationship to. So the number of motifs relating Santa Claus to a cult of amanita muscaria- there's almost nothing but relational [7:02:00] motifs there. And yet if you suggest this to people they just back away in horror, you know? Well, uhm, these hallucinogenic plants seem clustered in the new world in two areas. The first area is, uhm, the Sierra Mazateca of central Mexico and related areas. And there you have a number of things overlapping. You have [7:02:30], uhm, the- a- a mushroom area of multiple species where, unlike the [quaquatal?] shim-sham [flingut?] language area, in this central mexican langua- uhm, area they absolutely did use and discover these mushrooms. And we have these things called mushroom stones that, uhm, go, uhm, 2500 b.c.. So the mushroom religions is truly archaic in Mexico. [7:03:00] In the same cultural area you have the, uhm, the morning glory seeds that come from ipomoea purpurea and- and related hybrids. Are you all familiar with these? This is a psychedelic plant that you can grow yourself and take. Don't buy the packages of seeds and take them because, uhm, a benevolent government has made sure that they are soaked in horrendous poison so that you can't [7:03:30] get loaded on them. Uhm, but you can grow a crop out of them that will be toxin free. And this is a tremendous visionary intoxicant. It takes a couple hundred of these seeds but in that same area, strangely enough, there's another morning glory, [Named here. Can't find it on the web], it used to be called [?], that, as few as thirteen seeds will flatten you. [7:04:00] Now it's interesting, as long as we're talking about

morni- uhm, morning glory seeds, to note that pure unit volume, per by weight, probably the strongest plant hallucinogen in the world is, uhm, hawaiian baby woodrose. And yet there is no record of any culture ever utilizing that. It, uhm- there are thirteen species of argyria. It's called [7:04:30] hawaiian baby woodrose but it has nothing to do with Hawaii, it's native to India. There are thirteen species of argyria scattered from southern India out to Fiji and all contain ergot like, LSD like, compounds like chanoclavine and so forth. These- I got started on morning glory seeds because they were available. But don't sell this stuff short folks. I mean, it'll give you a ride you'll [7:05:00] never forget. Uhm, and the baby woodrose even moreso. Be very careful with the hawaiian baby woodrose because it contains cardioactive glycosides and, you know, if you, you know, maybe six seeds will do you. Twelve seeds might well plant you. And twelve seeds will fit on a tablespoon. So this is nothing to start choking down in large amounts. Yea. [7:05:30]

Audience: [Inaudible]

TM: Yes and could be extracted in a fairly simple fil- filtration system. Yea, good point. Yea.

Audience: [My question is are they dry? Do you grind them up?]

TM: You- Well they are dry. They're little crescent shape dry things. Yea grind them in a braun grinder and, uhm, uhm...

Audience: Do you mix them with anything?

TM: Apple sauce is the favorite carrier for these disgusting things, or milkshakes. Uhm, but it would be good [7:06:00]

Transcribed by Paul Mullins

[7:06:00]

TM: "Um... But it would be good to look into doing a little chemistry - the emetic in the morning glories is estracumerone, not the cardioactive glycoside in argeria nervosa but in ipomea purpurea it's.. uh... estracumerone and you could devise a simple chemical system for removing that and I think LSD.. w-you know...have you ever had what is called "Woodrose LSD"? Well it's wonderful! It's unlike LSD, it's more like psilocybin because it is highly visionary; [7:06:30]and one of the things about these morning glories is.. You know... I don't know whether we have to talk about Rupert's theory or what... but it's just an archive of Mayan and Toltec imagery, I mean, you take this stuff and you're there in the pyramidal complex on the day of Venus's heliacal rising when they do their thing... I mean it's pretty amazing."

Audience: [Inaudible][7:07:00]

TM: “Uuuuummm... it’s a close relative, it’s active not in the microgram range, but in the milligram range and there are several active compounds... Eurite... I think Chenoklavine is the psychoactive... and Erganovine... all these occur there.”

Audience: “And do you grind those and swallow them whole, or make an infusion?”

TM: “No, you grind them to a powder and then just take... capsule ‘em...and it’s a lot of capsules [7:07:30] it’s like half a cup of this horrible, whitish meal with a strange smell but... yeah basically about two hundred seeds. You may want to go higher but start with that.”

Audience: [Inaudible] [7:08:00]

TM: “Well, no, but if what you’re saying is true, that’s where the glycoside would reside. That’s not my understanding actually, wh-”

Audience: [Inaudible]

TM: “Well, maybe the caption got mislabeled or something because the way they do it where [7:08:30] I’ve seen it is they take the little seeds and they grind them on a matate into a powder, then they put it in water... as you ssssaid... and then, and they shake it, ss... uh..and leave it, and come back an hour later and shake it again and do that for a while; and then uh the stuff precipitates to the bottom..the physica-...the...the matter...and the liquid fraction is poured off and discarded [7:09:00] and they take the... the solid matter and they let it dry in the sun until it’s no longer runny but it’s a kind of like... the consistency of oatmeal or playdough or something like that and then they make a little tiny uh...uh...tortilla which they... they then toast on a metal griddle and so you get this thing which looks slightly smaller than a ritz cracker... [7:09:30] and is a toasted morning glory seed wafer, and you eat that, and that is the thing which is active. That’s how I’ve seen it done.

Audience: [Inaudible]

TM: “Apparently not, they toast it lightly, they don’t... it’s not blackened... It’s just sort of golden...”

Audience: [Inaudible]

TM: "No, it's the... it's one species of morning glory turbina, previously called revea, coryembosa. [7:10:00] The other one...uh... the morning glory that you have to take uh.. a couple of hundred seeds for is used in that area as a hallucinogen, but it's also used to induce labour and has a whole role in midwifery and...and like that.

Audience: [Inaudible]

TM: "No, that's the Hawaiian Woodrose and it has no history of human usage, [7:10:30] so you're on your own. This is... it's worth talking about maybe for a minute... that... er, y'know there are... hallucinogens are like hotel rooms, some are occupied and some are not, and it's always interesting to fiddle with the unoccupied ones, because if you're... if you believe Sheldrake, then it's an empty field. Uh, you know, one way of thinking of these things is... when you take a plant [7:11:00] it takes you. So, when you take mushrooms for instance, what the trip is, is all the mushroom trips that anybody ever had. And you lea... you know, you make a tiny contribution too, ah... it's... you leave a piece of your trip in the trip and so the... the trip is slowly evolving over time as those who take the plant each leaves a brick [7:11:30] or an offering or a little architectural motif on this vast edifice. Well then if you come... that was why a- uh... y'know a plant like Hawaiian Woodrose or to some degree Stropharia Cubensis because it is not the preferred mushroom among the Mexican traditionalists, then it's unoccupied. You can make of it what you want; it can be sort of... your vehicle. This is why a drug like ketamine, which is a new drug, [7:12:00]

Transcribed by Aurelio Lyra

TM.: ... a new drug, without a thousand years of input. My impression of where you go on ketamine is like visiting a new office building. That nobody has rented offices yet, i mean all the water coolers work, and there are these recessional distances with fluorescent lighting, but, there are no hurrying secretaries or crowded offices, or chatter around the water fountains. It's just empty. It's empty because not enough people have left their initials on the walls.

Audience Question: What is the variety of mushroom that is common in the Yucatan

TM.: Well, if you mean growing on manure. Yeah, that's Stropharia cubensis. See there are about 30 species of mushrooms that grow in that Mexican area, and most of them are what are called, well not most of them, but some are ephemeral mushrooms, meaning they are very small and they can be almost anywhere. And there are some larger ones too that can be almost anywhere. Stropharia cubensis is the only one of the good ones that locates on cow dung. Now, there are other mushrooms that grow on cow dung that contain psilocybin, but they also are more sickening. There are species of Panaeolus and species of Coprinus. If you collect a mushroom off dung and you want to know if it is a Panaeolus or Coprinus or Stropharia, just keep it around for a few hours. If it is a Stropharia it will just sort of be around. If it is a Coprinus or a Panaeolus, it will do what is called auto-digest. It will turn into a slimy mess.

Audience Question: Can't you tell from the spore print

TM: No, you can't tell from the spore print, but you can tell from the macro-morphology of it, if you know mushrooms. They're easy to tell apart.

Audience Question: [inaudible]

TM: You see that's tricky unless you're someone who really knows their stuff.

Audience Question: [inaudible] have you found that there is way in Hawaiian woodrose seeds [inaudible]

TM: It was more speculative, but i think it would be worth trying.

Audience Question: I thought that the ergamine alkaloid is not water soluble

TM: Some are and some aren't.

Audience Question: [inaudible] ... synthesizing LSD. Its apparently hard to get it started. I hear if you get a bunch of morning glory seeds and soak them in lighter fluid... [inaudible]

TM: Yeah that sounds right. Pet Ether is a good one. So is Chloroform. Have any of you read The Road to Eleusis. That's about the Eleusinian Mysteries, and argues, its by Wasson and Hoffman and Ruck, and argues that the mystery at Eleusis was a kind of ergotized beer. That they were gathering ergot off Paspalum and making an ergotized beer, and the only way they could've done that for 2000 years, stoning thousands of people each September at this cult site, without the thing getting a reputation for being toxic or causing convulsions, unless they had some way that was very efficient, of separating the toxic alkaloids from the hallucinogenic ones. So, that may have been a water fractionation technique, as well. Or, you know, the whole theory may be wrong, and whatever was drunk at Eleusis may not have been ergotized beer. It could have been a mushroom of some sort. This is what Robert Graves thought, that it was a mushroom.

Audience Q: [inaudible]

TM: The Road to Eleusis. Probably not, because Wasson is now dead and the estate is kind of funny about that kind of thing.

Audience Q: Two Questions. One is can you talk more of the emetic of morning glory and how to get rid of it.

TM: The emetic is Estracutarone. If you're not a chemist and used to dealing with high molecular weight solvents that you should do some kind of water, you know, dissolve it in water and then try and separate out the fractions. This would be, i mean, a lot of work needs to be done. I think in the underground there are publications being circulated that are, you know, the Wizard's Workbook for mushroom , er i mean, morning glory reclamation and stuff like this. Its that, you pay your dues with morning glories, but it's usually worth the price of admission. I mean, it's only nausea, for crying out loud. Yeah

Audience Q: You were talking about different hallucinogens and were telling, i got the impression that you vocation is that somehow consciousness creates the reality that's out there depending on how consciousness is used with different hallucinogens. Is that...

TM; ... Yeah, i think so. That we leave our fingerprints on the drugs that we take, and that drugs that have been taken for thousands of years have a lot of fingerprints on them.

Transcribed by Chris Galbraith

TM: (07:18:00)..into the field, you know. One way of thinking, since someone talked of Sheldrake earlier, one way of thinking about psychedelics and trying to define what do they do, is that they are amplifiers of the morphogenetic field. That, you know, that the past of objects somehow becomes present. Em, this would fit it in with my notion that when you take a psychedelic you are rising into some kind of superspace, (07:18:30) that can be mathematically described. Because having the past be co-present with the present is a way of saying that you will shift your dimensional relationship to the datafield, and now it appears to be one coherent thing. Yeah?

Audience: Um, what is the plant that grows in the South West that has harmeline in it?

TM: Pegamum Harmala, the girant syrian rue. Its original (07:19:00) range is from Marocco to Manchuria, but at some time in the nineteenth century it was brought into this country as a range fodder for, for goats. I mean its pretty rasky plant. Em..

Audience: INAUDIBLE

TM: It,s uh, it has small yellow flowers, and it's a kind of, it has succulent leaves, sort of waterholding leaves, and it looks like a form of sage brush, and when you cut into it (07:19:30) with a knife or a machete it's brilliant yellow inside. And that brilliant yellow is the harmine.

Audience: INAUDIBLE

TM: Pound it up with a sledgehammer to separate the fibers and do a hot water wash on it, and then, you know, do a second hot water wash, then get rid of the physical stuff. Combine the two mother liquors and drive it (07:20:00) down to a reasonable volume. And it'll do the trick. Yeah.

Audience: You're probably familiar with ..INAUDIBLE

TM: John Allegro and Andrija Puharich, yeah,

Audience: What's your assessment of... inaudible

TM: Well, not to rain on anybody's parade.. Andrija Puharich is a very mercurial person, is that what we want to say. (07:20:30) Recall that he was the guy who pushed Uri Geller for a long time. And they were forever tromping into the Negev and coming out with blank cassettes that had held the wisdom of the galaxy, but the aliens erased them before they let them return.

(Audience laughing, unrest).

That could happen here.. So that's Andrija Puharich. Ah.. He's been around for a long time, so you have to, these people are such eccentrics, I mean you have to (07:21:00) just respect people's persistence and survival power. (Audience laughter) Eh, but I think you know his scholarship, and his notions, the rules of evidence is fairly divergent from even from my fairly loose cannon. (LAUGHS) So, Allegro is a little different case. You all know the book 'The sacred mushroom and the cross'? He managed to hypothesize one of the most radical (07:21:30) theories ever to come down the pipe. I don't know how true it is, but his theory is that Jesus was a mushroom. (Audience laughs) Ha, ha.. And you know this would not probably have cut too much mustard except that the guy was a dead sea scroll scholar of world renown, ah, had a scholars grasp of Arameic and Akkadian, and was fully licenced (07:22:00) to be one of the people who tell us what the primary documents of Christianity really mean. The problem was, when Allegro got a hold of them, he said, well, what they really mean is that a sacramental mushroom was gr..., being grown in caves by navateans (?) down the Ram Qumram and they called it Jesus, in order to befuddle the Roman authorities and created (07:22:30) the cheerful fairy of the friendly carpenter who tells us to render unto Cesar that which is Cesar's, and this was all a publicity stunt just to keep, uh, the Roman authorities guessing. And he has textual, he claims he has textual support for this. The problem is, you have to be an Arameic philologist to follow the argument, and I mean, the argument is unbelievably tortured. (07:23:00) There is a lot of question.., there is a peculiar opaqueness about the early history of Christianity. I mean, if we are to try and take it seriously and understand what happened there, then it must be, that, first of all, if we believe that Christ was a real person, then he must have been born in 6 B.C. Because there was a conjunctial maxima of Jupiter and Saturn at that time, which is a good astrological (07:23:30) event to

hang the nativity on. Which means, then, that the crucifixion would have occurred in 27. Well, why is it, then, that there are no mentions, no mention of Christ, of Christ can be pushed back later than, earlier than AD 69. What was going between 27 and 69? The gospels are not contemporaneous, and uh, the mention (07:24:00)

Transcribed by Aina Mumbi

24:00 - 30:00

Women know whose children are who's because they see the child come out of their body, and they nurse the child. But men do not in that situation have their children. My children. What they have are our children, the tribal group. And uh, this boundary dissolving thing. Let's dwell on this for a moment, because this is central to my arguments, and it has political consequences for our own lives. Um, all primates, clear back down into squirrel monkeys and lemurs. Um, all primates have what are called male dominance hierarchies. Uh, what this means is that most, the males with the longest claws, the hardest muscles, and the meanest dispositions, take control of everybody else. Uh, women, children, weaker males, uh, everybody comes under the thumb of the alpha males of the pack. This is true, as I said, of squirrel monkeys, howler monkeys, so forth and so on. It is also true of us, sitting here in this room. This is a male dominant society, I mean there's a lot of complaining and hair pulling about it. And there's a political alternative, in the form of, of the women's movement and feminist sensitivities, but for most people, male dominance is the rule. Well I would like to suggest that our peculiarly discomforted relationship to reality is a consequence of the fact that, for a long period of time, perhaps as short as twenty thousand years, perhaps as long as a million years, as a species, and not consciously, we accepted into our diet a drug that had the consequences of suppressing male dominance.

That this was the social consequence of accepting psilocybin into the diet. The ego is a structure that forms in the psyche like a calcareous tumor, or growth, if you do not have regular recourse to the cure. And the cure is, uh, psilocybin and the boundary dissolving sexual and social style which is carried in its wake. So the reason that we as people are, uh, haunted by the idea of a lost paradise a perfect world sometime in the misty past is not, you know, Mircea Eliade called it, "the nostalgia for paradise" and thought of it, uh, as longing that had no basis. But I think that it's entirely a memory of the period when male dominance was chemically suppressed, ego was chemically suppressed. And by male dominance and ego I don't mean to lay this entirely on men. I would wager probably that everyone in this room has more ego than they need. For example, starting with me, and that's part of the paradox you're supposed to enjoy.. (audience laughter). You know, the ambiguity of me preaching the loss of ego. (audience laughs). So, essentially, you know, what happened was, chemically, a chemically driven leap in evolution as a consequence of the suppression of these behaviours that savoured male dominance. Uh, as a species, uh, we would have continued with male dominance forever had it not been for psilocybin in the diet. And it established uh, a situation, in which, in less than two million years the human brain size doubled. This is without contest the greatest mystery in the whole of evolutionary theory. Uh, Lumsden, who is an evolutionary biologist, called the doubling of human brain size in the last two million years, uh, the most spectacular transformation of a major organ of a higher animal in the entire fossil record. Well now it would be spectacular enough if it were the liver of an otter, or the (both laughter) hha, ha the pancreas of an elephant. But notice it is the organ that created the theory of evolution itself. And all other theories, so that we're getting a little chronological here folks. (background laughter) There's something fishy going on. Uh, what was it that caused this explosive doubling in human brain size. Well I maintain that it was the new behaviors that emerged with the suppression of ego, and their reinforcement of nomadic pastoralism. And that there was a period, let's call it from the melting of the last glaciers in (unintelligible), 6500 BC,

there was a period when men and women were in balance with each other. Children and adults were at peace with each other. And human beings and the planet were at peace with each other.

Transcribed by Christy Redden

[07:30:00]

TM: Hans Jonas is a brilliant—his book, “Chri-”, uh ... “Gnosticism: The Message of The Alien God to Infant Christianity”—if that’s not a title to die for ... Ahem. [audience laughter] Huh?

Audience: [inaudible question]

TM: Oh, “The Apocrypha and Pseudepigrapha of the New Testament” by Charles[worth]. Now that's a ... that ahh weighs in at about 35 pounds, but theological libraries shoul-... will have it, but it's in the locked case. You don't want seminarians [07:30:30] mucking around with this kind of stuff ... uhh ...

Audience: [inaudible] And by extension, there’s “The Urantia Book” too, which has about 2000 pages on the life of Christ, and covers those years after 30, or I guess after 27 or so ...

TM: That's right. “The Uranita Book” is a very spectacular and early example of channeling before it was even named, ahh, and, uhh, very interesting of all the channeled material, “The Urantia Book” for its pure grandiosity puts everybody [07:31:00] else, uhh, to shame, right? [audience laughter]

Audience: They talk about seeding the planet.

TM: Yeah! Well, these are persistent themes, you know. I mean all of Gnosticism is the perception that we don't belong here. That we are creatures of another realm, Beings of Light, who because of some horrible cosmic mistake have been trapped in the world of matter; and the gnostics take the Pentateuch, [07:31:30] the first five books of ... of Moses, and turn it into a nightmare story, and say that, you know, the god of this world, which in Jewish tradition is called Yahweh, who is creator of the world for the Gnostics, he is not the real god at all. He’s the demiurge. He’s a kind of mad god who has entrapped the light, and the task of salvation [07:32:00] is to gather the light and then release it back to it’s hidden higher source beyond the machinery of Cosmic Fate.

[Sudden silence in recording; audience inaudible]

TM: Well, that—that's good. That's, it's sort of like, you know the "Māṇḍūkya Upaniṣads" — it's my favorite Upanishad, because it's the shortest. It's only a page and a half long, which it—uhh, [audience laughter] you know, which it, uhh... you know, others have been so similarly inspired to brevity, [07:32:30] but it's the Breath of Brahman. It traces - it's the description of one — eh-uh ... exhalation/inhalation cycle. Yeah?

Audience: I know people who can't even say it: Yah—Wha-!

TM: Yeah, wha...!?! Well, you're not even supposed to say it, if you're Orthodox.

Audience: [light laughter]

TM: G—dash—D. Yeah?

Audience: You said Yahweh. I'm fascinated by the Rastafarian [inaudible, cough] by which the abbreviation of Yah, [07:33:00] or ... the same phrase hallelujah is supposed to be that twist that [inaudible] could be [inaudible] your understanding is that [inaudible] Yahweh as a verb?

TM: Well, I don't know too much about Rastafarianism. It was founded by Marcus Garvey and get - had this notion of return to Africa. Uh, you know, syncretism is always with us. Gnosticism was characterized by syncretism. The whole late Hellenic uhh, religious efflorescence, was largely [07:33:30] syncretic and certainly that's what we have now. I mean, you know, The New Age. You go to these fairs and the people who are talking to the Pleiades have the booth next to the people who are talking to Zubenelgenubi and both have world plans from the Saucerian Allfathers, and the two plans are different and you just phooey, uuh, ugh ... you know?

Audience: [laughter]

Audience: Gnosticism is alive and well in the hallways of academia, I mean. You got guys like Marvin [inaudible: Lins-key] [07:34:00] and Hans [inaudible: Bor-betch] who ran an [inaudible] into his brain and into the computer and you know so he can become pure information. So that's about the least for which people matter, is for information, then I don't know what is ...

TM: No, I agree. There are two sentiments loose in the world, and you're going to NOT get through this life without taking sides. You know? Do you believe that our destiny is in another dimension made of light on the other side of the Universe, or do you believe that we should, uhh, you know, clean up the rainforests and save [07:34:30] the planet? You wanna be very careful with your political agenda. One of my sub-interests, which sort of has a relationship to this, but it's oblique, is: asteroidal impacts. I think asteroidal impacts are one of the great undiscussed, uhh, factors in evolution that tie... that every solid body in the solar system is heavily [07:35:00] cratered with

impacts by infalling bodies. There's this thing down in Arizona that only happened 50,000 years ago. It was a pissant sized object and everything within 800 miles of the impact point died instantly. It dug a hole half a mile into the ground. It was a nothing-burger. This thing which came down 65 million years ago, they now think on the Yucatán, that it killed everything on the [07:35:30] Earth larger than a chicken — died. You know, I mean, you wanna talk about eco-castrophe, I mean, we have never - you can't even conceive of what it's like when something like that happens to a planet. They estimate that the ... at the velocity this thing must have been traveling, it was five miles into the planet in the first second and a half. It raised a wall of rock 6,000 feet high that moved outward at Mach 7. [audience laughter] [07:36:00]

Transcribed by Nathan Johansen

[07:36:00]

TM: Kay? Eeee! I mean, [clears throat] he-yeah . Ah-ha-hem! [audience laughter] Eh! And the planet rang for a million years, you know, and it was, and but if it hadn't been for that, there would be no flowering plants, no triumph of the mammals, no Whitney Houston ... no ... [laughter]

Audience: No sperm entering the egg.

TM: Well, but ... eh, suppose: you know, there's all this tumult in our psyche about the great change that's supposed to happen, and where are we supposed [07:36:30] to put our political energies, and what are we supposed to be doing? Well, it would be pretty ironic if we, you know, beat ourselves over the head and saved the rainforest and all this malarkey, and then this something came down and just turned the whole thing into hash; and people would say: "My God! How could we have been so stupid!? We should have been extracting and sequestering U-235 and plutonium. We should have been building starships the size of Montana. [07:37:00] We should have been sparing no effort; and what did we do? We re-planted rainforests!?" And now look, the whole thing ... so, you have to [audience laughter], it uhh, you know, good intentions are not sufficient. You have to locate where the threat is coming from and act accordingly. There are no points for good intentions in the game of evolution. So mind and .. and we have to decide, you know, what does life want? Is it that life at it's most [07:37:30] basic level senses the finite, uhh, duration of the star's life? And so it wants to use this moment of sunshine to build something that could carry us out into the mainstream of the galaxy to the denser star-fields? Or, no!? Is that some kind of Titanic-Apollonian Male-Dominated Techno-Fascist Materialist-Trip, [audience laughter] and what we need to do is cultivate [07:38:00] gentleness, and attention to the bugs, and the grasses, and the water? I don't have an answer to that. I think it's a real dilemma. I think people who think they do have answers haven't really connected with how ambiguous the situation really is.

Audience: How can you do both?

TM: How can you do both?

Audience: What says The Mushroom? Well, no. I mean, some people can use [cough; inaudible].

TM: Well, what the mushroom says is it's .. it's a total "Apocalyptarian" [07:38:30]. I mean, it says: "Rouse your camels, pack your tents, we're moving out! This has been fine for a while, but ahead lie worlds of unimaginable challenge at great distance." But, of course, the—the mushroom sounds like a Techno-Fascist Hortatory Male-Dominator, uhh, when it talks like that. You take Ayahuasca and it says: "Clean up the rivers. Care for the children. [07:39:00] Replant the forest." Well, wha' ...? (sigh).

Audience: But then you have to live with the mushroom possibly being the Universal Traveller that it is, it has that Urge. It's got the Wanderlust. So it's of course it's going to be [inaudible; "cosmic"?]. [laughter]

TM: That's right. It has nomadic ethics, so it pushes nomadic solutions. Where the Ayahuasca, an enormous jungle plant—a flowering plant, a creature born out of the last catastrophe, just like we are—has a different, uhh, agenda. No, the demons are of many kinds [07:39:30]. "Some are made of ions, some of mind / The ones of DMT, you'll find / Stutter often, and are blind." Means, you know: just because somebody, uhh, ehh, just because [light laughter] somebody once said of channeling: "Just because somebody's dead doesn't mean they're smart." [raucous audience laughter]

TM: So, [laughter] it could be, you know? [laughter] Everybody's got their own, uhh, agenda. Well, why don't we break ... yeah? [07:40:00] Or question? Last question.

Audience: Speaking of the [inaudible; "cosmological expanse"?], are you aware of the present Miles' work?

TM: Uhh, on the steady-state or something?

Audience: On virus' [inaudible; "spreadability"?].

TM: Oh, yeah, uh-hm: The Panspermia Theory.

Audience: Yeah, and ... and, and again that argues strongly for the fact that even [inaudible] may have come out of space, and probably only other than an impressive array of statistics, uhh, [inaudible] that lent cometary presence [07:40:30] in near-orbit to viral disease.

TM: Yeah, well I think that the next revolution in biology is so obvious that you can be totally radical and completely confident you're on safe ground and say the next great revolution in biology is the realization that space is not a barrier to life, and that, eh, technology is only one method for traversing [07:41:00] between the stars. If in fact planets are regularly pulverized by cosmic catastrophes, then they must be like bursting seedpods and, uhh, everything is subjected to a tremendous evolutionary hammering; but spores, viruses, stuff like that. Particulate

matter, it just drifts out between the stars and when it finds another suitable environment, uhh, it it [07:41:30] breaks out. We don't know what the constraints on life are. You know, the Oceans of Europa could harbor life. You know, these hot-vent sulphur-vent organisms that we find, uhh, in the O—in the deep oceans here? They could survive in the Oceans of Europa. If there were hot sulphur vents at the bottom of those oceans, those organisms wouldn't, uhh, bat an eye.

Audience: [inaudible] Isn't it ice covered?

TM: Ah, Europa [07:42:00]

Transcribed by Nathan Johansen

Audience: [inaudible] Isn't it ice covered?

TM: Ah, Europa [07:42:00] is covered with ice, but underneath the ice is water, and there are — uhh, fractures, uhh — and uhh, you know, the uhh — the exotic chemistries and pressures and temperatures of the Jovian environment could produce life. We don't know, uhh — what the constraints are. If — if cometary environments are a better place for life to arise than a warm pond on a newly condensed planet, [07:42:30] then all bets are off as to what, you know — planetary surfaces may be unlikely places for life to get going. Uhh, it's hard to say.

Audience: How sustainable are gaseous creatures on a gaseous planet?

TM: That's right. We don't know. You could have — you could have life at temperatures and pressures, uhh, where WE couldn't exist for a microsecond, uhh, like at the bottom of the Jovian atmosphere — something like that. No, there's more mystery [07:43:00] than anything else.

Audience: [inaudible]

TM: Uhh, the—the (ehh) it's—okay the notion here is—I've always felt that the psychedelic experience should be good for something. It arose—uhh, [audience laughter]—in a very practical sense, and I always felt that there was something that wanted, that you should be able to learn that was very hard to bring out. Ahem [clears throat] and we talked a little bit yesterday [takes sip from drink] about [07:43:30] this strange episode that happened in the Amazon, where instead of an ordinary trip, it was locked in for weeks and weeks, and then people differed as to whether it was a transformative incident or a psychosis, or ... what exactly it was, and but, what happened was — uhh, or what I think wants to happen in every psychedelic experience is that there is a totality symbol, you know Jung tried to get his patients to make [07:44:00] mandalas because he says they were totality symbols. Well,

eventually the totality symbol is more than a symbol— it actually becomes a true map of the totality and I—what this boils down to is a kind of very strange revelation about the nature of the I-Ching that takes very seriously the idea that the I-Ching is a tool for studying time, but then takes the idea much further. It's hard to give this lecture, it's hard to listen to this lecture, because the learning curve is steep, and you just have to stick with it for awhile and then there will be pay dirt, but it's — uhh, you have to umm, bear with me — and I had to bear with the entity which was revealing this stuff to me, because it took the form of [07:45:00] ... a, uhh ... Are you all familiar with the idea of a Kōan?

Audience: [a soft murmur, but mostly silence]

TM: This is something that your Guru — a little saying or something — that your Guru gives you that if you can figure it out then you move on to the next stage. Well, so the Koan (sips from drink) that I was presented with had to do with the I-Ching, which I was not that passionately fascinated by—I was just sort of mildly interested in it, [07:45:30] like a lot of other freaks, and I was not at all mathematically inclined, I mean, that I am the author of a theory of pure mathematics is as astonishing to me as it is to anybody else, I'm sure.

TM: Basically, as you know but let me review it, the I-Ching is a Chinese System of Divination that uses 64 structures called hexagrams, and hexagrams are made of broken [07:46:00] and unbroken lines stacked one above another, and they are uhh, the sum set—sum total—of the possible set of such structures is 64. And it's been remarked by a number of people that the I-Ching has peculiar structural affinities with the DNA, but nobody has ever really known what to make of that. Well, this dialogue with this mushroom entity, uhh, began by [07:46:30] posing a very simple question, which is—as, you know, most of you—the I-Ching hexagrams occur in a sequence which is called the King Wen sequence, which is very old. In fact, portions of the King Wen sequence are scratched on shoulder scapula, umm, that are 35,000 years old. It's possible to argue that the King Wen sequence of the I-Ching is the oldest abstract sequence, uhh, [07:47:00] ehh, in the world. The question is, or what the Koan was, was: Is the King Wen sequence a Sequence or is it simply a jumble of hexagrams that over time has become traditionally sanctioned as The Sequence? In other words, if it's a sequence, you should be able to write the rules that generate that hex—that sequence— and no other. [07:47:30] So umm, lemme dig into this here ... the first hexagram ... can you see this colored chalk? We have two other choices: we have a orange and blue. Here, we'll do a visual test ... Ooo... Eww. (multiple utterances indicating distaste) Is this the stuff?

Audience: [inaudible]

TM: Okay. Why is this so “half-acid” (ordinarily: half-assed) as they say ... [laughter]. Uhh.

[07:48:00]

Transcribed by Nathan Johansen

[07:48:00]

TM: So, here's the first hexagram. It's called the Creative. And it's made of six lines. This is no news to anybody, I hope. Here's the second hexagram. It's called the Receptive.

Audience: [inaudible]

TM: The yellow? Kay, lemme do these this way and then I'll switch ... [07:48:30]

TM: So, when I started looking at this question of, uhh, of the order in the I-Ching, umm, the first thing I saw — it only took me about ten minutes, of just looking at it — and I noticed, and I'm not the first person to have noticed this — that it isn't 64 hexagrams, it's 32 pairs [07:49:00] of hexagrams, and the second member of each pair is formed by turning the first member upside down.

TM: Do you see? So—so that only took ten minutes; that was no—no problem.

TM: Now, there are eight cases in the I-Ching where inverting the first hexagram causes no change because of the nature of its structure. Uh, you meet the first case here. Obviously if you turn this thing upside down, [07:49:30] it's still six unbroken lines. So, in the eight cases where inverting a hexagram causes no change, a second rule is generated.

TM: The second rule is: if inverting the first hexagram causes no change, then all lines change. Very straight forward, right? But now, umm, the problem—the Koan—has changed. And the question is: What are the ordering—what rules order the 32 pairs? [07:50:00] And this was much trickier. Much trickier. And after awhile the prompting voice said: "Look at the first order of difference." This is just a fancy way of saying: count how many lines change as you go from one hexagram to another. It—ehh—if you go from this hexagram to this hexagram, how many lines change?

Audience: Six.

TM: Six. So, the first order of difference is six, between [07:50:30] these two hexagrams. Similarly, we can go from two to three and there will be another first order of difference.

TM: Now, logic should tell you that the values of the first order of difference are going to be whole numbers One through Six, right? What I did was I went through the I-Ching and actually checked on these, and I discovered that again—immediately, what jumped out, uhh, at me—was there were no Fives. So we wrote [07:51:00] computer programs to randomly arrange hexagrams and check for Fives. Now, we discovered Fives are as common as any

other number. The exclusion of Fives in the King Wen sequence was a human decision.

TM: Someone didn't want Fives to show up in the first order of difference. Okay... so then I, uhh, looked at these values, and what I discovered was: When you ... inside the pairs—when you [07:51:30] invert one to get the other—the first order of difference is always an even number. So within the pairs you have no freedom, it's going to be an even number. Between the pairs, you can arrange them so that you get odd numbers or even numbers.

TM: Now what I discovered was, between the pairs, half are odd and half are even. Again, human agency did this. We wrote computer programs [07:52:00] to randomly throw hexagram sequences and test for this quality, and we found that—uhh, only one in every 7,500 times could you expect to get a sequence which would be, uhh: 25% odd, 75% even; which is what this enforces. So, I was very excited by this, because I said: “Wow! There's all this hidden stuff in the I-Ching [07:52:30] but I've never once ... why is this thing not ... [inaudible; interrupted by something irritating needing adjusting] Umm, [inaudible] inching up on me ...

Audience: [inaudible] ... There may be one on the the other side of you.

TM: This thing?

Audience: Yeah, right on the other side of you.

TM: Okay. [continues to adjust something on the TimeWave graph]

TM: So, I thought, how weird that all this structure is in there ... and I'd read all of Wilhelm's Commentaries, and Lama Govinda, and these people, and uhh, it didn't seem that they had noticed this kind of stuff. So I was very excited. I thought that I was really on to something, and I made a graph of the [07:53:00] first order of difference and it looked something like this. Of course it has [counting deliberately, slowly]: One, Two, Three, Four, Five, Six ... on this axis ...

Audience: [inaudible]

TM: Blue?

TM: And [counting deliberately, slowly]: One, Two, Three, Four ... to 64, this way ... because there are 64 hexagrams. And then I drew the first order of difference. Now, notice ... remember this was Six, so ... [07:53:30] up here we put a point, and the next one is something else ... and the next one is something else, and then we connect the points. And what you get is a structure which looks ... like this. Roughly.

TM: In other words, it looks stochastic, it looks random. [07:54:00]

Transcribed by Nathan Johansen

TM: [7:54:00]...it doesn't look like you're on the track of any kind of order here, except that, i noticed a really funny thing, about this. What i noticed was, that this section and this section, are mirror images of each other. So imagine for a moment that you have a copy of this, right here. What you're then able to do, is rotate the copy a 180 degrees within the plane [7:54:30] and you'll discover that it fits perfectly in here. It dovetails at the beginning and at the end but nowhere in between. This is, this is again a product of human decision. Someone made it, so that it would do this and the question is why? Why would anyone want to do that and when it works you have hexagram 1, across from hexagram 63 [7:55:00] and hexagram 2, across from 62, 62... In other words, these always sum to 64, when it's in the right position. So i just thought that i was uncovering some kind of, like (ahh), you know, the equivalent of Chinese kabbalism some kind of lost intellectual system and (ahh), and, but the voice said to me, it said, this is a picture of time [7:55:30] and i couldn't understand what exactly was meant by that, it seemed to me a fairly esoteric thing to assert that it was a picture of time. Now remember they're 64 hexagrams in the I Ching and they have six lines each. 6×64 is 384. When it told me that this was a picture of time, i began to entertain the idea that this was, [7:56:00] somehow could be used as a calendar. So then i said, well what it is, is it the whole I Ching running one way and the whole I Ching running backwards the other way combined into this peculiar structure, which has 384 data points in it, which are the lines or so called yáo of the I Ching. Now 384 is 19 days longer than the solar year length, so if you have a calendar [7:56:30] of 384 days it would precess against (ahh), the equinoxes 19 days every year. So it doesn't seem a good candidate for a calendar if you're trying to keep solar dynamics central. But i discovered something weird about (ahh) this number, 384 days, now think of it as days and that is that, peculiar things happen when [7:57:00] you multiply this number by a numbers that are inherent to the structure of the I Ching. When you might, when you multiply this number by 64, you get a day number which when you break it down into years is 67 years 104.25 days. Now what's interesting about that number is that, it-it is 6 sunspot cycles of 11 plus years. [7:57:30] There's also a major sunspot cycle of 33 years so it meant each line, in a super hexagram made by multiplying this number will be associated with one sunspot cycle and the trigrams inside the hexagram will be associated with the major sunspot cycle. When you take 67 years 104.25 days, again by 64, you get [7:58:00] 4306 years, plus some days. This number, is very close to twice the amount of time that it takes for (ahh), a Zodiacal Era such as the Age of Pisces or the Age of Aquarius they, last roughly this long. Well if you take this number by (ahh) 6, not 64 but 6, [7:58:30] which is a legitimate, number because it's built into the I Ching, you get (ahh), 25 thousand years roughly. This is the precession of the great year or the equinoctial year as it's called. So i thought, wow this is really far out! It's some kind of a, (ahh), multi-level resonance calendar... Oh and i forgot to say about 384 days, this was central excuse me. (ahh) That this is 13 [8:59:00] lunations. A lunation is 25, is 29. something days and when you multiply that number by 13 you get 383.89. So i said, ah ah! What this thing is, is that keeps track of the moon on this level, it keeps track of the sunspots on this level and it keep track of the great year of the zodiac on this level. All naked eye astronomical phenomenon not hypothesizing [7:59:30] any advanced technology but hypothesizing an advanced (ahh), (ahh), intellectual, point of view. Well, [drinks water] so i thought i was finished and that somehow it wanted to tell me about a Neolithic Calendar in ancient China for some reason, but there was more. [drinks water] Popeye had spinach, i have this. [audience laughs] The prompting voice...[8:00:00]

Transcribed by Tiago Ramos

[08:00:00] The prompting voice said “this structure which you have created” by the way some of you who are scholars of the I Ching remember in the uhm second half of the Wilhelm and Baynes translation there are whole bunch of VERY ancient sayings that nobody knows what they’re talking about they’re so esoteric. And the most MYSTERIOUS of these sayings is the saying which says “the forward running numbers refer to the future. The backward running numbers [08:00:30] refer to the past”. Well in the I Ching there ARE no forward or backward running numbers unless you do something like this and then look what you get: one, two, three, ... 63, 62, 61, 60, 59. You get forward and backward running numbers. So I said “wow.. you know, we’re digging this thing out. The I Ching is NOT enorical [??] as it’s been done at country fairs for three millennia - the I Ching as we possess it is a piece of broken machinery. [08:01:00] It’s a though you have you know, the main gear out of a machine and you’re trying by.. [pause] archaeological reconstruction to re-build that machine. So.. [pause] I was sort of stuck at this point and the prompting voice turned on and said “this structure which you’ve made which is the entire I Ching running forward and backward against itself - which would place it then at the top of a [08:01:30] um, of the uh hierarchy should be placed at the bottom of the hierarchy. Treat this thing as a single line” it said. And I was calling this at this point the simple wave. It said “treat the simple wave as a.. a line in a hexagram”. Well when you do that, [pause] bear with me folks. Remember I said the learning curve is steep. [08:02:00] However, it’s not long.

Audience: Can I ask for you’re [inaudible]

TMK: Oh yeah.

Audience: Can I get the [inaudible] across the room.

TMK: What.. what color?

Audience: Yeah well uh..

TMK: Yellow?

Audience: [Inaudible]

TMK: Yellow?

Audience: [Inaudible]

TMK: Lemme see.. [pause] Ahh. Ok so if we treat this module as the bottom of a hierarchy then we want to treat it like a line. So what do you do with lines [08:02:30] in I Ching land? You p.. stack six of them on top of each other. So I’m gonna symbolise this thing with an “S”. Ok. So here’s what I did. I made.. I took one of them. And another one. And another one. [sounds of drawing on a surface] and another one. And I said “did I do good?”. [08:03:00] [audience laughs] And it said “Sort of. But a hexagram is more than six lines isn’t it?” And I said “Well what more is it than six lines?” It said “well it’s two tri-grams”. Said “oh.. ok”. So then I went like this.. [sounds of drawing on a surface]. Do you see how I superimposed the thing over the six two-larger ones which were [08:03:30] superimposed over three? So then I said “S’alright?”. It said “Yes, except you forgot one thing. A hexagram has an identity as a whole. As a hexagram”. Said “Ok..” [scribbles] “Good?”. It said “Yes. Good. Now, what are you going to DO with it?”. And I’ll show this to you. Uhm.. [scribble] Just so you can get.. [08:04:00] the idea. I don’t know how visible this will be. This is what you get if you do that. And what it looks like is exactly what it looks like, which is a hodge-podge of crazy lines running everywhere on three levels [audience laughs] and uh.. The thing said to me.. It said “this is a map of time”. And I.. went.. I made the mistake of saying to my [08:04:30] friends and acquaintances “this is a map of time!” [audience laughs]. And they said, you know “we’re very concerned. Apparently.. [audience giggling] you didn’t get better even though you claimed you got better. And now, you know, you run around, showing this thing to people.. And notice.. It.. oh it ha.. Everything is in closure up here, and then everything attains closure down here. And then there’s sub-closures. Six [08:05:00] on one level, two on another, and the final on this line. And FINALLY my friend Ralph Abraham took pitty on me and he said “the problem with this thing.. is.. That it cannot coat [??] dogma. Nobody can understand this thing.. except you. You are necessary for its interpretation”. [audience laughs] And I said “So what am I.. what do I do?”. And he said “you must LEARN how to change this into a more orthodox mathematical object that.. That math.. Mathematicians can then discuss with you”. And I was completely

stuck. And I s.. sat with it for.. two years. I.. cause it just seemed.. I.. I am not a mathematician. I had NO clue as to how to do that. And finally one afternoon.. Uh.. the pot was good enough, or the stars moved into position or something.

[08:06:00] (end of this transcription segment)

Transcribed by Nick Whiu

TM: [8:06:00]...and in a single instant i saw how to carry out the mathematical reduction of this wave and i did it.

Audience: [inaudible]

TM: Oh, on this?

Audience: Yeah, it looked that way from here.

TM: Oh well if you look at it closely you'll see that because of a, are at different scales it isn't that, one side is egl- exactly like the other side. Yeah, there are dissimilarities. [8:06:30] So i finally, figured out how to, mathematize and conserve all the qualities of that wave and i put it into an ordinary cartesian object, which i doubt you can see but you don't really have to see it anyway. All this is, see what that is? It's just a one, it's an ordinary graph of some sort.

Audience: [inaudible]

TM: Ah?

Audience: Is that the sum of...[inaudible]?

TM: It's the sum of certain qualities. There was skew, [8:07:00] parallelism, angle of approach, crossover. There were about five things that i felt were important and i figured out how to mathematize them all, so that this, which is an or-ordinary cartesian graph, is in fact a topological equivalent of Maya cult diagram and... Yeah?

Audience: Each one of those points is a summation of these factors?

TM: Yeah right, uh uh. So, then (ahh), [8:07:30] and then i started saying to people, this is a map of time. [audience laughs] And they said, is it? [Terence laughs] Well, where are we? [Terence laughs] And i said, well (ahh), hum, (ahh), we, (ahh), hum... In order to know where we are we would have to know where the endpoint is. If you have a wave you have a wavelength so, we have to find the endpoint. So then i began collecting historical data, and fitting [8:08:00] curves,

to it, trying to define the endpoint. Now, remember yesterday at the close of the day or in the afternoon we got off on what appeared to some people to be, attention about novelty and science and time and whether, it was (ahh), whether it-it should be viewed as a flat plane or a fractal or something like that? Well, what the thing was telling me was, that novelty, is (ahh), something [8:08:30] which can be charted in time and that these waves were actually pictures of (ahh), of (ahh), the ebb and flow of novelty. That this wasn't charting stock prices or population rise or average temperatures, it was charting the ebb and flow of novelty through time and that... Como?

Audience: Novelty is...[inaudible]?

TM: Novelty is (ahh), [8:09:00] a density of connection, as opposed you know, complexity can be quantified then you say complexity ebbs and flows. Mean if we have a device which measured complexity and we measured this point right here, as opposed to this point an inch behind my finger, i'm hoping it would tell us that an inch behind my finger is a more complex environment than this point right here. [8:09:30] So space and time, is then, seem to be a medium with a density (ahh), comp-densification of complexity embedded in it like raisins or something. Yeah?

Audience: Looking at your...[inaudible]...creation in that graph. In other words, how do you establish origin and the endpoint when looking at that graph?

TM: Well, until you scale it against time, you don't have to, i mean i think...

Audience: [inaudible]...[8:10:00]

TM: Well i think what you're, i think if i understand your question right. Remember how i said that over here it was at closure? It goes like this. And that's both lines, they're running, that's both sides of the graph they're perfectly superimposed over each other. At this point they ceased to be superimposed. One goes that way and one goes that way and then you start getting this kind of stuff and then when you come down to the end [8:10:30] they fall into closure again.

Audience: [inaudible]

TM: Yes it's a thing of say... exactly you got it. Okay.

Audience: What would be the beginning of time? Is that some...[inaudible]...Garden of Eden...[inaudible]?

TM: Well (ahh), to this point we haven't discussed this thing scaled against calendrical time we just kind of look at it as a mathematical object. Then what i realized was, if these are part, if-if [8:11:00] this thing has 384 points in it, and this has, six. Then the, what the thing was telling me was, you have to map the, you have to map the way back over itself. So you take all 384 points and you cram them into this space wandering up this hill, then you go to this space and you cram all [8:11:30] 384 points in here and you create a fractal infinite regress. Do you understand? [audience laughs] Say you understand. [Terence and audience laughs] You will understand. Okay so then that was the time, that was the time map. It was saying novelty can be described by an infinite fractal regress that is contained in the I Ching. Now, the main objection that i was meeting from people who wanted to lock me up was, they were saying...[8:12:00]

Transcribed by Tiago Ramos

TM: [8:12:00]...was, they were saying, now let's get this straight. You want to revise modern physics, based on a pattern which you found in an ancient Chinese book of divination is that correct? [audience laughs] And i-i could feel the force of that criticism but that's how i think, you know, where somebody from some nut piece of data then wants to build castles in the air and so (ahh) i created a metaphor [8:12:30] which is satisfying to me i hope it's satisfying to somebody else, trying to explain why we should seek a law of physics, inside the structure of (ahh) the I Ching. [drinks water] And here's the metaphor, think of sand dunes. Picture them in your mind, since this is the New Age you may even close your eyes if it helps. Picture sand dunes. Now, [8:13:00] notice, that sand dunes, look, like wind. Sand dunes look like wind, and sand dunes are made, by wind. So now let's analyze the situation, let's think of wind as input and let's think of sand grains as bits inside a computer. So when the wind blows the program [8:13:30] runs and the bits rearrange themselves and they arrange themselves into a lower dimensional slice of wind. Essentially wind, which has a pressure variant phenomenon variable in time, turns into a pictorial phenomenon variant across the pictorial surface. You see how that works? Well, now...[drinks water] [8:14:00] Sand dunes created by wind, bear the impression of wind. (ahh), lines of foam and beach detritus deposited by the incoming tide, bear the form of waves. So what it was telling me was, it was telling me that, things formed in time bear the impression of the forces which created them. And i said, well then what is the equivalent of sand dunes or waves of beach detritus [8:14:30] in the real world? And it said, human beings! Genes, not grains of sand. Genes are moved by time and we as hyper dimensional objects, we human beings and other animals, we bear the impression of the forces that created us and if novelty truly does Adam flow, the way wind speed ebbs and flows over a landscape, than the creatures [8:15:00] that have arisen in time will bear the imprint of this ebb and flow and i believe that what was going on with the people who created the I Ching, was that they (ahh), were practicing some kind of yoga or some kind of psychedelic + yoga thing and they were, (ahh) stilling their micro physical functions and they were descending deep into organism, and there they [8:15:30] were seeing the ebb and flow of variables of some sort, and they watched... Who knows how long? Centuries maybe. And they said, you now, in the organism there is the ebb and flow of variables and then they ask questions like, how many variables are there are there an infinite number? And they began to create notation system for these variables and finally they came to the conclusion, no, there are not an infinite number [8:16:00] there are 64 of these temporal variables. And think of them as elements, in the same way that the entire world of physical manifestation can be created out of a 104 physical elements, the entire world of temporal manifestation can be created out of 64 elements and so the way i think of reality having survived this experience, is,

[8:16:30] you have hexagrams moving on many levels. Let's say you have a hexagram which rules this 10 thousand year period. For 10 thousand years this hexagram will rule and then on the next level the hexagrams are changing every, 100 years, and then on the next level every 10 minutes, and on the next level every 15 seconds. Wha-what any point in The Matrix called now, is, is the perspective [8:17:00] you have when you look through the moving film of these temporal elements moving on many many levels you see, They're, they're, they create and unique juxtaposition with each other in every single moment and that is (ahh), what the unique felt presence of-of (ahh), immediate reality is all about. Well, i, by this time... Yeah question? [8:17:30] No...

Audience: [inaudible]

TM: What?

Audience: That, that position where, where they all come together...[inaudible]...I look at that, always look at this symbol, the I Ching symbol as the guiding symbol of this plane and reality...[inaudible]...So your thoughts about the exact...[inaudible]...time and body time. Is that true? [8:18:00]

Transcribed by Tiago Ramos

Audience : [...] [8:18:00] membrane that is between time and [non-time? God-time? ..inaudible], but is that true?

Terence : Yeah, pretty much. I mean... You know... Plato said "Time is the moving image of eternity."

Audience : It's a wavefront.

Terence : It's a wavefront, and it's an interference pattern. Yes, it's a, it's a, it's a, uh a kind of hologram, uh.. and a set of resonances and interference patterns that are created when these waves moving at many levels expression, superimpose and collide with each other. [8:18:30] And through the use of small computers, we can explore various places within the wave, and we can position it against time. Because what it's saying is that novelty comes and goes. You know.. Yesterday was wonderful, tomorrow could be dogshit. Same for last year and next year. Uh.. Time undergoes changes, on many scales. [8:19:00] I mean from moment to moment if you watch your mind... You're going up, you're going down, and then on the daily scale up, down, yearly scale up, down, and then on all scales there is ebb and flow of novelty. And all these scales can be mathematically collapsed into one wave and then with a computer you can not only predict the future, which is fairly trivial because who can gainsay it, but you can also predict the past! [8:19:30] Which is very tricky. Because most people have a good deal more information about the past than they do about the future. Ya..

Audience : [8:19:40] [hardly audible comments or questions] larger scale... going up.. .

Terence : That's right... That's right.. Well no, you've got the whole concept correct except you don't need [8:20:00] an infinite number because look what happens... If you start with 384 days and you start multiplying upward by 64, remember I said the first one was 67 years, we only have to carry out about six of these till you have 72 billion years, more time than is necessary for the universe to have burst itself and reached its present state. Similarly, if you start dividing... uh, you only have to divide [8:20:30] 11 times to reach the realm of Planck's constant (6.55×10^{-23} Earth seconds), in technical parlance known as a jiffy. Beyond the jiffy, there is no need to continue the divisions because the jiffy defines the grain of the canvas on which reality is projected. So what we have are, uh, you know, uh, a cosmology of roughly 22 levels [8:21:00] at the highest level it's 72 billion years, at the lowest level it's in the realm of Planck's constant, and we are somewhere suspended in-between, and these things are coming and going on every level. Yeah..

Audience : [inaudible] .. the way that you arrived at this conclusion.. to say the least... however, it seems to me that you'll be able to use this model to see some difference in the way [inaudible] compared to the Third Reich. [8:21:30]

Terence : Absolutely!

Audience : [inaudible]

Terence: Yes, I'm hurrying us toward the more fun part of this and I think that we'll do it now. What we're gonna do now is look at the wave placed against history, with my end date, December 22nd 2012, although the machine will accept any end date. And the idea that you should be asking yourself is.. you know, "this clown [8:22:00] claims that this thing describes the ebb and flow of novelty, but does it in fact fit my intuition of the ebb and flow of novelty?" Now, here's the good news: the next part of the lecture does not depend on anything that's been said in the first part. Uh.. you don't have to understand anything I said in the last half hour to appreciate the neatness of the next level. Lucky for us, eh? [laughs in the audience]

Audience: [inaudible] [8:22:30]

Terence: Mmm. That's fine i think. So now... Because you know some people aren't interested in this.. You tell them you can predict the future and they say "well, predict it!". And then you predict it correctly, and then they say "Great!". It never enters their mind to ask "How did you predict it?" which is what I, out of obligation to intellectual fairness, feel that I should expose you to.

Now, let's look at the wave. [8:23:00] Eum..

Now, let me explain the rules of the game here. There are six billion years currently on screen. Today is over here, at 98.8 percent. This is the last 6 billion years. And, let me explain to you how you interpret the wave. And if you want to take a moment and rearrange yourselves, [8:23:30] the rest of it is gonna be fairly close focus on this thing, so don't be shy, and don't make yourself uncomfortable.

Audience: [two people talking, inaudible questions about the end date]

Terence: Ah, the end date! Uh.. It.. I got it by fitting historical data to the wave and seeing.. I had certain intuitions.. I mean, for instance, I said “Well, if I have a wave which describes historical novelty, by God it better do well on the Italian Renaissance, it should do well [8:24:00] on the 20th century, and it should do well on the Golden Age of Greece. If a wave of novelty incorrectly predicts those episodes, it’s a pretty worthless theory of novelty. Once I had chosen an end date, and I chose December 22nd 2012, I got a lot of support for that by realizing that the Mayan calendar chose the same end date. [8:24:27]

Transcribed by Giovanni Colombo

TM: [8:24:00]...it should do well on the 20th century and it should do well on the Golden Age of Greece. If a theory of novelty incorrectly predicts those episodes, it's a pretty worthless theory of novelty. Once i had chosen an end date and i chose December 22nd 2012 i got a lot of support for that by realizing that the Mayan calendar chose the same end date. Now the only thing i have in common with the ancient [8:24:30] Maya, is that we both take psychedelic mushrooms. Now is it conceivable that there is a message in the mushroom, as specific, as no matter where in space and time you are and you take these mushrooms it says, December 22nd 2012 AD. It appears so because the Mayans, their civilization rose and fell with a very interesting part of their own cale-(ahh) calendrical machinery. [8:25:00] They predicted the end of the world a thousand years after their own eclipse and they predicted the birth of their cal-they set the birth of their calendar a thousand years preceding the emergence of their civilization. Yeah.

Audience: (ahh) So, now this is 2012...

TM: Huh, huh.

Audience: Is this what the Mayans have as a completion of a large cycle or is it what they are believe it is, the completion of all their cycles?

TM: It depends on, on who you talk to. (ahh) [8:25:30] The Mayan calendar is built up of nested cycles some twenty years in length, some two forty and there are 13 baktuns. Which i think a baktun is 396 years in duration and most Mayanists believe, that, that a set of 13 baktuns, is the complete calendrical set. There's a minority of Mayanists who want to argue that there are greater cycles than that. [8:26:00] (ahh) In any case baktun 13 will come to an end December 22nd 2012, so (ahh), you know, it's good enough for me. [audience laughs]

Audience: Could you say just a little bit more about the, property of novelty, is, is it synonymous with complexity?

TM: Well (ahh), you know, if, since this is a push-pull theory and we have novelty versus something, the opposite of novelty is habit. [8:26:30] Rupert insisted on that. I was calling it entropy and, conservatism and recidivism and he said no. It's a war between habit and novelty. Habit means a reversion to a traditional and already established pattern. Novelty means a breaking out into a previous domain, untested domain of new connections and (ahh), and new possibilities.

Audience: [8:27:00] [inaudible]

TM: You mean as in...(ahh)?

Audience: Something...[inaudible]...surprising you?

TM: Yes. The unexpected is built into it because when you come around some of these curves there are unexpected things going on.

Audience: What about the chaos order boundary, sounds like that a lot?

TM: Yeah, well you can think of it that way. I haven't completely, resolved how novelty should be defined because if you know anything about Information Theory you know that they had a hell of a time getting a definition of complexity [8:27:30] together over there. They also were interested in mathematical definitions of complexity but they haven't made too much progress.

[This concludes tape 6, our program continues with tape 7. Our program continues with tape 7]

TM: Let me explain to you how to read the graph. Because it's the exact opposite psychologically of a, stock market graph. I think when you [8:28:00] look at a stock market most of us want it to go up, not down. In this game we want it to go down. The, nov-, the higher states of novelty occur as you approach zero. So this is the most novel point on the screen, this is the most, habit impacted moment on the screen and what you see is habit and novelty are at war with each other. (ahh) Now here's how i [8:28:30] interpret this particular screen and it is a basis for interpreting all the rest. This is a turning point, after a long period of habit, consolidation and recidivism, whatever that means at 4.7 billion years ago. (ahh) Something very novel happened along this descent. I maintain that it's actually the stabilization of the surface of the Earth itself.

That what we're seeing here, [8:29:00] is the Earth changing into a stable planetary body and then (ahh), the earliest forms of life, the Proto life, appears right here and undergoes a series then of fluctuations then (ahh), there is some kind of a problem, some impediment to what would otherwise be, the rather straight shot toward novelty by this (ahh), [8:29:30] spike here. Well, evolutionary biologists say that in the early history of the Earth there was a crisis having to do with the production of oxygen as a waste gas. Life arose in a non-reducing atmosphere. The first, pollution crisis in the history of the Earth was pollution by oxygen and organisms had to develop complex

membranes and mechanisms for dealing with this and that's what happened along here...[8:30:00]

Transcribed by Tiago Ramos

TM: [8:30:00]... and that's what happened along here. And (ahh), once that was achieved then the pace of novelty quickened and the descent continued and we, our entire civilization, in fact, you know, the last bill-million years as a matter of fact, is lost down here in this decastric fluctuation near the zero point. In other words, relative to these places in the wave, we're so near the maximum of novelty [8:30:30] that it's practically punching in through the walls and in fact human civilization (ahh) correctly mirrors that. I mean, for you would expect to find a civilization on this graph, it's somewhere down in here. Well now if everything is working right...

Audience: [inaudible]...98.8%.

TM: 90 let's, yeah, 98.8% if the...

Audience: The target date of today.

TM: The target date of today. Now what I'm going to do if there's a zoom function here [8:31:00] and we're gonna start flying towards the present and every time a screen changes we're gonna see half as much time on the screen. We have six billion years up, we'll go to three, then one and a half, then .7 time and so forth. This seems to be an excellent computer with a fast chip so...

Audience: [inaudible]...the right hand on the screen.

TM: Yeah, yeah, yeah, and [8:31:30] we're gonna get greater and greater detail and, your attitude towards this should be, i'm asserting that this is true, you have a notion of where the high points in the evolutionary human history have occurred. You should be asking yourself whether this fits your intuition. Now obviously (ahh) it's pretty vague stuff when we're looking at 6 billion years but on the other hand, we can take this thing down [8:32:00] to three days if necessary and (ahh) we know where the great changes have come in the last thousand years it's not that ambiguous. So let's (ahh) test the zoom function...[silence]...zoom it asks me, yes i reply. Seek minimum it asks me, no i reply. Approach factor it asks me, and i'm going to tell it two, in order to have the screen each time it would accept any number but two [8:32:30] seems rational for demonstration purposes.

Audience: [inaudible]

TM: No it's gonna slice the time. It's gonna slice it each time and rescale.

Audience: It's coming up with minute, hour and day...[inaudible]...so is the origin of time... [inaudible]...like the origin of the universe?

TM: You would presume so.

Audience: So the Big Bang would kind of like be in the middle of the novelty...[inaudible].

TM: The Big Bang would be, no, the Big Bang would be very high because there's no life, [8:33:00] there's no atomic system, there's no molecules it's a very low complexity situation at the birth of the universe.

Audience: It's not the...[inaudible].

TM: Yeah, no, yes that's right, the Big Bang it's somewhere up here, up here (ahh). Okay now, before i do this let me locate escape, okay. This is such a pleasure to do it with fast machines. Okay there's three billion, see how detail [8:33:30] is coming up as time is lost? And, and if anybody wants me to stop it at any point i will (ahh).

Audience: [inaudible]

TM: Here's 750 million years. This is virtually the entire history of life on Earth and in fact, of higher life. I'm sorry, you know, organisms, not, not multicellular life. This is the history of multicellular life and what you see is there was a steep descent [8:34:00] into novelty, until about 300 million years ago and then there are a series of oscillations close to zero until (ahh) about 65 million years ago and then there's a sudden plunge deeper into novelty immediately preceding the conrescence which occurs on the, at dawn Greenwich Mean Time December 22nd 2012. One thing about this theory, it's not vague [8:34:30] (ahh), and it, notice that it doesn't edge on

predictions either. It fills every screen is full of predictions.

Audience: [inaudible]

TM: Two.

Audience: Approach factor?

TM: Approach factor, yah. Okay we got 750 million years on the screen, 375 million years on the screen. Now i wanna talk about this for a minute. Now this is a screen full of dramatic [8:35:00] predictions, these are tremendously punctuated and temporally define plunges into novelty and (ahh) we don't have tremendous paleontological records for what's going on 275 million years ago but from studying these low points and talking to geochronologists about them, i've decided that these are (ahh) planetesimals impacts on the earth. [8:35:30] Now you know that the last one was 65 million years ago, that's this one, right there but there were others, there was one (ahh), this one, 220 million years ago.

Audience: [inaudible]

TM: Oh, asteroid strikes on the Earth.

Audience: [inaudible]

TM: Oh well, there was a little tiny one in Arizona. Those happened all the time in Cosmic terms, every hundred thousand years or so. [8:36:00]

Transcribed by Tiago Ramos

TM: [8:36:00] But, (ahh) this thing that happened 65 million years ago was a planet shattered (ahh) and, they're rare, they're rare. Okay so, so, i'm suggesting that these are asteroid impacts which then evolution had to restart, reclaim his territory and then, there is something else happening. They may not all be asteroid impacts. They could be (ahh), you know, enormous episodes of volcanism on the Earth such as [8:36:30] the Deccan traps in India or something like that. Now let's start the thing again.

Audience: And now what timeline...[inaudible].

TM: What we're looking at now? 375. [silence] Seek minimum, no. Approach factor, two, go for it. [silence] That's 187 million years, there's the impact 65 million years ago. Now let's look at this. This is the last [8:37:00] 93 million years.

Audience: [inaudible]

TM: Ah yes, it looks like the thing we started out with, somebody's paying attention! [audience laughs] Right on, yes yes.

Audience: [inaudible]

TM: See what happens is a fractal is a nested dataset and every time you pass through a whole number, the pattern repeats. This sets up a very interesting, (ahh), (ahh), set of circumstances inside [8:37:30] the way which is that we can talk about temporal resonance. We can talk about how the Third Reich, is a resonance of ancient Egypt. We can talk about Saddam Hussein as a resonance of Muhammad because when we look at the way these things are lined up historically we see that, directly above Saddam Hussein and in a relationship of parallelism is the career of the prophet [8:38:00] and so what is being suggested here is that every day, every moment, is in fact an interference pattern created by other times and places. This is not, this is a fairly challenging and peculiar idea not something the linear western mind would have ever come up with. So for instance, if you should find yourself having lunch in a place called Hadrian's hamburger stand, this has [8:38:30] something, to do, with the emperor Hadrian and his four-year military campaign in Scotland. He is a direct causal influence on your being at Hadrian's hamburger stand for lunch. I like to say, (ahh) Rome falls 9 times an hour [audience laughs] and you have to be, perceptive. You have to be paying attention to the ebb and flow of your own inner, thoughts but, if you are you feel the fall of Rome,

[8:39:00] you also feel the Age of Exploration, of the birth of Buddha (ahh) the, the fall of Carthage. It all happens nine times an hour. It also happens twice a day and once a year, yeah.

Audience: [inaudible]

TM: (ahh) Sometimes, yeah it is very similar.

Audience: [inaudible]

TM: That's right.

Audience: [inaudible] [8:39:30]

TM: Yeah there's, (ahh) we never tried to do it, scientifically, you know where you would actually keep track, but (ahh) major astrological conjunctions are often reflected in major ingressions into novelty.

Audience: Terence, interestingly as you or anyone else that's (ahh) aware of this, ever tried to convolve this with, with say Einstein field equations?

TM: No because i'm not smart enough to do that.

Audience: I think that would be a fascinating [8:40:00] thing to do because what you do is input, input using as one variable this entire system.

TM: That's right.

Audience: And what it would produce would be fascinating.

TM: I think God has chosen you for this work. [audience laughs]

Audience: This makes me ask, what are the historical antecedents of Reagan and Bush? [audience laughs]

TM: Ohh, ohh, Ronald Reagan was, (ahh), (ahh), his historical antecedents were the last six Roman emperors [8:40:30] before the fall of Rome in 475 and Bush's antecedents is (ahh), (uhm)...

Audience: [inaudible]...clowns...[audience laughs]

TM: No i think, i think, i think Bush gets to be (ahh) Justinian.

Audience: Oh!

TM: You remember somebody said history always occurs twice, first as tragedy then as farce? [audience laughs] That person, who had a good intuitive (ahh)... [8:41:00] So now let's go into this a little more. (ahh) How much time do we have? Oh 93 million years, okay. [audience laughs] So, here's the a, here's the asteroid impact and, and, dead on! I mean, 65 million years it's right there, to the degree that we can date these two events. It's a win it's a bull's eye, and, you know it was a huge setback for organic life as i said this morning, nothing larger than a chicken [8:41:30] survived it. (ahh) The mammals begin their radiation and, and (ahh), this are, you know, just different vicissitudes. I'm not sure what to make of this spike here but i haven't really spend a lot of time on that period from 40 to 36 million years ago. Somebody else may have a notion as to what this represents.

Audience: [inaudible]...the recovery though is fairly rapid.

TM: Which it was. (ahh) Evolutionary biologists say, you know, that forms quickly...[8:42:00]

Transcribed by Tiago Ramos

TM: [8:42:00]...reoccupied all the niches and remember if this hadn't happened, we wouldn't be the planetary rulers that we are. We'd still be little furry creatures trying to steal eggs out of the nest of the saurian masters who ruled the planet.

Audience: Why is this?

TM: Why? Because all the dinosaurs were killed in this impact and that allowed these little egg stealing rodent-like furry creatures to undergo an [8:42:30] explosive evolutionary radiation leading directly to our own vast superiority over the rest of nature. Oh, yeah, yeah, no, yeah?

Audience: [inaudible]

TM: Oh, that's a whole different scale you see, the dinosaurs died off 65 million years ago. The ice age is a phenomenon of the last 5 million years, and we'll see the ice ages but not there, right now those ice ages [8:43:00] are down in here, somewhere lost in the detail. Let's to go back to our zoom.

Audience: We'll get there, won't we?

TM: Oh yeah, we'll get there.

Audience: I'm waiting to be at my writing spot.

TM: Don't worry! No, we don't wanna seek the minimum, the approach factor should be two. [silence] Ok, 93 million years on the screen, 46 million years on the screen, [8:43:30] 23 million, 11 million, 5 million, 5 million years on the screen, now here your ice ages. Here they are you see, (ahh) when the ice is in place, species are bottled up and gene transfer is impeded, [8:44:00] this constitutes a non-novel situation. Then when the ice melts, these gene pools re-encounter each other and you get proliferation of form. We're getting excellent agreement here, this is the melting of the last glacier, (ahh) maybe. I'm not...

Audience: [inaudible]...the last glacier was about 13 thousand years ago?

TM: Yeah i think it's actually over here still lost in detail. But these are, (ahh) you know how evolution is described as punctuated, how it [8:44:30] isn't that evolution proceeds smoothly but that will be a climax stasis and then suddenly many new species well, these are the punctuated evolution. This is actually a picture of punctuated evolution and the high numbers of species

are down in this troughs and the low numbers of species are on this ascents close to the changeover, point. So, (ahh) again the paleontological data isn't that clear but at this [8:45:00] scale of resolution we're getting good agreement between data and theory.

Audience: I think different...[inaudible]...(ahh) a guy called...[inaudible]...do you know?...[inaudible]

TM: Well, it, it's, the, they are topologically equivalent but not numerically equivalent.

Audience: [inaudible]

TM: Yeah.

Audience: [inaudible] [8:45:30]

TM: That's right. It's a damped oscillation. Is really what we're seeing.

Audience: [inaudible]...because that's one of things...[inaudible]

TM: Yeah, well i'm hope you'll be on it by Monday afternoon (ahh). [audience laughs] Ok, let me restart the zoom.

No, i'm restarting the zoom, zoom. Yes?

Audience: I have a question.

TM: Ok.

Audience: About magnetic poles...

TM: Yes, these [8:46:00] could very well be magnetic reversals.

Audience: [inaudible]

TM: Yeah, they, they very well could be magnetic reversals and...

Audience: So we're looking at ice ages.

TM: I, well what we're looking at is i'm suggesting they're ice ages, it was suggested that they're geomagnetic reversals. Geomagnetic reversals and ice ages may even have links to each other.

Audience: [inaudible]

TM: (ahh) Well we see that over here (ahh) a steep [8:46:30] descent into novelty going deeper than we've ever gone before and that would probably indicate that an animal or an organ as appeared of a density of complexity greater than anything which preceded it. So i would say yes.

Audience: What, how, how you know that?

TM: Well, let me start the zoom and we'll get over in here on a big scale and then you can see. Ok, we're gonna go from 5 million, [8:48:00] down to 2 million. Now let's discuss this. Because this is the domain in which we evolved. Our story is on screen at this point (ahh), it's said that (ahh), the... A hundred thousand years ago at the Klasies Cave

River mouth in South Africa

there were Homosapiens indistinguishable from the people sitting in this room. [8:47:30] The oldest Homosapien skeletons are from there. That clear over here (ahh), this is the fungi deradiation meaning the proliferation of these crymate forms (ahh), and, and that's about (ahh), 900, a million years ago. (ahh) This, this is the whole period in which the primates were, breaking away from the rest of Nature and, and this is, i think probably... [8:48:00]

Transcribed by Tiago Ramos

TM: [8:48:00]...where the mushrooms begin to come into the picture and see how the whole system is propelled into lower levels of novelty than anything which preceded it.

Audience: Lower...[inaudible]

TM: Higher levels is novelty, when the wave moves down novelty is increasing. Zoom, yes. Seek minimum, no.

Audience: [inaudible]

TM: That's one way of saying it [8:48:30] or increase density of connection or (ahh), it means something happening which is never happened before which allows (ahh), novelty to build upon itself. We talked about this a little bit yesterday. About how the early Universe was very simple and then came ordinary chemistry and then (ahh), organic chemistry and then life and then complex life and then higher [8:49:00] animals and then primitive human beings and then language and culture and then computers and particle accelerators and all of this representing steeper and steeper descents into novelty. Headed toward a confrontation with novelty at infinite density, not millennia or ballenia in the future but, twenty years from now.

Audience: It's known that something being created...[inaudible]...being [8:49:30] stored...[inaudible]...entire system.

TM: Conserved is the word i use but yes, that's right.

Audience: [inaudible]

TM: That's right. Well, when we get to the present you'll be able to see, you know, the past few months, the next few months, the next few years. We approach it this way cuz i wanna convince you that there's something [8:50:00] sort of woo woo about this thing. It does seem to have an uncanny predictive ability. Now, the most commonly met-abjection to this, and it may be forming in your mind is, that this guy just doesn't understand patterns and that every pattern can be used to describe a different pattern. But i resist this because notice that, this whole set of correlations is dependent upon this zero [8:50:30] date which we inputted. If we shift the zero date, then all the other, predictions would be thrown off. Well now naturally if we shift the zero date 50 years, it's not gonna have a hell of an effect on an event 175 million years ago, but if we move the date 50 years and we look at 1492, you know, it's all screwed up. You have to be right on the money [8:51:00] when you get into the historical data field because the historical data field can vary over a 24-hour period. I mean, John F. Kennedy dead, John F. Kennedy alive, the difference is 10 minutes. So, it can be very, (ahh) it can be very, highly, (ahh) quantified specific yeah, (ahh) okay. (ahh) Enter.

That's 2 million, roughly 3 million years on the screen, 1.5 [8:51:30] million years on the screen, 700 thousand. Let's look at this for a minute. This is the last million years and the last hundred thousand years are right there. This is the emergence of modern human type and it sets off the last cascade at least at this scale. So, all of this is evolutionary advance and [8:52:00] climatological flux and so forth and then from the time the modern human type emerges, it's a straight shot, down in there. [silence] Now, obviously we all know more about time as we get closer to the present. This is 366 thousand years to a 100 thousand years up there. [8:52:30] There's the last 200 thousand years, there's the last 100 thousand years. [silence] This is, this is the environment in which we were, shaped. These are (ahh), very pro-, these are climatological fluctuations here but the last, this is the last glaciation...[sex moaning sounds from a computer in the audience]

Audience: Oh, forgot, shut down the computer! [8:53:00] [audience laughs]

TM: Is it dying or is it having a good time?! [audience laughs]

Audience: [inaudible]...I forgot it does that! Anyway...

TM: What are you doing this evening? [audience laughs]

Audience: [inaudible]...Harry met Sally remember that orgasm in the restaurant?

TM: Remember the orgasm in the restaurant when Harry met Sally? [8:53:30] Vaguely... [audience laughs] (ahh)

Ok, the last 91 thousand years the glaciers melt, here. The glacier melt begins around 19 thousand years ago and as you see is just a straight fall from there to the moon flight into, H. Ross Perot [audience laughs] and to all the rest of it. And these are again episodes probably of glaciation or flux in the incidence... [8:54:00]

Transcribed by Tiago Ramos

TM: [8:54:00]...of incoming cosmic radiation, is hard to say what it is.

Audience: [inaudible]...the last 3 or 4 days...[inaudible]

TM: Oh yeah, we can go down. We can take it down to very small. The, (ahh) i mean, understand that the (ahh), the program does many wonderful things which we're not doing. I'm just doing a simple demo but obviously all this stuff has got to be about something. (ahh) [audience laughs] [8:54:30] Now we're getting into the area where people have real data, that's 45 thousand years, 22 thousand years on the screen. Let's look at this for a minute. This is worth talking about. Now we, now the pressure begins to come on. It's all very well to predict the interglacials that may or may not have occurred, the predicting assassinations of dynastic families is a little trickier. Here's the glacial melt, [8:55:00] begins and species, this is the descent, this is where the mushroom paradise, existed in its fullest expression from about (ahh) 17 thousand years ago to about 10 thousand years ago. Well now what is this sudden interruption of the descent into novelty here? I maintain based on the archaeological record that is what is called the Tanged Points techno-complex. Do you all know what that is? [8:55:30] It's (ahh), does anybody know what it is? Tanged Points techno-complex means that (ahh), before this, before this point (ahh), when an arrowhead is found, you find one. It means it was lost by somebody who was hunting. Around 10 thousand BC you begin to find large numbers of arrowheads all in one place without (ahh) chipping, fragments. [8:56:00] This was not an arrowhead factory, this was the site of a battle between human populations. War, is invented here because agriculture, is invented here. You're looking at the end of the partnership paradise. The era of orgy gives way to the era of anxious monogamy, warfare, agriculture (ahh) you know, egohood, is born. Now somebody asked about, [8:56:30] who who, asked about Çatal Höyük? Somebody... Çatal Höyük, bottom of this stab here. The fire that burned through Çatal level 5A occurred in 65 hundred BC. We know this from charcoal dating. It's right there, it's on the money. See, somehow this, the, this whole thing Tanged Point techno-complexe bummer was overcome and there was a steep descent, into novelty [8:57:00] and (ahh) Çatal Höyük was the product of that. But then it was destroyed and there was a rebound into chuckle avidness for a while and then write down here in the bottom of this thing, is where the Great Pyramid is sitting. You know, the Great Pyramid was finished in September of 2970 BC. Why this should be so controversial?

I do not understand because there are grains of charcoal [8:57:30] between the unmoved stones. That charcoal is not been anywhere since the day that stone was set in place and its 2790 BC. These people, who want to push it back and say it's 10 thousand years old, well the obligation to prove is on them because the carbon radiological data argues. You see, there's some tendency in the New Age, which i don't understand very well, that wants to make everything older, than it is. [8:58:00] You know, the pyramids are 50 thousand years old, Atlantis rose and fell a 100 thousand

years... The miracle, is how new, everything is. The pyramids were built day before yesterday. Charlemagne was King of France early this morning. It's all, very, very, recent. I mean the emergence of mind out of non-mind is an event, practically (ahh), on top of us. Now let's start it up and we'll get really down [8:58:30] to the...

Audience: Can you hear me?

TM: Huh, huh.

Audience: Is the progression of time changing...[inaudible]

TM: Well, yes in a sense because you see what happens is when you, it's a built-in mathematical property of this wave that when you get to the end of a big wave, there's, when you get to the end on any scale there's a sudden drop, to the next scale and then it goes along to the end [8:59:00] and then there's a sudden drop. So if what we're saying is that a universe is made like, a universe that actually have this structure that i outlined for you, of 26 levels, where each level was 1/64 smaller than the level which preceded it, a universe built on that kind of architectonics would only be half way through its, life, an hour and 35 minutes before the end. [8:59:30] Do you see how that would work? But in the last hour and 35 minutes it's going to go through as much development as it went through in the previous 72 billion years. So yes, time is accelerating, accelerating into, you know, we've gone from, barely moving to approaching a staggering speed and i maintain, you know, that in 2012, the last, 6 days preceding the approach to conrescence...[9:00:00]

Transcribed by Tiago Ramos

TM: [9:00:00]...will be the jackpot. I mean the laws of physics will break down, everything will be in a state of visible motile transformation. This isn't happening in the human world, it isn't happening in our minds. It's a crisis in the strut- the structure of physical law itself and that's why, people, that's why, this theory will be hard to disprove or prove until so close to the end date [9:00:30] that you'll barely have time to make a telephone call to say whether it's true or not before if it is true your telephone call becomes totally irrelevant you know.

Audience: [inaudible]...space time itself are being contorted, twisted and...[inaudible]

TM: Yeah, that's right.

Audience: [inaudible]...to make that particular note.

TM: No, that's right. And in fact seems unlikely to you, let's always, let's never forget what the Orthodox guys are peddling. [audience laughs] They're peddling the Big Bang Theory [9:01:00] which says the universe sprang from nothing in a single instant. I would prefer what i called the big surprise cosmology because it seems to me if you

have to have a singularity, the, the least likely place to find the singularity would be in a featureless high vacuum. If you want to find a singularity look in a corner of the universe where there are planets, stars, elements, organisms, alphabets, civilizations, [9:01:30] mines, in other words look in a complex domain if you want to find a singularity. That's where you might have some chance of finding it but finding it in a unflood nothingness is a strange place to look even.

Audience: One of the arguments, maybe being proposed by those on the...[inaudible]...that in fact is a very complex universe that then push through a membrane into the singularity which then creates another entire...

TM: Well, one possibility [9:02:00] is that it's a wrap around that we're just not, we're not whistling dixie when we talk about the archaic revival. We're actually, what history is, is a finger reaching for the reset button and when you finally touch if you find yourself at the moment of the Big Bang. You know, you've actually sent it screaming back to the first moment.

Audience: [inaudible]...exercise in, in holographics...[inaudible]...that final experience is a very pertinent important holographic description [9:02:30] (ahh) the whole, the whole...

TM: That's right and every cycle is a holographic description of the cycles that preceded it.

Audience: We've just seen.

TM: Right. So in 1945 when the bomb flickers into existence over Hiroshima, this is the resonance of the Big Bang. It's being caused by the Big Bang and, the entire life of the universe, is then [9:03:00] somehow reenacted in the remaining 67 years. In the same way the, remember there was a 4306 years cycle. We are reenacting that cycle in, in the present 67 year cycle. We have reached A.D 700 right now, i mean if you wonder why things are so benighted, it's cuz we're in the heart of the Dark Ages. [audience laughs] You wonder why you can't understand the nature of the collapse [9:03:30] of the state vector? Well it's because you have an AD 700 intellectual machine looking at it. My God, the Calculus hasn't been invented, Algebra hasn't been invented, the New World hasn't been discovered. These things will all happen ahead of us. (ahh) Right now we are in the heart of the Dark Ages by the late nineties will be closing distance with the Renaissance. Clearly we have to put up with a bunch of Christ fundamentalism, epidemic diseases [9:04:00] and general not headedness until we get to that point, but then after the turn of the century we can expect the equivalent of (ahh), (ahh), the (ahh), Renaissance, the Industrial Reformation, (ahh) the rise of Napoleon, the Civil War, Adolph Hitler. It will just be coming quick, quick, quick, quick and finally you know, you just, it just, pulls you in and everything happens at once. One way [9:04:30] of thinking of this is that the entire rest of the future history of the universe is being compressed into the next 20 years.

Audience: [inaudible]

TM: Yeah.

Audience: [inaudible]

TM: But in other words the heat death of the universe is 20 years away essentially is what is being suggested. Because time is beginning to accelerate at such a rate that this compression factor is enormous. Okay (ahh), (ahh), let me see, what have we got. We got 22 thousand [9:5:00] years on the screen and we talked about it, so let me shift here. Oh no! Zoom, yes. Set minimum, no.

Audience: What gives us to be able to, sense this acceleration of time?

TM: (ahh) Yes, i-i think you know, Jeremy Rifkin wrote a book (ahh) anybody read it, what was it called? Nobody read it. [audience laughs] It was called, anyway the premise of the book was that time is accelerating but he thought of it as social time, [9:05:30] cultural time. I don't. I think it's embedded in the fabric of space-time itself. Yes i think in a few, you see, you can only react to crises that you understand. So if i tell you the ozone hole is disappearing, you're alarmed. If i tell you an asteroid is going to strike the Earth, you're alarmed. But if i tell you that the Earth is about to collide with a hyperdimensional knot in the nexus of space-time...[audience laughs] [9:06.00]

Transcribed by Tiago Ramos

[Audience laughs]

TM: [9:06:00] (ahh) You know. But that's what's happening. Ahead of us is an enormous speedbump. We are colliding.. We're about to collide with something that we can barely cognize. So, it's hard to know what to think about it. Yeah?

Audience: Uh, this may be a little lala, and a bit simplistic but you said in words uhh, you know we all have experienced this sort of sudden shift in time, just the experience in one lifetime (uhh). You know, like a two or three year old, (uhh) the moment that we experience it seems to last along a period of time. I mean, my god, some of it lasted (inaudible), well we don't have that sort of. Well, that's what happens over a course of a lifetime. What happens when consciousness.. consciousness shifts out to infinity, what happens to the moment then, does it become vanishingly small or, in terms of the frequency..

TM: It stops! It stops! Yeah, well, see.

Audience: Or, the whole process of speeding up, that it takes forever.

TM: [9:07:00] Yes, it's possible that dying takes forever.

Audience: Right.

TM: You see.

Audience: [inaudible]

TM: And, and, and, so you know. You start to die and then you die and die and then realize you're going to die forever, and never approach it. Because the, the seconds become stretched to millions of years. It's something, it's something like that. It's about, and I think the psychedelics are about the fabric of time. [9:07:30] When you strip away the hallucinations and the personal reference, and the crazyness. The barebones of it are, it's about time, it illuminates what time is. Yeah?

Audience: [inaudible]... when time is.. [inaudible].. towards and end-point. [9:08:00]. [inaudible].

TM: Yeah, I mean, part of the problem with proceeding what's going on is that we're mayflies, something. I mean, we live so briefly, that to us it looks like the world is standing still. But in fact, staggering amounts of strange are going on. I mean (uhh) [9:08:30], the automobile is a hundred years old for crying out loud, we can't conceive of a reality without the automobile. So, uhh, and just in my lifetime, you know, I've seen immense change. So, and this is going to accelerate eventually to the point where I believe they'll hold conferences on the acceleration of time and, people will, boards will be appointed to try and figure out if anything can be done about it.

Audience: [laughs]

Audience: I know you have a distant for [9:09:00], quantum physics, but there was a conference apparently last spring in Spain. Actually, it was a conference of astrophysics, I believe. Because I heard some reports on it, their serious topic of discussion was, was trying to attempt to answer the question does time exist. I mean, this was being serious, on the agenda, at some astrophysics conference.

TM: Yeah, time is the great, misunderstood, or ununderstood quantity in our lives, for sure. [9:09:30]

Audience: Terence,

TM: Yep

Audience: [inaudible]

TM: Right

Audience: [inaudible]

TM: I don't necessarily reject it, I just think they shouldn't sneer at me. When their theory is so kakamany. I mean, in other words, I haven't proposed anything weirder than the big-bang. Saying that a universe can condense itself faster and faster [9:10:00] down into a supernovel object, sounds to me like a considerably more conservative statement than to say that a universe can spring from nothing, for no reason, in any single instant. They cornered the market on unlikely approach to cosmology.

Audience: [inaudible] alternative to their stuff.

TM: To their theory? No, but I'm gonna write one.

Audience: There is actually serious debate on the whole topic. There was a book recently published [9:10:30], in the last year. Called 'Did the big bang happen?' which was written by another cosmologist,

TM: Well, the big bang looked like it was a real trouble as recent as six months ago but the new data from this, is is ogos three or, one of these satellites. They finally actually found, uhh, irregularities in the microwave background, and until they found some irregularity. Because they couldn't figure out how you get from the supersmooth initial conditions [9:11:00], to the clumpy present situation. Now, this new data appears to have pulled their chestnuts out of the fire. But I think the big bang may be in need of serious review. I mean, you have the inflationary, the super inflationary cosmology is an attempt to fix some of those problems, but it gets you know.. There are problems yeah.

Audience: [inaudible] [9:11:30]

TM: That's right.

Audience: [inaudible].. are also.. [inaudible]

TM: What does he say exactly?

Audience: Uh, I can't remember the exact book but he.. [inaudible].. speeded up.. [inaudible]

TM: Yeah, that's absolutely right, if we get a little deeper into this we can actually discuss..[9:12:00]

Transcribed by Dirk

TM: [9:12:00]...discuss maybe why he would have said such a thing because i think we can illuminate it. Here let's (ahh), do a little more. We've got 22 thousand years on the screen, 11 thousand years on the screen, 5 thousand and some. This is in a way my favorite screen because this book i want to write i'm going to call, History's Fractal

Mountain and there it is folks. [9:12:30] History's Fractal Mountain (ahh), Çatal Höyük is over here in the bottom of this. Along this descending gradient here, like pearls on a string, you get the great ancient civilizations, Ur, Chaldea, Babylon, and Egypt. And, this actually, the graph actually confirms the intuition of the theosophical mentality [9:13:00] that Egypt did achieve, some level of advance that was not surpassed, until late Roman times. That there was a-a tremendous breakthrough on the part of these civilizations. This, negative habitual or recidivist upward curve is studded with a whole bunch of a, of war-like [9:13:30] male dominator civilizations. The Hittites, the Mitanni, the Assyrians and up here at the top, Mycenaean Pirates overwhelmed the last outpost of the Goddess Culture on Minoan creed. This is Homer, right there. Homer sings his song and it's that, that to me fits because i had a professor who once said to me, you want to know where it went wrong? I'll tell you where it went wrong. When these Greeks pulled their boats [9:14:00] up on the shore and stopped being fisherman and started talking philosophy the shit hit the fan [audience laughs] and that's precisely what happened. There it is. You see the steep, steep descent into novelty and then after the fall of Rome, oscillation around the mean, where it's sort of up it's sort of down but there's no real progress until the Industrial Reformation. I mean in the Industrial Revolution of the 17th forties. [9:14:30] Let's...

Audience: [inaudible]...makes sense because any, any-any...[inaudible]...attempted, (ahh), descend into novelty ascend into novelty...[inaudible]...by the emerging church at the time.

TM: That's right. Of course this isn't Eurocentric, it's global.

Audience: [inaudible]

TM: Oh you mean, where is the birth of Christ? Roughly, i-is right here. It's this, it's (ahh), there's a little kind of a choke and then a very steep fall right afterwards. That's the birth of Christianity [9:15:00] of Roman, of the Roman Empire vs The Republic and so forth.

Audience: [inaudible]

TM: Yeah.

Audience: [inaudible]

TM: Yeah, sort of.

Audience: [inaudible]

TM: Yeah, right about there. Let's see, we may get it on the next pass.

Audience: [inaudible]

TM: Well it wasn't. [9:15:30] At first it was (ahh), physical. It was that, chemis-it was that atomic physics gave way to chemistry which gave way to molecular biology, which gave way to life. It keeps moving, it keeps being active at the front of the wave but it leaves a residuum behind it of this previously created structures. Right now the wave is clearly lodged in all-in our species while everything else [9:16:00] is, is, under the Aegis of Darwinian mechanics. We're apparently under the Aegis of cultural, mechanics.

Audience: [inaudible]...absolutely. Depends on the intensity of the prominent future. You know, if a meteor came in, in the middle of the...[inaudible]

TM: Yeah, that's right.

Audience: It's not really...[inaudible]...or dictate by human law. It just so happens...[inaudible]

TM: Wow...

Audience: [inaudible]

TM: How so? [9:16:30]

Audience: [inaudible]

TM: It-it keeps condensing toward, it keeps-it builds on complexity. Wherever there is complexity, you will get more, complexity. It doesn't build on simplicity. It-it builds on the last most complex achievement see? [9:17:00] So intelligence rest on animal organization which rests on, cellular biology which rests on molecular biology which rests on physio...

Audience: [inaudible]

TM: You got it, okay. (ahh) to...

Audience: [inaudible]

TM: Now pretty soon we're... Now there's the descent. Here let's stop and look (ahh), the-the [9:17:30] crucifixion is right there and it's interesting you know, Christ was an absolute contemporary of Caesar Augustus, so you get this great religious reformer at the same time that you get the great reformer of Roman Politic. So two of the most important personalities who ever lived are alive at that point. That strangely enough does not win the prize. See this deep little chip here? [9:18:00]

Transcribed by Tiago Ramos

TM: ..See this deep little chip here? [9:18:00] If we were to blow that up and look at the bottom of that trough, there was a moment when you could have had a dinner party, when Lao-Tzu, Confucius, Mencius, Pythagoras and Ezekiel could have all gotten drunk together, uh, had they.. been able to find each other. Right back there, in the.. immediately preceding the Greek Renaissance. Now the fall of Rome is in 475 [9:18:30] right there. And you see how the time after the fall of Rome is all of a certain general character, clear up to seventeen-hundred. And then certain technologies and mathematical techniques propel to an even deeper level of novelty. Now the next screen is the one that I think that is probably where we either win or lose you.

Audience: Look at the overall shape of that wave. It's clear that there's an [9:19:00] overlining principle at work here. I mean the birth and death of Christ is practically [inaudible] on that curve.

TM: uh, yi-.. mmm..

Audience: No, I mean there is a deep and strong move into novelty in those positions and [inaudible] and those events are relatively [inaudible]..

TM: That's true.

Audience: It just points out that it's not being driven by what we do [inaudible].

TM: No, it's not being driven by these great personalities. They are being driven by it. I'm sure that if you could've [9:19:30] stepped into Christ's mind while he was undergoing the passion, the main question he was asking himself was: "What.. is going on? You know, why do I say what I do? Why do I do, what I do? I don't seem to be my own person. You know, I seem to be a puppet of some cosmic force."

Because he was a puppet of some cosmic force. You see, the transcendental object at the end of time is like [9:20:00] one of those reflecto balls that hang in discos, you know. And as it turns and spins it sends off distorted reflections of itself which ricocheted into the past. And if you are correctly situated, it'll turn you into a Christ, or a Buddha, or a Lao-Tzu. If you're not quite correctly situated, it turns you into a Madame Blavatsky, a Meister Eckh-.. in other words second stringers. [9:20:30] If it.. uh if.. if it's you know just get a little of it well then you are a person with strange insights and great personal charisma, and the people around you love you. We all are very close to this thing. Every night when you dream you come into the presence of the transcendental object of the end of time. We are all distorted reflections of the last thing. And as we get closer and closer [9:21:00] to the eschaton, the last thing, the distortion begins to leave. And you say, "my god, it's like watching a photograph from a SX-70 develop. First it's just mirk, and then you say, oh there's a person there and it's getting clearer and clearer". You know, we are actually being pulled into the attractor. The veils are being parted. The truth is becoming more and more and more immanent. [9:21:30] And in the final confrontation with it, you know it's the apotheosis. It's the apocalypse, the apotheosis, the apocatastasis. A whole bunch of Greek words beginning with 'a'. [audience laughs]

Audience: We are all [inaudible]..

TM: [laughs] No.

Audience: [inaudible] [audience laughs]

TM: ..okay.. [audience laughs]

Audience: [9:22:00] Did you address the time-span [inaudible]..?

TM: Well, no it picked up the time-span that we had. See it just accepted the correction. Thank you very much. Good thinking. Now is it alright? Yes. Okay now, this is the screen upon which the theory will stand or fall. Because this is the screen that is filled with the history that we know. We're not talking fossil records or Çatalhöyük [archaeological site in Turkey, of a 7500 BC to 5700 BC Neolithic era settlement] or any of that. [9:22:30] We're talking very precise dates. It's saying that there was a very steep descent into novelty around 948 AD. What is this?

Audience: What is its center again?

TM: W-.. 1400 years. And this first steep descent into novelty is, uh the intellectual flower of Islam within the confines of the Umayyad and Abbasid caliphate and the invention of algebra. [9:23:00] An intellectual tool that sets the stage for modern science. Essentially *this is* the birth of modern science. And you see how steep, sudden and precipitous it was. Okay, then you go over to this next one. ..and let me try something over here since this is such a fast machine.. See I'm moving the little pointer. [9:23:30] And it's telling me exactly what I'm pointing at. I haven't done for you before. But this is very good for checking these things.

Audience: Oh, to know exactly the dates.

TM: To know exactly, yes. We're pointing at the exact date. And I wanna get it over here. To the bottom of this sucker. 1121, [9:24:00] the first crusade. The collapse of fortress Europe.

Transcribed by Andrea Casanova

TM: [9:24:00] 1121, The First Crusade, the collapse of Fortress Europe. This is the beginning of the globalization of the European mind. We're dead on here. Okay now the next steep descent into novelty is this one, obviously. Let's go over there and see what it is. [9:24:30] There it is, 12-1430, oh no 1358 i'm sorry, just a minute here let me get my... Okay, do we all agree it's pointing at the bottom of the thing? Yes?

Audience: That's the end of the novelty, not the beginning of the novelty.

TM: No, that's the densest point of the novelty. It's 1354, what happens in 1354?

Audience: The Black Plague.

TM: [9:25:00] That's right. One third of the population of Europe is dies in an 18-month period beginning in the late 1354. The greatest demographic collapse that Europe has ever experienced, it's an absolute hit, dead on (ahh). Now let's (ahh), go over here to this... Now notice though that the recovery is quick, there's a steep descent into novelty and an almost immediate reversion back up to the [9:25:30] the same level of (ahh) habit exactly, business as usual. But this next one is different, it's a steep descent into novelty and then it really stays down, for a long time and explores this. So let's go over to the turning point, which is up at the top.

Audience: [inaudible]... It's global.

TM: It's global, but having said that you have to notice that [9:26:00] (ahh), the world is now dominated by European values and culture so, while we can chart the ebb and flow of the Han Dynasty at this point European culture is moving to the four because European culture is beginning to put its imprint on all of world history. [This concludes tape 7, our program continues with tape 8. [9:26:30] Continues with tape 8]

Audience: [inaudible]

TM: That's right. This is a picture of a resonance pattern, an interference pattern of many times and places. Now up here at the top of this thing, at the very top, it's, 1455. What happened in 1455, does anyone know? [9:27:00]

Audience: Christopher Columbus?

TM: What? [audience laughs] Columbus was born? Thanks for playing! (ahh) [Terence and audience laughs] (ahh) In 1455 Constantinople fell to the Ottoman Turks making European access to the Far East impossible, therefore the Age of Exploration, begins and (ahh), and you get Vasco de Gama and all those people. This was a tremendously shattering [9:27:30] event for European civilization to lose Constantinople to the Ottoman Turks. (ahh) Now let's go over to, (ahh) wait, back i mean, to, this place. This is another very seminal event which combined with this Constantinople loss set the stage for this descent into novelty, even though it's way up here in habit there's a little chip out as there's a, [9:28:00] a-a novel invention of some, sort that happens in 1540, (ahh)...

Audience: [inaudible]

TM: 1440 i'm sorry. The invention is, the invention of printing in months in 1440 (ahh), that did it friends (ahh), as far as most people are concerned.

Audience: [inaudible]

TM: Enlarge at one set now? Good idea.

Audience: [inaudible]

TM: Yeah, let's do one Zoom (ahh)... [9:28:30] I think i have to move it over clear all the way before we do that zoom or it'll be some kind of a screw-up.

Audience: [inaudible]...focus on your right.

TM: Right, let me (ahh)...

Audience: [inaudible]

TM: Well, i'm glad you like it because it's my best trick. [audience laughs]

Audience: Not bad. [inaudible]

TM: I do, i do.

Audience: Oh you do?

TM: It's just we haven't written a manual yet. [9:29:00]

Audience: [inaudible]

TM: Ooh, hard to say. [audience laughs] Okay, now it's pointing at today. Now let's do our zoom. Approach factor, 2, strange that it didn't ask for the seek minimum, isn't it?

Audience: [inaudible]

TM: [9:29:30] Okay. Now we're seeing the same thing again, we're just seeing in higher detail (ahh), but what i'll, i'll fudge by telling you that up here 1455, down here 1492. Along this screaming descent into novelty are all the painters of the Quattrocento. This is the Italian Renaissance. [9:30:00]

Transcribed by Tiago Ramos

TM: All the painters of the Quattrocento, this is [9:30:00] the Italian Renaissance, this descent into novelty. And

this, is the era of exploration. 1492, good huh? Good, good! The absolute thing is in 1485, and all the painters of the Italian Renaissance are along this thing. Now notice that in 1492, there isn't an instant rebound. [9:30:30] There's 1492. But instead, because this lost half of the planet has been discovered, this sets off the age of discovery and, and habit is unable to reassert itself, because too much peculiar data is flowing in, too many lands, people, materials, philosophie, alphabets, languages, sexual styles, cuisines.. It's like they're overwhelmed. [9:31:00] However after a while they get their act together, and manage to turn it into, uh hell itself. RIght there, right... [audience laughs]. What that is, what ends the era of discovery and optimism and psychedelic exotica, [9:31:30] is the 30-years war. The 30-years war begins 1619 [actually 1618], it ends 1648. It begins with Europe Medieval. It ends with Europe Modern: Parliaments have replaced popes and kings. The whooole name of the game has been changed. Now, the 30-years war lasts until 1648. Sorry. 1648. [9:32:00] At the bottom of this cut in here, which is in a situation of rising habit, there nevertheless is a strong tendency towards novelty, reaching a culmination.. in 1677. Newton publishes the Principia, the celestial mechanics are put on a firm basis, the Calculus has been invented. The modern-, the world of modern science is now [9:32:30] completely in place. Then an- an-, wha- an- aside from the 30-years war, what Europe is exporting to the rest of the world on this hellish offswing, is slavery, the Patron system, forced labor, uh brutal return to habitual methods of the past. You may not know that slavery died with the fall of the Roman Empire. If you've owned a slave [9:33:00] during the medieval period, you owned ONE slave. It was a house slave. And it proved, your own ownership of this person proved, that you were a person of IMMENSE wealth. It would be like owning a beach bonanza today, it's beyond owning a Rolls Royce. But, the need for a drug strangely enough, the drug being sugar reversed this, and in the 1440's [9:33:30] they began buying Africans and taking them to the Canary island to work sugar. So, uh you know, the moral power of Western civilization could not stand in the way of the re-establishment of slavery and the sugar trade. Now, up here at the top of this thing there is a steep, there is a twist, a turn, right there, in 1739. This is the European Enlightenment. [9:34:00] The European, uh Enlightenment was the great uh intellectual step that set the step of secular civilization. People like Voltaire. And out of that came two revolutions.

Audience: [inaudible question]

TM: Well, the inquisition would have been I presume a fairly un-novel thing. Since what it was, was a power group [9:34:30] torturing the helpless. Which there's nothing new in that for heaven's sake.

Audience: It went on for a long time too.

TM: It went on for a long time, and enough of that. It was a Spanish phenomenon. I- It was confined geographically to a number, to a very small number of places. Right.. there. August 1, 1776. The American Revolution takes place as a consequence of this steep descent into [9:35:00] novelty at the beginning of the European Enlightenment. Well as you know, the American Revolution is generally thought to have had a happy conclusion. The French Revolution.. not so happy. And if you explode that Aerean look, you can see that they're happening at different slopes of that thing. Then the restoration of Louis Napoleon in 1803, is there. [9:35:30] This bump is the American Civil War and the Franco-Prussian war, which were the first modern wars and completely distorted the demographics of the United States and Europe. And, now i want to..

Audience: What year is that?

TM: The Franco-Prussian war began in.. 1848, I think. And the Civil War was 1865. Let's uh, I wanna go over here tooooooo.. [9:36:00]

Transcribed by Andrea Casanova

TM: tooooo [9:36:00]

Audience: [inaudible statement]

TM: I think you're right. I didn't feel right about saying that. And that would-

Audience: 1848 was the other one.

TM: Was-, 1848 was the year of revolution. But the Franco-Prussian was at the same of the American Civil War, you are right. Ok, there's today's date. Now let's do the approach. [9:36:30] Approach factor.. two. [beep] Ah, okay that's 357 years on the screen. You see the American and French revolution. The Franco-Prussian War, the American Civil War, the Twentieth Century. Now let's look at the Twentieth Century. And this is, remember how I said that the Great Pyramids were at the bottom of this trough, at a higher level. Now we are seeing the same pattern again. What we get [9:37:00]at the bottom of this trough here, is the Third Reich. And to show you how the resonances work, think about the Third Reich in relationship to Ancient Egypt. First of all, probably the word 'Führer' can be traced to the word 'pharaoh'. These-, this is the same concept [9:37:30] of a master leader. In addition, the Third Reich and Ancient Egypt shared an obsession with large-scale tasteless architecture. In addition, both civilizations had a real tendency to lean on the jews. So you see, you get this strange kind of microscope on the histor-. Most people would not associate Ancient Egypt to the Third Reich. But when you begin listing [9:38:00] the similarities you see, one is a reflection of the other. Okay within the Twentieth Century, ah this is somewhere like 1903. The- uh, uh invent- you know, uh, Einstein was in 1905, the general theory, I think. Which came first, the general of the special?

Audience: The special.

TM: The special came first [9:38:30] in 1905, and the general came slightly later. Down here in the bottom of this trough, let me show you. Right there. Hitler becomes chancellor of Germany. And then all of World War II is fought in the bottom of that trench. Here's 39', here's August 39'. That's June, that's September [9:39:00]. So that when it begins. Even though it's a novel situation, because it's a war it's a recursion to habit. So at the bottom of a trough of novelty you get a little upward pimple of recursion to habit. Then, uh let's look at.. There it is. That's Hiroshima right there, and Nagasaki right there. The war ends, and novelty is left behind [9:39:30]. And remember that the psychology of the post-war mind was everybody wanted things to get back to normal. I mean, certainly the Europeans wanted things to get back to normal. Their whole scene had been bombed into the Stone Age. And in this country, people just wanted to get their place in the suburbs and marry the girl next door, and have a slew of kids, and buy a Chevrolet. And forget about, you know thousand year millennial plans, and all the rest of it. [9:40:00] And so this is the post-war, cold-war era. And it lasts, let's look. Oh there's 1952. Uhm, 19-, here's-, the launching of Sputnik is there.

Audience: It was in 59'.

TM: No no, Oct- October first 1957. A day graven in my mind till they lower my box. [9:40:30]. Uhm. The first american satellite was launched right around there, Explorer 1.

Audience: [inaudible].

TM: Give me the date! [audience laughs]. Ok there's the assassination of John Kennedy, as close as I can get it at this resolution. If I go back one, I'm before it. So you see, [9:41:00] it's right at the bottom of that steep stab, that takes place against this other thing.

Audience: What turned it around?

TM: What turned it around? What's- What's the turning point? I thought you'd never ask.

Audience: Yeah yeah yeah yeah, and what is it?

TM: Oh, I'm about to get it for you. There it is. August 1967. It's the summer of looove. Not only does this thing illuminate history it also, you know fulfills my deepest inner delusions [audience laughs] [9:41:30]. So, and remember I said when we were looking at history's fractal mountain, that this was Homer, up here. So, then you can see that the freak thing, the hippies were like the pre-hellenic Greeks. I mean, all those, you know all that bralessness, and loose-fitting clothes and tambourines and ecstatic Bacchanalian with a [9:42:00]

Transcribed by Andrea Casanova

TM: [9:42:00]...with a philosophical undertone. I mean it was a Greek mentality, that broke out in 1967. Then here's the long descent into, you know, the dreary present moment and (ahh), (ahh) what can i show you hereeee? Richard Nixon getting the axe.

Audience: [inaudible]

TM: Yeah. Now we're into the Reagan-era down here. [9:42:30]

Audience: [inaudible]

TM: Yeah.

Audience: Can you enlarge?

TM: Yeah i'm gonna cut it. I'm just trying to get back to today. There it is. Oh, okay. Cut it, zoom yes, approach factor 2, enter.

Audience: [inaudible]

TM: Ah well it's gonna be...

Audience: [inaudible] [9:43:00]

TM: There it is. That's the Hippie thing and then the descent. Now that's in the, that's the 8-the 70s and 80s. That's the last 11 years (ahh), i wanna stop it here. Now, now, see how tight, it has to be, to work. Remember that we've been looking at this thing from, we've descended from 6 billion years, [9:43:30] to 11 years. We have predicted

asteroid impacts, glaciation, speciation, the rise and fall of Empires, now we're down to the short and curly i would think. (ahh), [audience laughs] Let's take a look here at what we've got.

Audience: [inaudible]

TM: Who, i suppose, now we're all experts on this phase of things cause we've all just lived through (ahh), i don't see anyone here under 11, [9:44:00] so we've just lived through all of this. So let's take a look at what it is (ahh). Now, let's see, when was George Bush elected president?

Audience: 88.

TM: 88. So would have been November 88. That's October, that's November. Now what is the resonance to that moment? I don't think of it so much as, as Bush being elected as Reagan leaving office. The resonance here is the fall of Rome [9:44:30]. Rome falls right there. Well then, then see we have a series of, of high and low points which we should be able to correlate to, (ahh) recent, catastrophic or world-changing events. So let's play the game... [9:45:00] What's happening down here, for the 30 days preceding, that day, is a million people are camping out in Tiananmen Square. They, the-they, at the very bottom of the trough is the night that they had the most people in the square and then it turns upward as you can see because the, constipated fascist oligarchs in [9:45:30] charge of that society were preparing to do murder and there's nothing novel or new about murder, it's the oldest game in the book. So that went on there, then remember the Romanian, oh-no no. Let's go over here, the next steep descent into novelty is right, there. Right, that's too far. No, no no, that's right. Okay right there, who knows what happened very close [9:46:00] to 11-, 11/89?

Audience: The Berlin Wall.

TM: The Berlin Wall fell down. Germany is unified right there. So Tiananmen, Germany, then a bummer of some sort and what is that bummer? It's the Romanian Revolution which as you'll recall was handled in a messier style, where you hurl, put people up against walls and machine-gunned them and so forth and so on.

Audience: [inaudible]...convergence...[inaudible]...August 87.

TM: August 87?

Audience: [inaudible]

TM: Along that line. Well then let's go over to here.

Audience: I wanna see that harmonic convergence.

TM: Oh you want to see the harmonic convergence? Give me the date.

Audience: August 87. 8/87.

TM: 8/87. In judging this you have to ask yourself, was the harmonic...

Audience: [9:47:00] [inaudible]...1st anniversary Iran-Iraq war...[inaudible]...Wait we'll go back to 87.

TM: But don't you want to go back to 87?

Audience: Yeah.

TM: Yeah.

Audience: [inaudible]...harmonic convergences on the anniversary every year...[inaudible]...six month...[inaudible]

TM: Well maybe it's not... Oh, okay. August what?

Audience: [inaudible]

TM: There is the closest we can get. What it shows that, is, that a long descent into [9:47:30] novelty that had previously been impeded but there isn't anything particularly special about that day but it does fall in the domain of going over this hump. Over here (ahh), you'll recall the, the Gulf War and all that. Here's how that looks. [9:48:00]

Transcribed by Tiago Ramos

[9:48:00] Terence: "Mmkay now, look here, August 3rd, 1990, there's where saddam hussein invades kuwait, it's also where mohammed is born one level up. Uhm, I can get higher and lower resonances simply by touching eye here, we haven't done that but it's possible. [9:48:30] Now remember how after he invaded - then there was a lot of

breast beating and armies being moved into position and so forth that goes on until there, now there, no, no, there is where the 30 day ultimatum from the security council is issued. The war begins, the air war on the 17th of January right there [9:49:00] and the land war, well you can see that it's - it's, there's a steep descent into novelty which then is slightly moderated and at the kink is where the war begins. Now the next steep descent into novelty-

[AUDIENCE: "So lining people up and machine gunning them happens during the periods returning to, to -"]

Terence: "- to habit, that's the usual habit."

[AUDIENCE: "and war happens during novelty?"]

Terence: [9:49:30] "well, wars can have, war is kind of an ambiguous thing, was is a habitual activity but it does cause novelty, especially technological novelty so you know that's why it's nice that you can blow up these waves and see the variation within the theme. Now this point, that's it, there it is [9:50:00] the coup in the soviet union, right at the bottom of this one, and now the next one is really intriguing to me and i'll show you why, there it is, it's february 21st of this year and it's the lowest point of novelty for this year. Now, i was really puzzled by this because i watched very carefully that [9:50:30] week and there didn't seem to be anything very novel going on-

[AUDIENCE: "Your book came out"]

Terence: "My book did come out, you're right but i was modest enough to not place that in a context of world history."

[AUDIENCE: *inaudible*]

Terence: "Well you know what happened and this leads us to the slippery edge of prophecy, there was an event which happened not on the 21st of February but on the 20th which may be [9:51:00] trivial and forgettable and absolutely not worth talking about or maybe one of the most important events in the history of the 20th century. Do you know what it was?"

[AUDIENCE: *inaudible*]

Terence: "No no, Ross Perot goes on Larry King and offers a suggestion about his availability for the presidency now if the guy fades and becomes a nothing-burger it doesn't count but he does have the wave [9:51:30] blowing at his back, uhh that's for sure. So that's basically it uhh, if you want to see, let's see"

[AUDIENCE: *inaudible*]

Terence: "No, well, let's look at the future, let me get the *shmiggy* somewhere roughly into the middle and then we'll build. [9:52:00] Okay now let's see if i can figure out how to do this. Specify target date , C, target date months, let's do today, today is the 5th month, the 31st day, of 1992, we don't want to add days, okay we want to move that over to [9:52:30] 50 percent. "

[AUDIENCE: "Target date.." *inaudible*]

Terence: "Yes, that's where the cursor pops up. Now let's choose the timespan, E, let's do 10 years, plus months zero, plus days zero, now let's graph the wave. Yes, yes. [9:53:00] So it's pointing at today. 10 years. The last 5, the next 5. And what it shows is that we are actually as if you didn't know, exploring a very deep trough of novelty, it will last until August of next year and then there will be some kind of uhh, some kind of return to habit with a vengeance [9:53:30] now the november election is, now wait a minute there's something wrong here let me see, no i want to point it at today.

[AUDIENCE: "You see it right there, right there right?"]

Terence: "Yeah, okay that's as close to today as we can get. "

[AUDIENCE: *inaudible* " very creative.." *inaudible*]

Terence: "Yeah, we're definitely getting ready to go down into novelty."

[AUDIENCE: *inaudible* "thing next to the novelty thing.." *inaudible*]

Terence: "[9:54:00] You mean clear to here?"

TM: You mean clear to here?

Audience: Yes

TM: Ok well it's gonna last until... August '93. The thing to keep you eye on is this. Which is such a spectacular drop. I mean look how much weirdness we've been through, but it's taken us this much time to do it. This sucker is gonna do it in a three month period in early '96.

Audience: [Inaudible] [9:54:30]

TM: I haven't the faintest.

Audience: [Inaudible]

TM: Well, I hope you'll do this. Uhm, I think it should be done. Here I'll show you [9:55:00] a function you haven't seen. Instead of zooming in we'll zoom out.

Audience: [Inaudible]

TM: Uhm, well no I'll just- instead of ten years on the screen we'll see 20

Audience: Oh I see

TM: Now it's still pointing- uhm, well no wait a minute. Ok there you see it.

Audience: [Inaudible]

TM: Yea, right, then there's the whole thing. [9:55:30] So that's the idea. Now, the notion is that- remember how I kept talking about how a cone contains all possible ellipses and you section it? What the psychedelic experience is, is a sectioning of eternity. And you can build up a picture of the cone by sectioning eternity sufficiently that you get a map like this. I mean I'm convinced by this that [9:56:00] time is fractal. That instead of treating time as a zero quantity as the newtonian equations do, or as a very gentle curvature as the Einstein equations do, but we have to sub in this fractal dimension. And that this will make possible a science as mo- more powerful, relatively, to present

science as present science is through the power of the calculus to Greek science. Time, [9:56:30] about which we previously knew next to nothing except that it seemed to keep happening, can actually be described, uhm, in the same way that energy and, uhm, other factors in the universe can be described. Now what I- the last thought I want to leave you with, is I don't think anybody could fig- could make this up. Certainly not me. A person with no training in mathematics, no interest in this kind of [9:57:00] thing. I was told this stuff. And, you know, most, God forbid, channeling is of the horrible variety which tells you to eat brown rice and love your neighbor. You don't need channels to tell you that, you have channels in your own head which tell you that. This is a mathematical equation. I mean, it's embedded in a lot of rap. But the real channel is [9:57:30] an equation for the description of time which makes, uhm, assertions, makes predictions, uhm, is willing to be held to mathematical analysis. All the things scientists are always screaming that occultists never will provide them with their theories, this provides. So I'm willing, since it's only one person, one person's life, I'm willing to, uhm, preach this, a little bit, because I'm not- [9:58:00] maybe I- I can't believe- see the choice here is pretty stark. Either I'm nuts or I'm Newton. There's no inbetween. Becau- there is no inbetween!

Audience: [Inaudible]

TM: Uhm, yea, def, uhm, it's- it's- It's right, I'm the greatest intellectual synthesizer in the history of man. If I'm wrong, it's just horse shit. So then the question is which is it? [audience laughs]

Audience: [Inaudible] [9:58:30]

TM: You- you mean, who am I the resonance of?

Audience: Yea

TM: A question I've never asked, uhm. [laughs]

Audience: [Inaudible]

TM: I figured this out... There were many- it took a long time but from 1971 to 1973 [9:59:00] is when I figured it out.

Audience: [Inaudible]

TM: Here to- let's see. Let's go back. Let's go there and see.

Audience: [Inaudible]

TM: Then you would have it. Then you would have it. [9:59:30] Okay Let's see.

Audience: [Inaudible]

TM: No, the life changing experience was in 1971. Well let's- let's point at this little dip here, giving me the benefit of the doubt, and say that it was April 26, '73. I'm sure that had you visited me in April 26, '73 you would have found me hunched over graph paper and working seriously. Now let's see what the resonance of that is. [10:00:00]

Transcribed by Paul Mullins

TM: Now let's see what the resonance of that is, I, is the resonance call. It asks higher or lower. We answer higher, that means earlier..Higher. Major or trigonometric resonance, forget that, major is the answer. Which point, 1st, 2nd, 3rd, 99th, I have no idea what that means, let's answer, first. Uuuuumm 526 B.C., Oh it's the Greek renaissance, Plato Pythagoras, Ezekiel Confucius Lousive? ... (talking to the guy that asked the question) hey I think it's time to knock off , you should quit when you're ahead, you know?... (audience laughs)... Inaudible question...
TM: Well in a sense there is, no no (audience laughing), wait a minute, in a sense there is, this is a fractal, it was invented or channeled by me before fractals became the absolute obsession of frontier mathematics, now everybody wants to talk about fractals and everybody says, you know population growth, river mouths, everything can be modeled by fractals, but nobody says Time can be modeled by a fractal. So I think probably the rise of fractal mathematics is indicative of this, the other thing is, this could never have been brought to the public without small personal computers. I developed this/finished in 75 and in 77 they began selling small computers, so uh, it's uh. It's a weirdness, it's a hallucination. That's what it is. My dream has always been to bring something here from there, and apparently the only things which travel well from there to here are ideas, and I'm not an artist so I couldn't paint, so this is a psychedelic idea, I think there are millions of these kinds of ideas swimming in the psychedelic ocean.. Yeah (Inaudible question) [10:02:28] Well that's because we really haven't talked about the nature of the concrescence, you know what is, what is, this all argues for an impossible conclusion, that the world is going to disappear up it's own wazoo at dawn December 22, 2012... (inaudible crowd mumbling) TM what?... oh you want to see the last day? (more crowd mumbling) TM well here lemme uh, well here, yeah I'll show you, I'll show you the final thing, we're running over but anybody that wants to leave has my blessing and my sympathy. (More crowd mumbling) (Sounds like they are working out a math problem on the white board) [10:05:00] TM You see there it is, it runs down, he don't go no mo, that's the end. Now I have created one way out that preserves the theory and a rational universe and it is simply this, that what happens on december 22, 2012 is that time travel is invented and because it is invented it is no longer possible to portray historical data on a linear graph, so that's all. It's just it was a thing about technology and eventually a technology was created which made the three dimensional spacetime matrix itself, obsolete... (crowd member says it's the dimensional octave jump) TM The transcendental object is the despair of description, it cannot be known it can only be approximated, it's the sacred heart of Jesus, it's the flying saucer, it's the philosophers stone... [10:06:00]

Transcribed by Shane Poe

TM: [10:06:00]...it's the Philosopher's Stone, it's tantric union, it's good LSD, it's all of these things and more! It cannot-it transcends, language and understanding but the closer we get to it, the more it will be revealed. And the reason the 20th century is so peculiar, it's because we're so close to the zero point, we're so close to the transcendental object but, you know, take a hit, there it is! [10:06:30] Close your eyes and daydream, there it is! Have an orgasm, there it is! It's trying to breakthrough, it's almost upon us. We've been sailing towards this thing for, 72 billion years and we are now 22 years from impact, the walls are so steep, the acceleration is so great, we are there, for all practical purposes and then what spiritual life and head-dom and all that means is, realize [10:07:00] that we are there, so that anxiety drains from your life body and world view and then you just ride the wave and when people talk of catastrophe, revelation, salvation and destruction, you just smile a small smile knowing that it will be all that and more and more and more, It's something, i think it's to reassure us, you see i think the world is going to get hip to the fact that we are actually [10:07:30] caught in a plural pool in time that is sucking us into another dimension, without something like Timewave Zero a notion like that could get fairly alarming and spread a lot of panic. With Timewave Zero you just say, look we have a map of what's going on, we'll check off the milestones, as long as the wave keeps working nobody should freak out. Just settle in, hang on and we'll [10:08:00] navigate through this. So it's a vital piece of knowledge necessary to face the eschaton without panic because this crazy religions want to tell you that you're going to be judged and damned and fired and roasted, no no that's not it, they got the story wrong. We're just being sucked into hyperspace, and hyperspace is, the human imagination, the human heart, the human soul, it's the domain of our dreams. [10:08:30] Our imagination is a flickering image of what it will but what it really will be, (ahh) is the despair of prose. What it will really be, can only be, approached in, silent darkness on 5 grams and then you can't tell anybody about it. Thank you very much. [audience applauds] [This concludes In Search of the [10:09:00] Original Tree of Knowledge, a weekend workshop with Terence Mckenna. If you would like additional copies of this recording or a complete catalog of transformational audio tapes, please call Sounds True. 1-800-333-9185 or write, Sounds True 735 Walnut Street, Boulder Colorado 80302] [10:09:30]

TM: Does anyone want to ask a question or is it all just perfectly clear utterly convincing and...

Audience: [inaudible]

TM: Bad effects of psilocybin? Somebody once said, what's wrong with DMT and i said, well nothing unless you fear death by astonishment. [audience laughs] (Ahh), but-but your question is a good one. [10:10:00] First of all, (ahh) you know, i talked a lot about how all we have to do is destroy and obliterate ego, however there is a very small percentage of us who have a hard time creating any ego whatsoever and the-for this people boundary dissolution is no problem, their boundaries are dissolving all the time on them. I would say that they are at the, (ahh) contraindicated end of the spectrum. [10:10:30] That if you're, fearful already and fighting to keep from being overwhelmed by confusion at what's going on in your life at the paper box factory or something, [audience laughs] then probably tossing in mega doses of hallucinogens is not, the way, [audience laughs] for you, to do it or if you do, if you're, just bent on doing that, then i would say (ahh), do it in the presence of some kind of professional and how you find a professional [10:11:00] in this legal climate you'll have to discuss with me in privately (ahh), (ahh). I don't want to make it sound dull, i mean, it's a tricky thing. I don't want to make it sound like it's absolutely riskless. Physically, i think it's pretty safe, unless you are odd in some way but you need to know, you know, you don't want to find out you're odd an hour and a half into it. [audience laughs] But the, the-the problem comes, [10:11:30] with

the mind, you know. If, if-if you are delicately balanced, if your whole life has been about not looking at that, or that, or that, then this is not your game, you know, you should go back to, watching Jeopardy [audience laughs] and... (ahh), the, the kind of person, the kind of person who is called to this, is a person who has an exploring soul.
[10:12:00]

Transcribed by Tiago Ramos

Soul, I mean my- I.I.I am not a courageous person in the sense that you won't find me shooting white water, you don't see me, ah, you know- rappelling down the faces of cliffs, but from the time I was a..a, the tiniest little kid I was into the weird. What weird- "Weird is the compass heading, and if you keep your compass always pointed toward the peculiar, toward the acrab, the bizarre, the unspeakably alien - then, you know, you'll find these places... [audience laughter]...the people...the people who think life is all cut and dried, and are perfectly happy to have Carl Sagan and George Bush explain all of reality [audience laughter] have never left the broad, swift stream of mundane thinking, but you know, off in the byways [10:12:57]...and tributaries, there's a wonderful alchemical saying, which I generally mangle, but I think it goes something like this: "the tallest mountains, the oldest books, the widest deserts - there you will find the stone"... and what it is, is it's a prescription for exploring weirdness, that's all. It's not gonna be on MTV... it's not gonna be in, god forbid, Esquire... [audience laughs] it's going to come, uh from, you know... doing your homework, visiting strange people in strange lands, and checking it out. The... what, what I can't give you, to return to your question, is... I can't give you a guarantee that it will be fun. You know, the Rolling Stones have that wonderful line, "You don't get what you want, you get what you need" [10:13:50] This stuff is ruthless... and if there's something you're trying not to look at, it's gonna get you, for sure... but... ask the veterans, most people will tell you, you learn more from the bad trips than you do from the good ones... the good ones are ecstatic, and connect you up to nature and other people... the bad ones show you your kinks and your limitations and your thought *ferrers, and that sort of thing... it's not an easy road to hope... that's why I think, uh, there's a little bit of social confusion about it... one of the things I should make [10:14:30] clear is, I really advocate high doses rarely... I think the worst thing you can do is get into a style of psychedelic diddling, where you know, you take half a gram every day... all this is doing, is giving you a tolerance to psilocybin... you're not having The psilocybin experience, you're having the tolerance to psilocybin experience. The, really the [10:15:00] way to do these things is to, um, do them rarely, so that your whole system can reassert itself and come to equilibrium, and then, just slam it! [audience laughs] And, uh, this is amazing... I mean, I think... I think this works for all these psychedelics... I'm, uh, I'm an inveterate cannabis user, and I wish, in a way, that I could get a slightly better grip [10:15:30] on my cannabis use because, I think the real way to do cannabis is like... once a week, by yourself, in silent darkness, with the strongest stuff you can get... and then immense amounts of it [audience laughs]... and you know, people call it a recreational drug, and a this and a that... hey, done that way, [10:16:00] it will catapult you into places where it's the... I love it, it's a great place to get to on cannabis, and some people never in their whole life touch it, is the place where you say, "My god, I've done... too much!" [audience and Terence laugh] It's not easy, folks but... it's worth shooting for! [laughter continues] basically, what you should do is, is, you know, do some homework, [10:16:30] read some books, talk to your friends, and then, hang on hammoth! It's like,[laughter] you know... it's very much like riding an enormous roller coaster.. You know, once that baby rolls out of the station, do not stand up... do not try to climb out of your car... shut up and hang on, with the faith that most people have lived through this! [laughter] [10:17:00]

TM: Someone else... yeah?!

Audience: [inaudible] ...

TM: Well, I... uh.. my argument would be, that people don't take it enough [10:18:00], and they don't take it, uh, frequently enough... that, there are a lot of people who would really rather not get loaded, but who feel they must take some psychedelic drug in order to keep membership in their peer group...

Transcribed by Randy Sloane

... and they don't take it, uh, frequently enough... that, there are a lot of people who, who really would rather not get loaded, but who feel they must take some psychedelic drug in order to keep membership in their peer group... so what they did, you know, you can always spot these people, because their first question off at the get-go is, "will I be able to drive?" ... I love this question! [audience laughs] because, you know, it indicates you've got a real tough nut [10:18:30] on your hands... in every sense of the word - "No, you will not be able to drive." Uh, so, you know, I, uh, one of the things that inspires me to do this is, I want to get to the people who've taken 3 grams of mushrooms, and the people who've taken 150 mics of LSD, and I want to convince those people that they never got close to what I'm talking about, [10:19:00] even though they had a life-transforming experience and saw things totally differently... they never got close to what I'm talking about... and so, what you have to do is convince people to take high doses, and then, that can break them through, and then, frequently enough that they don't forget what the deal is... so I think if you take a psychedelic population and divide it into those who've done 5 grams and above... then you will see [10:19:30] an exceptional, uh, slice... but not the dabblers... the dabblers don't count, and we can all be at times guilty of this, I think...

TM- Is that your last question? Does that do it for you? [inaudible] Or do you want to be ? psychotic, you choose. [laughs]

[inaudible]

[laughter]

TM- Well I love competition, I mean I... The competition is terrible, that's the entire basis of my success... Yes, you because you were before, if you still wish.

Audience: [inaudible] [10:20:30]

TM- Why? Because, I mean I don't know if it's preferable but, here's the thing- people are going to think you're a nut if you come down and say, Johann Sebastian Bach or Jerry [10:21:00] Garcia is God, and this is what you'll have to say if you listen to the dead or the B Minor (mass)... so what I'm interested in, is, um, I want to know the thing in itself... not what it does to Bach, not what it does to a river flowing through a forested valley... I want to see what it can do with darkness, [1:21:30] and silence... and I think most people think it will be boring. Probably because they've been hanging out with these beady-eyed gurus meditating, and god knows there's nothing more boring on earth than most meditation - however, psychedelic... sitting in a darkened room on 5 dried grams of psilocybin mushrooms is nothing like meditating, and that's where it can get at you. My relationship to it is always one of, [10:22:00] I want to know what it is... and so, I think this sensory deprivation method is the only way to get at that... other people might not like that, people say "you mean you put down that whole thing of going into nature? Isn't nature the great affirmation?" and all this, and my answer is, yeah, but it works for me sortof without the drugs, plus, and this is maybe my own weirdness and I'll share it with you... I have noticed [10:22:30] that these things are incredibly

disruptive of the ordinary flow of casuistry... you all know the ordinary concept of synchronicity? Well if you don't stay in your room with the lights out and the phone unplugged.. And the damndest things will happen to you. I mean, I- you couldn't pay me to go into an American city even mildly loaded because... adventures beckon. Now, some people like that... you know, some people [10:23:00] say, you know, "Let's take 500 mics and go meet weird people!" [laughs] nuh-uh, not this cookie! uh...

Shamanic Approaches to the UFO

21 November 1987

Angels Aliens and Archetypes 1987 Conference, San Francisco, California

Description

- [Video Link](#)
- [Transcription](#)
- [Other links](#)

Well I 'm aware of how late in the day it is and I know some of you must be double parked so I'll make this as succinct as possible. This morning's discussion caused me to wonder how much we would understand about electricity if our method of studying it was to stand on the tops of high hills and wait to be struck by lightning. It seems to me that's sort of position that we're in vis-à-vis the UFOs. We have no real theory. We have conjectures. We have fiercely defended hypotheses but we have very little that is concrete to go on. It's almost as though the issue of the UFO were an onion, and as we peel the layers of the onion we discover that when we get to the center there is nothing there whatsoever left. It reminds me that if you cross an onion with a UFO what you get is a flying saucer that brings tears to your eyes, and so what I would like to do is, just based on the notes I took today, to review what the options available to us are in terms of trying to get some kind of intellectual handle on this phenomenon, and I'll move through them rather quickly.

One possibility that I suppose is now out of fashion because it wasn't mentioned here today, other than what Jacques said about ball lightning and plasmas, is that the UFOs are somehow natural phenomena, perhaps piezoelectric forces that have an ability to interact with the delicate electro chemical machinery of the human nervous system to create an impression of hallucination or visitation or abduction. That's one possibility.

The more serious contender, as explanation I think fall into three categories. Is it us? Are we being visited or is there another tenant in the building that we are unaware of, and my own feeling about this tends to vacillate. I have had contact experiences. I have seen a UFO very close. I have met with entities from other dimensions, and it has not impelled me to take a strong position. I've paid very close attention when these experiences were happening to me, and there always seems to be loose ends that argue against whatever hypotheses seems currently most attractive, and though Jacques didn't mention it today I recall in his book *The Invisible College* he stressed the absurdity that seems to attend the contact experience. That if the contactee will truly tell the unvarnished truth then there will be elements in the story which will make the contactee look like a moron, in other words, the invalidation of the experience is an inimical part of its structure, almost as though the entities were saying, well you may tell this story if you wish, but if you'll tell it truthfully you'll be taken for a fool. Well there's nothing wrong with being taken for a fool except that it does peel the phenomenon rather nicely away from the very sober ladies and gentleman who are making their careers in some branch of science. They are not interested in investigating the kinky, the anecdotal, the possibly pathological.

In preparation for this conference I reread Carl Jung's book published in 1954 called *Flying Saucers A*

Modern Myth of Things Seen in the Sky, and to my mind no one has really gone beyond Jung. He understood very clearly that saying that something is a denizen of the psychic realm no way precludes its also having efficacious force in the physical realm through the phenomenon which he called synchronicity. Some of the points which Jacques made today about the nature of the medical examinations are reported they are absurd, they are unnecessary to be performed at our level of technology, let alone any future more advanced levels that we might be asked to believe in. So if the UFO phenomenon is something that is coming from us then what is it and what is it for?

I've given a good deal of thought to this question over the years because I tend to lean toward the notion that the UFO problem like many subtle problems is haunted by our own naiveté concerning language. If I were to randomly choose, and don't worry I shant, five of you to come up here and each one of you would have forty seconds to explain to the rest of us what an atom is it would be preposterous. None of us know. I doubt that there's a person in this room who can give an account of the atom that tallies with the "orthodox" description of the atom. So there is a curious fuzziness about the most mundane parts of reality when we really attempt to magnify and understand them in the clear light of consciousness. How much more ambiguity there is than naturally attended upon examination of any kind of phenomena which are rare or tend to be fringy. So it isn't a matter of achieving consensus over the UFO. We can't even achieve consensus about what constitutes a decent soufflé. So this passionate desire to drag us all under the umbrella of a single explanation is I think missing the point.

To my mind if the UFO phenomena is something arising out of the superego of the human psychic organization then we should ask why, what is it doing, and I don't want to sound like a public relations agent for Jacques Vallee, but to my mind with the exception of Jung, Jacques is the only commentator on the phenomenon who has really pushed the frontier back. To my mind in *The Invisible College* when Vallee says, "In looking at the effect, not asking the question what is it, but what does it do, you very quickly see what the flying saucers are doing. What they are doing is eroding faith in science. They are an antidote to the scientific paradigm that has evolved over the past 400 years and which has led us to the brink of global catastrophe." So the notion being developed here is that within the structure within the human psyche there is something like a governor, something like a monitoring circuit, which when a society begins to evolve in a pathological or lethal direction phenomena can be induced, not by the egos of men and women, not by there institutions, but by the overmind, the collectivity of the human species phenomena can be induced which are so corrosive to the ideology currently in place that there underpinnings are cutaway, there validity is called into question, and there programs for social development and control are invalidated and destroyed.

Shamanism (Small part of a much larger talk)

Somewhere in the early 1990s...

Location, City, State

Description

- [Audio Link](#)
- [Transcription](#)
- [Other links](#)

Well, in 15 minutes to try and say something about shamanism and hallucinogens, we're just going to touch the surface, and I figure the simplest way to do this is just to sort of unload on you how I see these things.

Um, shamanism is not some obscure concern of cultural anthropologists; shamanism is how religion was practised for its first million years. Up until about 12,000 years ago, there was no other form of religion on this planet, that was how people attained some kind of access to the sacred. And, um, so shamanism then becomes, uh, about technique, and if any of you are students of the literature of shamanism, you probably know that one of the great overviews of shamanism is contained in Mircea Eliade's book, *Shamanism: The Archaic Techniques of Ecstasy*. The archaic techniques of ecstasy. In other words, shamanism is not so much a religion, as ordinarily conceived, as it is a kind of, uh, pre-rational science; a kind of methodology for attaining a certain kind of experience.

And then the question becomes: What experience, and what's so great about it? Well, the experience that is attained – if we can attempt to rise to some kind of cosmic overview, so that we are not dealing with the experience in the context of what the Mazatecs say, or the Huitoto, or some other tribal people – but when we attempt to pool all of this descriptive data, then what is the experience that the shaman is having that is making him or her an exemplar in their own society and, in a sense, almost superhuman? Well, if you analyse thousands and thousands of these shamanic experiences, both drug – both plant-induced and non-plant-induced – the overwhelming connecting thread is boundary dissolution. This is what the experience is that we are all seeking, that we call terrifying, wonderful, desirable, horrible, but what it is, is it's the experience of having the roof fall in and the floor fall out – all at once! Boundary dissolution. Why should that be so important, so wonderful? Because it acts psychologically, in the human being, uh, like a birth experience. The world is made new. Everything is seen through newly opened eyes.

Now, there are many techniques of shamanism for attaining this state: celibacy, withholding food, ordeals, flagellation, mutilation – that doesn't sound like a program for a lot of fun, does it? – and then, hallucinogenic plants. Now, it's a question which always emerges at these conferences: "All of you people are talking about drugs and plant substances. Isn't there another way to do this? Isn't this what the great yogic systems, the great tantric systems of thought, have opened up for us, without the self-polluting act of ingesting a plant into our bodies and polluting our precious bodily essences?" The answer is, *No!* No! [laughter] And the further answer is, the reason the universe is constructed this way is so that you will be forced to humble yourself into the admission that you *can't do it alone*. Why *should* you be able to do it alone?! Where is it writ in adamantine that Joe Blow should be able to walk directly into the antechamber of the Most High simply because he or she wants to? Nowhere! The *sine qua non* – fancy Latin for you can't get along without it – the *sine qua non* for attaining a psychedelic experience is humbling yourself to the point where you admit that you must submit to the experience of the plant or the drug.

This act of surrender is the major technical function you will be called upon to perform during the psychedelic trip. You just keep saying, “Take me, I’m yours! Take me, I’m yours!” – and it will, uh, do the rest.

Well, this is much too much to get into in 15 minutes, but *why* the tension between boundary and boundary dissolution? Uh, why the tension between the closed personal world of reinforced neurotic constructs that we call ordinary psychological health – why the tension between that, and this vastly expanded and opened state of being where, uh, life, Tao, seems to flow through us? Well, the tension between these states has to do, I think, with the fact that there is a blind spot in the human mind. We do not like to have called to our attention, uh, the animate and caring nature of the universe. Because the universe is something that we have had to fight our way through to get to our present position. I mean, how many reindeer bit the dust that we could sit here this morning? Uh, how many forests were cleared? – you see, we have a long history of, uh, resistance and conquest to Nature, and when we experience the boundary-dissolving qualities of a hallucinogen, we learn what Pogo learned: *We have met the enemy, and he is us*. And closing that loop then creates a dimension of moral responsibility; and this is why the shaman is a special person – because the shaman has somehow closed the loop of moral responsibility, and in so doing, becomes tremendously authentic to the people, uh, in the society that is constellated around the shaman.

The shaman basically, uh, is an exemplar, a model, for how to be. Not simply how to be in the psychedelic or the trance state, but how to be in the act of wooing; how to be in the act of hunting, child-rearing, so forth. It’s a kind of exemplar that bursts through cultural conditioning. Cultural conditioning is like bad software. It’s over and over, it’s diddled with and rewritten so that it can just run on the next attempt! [laughter] But there is cultural hardware, and it’s that cultural hardware – otherwise known as authentic being – that we are propelled toward by the example of the shaman and the techniques of the shaman. You know, if someone tells you that vast spiritual riches await you if you will but give up sex, interesting food, and your own thoughts for 10 or 15 years, and follow along with them, then something will be attained; this is no challenge to most of us, because we have our lives to lead, mortgages to pay, children to feed, car payments. But, if someone tells you, “Eat this plant, and you will come into your birthright,” that’s a real existential challenge. The excuse that it’s difficult, or unattainable, has been removed. There can no longer be shilly-shallying around that issue. Shamanism, therefore, is a call to authenticity.

Well, then the last point that I want to make: this authenticity is generally presented – and has generally been presented throughout the evolution of the psychedelic movement in the United States – as a kind of personal integrity, a kind of psychological health, as though you had confronted all your demons and slain them, and you are now balanced, or individuated, or whole – something like that. That’s true; that is the first stage of the shamanic integration. But, that is not the goal of the shamanic integration; otherwise it just becomes a kind of chemically-assisted psychotherapy. The goal is then, having attained that balance, that wisdom, and that connection, to then rise up to a level of universal meaning. In other words, to break through the machinery of cultural conditioning in the same way that the shaman does, and to attempt to, uh, discover something authentic – something authentic outside the self-generated language cloud.

And, to my mind, what this authentic thing is, is -- it’s hard to know how to put it, but it’s the animate quality that resides within the psychedelic experience. That the universal mind is alive, is sentient, is perceiving, is there to meet you when you come through from the other side. So, we’re not talking about psychedelics as a spotlight to be turned on to reveal the detritus of our own personal unconscious. It is not a spotlight. It is not shining from behind you; it is shining ahead of you. It is actually that the same organisational principles which called us forth into self-reflection have called forth self-reflection out of the planet itself, and the problem, then, is for us to suspect this, act on our suspicion, and be good detectives and track down the spirit in its lair! And this is what shamans are doing: they are hunters of spirit.

Now, anthropology tends to want to – well, *place in a museum diorama* is too harsh a phrase – but wants to *freeze* these things in context, so they become artifacts; so then we say, well, “How *do* the Huitoto think about the

shaman?” and I’ve even seen papers, “What do the Huitoto Think of the Shaman in Winter?” “What do the Huitoto Think of the Shaman in Summer?” – well, not only is this a stupid question on the face of it, but since they don’t *have* winter and summer, it’s a stupid question beneath the surface!

Shamanism does not exist in the same way that other culture-bound institutions exist for us to catalogue and reflect on. Rather, this is a case where we played the role of the prodigal son – the descent into *Physis*, the descent into matter. For 15,000 years, we have wandered a desert, and we are now very well adapted to the deserts of rationalism, materialism, state politics, patriarchy, so forth and so on. But, there is no food in a desert! [laughter] Eventually, there has to be a Promised Land, and I believe that many people in this room know that personally, that Promised Land is the psychedelic experience.

The larger challenge – and it is a larger challenge; it’s easier to fix your own mind – the larger challenge is to somehow make this private doorway a public option. Empower ourselves to speak of this in such a way that it cannot be put down. It cannot be rolled over; it cannot be pigeonholed; it cannot be handed over to a clique of experts but, rather, it has to be confronted as the authentic thing which we lost so long ago that we no longer have any image of the thing lost; we simply have an ache - an ache that cannot be gotten rid of. The solution to this is a re-empowering of the shamanic meme: a taking of the idea of shamanism, pouring it into the best our own self-exploration has given to us – which to my mind means art, psychotherapy, and, uh, art [laughter] – and to try to empower these institutions to give back our authenticity that was lost. The cultures that possess shamanism function – the entire culture – as a shamanic model for those of us who wander in the Prodigal’s desert of materialism.

And through the work of people like Gordon Wasson and Richard Evans Schultes, and the 19th-century Richard Spruce, the tools have been catalogued. The magical plants. And I don’t believe that shamanism without hallucinogens is authentic shamanism or comfortable shamanism. Now, this is a great debate in anthropology. Mircea Eliade, on one side, saying, “When shamanism turns to narcotics, it has entered a decadent and final phase.” The very use of the word “narcotics” betrays such a botanical naivety [laughter] that you know you’re not going to be happy with what follows! [laughter] Wasson, on the hand, said, “A shamanism that does not resort to hallucinogenic plants is a shamanism that has lost its roots”; a shamanism that relies on ordeals, pathological personalities, and withholding of food, is a shamanism that has lost a sense of its techniques and its efficacy.

So, the last thought I would like to leave with you is – and I hope I’m preaching to the converted, but if there’s a single person in this room who doesn’t know what I’m about to say, then it’s worth repeating – and that is, we are not bullshitting you! This is not yoga! This is not NLP! – not to knock those things [laughter and applause] This is real! It is so real that you can take the most hardened, rational, reductionist asshole and drop him into that environment, and he will meet his Maker, you know?! [laughter and applause] It dissolves you into a confrontation with authentic being, and this is what we are starving for; this is how we’ve gotten into the messes – and mess – that we’re in. Take seriously the techniques of shamanism. Study the plants. Make real choices, and then, don’t dabble the dose! Once you’ve done your homework, *go for it!*

[Applause]

Shamanology

Day Month 1984

Mill Valley, CA

Description

- [Audio Link](#)

~*~*~*~Part One~*~*~*~

My name is Terence McKenna and I'm, uh, a philosophical gadfly and shamanologist, writer and lecturer [laughter]. Uhm, Louis assured me that you were so familiar with my work that probably we could handle this meeting as a dialogue after a short introduction to some of the things that I'm interested in. So we'll attempt that. I'll talk for a few minutes and then we'll see if we can't have that conversation about the aspects of these things that interest you.

If any of you have read "The Invisible Landscape", which I am the co-author of with my brother, you know that it ranges over fairly hardcore chemistry and neurophysiology, through the phenomenology of shamanism, and on into a fairly extensive discussion of principles of ordering in the *I Ching*. But what I seem to, uh, find myself publicly lecturing about is the relationship of, uh, hallucinogens, especially plant hallucinogens to shamanic healing in the context where use of hallucinogens is associated with shamanism. If you look at the worldwide distribution of hallucinogens you immediately notice that there are several unexplained anomalies. Why is it, uh, that fully 80% of the world's known plant hallucinogens are concentrated in the Amazon Basin, even though the flora of the Old World jungles of Indonesia, uh, is equally rich? And Weston La Barre and a number of people have written about this, trying to say that perhaps it is because the people of the Amazon are closer to the hunting and gathering pre-agricultural mode than anywhere else in the world. But for whatever reason the people of the Amazon have developed, uh, the use of hallucinogens in curing and shamanism to a very high degree.

And [cough] while a number of plant species are involved in the production of these various, uh, drugs, the chemistry of them is more simple than the botany. In other words, almost all of the hallucinogens in use in the Amazon, uh, rely on a monoamine oxidase inhibition to propitiate dimethyltryptamine. In other words, monoamine oxidase, uh, is the enzyme system in the body which degrades monoamines, which would be serotonin, but also any introduced monoamines which would be all alkaloids, and, uh, many drugs. When the monoamine oxidase is inhibited, chemically, it can no longer do its job of, uh, deactivating, uh, these compounds, and consequently you get an accumulation of them at the synapse. And this is, uh, thought to be the mechanic by which the hallucinogenic, uh, experience is induced with these drugs.

For many people who seem interested in curing, I think this morning I will, uh, in brief remarks, concentrate on one ethnomedical system, and if your questions range beyond that, that's fine. But I aim to concentrate on this one ethnomedical system because part of what I am trying to do is to get researchers like yourselves to look more closely at this. There're a number of unanswered questions. In fact I would say more not known than known.

The system that I refer to is the endemic use of ayahuasca throughout Bolivia, Peru, southern Colombia,

portions of ,uh, Ecuador and Brazil. Very briefly, ayahuasca is, uh, a combinatory drug made out of the boiled leaves and stems of a [????] woody climber called *banisteriopsis caapi*. A huge, woody vine that sometimes reaches 200 meters in length in the jungle. And, uh, it is boiled to make a hot water infusion, and then to this is added a small amount of the DMT-containing leaves of some other plant, either *banisteri*..uh..either *diplopterys cabrerana*, or *psychotria viridis*. Now, my brother has just finished toward the Ph.D. at the University of British Columbia, and much of what his thesis consisted of was, uh, looking at drug and plant samples that we collected in the Amazon in 1982 when we went down there. For over ten years, Schultes and Bo Holmstedt of the Karolinska Institute had published theories of the activity of ayahuasca which stated that they believed it worked through monoamine oxidase inhibition, but they had never really been, uh, tested. Now it has been looked at in the laboratory, and essentially confirmed that this is precisely what's happening. And it's a very interesting comment on ethnomedicine, because unlike peyote or *amanita muscaria* or the psilocybin mushrooms of Mexico, ayahuasca is a combinatory drug. It is prepared. It is not simply picked and eaten. So, as a consequence of this, it can be made either well or badly. And as a consequence of that, the personality of the shaman becomes far more important in the ayahuasca cult, than in the cults that revolve around the use of, uh, plant drugs where no preparation is involved.

Now, at the beginning of this, I mentioned that all the, all the, uh, hallucinogenic drugs of the Amazon are based on this tryptamine, uh, beta-Carboline, uh, interaction. What we were doing in 1982 was looking at a much more endemic and restrictive drug complex, which is, uh,...for over 30 years there's been persistent reports in the ethnographic literature, that there was an orally active DMT drug, which was very interesting to pharmacologists because there is large amounts of, uh, monoamine oxidase in, uh, the human gut. Assumed by evolutionary biologists to be there to degrade, uh, potentially dangerous or toxic monoamine that might be taken in through the diet. So it's very interesting to pharmacologists to hear that there is an orally active DMT drug, because it, uh, flies in the face of pharmacological theory. It should be impossible. Uh, and the pharmacologists said that if there was an orally active DMT drug, then it must be complexed with an MAO inhibitor to make it work.

So what we were doing was going down there and visiting various shaman in various places, persuading them to make the paste for us, making voucher specimens of the plants that went into it, and then taking, uh, the voucher specimens, the paper material, the air-dried material, all this stuff back to Canada. And, uh, our assumption was that we would pretty much confirm Holmstedt and Schultes', uh, assertion that this drug also worked by monoamine oxidase inhibition.

It now appears not to be so. Uh, it also appears to be, uh, there're questions about the composition of the drug. The people who use this drug were disrupted in the 1930's. There was, uh, a dispute between Colombia and Peru, and when the new boundary was drawn, these people felt they were in the wrong country. They felt Peruvian, but they ended up in the Colombian side of the line. The Putumayo River was set as the new border, and they undertook then a kind of exodus, in which, uh, ten to fifteen thousand of them, uh, moved about a hundred miles across the Putumayo River to the present center, uh, where they're located. And in that [crossover?], we believe that the knowledge of the drug was severely compromised. The reason for this is because samples of the drug that we collected north of the Putumayo River in 1971 actually did show the presence of beta-Carboline in them. But samples prepared below the Putumayo River had no trace of beta-Carbolines in them, and in fact in bioassay, seemed , that means when we took it, assumed, uh, either inactive or toxic, and it's well known that the trees from which this, uh, drug is prepared is also the source of an arrow poison. And in fact among the Yanomamö, uh, if they are, the men are on a hunting expedition and they run out of the supply of the drug, they are persistently reported to scrape the arrow poison off their quill arrows and to sniff that. [Laughter].

So what exactly is going on was not clear. I think we took turns doing the bioassays, uh, with the drugs in

Peru. And I think my brother got, uh, the most powerful and frightening sample. And it sounded from his account like a paralytic poison. He felt numbing which began around the lips and proceeded down his throat. His breathing became very shallowed and labored. His mind was racing but he couldn't move. There were no, there was no eidetic or hypnogogic imagery. There was simply a, uh, a massive sense of respiratory, uh, depression. And when he recovered from this and questioned the shaman who had made the drug, his only comment was that it does take getting used to. [Laughter]. But I'm not sure that we'll repeat the experiment.

So I, I mention that because, uh, here is an unsolved problem. We took the best suggestion of the generation of researchers ahead of us, and went to the Amazon and ran their suggestions to ground, and it appears not to. Their conjecture was incorrect. These [virola paste] drugs don't work through MAO inhibition. So here is the continuing unsolved pharmacological problem if any of you find yourselves doing field work in the Amazon, this is the one to bear in mind.

The ayahuasca complex that I mentioned earlier is much more accessible and in fact is perhaps the most widely distributed psychedelic drug taking, uh, uh, complex in the world. It involves millions and millions of people who, on a regular basis approximately weekly, gather together usually in windowless corrugated roof sheds. And the local *ayahuascero*, and in these areas ayahuasca and shaman mean the same thing, uh, he leads the group in the taking of this drug. And, uh, a number of people are come to these sessions because they have medical or psychological problems, either is, there is no distinction made. Many people come to these sessions out of curiosity. A certain percentage come with the attitude that they're going to take a psychedelic drug, in other words that this is a visionary experience. And, uh, this phenomenon of taking the drug is completely embedded in the people's lives. And very very efficaciously so, they call it *La Purga*. And in fact harmine, the main monoamine oxidase inhibiting constituent of ayahuasca, actually is a, uh, a strong anti-worm remedy. And this is important and definitely gives the people taking ayahuasca a, an adaptive leg-up on everybody else because intestinal worms are an endemic problem in these areas. And I believe there's no question that if you're taking ayahuasca every couple weeks, you're probably being very free with this.

Uh, the curing, uh, scenario of the *ayahuascero* is easily identified to the curings of nigh all shamans world wide. In other words it consists of magical songs, the blowing of tobacco smoke over the body of the patient, the laying on of hands, the sucking on the afflicted part of the body to remove a, uh, a, uh, magical object which may or may not be visible, uh, the interpreting of visions and this sort of thing. The *ayahuascero* really functions as a hierophant for these groups of country people. And I might say a word about the context in which this is happening. Their ayahuasca is used by deep forest Indians and they have their own folk ways about it. Uh, it's really a mass phenomenon of displace Indian and uh, mixed Mestiso population.

What you have in the Amazon are, uh, relatively new cities. New if we mean, by new, built within this century. Iquitos in Peru arose first as a consequence of the rubber boom, many of you who saw Herzog's film "Burden of Dreams" are not, uh, "Fitzcarraldo", uh, got a good idea of what ayahua, uh what Iquitos is like. Pucallpa is a much newer city in the south of Peru and is essentially 50,000 Indians have come out of the jungle to work in the sawmills. And, uh, to create a tremendous, uh, pocket of syncretic foment, where folk beliefs, shamanistic practices, uh, languages are all in a state of homogenation, and very rich, very rich for those people to live in, and very rich to do research in. And, uh, it was there that we found the, uh, *ayahuascero* who seemed to us to have the most, as they say in Hebrew, he was *memash*, he was "real", he was, uh, had a sense of existential authenticity about him. And then in the laboratory we backed that up. His stuff was consistently stronger and better made than anyone else's.

So Kat and I spent six or seven weeks with these people, we just moved in with them. We took ayahuasca as often as we could arrange to do, which was at least once a week and sometimes twice a week. And I, we

can attest to its curative powers because the peeks of ayahuasca taking were, uh, interspersed with the [trentures] of salmonella infection [Laughter]. Each time we got salmonella we would ask the shaman to move up the next, uh, ayahuasca trip...and that would give us about three days brace before the next bout of salmonella. It was a terrific problem. If you know what it is, you know what I mean. If you don't, you're lucky.

So, uh we can, I can answer questions about this, uh many different levels I guess before I open up for discussion. So many of you seem interested in curing, I should describe and maybe Kat can help us of our impression of what is going on in the curing. Naturally, uh, well...have to talk about psychedelic drugs. I think the word psychedelic is maybe too broad, because it includes things which are very different from each other. It can include things as different as ketamine and mescaline. And uh, certainly, uh we...Tryptamine, uh, intoxication if we can use that word advisedly, is very distinct from the intoxication or or, uh, the immersion in the phenomenology of LSD or mescaline. Something like that. In our cultural context, DMT is almost never encountered. And when it is encountered, it is usually smoked. And it's very very brief. It onsets in about 45 seconds. It lasts 100-300 seconds, and then it fades in a few minutes, and is tremendously intense visual hallucinogen. Very difficult in fact to imagine, and more intense than that. Now, psilocybin which is the active hallucinogen in mushrooms, is 4-phosphoryloxy-N-N-dimethyltryptamine. It's well understood that the phosphoryl group is removed as it crosses the blood-brain barrier. This turns it into psilocin, 5-hydroxy-N-N-dimethyltryptamine, uh, I mean 4-hydroxy-N-N-dimethyltryptamine. And this is, this is very close to serotonin. So close that it's reasonable to assume that these compounds are competing for the same types of activity at the synapse.

Now, though, uh, psilocybin cannot be directly changed into DMT, it's a two step process, the structural affinities of them are very clear. What seems to be happening in ayahuasca is a very small amount of DMT, and uh, a lot of MAO inhibitor being used to activate it. Uh, and I should talk about these MAO inhibitors in ayahuasca. They are harmine, harmaline, tetrahydroharmine, the family of compounds known as beta-Carbolines. Now, beta-Carbolines are psychoactive in their own right, but not hallucinogenic. Some of you may know the work of Claudio Naranjo, who used harmine and harmaline in therapy. But if you study his work on the subject very carefully, it becomes clear that fully half of all the human descriptions of, uh, the psycho, uh, activity of beta-Carbolines come from one subject. And massive doses had to be given. They were giving, uh, 10 mg/kg in some cases, to [elucidate] even low eidetic activity behind closed eyelids. So to call it a hallucinogen is perhaps a misnomer.

Uh, one of the things that my brother discovered that seems fascinating to me is that in *in vitro* systems, meaning in test tubes, uh, ayahuasca brews that we brought from the Amazon were found to be a million times stronger for MAO inhibition than they needed to be. When he diluted these to 1 millionth the strength that the people were taking in the Amazon, you're still getting 80% MAO inhibition. So what seems to be happening if we can extrapolate from *in vitro* to *in vivo*, is they are way overdoing the amount of MAO inhibitor you need. And just barely saddling up to enough, uh, tryptamine to potentiate the, uh, the hallucinogenic activity.

When you take ayahuasca, first after about 30 minutes you feel a kind of calmative effect. Which if you've taken a large amount of it, can actually become almost the beginnings of a live anesthesia. And then in darkness under the influence of the *ikaro*, the magical song, the hypnogogia begins to weave itself. And it's not, uh, sharp edged bright geometric kinds of hallucinations. It's much more, as he says in his thesis, the color is of the forest floor. Rich ochres, olive drabs, warm browns, dusty oranges, all very impressionistically put together. And very much subject to audio control. The *ikaros*, the magical songs, are actually, uh, technically tools for controlling the fabric of the hallucination. This is very interesting to me because as some of you may know who've heard me lecture before, I'm interested in the effect of these things on the language centers and the relationship between visual modalities to spoken modalities.

And definitely, this is what's happening in ayahuasca. The songs are being used to to control the visions. Perhaps it's what's happening in peyote circles as well. I don't have great familiarity with that, but I know there's great stress on attaining these magical songs, which are not produced from the ego. They are spontaneous outbursts of, uh, linguistic order, that affect the visual cortex and control the fabric of the hallucinations. And, the shaman can use this to, in his own language, to look into the body. He can see into the body and I would say of ayahuasca the most, I don't want to say "health oriented" but it's definitely somatically oriented. You, you feel how you feel on it, and you see into yourself and you can actually direct energy in a visual way that is way more intense than mere metaphor. And if a person such as myself can do this, you can imagine someone who's given their life to manipulating these states--how intense it must be. And they see into the body and they direct sound into the body, and by this means energy blockages can be broken up, diseases diagnosed, psychological conditions addressed, all kinds of things are, uh, go on.

And, uh, our attitude when looking at this was not the, uh, attitude of representatives of the superior culture studying the quaint folk ways of preliterate peoples. It seems very clear that this healthcare delivery system is very effective, perhaps more effective than our own, especially in the treating of psychological disorders, of which there are a number in Peru that only these populations are, uh, subject to. I am not an anthropologist or sociologist and not particularly interested in phenomenological descriptions of these things. I really believe that there is a, uh, a, uh, potential impact on our own society from all of this. If we could understand what was happening, we could have a much, uh, better chance of being able to orient our own healthcare delivery systems to be more effective. Uh, a friend of ours, an anthropologist who lives in Finland, uh Luis Luna, who showed his film in Vancouver last year, he is completely convinced that the real mastery of ayahuasca lays in following a very rigorous diet. Which, uh, the deep forest *ayahuasceros* used. And this may be true. I mean, definitely, uh, beta-Carbolines are endogenously produced in human metabolism, so are beta-Carbolines, uh, the, uh I mean so are tryptamines. And the peculiar diet in the Amazon anyway which is high starch, uh, uh, low protein, high sugar, very few green vegetables kind of diet, may predispose the, these people to accessing ayahuasca more easily.

Kat had no trouble getting off, uh, when we were being dosed down there. I had more trouble and I think it was simple a matter of, uh, the ratio of the compound to body weight. I was definitely the largest person in any of these sessions, and, uh, the same amount is doled out to each person, and not in a context where you can say "I'd like to take more please" [audience laughter]. You just have to go with what's going on. But we also, our informant prepare several bottles of ayahuasca for us. And in a series of experiments in the United States when we got back, we verified that it is not only a hallucinogen, but it can be a terrifyingly intense hallucinogen, uh, if, uh, if, uh, errors in dosage are made. It can be, uh, well I said after I made my error of dosage, I never hope to be more stoned than..[laughter]...

So, uh, that's, uh, what I offer to you as interesting perhaps to you in your own fields. I must be aware that I have other angles: the extraterrestrial angle, the end of history angles, several different things. But all of these things were inspired by our belief that these Amazon peoples have a technology for exploring the modalities of the unconscious, that is centuries ahead of us. I mean, we are at the very beginning of exploring the unconscious. The Freudian and Jungian models, which you can think of the Freudian model as embedded like a, uh, black dot in the center of the Jungian bull's eye. Each theory of the unconscious claims more and more territory as its own. But what I have become convinced of from using these hallucinogenic drugs is, that the major portion of the unconscious has very little to do with human beings. It is simply a modality, an interior landscape, and large portions of it, uh, uh, are not human. You could almost make the cybernetic metaphor of, uh, ROM portions of the unconscious. ROM stands for Read Only Memory. This means that if you have a computer with Read Only Memory, you can *read* what is in that section of memory, but you cannot change it or input into it. And I believe there are "read only"

portions of memory that no human being has ever inputted into. So they bare no trace of, uh, humanness. But they can be contemplated, and this is the idea the Alien Other, uh, a tension that appears in modern society. It has appeared before in Hellenistic society. Uh, as techniques are developed for exploring consciousness, these transhuman, non-human dimensions slowly come into view. It appears to be, uh, a co-equal dimension of existential validity, which our cultural and linguistic programming has blinded us to rather severely. Now of course, we're returning to look at it again in the larger context of the higher, uh, intellectual thrust of the twentieth century, being an effort to recapture and understand archaic, uh, forms of thought. This is why our fascination with the unconscious, with drugs, with shamanism, with the forms of art like cubism and this sort of thing, because we are trying to give ourselves cultural balance by harking back to a time *in illo tempore*, sacral time, a time before history. And these drugs, uh, the means to do that properly understood. Our problems on this end are simply the baggage of cultural and legal and, uh, conventional assumptions about what these things are, and there's a great deal to be learned from these shamanic, uh, uh, societies and conventions.

However I'm not, uh, I call myself the shamanologist to set myself aside from the people who claim to be shaman. Shamans. [laughter]. I don't, uh, I I think there's a great deal to be learned from shamanism, but that there is a great deal that can be extrapolated from it that we need to create our shamanism, and that we *will*. When we're sitting in this cult hut in utter darkness with people vomiting and singing and undergoing [...] and you're still trying to perform the eidetic reduction, still thinking about Husserl and Heidegger, and realizing that you, you're, your mental insides are too different to understand in *their* shoes, you have to make your own shoes.

So let's talk about all this....

*But then you said that, uh, mushrooms are catalyzed into a tryptamine..So I wasn't clear as to..

Either I wasn't clear or you misunderstood me. Mescaline, which is the active, uh, constituent in peyote, is not a tryptamine. It's an, it's a kind of amphetamine. Mushrooms, psilocybin is an interesting compound. It is the only 4-substituted indolethylamine that occurs in nature. So it's, uh, it's unique and in another context, this is one of the reasons we were led to suggest it might be an extraterrestrial gene inserted from the outside. Because you just don't get single instances of a compound occurring in organic nature. Serotonin for instance which is very closely related to psilocybin, occurs in everything from planeria to man. It occurs virtually in all known living systems. Psilocybin only is known to occur in the very limited number of fungi. It is a phosphorylated tryptamine. Uh, the tryptamines then that occur in the virolas, in these trees used to make the paste, or in the admixture plants of ayahuasca, these are not phosphorylated tryptamines. These are things like, uh, N-N-dimethyltryptamine itself, and 5-methoxy, uh, MeO DMT....

*[Inaudible]

No it was never there in those cases.

*No no I mean in the...

In the case of...yes

...Catalyzed so, in the end result it...similar...

Yes they are very very similar, with one exception I think. Maybe more? [laughter] The major difference

is, that unlike psilocybin--psilocybin has one very curious property, which is that it seems animate. You contact an organized entelechy of some sort very easily. It speaks to you. I've compared it to the Logos of Hellenistic syncretism. It seems to be a, uh, a, uh, psychic component not under the control of the ego. And this is very curious. Frightening to some people. Uh, when I was with Albert Hoffman at the Entheogen Conference in Santa Barbara I asked him you know he discovered LSD and he characterized psilocybin. And I asked him which he preferred to take. And he said he preferred LSD, and I said "Why?". And he said "There's something....too animate about psilocybin." And closer questioning showed that this was unsettling to him. It's too much like the orthodox notion of madness. Having a dialogue with an independent voice in your head is quite unsettling to a certain sort of person I think.

And you don't have the same experience with ayahuasca?

It teaches. You want to say something...?

Yes I think that ayahuasca has the feeling of some kind of entity in it as well but, uh, it doesn't particularize like, uh, little creatures that can come at you and bombard you or whatever. And psilocybin is sort of more along the lines it's very large and very gentle. And so if my, I had experiences where, I think Dennis did as well, where I was lead through the forest by someone so much bigger than me, that I couldn't see him or her, you know but [Terence: "Mmhmm"], taught about the plants along the way, and which they were. Once I saw a huge hand dangling above my head that was all black with jewels, and crevices you know and...that kind of entity. Not frightening though. I never found it frightening.... The rushing, the coming of it is where people vomit, where you have a very strong [???] that's what they call it. [???] Very strong at the beginning, that's what scares me....[inaudible]

When you quake, I mean, and they seem to encourage that. For instance, uh, the shed where we would do it had a corrugated roof and no windows but it was up on short stilts. The shaman would stand up and put his hands in front of him, and tremble, and he would transmit this trembling into the floor and shake the entire building. And several times, uh, the protocol is when you feel you're going to vomit, you just go outside and vomit. And people are coming and going all the time. We didn't vomit that much, which was very puzzling to them. They really stress vomiting, and they identify the vomiting with the purgative, uh, effects of it. And when we would not vomit, they say "Oh you must live very cleanly. You must be in very good shape." But actually all that was happening, I think, was that we were following the rules they laid down, and they were not. [Laughter]. Like they would say, you know, "Never eat pork before doing it. Don't eat anything for 6 hours before doing it. No salt. No alcohol." And we would do this and be fine. And they would just be [audience laughter] [Kat: Even the shaman was...] puking out ten different ways, and getting sick. [Laughter].

But the, the entity in ayahuasca, it teaches by showing. The visions teach. The thing in psilocybin is much more puzzling. I mean, it's a haranguer. You actually have, uh, you know, uh, psychic arm wrestling with somebody who wants to, to, who loves controversy and rhetoric, and is well able to express itself and present itself. That's a very puzzling thing that, uh, could lead one far afield if you sought a reasonable explanation. Um, so those are the major differences.

I think ayahuasca lends itself to be a better healing drug...

Mm hmm.

...than psilocybin. Because it is gentler, because it can still communicate, uh, with the other people. It's very close, in fact this kind--this number of people in this smaller space, you know. And you can, it can flow back and forth. Whereas psilocybin....if you've experience you know...you can blast off. [Audience laughter]. So, uh, maybe when you're by yourself on psilocybin, but...collectively I think, ayahuasca [inaudible].

It's very earth-centered. I mean, even taking ayahuasca up where we live in Sonoma County. Immediately as it comes on it's about sunlight on brown water, huge twining roots. In other words it creates the jungle. It is the jungle in some strange way. The psilocybin entity is Gnostic. It points to the center of the galaxy. It talks about ending history. It's full of a sense of crisis and the need for activity and, uh, humor. But this intense desire for change. It is not a drug of acceptance, you know. It wants transformation of a very radical sort. The ayahuasca seems to, uh, create, to integrate. Especially into that environment. You know the major, uh, alkaloid fraction of ayahuasca is harmine, which was, a beta-Carboline, which was first, uh, isolated from Syrian Rue, the giant Syrian Rue *peganum harmala*, and that's what called harmine. Before enough was known about the compound to realize, the compound in ayahuasca, to realize that it was the same as the compound in *peganum harmala*, it was called *telepathine*. Because the early explorers, uh, Villavicencio and Koch-Grunberg in the early years of this century, uh, reported that the people were inducing states of mass telepathy. And there is some reason to think that this might be true in some sense. In other words, these people live in a state of semi-telepathy anyway.

If you can imagine a hunting-gathering tribe of 30 people moving through a vast rain forest with their children and their elders, uh. The notion of the super-expressed individual that we take for granted is not really there. There is more a sense of the unity of the group. Then, when the elders get together and take ayahuasca, there is a kind of melding together to obtain consensus, and also impose, uh, information impossible to obtain any other way. For instance, weather information. Shamanism is always related to weather prophecy. And it's always been assumed that this is just a "wing and a prayer", or that they had subtle, that they were super-sensitized environmental clues about weather change. But also things like game movement. This is very important to know. And, and, and for all of these things ayahuasca was invoked and used.

I want to go back to something you said about, uh, about personality of mushrooms. I think it's an interesting political comment, uh, that mushrooms should be growing here in this county which is so apathetic and we need to do something, and we don't have a more gentle type of, uh, of drug here..endogenous.

And also we don't have a collective format to use them in, which is [inaudible]....

Two things. Let's see first is, uh, when you described your brother's experience, reminded me of [Michael Harlan, sp?] description of his, uh, ayahuasca experience. And he said, after I guess going through a kind of deathlike experience, that that's why they call it the "little death".

Mm hmm.

And the other thing was that he said that in their preparation of ayahuasca it was from a tree datura. Did you find that?

Uh, tree daturas, arboreal daturas in the subfamily *brugmansia*, are used in certain areas, uh, rarely and not

in these, not in these public gatherings of people. Tropane alkaloids are notoriously difficult to control. And that would be more within a context of *brujeria*, of real sorcery and witchcraft, and generally tends to be more "montane", uh, a phenomenon of the mountains. Especially around, uh, the Valley of the Sibundoy and those places. We never, uh, we grew *brugmansias* and have them of course, but we never, uh, combined it with ayahuasca because it, knowing just what the tropanes are like on their own, it seemed very, uh, dangerous. You know, some tropanes make you sweat and your heart race. Other tropanes make you fall asleep and your body temperature drops, and your respiration falls. And it just seemed like a dangerous area.

There are a number, one of the interesting chemical frontiers of this is these admixtures, in which you have the basic ayahuasca, the boiled stems of *banisteriopsis caapi*. Normally what's added to that are the leaves of, uh, *psychotria viridis*, a rubiaceae bush related to coffee, which has a great deal of DMT in the leaves. Uh, in the northern part of the range where this drug is being made, where it is called not ayahuasca but *yagé*, uh, *brunfelsias*, which are also solanaceous plants with very high molecular weight tropanes, that have defied characterization. They are sometimes used. But we knew Tim Plowman and he's, the only, uh, non-Indian person ever to take *brunfelsia*, and his description of it, it sounded like, you know, his life hung in the balance for 36 hours, and he didn't know whether he would make it or not. So we didn't go too deeply into that. What we did do, was we always asked our informants, "What other plants are sometimes used in ayahuasca?" And they would usually name them, and we could collect vouchers of 9 unusual admixture plants that we collected. Only one, a, uh, a, uh, menisperm, which is this very small family of plants. A menisperm, *abuta grandifolia*, was definitely alkaloid-positive. And that's, there's more work to be done there. But, uh....this technology of admixtures is very interesting, and not well understood. And, uh, that kind of thing could be worked out up here in the laboratory, if you could get and grow all these things.

[Kat inaudible...]

That's right, that's right.

Andy [inaudible] was saying that he felt [...] of the, uh, multiple alkaloids, and that it, uh, made an incredible amount of difference to the person who was going through these things.

Yes. Well that's a weaker way of saying what I said. I mean, ay... ayahuasca's not effective without an admixture. It's an odd experience. But it's not an effective trance inducing compound of visionary compound without an admixture. You have to have it.

Can you contrast what you're saying with *muscaria*?

Amanita muscaria? Well, that's an entirely different situation. For those of you who aren't familiar with it I'll review it briefly. *Amanita muscaria* is a, uh, mushroom that has a mycorrhizal relationship with birch trees, that is distributed throughout the world at altitudes above 5 thou..well no actually it occurs at sea level too. But, anyway, it, uh, is highly variable both geographically and seasonally. And in Siberia in the Amur river basin the Yakut shamans and a couple of other tribes have utilized this for a long, long time. Uh, Gordon Wasson wrote a book in which he tried to suggest that *amanita muscaria* may have been the basis of the Vedic hallucinogen *soma*. The problem with *amanita muscaria*, which he freely admitted, is it is very hard to get satisfyingly loaded on it. Uh, you can--it is not consistent, and we don't know...there've been various suggestions made: that you must roast it over a fire to create, uh, a change in its chemistry,

that it must be pounded with milk curd. Apparently readings of the Vedas suggest that whatever *soma* was, it was pounded with milk curd. People have even come forth with chemical theories that show that the active agent in, uh, *amanita muscaria*, which is muscimol, is very closely related to the active toxin in *amanita muscaria*, muscarine. You can decarboxylate muscarine to muscimol using the enzymes in sour milk. So it might be possible to incubate, uh, *amanita muscaria* in sour milk, and turn the toxin into more of the active agent. Um...

Is that also toxic?

Well, any, I mean sure. You have within any alkaloid or what's called an LD50, which is the horrifying concept that [audience laughs] I don't need to go into [Terence laughs].

One thing...other mushrooms often, if the, uh, specific reaction of the person relates to their own biochemistry and especially what they've eaten within the last 48 hours before you ingest it. Do you think that semi-toxic effects from certain mushrooms...For example if you drank wine, um, even very common ones like morels, um, that..It varies from person to person. So that could be an additional factor too.

That's right there's a *lepiota* species where if you eat it it's perfectly harmless, but if you have very much alcohol it's fatal and irreversible. Uh, another thing to bare in mind is that, uh, there are a number of monoamine oxidase inhibitors that occur in foods. Certain foods are high in these things and, uh. For instance soft cheeses, Bries and Camemberts are just loaded with tyramine, which is a monoamine oxidase inhibitor. This is why, uh, certain, uh, anti-psychotic drugs, this is an admonition that they must not be given. And, uh, I think it would be murder to take ayahuasca on top of a typical diet of Camembert and Brie. [Audience laughter]. Fortunately these things are unknown in the Amazon [Terence laughs].

In Berkeley we all had a ton...

Yes in Berkeley it'd be tricky to keep track of yourself [laughter]. But I definitely felt, uh, when we were in the Amazon, the diet is so strange. And you cannot avoid it, uh, because you can--everything you carry in goes on your back or on the back of an Indian who you are paying, and it may not seem like much, but over days and days....So there's always an effort to, to eat off the land. And, my God, you know if you've never been in a tropical jungle. People have a notion about a tropical jungle that it's just full of food. Wonderful things to eat, all these plants and things. But you see, the Amazon has been above water 220 million years. That's 220 million years of uninterrupted evolution of a tropical ecosystem with ample, uh, water supply. So that means, every ecological niche is occupied. Protein is at such a premium, that there is no protein. You could starve to death in the Amazon. There is no protein. Um, Chambers, who's the world's expert on the tropical rain forest, estimates in the Amazon 96% of all utilizable organic material, at any one, at any given moment, is in a living system. In other words only 4% of the organic material is not at any one given time in an organic system. What that means in practical terms is, a leaf falls. Ten minutes later it's gone [laughter]. The, the leaf cutting ants, the "this" the "that", it just sucks it right up, you know? And, uh, minerals in free suspension in rain water, they estimate the average flow distance of an ion in rain water is something like a centimeter [laughter] before it's uptaken into a living system. So there is no food in the Amazon, and this is one of the reasons why coca is so popular. Coca in the Amazon is not a drug, it's one a food, and two an appetite depressant.

And this is what they're, they're, uh, you know and people are going to the Amazon. People are outrage at the notion that coca could be though a drug. A drug is something bad. Coca is wonderful, you know? So,

uh, it's a very tight ecosystem with very little elaboration of protein. And that's, uh, that's why the search for food plants has been so intense. And perhaps why the discov..so many drug plants have been discovered. Because every single thing has been tested again and again for its effect as a food, a poison, a hallucinogen, because everything is to be utilized.

Mm Hmm.

You mention the use of, uh, magic songs in the directing of the group experience of ayahuasca. Uh, we will mention that you are interested in the relationship between the visual experience and, and language centers. Do you think that it, the linguistics, per se, do you think it's sound I mean as in frequency, verses linguistics in terms of semantics, that guide the [???] could you [speak?] to that distinction?

Well, is it possible to, for a human being to make sounds which do not reflect syntactical deep structure of language? I mean in other words, we're so hard wired for language that in any extended verba...vocalizing, a Chomskyite would be able to come and find the linguistic structure of it. I'm not sure. I think, uh, this is a really interesting question because you have input through the senses. You have one, one, one sense perceptor which is geared to transduce, uh, audio input. And one which is set to transduce visual input. But it's probably something about the way these perceptual systems have evolved, that they divide the incoming input. Actually, all that's happening is that you're moving through a multi-leveled wave system of various kinds of inputs, which you are transducing into tactility, vision, and sound. Uh, I think this a very interesting area for research. Just recently, someone sent me an article, which I thought was very very suggestive, that occurred in no less respectable a place than Martin Gardner's, uh, or the amateur scientist in Scientific American. But they were pointing out in there, that if you can sustain a hundred Hertz hum with your voice, you can actually make an electric fan appear to slow down and stop. You can also cause roll lines to appear on a TV set. Now, what exactly is happening here? It isn't that the fan slows down, or that the roll lines on the TV. The, the scientific explanation which they put forth was, that a well-sustained hundred Hertz hum actually vibrates your eyeballs, so that they become like strobes. And you can freeze motion. And you can, uh, uh, slow things down and start them up again.

So other people aren't able to perceive...

No, other people don't perceive it, but you perceive it. There were anecdotes about airplane mechanics who can look at a spinning propeller, and tell if it's flawed by jerking their head back and forth very quickly. And, uh, this is very interesting because here is a way to use your voice to control your visual input, and to actually gain secret information. If we had written a secret word on that propeller, you could win bets in a bar by, uh [audience laughter] [Terence laughs]. So, um, I think this needs to be looked into. What can we learn about the world by subjecting our bodies to different kinds of self-generated vibrations? And, you know, without the back up of someone like Martin Gardner, I'm sure people would dismiss a wrap like that as pure fancy, utterly preposterous.

The guy who wrote the article said it was very hard for him. He didn't have perfect pitch. It's very hard for him to maintain this hundred Hertz hum. So what he did was he got a wave generator, which, uh, would perfectly generate the hum. And then, he, uh, modified a, uh, football helmet so that he could strap it to his stereo speaker [gasp from audience]. So he would rest his chin on his speaker [more gasping], and run the thing up to 100Hz [audience laughter], and then clock the motion of the fan. Well, this is just an example of a peripheral human abilities that we have not explored. I'm sure you all know LSD, have experienced the time-smearing effect of motion, where you move your hand and it just leaves it hanging there in all of

its stages. And people will say, "Well your retinas are simply not quenching the previous image. There's some problem in the, uh, something or other." But, the effect is to, is to smear the psyche in time. Because, we, the psyche is defined largely by the, uh, the way the sensory inputs are, uh, interpreted.

So, I think, uh, these linguistic phenomena are very, uh, suggestive of special abilities. I, I've said many times, you've certainly all heard me say it: Philo Judaeus who was an exact contemporary of Christ: born before, died after, was on a bug about what he called the more perfect Logos. And he said, the more perfect Logos will be beheld rather than heard. But it will go from being heard to being seen without ever crossing over a quantized point of division. Now that suggests that hearing and seeing are just two ends of the continuum, and that your eyes slot you into part of that spectrum. Your ears slot you into another, but that it's really a continuing spectrum. And this, the evolution of this more perfect Logos is my, uh, my hope for psilocybin--that this can become an experience for people, a kind of *ursprache*. You may be aware of, uh, Robert Graves' book The White Goddess, where he talks about a perfect, poetic language that pre-dates history. A, a language of poetry so intense that to hear it was to understand it. It required no conventionalizing of cultural context and dictionary. It was so laden with existential validity, that to hear it was to understand it. We have very few articulations like that left, perhaps moans, screams and howls are the only words.

The ikaros, uh...

The ikaros...

They're and then...varied, uh, Peruvian, Indian dialects. And yet, when you're taking ayahuasca and they're taking it and seeing them, you can understand them though you've never heard the language before.

The evaluation, uh, from [inaudible].

Yes all of that including understand the language also. Very easily, we were having images which jived with each other that we were getting.

And do they then jive with the images that the, uh, people...

That's harder, it's hard for them to talk about that. Those people. Because they are magical songs they don't analyze them in non-magical terms.

Did you get any cross...??

Yes, yes we did. We had, um, back to you were talking about [inaudible] aspects...Moments that had to do with the sounds, that had to do with the visions. That we all recognized at one point. We and the environment outside all recognized the [encroaching presence of Death]. We had to a death element, was just outside the building. The baby cried, the dog howled, the clouds went over the moon. Everybody got a big chill.

I just did.

[Kat laughs]

And the shaman jumped up, and, like commanded all of us in a way to go with him. And then began hooting it away. And it took some minutes. And then it was gone, and all, in one moment everyone just laid back and moved aside. That was a very telepathic moment that was not conducted in any language common to everyone there.

What was your experience when you took it after having salmonella? And what experience that will connect to having had salmonella?

Um, you just look at it [inaudible]

Yeah, uh, I'm wondering if there were things you experienced during the ayahuasca trance, that were you definitely connected to having salmonella....

Oh, yes, Travelling through your organs. Travelling through your blood stream. Being in your stomach. In your guts. Recognizing like on a tiny level, being, uh, a molecule travelling through, you know? Seeing the little, yellow enemies or whatever. All of the things happening on that level [inaudible] very well. And it just felt like it just flushed it all out. Like the awareness, the deep awareness that we got on ayahuasca, made all the bad invaders go away. [Inaudible]

Yea right. It's very much like what Pelitzer is doing it's a, in their behavioral medicine club. [Inaudible] traces and meditation.

Yes.

Mm hmm.

Yes.

I wanted you to comment on the relationship of what you're talking about to psychedelic synesthesia...let's say things like LSD.

You mean, by psychedelic synesthesia you mean fusing of the sensorium under psychedelics drugs?

The initiation of, of, visual phenomena by sound.

You mean do I think that happens on LSD?

What you're talking about in ayahuasca.

Yes, pretty much except that it's controllable, you know? And, and in fact that's almost too, um, too restrictive a term. It isn't that the sound controls the visions. It's that the sound is the visions. And if you want to change the vision, you must change the sound. And so you actually can take control. Ayahuasca is wonderfully suggestive, and can be led in a way that these other things sometimes can't be. For instance, one of the most puzzling, uh, things that it can do is that you can suggest a motif. For instance, art deco, and it will just go to that, and flood you with millions and millions and millions of objects, all perfectly exemplifying this very constrained artistic style. And then you can say "No. Attic vases. Let's do Attic

vases." Thousands of them, more than there must be! You know? And then you can say "OK, now do one that, now surprise me." And it will produce an equally co...aesthetically coherent stream of images that are not referent to any, to any, uh, historical period. So then this raises questions, you know. What is fashion?", What is style?, What are these collective image systems which come out of nowhere, gain great power and then fade away? And how is it a drug can command them out of this single human mind? How is, what does it mean, that on a psychedelic drug, one person can see more art in an hour than the species has produced in 10,000 years? What does that say about how effectively we are accessing our souls? It mean, I mean the, the potential then is so great. I mean, you prove it to yourself, you know? It, uh, very frustrating to imagine that that kind of beauty. Those depths of ecstatic revelation are that accessible to the individual, and so totally hidden from us as a group.

How can the potential be tapped in our time?

By chan...by evolving language. By recognizing that reality is created by language and no longer accepting the natural evolution of language, but actually going to work to evolve language ever more rapidly. So that we can, eh, uh, communicate these modalities.

I think that's a lot of what [???] inherently is trying to put together...to express these experiences that doesn't totally violate them, and, and rip them apart.

It's a very long process, creating a new language.

You mentioned at one point, uh, transcending the ego. What kind of people experience that? What do they manage a specific healing intent for each person, or a collective event that happens when you get off, or, uh... I ask this because I think it's very intimately connected with what the [fifth dimension....inaudible] that tapping out our potential has to do with transcending the ego.

Transcending the ego and its expectations in a linguistic set, mainly.

And controlling our experience.

Yes, language has not been examined enough, it seems to me. All the argument over man's place in nature and that sort of thing, doesn't take cognizance of the fact that if you want to, if you want a miracle, then language is the thing to look at. Because, we know that our, uh, genetic component is only 3% or something removed from chimpanzees, and this and that. But this thing that we do with sound and meaning is of an ontologically different order. And I am not sympathetic with the people who want to blur the distinctions, and say that dolphins talk, ants talk, bees talk...They may communicate, but this is a very different thing, what man's able to do. Because for 50,000 years or so,

Man hasn't, uh, the species hasn't been in evolving in the somatype. Somatype is relatively steady. What is evolving is culture. And what culture is, really, is language. Uh, culture is merely the, uh, epiphenomenal accompaniment of language. So, it is the evolution of language that is changing. And, uh, all our ontological, all our religious ontologies, uh, in the western tradition: the insistence on the coming of the Word into the world, relate, the Word becoming flesh. In a sense, Man is the Word become flesh. And, uh, what all this leads to I'm not sure. I often like to think that our map of the world is so wrong, that where we have centered physics, we should actually place literature as the, uh, the central metaphor that we want to work out from. Because I think, uh, literature occupies the same relationship to life that life occupies to

death. And I don't think very many people have thought of it in those terms. [Audience laughter].

[Inaudible chatter]

[Inaudible] true testimony of the [wordsmith?] [laughter]

Well, in the sense that, uh, a book is a, is life with one dimension pulled out of it. And, uh, life is, uh, is something which lacks a dimension which death will give it. I imagine death to be a kind of release into the imagination, in the sense that for, uh, characters in a book, what we experience is an unimaginable dimension of freedom. And, this is why people like James Joyce, though arcane and difficult to pierce, seem to me central to understanding this. Because they're saying something about the relationship of books, reality and death. That this is a cycle of expansion and understand that it's happening through language. At one time there were no books. And, uh...

I think what you're saying is assuming perceptive, at the same time I think there's a better problem which is, that if you take a metaphor of literature, what you've done is, you take the same thing that we're doing all the time, which is trying to abstract new elements into metaphor. It seems to me the central problem we're in is that, it's very difficult for us to give equal emphasis all possible metaphors, all possible... a physical metaphor, a biological metaphor, psychological, literary metaphor. We focus too much on one thing where I'm able to express, well, not unable but have a great difficulty in expressing a totality.

Well, see, what you want is a theory of being true to experience. And what we have, by centering in physics, is a theory of being true to itself. Meaning, physics doesn't contradict itself, there, they go to great pains that doesn't happen. On the other hand, the models that it offers no bear no relationship to anything anybody can see, experience, know or understand. So somehow an explanatory vehicle was chosen, which explains something. But nothing with any immediacy.

Well, what I'm saying is they draw in other things but not to, they push out, they, uh...the quantum physics model but integrate all of them so they form a more comprehensive view, and not try to select over the other.

Yes, but you want it to be true to experience.

Yeah.

And the entire set of objects manipulated by physics are unseen unknown, I mean, I mean, take as simple an object in physics as the electron. It seems more remote than, uh, the resurrected Christ to me [laughter].

And yet by invoking those notions we can create of them, you know, to try and find further particles.

We created, that's right. But do these new creations then reflect back on experience? Do we learn, then, to be better people or more at ease with ourselves or...It seems the answer is "No". We just unlock more and more demonic, uh, levels of, uh, power.

But that the contradiction that physics produces in itself, how they're trying to find a unified field theory for...

But what we need is a uniform social theory. So that we don't cause our extinction.

~*~*~*~Part Two~*~*~*~

...about a biological process where both the ayahuasca experience and the scientific experience can be integrated.

Yeah I don't regard, I'm not uh, I'm not uh one of the, uh, noble savage people. I mean, I've spent too much time in the Amazon and things go on that would curl your hair. There are people whose idea of a hilarious joke is to toss a dog in the fire. And, uh, but I think there is something to be learned, you know. I mean you can stand off and watch somebody tossing a dog in the fire for their own amusement and say "What...these people are barbarians". On the other hand we carpet bomb Asian cities from 30,000 feet in the air in the name of policy. We don't even call it fun, we're so alienated from what we're doing. So, you know, what to make of it?

Good point.

A couple things that interest me, and they fall very nicely on this. One is I would like to hear you talk briefly perhaps about the highlights of what you call the the invisible landscape. What are some of the things that stand out in that, uh...And the other is that I get the impression you have the very distinct idea of where we, of the direction in which we can evolve. Um, and I wonder if you would say something about that direction and perhaps those two topics.

Sort of converge...Well, without trying to, um, solve the problem once and forever, let's just say: Man has a very strong Gnostic bent. And, you know, Gnosticism, Dualism, the idea that you don't belong where you are, that you belong somewhere else, that this is not your world, that you're a stranger in it, is, uh symptomatic in modern parlance of what's called alienation. You're supposed to like where you are. You're supposed to see yourself as part of the seamless fabric of Being, and that sort of thing. However, the people who take that position, that, that alienation is symptomatic of neurosis, don't realize the cultural momentum of the last 500 years has made the Gnostic myth a reality. In other words, we have become a menace not only to ourselves, but to the planet. And the only way that both parties can, uh, save themselves is by a separation. And this, on one level, is the greatest,uh, crisis that biology has faced since animals left the ocean for the land. On another level, it appears inevitable in the present social context, that we're going to go to space.

But we are, uh, the birth pangs of doing this are very destructive. For instance, and I'm sure you've heard me say this, that civilization is a 10,000 year dash to space with the potential to destroy yourselves. We, history is the departure of a species for the stars. But it takes 10 to 15,000 years. A moment of biological and geological time. But in that 10 to 15,000 year period, if you happen to be unlucky enough to be born somewhere in there, it's going to look like it's all up for grabs. We are creatures of information, and the imagination. The monkey we are already beginning to transform and shed. We don't look like the other monkeys. And we look less like them all the time. We are...Humanness may not even be a monkey quality. It may be something that was synergized in the monkeys but that is taking, uh, that has an inner life of its own. In other words, we, since the early 1950's, have had a notion of the structure of DNA, and this sort of thing. Well it's perfectly obvious that within the century of the discovery of DNA, any species which makes that discovery takes possession of its own form. And we are going to do that in the next 50 years.

We are going to design, we are going to design the kind of people that we want to be. And if we don't want to be people, we will design that out of the picture.

I think of... the picture that, the Mushroom has of the human species, is much more like a coral reef. In other words, it sees our "artefractria" as contiguous with our flesh. We make a distinction. But what it sees is, uh, an animal which takes in raw material and excretes it in ideological molds. That's what we do. We turn ideas into facts, on all levels. This cannot go on any longer on the surface of the planet, with the levels of energy and control that we have brought to bear. Because we are now in a position to destroy the whole earth, or to sculpt it, turn it into a Disneyland, which is a kind of destroying of the earth. So we have become a toxic force in planetary biology. We feel it, and the planet feels it. What must happen is, there must be a cleavage. And it, a birth is a good metaphor. Because, uh, uh, an infant being born can hardly, uh, face the experience with anything other than trepidation. The weightless state, the effortless nurturing, the complete immersion in the support system, all that is ending in earthquakes and spasms and pain, and anguish, which looks, it must look like a death process. And yet, it's a life process. It is necessary for the mother and the child, that this cleavage take place. This is now happening, uh, on a mass cultural level for us. We, to be who we want to be, we have to leave the planet. It, as Joyce says in Finnegan's Wake, "Up n'ent, prospector. You sprout all you're worth and woof your wings!"

And, would you say that, uh, all of the higher forms are in all the lower forms simultaneously?

Uh, yes, what's the word for that? Uh, uh, "implicate". They are implicate in the lower forms. That's right. But, uh, I don't know. It's, it's a great, uh, It's a great challenge to us to fulfill the things that we can imagine we are capable of. Our imagination is really the sail of the soul. The question is, you know, where will that sail take us if we will but let it?

Well what is imagination? Or what is its true relationship to the unconscious of which you spoke?

Well, its relationship to the unconscious...I suppose it is the unconscious made conscious. In other words, uh, all, all the mythologies, uh. I think it's Mircea Eliade in Myths, Dreams and Mysteries about the evolution of human flight. And says, talks about first about shamanic flight, and then the notion of the dirigible and the Wright flyer and the space ship. And he says these, uh, ontologically self-transforming images of flight say far more about the nature of the human soul than they do about technology. This is again this idea of James Joyce's that Man would become "durgeable".

Uh, I haven't mentioned the flying saucer here this morning. But this is one of the things that I think is very interesting. I think flying saucers have been the province of very dubious intellectual cadres for probably long enough. And that is really should be looked at as a totality symbol, which haunts human history in the same way that Alfred North Whitehead thought that the color dove grey haunted human history. In other words, it's a, it's a thing always present. It is the symbol of the ontological transformation of the human species. And always takes upon itself the, uh, the *accoutrements* of the current cultural myth, so that it can be seen as the intercession of the Immaculate Conception, or the, um, descent of an angel. Or, the, the current myth is that there are probably advanced civilizations somewhere in the universe, and so that this is what it is. It's really nothing so trivial, you know. It is the alchemical object. It is, uh, the blind spot in the, uh, in the consciousness of the race. And it has to be the blind spot, because it is a mystery. All appetite for the future is an appetite for this, uh, modality of super freedom that comes from transcending the limitations of dimension.

That's why we have, that's why our, we are so riddled with apocalyptic mythology. Because we really do have a prescience about what is going to happen to us. We really do sense at a very deep level, that the

linear extrapolation of our historical and cultural tendencies does not give a true picture of the future, that the major factor which will shape the future is uncertainty. And we have never yet created a method for integrating that uncertainty, and planning, planning for it. Novelty is the thing that continually overturns all efforts to, uh, project toward a given end-state.

So it's correct to say then, that our evolution will be, or can be seen as our re-claiming more of the landscape of the unconscious.

Yes absolutely. That's what it is. That is our world. Our world is in our minds, you know? The kingdom of God is within you. That's the wrap. But the point is, then, you know, to get a lease nailed down somewhere in the world of the imagination, so that you can be part of it. Yes the planet is simply, uh, a precursor of what we will project outward when we have the ability to do so. And this is coming soon.

How, um, can we, um, uh, how to propose to accelerate the evolution of language?

I think that we have to make a very reasoned case to the establishment, that the, um, that the psychedelic drugs have to be looked at in a non-hysterical manner, by experts. And we don't know who the experts are. They may not be pharmacologists. They may turn out to be linguists. Or they may turn out to be jugglers. But we have to recognize that what we're talking about when we're talking about the advancement of human evolution, is the evolution of the human mind. Uh, and these drugs, and, do..You know, before the argument was whether to be called a hallucinogen, or a psychedelic or an entheogen...They were just called consciousness-expanding drugs. And that really, as a phenomenological description, is more useful than these other things. They expand consciousness. Well, therefore, we should be really bearing down on them, because the problem is we don't have enough consciousness. And we don't know how to direct it, and sculpt it, and orient it toward our own salvation. So, we can't just take our mental states as "given", as somehow sacrosanct, and therefore not to be tampered with. We have to actually begin to engineer them. And Arthur Kessler has made the point that this is not big news, but there's some resistance to it. Again I think a, a, uh, recursion of dualism, in a more dangerous form. The dualism of the natural and the unnatural. Yoga is natural, drugs are unnatur...All these dichotomies, I mean. Who can argue with the notion that dualism is the root of all evil?

Uh, how can it be otherwise? [Audience laughter]

Um, a question relating to this is that, there's something, we have all this choice, we have all this power, and yet we are also prone to a great many powerful mistakes. And, with the element of that which happens spontaneously through us. And this, as far as dichotomies do. Where do we leave off engineering and, and, let, let um, that which is beyond us [inaudible] through us?

You mean the thing which is leading?

Yeah.

Well, we need to open a more coherent dialogue with the thing which is leading. Again, the re, the reason I don't, I'm somewhat immune to political anxiety and that sort of thing is because I really do believe there is a control system that is larger than any institution. I don't believe that the evolution of fate on this planet is in the hands of the Communist Party, the Catholic Church, the Jews, Wall Street. It isn't in--no one is in

charge. What is in charge is the most intelligent life form on the planet, which happens to be trans-human, not human. We have had for some time now the concept of, uh, the collective unconscious. But we need now to think in terms of the collective consciousness of the race. Which is not passive. It's not just the storage place of old memories and myths and that kind of thing. It is more like an entelechy. It guides. It opens avenues to certain choices and preaches avenues to other choices.

You know, I think it was in Mysterium Coniunctionis that Jung said, uh, the unconscious has a thousand ways of terminating a life that has become meaningless. A chilling notion. And what he meant was, you know, you'll step off a curb and be hit by a bus, cause you didn't look. But the real analysis is that a decision had been made at a higher control level to just fling you away. Well, how much more disturbing it is to think that that could be possible on a global level. So we have to open a dialogue, and no longer, you know, all these words: intuition, artistic vision, trance, uh, memes like poetry, these are all ways of trying to have a dialogue with the control mechanism. And the psychedelic drugs, especially psilocybin, I think lay that open. We need to have professional facilitators of dialogue. We need to understand who is speaking. We only now have possibilities, you know, that the voice that speaks on psilocybin is an out-and-out extraterrestrial, you know, with a, with its own history, its own evolutionary standards, et cetera. That it is what Jung would call an autonomous portion of the psyche that has slipped beyond the ego's control. Meaning, that you're crazy, or at least that you are experiencing a form of consciousness not validated by this society. Um....

I want to stick something in there too.

Yeah.

I agree with your analysis, but I don't share the same faith that we will inevitably make it as a species. Because what I see happening in a collective conscious/unconsciousness or that unconscious becoming conscious, is a struggle of whether to live or to die. And although I believe and hope certainly it decides or we decide for life. I don't see that as inevitable.

Well, this is the question "Is God mad?", you know? Are we living in a universe run by a mad god, where the choice for death could be made as easily as the choice for life. This is what the Gnostics of the Hellenistic era feared.

That isn't quite what I'm saying though, because I think the, yea, or a subordinate consciousness, but made up of all of us. So our individual decisions of consciousness I don't think are relevant to the totality.

Well, is it built up of, is it an, is it a bottom-up thing, or a top-down thing?

I think it's a both. I don't see how, in, in this level of talking how you can really separate out all the elements. Um, and if you talk about cells in your body, uh, yea they don't go off a live a life of it's own, it's all coordinated. But it isn't coordinated by one thing in the body. The whole body coordinates itself. And each cell is a part of the coordination [inaudible].

Yes, that's right. Yes, I see what you're saying.

How do you find a local ayahuascero? [Laughter].

Aha!

These are not the ones...

Well, I'll tell you, uh, [Terence laughs].... A few years ago, we bought, uh, 10 acres in Hawaii, and moved as many of these Peruvian drug plants as we could get, uh...[laughter]...in there. So that was four or five years ago. Now those plants are grown and hopefully the next time we go back to Hawaii, we'll be able to produce ayahuasca. We're calling it Hawayahuasca. [Audience laughter]

Oh no!

Other than that, I don't know what to tell you. These things, the...Botanists don't think in terms of live plants. They always make voucher specimens. So we were, in 1982 or 1 whenever it was, we were really the first expedition looking at Amazonian psychobotany, that really put emphasis on live plants. And we got out hundreds of them, you know? But then growing them they can only be grown in green houses or in the subtropical environment. But eventually, we're hoping that, uh, researchers who need, who want to grow the plants can buy stock from a place like that, and not have the expense of having to send an Ama, an expedition to the Amazon.

I find it hard to build a shamanic institute in Ecuador. And, uh, it's just an interesting idea we're tossing back and forth.

Well, when we originally conceived this idea of a psycho-botanical farm, we bought land, uh, near Florencia in the state of Cauca, in Colombia. And then it become politically unfriendly to foreign scientists and, and so we stayed away for years. And then I just read last week, 13 tonnes of cocaine was busted in Colombia, and it was all in Cauca. So I assume, it'll be years before it's cooled down enough to do it there. And I like the idea of doing in Hawaii. It, the Amazon is so difficult an environment to carry out even minimal field studies in, that it's very hard to do much other than interview the informants, collect the vouchers, collect the drugs, and get out. Because, after two or three weeks, you're really beginning to show the strain. I mean, it's hard to sleep in hammocks. So you go into a kind of never asleep, never awake. And the strange diet, the intestinal problems, insect toxins. Uh, people are not always 100% cooperative and honest. Um, [laughter] numerous problems. And since we were not ethnographers or anthropologists per se, our real focus was on the plants and the drugs. So hopefully in Hawaii, a more, uh, commodious and low-key atmosphere can be created for experimenting with these things.

This relates to your question, which is "How can an exper, how can a group of people create an experimental context for doing these drugs with an eye toward making some kind of progress or, or getting something out of it"? And it's a real challenge. We were amazed when we went to Peru and began taking ayahuasca. We had never taken drugs with groups of 30 people, you know? We had either taken them, uh, alone or one or two people, or occasionally with 100,000 other people at a rock concert. But the notion of 30 or 40 it's very intense. And without a tradition, uh, it will be even more demanding. But it's important to do. The whole problem in psychedelic research is the, um, reluctance to have human subjects in the picture, you know? As soon as that begins happening, the institutions and the government, and people's wish to make careers rather than to actually do original work. A whole bunch of factors come into play that make it very, very frustrating. And yet, the LD50 in rats, the absolute structural determinations, the botany, the chemistry, the linguistic studies can only go so far with this stuff. The real thing is what does it do?

I think that, partly because in science, human experience isn't considered a valid subject of study. And so that's, you know, so people don't ask those questions because, well, you can't quantitate it and you can't...

That's right.

Why don't you get bold and get the mental health grant to do it?

Well, I think this is Dennis' notion. What, what he wants to do really, and I think he has Frank Barr interested and some other people, is, uh, return one more time at least to the Amazon, and study them taking it. And actually take blood samples, and study diet, and get a re--a full biomedical study of what's going on. And that should be sufficient data, then, that you could, could get a grant for human experimentation in this country. All this remains to be done, but, the work is just beginning to be done in psychedelics. Essentially the botany is now well in hand. There are only botanical details now. But the chemistry, the pharmacology, the neurophysiology, the psychology, these are just wide open areas.

I'll take the opportunity to thank you for, uh, doing what you're doing. The, I can't remember since sitting like this in India. Being so alive and fireworks going off, that..

Oh well thank you very much.

Hear! Hear! [Laughter]

I would like to hear from some of you who've been so silent. [Terence laughs]. People who have, are either appalled that we're this deep into this stuff [all laugh].

Let me preface the question, um...From my own meditative experience, I feel like I'm just beginning to get to a point where I can feel how energy and stillness are both necessary. And, in, like the existential, phenomenological sense that they co-constitute one another. It cannot be one without the other. And, by energy I mean all its forms too, including Mind, as you, uh...for me was good to hear another way of saying that Mind, the idea of Mind from the [??] and yoga philosophy, that, and the reality that someone else feels is comforting. [Terence: "Mmhm"] Including the intellectual stuff. All that form. In your experience with these cultures, these different cultures, is there a, I hear a lot about the energies of it. The form, et cetera. Is there any stillness work. Is there any, uh, is stillness sacred. Is there, is there a "meditative" quote/unquote tradition, or...

Oh yea! For sure. Yes. It doesn't call itself that. It calls itself trance. But trance is, is not a state of unconsciousness. It's in fact a state of full alertness. But you can't move. And you don't experience this as paralysis, because you don't care to move. But yes, I think that you, that there must be stillness for these things to manifest.

One of the most puzzling things about psychedelic drugs is, trying to teach people how to invoke the modality. People have the attitude toward drugs, if you take them they will work. And this not true at all, especially with drugs where a modality like Mind is what you're attempting to conjure. So that, you know, uh, a drug will potentiate you for a vision state, but number of other things have to be present: energy and stillness being, I think, the two most important ones. And then, a third factor which is, uh, the invocation. You must invoke it in some way. And it's hard to explain what that is. It's sort of like, you know, it, it, the

difference between being alone and with someone. You, though you are alone taking the drug, you have to assume the I-Thou tension [phone ringing] and then you will discover the Thou on the other end of the equation. [Yes?] And so the stilling will allow this, and if, it's almost uh [Uh..can you call me after three? I have a meeting] ...sensory deprivation [Thank you.] is what's required. Not in the formal sense of [phone hangs up] a tank or anything like that. But you must sit still in darkness. And you must look at your closed eyelids with the expectation of seeing something. And then you will.

Within the cultural spoken discipline about mental stillness and the importance of that, or talking about the, the drugs or plants in terms that that would be a positive thing or...I'm just curious.

I think that the context is isolation. That's what they would say about this. They say, "Well we go into isolation. We put ourselves away. We put ourselves into a tree, or a cu, a cold hut, or something like that. And do not move around a lot."

I see that [inaudible]....

Well this question, though, of the roll of hallucinogens in, in Taoist practice is not, uh, not well understood. If you know James Ware's book, the number, the attention given to fungi is out of all proportion. I mean, their pharmacopoeia was largely fungal. The, there are no known psilocybin mushrooms from China reported. However, this is a place for somebody to make a quick reputation I bet. Uh, if you chose carefully where you went to look, I'll bet you find it. Because we know *stropharia cubensis* is in Thailand, Laos, and there is no reason at all that it shouldn't be in China. And it was in Southern China, that the Taoist pharmacopoeia was evolved and elaborated.

It's in the art.

...and he wrote a couple of papers I have copied....

Strickmann.

Strickmann, yeah. And he...

Oh yes.

Questioned.

Yes he's doing very interesting work in this all of this.

It's in German.

I think that, uh, hallucinogens are basic to humanness, and always have been. You know Carl Ruck and Wasson wrote a very convincing book to show that the Eleusinian Mysteries were an ergot, a cult of ergot intoxication. I thought that sounded totally crazy before I read the book. I thought it was going to be some flung-together case that would convince nobody. Actually [cough] I can't believe that it's anything else, having read the book. The evidence is overwhelming.

Well, Eleusis was the central wellspring of mystery for the Western mind for 2000 years. Everybody who

was anybody went to Eleusis, and had the experience. And, uh, there were times when the mystery was profaned to the point that, uh, writers can speak of wealthy Athenians who had the mystery in their house, were able to offer it to their guests after dinner. Well what kind of mystery is this? [Audience laughter] And, um, mmm, John Allegro wrote a much less convincing book, uh, The Sacred Mushroom and the Cross, trying to say that Christianity itself was a mushroom cult. In fact, going much further than that...

Oh yeah.

Saying that Christ himself was in fact no person at all, but a code, a system of coded epigrams for a mushroom. His case is harder to judge, because it depends on the knowledge of, uh, of Aramaic philology. But, uh, my brother has suggested to me, and in fact has, uh, set an outline for a book. He believes that consciousness itself arose in the higher primates in a feedback relationship with hallucinogenic plants. In other words, he would go much further than Wasson, who's saying religion was caused by a relat..He's saying thought itself was caused by monkeys relating to these plants. And we know from laboratory experiments that, if you set, uh, monkeys in a situation where they can, uh, smoke DMT by just walking up to a, uh, pipette and taking a hit, that 20% of the monkeys will refuse food and water in preference to that. Well, now, [laughter]. So, if that [laughter]. We'd rather be stoned! And, so having this predilection apparently it's simply--the shift is what they like. They like the thrill. The shift of modality from down to up, and up to down. But you stretch that over 100,000 years, and the next thing you know you've got the integral calculus, and the 384-byte chip and all the rest of it. So it may be that humanness is a symbiotic relationship between certain plants and certain monkeys. And that you don't have humanness unless you have the plants and the monkeys together. This is why we may be the heirs of an inhuman culture.

In, in Colombia once I saw a graffiti, and it, my Spanish, I can't get it right. But what, it was, it was a picture of a mushroom, and it said "Without this you are not yourself." [Laughter]. So this is, you know, Arthur Koestler, I think it was in The Ghost in the Machine, said very clearly that he felt there was no hope for the human species without chemical intervention. That we cannot be the sharp fanged monkey, and the possessor of atomic weapons. And that we're going to have to chemically intervene to mute the monkey, uh, the monkey proclivities. And, uh, it may be true. But the, the depth of their influence upon us: our thought systems, language.

I hold the, the peculiar opinion that language preceded meaning, by millennia. That long before people could communicate, they discovered how interesting the small mouth noises were, and made them for each other as a form of entertainment, which then bifurcated into chanting and singing. But it was very late in this experiment in the small mouth noises, that someone got the idea that you could assign a meaning to certain mouth noise, and everybody would agree that that's what that noise meant, and then you could discuss things. So, you know, we're creatures of language and thought, and uh, probably because these drugs, these plants first kicked that over in us.

I'd like to go back to drugs and consciousness. [Laughter] Stop right there for a minute. Um, are you...There are several ways a person can take that notion, really, in several different directions [inaudible]. On the one hand, you could be suggesting that the experience itself of a hallucinatory state is such a, um, different experience from normal waking consciousness that it demands thought to come to terms with it. And I don't think that's a very tenable line because the dream state itself would have similar experiences. We know that chimpanzees and lower primates are dreaming, so that doesn't seem to be too far. Um, the other way would be to say its the actual communication with more developed intelligence that is inducing thought in our species. The way we're doing that now with chimpanzees and teaching them sign language. They're starting to develop humor and things like that.

Mm hmm. Mm hmm.

If you wanna go that way too, then you have to then get to: How did that being itself develop consciousness. But, uh, it's an interesting line but I don't think it would stop there where you want it to...

Well, the way I think of it is a third possibility. A kind of a geometric model. Which is just to say, here you have a grid called "experience of the world", and they we have "waking". So that's a dot on the grid. Then we have "dreaming", that's another dot on the grid. But you can't construct a 3-dimensional reality till you have a third dot. And this what the psychedelic experience is providing. It's providing a reference point for the production of new metaphor. So that it isn't really, it isn't, and you really notice this with acid, it isn't the taking of LSD that is so important, it's the talking about it. That having, in other words, the reference point. Remember when we were all freaks, and all we talked about was how, uh, how in the light of acid everything was "thus and so" and "thus and so" and it took about five years longer for some of us, [laughter] uh, to assimilate that. So we no longer had to run around saying how everything was in the light of LSD. We had integrated that point on the grid. And I think that's what it is, is we tap in to...worlds of experience. And each world of experience taps, uh, across, stretches our metaphors, is a boot in a tail for further evolution of language. And that's all the evolution we have now.

I said this earlier, but it's a point worth making again. It isn't culture that's changing and carrying everything with it. It's language that's changing, and it carries culture with it. Culture lags far behind. But the evolution of language is the evolution of reality. And this is a cliché but we, the challenge of the cliché is to make it operational, so that like God, when you utter a word, it becomes so. You know?

Um, you see, what do you reflect on in terms of the origins of the use of hallucinogens and that whole, you know, scheme of the sort of negative of it. You know, the, literally. When you're talking a great deal about the sort of evolutionary potentials. And I'm curious about, you know...

Negative potentials.

Yeah. Negative potentials. And how we deal with those foreseeable.

Well, uh, the only answer I can give is probably not a very good one. The forces of, uh... Let me put it a different way. The government gets to everything first. And, they have been at the problem you ask for 20 years with an amazing little success.

I worked for the Department of the Interior for a while. I can tell you why... [Laughter]

Well there are many reasons why. But it doesn't seem very pervertable. They were very excited at first, you know? But then, and I think what they got into, although perhaps you can say more about this cause you probably follow the literature. They like to give, uh, psychedelic drugs to people and then hypnotize them. And then get them to do terrible things, which they wouldn't remember later. And claims were made that this was possible or being done. But it certainly didn't seem to come into wide application. They also looked at, during the Vietnam War, they want, they built artillery shells which would deliver aerosol DMT. Uh, they envisioned, uh, dropping one of these aerosol DMT bombs, uh, on a Vietnamese town. Everyone falling into this intense hallucinogenic state, and they could just roll right in. But, like plans [audience laughter] in the 1960's, radicals had. There was the fantasy of poisoning water supplies with LSD. Well it

just turns out that they're chemical factors and buffering problems, and it just does not very easy to do these things. I suppose, maybe I'm too sanguine about it and irrationally so, because when I asked this question of the Mushroom Entity, the perversion of this.

Yes, good.

I was told, uh, that it was good in such a platonic sense, that you could only approach it if you were good. So that it was like ethical mercury. The grasping hand [audience laughter] would sign that it flowed right through it, and there was nothing left. But I may be God's fool, you know. That may be...[audience laughter]. Certainly we know the Nazis used scopolamine as a truth serum. Although now when you look at the damn scopolamine it's not very impressive. People don't, they lie as much as they tell the truth. So it's a little puzzling as to why. But it, definitely, uh...

Language [is called??] a truth serum.

That's right. That's right. [Terence laughs].

Also I have to agree with what James calls the cognitive imperative. [??] happens because [inaudible]

That's right.

And, uh, so a lot of other use of, all these things, may depend a great deal on what people believe happened.

Very true.

And also technology is the production, is the, uh, you could think of it as the residue of the workings of the imagination. And the imagination is not, is under the control of the, the Superego or the Overmind. So I think technology has a weird way of always escaping the intentions of, uh, those who are working with it. A perfect example would be the, the chip which makes possible the personal computer. That thing was developed under contract to the Air Force by I think Sperry Rand. And, when it was finally finished, it didn't work right. It was far too slow. They wanted it for guidance systems of missiles and this kind of thing. So this thing is 1000 times too slow. It's just baloney. It's worthless. Toss it in the waste basket. But somebody said "But wait a minute! You know what you could do with this?" [Audience laughter] And created, you know, an information revolution that must be absolutely appalling to the forces that wished to control. I have an Apple II computer, and a \$350 modem, and, uh, I can access the, uh, Defense Department databases. I can access, uh, all, uh, the complete shelf list of the Library of Congress, all chemical abstracts. In short, all information in the world I can access from my living room in Sonoma County. And so can anyone else who buys \$1000 worth of equipment. This was not part of the plan [audience laughter]. This is a fact that terrified them.

And, my God, these computer networks where, as an example. A few years ago someone invented a device, this is an anecdote that will give you the idea. Someone invented a little device which looked like a ball point pen. And it was this small cybernetic device that could be programmed with a category. Like, let's say "stamp collector" or "sodomasochist". When you wore this pin, if you got near anyone else who was wearing a similar device programmed with the same word, your pin would begin flashing a little light. The notion was, that these things could be sold who hang out in singles bars, and would create a dimension

neither public nor private. [Audience laughter] A new dimension, where people of similar interests could get together completely [audience laughter]. Isn't that interesting? And this thing had a range of 20 feet, OK? [Audience laughter] So now comes a thousand dollars worth of cybernetic equipment and the telephone, and it's the same device. It doesn't clip into your shirt pocket, but we've extended the range to include the entire planet.

Think it had a search program on it too.

Oh you do, you go into these, you go into these computer networks, and you say, you know, "Who listed, who listed that they were interesting in: mushrooms, psychedelics, psilocybin, consciousness altering drugs, hallucinogens?" And then, out of 70,000 users on the network, in four and a half seconds it tells you that 12 people listed one or some of those words. You immediately type a little letter to each one, shoot it off through the system, and you're in contact with those people. This makes conspiracy [audience laughter] on a level almost impossible to conceive. A form of liberation. And, uh, these kinds of hard-wired technologies are simply patriarchal, um, follow-ons to the feminizing of consciousness that is happening in drugs. In other words, the, you can almost think of, uh, drugs as the software and cybernetics as the hardware of what is being done. But vast areas are being opened up for human interaction. Completely unregulated by any kind of institution. And these will create new kinds of social realities.

Like a new kind of psychedelic experience.

Right [audience laughter]

It is a psychedelic, uh, it's a hardwired psychedelic experience. You are, people think, uh, tend to think of computers as masculine I guess, because, the first generation of people who built them were male. But what they actually are, are the mysterious mama-matrix of information. It is like the unconscious *made conscious*! The unconscious is...these seem to be unconscious. All information is rising into this dimension of accessibility. So that you need not wonder how many people died of tuberculosis in western Nepal last year [audience laughter]. You just key into the biomedical index and you find out. So, I'm, and this seems to me, you know, the word psychedelic has been, uh, attached to the drugs and confined. But many things are psychedelic. Anything which expands, adumbrates, aids and, uh, and supports consciousness is psychedelic, if we take the word down to it's, uh, Greek roots. So this is, uh, this is very exciting.

~*~*~*Part Three~*~*~*

First how do you see the roll of the I Ching, um, in all this?

[Laughter]

Such a question, so late in the game. [Laughter]

Well, the I Ching, you asked about stillness concepts. The I Ching is, uh, a very old system of something that, uh, was created out of the combination of, uh, Taoist yogic techniques and, um, mathematical curiosity. What was happening I think, was that in states of deep meditation modalities were observed, you know? It says in The Sundara Pundarika, uh, Tantra Sutra, uh that when the Buddha attained enlightenment, through the night, he watched the causal uprising and down flowing. And, this is what you

see in these deep states of, the, it's called stilling the heart meditations. You see the passage of modalities of some kind. They're elements. And the Chinese noted that there were 60, seemed to be 64 of them. Or you only needed 64 terms to describe them. And they sensed that it was something about time. But they, they had... Their linguistic and categorical imperatives were such that they didn't see it the way we would. They, um, they assumed these things to be, uh, like archetypes.

What I suggested was that they were actually varieties of time. And actually there was a 16th century Chinese, uh, philosopher who pulled this all together out of the ancient sources, and said, you know, "The hexagrams are descriptive of time. They're hierarchically structured at many levels." So that on one level, hexagrams are, are influencing a situation and passing away at a rate of many a second. And on another level, at a rate of many a minute. And on another level at many an hour. And on another rate at, on another level at a rate of a few per century. And it is the, um, the interpenetration of these modalities on various levels that finally issues into what we call the here-and-now situation. And, um, it's too complicated to go into here, but there is a way of looking at the sequence, and structuring it that allows you then to draw maps of novelty's ingress into time. To create a completely non-scientific theory of time that is nevertheless not a cult, meaning has no hidden elements, as completely mathematical and predictable and self-consistent.

This was more of my question, in that you're talking about information and structures being generated in new ways through computers, and the effect of the I Ching on our culture. In the formation of a cultural understanding of time. And if there's a conflict because, you know the computer structure [inaudible] internal inconsistent structure. And the I Ching isn't illogical, but also internally consistent structure.

Well like DNA, these vary large systems of very large numbers of elements can, can have, uh, irrational inputs and still have everything end up in the right place at the end. I mean if you read Pogorian's work, where you discover that global rules govern situations which, when analyzed very locally appear highly chaotic. And this what the I Ching is saying. I mean, here we have a world which appears highly chaotic, but when analyzed at higher levels, uh, turns out to be, uh, describable by, uh, very rigorous methods.

So the converse is true too, that what seems to be a very orderly structure in a computer network is on a higher level actually chaotic.

That's right. This problem of order and constraint is a very difficult one. For instance a sociologist can tell you, that in the next 12 months, I don't know what the number would be but lets say, 30 people are going to jump off the Golden Gate Bridge. Well now, does that, so then someone jumps off the Golden Gate Bridge. Well think they're despondent, they've lost their job, they don't want to live any longer. Are they free? How free are they, if at the end of the year, we look at the wreck and say "Yes it certainly is true. 30 people jumped off the bridge just like you said they would." So apparently there was almost no freedom in the total system. It came in right on the dot. Yet every one of the people who jumped off the bridge felt they were making a, uh, completely independent choice exercising free will. Where they free?

Which goes back to what we're talking about [inaudible]...It seems that ...

Perhaps, or it may be something else. It may have something to do with how probability works, you know?

Yeah.

It's not clear that probability is a good way of, uh, uh, uh, describing nature. The only time we get, uh, randomness is when you examine the output of a random number generator. There is no other process in nature that can be relied upon to produce random numbers. Yet we use the notion of randomness. Our entire physics is probabilistic and statistical. And the notion of randomness, a very unexamined philosophically, notion centered right in the middle of things. And it may be a kind of fudging. What we think is an explanation, that things are probabilistic, is actually a statement of complete ignorance. That we don't know how things work so we say they're probabilistic.

[Inaudible]...Well there's a pattern, or there's a norm. But nothing really fits the norm. So you always have to describe it by approximation.

That's right.

So, that's where the probability of humans getting close to this approximation and using this tool Because everything is a dynamic state. You can't quantify this except on a moment by moment basis hence a static model. [Inaudible]

But it's created all kinds of consequences that were not expected. Like the notion of, uh, the citizen. And the way democracy is. And the way power is a portion. Because we have these probabilistic and statistical notions about, uh, human beings. Politically we atomize ourselves. We say, you know we live in a fiction but all citizens are equal. Which is absolutely poppycock. It's simply that how else can we have the kind of social system we have, and have it function? So the tools you have to be aware of the tool...of what the tool does to you, as well as...yes.

McLuhan should be looked at more carefully. I mean, McLuhan was never correctly centered vis-a-vis the psychedelic phenomena, the way he should have been. People thought he was talking about the impact of television and print and this sort of thing. What he was really talking about, was how cultural, uh, uh, inputs to sensory modalities change self-definitions. And the drugs have done that to a great extent.

[Completely inaudible from audience!!]

Although this abolition of the future is a controversial thing. For instance, I try to produce maps of the future with the I Ching on my computer. And people say "You want to destroy the future! You want to take the surprise out of being." Well that seems to me rather silly. I mean, if you tell me you're going to South America, and I give you a National Geographic map of South America, have I destroyed the trip for you? Now there's no point in going, you know where every capitol city is, where the rivers run, how the mountains lay? It just ruined for you, you know? Um, I don't think so. Because what we are interested in are the details. Maps don't, uh, don't make it enough necessary to go to the places they portray.

...Somehow the rational conceptualization would somehow interfere with the intuitive flow of....

Yes. People don't want to feel that, uh, freedom has been compromised. You know? But I'm...My theory of time is not a predictive theory of events. I've just quantified one...one quality which I call Novelty. And following Alfred North Whitehead. And talk about how...History is the career of novelty ingressing into Time. And sometimes novelty comes fast and sometimes it comes slow. Consequently, its ingression rate

can be portrayed as a line graph. And in some periods, uh, there's very little novelty. There is disorganization and, uh, and, uh, compromise of connection. And then in other periods of history, we'll say Periclean Athens or, uh, Mogul Delhi or the 20th century, or, uh, the Nara period in Japan--there's great cohesiveness. But there's this ebb and flow of something which physics will not, uh, will not be found to describe. In other words, I like to make the analogy that science describes what is possible, what is possible. And what we need is a theory that tells us, out of what is possible, what is it that will undergo the formality of actually occurring? We have no theory of what it, out of possible sets of things why certain things will undergo the formality of occurring. And this is what we need.

...Science as, as, the way of looking at the world. We decided that that is what will come out.

But science only describes the most trivial kinds of events.

Whether or not we're the most worthy of forming our reality.

Well it's a good first try. Because what its simplest case, what sciences tells you is...What science is interested in is those situations where if the initial conditions are reestablished exactly, the process will occur exactly as it occurred every other time. The initial conditions are the same, the end state will be the same. But in all, uh, experience, this isn't true. I mean, if I say that I'm falling in love, and you once fell in love, that doesn't mean that the way your love affair ended is how mine will end. And so there is not guidance for understanding by extrapolation of past cases. And this is where we need help. Because this is where we feel and bleed, is in the realm of these, uh, processes where initial conditions are no guarantee of final end states.

But I wonder if we have that way to predict that to avoid pain and avoid suffering and avoid a certain notion of life.

You mean, we would fear to be victims?

Well, if we long to escape present feelings....avoid what was going to happen. And saying with uncertainty. I don't think that...

Well presumable if you have a theory which will tell you how, uh, a situation will evolve. Then you steer it the way you want it. You know? It isn't wrote. It isn't like a ball rolling downhill.

And of course you have to take, you're steering it consciously itself.

Well there's not escaping the input, the fact that it is, that there is a hand on the tiller. The uncertainty principle has to be expanded to include everything. And to actually, the notion of certainty is, the uh, culturally naive and unexamined, uh, notion.

See the problem with Western thinking and science especially is that, uh, it's a historical phenomenon. The oldest scientists were people like Thales and these people 2000 years in the past. This means that the most epistemologically fundamental assumptions of science are the least examined for, uh, flaw in their sophistication in the light of experience. The fact that we rely on an intellectual method 2000 years old, uh, almost precludes our understanding anything interesting. That's why people like Ralph Abraham, uh, with his theory of dynamics and Ilya Prigogine with his non-equilibrium thermodynamics, and Manfred Eigen

with his autocatalytic hypercycles...These are interesting new approaches because they, uh, they don't predict end states from initial conditions. They only predict broad target areas where processes can be expected to come to rest.

I think a great deal of anxiety would, would leave human society if we had this grip on the future. It's, uh, you can make a biological argument that what life does, leaving aside what it is, what it does is it conquers dimensionality. The earliest lifeforms were, um, had no impression of the world except that portion of the world which physically impinged upon them. In other words they had a tactile sense. And then very slowly light sensitive mela, uh, melanin chemistries were entrapped, and light sensitive cells arose so that light and darkness could be distinguished. And then, following upon that, uh, uh, motility. So that a third dimension would come. The dimension of space. And then as higher animals evolved with binocular vision and the ability to walk into the space perceived 3 dimensions were gained, intelligence, the unique human property of being able to command past experience as though it were present through memory, is like extending this dimension-conquering faculty to time.

And I think that the psychedelic drugs show that that's the way the evolutionary arrow is pointing in Man. Again, Mercea Iliade's statement about how the images of flight spoke volumes about the internal aspirations of the human psyche. We want to conquer dimensions. Life wants to conquer dimensions. And first it conquers the tactile, the immediate 2 dimensional space, then the immediate 3 dimensional space, and finally through memory the dimension of time is added in, and then theories of sort that the I Ching represents and my own ideas represent, whether or not they're true, they represent an effort to do for the future what the faculty called memory does for the past.

Well if they work at all, and in some sense they're mapping something. And as you're talking I'm realizing that what I was saying underneath it is that, um, I have used, uh, I Ching and the, uh, [?] a long time. And what I realize now I was dissatisfied with is they have to a certain extent alien philosophic systems [Coughing] had to stop using them. What happened was I started to dream more and more....what happened you know, one step two steps whatever down the road. And that's much more congenial to me. The problem really isn't due to [padding?] time but uh, if you do it through your own dreams then you have, you know [Coughing!!!] in those systems which is utterly congenial to your own way of feeling.

Yes, well sometimes you're trying to understand your own life, and sometimes you're trying to create a general theory of Being. And, these things will issue into different sorts of stances.

Mm hmm

Uh huh?

Would you say that intuition or imaginal mind is to the future, what memory is to the past?

Essentially, yes. I mean I believe that, uh, eschatological objects, if you want to put it that way, cast shadows backwards over the landscape of history. And that we, we are drawn towards these things. They're what C H Waddington called creodes. They are narrow, caramelized pathways of development that would take an enormous amount of energy to lift you out of that channel, and drop you somewhere else. It isn't impossible, but it's highly, uh, highly improbable. Uh, this is why religion cannot be dismissed, because religion is like the, the mass intuition about fate. And the religious ontology for the human species is generally eschatological. Not always, not in Buddhism, or, well, there are exceptions. But it generally is eschatological. In that we are seen to be in the grip of a backward flowing casuistry, that there is something

forward, the *telos*, so unwelcome in science.

Science insists on operating without teleology. And so its explanatory power is in proportion to that. But the sense of the *telos* is very great, and I think that it's physically there, that the, that what is really happening is there is, there are forward moving, meaning from the past to the present, causal, um, chains, and there are causal chains which operate the other way, from the future into the past. The present is the interference pattern caused by the backward and flow, the forward and backward flowing casuistries inherent in time. Where they meet, they form an interference pattern. A standing wave if you will. Which is what a hologram is. And its that which is experienced as now, and it is half of the past and half of the future. One of the interesting things I've noticed about the future...

I want to stop there cause I disagree in that I think that interface pillar requires operation of consciousness. That I notice while I'm doing therapy with someone, that its the reinterpretation of the past that changes causal lines in the past. That it's not simply something laid down, the past comes to the future into the present, but the interpretation of what the past was that makes it real.

But in that sense, the past is a part of the present.

Yea.

It was Proust who said the past can never be understood until it is remembered.

Yea.

And it's that...

And it's remembered in a totally different way. It's restructured each time we remember.

Yes. Nothing, nothing is fixed. This is for sure.

And in some ways it seems...to my clients it isn't the past they're really talking about but they're symbolizing certain aspects of their present reality in terms of certain memories, in terms of certain ways of seeing the past.

Oh the past is constantly, constantly changing. One could study the changing paths. Did you know the Renaissance was invented in the 1850's? It didn't exist until a German historian decided that's what had happened. And now we live in the light of the Renaissance, you know? It's just, we don't question.... Nobody was running around Florence talking about "how great it is that we're living in the Renaissance now", you know?

History is fiction.

History is fiction or Stephen Dedalus said "History is the nightmare I am trying to awaken from."
[Laughter]

I was wondering in [??]... the psychotropics get back to the...could there be an element to an entelechy...

At the end of time?

That is, uh, drawing us to the future.

Yes! I think so. I mean, I, I'm basically on this issue fairly Platonic. I mean, I think that, uh, you know Plato said time is the moving image of eternity. And that, I think, is probably true. That the, that eternity is all time, and when you, and it somehow exists in the higher dimensional matrix than what we experience. So that we can only section that dimension to create the 3 or 4 dimensional world that we live in. But, that there is this, uh, this Platonic completeness, at least in essence, whatever that means.

And that sort of carries me back to my Time Maps. They don't say what will happen, they only say that certain levels of novelty and its lack will be fulfilled at certain points in time by some set of events. You see the difference? So you can't have an absolute determinism. If you have an absolute determinism, you preclude the possibility thought meaning anything. It just means I'm saying what I'm saying because I have to say it. You're thinking what you're thinking because you must think it. So an absolute determinism is hopeless and indefensible. And destroys the intellectual enterprise entirely. So we have to have a free future, but how free, you know? Looking at the case of the Golden Gate Bridge, and the number of people who will jump off it. And certain things are very, uh, bound. The time of sunrise tomorrow morning. You wouldn't feel great trepidation about making a prophecy about that. But, nevertheless, forces could be invoked which would make it rise earlier or later. But it is very much embedded in the matrix of inertia. That everything interesting is not, is much more up for grabs.

Yes.

What psychedelics do, and I begin this as a kind of summation, is they enrich experience, which sounds trivial except that experience is all that we have. One of the things, if I, if my career or whatever it is could be said to be about one thing, it's the notion that your understanding depends upon your self. In other words, no myth of the tribe will satisfy these myths like science and religion and politics. They do not satisfy. Uh, when I talk about this I usually mention the notion of the flying saucer. People who believe in flying saucers, as alien spacecraft, nevertheless so undervalue their own identity that they believe that it will, that contact will come to the Secretary General of the United Nations, he will assemble Time, Newsweek and the reporters from the Economist, they will get together with Carl Sagan and whoever [laughter], and they will all explain it to all of us, and they we will understand what's going on.

This is a, um, a sold out point of view. You have accepted their definition of you as a citizen. The real fact of the matter is an anarchy of the imagination, where each one of us is our own Magellan. We are not living in the age when all frontiers have disappeared, when all things have been tamed and made mundane. We're living in, uh, the most exciting era that has ever been! Because we are about to turn to the real terra incognita, which is the terra incognita in our minds. And, uh, it is for us to do. And this is why the drugs are so controversial, because they free you from the myth of the tribe. And that single fact, the fact that they decondition you, they don't decondition you at the chemical level, like make you forget everything you believe so you have to start over. They decondition you at the ideological level. So you just look around at the society you're in and its contradictions and preposterous assumptions are perfectly visible to you. And that frees you then to create a new world, through self experience, not by taking Heidegger's word for it, or somebody else's word for it, but creating it through your own experience. And this is what we should all be involved in, and this would carry us to psychological balance. It's trying to make sense of our intuitions, in the light of the enormous pressure to accept pre-packaged ideologies, which makes neurotics of us all. And the only, the only way out of that is to step back from it, and say "I will only

believe what I know. I will be like someone from Missouri", you know? "Show me and I'll believe it." This is why I always, my favorite person in the New Testament is, uh, is Thomas the Doubter. Because if you'll recall, uh, Christ, uh, returned to the apostles were gathered in the Upper Room. And Christ came to them I think from the 40th day. But Thomas was not there. So then, later and then Christ went away and so then Thomas came and they said "The Master was with us." And he said, you know, "You guys have been smoking too many of those little brown cigarettes." [Laughter] "The Master has gone from the plane. Unless I put my hand into the wound I will not believe it." So then a few days later, Thomas was with them, and Christ came again. And he said to him, "Thomas, put your hand into the wound that you might believe." And he did. And he believed. OK so what, what conclusion do we draw from this story? The conclusion is [Laughter] that of all of the people, of all of the disciples, the only person in all of human history recorded to have actually touched the incorporeal body of the risen Christ was Thomas the Doubter. And he was allowed that. He was vouchsafed that unique, uh, um, blessing because he doubted.

He doubted.

And that's, yes he insisted on experiencing it himself. And so he touched the incorporeal body, the White Stone at the end of time. And this is what we are trying to do, because, you know, if you can get your hand on the door knob, you can turn it and walk through. And, uh, the Secretary General of the United Nations need not be at your elbow, nobody need be at your elbow. And this is what shaman know. They have touched the door knob, turned it, and walked through and they are out of time, and out of history, and they're immense personal presence, or at least the immense personal presence that I have experienced, uh, among the ones who were genuine, is because they have taken responsibility for their model of the world, and have modeled the world based entirely on their own experience.

Yes

One question. I was never exposed to drugs, never tried you know anything. And the way you're talking to us...this is the only way to, uh, view where to become awareness of our own being, our own...Uh to me the experience uh, came to me, uh, with [?] exercise. Which without any drug, without anything. My life changed to this because I became aware of a different dimension that I was never aware of before. But it was without drugs without anything.

Yes well...

So how do you explain this?

No I don't think drugs are the only way. I think that they are the most effective way when you're talking about transforming an entire society, or a planet. But there's you know many shaman are not drug users. We've here spoken because we spoke mostly of Amazonian shamanism, as though the use of hallucinogens in shamanism are always co-present. Not necessarily true. Uh, I have often people say "You mean you don't believe in yoga, you don't believe in ehhh.?" Well, I think that these things may be efficacious. I think we're caught in a culture crisis where there is real, uh, immediacy to the notion that we have to get on with it. But yes near death experiences.. um.

How do you compare the two experiences? Because to me I became very aware near dimension and my home....I had to learn that. Nobody ...??? And the world looked at me like it was supposed to be...And,

uh..???? How could you compare the two experiences? In any way?

Well, I guess you can compare them in their results. You can't compare them in their content. That's the thing. Yes.

Some people think you compare them with chemistry

That's true.

So. I think that um, there might be more similarities than when you first consider the point.

I'd like to get back to one of your concluding statements on how the use of the psychedelics will, um, decondition a society whose pathology. Now that doesn't seem to have happened in the Amazonians. It seems to have reinforced their mythology.

It was based on the plants.

Yes that's right.

Well we have no record behind them using this drug. We have no notion of what ideological transformations may have brought them to that point. There are tribes in the Amazon right next door to the people we're talking about who don't use drugs. And so we can't know what upheavals of ideology they have been through. When there is a tradition which, um, supports the notion of the deconditioned individual, then you get the notion of shamanism. We don't have any comparable institution. So that, there, if you are of a shamanic temperament, you will be selected out and put in that position. Uh...

But we, we do but we don't give it credence where the total....sort of context. We have sports for example. There's ample evidence for athletes entering into all sorts of shamanic experiences and experiencing [] with everything else, and not knowing what in the world's going on with the, you know? And they it just happens with Marathon runners and droves at these things experienced....Uh. Distance runners anyone who gets into hyperventilating tremendous physical activity. We do have that in our culture. It's a warrior type act against post war revealing It does exist.

It's also a question of how much you can decondition yourself in the absence of any other example. In other words, uh, if you're part of a nomadic Amazonian tribe there is no model, there is the social model of the tribe and the only thing you can decondition yourself into is acceptance of the secret non-public aspects of the ideology in the men society or something like that. Well then we have, uh, we have pharmacological means for intervening, where and we need them because we're at such a terminal state with this problem.

It's a personal response and also a social one.

That's right we need to talk about it. And it isn't necessary for everybody to go out and get loaded. It's more about participating in a new language of self reflection. This is what we need to do. Some of us should take drugs, the people, it's a professional kind of obligation. [Laughter] You know that's what a shaman is. He's the guy whose professional obligation is to take drugs. But we all have an obligation to

create a language that values us and the people around us. And this begins with a language that values the self, and our experiences. Experience, this is the central thing above and beyond all else.

I want to come back to something you were saying a while ago, and that was the conditioning of the culture. And, um, I just have a couple of observations I'm marking the reaction to. It's always a curious fact to me that uh, during the 60's as we were beginning to move out into space, we were also taking drugs at a ...rate. There was an inner and outer exploration going on there simultaneously. Out of that experience I think we have in some ways re-conditioned the society specifically in regards to the psychedelic experience and the ecology movement. And beginning to see things in more whole patterns. And I wonder if you have any comments about any of that?

Well, I think all of these things like the ecology movements, the, the hippies, uh, the dietary sensitivity. All of this stuff arises out of, uh, the awareness of the culture crisis. Basically traceable back to the Bomb. I think the bomb has had a wonderful effect on focusing people's attention wonderfully on problems that before they just tended to fly off in all directions. The thing I might say about space. I don't believe that you know we will go to space as we are, so that we're going to create you know a South Bronx on Mars and to slavery and the moons of Jupiter and this kind of thing. I think space is too much like the imagination. This enfolding velvet darkness that stretches to infinity. That cries out to have artistic objects dropped into it. Uh, it's uh, like going into the mind. Going into the unconscious. The same thing that we must do here on earth before we go to space. We must, we cannot afford the unconscious anymore. This is a concept that has to take its place with the high button shoe. We must be entirely conscious because we have the power to shatter the earth like, uh, a rotten apple with a stick of dynamite inside of it. So there can be no more talk of the unconscious or the freight of the primate body or anything like that. We have to get our act together, because, uh, nature is very ruthless and we cannot have, you cannot rest on the notion that there's some kind of Deus ex Machina [???] which is going to make it all right even though we blundered endlessly. So it's basically strangely enough a call to responsibility. Which is always what has always charged against psychedelic drug use is its flagrant irresponsibility. So its a pretty, uh, the lines are drawn.

Sounds like you've got a [pretty big job again]

I think so. Thank you all very very much for, uh, helping me think about all of this.

- [sound photosynthesis](#)

All right, well, it's nice to be back in San Francisco. I moved out of California about 8 months ago after 30 years and I still have ambivalent feelings about it when I see springtime coming on so very beautifully. On the other hand there are a lot of squirrels in the woods and I am sort of preferring to pull back from all that and do home projects, workbench projects.

I sort of think of these get-togethers, they happen periodically, cyclically, but unscheduled as a state of the stone addresses or an opportunity for the community to come together and everybody see who's here once again, who has survived, who's gotten out, so forth and so on. I'm very bullish about the situation. Fortunately I hold the theory that things have to get a lot worse before they can get better. So whenever I see things getting worse I assume that's the first step toward progress.

I think that in the time we've been getting together and talking about these things the general tone has changed dramatically. When I started talking about all of this, my audience was entirely my peers, old freaks. [audience laughter] And many of you were 10 years old. And now the message has been out there for about 12 years that psychedelics actually represent an opportunity for feeling, an opportunity to return to religion as it was practiced before the invention of the marketplace. And I'm very pleased as I go around meeting people and discussing this issue to see how much of the youth culture has become sensitive to the psychedelic issue. Because it really means that after 20, 30 years of unstinting distortion and misrepresentation by the media and some of the powers that be that nevertheless the curiosity is intact, the opportunity is available, and people have not been fooled by the effort to denigrate, dumb down, sideline, water down, sell out, white wash and screw over the idea that psychedelic plants are an excellent and necessary part of any program of spiritual self-exploration.

I'm not going to talk that much about this today because I think it would be preaching to the converted. I'm not even going to remind you that our evolutionary heritage lies in the use of psychedelics. That it was in all probability psychedelics that called forth our humanness. I've talked about this in numerous forms- it doesn't have to be particularly gone over today. Since this is a hometown crowd, since this is peer review, I would rather go to some of the stuff that plays more with the resistance in Des Moines and Cleveland and beta-test it here. [audience laughter] For there's still time to recant. San Francisco is an incredibly forgiving town. If you need to go somewhere and make a mistake this is probably the place. [audience

laughter]

Surfing on Finnegans Wake

Day Month 1995

Esalen Institute, Big Sur, CA

Description

- [Audio Link-YouTube](#)
- [Partial Transcription from DominatorCulture](#)
- [Other links](#)

Finnegans Wake is the, is the, uh, last, and most ambitious and most puzzling work of, uh, the British writer James Joyce who of course wrote Dubliners and Ulysses. And if Ulysses is the algebra of literature then Finnegans Wake is the partial differential equation. Uh, most of us break down at algebra. Few of us aspire to go on the partial linear differential equation. Um, in some ways I think it can be arguably said that this is the quintessential work of art or at least work of literature of the 20th century and Joyce intended it that way. Uh, Joseph Campbell called it a staggering allegory of the fall and redemption of mankind. Equally respected critics have called it a surrender to the crossword puzzle portion of the human mind. So, uh, the main thing about it is that it is linguistically dense. It is dense on every level. It has over 63,000 individual words in it. That's long- more words than most fictional manuscripts have words, period. It has over five thousand characters in it.

Uh, Ulysses was designed as a kind of...Joyce thought of it as his daybook. Uh, it follows the peregrinations of an ordinary Dubliner – this is Ulysses – an ordinary Dubliner through the vicissitudes of his day, his struggles to buy some kidneys to fry for breakfast, his chance meeting with his wife's lover, so forth and so on. A fairly straightforward exposition of the techniques of literature that have been perfected in the 20th century: stream of consciousness, uh, so forth and so on, slice of life.

Finnegans Wake was designed to be the nightbook to that daybook. So it was conceived of as a dream and one of the questions that undergraduates are asked to shed ink over is whose dream is it and what is this book about? I mean when you first pick it up it's absolutely daunting. There doesn't seem to be a way into it. It seems to be barely in English and the notion, you know, that one could, by spending time with this, tease out characters, plot, literary tension, resolution, this sort of thing seems fairly unlikely. Actually it's one of the few things that really repays pouring effort into it. The first twenty-five pages are incredibly dense and most people are eliminated somewhere in those first twenty-five pages. And so, never, really... It's a language and you have to gain a facility with it and you have to cheat, that's the other thing. There's lots of help cheating because it has spawned a great exegetical literature; all kinds of pale scholars eager to give you the Celtic word lists of Finnegans Wake or a discussion of, uh, the doctrine of the transubstantiation in Finnegans Wake, so forth and so on. Hundreds of these kinds of doctoral theses in Comp Lit have been ground out over the decades.

The reason I'm interested in it, I suppose I should fess up, is because it's two things clearly. Uh, Finnegans

Wake is psychedelic and it is apocalyptic slash eschatological. What I mean by those phrases is – first of all -what I mean by psychedelic is there is no stable point of view. There is no character per se. You never know who is speaking. You have to read into each speech to discover, you know, is this King Mark, Anna Livia Plurabelle, Humphrey Chimpden Earwicker, Shem the Penman, Shaun – who is it? Uh, and identities are not fixed. Those of you who have followed my rap over the years, I'm always raving about how psychedelics dissolve boundaries. Well, uh, Finnegans Wake is as if you had taken the entirety of the last thousand years of human history and dissolved all of the boundaries. So Queen Mab becomes Mae West, you know, uh, all the personages of pop culture, politics, art, church history, Irish legend, Irish internecine politics are all swirling, changing, merging – time is not linear. You will find yourself, uh, uh, at a recent political rally then return the court of this or that Abyssinian, uh, emperor or pharaoh, uh. It's like a trip and the great technique – I was thinking about this as I was thinking about this lecture – the great technique of the 20th century is collage or pastiche. It was originally developed by the, um, Dadaists in Zurich in 1919. Right now it's having a huge resurgence in the form of sampling in pop music and Joyce was the supreme sampler. I mean, he draws his material from technical catalogs, menus, uh, legal briefs, treaty language, mythologies, dreams, doctor/patient conversations – everything is grist for this enormous, uh, distillery. And yet, you know, what comes out of this once you learn the codes and once you learn to play the game is a Joycean story that all graduates of Ulysses will recognize.

I mean the main- what Joyce was about was an incredible sympathy with common people and an awareness of the dilemma of, uh, you know, being a Jew in Irish Ireland, being a devotee of Scholasticism in the 20th century and of dislocation and of disorientation of being the cuckolded husband, of being the failed divinity student. All of these characters and themes are, uh, familiar. It-it's quite an amazing accomplishment. There's nothing quite like it in literature. It had very little, uh, anticipation. The only real anticipator of Joyce in English I think is Thomas Nash, who most people have never heard of. Thomas Nash was a contemporary of Shakespeare and, and wrote a famous – I don't know what it means in that context – but a novel called, it was called the *The Wayfaring Traveler*. Anyway, Nash had this megalomaniac richness of language. This attitude that it's better to put it in than take it out and, and that's certainly what you get with Joyce. I mean, Joyce is so dense with technical terms, brand names, pop references, uh, localisms, uh. His- the way to conceive of Finnegans Wake really is like a midden, a garbage dump and there is in fact a garbage dump in the Wake that figures very prominently and what you as the reader have to do is go in there with nut pick and tooth brush and essentially remove one level after another level after another level and sink down and down.

And the theme is always the same, you know. The delivery of the word, the misinterpretation of the word and the redemption of the word in every level at all times and places. Uh, the reason I've now gone some distance toward explaining why I think of it as psychedelic; the reason why I think of it as eschatological and apocalyptic is because he really—you know, it's hard to tell because we don't have James Joyce around to ask – how much of this material he took seriously and how much was grist for his literary mill – but he was perfectly conversant with renaissance theories of magic. The entire book is based on *La Scienza Nuova* of Giambattista Vico who was a, a um... I don't even know what you would call him, a Renaissance sociologist and systems theorist. And Joyce once in a famous interview said 'if the whole universe were to be destroyed and only Finnegans Wake survived that the goal had been that then the entire universe could be reconstructed out of this.'

Some of you who are students of Torah, this is a very Talmudic idea, that somehow a book is the primary reality. You know – the idea in Hassidism in some schools is that all of the future is that all of the future is

already contained in the Torah. Then when you ask, well if its contained there, then isn't it predestined – the answer is no because the letters are scrambled and only the movement of the present moment through the text correctly unscrambles and arranges the letter. This is Joyce thinking for sure and it's, it's very close to a central theme in Joyce and a central theme in the Western religious tradition, which is the coming into being the manifestation of the word, the declension of the word into matter. And, uh, uh, in a sense what Joyce was trying to do, he was in that great tradition of literary alchemy whose earlier practitioners were people like Robert Flood, Athanasius Kircher, Paracelsus; these are not familiar names but in the late flowering of alchemy when the birth of modern science could already...the rosy glow could already be seen, the alchemist turned toward literary allegory in the 16th and early 17th century.

Joyce is essentially in that tradition. I mean, this is an effort to condense the entire of experience, all, all-as Joyce says in the Wake, all space-time in a nutshell is what we're searching for here. A, a kind of philosopher's stone of literary associations from which the entire universe can be made to blossom forth. And the way it's done is through pun and tricks of language and, uh, double and triple and quadruple entendre. Uh, no word is opaque, every word is transparent and you see through it to older meanings, stranger associations. And as your mind tries to follow these associative trees of connection, you eventually, you, you get the feeling, which is the unique feeling that the Wake gives you. It's about as close to LSD on the page as you can get because you are simultaneously many points of view, simultaneously many, uh, uh, dramatis loci, many places in the plot and the whole thing is riddled with resonance. Uh, you know, a man, uh, doing a task on one level is on another level a Greek god completing a task and on another level some other figure of some more obscure mythology. So really one thing about Finnegans Wake, it's like a dipstick for your own intelligence. What you bring to it is going to determine what you get out. And if you have read the books which Joyce was familiar with, or if you have armed yourself with such simple things as a Fyodor's guide to Ireland or a good map of Ireland or a good work of Irish mythology then, uh, it immediately begins to betray its secrets to you. And it's so rich that it's easy to make original discoveries. It's easy to see and understand things which probably have not been seen or understood since James Joyce put it there because he had this kind of all-inclusive, uh, intelligence.

Maybe I didn't make clear enough why that, to my mind, this is an eschatological phenomenon. This production of the philosopher's stone. It's about the union of spirit and matter. That's what the philosophers stone is about. And writing a book, which aspires to be the seed for a living world is about the union of spirit and matter as well. And the, the, um, Christian scenario of redemption at the end of profane history is another scenario of transubstantiate union; union of spirit and matter. This seems to be in fact the overarching theme of Finnegans Wake and of, uh, of the 20th century. In terms of the temporal context for this book. It was finished in 1939, a few months before 1939 and Joyce died early in 1939. In a sense he died in one of the most science fiction moments of the 20th century because the Third Reich was going strong; it had not yet been pegged down a notch, schemes of eugenics and thousand year racially purified super civilizations – all of that crazy early 40's stuff was happening and the book is surprisingly modern. Uh television appears, psychedelic drugs appear, all of these things appear presciently. He was some kind of a prophet and also he understood the 20th century sufficiently that the part he hadn't yet lived through was as transparent to him as the part that he had. He could see what was coming.

Well, that's by way of my introduction. I want to read you what some other people have said about this because I don't think I can say enough on my own. This is the indispensable book if you're serious about this, a skeleton key to Finnegans Wake. It takes the view that we don't know what this thing is so we have to go through it literally line by line and he tells you the story of- entire story in the one page version, in the

ten page version and in the two hundred-page version. Even in the two hundred-page version there are sections where Campbell simply reports: the next five pages are extremely obscure. Mark it! But uh, this is, uh, just a short section and one of the things about working with the Wake is - at first this language which is so impenetrable and bizarre, it ends up infecting you and you become unable to write or talk any other way. So I'll read you some of Campbell's introduction and I think you will see it's like the Wake itself except in baby steps.

Introduction to a strange subject. Running riddle and fluid answer, *Finnegans Wake* is a mighty allegory of the fall and resurrection of mankind. It is a strange book, a compound of fables, symphony and nightmare. A monstrous enigma beckoning imperiously from the shadowy pits of sleep. Its mechanics resemble those of a dream, a dream which has freed the author from the necessities of common logic and has enabled him to compress all periods of history, all phases of individual and racial development into a circular design of which every part is beginning, middle and end. In a gigantic wheeling rebus, dim effigies rumble past, disappear into foggy horizons and are replaced by other images, vague but half consciously familiar. On this revolving stage, mythological heroes and events of remotest antiquity occupy the same spatial and temporal plains as modern personages and contemporary happenings. All time occurs simultaneously. Tristram, Wellington, Father Adam and Humpty Dumpty merge in a single precept. Multiple meanings are present in every line. Interlocking allusions to key words and phrases are woven like fugal themes into the pattern of the work. *Finnegans Wake* is a prodigious, multifaceted monolith, not only the cauchemar of a Dublin citizen but the dreamlike saga of guilt-stained evolving humanity. The vast scope and intricate structure of *Finnegans Wake* gives the book a forbidding aspect of impenetrability. It appears to be a dense and baffling jungle, trackless and overgrown with wanton perversities of form and language. Clearly such a book is not meant to be idly fingered. It tasks the imagination, exacts discipline and tenacity from those who would march with it, yet some of the difficulties disappear as soon as the well-disposed reader picks up a few compass clues and gets his bearings. Then enormous map of *Finnegans Wake* begins slowly to unfold, characters and motifs emerge, themes become recognizable and Joyce's vocabulary falls more and more familiarly on the accustomed ear. Complete understanding is not to be snatched at greedily in one sitting (or in fifty, I might add). Nevertheless the ultimate state of the intelligent reader is certainly not bewilderment. Rather it is an admiration for the unifying insight, economy of means and more than Rabelaisian humor, which has miraculously quickened the stupendous mass of material. One acknowledges at last that James Joyce's overwhelming micro/macrocosm could not have been fired to life in any sorcerer furnace less black, less heavy, less murky than this, his incredible book. He had to smelt the modern dictionary back to protean plasma and reenact the genesis and mutation of language in order to deliver his message. But the final wonder is that such a message could be delivered at all.

Every book has to be about something. I mean, so what is this book about? Well, as far as anybody can tell, it appears to be about someone named, uh – well they have hundreds of names actually but for economy's sake, someone named Humphrey Chimpden Earwicker or abbreviated HCE. Humphrey Earwicker runs a pub in Chapelizod, which is a, a, uh, suburb or district of London and he has as it says, his lickle wiffey who is Anna Livia Plurabelle. Now these two people, this barkeep and his wife and their two children, Jerry and Kevin or Shem and Shaun, or, and then they also have hundreds of names because they occur on hundreds and hundreds of level – every brother struggle in history is enacted by the two boys, Jerry and Kevin. They are Shem the penmen and Shaun the other one and they, they dichotomize certain parts of the process. So here is, in one paragraph, this is the cliff notes version of what *Finnegans Wake* is all about. If you commit this to memory, you will never be caught wanting at a New York cocktail party.

"As the tale unfolds, we discover Humphrey Chimpden Earwicker is a citizen of Dublin. A stuttering tavern keeper with a bull-like hump on the back of his neck. He emerges as a well-defined and sympathetic character, the sorely harrowed victim of a relentless fate, which is stronger than, yet identical with himself. Joyce refers to him under various names, such as here comes everybody and haverich childers everywhere. Indications of his universality and his role as the great progenitor, the hero has wondered vastly leaving families - that is deposits of civilization - at every pause along the way from Troy in Asia Minor (he is frequently called the Turk) up through the turbulent lands of the Goths, the Franks, the Norsemen and over seas to the Green Isles of Britain and Ire. His chief Germanic manifestations are Wotan and Thor. His chief Celtic, Manannán mac Lir. Again, he is Saint Patrick carrying the new faith. Again Strongbow leading the Anglo-Norman conquest. Again Cromwell conquering with a bloody hand. Most specifically, he is our Anglican tavern keeper H.C.E. in the Dublin suburb of Chapelizod.

Like Ulysses, the ground zero here is the utterly mundane – middle class tormented Irish people embedded in the detritus of the 20th century. But there's an effort to never lose the cosmic perspective, never lose the sense that we are, you know, not individuals lost in time but the front ends of gene streams that reach back to Africa that we somehow have all these ancestors and conflicts, warming and storming within it. It's a, it's a very glorious, psychedelic, heartfelt, Irish view of what it is to be embedded in the mystery of existence.

Well OK, enough arm waving, now let's cut the cake here:

riverrun, past Eve and Adam's, from swerve of shore to bend of bay, brings us by a commodious vicus of recirculation back to Howth Castle and Environs.

Sir Tristram, violer d'amores, fr'over the short sea, had passencore rearrived from North Armorica on this side the scraggy isthmus of Europe Minor to wielderfight his penisolate war: nor had topsawyer's rocks by the stream Oconee exaggerated themselves to Laurens County's gorgios while they went doubling their mumper all the time: nor avoice from afire bellowed mishe mishe to tauftauf thuartpatrick: not yet, though venissoon after, had a kidscad buttended a bland old Isaac: not yet, though all's fair in vanessy, were sosie sesthers wroth with twone nathandjoe. Rot a peck of pa's malt had Jhem or Shen brewed by arclight and rory end to the regginbrow was to be seen ringsome on the aquaface.

The fall (bababadalgharaghtakamminarronkonnbronntonner-ronntuonnthunntrovarrhounawnskawntoohooorderenthurnuk!) of a once wallstrait oldparr is retaled early in bed and later on life down through all Christian minstrelsy. The great fall of the offwall entailed at such short notice the pftjschute of Finnegan, erse solid man, that the humptyhillhead of humself promptly sends an unquiring one well to thewest in quest of his tumptytumtoes: and their upturnpikepointandplace is at the knock out in the park where oranges have been laid to rust upon the green since devlinsfirst loved livvy.

So, now, granted that the first pages are dense and it isn't all this dense because even though the concept of fractals lay years in the future, the effort here is to tell the whole damn thing in the first word. To tell it again in the next two words, then to tell it again in the next three words and so on. So here in these first roughly three paragraphs, a huge amount of information is being passed along. Uh, first of all, uh, we're given a location if we're smart enough to know it. Riverrun, past Eve and Adam's, from swerve of shore to bend of bay, brings us by a commodious vicus of recirculation back to Howth Castle and Environs. Well, now, if you know the geography of Dublin, you know that's where you are because, and notice Howth Castle and Environs is HCE. These initials recur thousands of times in this book always bringing you back to, to remind you that this has something to do with Humphrey Earwicker.

What this first sentence says is: riverrun. It's the river Lethe, which we will meet in a thousand reincarnations because Anna Livia Plurabelle is the personification of the goddess river. The river runs past Eve and Adam's and there is a church there on the shore named Adam and Eve in Dublin. From swerve of shore to bend of bay, then this strange phrase, "brings us by a commodious vicus of recirculation". This announces the great architectonic plan of the Wake. That it is fact going to be based on the sociologica; ruminations of Giambattista Vico's Scienza Nuova. The vicus mode of recirculation because as I'm sure you all know, Vico's theory of the fall and redemption of mankind was that there were four ages – I can remember gold, silver, iron and clay, I think – and so this idea of the recirculation of the connectedness of the cyclicity of the-as he says, the same again, again and again. Finnegan and again; the same again. This is one of his great, great themes is the recurso. Everything comes again, nothing is unannounced. Every love affair, every dynastic intrigue, every minor political disgrace, and a minor political disgrace figures very prominently in this book because as the carrier of Adam's sin, the great dilemma for Humphrey Earwicker is he is running for a minor political post, Alderman, but apparently one night, uh, rather juiced – there's many versions and you hear them all and they're all given in dreams and mock trials in an accusatory fantasy. He either innocently took a leak in the park or he fondled himself in some way in the presence of Maggie and her sister in such a way that his reputation is now at great risk and it all depends on the testimony of a cad – a soldier or perhaps three soldiers. It's never clear. It's constantly shifting. And, uh, this question of, uh, what happened when by the mund of the magazine wall, where our maggy seen all, with her sisterin shawl haunts the book because on it turns the question of whether H.C.E. is a stalwart pillar of the community or in fact a backsliding masturbator and a monster as one always is if one is trapped in a James Joyce novel.

Uh, then this puzzling list in the second paragraph is simply a list of things, which haven't happened yet. Sir Tristram, lover of music, violer d'amores, fr'over the short sea, had passencore rearrived from North Armorica on this side the scraggy isthmus of Europe Minor to wielderfight his penisolate war. Now this word penisolate is typical Joyce punning. Peninsulate war because obviously it's being launched from Brittany. Penisolate war because Sir Tristram is the great archetype of the lover and, uh, so his war is penisolate. So that's the first thing that has not yet happened, it's telling you. Sir Tristram has not yet come to Ireland to put it simply. Ummm, "nor had topsawyer's rocks by the stream Oconee exaggerated themselfe to Laurens County's gorgios while they went doubling their number all the time." Now this is further obscurity. There is a stream in Georgia and topsawyer is a reference to Tom Sawyer because Tom Sawyer was Huck Finn's friend. Huck Finn is Finn in America. There is a huge amount of Mark Twain that has been poured into these books because of the Huckleberry Finn connection; Finn in the new world. Um, and Topsawyer's rocks is a reference possibly to testicles and so forth and so on. Every single word you can just take a word and go into this and- until you exhaust yourself. And then the next thing that has not yet happened: nor avoice from afire bellowsed mishe mishe to tauftauf thuartpatrick. Tauftauf is Celtic for thou art baptized, so Saint Patrick has not yet baptized in Ireland.

Not yet, though venissoon after, and the venissoon is a pun on[...?] had a kidscad buttended a bland old Isaac. It's a reference to the Isaac/Esau tale in the bible. It's also a reference to Isaac Butt who was a figure in the politics of the Irish rebellion. Not yet, though all's fair in vanessy, were sosie sesthers wroth with twone nathandjoe. That's at this point a very obscure reference but there is a great incest and sister theme in Finnegans Wake and the twin- the mistresses of Jonathan Swift become carriers of a huge amount of energy in here as do the mistresses of Thomas Stern, uh, because it's better to be swift than stern, or something like that.

Uh, and then the last of these things which hadn't happened yet – "Rot a peck of pa's malt had Jhem or Shen brewed by arclight and rory end to the regginbrow was to be seen ringsome on the aquaface". That seems pretty obscure to me. According to Joseph Campbell, it's simply a reference to the presence of God moving over the waters, uh, in the first lines of genesis. "Ringsome on the aquaface". Then this phrase, the fall and the multisyllabic word ...bababadal...that word. These are the Viconian thunders and they announce the beginning of each Viconian age. And, and when the thunder speaks, you know then that you're into a transition. Then it actually launches in the last paragraph into a fairly straightforward evocation of at least the mythological, uh, Finnegan. As you all probably know, there is an Irish drinking ballad of great antiquity called the ballad of Tim Finnegan, or the Ballad of Finnegan's Wake. And it tells the story of Tim Finnegan who was a hod carrier, a bricklayer's assistant, and he was given to, uh, hitting the poitín rather hard and he fell from his ladder. It's the Humpty Dumpty story. He fell from his ladder and he broke his back and his friends waked him in the grand Irish fashion and at the height of the wake, they became so carried away and intoxicated that they upended a bucket of Guinness over his head and he revived and joined the dance.

(plays ballad)

This is the resurrection. I mean, Tim Finnegan is very clearly for Joyce a Christ figure and here is then the first evocation of Tim Finnegan. The fall, then the Viconian thunder, of a once wallstrait oldparr, which is just an old person, is retaled early in bed and later on life down through all christian minstrelsy. The great fall of the offwall entailed at such short notice the pftjschute of Finnegan. Now this p-f-t-j-s-c-h-u-t-e, pftjschute, is Norwegian I'm informed and it refers to the act of falling and the act of falling from a hill. Finnegan, erse solid man, that the humptyhillhead of humself promptly sends an unquiring one well to thewest in quest of his tumptytumtoes: and their upturnpikepointandplace is at the knock out in the park where oranges have been laid to rust upon the green since devlinsfirst loved livvy." This is fairly transparent if you're Irish or a citizen of Dublin because what it's talking about is Dublin is imagined to be situated basically in the belly of an enormous giant person who is, uh, Finnegan. Finnegan lies like a giant reclining figure along the liffey there. Husband and wife, river and mountain, and, and this is actually then the focus has changed and now we're talking about the geography. He was a solid man, erse solid man, but then he the somehow [??] that the humptyhillhead of humself promptly sends an unquiring one well to thewest in quest of his tumptytumtoes. If you have a map of Dublin laid out, you can actually see this enormous man in the landscape and there are many enormous men and women in the landscape of this planet. Joyce maps the Dublin geography over all of them. Some of you may know Iztaccihuatl, the magical mountain in Mexico. Iztaccihuatl means the sleeping woman in Toltec and many mountains are imagined to be, um, sleeping people. So here he introduces this theme and, um, this is one paragraph. This is the invocation of Finnegan as hod carrier:

Bygmester Finnegan, of the Stuttering Hand, freemen's mauerer, lived in the broadest way immarginable in his rushlit toofarback for messuages before joshuan judges had given us numbers or Helviticus commuted deuteronomy (one yeastyday he sternely struxk his tete in a tub for to watsch the future of his fates but ere he swiftly took it out again, by the might of moses, the very water was evaporated and all the guenneses had met their exodus so that ought to show you what a pentschanjeuchy chap he was!) and during mighty odd years this man of hod, cement and edifices in Toper's Thorp piled bildung supra bildung pon the banks for the livers by the Soangso. He addle liddle phifie Annie ugged the little craythur. Wither hayre in honds tuck up your part inher. Oftwhile balbulous, mithre ahead, with goodly trowel in gras and ivoroiled

overalls which he habitacularly fondseed, like Haroun Childeric Eggeberth he would caligulate by multiplicables the alltitude and malltitude until he seesaw by neatlight of the liquor wheretwin 'twas born, his roundhead staple of otherdays to rise in undress maisonry upstanded (joygrantit!), a waalworth of a skyerscape of most eyeful hoyth entowerly, erigenating from next to nothing and celescalating the himals and all, hierarchitectitiptitoploftical, with a burning bush abob off its baubletop and with larrons o'toolers clittering up and tombles a'buckets clottering down."

Now what this paragraph says is he was a great builder and I think if you think back through your impression of hearing it read, you knew that. You know, these words that are associated, words like: a waalworth of a skyerscape and entowerly, these are skyscraper words. Waalworth, skyerscape, entowerly, Howth, so forth and so on. And he can do this; he can build up a pastiche of surfaces, of impressions. Now you might say, why is there no economy? Well there is no economy because economy is an aesthetic criterion for shoemakers, not for artists. And uh, uh, you know, economy is the curse of the Bauhaus babblers from hell. Joyce was very concerned to refute all that. If you have to place this in a context, it's in the context of the most hallucinatory of the Baroque, uh. You know, this is Arcimboldo land. This is a work that would have been welcome at the Rudolfian court in Prague. It's a work of magical complexity and uh, and uh, enfolded self-reference.

Now we've just been through these first four paragraphs. Now I'll read you what Joseph Campbell has to say on it and by no means all of what he has to say on it. The first four paragraphs are the suspended tick of time between a cycle just past and one about to begin. They are in affect an overture resonant with all the themes of Finnegans Wake. The dominant motif is the poly-lingual thunderclap of paragraph three, bababada... that one, which the voice of God makes audible through the noise of Finnegans Fall. Narrative movement begins with the life fall and wake of hod carrier Finnegan, pages four to seven; the wake scene fades into the landscape of Dublin and environs.

We've just heard how he fell from the ladder. Now we move into a description, um, of the, of the wake and there's a certain voice that appears at certain times. It's where there are a lot of words ending in 'ation', continuation of that celebration until the examination of the extermination! These are the twelve judges. Each character when they appear has a certain tempo to their character so when that tempo enters the text, you know the character is present even though there may be no trace. For example, Anna Livia Plurabelle tempo is the tempo of the hen: herealittle, therealittle, goalittle, seealittle, doalittle – the hen is scratching. This is this nervous, birdlike – that's Anna Livia's signature. Here's just one paragraph from the wake scene, which builds and has quite a minor amount of humor associated with it.

Shize? I should shee! Macool, Macool, orra whyi deed ye diie? Of a trying thirstay mournin? Sobs they sighdid at Fillagain's chrissormiss wake, all the hoolivans of the nation, prostrated in their consternation and their duodisimally profusive plethora of ululation. There was plumbs and grumes and cheriffs and citherers and raiders and cinemen too. And the all gianed in with the shoutmost shoviality. Agog and magog and the round of them agrog. To the continuation of that celebration until Hanandhunigan's extermination! Some in kinkin corass, more, kankan keening. Belling him up and filling him down. He's stiff but he's steady is Priam Olim! 'Twas he was the dacent gaylabouring youth. Sharpen his pillowscone, tap up his bier! E'erawhere in this whorl would ye hear sich a din again? With their deepbrow fundigs and the dusty fidelios. They laidhim brawdawn alanglast bed. With a bockalips of finisky fore his feet. And a barrowload of guenesis hoer his head. Tee the tootal of the fluid hang the twoddle of the fuddled, O!

Well it's a drunken Irish wake, that seems clear but there are a lot of things going on. "E'erawhere in this whorl would ye hear sich a din again?" And "he's stiff but he's steady as Priam Olim" – all this Dionysian and sexual imagery is fully explicit. In some ways more realized as a character or more loveable is Anna Livia Plurabelle. Anna Livia Plurabelle is Molly Bloom on acid basically. Molly Bloom, we don't lose her outlines. We understand Molly because Molly doesn't offer us that much of her own mind. She stands for the eternal feminine but only in the final soliloquy in Ulysses do we really contact her. Anna Livia, it's her book. It may in fact be her dream and the whole thing is permeated with her tensions and her cares. As it says, "Grampupus is fallen down" meaning the great father God is at wake. Grampupus is fallen down but grinny sprids the boord meaning Anna Livia is always there. She's always there and in the wake. Really you could almost say that Molly Bloom's soliloquy has been expanded to three hundred or four hundred pages and the whole thing is a meditation on the river. The river is the feminine and the first image in the book and the last image are the image of the river. The river dissolves everything and carries it out to sea. Let me read this description of Anna Livia Plurabelle and then we'll go back to the synopsis:

How bootifull and how truetowife of her, when strengly forebidden, to steal our historic presents from the past postpropheticals so as to will make us all lordyheirs and ladymaidesses of a pretty nice kettle of fruit. She is livving in our midst of debt and laffing through all plores for us (her birth is uncontrollable), with a naperon for her mask and her sabboes kickin arias (so sair! so solly!) if yous ask me and I saack you. Hou! Hou! Gricks may rise and Troysirs fall (there being two sights for ever a picture) for in the byways of high improvidence that's what makes lifework leaving and the world's a cell for citters to cit in. Let young wimman run away with the story and let young min talk smooth behind the butteler's back. She knows her knight's duty while Luntum sleeps. Did ye save any tin? says he. Did I what? with a grin says she. And we all like a marriedann because she is mercenary. Though the length of the land lies under liquidation (floote!) and there's nare a hairbrow nor an eyebush on this glaubrous phace of Herrschuft Whatarwelter she'll loan a vesta and hire some peat and sarch the shores her cockles to heat and she'll do all a turfwoman can to piff the business on. Paff. To puff the blaziness on. Poffpoff. And even if Humpty shell fall frumpty times as awkward again in the beardsboosoloom of all our grand remonstrancers there'll be iggs for the brekkers come to mournhim, sunny side up with care. So true is it that therewhere's a turnover the tay is wet too and when you think you ketch sight of a hind make sure but you're cocked by a hin.

Well Nora felt that Jimmy would have been much better as a singer. She so states it, that she had great hopes for his voice. She was a very practical women, Nora Barnacle. There wasn't a literary bone in her body I think. I think that's what Joyce loved about her, was that that she was the real thing. All these women, Molly, Anna Livia, they all are Nora Joyce for sure.

He, uh, died shortly after it was published although it had been known in manuscript for over ten years to the literati of his circle. It was called Work in Progress. And, um, people didn't even know if he was serious or not and it was very hard to find a publisher. It was a typographical nightmare. Joyce was going blind and so, you know, trying to keep track of, of the spelling...there's hardly a standard spelling in there. There's hardly a word that is not somehow fiddled with and changed around. If you pay attention to what you're calling 'life as it is,' you will discover that it's not a simple thing at all. That it's an incr- it's like this.

I used to say when you're vacuuming your apartment, Rome falls nine times an hour and your job is to notice. You always do notice but you never tell yourself that you're noticing. So in the course of a day, you know, I live and you live to some degree the entirety of global civilization. Rome falls, Algebra is

discovered, the Turks are beating at the gates of Vienna and it isn't even 11AM yet, you know? Uh, so there is this sense of the co-presence of history. We're imprisoned inside the linear assumption that I'm a person in a place, in a time, I'm alive, most people aren't – but, but in fact when you deconstruct all that - that is fiction. And the truth is more this onrushing magma of literary association and, you know, in Ulysses you get an enormous amount of half-baked science. Leopold Bloom is always looking at things and explaining to himself how they work using very crack potted notions of hydraulics and electricity and this sort of thing.

Uh, I think uh, you know..people say that the psychedelic experience is hard to remember, that dreams are hard to remember but harder to remember than either of those is simply ordinary experience. You lie in the baths and you close your eyes for thirty seconds and...empires fall, dynastic families unfold themselves, power changes hands, princes are beheaded, a pope disgraced [??] that was for you [laughter] (Possibly directed at Robert Anton Wilson?) and then somebody drops something and you wake up and fifteen seconds have passed. That's the reality of life but we suppress this chaotic irrational side. The genius of Joyce and to some degree although in a more controlled form, Proust - and there were other practitioners, Faulkner certainly – what they called stream of consciousness but what it was, was an ability to really listen to the associating mind without trimming, pruning, judging or denying. One of the great puzzles to me is the great antagonism between Jung and Joyce because you would have thought they would have been comrades in arms but Joyce loathed psychoanalysis. He didn't- he thought that to use all this material to elucidate imagined pathologies was very uncreative use of it and it should all be fabricated into literature.

It's very hard to surpass. Uh, you know, Thomas Pynchon, William Gaddis, these people – everybody genuflects to Joyce but very few people plow in the way he did. I mean, Thomas Pynchon is considered a difficult hallucinatory writer and there isn't twenty pages in, in Gravity's Rainbow as obscure as a randomly chosen page here. Uh..I, I can understand the impulse to want to get the universe into a book because it hints at something that we've talked about in some of these circles or whatever they are – which is the character of life is like a work of literature. We are told that you're supposed to fit your experience into the model which science gives you - which is probabilistic, statistical, predictable and yet it's- the felt datum of experience is much more literary than that. We fall in love, we make and lose fortunes, we inherit houses in Scotland, we lose everything, we get terrible diseases, we're cured of them or we die of them – but it all has this, um, Sturm und Drang aspect to it which physics is not supposed to have but which literature always has. And, I think that- don't know if it's true but I think what Joyce believed and what I'm willing to entertain at some depth is the idea that salvation is somehow an act of encompassing comprehension. That salvation is an actual act of apprehension of understanding and that this act of apprehension involves everything.

This is why the alc- why before James Joyce and this kind of literature, the only place you got these kind of constructs was in alchemy and magic. The idea that, you know, through an act of magic, the universe could be condensed to yield a fractal microcosm of itself. Well then what Joyce is saying is that the novel, which was unknown in the alchemical era – the novel comes later – I mean, arguably but the real zest of the novel comes in the 19th century and that the novel is the alchemical retort into which these, these theories of how things work can be cast. I think the great modern exponent of this, although now dead, and certainly one who owed an enormous debt to Joyce was Vladimir Nabokov, especially in Ada. Ada is his paean of praise to Finnegans Wake basically and the idea tact in there is the idea of causality and of ordinary casuistry.

See, that- what all these people are saying, I think, and what the psychedelic experience argues for as well, is that we are somehow prisoners of language and that somehow, you know, if we're prisoners of language then the key which will set us loose is somehow also made of language. What else could fit the lock? Somehow an act of poetic legerdemain is necessary and Joyce in *Finnegans Wake*, he didn't live to argue the case or to work it out. He died shortly after but this comes about as close as anybody ever came to actually pushing the entire contents of the universe down into about fourteen cubic inches.

Joyce and Proust had one meeting and supposedly Joyce said to Proust, 'I'm too young for you to teach me anything.' Are you all familiar with *The Remembrance of Things Past*? Well, it could hardly be a more different work of literature. I mean, it is stately and cinematic and you always know where you are and the characters are defined. It's an old style novel but there are places in it where he just takes flight and, uh, prefigures the kind of writing that Faulkner and Joyce were able to do. As far as psychedelic influences, I don't, I don't know that there are arguably any. Joyce lived in Trieste for a while and taught English. He may have been, as a habitu  of Paris, he may have been familiar with hashish. He probably had some familiarity with absinthe, but I doubt that it was a lifestyle for him.

Um..I think that the whole of the 20th century is informed by this hyper dimensional understanding and you know, Jung tapping into it the 1920s, the Dadaists in 1919 in Zurich, the surrealists, even earlier, the *ecole du Pataphysique*, Jarry. What it's about, the 20th century...McLuhan's phrase comes to mind, the *Gutenberg Galaxy*. The spectrum of effects created by print, you know, the classes the conceits, the industries, the products, the attitudes, the garments, all of the things created by print. And we are living in a terminal civilization. I don't want to say dying because civilizations aren't animals but we are living in an age of great self-summation. What we look back at is basically since the fall of Rome there has been an unbroken working-out of certain themes – Scholasticism, the Aristotelian and Platonic corpuses, Christianity, always presented as, uh, somehow a rival to science is in fact- paves the way for science. There would have been no science had their not been William of Ockham, who was a 14th century Nominalist theologian. Really Western civilization has had a thousand years to work its magic and now there is a summation underway and I don't certainly presume, uh, at least not this evening, to judge it. How do, how do you place a value on an entire civilization?

But, uh, in the same way that when a person dies their entire life passes before them in review – when a civilization dies, it, it hypnogogically cycles the detritus of centuries and centuries of struggle to understand. And, uh, someone like Joyce, I think, just brings that to an excruciating climax because it's all there. It's all there from the smile that tugs at the lips of the woman Arnolfini wedding to quantum physics to what Moliere said to his niece in the 15th letter and so forth and so on. And uh, and the, and uh the task is to hold it in your mind. I think it was William James who said, 'if we don't read the books with which we carefully line our apartments, then we're not better than our dogs and cats.' And uh, you know, too often this is lost sight of and the point of it - it's not simply that we are aesthetes, literatures and that here in the twilight of the gods we should sit around reading James Joyce – that isn't the point. The point is that this is the distillation of our experience of what it is to be human and it's out of these kinds of distilling processes that we can launch some kind of new, uh, new dispensation for the human enterprise because we have played it, we have played it out. It's now a set piece, all of it.

When I listen to Rock & Roll now, it's interesting to me but it has the completeness of, uh, polyphony. You know, it's a done deal somehow and we're looking backward and we're anticipating. The purpose of literature, I think, is to illuminate the past and to give a certain guidance as we move into the future. And

this book by being at first so opaque and so challenging to aesthetic canons and social values eventually emerges as a very prescient insight into our, uh, our, our circumstances. The ballad of Finnegans Wake has hundreds of verses. In an Irish pub it can keep people going all night, uh, all night long.

It's a celebration of complexity and the human journey and Joyce doesn't judge. I mean, you know, it says somewhere in Finnegans Wake – "here in the Moy Cane, which is the red-light district of Dublin – Here in Moy Cane we flop on the seamy side, but up n'ent, prospector, you sprout all your worth and you woof your wings, so if you want to be Phoenixed, come and be parked." That's that passage about death. It was a very optimistic transformative sort of vision. Somehow complexity is the ocean that we have to learn to surf. That's the river and that's the psychedelic side of it. Imagine that you can get 63,000 different words in here, tell a story and have all article- all the common articles and modifiers operating normally anyway and then it's very optimistic. I mean, Molly Bloom's speech, uh, is, you know, probably the single most optimistic outpouring in all of 20th century literature, not that there was much competition. Yes, yes the final affirmation, yes.

Sam Beckett, Nobel prize winner, genius in his own right, but secretary to James Joyce for many, many years and passionately in love with Joyce's tragically schizophrenic daughter. One of the, you know, you want an unhappy story, you'll find out why Sam Beckett is not exactly laughing all the time because of a very complex relationship to Joyce's schizophrenic child. Joyce's family life was not very happy. I think he had a wonderfully sensuous life with Nora but I don't know what it would be like to be the guy who wrote this book and lived with a woman who thought you would be better off as a saloon singer. Uh, not exactly a saloon singer but still....

Shall I try and find a passage?

"Let us now, weather, health, dangers, public orders and other circumstances permitting, of perfectly convenient, if you police, after you, policepolice, pardoning mein, ich beam so fresch, bey? drop this jiggerypokery and talk straight turkey meet to mate, for while the ear, be we mikealls or nicholists, may sometimes be inclined to believe others, the eye, whether browned or nolensed, find it devilish hard now and again even to believe itself. Habes aures et num videbis? Habes oculos ac mannespalpabuatus? Tip! Drawing nearer to take our slant at it (since after all it has met with misfortune while all underground), let us see all there may remain to be seen.

But I am a worker, a tombstone mason, anxious to please averyburies and jully glad when Christmas comes his once a year. You are a poorjoist, unctuous to polise nopebobbies and tunnibelly souly when 'tis thime took o'er home, gin. We cannot say aye to aye. We cannot smile noes from noes. One cannot help noticing that rather more than half of the lines run north-south in the Nemzes and Bukarahast directions while the others go west-east in search from Maliziies via Bulgarad for tiny tot though it looks when schtschupnistling alongside other incunabula it has its cardinal points for all that."

Tip. Now, this word tip which keeps occurring throughout the text, uh, i-, no one is clear what it means, but Joe Campbell's guess is it's a tree branch which is tapping against the window, and whoever is dreaming this huge hallucinatory gizmo of a dream, every once in a while the tap of the branch breaks, breaks through.

McLuhan, I don't know how many of you recall him from the 60's, but he had for a very brief period of time, about 5 or 6 years, an extraordinary influence on American culture. You couldn't pick up a magazine

or turn on the TV without hearing McLuhan, McLuhan, what he said, what he thought, what he predicted. He was consulting with Madison avenue, with politicians, with Hollywood, um, so forth and so on. Add it- his influence, he died in the early 70's and his influence died with him. Even though he had uh, founded the Center for Media Study at the University of Toronto in Canada, he really seemed to spawn no highly visible successors. Was a unique, um personality and breakthrough much in the same way that Joyce was a unique personality and uh, and spawned very few imitators. And the irony of this is that McLuhan did his journeyman work before he burst onto the world stage as this mysterious savant of media, he did his work as a Joyce scholar. That's what he was, uh a literary critic, Joyce scholar, medievalist, that sort of thing. And then in the early 50's or middle 50's he wrote a book which I never read. It's very hard to find, called the Mechanical Bride that was his first testing of his um, ideas.

Um, McLuhan is primarily understood as a communication theorist or a philosopher of media, and that's what he talked about. He turned the analytical, Western, deconstructionist method on the technologies of communication: uh, printing, film, photography, dance, theater, even such things as uh, money he thought of as forms of media, and he carried out and analyzed these forms of media and reached uh, very controversial conclusions. One of the things that was puzzling to me as I went back through and read all this is one of the things was McLuhan was synonymous with incomprehensibility in the 60's. I mean, the whole thing was "who can understand this guy!" You know, he's like buddha, he speaks these words we can't understand. Well, now, 25, 30 years later it reads pretty straightforwardly, and uh, most of what he s- predicted has come to pass. I think even McLuhan would be amazed at the speed with which the Gutenberg world has been overturned. I mean there's no hint in here of home computers, let alone interactive networks, virtual reality, uh phone sex and so forth and so on, but these wer- this was all grist for the McLuhanesque mill and had he lived he would have much to say on all this. It surprised me on reading all this stuff how demanding it is on your own um, literacy. I mean you basi- he assumes basically that the people he's talking to have read everything, and have understood it. I mean from Homer to Rabalaise, to Chaucer to mamet. He assumes you have complete knowledge of modern film and popular journalism and popular culture. All of this was grist for his mill. Um, I'll show you the books I'm reading from and talking about, and then I'll actually read you a section of McLuhan because it's a- like Joyce it's a stylistic thing that you can't really uh, encompass without getting your feet wet. Um, this was his best known book probably, and this is the original paperback edition. This book was im- immensely discussed when it came out and probably very little read judging by the quality of the discussion. Understanding Media: The Extensions of man. This is how most people heard of uh, McLuhan, and he followed it up with um, The Gutenberg Galaxy. These are all first editions. These books I don't think are in print. Few intellectuals in this century have fallen so totally through the cracks uh, as McLuhan. The Gutenberg Galaxy, very interesting. I'm going to read from some of it tonight. It's organized around chapter headings such as "Does the interiorization of media such as letters alter the ratio among our senses and change mental processes?" Or um "Popes Duncead indicates the printed book as the agent of a primitivistic and romantic revival. Sheer visual quantity evokes the magical resonance of the tribal horde. The box office looms as a return to the echo chamber of bardic incantation. That's a chapter heading. [audience laughter]. Um, Topographic -- The voice of silence, and one of my favorites: -- along the electronic wave as triu

--

There's a lot of sun in McLuhan and this comes out of him being a Joyce scholar. You just can't mess with that withoug--. This is his third book "With Harley Parker Through The Vanishing Point.. And I guess I should say a few years ago somebody asked me to review McLuhan's letters which had been published,

which I did. It was uh, Gnosis or somebody. Anyway it brought back to me uh, he was a convert to Catholicism and an extraordinarily complex intellectual uh, with uh a medievalist who became a Joyce scholar who became a communications expert, and in McLuhan there's a very deep strain of nostalgia for the essence of the medieval world of what he called manuscript culture, and essentially his entire output is a critique of print and of the impact of print on uh, culture, a- w- and I think though he attempted to be fairly even-handed, his final resolution of all this was that it had, it had had many many det- detrimental and distorting effects uh, on the Western mind. This is another little book he published back in the heyday, and he experimented with topographic layout uh, some work hearkening back to the surrealists whom he discusses a great deal. Uh, and there was something about- it was his fascination with topographical layout that also brought him in so much congruence with the Wake. So let me read you a section from The Gutenberg Galaxy that is both interesting to think about or if you can't understand it, then an interesting example of uh what McLuhan's style was like and what I mean by that he was an extraordinarily demanding intellectual he doesn't cut you much slack. This is a short section called "Only a Fraction of the History of Literacy has Been Typographic."

"Til now we have been concerned mostly with the written word as it transfers or translates the aural-tactile space of sacral non-literate man into the visual space of civilized or literate or profane man. Once this transfer, or metamorphosis occurs we are soon in the world of books, scribal or typographic. The rest of our concern will be with books, written and printed, and the results for learning and society. From the 5th century BC to the 15 century AD the book was a scribal product. Only one third of the history of the book in the Western world has been typographic. It is not incongruous, therefore, to say as G.S. Brett does in 'Psychology, Ancient and Modern.' And Here's the quote: The idea that knowledge is essentially book learning seems to be a very modern view probably derived from the medieval distinctions between clerk and layman with additional emphasis provided by the literary character of the rather fantastic humanism of the 16th century. The rather unnatural idea of knowledge is that of cunning or the possession of wit. Odysseus is the original type of thinker, a man of many ideas who could overcome the Cyclops and achieve a significant triumph of mind over matter. Knowledge is less a capacity for overcoming the difficulty of- difficulties of life and achieving success in this world." So that closes the quote.

Then McLuhan comments: "Brett here specifies the natural dichotomy which the book brings into any society. IN addition to the split within the individual of that society, the work of James Joyce exhibits a complex clairvoyance in these matters. His Leopold Bloom of Ulysses, a man of many ideas and many devices, is a freelance salesman. Joyce saw the parallels on one hand between the modern frontier of the verbal and the pictorial and on the other between the homeric world poised between the old sacral culture and the new profane or literate sensibility. Bloom, the newly de-tribalized Jew, is presented in modern Dublin, a slightly de-tribalized Irish world. Such a frontier is the modern world of the advertisement. Congenial, therefore, to the tran- to the transitional culture of Bloom. In the 17th, or Ithaca episode of Ulysses we read, "what were habitually his final meditations of some one sole unique advertisement to cause passers to stop and wonder a poster novelty with all extraneous accretions excluded, reduced to its simplest and most efficient terms not exceeding the span of casual vision and congruous with the velocity of modern life. In [The Books at the Wake](#), James S. Atherton points out, and here's Atherton's quote: "Amongst other things, Finnegans Wake is a history of writing. We begin with writing on a bone, a pebble, a ram's skin, leave them to cook in the mothering pot, and guten morg with his cro magnon charter, tinting fats and grate prime must once for omnibus step rubric-red out of the word press. The mothering pot is an allusion to alchemy- that there is some other significance connected with writing, for the next time the word appears it is again in a context concerning improvement in a system of- in systems of

communication. The passage is "all the airish cygnics of her dippendump helpabit from an father hogum told them mutter maskins. Dippendump helpabit combined the deaf and dumb alphabet signs in the air or 'airish signs' with the ups and downs of the ordinary ABC and the more pronounced up and downs of Irish oggam writing. The mason, following this must be the man of that name who invented steel pen nibs, but all I can suggest for mother is the mothering of freemasons which does not fit the context, although they of course also make signs in the air. Is that perfectly clear? [audience chuckles]

Now back to [McLuhan](#). "Guten Morg with his cromagnon charter" expounds by mythic gloss the fact that that writing meant the emergence of the caveman or sacral man from the audible world of simultaneous resonance into the profane world of daylight. The reference to the masons is to the world of the bricklayer as a type of speech itself. On the second page of the Wake Joyce is making a mosaic, an Achilles shield, as it were, of all the themes and modes of human speech and communication. "Bygmester Finnegan, of the Stuttering Hand, freemen's murer, lived in the broadest way immarginable in his rush-lit toofarback for messuages before joshuan judges had given us numbers ..." Joyce is, in the Wake, making his own Altamira cave drawings of the entire history of the human mind, in terms of its basic gestures and postures during all phases of all human culture and technology. As his title indicates, he saw that the wake of human progress can disappear again into the night of sacral or auditory man. The Finn cycle of tribal institutions can return in the electric age, but if again, then let's make it a wake, or awake, or both. Joyce could see no advantage in our remaining locked up in each cultural cycle as in a trance or dream. He discovered the means of living simultaneously in all cultural modes while quite conscious. This means he cites for such self-awareness and correction of cultural bias in his "collideroscope." This term indicates the interplay in colloidal mixture of all components of human technology as they extend our senses and shift their ratios in the social kaleidoscope of cultural clash: "deor," savage, the oral or sacral, "scope", the visual or profane and civilized.

So that's his comment. Only a fraction of the history of literacy has been typographic. These people, Joyce, um to some degree Pound, uh, McLuhan, they were the prophets of the world in which we now stand, the world of uh, integrated, interactive media, extraordinary data retrieval that erases the 17th century notion of the unconscious. Nothing is now unconscious if your data search commands are powerful enough. And uh, the, the remaking of the human image that required centuries for print, the transition that we talked about in here from scribal culture to true book culture occupied five hundred years. The transition from book culture to electronic culture has occurred in less than fifty years. I mean it- it's eerie to read his examples of contemporaneity because they're stuff like Marilyn Monroe, Perry Como, James Dean. I mean, he's writing from another era and yet from his point of view he's firmly embedded in a kind of super future that we are uh, now able to look back on.

Here's another section that I think makes some of this more clear. The name of this section is "The medieval book trade was a secondhand trade, even as with the dealing today in old masters." Then, from the twelfth century onwards the rise of the universities brought masters and students into the field of book production in class time, and these books found their way back to the monastic libraries when students returned after completing their studies: "A number of these standard textbooks, which- of which approved exemplars were kept for copying by the stationarii of the universities, naturally found their way into print quite early, for many of them continued in undiminished request in the fifteenth century as before. These official university texts offer no problems of origin or nomenclature." And then he's quoting Goldschmidt. He adds, "Soon after 1300 the expensive vellum could be dispensed with and the cheaper paper made the accumulation of many books a matter of industry rather than of wealth." Since, however the student went

to lectures pen in hand and "it was the lecturer's task to dictate the book he was expounding to his audience," there is a great body of these reportata which constitute a very complex problem for editors. "

So really, like for Joyce, for McLuhan the book is the central symbol of the age, the central mystery of our time. In a sense I sort of share that notion. It's a very Talmudic notion. It's a very psychedelic notion. It's the idea that somehow the career of the word is the central uh, overarching metaphor of the age. And naturally if the book is the central metaphor for reality then reality itself is seen as somehow literary, somehow textual, and this in fact is how I think reality was seen until the rise of modern science. That we're always taught you know that the roots of modern science go back to Democratean atomism um which is of course true, but the number of people who knew that a thousand years ago was probably very few. Uh, the, the real notion out of which science had to divest itself is the notion uh, of a book or if that seems too concrete, a story, a narrative. The story of mans fall and redemption. That was what the Christian Exegesis of uh, post edenec time was all about. With the rise of modern science the idea of narrative hs become somewhat overthrown. McLuhan would say that narrative persisted far beyond its utility because the um, biases of print kept it in place for such a long time. Everyone assumes that tools are tools and you use them and that's that. For McLuhan the entirety of the toolkit of wa- of modern western man can be traced to the unconscious assumptions of print. For example, the idea of the individual which is a pretty personal notion right there in close to the heart. The idea of the individual is a post-medieval concept legitimized by print. The idea of the public, this concept did not exist before uh, newspapers because before newspapers there was no public. There were only people, and uh rulers very rarely bothered to pass on their thinking to anybody other than their closest associates, and then only for utilitarian reasons. The notion of an observing citizenry, somehow sharing the governance of society, this again is a print-created idea. Uh, the idea of interchangeable parts which- without which our world would hardly function, there would not be automobiles, buildings, aircraft, interchangeable parts. That's an idea that comes from the interchangeability of letters in a printer's block. Uh, f- all- that was the first industry to ever utilize the concept of uh, easily reformulated subunits. And it's strange, you know, the Chinese get credit for inventing printing thousands and thousands of years before Europe, but they would carve a single block of wood and print it. They didn't get the notion of moveable type. And moveable type, the distribution of books becomes the paradigmatic model for the distribution of any product, you know? Uh, you- it's produced, it's edited, it's uh, manufactured, it's sold and then sequels are spawned. All products have followed this model, but books were one of the earliest mass-manufactured objects to be put through this cycle. Modern city planning, the linearity of it, the way in which land surveys are carried out- these are all unconscious biases imbibed from the world of print, and they make sense if you're a print-head. But one of the peculiar things, uh, notice that animals do not possess language. Uh, many human societies do not possess writing and very few human societies, only two on earth, invented printing and yet once invented it feeds back into the evolution of social structures and defines everything. And yet it's an extraordinary uh, artificiality and we have been imprisoned in it for hundred and hundreds of years now. Now it is breaking down and uh, we are changing to a different sensory ratio and you might suppose if you hadn't give this a lot of thought that the new electronic media, television and so forth would carry us into an entirely different sensory ratio. McLuhan felt differently. He felt that it was restoring us to a medieval sensory ratio. He felt that television screen is much more like an illuminated manuscript than a page of print. The distinction may seem subtle at first but if, if you're looking at an illuminated medieval manuscript, notice I said looking, you must look in order to understand. Reading is not looking. Reading is an entirely different kind of behavior. As a child you learn what an 'e' looks like, what a printed lower case 'e' looks like. After seeing twenty, a hundred, a thousand, ten thousand you know what it looks like. You have an expectation of the gestalt of the lower case 'e'. And nobody opens a book and looks at print unless

there's some extraordinary abstract discussion going on. We read print but we look at manuscript because manuscript carries the intrinsic signification of the individual who made it and his or her inter-idiosyncracies need to be parsed through to get the meaning. Similarly with television, television, uh, is a very low resolution media. I mean these are little pieces of light, pixels flying back and forth, and they must uh, be looked at. They cannot be read, uh, and it's an extraordinarily engaging process. It's- that's why it's uh, creates an entirely different set of social biases than print does. And McLuhan called these biases, and was the one distinction or the one idea of his that made its way into popular culture. He distinguished between what he called hot and cold media. And usually people botch this every time because nobody really to this day understands exactly um, what he meant. So let me read you a little bit about this distinction. This is in chapter two of understanding media, and chapter two is called "Media, hot and cold."

"The rise of the waltz," explained Curt Sachs in the World History of the Dance, "was a result of that longing for truth, simplicity, closeness to nature, and primitivism, which the last two-thirds of the eighteenth century fulfilled." In the century of jazz we are likely to overlook the emergence of the waltz as a hot and explosive human expression that broke through the formal feudal barriers of courtly and choral dance styles." But obviously it was. I mean, when you contrast it with what came before.

"There is a basic principle that distinguishes a hot medium like radio from a cool one like the telephone, or a hot medium like the movie from a cool one like TV. A hot medium is one that extends one single sense in "high definition." High definition is the state of being well filled with data." I love that. "

A photograph is, visually, "high definition." A cartoon is "low definition," simply because very little visual information is provided. Telephone is a cool medium, or one of low definition, because the ear is given a meager amount of information. And speech is a cool medium of low definition, because so little is given and so much has to be filled in by the listener. On the other hand, hot media do not leave so much to be filled in or completed by the audience. Hot media are, therefore, low in participation, and cool media are high in participation or completion by the audience. Naturally, therefore, a hot medium like radio has very different effects on the user from a cool medium like the telephone. A cool medium like hieroglyphic or ideogrammic written characters has very different effects from the hot and explosive medium of the phonetic alphabet. The alphabet, when pushed to a high degree of abstract visual intensity, became typography. The printed word with its specialist intensity burst the bonds of medieval corporate guilds and monasteries, creating extreme individualist patterns of enterprise and monopoly. But the typical reversal occurred when extremes of monopoly brought back the corporation, with its impersonal empire over many lives. The hotting-up of the medium of writing to repeatable print intensity led to nationalism and the religious wars of the sixteenth century. The heavy and unwieldy media, such as stone, are time binders. Used for writing, they are very cool indeed, and serve to unify the age; whereas paper is a hot medium that serves to unify spaces horizontally, both in political and entertainment empires." And he just goes on like this endless, and this was his metier, or his media to connect and comment, um, on this stuff, and television, really with his, both his own media for reaching a very large audience. In fact, I remember the excitement that swept through. I didn't even have a television at the time. I was living in Berkeley at the time and somebody said "we have to go up to the student union at 6 o'clock because Mike Wallace is interviewing Marshall McLuhan, and it seemed like an incredibly freaky notion that McLuhan would be on TV. It, it shows you what a stultified, categorically different world we were living in uh, at the time. Here's just a little bit of uh, of McLuhan on television. This is chapter 31 of Understanding Media, The Timid Giant.

Perhaps the most familiar and pathetic effect of the TV image is the posture of children in the early grades. Since TV, children- regardless of eye condition - average about six and a half inches from the

printed page. Our children are striving to carry over to the printed page the all-involving sensory mandate of the TV image. With perfect psychomimetic skill they carry out the commands of the TV image. They pore, they probe, they slow down and involve themselves in depth. This what they had learned to do in the cool iconography of the comic-book medium. TV carried the process much further. Suddenly they are transferred to the hot print medium with its uniform patterns and fast lineal movement. Pointlessly they strive to read print in depth. They bring to print all their senses, and print rejects them. Print asks for the isolated and stripped-down visual faculty, not for the unified sensorium." You see?

So, often very unexpected paradoxical insights emerge from this stuff, and in this book that he did with Harley Parker, "Through The Vanishing Point, Space and Poetry and Painting", uh, it's an interesting technique. They take a number of works of art, either um, literature such as the song from Love's Labor Lost by William Shakespeare, or the Ballade De Bon Consil of Geoffrey Chaucer, or the Rubaiyat of Omar Khayyam and then comment on it and also visual arts, because McLuhan really felt that the art historical and technological and architectural output of Western civilization could be essentially psychoanalyzed, could be seen as the tracings of the mass consciousness, and the, uh- he felt that the evolutionary sensory ratios within historical time had been very very rapid, that uh, for example, he talks about how St. Augustine was a person of great piety and learning, and um, people doubting this would show him an open page of scripture or theological desputation, and he would look at it for a few moments, minutes, and then they would close the book and he could tell them what was written there, and this was taken as proof of his piety. He was, as far as we can tell, the only man in Europe who could read silently at that time. This was a period when the, the audial uh, pre- uh, scribal culture was still being assimilated.

Uh, McLuhan spends a lot of time analyzing this episode in the 14th century when the laws of perspective spring suddenly into being, uh, as- somewhat in the way, very similar in the way that fractal mathematics have introduced us to a new superspace. For the Renaissance, spatial perspective was essentially a filing system for visual data. at last they knew where to put everything, and where to look for it once they had put it there, which if you a pre-perspectivist arrangement of space you have look, not read, look at each painting in order to locate where the information is. This is again this read-look dichotomy. McLuhan never discussed psychedelics, uh, but psychedelics I think clearly are an extension of these kinds of media that we have to engage with.

That you have to look at, that you cannot read, you cannot take for granted. And these give back a much more complex world. I mean, notice that the world created by print is a world of gestalt. Buildings, highways, bridges. We know how these things are supposed to look. We don't experience astonishment each time we enter a home or an Institutional edifice. There is a built-in set of syntactical expectations in linear space, and when those are violated this is very noticeable and becomes the basis for architectural or design innovation, or something like that.

I think that what's happening, and I think that this would be McLuhan's take is that all of these new media that attempt to suppress the appurtenances of media are in fact having the effect of returning us to an archaic sensory ratio, and McLuhan was on to this. He is the one who coined the phrase electronic feudalism. And he felt that, that we were headed back toward a medieval sensory ratio because he saw television as like manuscript, but I think had he lived into the era of VR, psilocybin, HDTV and implants, he would've seen we're not reaching back to the Medieval. That was simply a stepping stone to the archaic, and that we are going beyond the entire domain of scribal humanity and actually reaching back to a shamanic, uh, feeling-toned kind of thing, and all of the breakdown of linearity that you see in the 20th

century: abstract expressionism, dada, jazz, rock 'n roll, nonfigurative painting, LSD, all of these things on one level can be seen as uh, as I've said, as harking back to the archaic, but on another level what they can be seen as are uh, new behaviors emerging as the cloud of print-constellated constipation is, is lifted, its breaking down. An interesting question that we would put to McLuhan if we had him here tonight I think is to what degree can what he said about Television not be applied to HD TV. It seems to me that HD TV is television without the biases of TV, and you know, a perfect medium is an invisible- a perfect media is an invisible media, and print is the least invisible of all media, I mean, print is an incredible, uh Rube, Rube Goldberg invention for conveying information.

Here's McLuhan on this same subject rather than me dwelling on it. This is from *The Gutenberg Galaxy*. This is a section called *A Theory Of Cultural Change is Impossible Without Knowledge of the Changing Sense Ratios Effected by Various Externalizations of Our Senses*, in other words, by media. "It is very much worth dwelling on this matter since we can see that from the invention of the alphabet there has been a continuous drive in the Western World toward the separation of the senses, of functions, of operations, of states emotional and political, as well as of tasks, a fragmentation which terminated, thought Durkheim, in the anomie of the 19th century. The paradox presented by professor Von Bexie is that the two-dimensional mosaic is in fact a multidimensional world of interstructural resonance, it is the 3 dimensional world of pictorial space that is indeed an abstract illusion built on the intense separation of the visual from the other senses. There is here no question of values or preferences. It is necessary however for any other kind of understanding to know why primitive drawing is two-dimensional whereas the drawing and painting of literate human beings tends toward perspective. Without this knowledge we cannot grasp why people ever cease to be primitive or audial tactile in their sense bias. Nor could we ever understand why men have "sense saison" [??] abandoned the visual in favor of the audio-tactile modes of awareness and of organization of experience. This matter clarified, we can much more easily approach the role of alphabet and of printing in giving a dominant role to the visual sense in language and art, and in the entire range of social and political life. For until we have upgraded the visual component communities know only a tribal structure. The detribalizing of the individual has in the past at least, depended on an intense visual life fostered by literacy, and by literacy of the alphabetic kind alone. For alphabetic writing is not unique, but late. There had been much writing before it. In fact, any people that ceases to be nomadic and pursues sedentary modes of work is ready to invent writing. No merely nomadic people ever had writing any more than they ever developed architecture or enclosed space. For writing is a visual enclosure of non-visual spaces and senses. It is therefore an abstraction of the visual from the ordinary sense interplay, and whereas speech is an outering utterance of all our senses at once, writing abstracts from speech.

That's very interesting isn't it, that this association of nomadism to the inability to create architectonic space and therefore no writing. That a word is a structure, a written word is a structure and therefore no nomad would ever do such a thing. Interesting.

I think he's saying reading is not seeing, and those who read do not see, even when they lift their eyes from their books, they, they, they carry the attitude of print into the world. They read, they attempt to read nature, and you can't read nature. You must look at nature. You must see nature. Certainly, I think in my own life, I was thinking about this a few months ago and it surprised me. I'm trying to think of the books that really influenced my life and I thought of, you know, *Moby Dick* and Huxley's *Doors of Perception*, but then when I really got down on it I realized that a little tiny book Huxley wrote that my mother pushed on me when I was about 12 years old called *The Art of Seeing* probably shaped me as much as anything. And in there it's a very n- McLuhanesque rap without McLuhanesque terminology. And he says the way to

overcome, and I think this is very very very intelligent and simple advice. Huxley says the way to overcome the print bias, and God knows he was a Cambridge-educated gentleman steeped in the traditions of English literacy and intellectualism, is uh, freehand drawing. Draw. Train your eye. Draw nudes, draw seashells, draw insects and pla- go into nature and train the eye to see and you will cease to read the world. And readers are emotionally-person- a seeing person does not want to form a relationship with the reading person. The- you know, this conflict that we get between men and women and between people about which we call the head-heart conflict is really a reading-seeing conflict. It isn't a head and heart, it's that, it's that readers and seers cannot relate to each others' emotional life because they seem to come from uh, such different worlds. So yeah, I think of uh, a very good point and the, the permission to abstract from nature that print created is why we have such a terrible culture crisis, you know? Because uh, uh, well f- just a kind of a trivial example. You know, it was said, by Marshall McLuhan, strangely enough, that the Vietnam War could not be won the way an ordinary war is won because the citizenry of this country couldn't tolerate the sight of what war was, and that modern warfare became impossible when it could be televised into the living room because war is something that you must read about. You must not see it. It must be this grand thing of the distant clash of armies and young heroes being created, but when it turns into amputation and maggots and screams of pain, the political fun goes out of it. So war is therefore a literary activity and, you know, the one argument that can be made, I think in television's favor, is people don't like to see images of violence. If we have to show so much violence on television, let it always be real. The violence is only indefensible when it's vicarious. If it's real violence you need to see it, because it's happening in a world for which you bear a partial moral responsibility, and I, I think warfare has been remade by media in that sense. A lot of politics has been remade because imperial doings are usually ugly, brutal, and not something that you want to exhibit before the populace. And yet uh, modern media makes that very difficult to avoid.

You know, you get the notion of public morality or, you know, the people won't stand for this! We have to get this story out! The people won't stand for this. Well now, this is a moral dimension inconceivable in medieval or Roman times. What would it mean to say the people won't stand for this? So there's an attempt to create through the collectivity a kind of community of moral uh, of moral judgment. The medium is the message means that the medium is the thing which is making the difference. In all- every discussion you ever hear since the 60's about TV, for example, is it good, is it bad, terrible, wonderful. They always- the discussion hinges around what's on TV. People say "well, television is terrible. It just shows violence." And then somebody else says, "No, television is wonderful. There's nature shows and movies from far away and masterpiece theater. This is a stupid argument. What McLuhan meant by the messa- the media is the message, is he meant that it doesn't matter what you put on TV. TV is TV. It has an intrinsic nature. And whether you're showing National Geographic specials or slasher movies, TV will do what it does. It has certain qualities just like driving a car or skiing, certain muscles are going to be exercised, certain, uh, perceptual systems enhanced, others suppressed. And uh, it's r- it's very hard for us to understand this because, because we have accepted this media so thoroughly into our life, but in fact it is shaping our value systems. Uh, in ways that are very hard for us to suspect or even uh, even detect. I mean, television, for example, uh, it's a drug. It has a series of measurable physiological parameters that are as uh, intrinsically its signature as the paramaters of heroin are its signature. I mean, you sit somebody down in front of a TV set and turn it on, 20 minutes later come back, sample their blood pressure, their eye movement rate, blood is pooling in their rear end, their breathing takes on a certain quality. The stare reflex sets in. I mean, they are thoroughly zoned on a drug, and when you think about the fact that the average American watches six and a half hours of television a day, imagine if a drug had been introduced in 1948 that we all spent 6 and a half hours per day on average watching, and the one thing about drugs in their defense is that it's very

hard to diddle the message. A drug is a mirror, but television isn't a mirror. Television is a billboard, and anybody who pays uh, their money can put their message into the trip. This is an extraordinarily uh, insidious situation. What McLuhan wanted to become, I think, was the founder of a general new sophistication about media, and he was essentially parodied to death by guess what, media. They made of him an icon of cultural incomprehensibility. Not since Einstein has somebody, have you been so preprogrammed in advance to believe "you ain't gonna understand this guy." And that's what they said about McLuhan and consequently his message and his insight failed. We will have to reinvent McLuhan around the turn of the century because we are producing forms of media of such interactive uh, power and potential social impact that we're going to have to go back and uh, and rethink all of this.

It's a pleasure to be in Manhattan. This is my spring money run to the mainland. I've been in Boston (where I noticed that their liberalism is actually rooted in Christian rectitude, not secular liberalism as I'd always thought) and I'm on to Atlanta. So this is just a brief visit with my favorite town. It's lovely to be here on an early spring evening. The city hasn't begun to stink yet — I really like that time of year!

This is called “Flaking on the Edge of Fractal Uncertainty”, or something like that. Anyway, it's just an excuse to catch up with you. I sort of feel like this is the home congregation — or at least the office of the Holy Roman Rota — the congregation of the faith. This is probably the audience where I feel most at home and have the least slack! I've been traveling madly since I was here last May. Mostly it seemed like a tour of the English-speaking world. I went to South Africa, to Australia, to England, back and forth to Hawaii many times. I think traveling really reinforces the impression that we are in the grip of the “transcendental attractor and the end of time.” You know, it's one thing to stay home and follow it on the Internet, but the sense of the planet just exploding... These Australian and South African cities and populations trying to deal with political redefinition, technological onslaught, media onslaught — it's amazing, amazing, very much like Neal Stephenson's vision in *Snow Crash*.

I turned 50 since I've been here last year. It feels weasel-wise, although those of you who are ahead of me in time may find it nve.

What I'd like to talk about — I guess it's sort of a riff, a soliloquy, a monologue on the adumbrations of Heaven's Gate, since that has a deep, humorous resonance with most people's value systems these days. Actually my son, who was with me in Mexico in January, who's 19, pushed me to think about these issues before all that, because he's dealing with the culture in a very different way than I am. I listen to his laments and complaints with great interest. So the thing that I thought would be interesting to unpack a little this evening is what I call “the balkanization of epistemology” — or what he calls simply the “curse of relativism.” This is the idea that you can't tell what's going on anyway, so no matter how squirrely what

you think, it's no squirrellier or no less squirrelly than what anybody else thinks. All ideas are somehow on this even footing, including ideas that have taken hundreds of years and the talent of thousands of people to put together, and something somebody just channeled in from Francis Bacon, who's living under Catalina Island in a state of suspended animation with a troupe of Atlantean engineers who are uploading human fetal tissue to who-knows-where.

This balkanization of epistemology: it's sort of like, if you believed in economic theory, thinking that it would be a good idea if everybody printed their own money. And then to the degree that you had vigor for the use of your printing press, you could run off more and more copies of whatever meme you had invested in, and I suppose these things would compete. In your imagination they would compete — but anybody who's studied economics for ten minutes can tell you there's something called Gresham's Law, which is that "bad money drives out good money." And I think it's even more true with ideology. Squirrelly ideas drive out ideas of depth and substance. There's a kind of danger of being gently — without quite noticing what's going on — ushered into a world of increasingly more cartoon like ontological and epistemological fantasies about what's going on, or what's partially going on.

To my mind, conspiracy theory is a kind of flight from facing the fact that probably nobody is in charge. You want a vertiginous vision that'll stand your hair on end? How about that? It's not the Catholic Church, not the World Bank, not the Jews, not the Communist Party — nobody is in charge! I was in London in October, in the conference that these shaved, pierced and scarified deconstructive "contemporary artists" were having near Buckingham Palace. They put me in a hotel in Vincent Square, so I had to walk back through Whitehall late at night, which is where the Ministry of Defense and all the back-channel, super-secret British ministries are. And the lights are burning late in those buildings. I assume it's because nobody has a grip, nobody has a clue. They have to pay guys with pony tails and earrings to turn on the machines every day, and then it sort of goes from there...

The balkanization of epistemology — it's not a popular topic, because the simplest and most fun way to discuss it is to launch attack by example. Alice Roosevelt Longworth used to say at these White House dinners, "If you have nothing good to say about anyone, sit by me." I've had the good fortune (or the 'fortune') to be on this circuit long enough to have collected horrifying stories about almost anyone you may ever have considered respecting, and given certain conditions I can trot this stuff out. It was a joke — I used to have this thing I called the "kiting checks and stealing cars" test, which was: examine a given guru or expert. Ask the question, how much time has he done for kiting checks and stealing cars? It turns out a lot of people can't pass this test! (My own past digressions were considerably more noble and ideologically motivated, but let's not linger there.) So I was reading TIME Magazine on United coming down, and it turns out, yes, Marshall Applewhite — there was a mug shot, and I thought, "Oh, so what'd he do?" And then I saw: "Oh, car theft, of course!"

The reason I got onto this whole issue of witnessing and media and authenticity of experience, and so forth and so on, was because I was getting a lot of people asking me for my take on alien abductions. Apparently, some significant portion of our fellow citizens are under the impression that pro bono proctologists from a nearby star system are making unscheduled housecalls at night. Well, you and I know

how difficult it is to get a medical professional to pay any attention at all to you! So I think the likelihood of that occurring, based on that alone, needs to be carefully examined. Now I think I know what to make of this thing. I think we need to become much more subtle, first of all in our own thinking — in other words, there are rules for sorting out the “feces versus shoe polish” dilemmas that come along through life. I was recalling to one of my audiences Occam’s Razor. (And of course nobody had heard of Occam; that wasn’t a good sign, and I won’t put you to the test. Just nod “yes” when asked. “William of Occam?” “Yes.”) He had a razor. He said that hypotheses should not be multiplied without necessity. Seems reasonable. I’ll condense it, or modernify it, for you: it basically means, “Keep it simple, stupid!” In other words, the simplest explanation is to be preferred until it breaks down, and then the next simplest explanation is to be preferred.

I didn’t realize that this kind of thing was such a leap into deep thinking until one night I was on the Internet and this site was announcing that an object twice the size of Earth was accompanying Hale-Bopp, the comet, into the inner solar system. And they’d just put up the ponied-up photograph that was supposed to support this idea. So I thought, “Wow, great, what are the world’s great astronomers and observatories saying?” The web designer obviously anticipated my thought. I looked down and it said, “HEAR WHAT THE EXPERTS ARE SAYING” So I clicked on this button, thinking, “What’ll it be, the Hubble Telescope update? The Arecibo facility in Puerto Rico? The Atacama desert facility in Chile? The Keck in Hawaii?” No, it was something called The Farsight Institute, which brought the news that its remote viewers were in agreement that the object sighted was under Gray control and had an Atlantean architectonic and was on a peaceful mission, having already discharged its cargo of umbilical and fetal tissue traded from the U.S. Military for advanced technology.

We can laugh about these things — we do laugh, we should laugh. It’s just too bad that some people off themselves in the process of struggling to try and figure out what’s going on. After the Heaven’s Gate thing, they were interviewing people on NPR, and people were saying, “Oh, I just can’t understand how these people could have worked themselves into believing such a bizarre group of ideas!” So then they buttoned that up and they said, “Well, now what’s happening with the White House Easter Egg Hunt?” Yes. It turns out, you know, a lot of people are carrying a lot of peculiar intellectual baggage. I mean, I don’t have any problem with people having religious ideas, but I think they should be clearly labeled as “IRRATIONAL”, and those people should voluntarily recuse themselves from debates about the nature of reality. The spectrum of philosophical differentiation between the Resurrection, the Easter Bunny, and Heaven’s Gate is only a matter of taste and aesthetics. Hey, it’s a hard truth, but something to consider.

So thinking about things like this, I’ve sort of come up with a rap, which I’m going to try out on you, which is the slim and meager fruits of my agonizingly slow maturation process. And I think there were hints of this last year, but these things come slowly. There’s this phenomenon in nature — nature is always a good thing to go back to when trying to tease apart what’s happening to us culturally and individually — there’s this phenomenon in nature called neoteny. (Perhaps I mispronounce it in my broad and charming Western drawl, but nobody knows this word anyway; you can get away with murder!) Neoteny. What it means is “the retention of juvenile characteristics into adulthood.” By a species — this is a strategy, it happens in nature, and it happens in evolution. For example (an evolutionary example), we human beings, of all the primates, are the most hairless. We have hair, and it’s all over our bodies, but it’s very fine and allows you

to see through to the skin. This is an infantile characteristic of most primates, but we retain it into adulthood. Another similar example: our head-to-torso ratio is a fetal ratio when compared to most primates. In other words, the fetus of other primates looks more like a human being than the adult form.

Neoteny. There are much more spectacular examples of this which involve what appears to be an ability to express sexuality in actually two morphogenetic forms. There are creatures which live in swamps where, as long as the swamp ecosystems are at equilibrium, they basically appear to be like polliwogs — in other words, gilled creatures, fishlike creatures. And they actually can have sex with similar creatures of the opposite sex, and give birth to polliwog-like creatures, and this all appears to be species reproduction as we know it. The amazing thing is, if the swamp is disrupted and goes dry, these things dig into the dirt, and six months later they come out as gilled animals with flippers, able to breath oxygen and move around on the land. And they then can have sex with creatures of the opposite sex and produce a second form. The interpretation of this is that the first form is the neonatal but sexually mature form, that is pinned in place by environmental factors, and then the second form is actually the true mature form, which is only called forth under special conditions.

The reason I mention this is that I'm thinking more and more about this issue of media manipulation, the Internet, the evolution of culture, who shall control it, and what are its effects. My doctor — recently I had a physical — and he said, "You knew, in the Nineteenth Century, most people your age were dead." And, yes, this is sobering to realize. Early death, something which has been with us until virtually the last half of the Twentieth Century, was a factor acting to reinforce a kind of cultural neoteny, within the cultural environment. Jung, I think, was on to this in some way, because he felt that the great adventure of individuation began in middle age.

Well, riffing off that, I think the idea that I'm coming to is that culture, in all of its offerings and splendor and artifactria, and especially in the form of ideologies, is not the friend of the life-prolonged, postmodern individual. Culture is not your friend. This is the vaguely-smelling-of-political-incorrecness message that continued drug use and philosophical abuse has brought to me. Generally the way the intellectual life is presented is that there are good ideologies and bad ideologies, and by a mixture of intuition, logic, education, master of the tools of the culture, we make choices between good and bad ideologies. But you can't help but notice, at a certain point of alienation, maturation, psychedelic boundary dissolution — it doesn't matter what the vocabulary is you use — you can't help but notice that culture is some kind of con game. It's a scam. It's a manipulation. It's for the nave. They can only work this limited set of tricks upon you three times, four times, six times, before you get it. You figure it out, you know? How many art openings, how many Next Great Novels by the geniuses among us, how many filimic triumphs, Nobel Prizes, Booker fiction awards, and on and on and on, can we tolerate in the illusion that we are moving into the truly new and exciting? It works for awhile, is the idea.

So then, what does it mean to get beyond cultural values? How does that look? I can only speak for myself, obviously. (If you find this hideously unsettling and worrisome, just stifle it. After all, it's just one guy, right? One unlettered nut and his coterie of cultists. So you don't really make the world a safer place by stamping out this voice.) It seemed to me in my peregrination through American culture that there were

traps. It's sort of like the Mahayana bardoes of the dead: there were allurements to be avoided, and obvious pitholes that no one in their right mind would drive into. The first one of these, I remember, was even before I contacted the larger initiatory machinery of society. It was under my father's tutelage that I learned to kill: elk hunting was a right of passage where I grew up, and I dreaded this from the moment I was able to cognize what it was going to be. And in time it ground toward me, manifested itself, and in some kind of miraculous epiphany an animal actually sacrificed itself to my trembling hand, and I moved on. Essentially my father never asked anything of me again in that context. But the future was waiting with sharpened knives, "red in tooth and claw." Not Nature red in tooth and claw — that's a misnomer — but society. So the first thing to steer around was the military involvement; I passed that intelligence test with flying colors. (It didn't hurt to be chickenshit and have bad vision, either — sort of the wind beneath my wings at that point.)

The next pitfall was corporatism, which never had a hold on me because I managed to choose the wrong schools in the first place. It was wonderful, in Boston last week, to actually go to Harvard for the first time. I totally liberated myself from ever wanting to have anything to do with that whole scene — not because it was so terrible, but because it was so ordinary, of course. This is part of my revelation about undoing the hype that evolves around the uninvestigated portions of reality. You're impressed by Harvard? You're impressed by crop circles? You're impressed by the Black Virgin of Czestochowa? Go there. Go there, have a drink in the pub across the street, buy the T-shirt, listen to what the locals are saying, and it'll all snap into focus very nicely.

But continuing — can you tell? — the thought. Beyond military involvement, corporate involvement, right universities, wrong universities, the one I think where middle-class values rear their heads most fiercely is the issue of marriage. I speak as somebody who has been ground finely on the anvil of this particular issue. It's almost as though, we're sort of like cuckoos — in fact we are cuckoos, but we're also like cuckoos — in that we're kicked out of the nest too early. So just as you're about to cross that big golden bridge into adulthood, it says, "Last exit in the neonatal realm. Find somebody as clueless as yourself, get back to back, and start a marriage." The process of being raised is essentially then self-generated. We then continue the process of cultururation, acculturation, the acquisition of cultural values, and stuff, now bound in this romantic myth. One of the things I really had to come to terms with was how much of my relationships in the past had been dominated by sentimentalism, and what a craven thing that is, and how brutally it uses us. Because it basically cashes in on that you're a nice person, and it screws you. Sentimentalism!

So then things happen. If you're smart, you succeed at whatever you chose — advertising, film making, fashion, modeling, playwriting. There's this insidious process which goes on in the culture, which is, just as you get your kids sent off to the Sorbonne, get your marriage dissolved, and your shrink patting you on the back and all of this, then money comes. You become successful, you get rich behind all this prostitution and self-mutilation that you did the previous twenty years. Just at a moment when, if they didn't recognize you, you would turn on them in fury and construct a real identity, they in fact come around. And you are inculcated, and lifted further, and anesthetized, and now you become a mentor to people making their way through the same blood-stained labyrinth, the footprints through which you seem to recognize somehow.

The idea here is that, obviously we're coming to some kind of cultural crunch. The print-created categories of the post-Renaissance are breaking down. We can explore this or deny it or create a mix of exploration and denial that is uniquely expressive of our own hopes and fears. Culture is some kind of a collective

hallucination. It's infantile. It's an epistemological cartoon, and it's breaking down. What brings the news that it's breaking down are the absurdities that nibble at the fractal edge. The great absurd propositions that have been passed on and revered and sentimentalized for millennia, like the Resurrection and monotheism and da-da-da-da all this stuff, are now having their false premises illuminated by the cheap goods that are being sold in competition — that cheapen, essentially, the entire magic show. It's now exposed as a bargain basement of trinket dealing and foolish goods. The wages of civilized existence are now found to be hollow in some way. But I think that people don't want to culturally confront this because they've been told "alienation is bad; this is alienation." Well, it's alienation from insanity is the basic thing.

The culture has become self-limiting, toxic. This is why it's generating technological antidotes to itself. That's why it's importing things like psychedelic plants and substances, or Eastern techniques of meditation, in a kind of delirium or a kind of self-review at the end of its existence. It's furiously exporting, into the lens of its own self-inspection, every text, every drug, every ritual, every method, every cuisine, every language group, every folk dance — every anything — in a frantic effort to find some kind of connecting metaphor. Well there isn't a connecting metaphor of the ordinary and usual sort. What all these ideologies do — all ideology — is provide closure of some sort, at the cost of realism. Whatever satisfaction you get from quantum physics or Marxism or Hasidism or any closed system of thought, you need to recognize that that satisfaction is purchased at the cost of realism. In Lit. Crit. there's this term "willful suspension of disbelief". Well that's all very fine in the confrontation with art, but in the confrontation with that which claims to be real, it's a precondition for being led down the primrose path.

I think the last time we got together the theme was how there were two kinds of people: artists and marks. The only way to relate to the engines of commodification of ideas and production of consumer ephemerata is to produce. The only sane position is to produce, because if you're consuming, you are in the victim part of this equation. And as more and more people realize this, the level of artistic content and creativity asymptotically accelerates, as it knits itself together across the interface of evolving fields of knowledge. We are — whether you follow my deeper metaphysical harangues about the presence of an actual mathematical dwell point in the spatio-temporal domain, that is sucking us into a kind of black hole of novelty, connectivity and boundary dissolution; or whether you just, as a rationalist, observe the speed of the acceleration of computer technologies, media technologies, interactivity, data accessibility to the normal person and so forth and so on — it's very clear from either perspective that social business as usual has been taken off the menu, and that we have unleashed, as a collectivity, something inside ourselves. Call it syntax, call it "grammar's appetite for virtual reality," call it the Gaian mind — it doesn't matter, whether you have a beansprout vision of it or an Extropian vision of it — whatever it is, what we have called "human consciousness" is moving into a deeper relationship with prosthesis, at a faster rate than anything we've known in human history. In a way it isn't new; since Ur we've been operating inside virtual realities of a sort. But when the medium is fired clay or steel and concrete, the speed at which these things unfold relative to a given human lifespan is such that a weird hallucination of equilibrium and business-as-usual is maintained.

That illusion of business-as-usual is giving way for us to a kind of vertiginous sense that the human unconscious, "morphogenetic field" — whatever it is — some kind of protean thing that links us all in an active, not passive, mode — is expressing itself through us. My dis of the alien thing earlier is not from the point of view of scientific rationalism. Not that I don't think the alien is among us, but rather I think the most foolish among us pushed forward against the velvet rope with their chattering description of it, like sugar-crazed five year olds, and that cooler heads have to come in and look at this. The alien is — where?

The alien is in our heads, in some way. And then people say, “Well, that’s the psychic explanation, that’s terribly humdrum.” No, no, I don’t mean that, exactly. I mean that, whatever its essence is, I will know it as I know your essence. You will know it as you know my essence, which is entirely as information. So then people say, “Well that’s some kind of flattening of it. You’re making it a literary conundrum, etc.” No no no no no, not that. The new technologies — VRML, enhanced reality, all that stuff — are showing us that the world is information.

You know, in every scenario of alien contact there is a prop. It has different ways of appearing, but basically it’s the landing zone. You have to build a landing zone, and every flying saucer cult worth its salt builds a landing zone. In a way, I think the new protean electronic Internet — the purpose of the Net is to catch the alien mind. The alien mind is within us. It will be coded by human fingers, but it will be truly alien. Simply because it is downloaded through the human neural network, do not think that the invoking of this thing — which is an artificial intelligence, a protean, non-human intelligence, a globally-distributed, self-learning, self-defining-teaching-integrating intelligence — is not going to be alien. And yet it is going to come through us.

The cheerful scenarios of Hollywood myth-making are going to be thin comfort indeed when we begin to see, indeed, just how alien we ourselves are, and how real we can make that for ourselves. Because we are dissolving away from the print-created nexus of rationalism and geometry that we call “public space.” It came into existence, you know, 500 years ago; it’s dissolving over the next fifteen or twenty years. And what it will leave us all in is a domain of Imagination, neither clearly public nor private, but clearly, intensely numinous, and realized in a way that we at this stage can barely even begin to comprehend. We have been living in the Imagination but our feet touch the earth because the laws of physics and the laws of materials and architectonic constraints held the Imagination in place. But what will we become when we unfold into the Dream? The answer’s going to depend on how clearly we think about it going in, and how demanding we are, upon ourselves, in terms of the kind of beauty we create.

We can see from how capitalism manipulates the commodification of ideas, that what it tends to do is flatten and trivialize, because it appeals to the mass mind. Is this simply a momentum of the print technology, that will play itself out in the new media multiverse? Or is it a more pernicious tendency that is going to try to actually survive the cultural transition? I certainly fear the latter, and feel that the best antidote to the survival of that tendency is for people to consciously celebrate diversity. Consciously insist on an expansion of language and an erasure of categories, and a psychedelization of the cultural enterprise in the service of beauty, diversity, astonishment... and mystery, the theme that I wanted to return and end with, which is: ideology flattens reality because it denies the Mystery, because it has all the answers. Whatever it is, it doesn’t matter; the ideology, by providing a complete explanation, automatically certifies its own falseness. In the interests of cultural maturity and living a postmodern existence, and taking art as our — the image comes to me, T. S. Eliot says in *The Wasteland*, “Come in under the shadow of this red rock.” For him it was the churches. For us, I think it has to be art freed from ideology, a celebration of beauty, culture with a direct relationship to beauty through the felt presence of immediate experience. That’s what the growing beyond ideology and certitude gives back to us, is actually the dynamic sense of being alive in uncertainty. Civilization denies that, and in a sense cheats us of our birthright in uncertainty.

Anyway, that’s what I wanted to download on you tonight. Thank you very much.

Q & A

This is one of those social situations where lack of brevity is proof of psychosis, and you WILL be judged!

Q1 It's one question, but it's in two parts. The first thing is the idea of neoteny. It struck me that there's a similarity between that idea of there being two forms of the same organism, with the Heaven's Gate people's idea that they were in human form, and that if they were taken out of one environment (which is the socio-cultural environment) and put into that special environment which is the cult (which is sort of "digging underground"), then they would be reborn into the next level.

TM Yeah, I advance these things as models. The Heaven's Gate thing — to me, all of this stuff is an intelligence test. Those people failed it. But my point in my main lecture was that they are not as bizarre as they are made out to be, in the sense that lots of people are running around with extremely bizarre ideas, that we have simply gotten used to because they are socially sanctioned. When Pliny the Younger first wrote his report to the Roman Emperor on Christianity (I was recently reading a book called *The Christians as the Romans Saw Them*) he said, "This is a cult. It's a cult of Christ. Religions deal with the great issues of cosmic origins and final endings. This doesn't deal with that; it's a cult of Christ." So we have built a culture around that cult, and yet the rantings of a Southern preacher suitably liquored up on Jim Beam and syphilis was convincing, I think, that these are the rantings of a diseased mind. So what I think people should do is learn to trust their intuition and develop their crap detectors to a little higher state of subtlety. Because as we approach — whatever this thing is — the narrow neck of happenstance that is constricting the end-of-the-century phenomena, there are going to be more and more claims upon our attention and our imagination, "wonder workers" moving among the people and on the networks. Do your mental calisthenics early, so that when they come knocking on your door, you will have the strength to tell them to keep on moving.

I couldn't believe the way in which the media portrayed the Heaven's Gate people as very careful thinkers, very reasonable people — I mean, I heard about this thing in 1975. Somebody said, "Hey, there are these two people who are running around who say that they're off a spacecraft. You wanna go see?" "NO!" Yet 'decent people' — and most of us are 'decent people' — just lack the imagination to imagine where you can get if you embrace pathological lying as a professional strategy for advancement. Joseph Goebbels showed that this can really take you places! I'm sorry, you have a follow-up?

Q1 This is a question about culture in general, when you mentioned the Net being a landing pad. It struck me that the reason we're all so addicted to culture is because it is the landing pad, we're trying to trap something in it. What I see as the obstacle to 'honing your crap detector' is not wanting to give up your claim on Beauty. If you've been trapped in your cultural net, if you don't want to give up your neural connection to Beauty, and live without it -- like in spiritual traditions you have this idea that you have to pass through this desert, where you have given up your water...

TM I would differ with you. I preach reason, but when into a tight place, I think the appeal to beauty is a deeper and more intuitive dimension in which to make the judgment. In other words, I'm like a thoroughgoing Platonist. I say, the Good, the True, and the Beautiful: these are three aspects of something we're trying to maximize. Truth; you can formally learn the rules by which one approaches Truth. It's tricky. The Good, it's even trickier. Beauty makes a direct appeal to the senses. Somebody asked me, what did I think about the face on Mars? And I had no problem dismissing that because it was tacky. In other

words, that's all you have to know about that, because the Mystery will not be tacky! It is not tacky!

Well that's awfully harsh. It's awfully harsh, but it brought us to the right position rather quickly and with dispatch — which was the point: why put these people through misery, if in fact ultimately we're going to have to say that their commodification of whatever intellectual system they're peddling is found wanting? So I think if we built a society based on Beauty, strange Beauty, the True and the Good aspects of this three-pronged enterprise would fall naturally into place. I have that faith.

Q1 I didn't mean give up Beauty, but give up our claim to Beauty

TM You can see more art in twenty minutes on high-dose psilocybin that you see in a long afternoon wandering around Florence.

Q1 That's right, but most of us don't spend our time in the psychedelic state.

TM Well, no, but we should spend our time reflecting on it, I think.

Q2 This is not a culture question, it's a drug question. What do think is the evolutionary advantage that led to addiction, and why does it still persist? What's the purpose of addiction? I have my answers, but I'd like to hear from you.

TM This touches a big subject for me, and some of you are familiar with my position on this. I think that psilocybin in the earlier human diet interfered with the ordinary primate tendency to form gender-based hierarchies, and that we actually medicated male dominance out of our behavioral repertoire during the period in which we were evolving language and culture and humor and theater and that sort of thing. Then later, when the psilocybin came unstuck from the human enterprise because of climatological change, this kind of abuse syndrome arose, because there was a sense of having had a relationship that was interrupted. And this is why human beings addict to countless substances, and behaviors, and each other, and political ideologies. In a way ideologies are drug fixes, because they fix some certain kind of mental disequilibrium. You just give yourself a shot of Marxism or Hegelian idealism and say, "Oh, that makes the pain go away!"

But that's what it is: it's disequilibrium brought on by being torn from the Gaian matrix, by having an early pseudo-symbiotic relationship with mushrooms interrupted. How about that?

Q2 It seems to make it a totally pathological issue instead of an adaptation. I think there might be more to it than that.

TM Well there might be more to it than that. It's pathological only when it's exercised in the presence of an inappropriate stimulus. In other words, it's pathological to addict to morphine, Marxism or monotheism; it's not pathological to addict to self-reflection, punctuality and — I don't know, it's just behavior. But thank you, it's not easy to climb up and face the music.

Q3 I was wondering, with the 2012 date, and approaching more and more connectivity, things are coming closer together and people are realizing that things are connected: it seems that there is a technological side to that. But in a way, the whole technology is geared towards military stuff, NASA's involved in this and

that; it's going that direction. But hemp, for instance, the earthly, natural type of thing -- the same people who are promoting technology and those things are down on psilocybin -- laws against it, paranoia against it -- because it changes people's minds. It ties them into a connectivity that's with the earth, with the earth grid, as opposed to something else, something out there that people are going for...

TM I think you're right about the whole issue about drug suppression in this society. It has to do with the fact that these things have unacceptable social consequences in the area of deconditioning and dissolving boundaries, and that they actually are synergistic to forms of local community and affinity-group building that establishments find very threatening. This all has to do — surely you can see how it all works — with the idea that culture is some kind of conditioning process, that you are not supposed to get behind or get in front of, or doubt. And it's complicated; you're given many choices. You know, you can teach at Wellesley, you can go into banking, into brain surgery, and you're still within the game. The reason drugs are inveighed against so furiously — when you can demonstrate in terms of the normal criteria by which social menaces are judged, that these don't even make it onto the radar — obviously there is some phobia or taboo or secret agenda about repressing these things. I think it's simply that we are very anxious in this society about other people's states of mind. The idea that people would take control of their states of mind by intoxicating themselves, or in any way altering consciousness, is considered fundamentally disloyal.

You're making this point very well, but I am not a pessimist, I am not into these conspiratorial theories, because from my point of view it all seems to be being negotiated in a fairly sane manner. In other words, the military-industrial complex has quietly taken its place as number 2 — behind the entertainment and media industries. Governments are being told by corporations, "Keep the roads repaired and care for the sick! We'll take over the manufacture and distribution of commodified goods." And apparently, in the same way that the Church was patted on the back and toddled off the stage at the end of the Thirty Years War, nation-states are going through this. Their *raison d'Être* for their existence, which was the whole Cold War paranoia scenario, has pretty much been unplugged. There's a lot of retro-inertia and people moving at different speeds within the system, but I think we're now living in the corporate, post-informational, boundary-less collectivity, and it was built by guys with pony tails with rings in their ears, who were druggies, basically.

I think there's a lot of bad things going on, but mostly just to make money. Very few scenarios of control are going to bring those who generate them much happiness. There's money to be made, for sure, on the good side and the dark side of the cultural transition. But as far as the drug thing is concerned, the very presence of the word 'drug' in our culture, in the de-numenized form in which it exists, makes it very hard to talk about the issue. I mean, everything is defined as a drug by those who are looking at it from a marketing and commodification position. Society, again, is not going to help you with this. You're actually going to have to someday face the fact that you're going to get as far as your intelligence can carry you. Expecting the society to undergo some fundamental reform, and then for it to take over the function of your transformation, is probably hopelessly naive. What this is, is not a free ride; it's some sort of opportunity in the midst of chaos. I think!

Q4 My question is in relation to Jewish mysticism, and specifically the Kabbalah. The Kabbalists believe in tikkun, which is the restoration of matter and creation, when the divine Seed is reconnected with the Godhead. My question is, do you believe that this is a metaphor for cosmic consciousness, in that we, as Man, as the earth, has a collective soul or collective consciousness, that somehow can be connected with the Other and brought forth to a new dimension of time and space?

TM The persistent myth of the West is this thing about the “going forth of the Word,” and the descent or the declension of the Word into matter. Kabbalistic mysticism has a lot to say about the realization or coming into being of the Word. Reality from that kind of point of view is some kind of literary construct. The difference between science and magic, fundamentally, is that science believes the universe is made of something, like matter and energy, and magic believes the universe is made of language.

Q4 What about the fusion of the two? What if language was sort of a lower evolutionary form of communication, and the higher form of communication would be something like telepathy or sensational connection?

TM If you have a powerful enough language, you can take control of reality. This is what magical languages, like in the late Renaissance, were about. The only thing which comes close to that today is code for computers. Essentially, these are languages which, when executed, something happens. They are languages of efficacy. They carry, not meaning, but motivation to activity. This Kabbalistic question is very interesting; someone showed me, recently, a sculptural object, which, when illuminated from various angles by a source of light behind it would cast, one after another, each of the Hebrew letters on a screen. In other words, this was a higher-dimensional object which had the entire Hebrew alphabet somehow embedded in it. When I mentioned this to Ralph Abraham, he said, “Well, all you have to do is digitize and quantify that object, and we’ll be able to compute from that three-dimensional object to a 5-, 6-, 7-, 8-, or 9-dimensional object, which would cast all letters of all alphabets into matter.” So one way of thinking of the “transcendental object at the end of time” is as this kind of Ur-letter or Ur-word in hyperspace, from which, as it sheds the radiance of its syntactical numenosity into lower and lower dimensions, realities — as literary functions of being — constellate themselves.

Q4 So would you say it's sort of like the fusion of the unconscious with the conscious, in such a way that we can experience the entire world in one moment, or the entire universe in one moment, or the entire works of creation in one moment?

TM Yeah, I think one way of thinking of the Internet is as a hardwiring of the Human Unconscious. In other words, all these databases, all these buried complexes and this data is becoming accessible to the inspection of the conscious mind in a single moment. So it’s almost as though, whatever the post-historical experience is, it’s something that cannot be achieved or approached in the presence of baggage as anti-progressive as the unconscious mind. We are discovering that we are, in a sense, simply protrusions on this larger protean form called “the human collectivity”, “the community”, the “unconscious”. Our dear identity, so dearly won, is simply a kind of convention of how we present ourselves in Newtonian space. But we are collectivizing even as we discover the depth of our individuality. It’s a paradox, but it’s not a self-canceling paradox; it’s a truth.

Q4 Would you say that the Godhead is what we would consider perfection?

TM I think of it as connectivity and novelty. Perfection — I’ve never tended toward these neo-Platonic things where it gets more “One”-ish, more “White”-ish, or “Light”-ish. For me it gets just weirder and weirder. You know, whether all these scenarios of transcendence and transfiguration come to be in some “real” dimension (whatever that means), you may be sure that, long before fifteen years have passed, every major and minor religion on this planet will have a VRML simulacrum of its eschatology up and running

for you to comparison shop with!

Q5 I've heard you several times, and I come because you use words so wonderfully. I have something to say about the print culture versus the Internet. I'm a librarian at a city college, and I see the Internet mostly being used by very ignorant people -- I'm afraid I see more the pernicious effects of the Internet. And when I read about people like Negroponte, who speak of bodies as "meat", to me that's the opposite of Beauty, because Beauty, as you said, is connected to the senses. So I don't see a liberation in terms of virtual reality, necessarily. I think it depends on who's doing it. At the moment -- you used the word 'commodification' a lot -- as a post-Marxist I can say that everything is being commodified now, including the World Wide Web -- although the kids with the rings in their ears didn't make as much money as Bill Gates, who didn't have a ring in his ear. [TM: He had a ringing in his ear!] What I'm getting at is that everything is still very much controlled by money, and as long as it's controlled by money, I don't see how it's going to be liberating.

Just one more comment. You speak so well; I heard you talk about Aldous Huxley, and you were the only one who talked about Aldous Huxley. (Everybody else talked about themselves.) What I'm getting at is, you are absolutely grounded in the print culture. Much of what you say about Beauty is what William Morris says as well. I guess I'm trying to make something of a defense for the print culture, and something of a warning about seeing the WWW as necessarily liberating.

TM You're right that I'm definitely rooted in the print culture. I consider basically my entire schtick as proving that you can turn a liberal education into a borscht-belt phenomenon. That shows how short people's memories are — “Oh, he quotes Homer! Amazing!”

But I think the fear that the Internet was going to plunge us into a world of barbarian illiteracy was a transition phase. Now I'm meeting people whom, I think, you would consider largely illiterate — in that they've never read a book — but they are very fully in command of the tools of the culture because they do all their reading on the Internet. What's happening is simply a celebration of diversity. Capitalism built the Internet, but it has not yet made a great deal of money off it. McLuhan said that no technology in history has ever been implemented with even a partial appreciation of what its real effects were going to be. The Internet is supposedly a great place to do business, but what I see it doing is empowering previously marginalized minorities and positions. It has certainly pulled the plug on the agenda of the nation-state. Corporations do not use war as an instrument of national policy. They do not like starving refugees; they like well-fed, true believing customer bases. And to this end they have exported a lot of chaos to ghettos of the world — and even there, there's a shrinking of the commitment to the kind of chaos that typified the age of nationalism.

We make these different metaphors about what's happening; here's a sort of neo-Christian metaphor, which follows McLuhan. We lived through the age of the patriarchal beehive or anthill, we lived through the age of the glorification of the perfect Man, and now what we're seeing is the protean advent of the age of the Holy Ghost. Electricity in McLuhan's pantheon was the descent of the Holy Ghost. It clothes the planet in numenosity, it accelerates information to the speed of light, and it creates a kind of collectivity of understanding. Were we not so secular and so embedded within it, we would see its transcendental implications much more clearly, I think. People like Teilhard de Chardin and McLuhan and various others have seen that. But the rest of us are so focused on the commodification issue that it seems banal and mundane. It is, in fact, not banal and mundane, and I think quickly this is going to become more and more

apparent to more and more people. We've only been dealing with the Internet for about three years, really, as a culture, and already it dominates all discussions of salvation, destruction, chaos, redemption. Wait 'til you see what's coming!

Q6 With this new glut of information and ideology: is it simply a matter of there being so many more, or is the choice between mystery and ideology any more difficult than it has ever been?

TM Well, I think so, because I really believe that you have to take seriously the hidden agenda of every form of media that you embrace or reject. So it's not simply about "more", it's that print, the electric light, every form of media changes us in ways that we don't suspect or understand until we move beyond it. Now we're understanding things about print that previously we couldn't even language to ourselves, because it was like the surface of our own bodies. Now we see that the assumptions of interchangeability based on modern industrial processes, or the assumptions about the quality of our voting (one person/one vote) — this kind of mechanistic thinking about society, which we were raised not to question, are in fact notions that only make sense in the print constellated universe. Now that we're moving into a world with different sensory ratios, how we do science, how we do fashion, how we do art, how we do relationships, how we define things as deeply ingrained and supposedly outside social manipulation as gender identity, and things like that, are discovered to be completely fluid.

Q6 But haven't they always been fluid, even though the ideology may have said differently? Wouldn't the fundamental decision between being fluid and remaining solid stay as equally powerful (even in the context of the fluid network, etc.)?

TM I think so. But as you say, our attention has drifted away from that. This whole thing I was trying to put across tonight, without just saying it flat out, was that we have become silly, we have become infantile. We lack dimension. This is not an adult style of civilization, the way we live. Now you're saying, well maybe in the past there have been adult styles. I don't know — maybe, maybe not. I'd probably tend to resist it. But for sure, this society is silly, trivial, juvenile, infantile, self-denying, self-flattening, uses a simplified vocabulary for emotion, for relationships, and to chart its way forward. And so then the defining of social values and the expression of social institutions is left to faceless collectivities — these "They"'s we're always talking about — the Corporations, the Media, the Government, the Somebody. Again, this is an infantile myth of how reality works. Imagine if you were actually a free and responsible individual! Play with this idea; it has implications for you, I think. And it may not have been true in the past. As I look back to how I was raised and the people who raised me, everybody was living inside a cartoon, a sitcom of some sort. We've blown the whistle on that. That was what the work of the deconstruction that modernism performed on the bourgeois sensibility was all about, to tell you you're more complicated than that, deeper than that, more dynamic, more self-surprising than that, more psychedelic than that. More sexy than that, smarter than that! I'm sorry, not to rant.

Q7 All I really want to know is -- you know, I had this great philosophical question, a psychedelic question, I was all excited -- but all I really want to know is: how does Terence McKenna live? How do these nights affect your life?

TM I'm trying to "walk the walk and talk the talk". What that means at the moment to me is: three years ago I moved from northern California where I'd been for 35 years in a kind of sandal/beansprout/blurred-gender culture that spoke a rhetoric of rainforest action and so forth and so on. I moved to Hawaii; I

moved off the grid. I live within thirty seconds of climaxed rainforest. I have an ISDN-speed (128k) connection straight onto the Internet (through the air, wireless; I point at my provider). So I'm trying to study the Internet in isolation from the rest of the culture. I just want, basically, an archaic world of nature and natural values, and the fastest most hi-tech machine I can get my hands on.

Somebody said, "What, is your message still the same?" My message is still the same, and it has nothing to do with me. The message is, "Don't follow me, eat a shroom!" Unlock the cultural box and check out what's going on. Your nervous system, your sexuality, and your vegetable friends provide an antidote to cultural dystopia, alienation, and victimization. Don't be a victim. Don't consume. Produce art. Keep your powder dry, one hand over your wallet, the other hand over your asshole — this the way to proceed with this society, I think. And then we'll all meet at the end and make extremely high art. I see it coming.

Ralph Abraham: So, in the 1960's our speaker Terence was a student, like many of you, at UC Berkeley. And he left in the middle of things to go on a tour around the world for seven years that ended in, uh, the, the deepest Amazon Basin where he had an experience that has determined his life in the 20 years following and which is the subject of his latest book, True Hallucinations. So now in this historic moment after all this time, Terence will ascend the platform of the University of California for the first time.

Terence McKenna: What I thought I would talk about, uh, when I was approached to to do this, uh. The pressure was to say something new which is a heart stinging pressure to a warhorse of the lecture circuit. I started out thinking I would never repeat myself and sometimes wonder if I'll ever have a new idea again. Uh, but what I wanted to talk about this evening is illusions, and I called the lecture the taxonomy of illusion, because I think it's interesting to, uh, to attempt to classify and relate the various kinds of illusions that stand between us and, uh, that presupposed naked radiant Truth [mic whirrs, all chuckle, clapping] that, hah, has more or less driven the engines of Western philosophy since Plato. Of course the great victory of modernity is to disabuse ourselves of such naive notions, but, uh, they die hard I think. Um, Ralph mentioned my, uh, my latest book and I didn't, I don't intend to talk about the book particularly, but I- in the book I quote, a, uh, the only piece of poetry in the whole thing not written by me. I now see that I seem to have lost it, oh no, here it comes up. But it relates to this on many many levels, this question of illusion and the relationship of the self to the real, and where the world falls in that equation, and the limits of knowledge [cup falls in the back] and all the other good psychedelic stuff that needs to be considered. The quote is from Pale Fire by Vladimir Nabokov, and if you don't know this book you should. It is without doubt one of the funniest books in the English language, and it takes the form of a very long poem and then the commentary upon this poem. The poem is written by a character that Nabokov creates named John Shade, and, uh, the part that I want to call to your attention this evening runs like this:

...that rare phenomenon
The iridule—when, beautiful and strange,
In a bright sky above a mountain range
One opal cloudlet in an oval form
Reflects the rainbow of a thunderstorm
Which in a distant valley has been staged
For we are most artistically caged"

Now, this is a very strange piece of poetry. This is not like, uh, even Wallace Stephens at his most obscure. In the first place, this word, 'the iridule'. You won't find this word in any dictionary and yet I sensed that this is obviously the word for this phenomenon. I know what he is talking about, I have seen, uh, this, uh, 'opal cloudlet in an oval form which reflects the rainbow of a thunderstorm in a distant place. We're- here we're in the realm of mirage and nature as mirage and nature as mirrored labyrinth. Uh, and then the final point, and I'll go through all this in the course of talking to you, but the final line of being artistically caged, this is I think, um, where the psychedelics come in because psychedelics allow one to pierce beyond the veil of cultural illusion, beyond the linguistic momentum of what has been handed on, what has been handed on. The faith of tantra and magick and psychedelics is that the apparent intransigent appearance of the world can somehow be overcome by an act of magick.

I used to collect, uh, Tibetan tonkas and the texts which go with some of these tonkas, I remember one in particular which, coming out of the Tibetan the translation was "all things being reversed, the great Hla (the great god) appears instantly". You see, the precondition for magic is the reversal of causality somehow, and as moderns we have grown to give great credence, I think, to the idea that the world is largely a linguistic structure, largely created through the participation of the observer, but we have not been able to take that perception and turn it into a technology. Instead we are still driven by, uh, the blind momentum of atomic structure. Who was it who said, uh, "the atoms blindly run" and then I think it was Whitehead who said, "yes, but within the body they blindly run according to the body's plan". You see, what, what I think we're dealing with are patterns and then the indeterminate dimensions between patterns. And it's in those indeterminate places within the interstices of reality that the observer is able to establish him or herself, and then model back, uh, the world.

The reason I wanted to talk about a taxonomy of illusion was because I thought it was important to relate the various styles of hyper-seeing, non-seeing and mis-seeing together because I think that the, the heuristic consequences of doing that are to realize just how shifting the sands are upon which the ontological edifice of Western thinking rests. I mean, that's always the point, you see, to deconstruct Western civilization because Western civilization, the toxic consequences are now clear for everyone to see. So, the first, uh, the first category or grand family of illusions which we would put into our taxonomic key would be social illusions, and when I, and, and, you know, later we can argue this, but at this point in the, in the discussion, illusion is slash delusion, so the great social illusions/delusions are sexism, racism, xenophobia, egoism, so far- uh, classism. The world is riddled and ruled by these social illusions and no one is free of them, and so they constitute one broad category. I might just mention, as an aside, a book which was very influential on me, and I never heard anybody else ever mention it, was, uh, a book call- by Rockliff called Illusions and Delusions of the supernatural and the occult. Uh, this was a 10th century book which I as a kid got in a Dover reprint and it was in a wonderful era where the study of anomalies was still young and so this book had everything poured in together from mesmers, ectoplasm, to people who had tumors that they carried around in wheelbarrows, to birds that did advanced arithmetic, so on and so on. And it was very much from the point of view of Victorian rationalism, and it also mentioned psychedelics. What it really was a was a category of edges, or a catalog of edges, I'm sorry. And it was only in the subsequent 40, 35 years that that vunderkamera approach to illusion, and I assume you all assume what I mean by that, and I mean- I'm referring to the era before the rise of Linnaean natural science when naturalists would simply fill cabinets with anomalous, natural and strange object, so the tarantulas were mixed in with the chambered nautilus which may be stirred in with the Zuni fetishes which may be stirred in with something else.

Then later these wunderkamas, these, uh, curiosity cabinets, as you would call them in English, gave way to Linnean taxonomy in the same way over the past 100 years I think the study of illusion and anomaly has, uh, attempted to rationalize itself. Uh, spatial illusions are an entirely different family of illusory phenomena and we all have encountered at some level, I imagine, the specially constructed environments that occur in behavioral psychology labs that trick you into thinking that the person in the foreground is smaller than the person in the background, so forth and so on. These kinds, uh, of illusions and are- are probably fairly trivial except that they address perceptions, and when we get to psychedelics as a source of illusion this is more important.

Another of the great family of illusions are, uh, in thinking about them I called them ontological illusions. Illusions of states of being, which may or may not in fact be reflected in reality. Uh, UFOs, Bigfoot, uh, crop circles, uh, mmm, the entire panoply of poultergeist phenomena and this sort of thing- ontological illusions. And these are very interesting, I mean one could give time to this alone, uh, because there are persistent ontological illusions in the human sensorium such as an- angels, elves, demons, djinns, afrites, nixies and sprites, that crowd, and there are ontological illusions that seem somehow tied to the evolving modalities of the group mind. Uh, UFOs are an obvious example. I mean, aside from the fact that people have occasionally seen strange things in the sky, the UFO archetype really emerges in the late 40s with, uh, the Rainier lights, and then a whole set of, um, taxonomic features of this particular brand of illusion, uh, coalesce the silvery discs, uh, the alien denizens with the cat eyes and the rubbery flesh, those same guys who give you unscheduled proctological examinations in the middle of the night [audience laughter] but notice that that particular taxonomic feature has been added recently through the assiduously careful scientific research of Strieber and company.

So, uh, these things are in a- in a- in, uh, well, cattle mutilation is very interesting one, very confined in time in space. The, the crop circle thing, similarly, it's not that, uh, there aren't crop circles but that what we have is essentially a pattern in an English wheat field but then radiating out from that are the illusions of those who cast their gaze upon it, those who proclaim it, uh, you know, telluric communication or particle beam research carried on by the air force, or in one version it was supposed, it was supposed that a particular crop circle had been decoded, found to be a lost Sumerian language which when decoded said basically "Don't stop here". It was essentially a no-parking zone for time machines. They were saying, you know, this entire century- just maintain speed and, uh, [Terence chuckles] you know, do not stop.

Um, psychedelic illusions, uh, again this is a related category but different from these ontological illusions. Uh, by illusion I mean that, uh, uh, these are, uh, confrontations with phenomena and apparently subjective ground and an ap- an assumed rational observer where then there is a more than ordinary amount of ambiguity. I mean most of reality is illusory, it's just that we do each other the courtesy of not pointing this out, [audience laughter] uh, you know. Actually you, you trace a very thin data path through the world and al- most of what we assume without question we have very little evidence for. I mean, something as simple as, uh, well, like that mount Everest is the highest mountain in the world. Well, first of all very few people have ever seen it. Uh, I saw it and because I saw it from a distance of about 500 miles it looked quite small and my own testimony as to whether it was the highest mountain in the world would be fairly unreliable and besides, what does that mean anyhow and how the hell do you figure it out? I mean, here we have one, uh, mountain in the Himalayas and another in Bolivia and you're telling me you know which is the higher mountain? It must rest on a whole bunch of weird and fishy assumptions resting on even shakier data. So, and that's just the question of the highest mountain in the world, give or- leave alone the state of your

lover's heart or your banker's for that matter.

What's important about the psychedelic family of illusions is that they, uh, propel the entire issue of illusion to center stage because they demonstrate that the, uh, uh, assumed bedrock of quote unquote 'ordinary perception' is in fact no, no bedrock at all. It's simply a very soft, uh, dwell-point somewhere in the mysteries of metabolism. And the, the consciousness, whatever its relationship to the brain, is spectacularly effected by the perturbation of the physical brain by, uh, endogenously introduced pseudo neurotransmitters of some sort. I mean, to my mind this is very interesting. You know Sh- Alexander Shulgin has secured in his work that you can take a molecule that is completely inactive and by moving one atom to a different place on the ring you can change this into an active compound. Now, it seems to me you could hardly have a neater demonstration of the quantum-mechanical foundation of consciousness because you've moved one atom and you've, uh, moved the mountains of mind 500 miles from where they were resting when last you looked. It's quite spectacular, and it argues then that mind, which strangely enough, the materialists always claim this, they just put different emphasis on the words- mind is a kind of iridescence on metabolism. For materialists that was a dismissal because to materialists what iridescence meant was a tertiary phenomenon not inimical to the structure of matter, but necessarily perceived only through the intersession of an observer. See, that's what iridescence is. It's somehow a more fragile part of nature than the rocks, the trees and the waters because it's a play between light and mind, again, a kind of illusion. A mirage.

Now, in a very different category of illusion, and this is one worth considering because it's the one we tend not to place in this category. And that is the illusion of materialism. This has broken down completely, uh, the idea that the material world was real sustained the investigation of nature from Parmenides to the early years of the 20th century. Virtually the entire history of human engagement in intellect-in the abstract intellectual modeling of matter, matter was assumed to, uh, be pretty much as presented in perception: solid, enduring, having simple location. Meaning, you know, it is, it stays where you put it, and when you look there again it's there, uh, that sort of thing. Now one of the best-kept dirty secrets of Western civilization is that the core science which is physics, the science which was always, um, the envy of all the other sciences for its mathematical formalism and its incredible, uh, predictive ability, because it's not unusual in physics to predict from theory an experimental result to the third or fourth decimal. This is spectacular congruence between, uh, theory and experiment. You don't get that in the social sciences. Even in physical- need I mention. Uh, uh, even in physical chemistry. However, the investigation of matter has now been pushed to such extremes that matter has shed its easily recognized and familiar face and has become something much slipperier, much more dependent on the presence of the observer, much less easily located in space and time, something much more of the nature of thought than, uh, than of the familiar conception of matter. This word has not reached bu- even as far as biology yet. The biologists are still laboring under the notion of the reality of physical material. Uh, if any of you read this book that was published last year with much a to-do called "Consciousness Explained". Uh, actually it should have been called "Consciousness Explained Away". Uh, here was an effort to drag out all the old material paradigms and, uh, ah, explain away consciousness. The problem is, uh, matter itself has taken on the qualities of mind and, uh, as this realization relativizes, uh, the life-sciences I think there is going to be, uh, a new interest in the potential for psychedelics to elucidate, uh, mental functioning because what will be come respectable, you see, is talk of the observer. This is what has invaded physics, the most rarefied and formal of all the sciences had, in order to make sense of its enterprise, uh, allow the observer a kind of primacy with the thing observed. As this seeps into the life sciences and psychology hopefully the phobia of actually involving yourself in your field of study that informs all these reductionists and ratomorphic types

in these schools of psychology will be overturned.

Well, uh, having flayed that dead horse sufficiently, uh, the uh, uh, another category of illusion that needs to be addressed, I think, is, um, um, how would one call it... Well, basically, uh, philosophical illusion or philosophical slash religious illusion. This is the idea [Terence coughs] that by a direct appeal to intuition we can somehow gain, um, a foothold on truth. I think this is as specious as the notion that we can gain a foothold on truth [Terence coughs] through reason or experiment. This foothold on truth idea may have to be given up, uh. I'm sure some of you have heard me recall [Terence coughs] the situation where Wittgenstein was raving about something and one of his students said "But is it the truth?" and he said "Well, it's true enough" and this is really- means a great divide has been crossed when you can say that because it means you understand now that you are no longer a fairy in a platonic super-world, but that you are actually a monkey with a brain full of mush trying to sort out, uh, you know, what's right in front of you. True enough is what we should probably rest with.

And you know, uh, illusions abound, uh, one for instance- I was speaking of these religious ontologies. I was talking to someone recently who amazed me because I've always thought of them as a person of great intelligence but who would never be reclaimed from the arms of mother church, and uh, we had dinner last week and he said "I realized it finally comes down to do you believe the universe is being run by the ghost of a Galilean politician?" and he said, you know, put that way I realized that it wasn't. Other, other, uh, religious myths are less easily undone, I think. Monotheism has an appealing philosophical neatness, but it leads, apparently, to colitrectomy, so, you know, you wanna watch that. Uh, this, this search for philosophical neatness may make for a strange bedfellows. Um, and of course Buddhism, uh, I love the illusion of Buddhism. It's the illusion that illusion can be transcended [clears throat] [audience laughs] And, uh, again, not really doing genuflection to the animal nature. It's amazing to me, I mean, if you were to meet a termite who stated that his or her, uh, goal in life was the perfect modeling of the cosmos you would think it was quite a comic undertaking, uh, and yet how different are we that we should presume, uh, uh, to more than a shadow of, of, uh, a shadow of the truth.

Well, then, uh, finally or, I don't know finally, but completing my laundry list here, um. Linguistic truth, or the truth of language and the illusions that language weaves because, uh, someone quite intelligent said, uh, "language was invented so that people could lie." In other words, it, it gives you that fudge factor of obfuscation where someone says, you know "why did you do that?" well, the best approach is "I didn't do that!" You know, you, you thought I did that. What you thought you saw, you didn't see. In other words, uh, I suppose that, uh, lawyers are probably the people who have done the finest work with language, uh, and, and behind them, politicians, and the true potential for language to elevate and to unite the community was early on betrayed into the production of, um, of illusion- illusory ideological goods which could then be marketed among the people and, uh, to spread confusion. Psychedelics reflect on this because psychedelics stretch and pull and melt and re-cast the illusion-producing machinery of language.

I mean, I think that if you had to say the one thing that psychedelics do for everyone, whether they have a good trip or a bad trip, because it's up to them to interpret what they make of this, is it shows you the relativity of your cultural viewpoint, you know? That it's just a w- it's just your point of view. You inherited it from, uh, a geolo- a geographical area, a culture, a set of parents. It has no relationship whatsoever to anything anchored in some kind of metaphysical super-space. It's just your cultural point of view, and travel actually does the same thing, and I've always felt there was a weird affinity between psychedelics and travel, and I suppose many people have or we wouldn't call it a trip, and, you know, we

wouldn't call it a journey.

But travel shows you the relativity of culture, and what's really happening when you travel, you see, is you're moving from one language domain to another. We don't think of it that way, but that is in fact what is happening. You can never see the Amazon jungle if you keep intact the bubble of linguistic assumptions of the place you started out from. Every place will withhold its secrets from you. I learned this in the Amazon because the first time I went I had virtually had no botany, and to me the jungle was green. That's what it was, and it was many shades of green and it was beautiful, and it was this and that, but it was basically green. The second time I went I was with, uh, a lot of botanists, and within days, you know, you learn the families. That's how they do it. With the same taxonomy I'm here applying to illusion was really developed to describe plants and animals. So you learn the families. The plants with square stems, the plants with the opposed leaves, the plants with, uh, with the particular flower structure. Once you know families, then you have a linguistic wedge in. But, you know, the cur- the corrupting or curious thing about language is that like all tools it shapes its user in ways that are not suspected until it's too late. So, uh, in- for instance the way in which Western Civilization is totally obsessed with the subject-object relationship. You know, and it's the basis of our science, our polity, our relations to commerce, the concept of product. All of these things come out of the subject-object relationship which is an aspect of language.

Uh, in the f- so I, I point all this out because, uh, in talking about my new book somebody said that I had gone too far. And I was amused because it implied from what, you know. It's not like there is a king's ex where greybeards in white coats tend the sacred vestal fires of reality. There is no reality. There are only people who know this and people who don't know this and are therefore being manipulated by the people who do know it! [audience laughter] This is true! Or true enough [Terence laughs] [Audience laughter & clappin]

And, uh, you know, one of the things that has amazed me with my own personal career because, you know, I started out basically shoveling snow in a cow town in Colorado and by fate or who knows what, uh, come to the present position and what I notice as I tran- traverse levels on a supposed ladder of success where you would expect, um, there to be more and more competition and people and activity. Actually it gets emptier and emptier. Uh, there is nobody minding the store as far as I can tell. This is why I'm so unsympathetic to conspiracy theory. We could use a few conspiracies. Nobody is minding the store. Everybody is getting rich, personally rich, and so they don't have time for, you know, to advance the Aryan race or the council of Zion or any of this fantasy and illusion that haunts the world of conspiracy theory. Uh, rather it seems, uh, everything is being left pretty much to develop on its own because people are afraid to grab or touch the levers and buttons in the control room of the historical vehicle. Uh, and what that means then is that people who can cut through these many many illusions. The illusion of materialism, the illusion of business as usual, the illusion of benevolent institutions carefully guiding us to reasonable destinies. If you cut through all that, if you disabuse yourself of all that, uh, you- you will empower yourself to eventually be able to stand up in delicate social and political situations and just say Bullshit! That's bullshit! [audience clapping]

And this is worth considering doing, uh, simply because we have an imperiled planet on our hands. We have been, for a long, long time, the victims of illusion. Western civilization- Stephen Dedalus is right, history is a nightmare from which one must awaken, quite literally. I mean we have been blind to what we have been doing. We are blind at this moment to what we are doing. If, in a single moment, the actual nature of our predicament were to fully make itself felt in the mind of any one of us, I think it would be

paralyzing. It would be horrifying. We, we have waited 'til the last moment of the last hour. The house is burning down around us and we rouse ourselves from the stupor of materialism, the stupor of Christianity and scientism, the stupor of male-dominance, sexism and racism. If we don't rouse ourselves from this stupor, the momentum toward extinction is now practically irreversible. You know, the Grateful Dead like to sing that song, 'we need a miracle every day'. We certainly, uh, we certainly do because with- and so then that brings me back to my original point, that the mome- that outside the ven of culture lies an unmapped terra incognita as vast as the New World was to the Old in the 15th century, as vast as outer space appears to us now. The New World outside of culture is a world that can be conquered through vision and language and, you know, many of you have sat through my recitations of what it's like to smoke DMT. Many of you, I'm sure, are familiar with the, the medieval woodcut of the guy sticking his head through the cogs and wheels of the cosmic machinery to observe a new world outside. The message here is, and it's, it, it's more than a message, it's a message if you just come to events like this and then go back to studying cost accounting. It's an experience if but you will avail yourself of these tools. The experience is of the discovery of a new world. A new world as real as any world that we know. It's not going to come from Time magazine or the secretary general of the United Nations or anybody like that. It's - it isn't that the world is tired and played out and that all frontiers have been explored. Every culture could support that viewpoint. It- within certain classes and in certain situations, but in fact it has never been true and it isn't true now. We are monkeys and monkeys love a helluva good fight and we have a helluva fight bearing down on us because we have to clean up the mess. We are going to- we're not going to go silently into the gentle night of extinction. There- it's just not going to happen that way. Creativity is going to be unleashed. Struggle is going to be, uh, an unavoidable part of trying to steer this battleship away from the cataracts of history in which we are now caught. Uh, I, I believe that it, there is a tremendous obligation upon the privileged classes of the high-tech industrial democracies, and I daresay that includes everyone in this room, a tremendous obligation to attempt to deconstruct the bomb that we have inherited. I mean that is literally our situation. The gift from the past, from the 19th century, from the 1940's, from the psychology of Nixon and Johnson and that crowd is, uh, a ticking bomb, except that it's a planet. And it's the greatest challenge to intelligence that intelligence has ever faced, and yet it's precisely the kind of challenge that intelligence should be able to meet because what it requires is large-scale strategic planning, implementation, a visionary responses. It is not incremental. It's sudden, complete, and dramatic. And I really believe that, uh, there will only be one chance, you know. It's- we are circling the runway of post-history and the engines are running low and they- there is one approach and then, you know, if you miss that approach you're into the drink.

Now, we can use- we have the great good fortune to be approaching the end of a millenium. Would it be redunant to say this only happens once in a thousand years? Yes! [Terence laughs] [Audience laughs] And it's extraordinarily fortunate. Once I was in England and I ran into somebody I hadn't seen for twenty years and I was amazed and I said to Rupert "How often does one get a chance to meet someone one hasn't seen for twenty years?" And he said "Well, I daresay I suppose once every twenty years or so." We can use the millenium. this, uh, this apparent coincidence of our dilemma and a calendrical turning point to, uh, create awareness of opportunity, and we can use the psychedelics to dissolve boundaries between ourselves and other people, between institutions that govern and the governed, and basically we have to insist on the seriousness of the situation and the potential for solutions, and what it means is a much more radical break with American society than we've been willing to contemplate, uh, in the last twenty years. [audience member claps. We, we went through this thing with, you know, the two-term governer of Arkansas and it took a year and a half to play that all out and to see what it comes to, and what it comes to is, you know, Washington is convulsed over the possibility of closing an airbase near Sacramento, so how can we even

conceive of this government making an impact on the real problems. It is still government by flim-flam. And that would be all very well if we had 500 years to dig ourselves out of this dilemma, but if there- if a radical political alternative is not opened up in this country then we are essentially, I think, going to amuse and entertain ourselves into extinction. The ordinary orthodox system has failed. What Bill Clinton exists to prove at best is that people of good will make no difference in those institutions because they are compromised and corrupted from the very beginning. It's just the way it is. They- those institutions are set up for business as usual. Business as usual, at this point, is a death sentence on the human race. Uh, what has to be done is, uh, a tribalizing of culture, an ecstaticising of culture, a dissolving of hierarchy. That means self-empowerment through claiming the new information technologies, through deconditioning from propaganda, through deconditioning, uh, from the pharmo-phobia that holds everyone within the pre-programmed molds that are being handed down from Madison Avenue and Hollywood. It means actually realizing that your life is your own. Your destiny is your own. It isn't within the confines of the culture because the culture is dissolving, and to the degree that the word is put out, that phenomenon will accelerate. We are in an extraordinary transition. Everything that has worked now doesn't. Meaning global economic systems, control of the spread of epidemic disease, uh, so forth and so on. All these systems are breaking down, and yet the new systems are not yet in place. So this is a situation of extraordinary malleability and a situation in which, uh, people of great vision and great ego can make tremendous impact. So it's a very dangerous situation. We saw this in the 1930s in Germany and in Europe, where there were all kinds of potentials, all kinds of possibilities. We forget how powerful a visionary Marxism was before the rise of fascism. Movements like Bauhaus and Dada and Surrealism all had agendas which were, which disappeared then under the rise of Fascism. This must not happen again, and what it has to do with is resisting images that are coming from the reality studio, resisting the images that are coming off the tube, coming through the newspapers, and creating a community based on psychedelics, sexuality, sensitivity, and good sense. Cultural val- and what good sense will mean in this situation is the preservation of the Earth, the preservation of diversity, deconditioning from product fetishism, deconditioning from, um, energy overconsumption. All these things we understand but we seem to lack the power to change our minds or if we have that power, then the power to change other peoples' minds. And I, I am in to psychedelics not because I think it's a sure thing, but because I think it is the only game in town. In other words, it's the only thing I've ever seen change an individual on a time scale similar to the time scale that we have if we're going to make a difference. I've seen over and over again, I'm sure many of you have, people go into a psychedelic jerks and come out halfway decent human beings. [audience chuckles] you know, eight hours later [audience laughter]. If we had 500 years to steer global society into safe harbor, it might be possible to do that, but we don't.

I mean, I really believe that we are being asked to participate in the birthing of a new order of being and that there is reason for great optimism and hope because it looks like we're just boring in to solid rock, but in fact there's somebody else boring through that solid rock, and they have triangulated our approach and they are hurrying to meet us. I don't think we fell into this situation because of bad fate or, or bad destiny. This is part of the process. History is what happens when an animal species, an advanced animal, falls under the influence of a transformative attractor of some sort. History is only about 25,000 years in duration. The interesting part in the last 5,000 years, what has happened is that something confounding has entered the local situation or was always dormant there but has stirred to wakefulness and it is not God, not the God that in Milton's wonderful phrase "hung the lamps like stars in heaven". It isn't that God. Maybe it's the God of biology, but whatever it is, it is to us as we are to the termite, and what it is doing is it is casting an enormous transcendental shadow back through time, over the epigenetic landscape of biological becoming, and in our species, for reasons mysterious to me, we mirror this thing and it has swung our

compass away from the forward flow of genetic theme and variation and in a course orthogonal to biology, a course set on the transcendental, and it is pulling us toward it through the medium of transforming our languages, through the medium of the imagination which is, after all, this mysterious mental domain in which we are whispered to by angels, demons, gods, ancestors, aliens, and out of that intercourse culture, self-transforming, shedding its face every 100 years, building on novelty is ascending toward a reaching out toward the unspeakable. This has been going on, I think, for billions of years. It has obvious and incontrovertably been going on since the advent of consciousness in the human species, and now we're there. We're in the final domain of the confrontation with the secret. It is impossible to conceive of history going on for hundreds of year. It- the planet cannot sustain it. Uh, all of these, uh, social structures and institutions that we have surrounded ourselves with are obviously lifeboats. They are not made to last. They are made to carry us to a certain point in the life of the Earth and we are now there, or we are within 20, 30, 40, 50 years of confronting the transcendental object at the end of time that drew us out of the animal body. History is the proof and the shockwave of the eschaton. This is a hard thing for secular audiences to wrap their minds around because they're familiar with hearing this from rattlesnake-handling Christers, but that's simply because religion has always been the repository of the irrational intuition. It never said that the irrational intuition is ipso facto false. It becomes a travesty when, hung with the, uh, trappings of dogma derived through the scholarly revelation of weasels, but the intuition, the intuition is pristine and the intuition of Islam, Judaism, Christianity and cults innumerable is that there is a finiteness to the historical experience. And then the more staid the ontology, the further into the future they put it so they can continue trading real estate, uh, for the next little while. I think that it is now possible to extrapolate the curves that describe our degradation of the planet, the spread of epidemic diseases, the ozone hole, the extraction of metals, the clearing of the rainforest, the rise of population, the spread of toxic compounds so fa- to see to convince yourself, even from a rational point of view, that history is a self-limiting process. Well, if you're a rationalist then you must conclude we're just headed for extinction. I would think then the rational response to that logical process would be to get your ass in gear and try and avert the distinct- the extinction, and if you're not a rationalist, then the conclusion you draw from all that is that, uh, we are within striking distance of merging with the mysterious hyper-spatial source of our intelligence, and that somehow this is a planetary birthing. Something is scripted as the breakup of Pangaea or the movement of glaciers south from the pole. It's just part of the process. Culture exists to transform mind out of the domain of matter. We are rising toward the rarefaction of ourselves into, uh, the transcendental plasmic body of alchemical and Buddhist, uh, uh, preoccupation. This is what is calling us out of matter. It's what called the monkeys out of animal organization, it's what calls technology out of the restless hands of the hominids, and it is what is calling all of us toward a kind of fusion with the community, with the psychedelic totality of the species, and with the larger gaian totality of the planet. This is what it all went for. This is the promise and the redemption of history. Without this redemption then history becomes the abortion that materialists fear it is. This is why the legitimate path to the transcendental, the linking of the individual with the transcend- transcendental through psychedelics now becomes the most important political work that can be done in the light of the rising awareness of the end of history. Thank you very much.

[audience claps]

Well, all of you who stayed, the intrepid core. I'll, i'll just go through these. I've not had any chance to look at them and, uh, handwriting is also degraded here at the end of the world so it's a little hard to sort out some of this. Um, "What role does an individual psychedelic experience play in the massive changes that you're anticipating?" It would seem to me- uh, well, my model for the psychedelic experience, there've

been a number of them. Uh, the idea that it's, uh, cre- mimics madness, that was one idea, that it takes you into the f- uh, Jungian unconscious, that was one notion, that it somehow illuminates the concepts of Indian, uh, yoga or after-death models such as the Tibetan Book of the Dead. All of these have been tried. My assumption has been a mathematical one, that, that what psychedelics are about is that mind, under the pressure, under the pressure of evolutionary constraints, turns itself into a threat detection device. Uh, and that's how we use it in three dimensional space, to anticipate threat and to meet it, but that that is, as it were, a lower-order application of mind and that, uh, in silent darkness what happens on psychedelics is that you- the mind unfolds literally into a kind of super space, or a higher dimension in the mathematical sense because I take seriously the i- the claims made in all times and places for millenia that shamans can locate lost objects, predict weather, see where the game has gone, and, uh, predict the outcome of disease situations. In all cases what is involved is a higher dimensional relationship to the manifold of history. So I think that, you know, you all understand that a locked box, if we had a padlocked box here on stage, a locked box is not locked in hyperspace. It has a f- a, a dimension in hyperspace from which the contents of the locked box are easily removed, taken out, and put back. In our world this looks like magic. Shamanism is like this and so, to answer the question "What role does an individual psychedelic experience play in the mass changes anticipated?" The role is that the individual gets in on the joke. At this stage in history to be a shaman is to have seen the end, and if you've seen the end it's like, you know, taking Anna Karenina and reading the last five pages, and then as you make your way through this bewildering morass of material you do have the faith that it's all going to end up as you discerned, so that's the political act. You see, terror of the future is one of the weapons by which the rationalists are holding everybody in line. Terror of the future can be put out to pasture through psychedelic shamanism.

Uh, ok. "It seems mushrooms for the masses is not really what you advocate." Ehhhh...[audience laughter] [Terence laughs] Mushrooms for the masses doesn't sound like such a terrible idea, I mean I always equivocate by saying, you know, if you're, if your problem is maintaining boundaries then you probably shouldn't take any psychedelics, but you can- in a mature civilization you know you don't uh, you don't define opportunities based on what will be detrimental to a small minority. Mushrooms for the masses seems to me a fine idea. I just don't see how it can ever come about because I believe that the society-shaping effects of these things are so powerful that, uh, they will never be tolerated. Just to go off on a tangent for a moment, this is why I am an incredibly pessimistic person about getting pot legalized because as far as I can tell the argument now in favor of legalizing cannabis is that it ain't no big deal so why not legalize it. The problem is that it is a big deal. You just have to bake it into some banana bread and you'll find out what a deal it is.

So, uh, you know, and if you read the 19th century accounts like Fitzhugh Ludlow, The Hashish Eater, people like that, it's perfectly clear that it can reach LSD levels of intensity if, uh, if you eat it. And I- the question, you know, if pot were, were judged on its social impact, uh, or, you know, its lack of addiction, its lack of detriment to health, it would have been legal a long time ago, but it subtly erodes commitment to dominator values in ways that are absolutely intolerable to dominator institutions. Uh, they'll let gays in the military before they'll legalize pot, that's how threatened they are by pot.

Well, let's see here. "Recently you appeared on talk radio with police chief Daryl Gates. What was the inside story and do you feel you were heard by him?" Well yes, I won't give this too much time. I did appear with Daryl Gates on his radio show. Clearly they're desperate to raise ratings. They'll do almost anything at this point. And Daryl Gates was, uh, a pussycat, very easily intimidated by I mean I make no great claims in this area, but intelligence. [audience laughter] He, he completely folded in the presence of,

you know, academic calm, big words, citation, that sort of thing. [audience laughter]

"What is the difference between your vision of the end of history and the Christian belief in a savior?" This is a great question. Um, my- the- ha, well, it's complicated. Uh, the way I think of this transcendental object at the end of time is on this level. For purpose of metaphor it's like those mirrored ball-bars that they hang in discos, you know, that spins and sends out scintillations of light all over the walls ceiling and floor of the room. The transcendental object at the end of time, and I like that image because, uh, alchemists- alchemists used to talk about what they called the scintilla, which is simply Latin for 'spark'. So the transcendental object at the end of time sends off scintillas, sparks which are like reflections of its essence but necessarily distorted. Well then, ranged all around this transcendental object, and at greater and lesser distances, are all the people who have ever lived, and if you are a Buddha, a Christ, a Mohammed, a guru-somebody or other, and you, you are- what that means is that you have been struck by a scintilla of reflection from the transcendental object and so you as it were mm, as- have assimilated its essence into your being, and now you must act it out. And I would bet you that if you could step into the mind of a Christ on the road to Calvary, or a Buddha preaching at Sinoth what you would discover going on in the personal part of the mind is the question "why me?" "Why me," and the answer is you just are dumb lucky, that's all. You know? You just happened to be standing in the right place at the right time and there is nothing special about you. You just have uh, a hit of the stuff. [audience chuckles]

Uh, and then the, the other part of the question- the, the problem with all these religions, and it affects flying saucer cults and it effects uh, occult schools of magic and everywhere is people claim to know too much. They are not willing to live in the light of ignorance and in the absence of closure. So you know, my God, you go to these uh, UFO conferences and you know, you've got the people talking to the Plebeians in uh, Booth 1 [audience chuckles]. Next to them people are talking to Commander Zamo of the Antares system, and then number 3 something else. No cognitive dissonance uh, between these groups. They all have coffee together and are dating heavily and it doesn't [audience laughter] ever seem to enter anybody's mind that this is a little odd. [audience laughter] In occult stuff, you know, y- you say "what's that?" and they say "well, that's the eleventh Amethystine Ray that was brought by the great white fathers of the Eleventh Lodge who came from the Galactic Center at the fall of Atlantis and established the [audience laughter]- you say, "how the hell do you know all this stuff?" [audience laughter, clapping]

I mean, nobody knows anything and, and Christianity, the anticipation of the end of the world and the exegesis of Revelations that has been worked out based on the visions of John of Athos uh, you know, it's a good try but it's not a uh, it's not a paint-by-numbers script for the unfolding of the world by any means. Uh, when the transcendental object at the end of time finally reveals its quintessence among us all prophecies will be fulfilled, all religious ontologies will find themselves uh, somehow vindicated and somehow humbled in the same moment, uh, because they were in fact uh, in Wordsworth's wonderful phrase "intimations of immortality." But you don't need to rely on the sanctioned intimations of immortality. You can have your own simply by taking five grams in silent darkness on an empty stomach after you've unplugged the phones on a Saturday night in your apartment. [audience laughter]

Uh, the, the real research into the nature of the Eschaton is done one-on-one uh, above five grams. [audience laughter, clapping]

Well, let's see here. Um, "I once heard you talk about an experiment your brother undertook where he was raving for three weeks, but you never explained what the experiment involved." uh, "What was it?" Well,

what a wonderful opportunity. [audience laughter] True Hallucinations. I, I never talked about this even, often to very dear friends of mine. I mean there are people who've known me for twenty years who I never told this story to because I think it takes as long to tell as it takes to read this book. You know that wonderful scene in The Time Ma- in Wells' Time Machine when he comes back to his gentleman's club and he says "Gentlemen, this is no tale to be told over greasy plates!" Well, similarly with this. So uh, y- I- and I didn't also want to make it the basis for my public career because this is real mm, uh, well, I almost said nutty stuff. [audience chuckles] It's uh, I generally um, disbelieve in violations of physical law and miracles, but I did actually in the course- I'm forty-six- I have seen three or four in my lifetime, and each time it's absolutely astonishing, whole worlds of possible questions are instantly answered and, uh, I wrote this book to inspire people to follow our method which is, our method is the rational but stoned mined in confrontation with the obscure. [audience chuckles] Seek ye the obscure, you know? If a book has, is not at least one hundred years old don't read it. Uh, if, if a country has more than one international airport don't visit it. Uh, if a village has more than one outboard motor don't stay, and just keep pushing and pushing and pushing because out there at the edges are the edges, and that- there are edges because nobody goes there, because the unsanctioned is hidden there. Uh, you know? That's where the shamans are and the mad people and uh, the sexual experimentalists and the uh, aesthetic experimentalists. Uh, that really is the method. Not, not belief. Belief is a toxic and dangerous attitude toward reality I think. After all, if it's there it doesn't require belief, and if it's not there why should you believe in it? [audience chuckles] It doesn't make a whole lot of sense. [audience claps]

By eliminating money and the separateness that it causes could the world be saved by sharing the resources and the work and eliminating all the unnecessary waste of energy and needless competition and consumption. Well, I'm not sure how money could be eliminated. See, I'm a funny person. I vacillate between- I have a very strong impulse toward political action and save the world and round up the miscreants and set things right. That's part of my thing, but I also have this incredibly evolved sense that it's a done deal, that it's ok, that the main task is a certain alertness and attention to one's comrades, and that it will all unfold through the intercession of the transcendental object at the end of time. People say this is a contradiction. Fine, it's a contradiction! I mean what are we doing here anyway? Is life supposed to be simple? [audience chuckles] Uh, so, but I, I, I preface that by saying one time somebody in a group like this challenged me and said "you're always talking about the peril of the planet and one thing and another uh, why, why don't you ask the mushroom how to save the planet?" And I, so then I thought that was kind of a facetious and challenging thing to propose, but the next time I found myself capable of asking the question [audience chuckles] I did! And the mushroom hesitated, and now I pass this on to you as pure fungal hearsay [audience laughter] on the networks. I said to the mushroom "so how can we save the world?" and it hesitated roughly a third of a second and said every woman should bear only one natural child. I thought about this for a long time before I ever publicly mentioned it to anyone, and I realized, you see I think that what is destroying us are two things. Number one, and uncontrolled rise in population that wipes out every good intention, every social program, every ar- e- expansion of agriculture succumbs to expanded population. This is destroying us.

The other thing that is destroying us is that we are not properly utilizing uh, the intelligence, talent and so forth of half of our population, the female half of the population. Now [audience clapping] people say [clears throat] that we must m- you know, women must be promoted and t- into professional positions and power positions and, and of course this is true and I agree, but what is really holding women back is that they spend a staggering amount of their creative lifespan raising children, and uh, if every woman were to bear only one natural child the population of the planet would fall by fifty percent in forty years without

wars, epidemic diseases. It would just naturally fall in half. Now, I don't think very many people have ever considered this possibility. We tend to think that our problems are insoluble. They are not insoluble. Furthermore it turns out, and here's news nobody likes to hear, a woman who, uh, uh, a child born to a woman in Santa Cruz compared to a child born to a woman in Bangladesh, that child will use between eight hundred and a thousand times more resources than the Bangladeshi child in its lifetime. So where do we preach population control? The third world, because that's where all the people are, but that's not the problem. People are not the problem. Incredible consumption by some people is the problem. It would be possible to imagine a world where inst- governmental institutions or whoever's running things could go to women and say "how would you like to have vastly increased leisure time? How would you like to have an in- increased expendable income, and how would you like to have genuine status as a hero in the struggle to save the planet?" If women were to have only one natural child, women would very naturally come into an enormous empowerment. No one, no institution could deny it to them. Uh, and interestingly enough this is not a plan where men, who have always been the planners and the managers of plans, play much of a role at all.

Well, I just passed that off in case you don't want to put your trust in the transcendental object at the end of the world, then the most politically conscious thing apparently from the mushroom's point of view that you could do is uh, encourage those kinds of policies and that kind of attitude.

Audience member: How many unnatural children? [audience chuckles] [Terence laughs]

TM: Are there unnatural children? Um-

Audience member: George Bush.

TM: [Terence laughs] Oh dear, still carrying a grudge? [audience laughter] Leave it. Leave it to Saddam. [Terence laughs]

Audience member: Only children would be neurotic [?? 1:22:35]

TM: No. That is not true. That's what always put out. The fact of the matter is in 1800 the average American woman gave birth thirteen times in the course of her lifetime. The two-ch- the two-child family is a genuflection to the industrial revolution. No traditional culture on this planet ever advocated the two-child family. It's a convenience that allows uh, factories to run and uh, jobs to be filled, and in fact as the father of two children I would argue that the two-child family, what happens is the children mirror the tension between the parents in a way that happens in no other configuration of uh, of parent-child relationship. So I would actually argue that uh, w- then, the so-called family values that these right-wingers are constantly binging us preserve are in fact values created to support the agenda of the industrial revolution which means global capitalism. They have nothing to do with archaic values which are enormous families, not nuclear families but extended families living communally. That's the traditional model, and if you're not ready to go back to that then one woman, one child is as good as anything else..in my humble opinion. [audience chuckles]

Let's see here. "You mentioned earlier this evening that psychedelics played a role in human evolution. How so?" Thank you for not groaning, those of you who have heard me explain this eighteen times. Uh, because it may be my only crack at getting into the history books, uh. [audience chuckles] It, i- it seems to

me clear, well it seems to everybody who looks at the question clear that the theory of evolution is handed a tremendous dilemma when it comes to human evolution. Uh, a planet of groundhogs, hummingbirds and slime molds poses no problem to Darwinian evolution as modified by molecular genetics. We pose a problem, specifically our brain, and it's doubling in size in less than two million years is very difficult for the theory of evolution to explain, and it's a, a particular embarrassment because that's the organ which generated the theory of evolution. [audience laughter] So it's like a real rip in uh, the, the sail of the galleon of evolution.

I believe and everyone believes that there must have been extraordinary selective pressures of the unique sort up on our early ancestors to have produced the human brain in such a short amount of time, and I think that the answer, and I don't wanna go into it in detail tonight, but briefly here's what it is, and it explains a lot about our sexuality and our politics and so forth. All primates um, clear back to squirrel monkeys and like that have what are called dominance hierarchies. We all know what this means. It means that the hard-muscled, long-fanged young males run roughshod over everybody else, the women, the children, homosexuals, the old. Everybody gets their marching orders from the dominant males. This is true throughout the primates and it is true of us as we sit here this evening. That's what's screwing up our politics and making us uh, you know, the situation with women so forth and so on, and it can be argued to other social problems as well. I believe that psilocybin uh, because it dissolves boundaries is uniquely positioned to mitigate against this tendency toward male dominance for a number of reasons uh, and when our remote ancestors moved in- out of the trees and into the grasslands they encountered these mushrooms and I think the great undiscussed frontier of evolutionary theory is the effect of mutagens in foods on human evolution. We- most animals maintain a very narrow food menu to avoid contact with mutagens. We, when we were forced out of the arboreal canopy we became omnivores. We came under nutritional pressure and for a long time we were testing all kinds of foods, and that would have meant a very high rate of mutation through that period and an acceleration in natural selection, and I think that uh, that psilocybin because it uh, improves visual acuity would have given a leg up to predators and hunter-gathering um, protohominids and so in a sense there was a period of time, perhaps as short as a hundred thousand years, perhaps as long as a million or more years when uh, male dominance in our species was suppressed chemically by psilocybin in the diet. It was still there [Terence coughs] hard-wired in the genes, but chemically suppressed by an orgiastic, religious style that had everybody taking mushrooms at the new and full moon and then having sex in a heap basically. This made it impossible for men to trace lines of male paternity. That's a consequence of an orgiastic uh, society, and w- a kind of paradise evolved and it was during that paradisaical interlude that language, theater, altruism, metaphysics, poetry, dance, uh, religion, all of the functions that we equate with unique humanness evolved under the aegis of a near symbiosis with sym- with psilocybin mushrooms, and then- this all was happening in Africa- then through climatic upheaval, drying of the African continent, the mushrooms disappeared and God forbid the old wiring reasserted itself. It must have been hell on earth. It must have been similar to what we're living through. It must have been an era of incredible brutalization when people stopped caring for each other, people stopped having group sex, they started fighting over women, fighting over territory, bashing each others' brains out, appointing leaders, uh, uh, developing weapons. The entire sick set of pathological institutions that leads to our dilemma was evolved in the wake of the invention of agriculture and the abandonment of nomadism and so forth and so on, and this is why I think we're so funny on the subject of drugs because we are literally the children of a drug. There wouldn't be human beings on this planet had there not been this hominid-mushroom interaction over a very, very long period of time. The reason we addict so easily to so many substances and the reason people destroy their lives with various addictions is we have an itch that we just can't scratch, and we try everything, and I maintain that you'll keep itching and you'll keep

scratching til you come to this very narrow family of hallucinogens, the tryptamine hallucinogens. Then the itch stops because you are restored to the archaic dynamic in which we created the most noble social systems that we have ever lived under: the archaic, shamanic, goddess-worshipping world of the dawn-time, and history is a fall away from that exactly as these monotheistic religions uh, insist. The fall into history, and I see then this emergent end of the world, post-history, millenarian culture as an attempt to reconnect with that archaic authenticity that was the birthplace of intellect, of poetry, of beauty, of love and of altruism.

Ok. [audience claps] These are great questions. I wish I had more time. Here's uh, one: "please define intelligence." Strangely enough, I was thinking about this today as I, I can't even remember why, but I produced a definition. Uh, i- it's a kind of a cribbing from Whitehead. Whitehead defined understanding in the following way. He said "understanding is the apperception of pattern as such." That's all. For instance, in this room there are many patterns: where the men are, where the women are, where the over-forties are, where the under-forties are, where the wealthy and the poor are. Each of these patterns if you can see it tells you more about the situation, and presumably there are an infinite number of these informative patterns. So I would define uh, intelligence as Whitehead defined understanding. Intelligence is the apperception of pattern as such, and the more of pattern, of the pattern and the more patterns that you perceive the more intelligent you are. Of course, these patterns must actually be there, [audience chuckles] otherwise you're delusory and that's a different issue.

And then I'll do uh, I'll do one more here.

Audience member: Aww.

TM: Aww. [Terence chuckles] You don't wa- go fast through them! [Terence chuckles] [audience laughter]

What do you think about meditation as a path to other levels of consciousness and understanding so-called reality as illusion. I, I've- meditation is a fine thing. I do it. Uh, I'm not sure what its relation to the psychedelic experience is. I, I, the best uh, the uh, this is essentially part of a larger question which is "can you get there on the natch?" uh, and m- m- you know, the short answer is no. [audience chuckles] The fair answer is maybe in exceptional cases, cases so exceptionable, so exceptional that the answer is no. [audience chuckles] Uh, the- and the perils I submit to you are much greater because uh, what is so wonderful about the psychedelics is how democratic they are. You know, you don't have to have enslaved yourself into some beady-eyed weasel and his set of precepts, dietary strictures and mantric formulas. Uh, it doesn't work like that. It isn't handed down through a human lineage. I asked the mushroom about this. I said "can, you know, what's the deal with uh, these other paths to enlightenment?" And you got to understand, this is the mushroom speaking [audience laughter] but it said for one human being to seek enlightenment from another is like one grain of sand to seek enlightenment from another; kt is preposterous. And I like that because I never met anybody whose intelligence seemed so intimidating that they deserved to be followed, and I daresay you probably haven't either uh, if you've been paying attention.

I mean how many [audience laughter], how many philandering zennys have to parade before us? How many coguptes [??] with a Budweiser welded to their good right hand do we have to encounter uh, before you get the message? You know, these guys are just slimeballs at worst and lost souls at best, and you're smarter than they are by an order of magnitude anyway, so why waste your time? Now, if you want to

follow, if you just can't tear yourself away from the concept of following, then you know, how about Plato, Heraclitus, Parmenides, Plotinus, Proclus? You know, dead guys, they're much safer. [audience laughter] You know? They're not going to try and climb into your wallet or uh, some delicate portion of your anatomy [audience laughter] plus they've been use-tested uh, in the historical arena uh, and have been found to be generally at, at least harmless at worst and in some cases actually to be recommended uh, so I would say you know, the whole message of psychedelics is self-empowerment. Trust yourself. Seize the tiller of your destiny. It is your life. It is your body. It is your mind, and it's your world to re-make as you choose to reshape it. History has failed. The past is no guide. Uh, the, the immediate generations preceding us have dealt themselves into bankruptcy. Their object fetishism, their ideological excesses, their uh, tendency to resort to brutality in the solution of every problem has essentially ruled them uh, out of play. They are no longer operable and uh, psychedelics because they do in fact enhance, accelerate and promote consciousness must, must, it's not a debate, must loom large in the future history of our species because if consciousness is not a major part of the human future, it is not a human future.

Thank you very very much. [audience clapping]

I wish I had some of that stuff! [audience chuckles]. Well, I was surprised to hear McLuhan invoked so many times today. And I will do it again. McLuhan had an idea of what he called the global village and the global village is coming to be. This is what the crisis that is being presented to us as a crisis in communism is. It isn't a crisis for communism- communism is going first. But what it is is the death knell for centralized structure, [audience claps] for centralized control. If you think what we've been through in the past year is something, wait 'til you see what's on the agenda, and I don't mean great CNN feed from Moscow as the Soviet Union turns into fifteen independent republics, I mean what's gonna happen here because what is so terrifying about Gorbachev from the point of view of the powers that be is that he models a leader who can't say "we did it wrong". [audience claps]

Baker was on one of the talk shows, uh, after one of these "we did it wrong" statements by Gorbachev. And they said to him, "Well uh, under what circumstances would uh, an official of the United States government admit a mistake. And he said "well, you don't understand, you see, we, we have a collective decision-making apparatus and hence we don't make mistakes." [audience laughter]

You see? So I, I think uh, to return to McLuhan for a moment. What's happening is as Yates said in his poem "the center does not hold." Mere anarchy is loosed upon the world, but as fans of chaos we should know that this mere anarchy is the incarnation of our goddess, Discordia, who is going to pull down [audience cheering] the [??] structure that is oppressing everybody. Uh, what I see happening and this is touched upon by others here is this intensification of local identification: bioregionalism, awareness of your immediate place and then no hierarchical structure or identification until you reach the planetary level. I live in Sonoma county, and I am a citizen of earth. I recognize no intermediate structures except my home. [audience clapping]

So I agree with Tim. I cheer on the people who present the protocols and plead their cases before these grey-faced medical boards, but in my opinion you just circumvent all that, you go around it. It's irrelevant. History has these dominator types by the balls [laughter] You know, history, history is a psychedelic experience. It, it's the collective unfolding of the dream of our species in space and time. We are at the apex. This is the peak, this is the 2nd hour of the trip. We're going over the top! [audience cheering, clapping]

Announcer: Sorry we've gone too late for questions

'til the sun comes up!

Terence McKenna Talks to the Psychozoic Press

by Elvin D. Smith v1.1 -Jan 19, 2012

Originally published in the Psychozoic Press, Issues 5-9 (1983-1984)

Non-Terence intro:

Q. When is a book more than a book?

A. When the material presented therein triggers within the mind of the reader conceptualizations greater than those which can be expected as a consequence of logical deduction.

The Invisible Landscape (1975) by Terence and Dennis McKenna is just such a book. When Terence sent me a review copy of this book some time ago, I was astounded, to put it mildly. The authors have shown how scientific knowledge in fields such as quantum physics, chemistry, genetics, and information theory interfaces with subjective metaphysical precepts manifested by the psychedelic experience. Science, they're telling us, has nearly reached the end of its rope by restricting its investigations to aspects of the physical world which can be repeatedly produced in controlled situations. Science has a difficult time getting an investigative handle on phenomena such as telepathy, UFO experiences, and similar paranormal phenomena, because these situations are difficult, if not impossible, to investigate from the laboratory bench.

Terence and his brother are also the authors of Psilocybin: The Magic Mushroom Grower's Guide (1976), written under the pseudonyms O. T. Oss & O. N. Oeric. Terence has lectured extensively on hallucinogens and consciousness at the Esalen Institute, and is currently working on another book soon to be published. His brother is busy preparing a doctoral thesis on plant hallucinogens.

You could say Grower's Guide launched the starship and provided the initial acceleration. Now that we're so close to the hyperdimensional shock wave--as we transfer into the higher dimensions--the ontological linguistic transformation that Terence McKenna speaks of becomes necessary--indeed, the most obvious choice--for communication. There is quite a shock front to get the hyperdimensional shift to become probabilistically localized, but his discussion on time and the #Iching in *The Invisible Landscape* make the potentialities distinctly visible. Yet what I first noticed about Terence was not what he was saying, but how he was saying it. (Those of you who have heard him speak or heard his tapes will know what I'm talking about.) Terence, and his brother too, both have a peculiar way of enunciating every word with a lucidity unlike any other speaker I've heard. Perhaps he has access to a 7-element hyperdimensional communications processor or something. "Fascinating", as Spock would say. He's probably a skilled hypnotist besides...

Terence McKenna, author, lecturer, and shamanic explorer of the realm of psychedelic states, has been described by some as being "so far out, nobody knows what he's talking about", and by others as "the most innovative thinker our times". You be the judge.

The writings of the McKenna brothers are fascinating to me, not because I agree with everything they are saying (I don't), but because they are presenting ideas which are self-propagating. *The Invisible Landscape* triggered more questions in my mind than it answered; the impression is that the ideas presented are just the tip of the iceberg, a single needle on the redwood tree, one cell within the nervous system. In this sense, *The Invisible Landscape* is a book that's more than a book. I decided to talk to the author.

INTERVIEW BEGINS HERE:

Psychozoic Press: Mr. McKenna, what's the most important shortcoming as you see it of science's approach to studying the world around us?

Terence McKenna: Science is interested in the kind of phenomena where, when you recreate the initial conditions, the same effect is always observed. And yet in life, you never experience the same sort of initial conditions; they're always different. Every set of processes that are really interesting has many end states. So you can think of science as a kind of large-grid description of the world. It only explains the simple phenomena that can be repeatedly triggered. All the complex phenomena--consciousness, memory, culture--these things slip right through it.

PP: In the lecture you gave at the Esalen Institute on "Tryptamine Hallucinogens and Consciousness", you talked about calling yourself an explorer. You referred to LSD, psilocybin, mescaline, and other hallucinogens as each being a distinct phenomenological universe. Would the physics of concrescence you're talking about in *The Invisible Landscape* be a sort of proto-science which seeks to integrate these various phenomenological universes?

TM: Concrescence is a philosophical term taken from Alfred North Whitehead. It means the growing together of something. And on the highest level, the growing together of everything. And in that sense, yes, these psychedelic drugs anticipate future states of human consciousness. The historical process is an exploration of these psychedelic states at the cultural level. You can actually say society is becoming more psychedelic; it means that society is becoming more and more reflective of the modalities of mind, and

that process can be seen as an informational "growing together", a concrescence.

PP: Yes. When you stop to think about the way thinking has evolved in physics, you can see that it covers larger and larger domains in trying to describe the material aspects of three-dimensional matter.

TM: Well, science has outsmarted itself by pushing its analysis of the physical world to such a limit that it becomes recursive. You discover that you're no longer talking about velocity and momentum and charge and spin, you're talking about syntax and language and point-of-view and perspective and emphasis. The language of psychology almost emerges as a necessary consequence of examining matter at the very deepest level. This is symbolized by the ouroboric snake taking its tail in its mouth. Any analysis pursued deeply enough will lead back to the question of who analyzes, and this is what has happened in physics.

PP: Some of the labels they have come up with to name these different qualities reflect that, too: "charm", "color", and "beauty". The problems they have with labeling these things are kind of interesting in themselves.

TM: Well, they intuitively feel them to be primary qualities, so they want to label them with primary philosophical values. It's very platonic--almost Pythagorean.

PP: Yes, I was reading something not long ago about the "truth" quark--that's getting pretty fundamental.

TM: That's right, the search is on for the truth quark, now that naked beauty has been observed!

PP: You also spoke of "tuning" images so that the intent of meaning could be beheld in 3-D space--a technique of communication for which language is just a foreshadow. I understand what you're talking about, but it seems you're avoiding the term "telepathy".

TM: Telepathy I assume to be mind-to-mind transfer of thought, but with no ontological transformation of language. In other words, if you could hear what I'm thinking without me speaking, that would be telepathy. But I'm talking about something very different. It's actually an ontological transformation of the language so that language is no longer perceived with the ears, it's perceived with the eyes. When I speak, between you and me there comes into being the subject that I am discussing, and we can both look at it. And I turn it for you, and you behold, then, my intent, rather than hearing my intent.

When you hear my intent, what happens is I make small mouth noises, which have meanings assigned to them in the language called English. You have an English dictionary in your head. So my small mouth noises impinge on your brain, and you look in your English dictionary, and you figure out what I'm saying. Because we have a more-or-less common body of meaning. Although there can be misunderstanding if the subject is subtle.

I'm talking, though, about a kind of psychedelic language. You can almost think of it as an audio hologram, where sound is used to produce visual displays that are mutually beheld.

PP: Could such a system be created using the internet? Navigation of thought?

TM: This idea, which sounds fairly outlandish, is actually very old. Philo Judaeus, an Alexandrian Jew of

the second century, talked about the more perfect Logos, posing the question: "What would be the more perfect Logos?" And he said it would be a phenomenon that would move from being heard to being beheld without there being at any point a noticeable transition from one to the other.

And this would have just remained wild theological rambling if it weren't for the fact psilocybin and the tryptamine hallucinogens, especially DMT, make this possible. By singing and making linguistic vocalizations on these psychoactive compounds you can then produce a synesthetic glossolalia; you can control the contour of the hallucinogenic topology to such a degree that you can put meaning onto it. In other words, you are no longer the passive observer of an alien continuum; you are, in fact, through sound, imprinting onto this continuum intent and meanings. So it becomes a sculptable medium. And this is what mushroom shaman know. I think this is happening at higher doses than are usually taken in a recreational context in this society. But above five grams--if you weigh in the 140 pound range, and you take it in comfortable, dark, situations where you lie still in complete darkness with your eyes closed, no music, and you work with it--this becomes possible. The whole shamanic tradition that touches mescaline, as well, stresses the magic song--the song which is not willed, but comes through you. With ayahuasca in the Amazon, it's the same thing; the magic song is very much stressed.

So I think there is a potential technology--a fusing of language, psychoactive drugs, and thought--that could produce this ontologically different form of communication. In a sense, to return to your question, it is telepathy, But it's a whole different idea about what telepathy would be like, rather than being mind-to-mind transfer of spoken thought.

And I lecture about this. What I'm concerned to do professionally is to try and get people to redefine the psychedelic experience--at least the tryptamine-based psychedelic experience: psilocybin, DMT, and ayahuasca. It isn't the psychedelic model that we inherit from the '50s or the '60s: that you are opened to past emotional trauma, that you have deep insight into your personal existence, that you uncover traumatic material and resolve it. The Freudian and Jungian models of the psychedelic experience don't prepare you for the phenomenology of psilocybin at high doses; something else is going on. We're going to have to have a new model because it relates to all this linguistic stuff and the way in which language and the visual cortex are keyed and controlled. It hints at a new potential for an expression of humanness that is not technological, except in the mushroom as the product of technology.

And it's like language. The way in which language emerged must have been similar to this. In fact it's possible to suggest that man was formed by the interaction of curious higher primates with hallucinogenic plants. Because in experiments with monkeys where they had available DMT pipes--where the monkey could walk over and take a hit if he wanted to, but he didn't have to--certain monkeys would become literally fascinated by consciousness, by the phenomenon of watching themselves go through some kind of totally weird transformation.

That lays the basis. Once you are fascinated by a neurophysiological response, the more you trigger it, the more the credos are laid down for it to be more and more accessible. So you can just imagine these monkeys bootstrapping themselves toward Milton, Shakespeare, Bach, and Einstein, with these plant hallucinogens.

PP: So you're actually saying then that we're going through a second or higher phase of learning with these hallucinogens.

TM: Right. The cultural catalysis that is a product of hallucinogens is now entering a new phase. It's related to an ontological transformation of how we perceive and handle language. And I'm sure technology will have some role to play in this.

Information is what is loose on this planet. If you were to come in a flying saucer from another star system and observe the Earth, you would not have Linnaean bias of seeing everything in terms of competing species. What you would see is that there is a gene swarm on this planet; an immense gene swarm is furiously exchanging genes, but species are not being differentiated out of it. And that gene swarm represents an information swarm, because DNA is essentially a way of storing and transmitting and replicating information. That is what life is.

But then with culture and the advent of language, and then the further advent of alphabets and writing, information is taking on this more and more intense, rapidly replicating and self-reflecting ability. And when you get to the level of computers and technology, it's almost like consciousness is beginning to move out of the monkeys and into the excreted, reef-like, technoconrescence that the monkeys produce. We are more like coral animals taking metal out of the earth, crimping it with ideas, and excreting it as machinery. I think it was Marshall McLuhan who said people are the genitals of technology. They exist to design next year's model and make it better. Information has this desire to self-reflect and replicate itself.

And of course, the psychedelics relate very closely to this. Because they are essentially information probes of some sort, reporting telemetric data coming in from nearby and not-so-nearby dimensions. But they are entirely interpretable as information, and in that sense probably susceptible to analysis by information theory.

PP: You've talked quite a bit too, about the UFO experience. I've read a few references to people who have had a perception of "galactic consciousness" with LSD. I've had that experience, too. But I notice you have made quite a point of differentiating the tryptamine hallucinogens from the others.

TM: Well, I'm not sure what you mean by "galactic consciousness". I can imagine that LSD gives you a vast and sympathetic perspective with nature on an astronomical scale. But what I'm talking about with these tryptamines is something a little different. It's the sense of the presence of an intellect of some sort--the sense that there are life forms, and forms of conscious organization, that really are alien and bizarre. But the problem is that they are not 30,000 light years away; they somehow, somehow, interpenetrate the here-and-now.

This is a persistent claim of shamanism, and of true folkloric thinking worldwide. But it's a very alien idea to the last thousand years of Western thinking, where we have been definitely on the retreat from the idea that the universe is populated with teaming angels, demons, or anything else.

Again, the reason I link the UFO to psilocybin is because in the high-dose situation, or in the repeated high-dose situation in isolation, the psilocybin experience blends imperceptibly into what is called the "contact experience".

And nobody likes to hear this, because the UFO people are very jealous of their UFOs and absolutely convinced that they come from the stars and are made of metal and bear great hope for mankind. They

think that any explanation which explains this in terms of human psychology or something like that is a reductionment. But actually, I don't think this is true. I think the UFO represents a sort of "shock wave" of concrescence; it precedes concrescence. It's a shadow of concrescence that haunts time and has always haunted time. It comes and goes, in and out of history. It is like a reflection of the end of history. It is the spiral lens-shaped topology left when everything flows together--when the temporal vectors collapse, you know, and we pass beyond description...

PP: The thing I was thinking of, just then, is that the attitude we hold toward these UFOs now probably is not much different than that which primitive men held about the moon and stars 10,000 years ago. They probably looked up in the sky and wondered what the silvery disk of white light was that moved across the sky at night.

TM: Yes, that's right. And you don't have to go back 10,000 years. A very interesting parallel to the relationship of the flying saucer to modern people is the relationship of the search for the philosopher's stone to the psychology of people in the fifteenth or sixteenth century. Here it was rumored, you know, that certain people could produce a magical object that would give you long life, transmute substances into gold; it was just this mystical substance that would do everything, the universal panacea. Certain people claimed to have seen it or possessed it at one time, and wild and fantastic speculation was launched around this thing. Thus it served as a great impetus to the exploration of physical matter. And then, as more and more was discovered about physical matter, obsession with the philosopher's stone was slowly itself transformed into modern science. And I think the UFO obsession, if it develops correctly, will slowly change from an obsession with brotherly space people who will come and save us from ourselves into a much deeper appreciation of the hyperdimensional nature of consciousness, and the realization that all mind is Mind. There is only one Mind. Humanness is a name for a section of Mind that we exercise some control over. But information passes everywhere. There's an aphorism: Understanding passes everywhere.

PP: How about the UFO experience in relation to other types of light visions, like people seeing angels and saints and Virgin Marys? Ezekiel's UFO, are you familiar with that?

TM: Sure. That's all this business of "the other" presenting itself within the context of the historical situation. In other words, what happens is that you're somebody in some historical period and you're out in the wilderness. Something very strange begins to happen. The immediate symptoms of it are that the hair on the back of your neck stands up and your knees feel weak and you see a tremendous light descending from the sky. At that point your mind throws an enormous question out in the universe, which is: "WHAT'S HAPPENING?" And the answer comes back dependent on your historical situation. It is either without doubt, a manifestation of Krishna, or the Virgin Mary, or the flying saucer, or the philosopher's stone, or your personal guardian spirit--it depends entirely on who you are. You explain. The mind just goes into a tizzy of explanation. Whenever the mind is confronted with something it can't immediately dismiss, it falls into a frenzy of explanation, and that is what happens in that situation. And again, it has close parallels with these tryptamine hallucinogens. Because what happens when you smoke DMT, and what makes it so strange, is you immediately have these very complicated three- (at least, possibly four-) dimensional hallucinations by which you are surrounded. And you attempt immediately to pour language onto them. You say, "It's a . . . it's like a . . ." And it doesn't work. And the more that it doesn't work, the monkey inside you begins to go into some kind of shock. Because language is supposed to work.

PP: So that triggers the glossolalia-like phenomenon you were talking about in the Esalen lecture?

TM: Well, in an effort to utter what the thing is, and seeing that English is hopeless, you are abandoned to your deeper intuition. And out of that comes the glossolalia, which then is actually able to "lock" that modality and affect it or "dance" with it. You wouldn't say "control" it, but you can then enter the flow and go through these changes with it.

I think that the great failing of psychedelic reportage and research is that the content of the experience is not stressed. They say "you have vivid hallucinations". But what the hell is a "vivid hallucination"?

I think people should be questioned very, very carefully. This is the interesting part. What it does to your heartbeat and whether your sweat increases and all that may be interesting to pharmacologists, but how many of us are pharmacologists? Most of us live in the real world, and what we want to know is what did it say to you about the real world, and the nature of reality, and how we should behave in the situation in which we find ourselves. That's what is most "obviously" important; and everybody's relationship to psychedelics is like that. They are into it for what it does for them--how it makes them understand being. But then when we rise to the level of scientific and psychological and clinical descriptions, all we hear about is heartbeat and whether the pupils are dilated, whether the reflexes were impaired.

PP: Is the psychedelic experience, then, going to be of paramount importance in the evolution of consciousness, or would these experiences be more appropriately regarded as accessory conveniences rather than essential elements? Just how important is the psychedelic experience?

TM: I think it's absolutely central. As I mentioned earlier, I think it not only causes us to become human beings, to emerge out of the primate substratum, but it is also driving us to move beyond being human beings. Speaking specifically of psilocybin, DMT, and ayahuasca, these are the hallucinogens which most closely resemble neurotransmitters. LSD does not occur in mammalian metabolism, [lysergic acid amide] only occurs in morning glories and ergot. Mescaline occurs in cacti, ketamine occurs in noorganic situation. But DMT occurs endogenously in the brains of all mammals, including man. The β -carbolines occur endogenously in the brain of man. In fact, as you ascend the primate phylogeny, more and more occurs, so that man has the greatest concentration. N,N-dimethyltryptamine is very closely related to serotonin, which is 5-hydroxytryptamine and is the major neurotransmitter that's driving the brain.

So I think it's possible even to suggest that to produce a state of mind roughly analogous to ayahuasca intoxication, all that's required is a one-gene mutation in the human genome. My hit on what these tryptamine hallucinogens are doing, is that they are literally anticipating future states of human evolution. This is the way the human mind is going to evolve. This is why, I think, there is such a persistent report that psilocybin hallucinations are science-fiction-like and seem to present these, you know, super-glossy, machine-like, highly polished surfaces that you can see into; I think that's an anticipation of cultural modalities. Like science fiction is an anticipation of the future, so is psilocybin. These things all come together. We are moving into the kinds of chemical brain states that will allow this kind of synesthesia--the visible glossolalia that I talked about. It could be a voluntary activity of normal metabolism.

PP: It seems odd, then, that the Eastern mystics haven't recognized this. Most of them are saying if there is any kind of drug involved, it's not a valid experience.

TM: Well, this is a special gripe of mine. I'm not impressed with priest craft. I think hierarchical religions

are anti-progressive. This is why I have such respect for shamanism, since what it chiefly is, is very idiosyncratic. Shamanism is experimental psychology carried out by people who are not like us. It is not a religion in the sense of a set of dogmas; it's more like a set of maps that are given to you, and then you travel where you will.

I don't think that the yogic states approximate the tryptamine intoxication. In fact, part of what I'm trying to do with my career is point people to this and say look at this. This has been overlooked. Psilocybin, which is the most often contacted of these tryptamine hallucinogens, has--in the literature and the legal codes and all that--been treated as though it were like LSD. People say, "LSD, mescaline, psilocybin, etc.". But psilocybin is totally different from anything else. It has a phenomenology that we need to look at very, very carefully. It raises all kinds of questions in areas where we have never before been able to do anything. It allows you the repeated phenomena of "contacting an alien intelligence". We can do this with psilocybin in the laboratory with naive subjects. So that's big news for experimental psychology. Even if this "talking to aliens in the head" is only a psychosis, it's still big news that here is a compound that will repeatedly trigger it in a situation where you can study it.

Experimental psychology, pharmacology, linguistics, information theory, aesthetics, heuristics--all these disciplines would profit themselves by including the psychedelic experience in the province of things to be integrated.

PP: Yes, I think so. The concept of communication with an alien intelligence, which you brought out in the Esalen lecture, has been part of my own experience, too. And much more so with psilocybin than with any other type of hallucinogen.

TM: Yes. Well, because of the book we had written about growing the mushroom, we had access to name lists of people who had expressed interest in the book. We sent out many questionnaires about how people related to psilocybin. One of the questions was: "How much do you take?" Another was: "Do you hear voices?" We discovered that people who never took more than two or three grams (that's probably eighty-five percent of all people who take mushrooms) did not report voices. But the group using the high doses, seventy to eighty percent of those people checked that they heard voices, and some people felt inspired to write paragraphs about it.

PP: You spoke about getting in touch with the oversoul through psychedelic drugs and leaving behind an era when man is "disciplined" by messiahs and saucers and progress is halted for millenia at a stretch. But wouldn't that make us as reliant on psychedelic drugs as we now are on technological materialism and hard science?

TM: No, because I assume that once you have contact with the oversoul, ways will be found to access it without dependence on psychedelics. The idea of the oversoul is another one of these metaphors to try and explain this "voice which integrates everything".

The reference to man being disciplined by saucers and messiahs is the idea that these religions, which arise from time to time and which halt all progress in any area except the exegesis of their own religious message, are like cultural governors. They occur because society becomes neurotically imbalanced. And in order to save it from itself, a kind of stasis is imposed in the form of some very autocratic, dogmatic religious faith which holds everything together for a thousand years or so while everybody catches their

breath. Then it is eroded, and then progress in psychology and science and mathematics and other things begins again. But then the culturally neurotic situation arises again. And each time the intervention by the oversoul is appropriate to the historical context.

For instance, the Hellenistic world, groaning under Roman imperialism, which was based on Greek philosophy, was totally ripe for a guy who rises from the dead after three days and preaches a certain gospel. And it's amazing, you know, where in a world where information moved no faster than a horse could gallop, Christianity exploded out of the Middle East. And the Roman authorities couldn't believe it. To them, it was just the wildest garbage! They were trained in Greek materialism and Euclidian mathematics and epicurean ethics. The idea that somebody could rise from the dead was utterly preposterous. Yet the servants were whispering and attending meetings, and the authorities dismissed it till it was too late.

Now, the flying saucer thing is very, very similar. No serious person gives it a moment's thought. It's just the stuff of the National Enquirer. Nevertheless, these polls keep coming out: thirty-seven percent of the American people believe flying saucers are real; eleven percent claim to have seen one. What's happening is that loyalty is being transferred from scientific institutions to the "space brothers". Not on the governing level of society, where everything is calm and controlled, but with the great masses who read the National Enquirer and say, "Well Ma dear, it seems tuh me th' space folk know a great deal more about it than prezydent Raygun!" That's dangerous talk. That means the official religion, which is science, is helpless in the face of this thing. They say, "It's something, but it's nothing." But they don't realize the important thing about the flying saucer is not, "What is it?" The important thing about it is, "What is it doing to human society?" What it's doing is throwing open the door to the legitimate belief in the irrational, and all kinds of other stuff.

It's changing, in other words, the social mass psychology. And that is something the government is usually the one to look after--our mass psychological images. Then here comes this other thing--out of the unconscious, I claim--to subvert the historical dreams of people who think they run things, and to instead send society in some other direction. It's like a metaphysical spanking. A mature society would not need messiahs or flying saucers to keep kicking it back into line. A mature society would just avoid being neurotic and things would develop without these lurches in one direction then another.

PP: I'm not sure if I'm going to agree with that completely, but...

TM: [laughter] If you don't, just walk out!

PP: Well, you talked along the same line about science betraying human destiny. The impression I have is not that science is betraying human destiny, but that science is dispensing its discoveries similar to the way the rain is sent on the unjust and the just. It seems that the political and economic communities have polluted science by applying that knowledge for localized and sometimes devious personal objectives. So all that comes down from science can go either way. Einstein wasn't thinking about Hiroshima, for example, when he worked out the equations of General Relativity.

TM: That's right. But on a larger scale, science has biases that have led us into the place we are: the fantastic concentration on understanding matter. What if, in the thirteenth century, they had become as obsessed with psychology as they became with matter; where would we be today?

PP: We'd probably be in our caves and huts meditating.

TM: Possibly. Or maybe that route would have taken us to the stars far sooner. What if shamanism had not been stomped on and pushed to the edge of the empire? What if instead we had pursued a route such as the Druids or the Incas or the Mayans? Because these were high civilizations; they attained levels of civilization comparable to where Europe was around 1200.

But we chose a certain path--a bias in favor of certain rules of evidence, certain ideas about what constituted claims on our cultural attention.

PP: I think that was necessary, though, to lay the foundations for more metaphysical developments later.

TM: Actually, I agree with you. What I often say in my public lectures is that civilization is the 10,000-year dash from the campfire to the starship. And it's a complete riot, and nobody knows till the last second whether it ends in complete catastrophe or in, you know, everybody being gathered into the Lord and setting off for the galactic center. And we won't know. It just becomes more and more frenzied and crazed. And in geological and biological terms it lasts only a micro-second. But if we who live seventy years have the fortune or misfortune to be born and die anywhere in that tiny 10,000-year span, it's a pretty crazy situation.

PP: You also talked about the primary and secondary qualities of matter such as mass, location, and velocity as opposed to color and texture, and then gave some discussion about these qualities being equivalently real, and pointed out that there's no justification for holding one set more real than the other. This brings us to the question: Is there any objective reality, or should we dispense with what is called objective reality?

TM: I think we should probably dispense with that notion. At bedrock, I don't believe the universe is made of quarks, or particles, or electromagnetic fields, or God's love, or anything like that. What I think it is made of is language. And where does language come from? It seems like it comes from inside our heads.

All these things--the Universe is this, it's that--these are just word nets. The Universe seems to be what you say it is. And to some degree, not what I say it is, or what you say it is; we are embedded in a cultural voice which says what it is. Then within that cultural voice we have our own small voice and we can "tinker" with the cultural definition of reality to some degree.

But over millenia, the cultural voice has changed its mind several times about what reality is. So I think we need, not a physics of what reality is, but a syntax, a grammar. We need to approach reality the way we would approach a work of literature, rather than the way we would approach a material system.

PP: So would you say language is rapidly becoming obsolete as a means of communication?

TM: It's self-transforming. Language begets meta-language, and so on. It's a bootstrapping effect.

PP: How does this sound: The probability that objective reality exists at all varies between zero and certainty as a function of the state of mind?

TM: Oh, I could "fly" with that.

Revision History

v1.0 - 1983-84 - Smith, ED - Transcribed 1983 interview with Terence McKenna, serialized in five parts.

v1.1 - Jan 19, 2012 - Erowid - Combined parts, made minor edits and corrections.

Terence McKenna Vs. The Black Hole a.k.a. Terence McKenna's last interview

Late October-Early November 1999

Terence's House, Big Island, Hawaii

Description

- [Archive.org via Psychedelic Salon](#)

Intro:

Erik Davis: I'm Erik Davis, and I had the great good fortune of spending a few days with Terence McKenna, and his girlfriend Christie Silness, in their jungle home on the island of Hawai'i in November 1999. Sadly the occasion was not so fortunate, McKenna had been diagnosed with a brain tumor the previous summer, and he was home recovering from a recent craniotomy. I was there to profile him for Wired magazine, and it turned out to be the final interview he gave before his death, at the age of 53, in April 2000. McKenna's home lay along a rutted road that round its way up the slopes of Mauna Loa from the south corner coast. It was a white modernist origami structure topped with a massive satellite dish and a small astronomy dome designed to house a telescope that McKenna could not yet afford. The house and gardens were surrounded by a riot of vegetation, but among the native flora lay thick ropes of *banisteriposis caapi*, and a sprinkling of flowering *salvia divinorum*. Every morning I ascended a spiral staircase decorated with blue L.E.D.'s to get to the study where McKenna spent the bulk of his time, either working on his Macintosh or sitting cross legged on the floor before a small oriental carpet, surrounded by books, smoking paraphernalia, and twigs of sage he occasionally lit up, and wafted through the air. His library was magnificent, thousands of books on alchemy, Tibetan art, Hindu meta-physics, systems theory, archaeology, astronomy, and of course, psychoactive lore. During the day I asked the usual reporters questions, but in the evening we would relax, and follow less quotidian pathways through the cosmos of conversation. McKenna rose to the occasion of his own mortal condition, and though he tired quickly and occasionally spaced out, he was as brilliant and funny as ever. What follows are edited portions of these dialogues.

ED: So what was your, uh, what was your, uh, your first like encounter, like with psychedelics, either in a strong way, or just?

TM: Well... was a friend of a friend of mine when I graduated from high school. They were building that band, so he insisted that we eventually smoke pot and take acid, and uh, and I had never encountered old lefties, or acid heads, or musicians, or gave a shit about any of this stuff. It was all new to me, I had just come from Colorado to the west coast, so I was easily swept into all of

this, and uh, yeah he and his friends were into, uh, who was that strange heroin based comedian?

ED: Lenny Bruce.

TM: No, no, not Lenny Bruce. Stranger, more heroin based [Erik Davis laughs]. The, the guy who did the thing about 'The Nazz!', Lord Buckley.

ED: Oh...

TM: Yeah. They were into all of this stuff, and I had been studying the evergreen review for a couple of years trying to figure out what was going with with culture, but when I finally got to the scene, and all this acid, and all this left-wing politics, and all that, then I understood, and...

ED: So anyways, so you got to, he turned, he turned...

TM: He basically turned me on, and uh...

ED: Were you kind of fascinated from the get go?

TM: We'll I'd been worrying about mescaline since I'd read 'Doors of Perception', three or four years before. I I'd also read, um, Havelock Ellis' 'The Dance of Life', which has a long chapter on mescaline. Actually that, that passage in Havelock Ellis, it's only a page or so, is one of the most seducing passages in all of psychedelic literature. They were, he was taking peyote at the turn of the century, these people really got into, under the wire. Like he took it a hundred years ago, can you imagine? That is hard to grab hold of [Eric laughs].

ED: But were you always, this sort of, partly, as much, influenced by, uh, the kind of alchemical mystical book, historical books you read in some way as, as well the more primal evolving...

TM: Well I was raised by Catholic rationalists, so you know, it's hard to square that. In other words, you would run around spending part of your time trying to understand the nature of guardian angels, and the rest of the time grappling with fairly rational concepts. I mean my families basic orientation was mining, and not science in the sense of degeed science. But my father was an electrician, my uncles ran radio and television repair shop, and my father flew, navigated, did radio, so uh, but I did spend a lot of time grappling with shit like the nature of the soul, the nature of sin, the, all of these, imponderables, you know. And of course what you end up doing is you end up reading scholars of mysticism. And then I would read about what John of the Cross, or somebody else had got hold of, and then I would try for it, and I don't recall getting too far, but uh...

ED: When you were still...

TM: Quite young.

ED: Right. But so you were still thinking in a Catholic mode.

TM: Yeah. Because it was all religious mysticism.

ED: Right.

TM: There was no other form of mysticism before, I guess before Huxley published his books. I mean it was somehow, uh, well for Catholics there was no other form of mysticism. There was 'Ouspenskyitis', and 'Gurdjieffianism', and all these peculiar... but none of that was quite kosher.

ED: Did you, so, did you have a, uh, a break with Catholicism? Or did it mutate into all of your...

TM: It sort of mutated. I read Jung is what happened. I read, I first read 'Psychology and Alchemy', and then that lead me on to, um, the other one which is deeper about all of that... it's something about the nature of the Kristos and Alchemy, and, and then I saw what the, how these geographically defined religious impulses could be part of some broader, deeper thing. And Alchemy, it was a revelation to me, all that. I didn't get religious history from the Church, the way I got it from Jung. Because from Jung I realized it was from books, and so you could read these books, I mean there was torment, torturous, was when I was first going to CAL, but on the other hand I had a library card, and I could actually get at this stuff, in whatever form it can ever be got out, I mean alchemy makes no sense at all if you actually read the literature.

ED: Right. So when you decided to start speaking, and doing these conferences, and speaking on the radio, did you have a sense of your, of a kind of mission?

TM: Well I always felt people should know about psychedelics, that that was the untold story, you know. But if there was anything new to be said or brought into the cultural dialogue, it was the news that these psychedelics were not these very tricky to manufacture drugs like LSD, but that it was really about plants. And I don't know how I would say I had a sense of mission, I certainly thought it was a fine idea that people realize. And I was also interested in feedback, you know it wasn't that I wanted to enlighten people, I wanted to hear what people had to say about this stuff, because to me it was also confounding. The transformations of language, the... what it did to information. I mean that's still what psychedelics are about, is what it does to information.

ED: Yeah, well talk about that a little bit, how do you...

TM: Well, it seems to show some kind of, uh, how would you put it, some kind of universality of source, or some, some, uh, language is not syntax, it's not grammar, it's none of these things, it's some kind of divine, uh, you could almost call energy, which flows out of objects and situations. Everything wants to communicate and so then what the chain of being is, is somehow handing connectivity on, you know, to the next plant, animal, human being, work of art, whatever it is. And uh, I'm, I still grapple with what all this means. And to me it's the most psychedelic part of the psychedelic experience is when you get the... the logos coming out of the trees, the rocks, the berries, the water, and everything. And it's the most Dao-ist part of it. It's where nature becomes transparent to it's own intent to communicate, or something like that.

ED: Do, are you uh, when think back of what you felt like you were involved with, you know in the mid-seventies, in terms of propagating the psychedelic experience, and you sort of felt like this is, you know, in a way were being one of a number of Johnny Appleseeds', uh, uhm... when you look now at what happened, emerged from that, are you disappointed in some ways? Or...

TM: No I don't think so. Considering the fact that uh, for the past year or so, or maybe longer, it's been legal to grow mushrooms in Holland and purvey them, I would say our goals were met. The thing with, brought into human cultivation, it'll never leave it, you know it's uh, a very rare thing to be able to bring an organism into the human family like that. And when we found *stropharia cubensis* it was standing waist deep in cow shit, and now it's part of the human family of agricultural production. It'll never leave it, it will always be part of the global culture now, so...

ED: And do you think that, do you think that you have the feeling that in some sense it will remain at least for the foreseeable a somewhat marginal, uh, road? Like a path that a certain, certain temperaments, or, uh, characters inside of the social matrix have, of reality have recourse to, but that don't really dominate...

TM: Sure, because if they really wanted a lot of psilocybin, you would do it differently. You would grow it in enormous vats of liquid that were the size of railroad cars, and you would produce millions of hits within days of scaling up. So uh... no, what it is, it it's uh, it's a folk technology at the margin of civilization, and an underground technology for the production of, uh, these drugs. Like, I understand you can make methamphetamine out of Clorox and some other shit, I have no idea, but it sounds very similar, very simple. Well so, this kind of, at the edge of things knowledge is very, uh, critical too. And that's where the shamanism is in the culture. The tricks of the trade.

ED: So, the shamanism enters, because that's an inevitable...

TM: Well, these are esoteric secrets, how to make drugs, and the drugs are, how to change minds and make money. So, inevitably it's going to be part of where some kind of negotiation takes place. Negotiations like that rearrange the morphology of the social order. Well, the mind space of the people there.

ED: Well, what do you think constitutes, uh, uh, a post modern shaman, someone who's legitimately doing shamanic work, and not sort of acting out a fantasy, or playing some game of,

of, like a, identification with the other?

TM: Well, I think you have to be... you have to know your pharmacology, and trust that you know it, and then be trusted sufficiently that you're willing to lead people with confidence through these places. These Ayahuasquero psychiatrists are very courageous to, and have built up sets of metaphors and assumptions that I think are probably true, or true enough, uh, but, you really, it takes balls to hold your ground with this stuff here.

ED: That must have been interesting in the sense, that you were propagating the, the philosopher's stone to the, to brethren.

TM: And it was going many other places.

ED: Yeah.

TM: A lot of people were interested.

ED: No, that's what I meant, through the whole sort of network of... freak... culture...

TM: Yeah. Well, and it wasn't so much the, the, the mushroom, it was the information, you know? The knowledge of the technique. It was like the atom bomb or something, it was whether you had it or not, it was whether or not you knew how to do it. And uh...

ED: So it's interesting to see the way that other plants, now... I mean if that, if the mushroom, the mushroom parasited on print pamphlet technology, now the, uh, more emerging plants that are re-encountered have a different...

TM: Well, so...

ED: ...obligation device, of information fasted forward.

TM: Yeah, in one case a Brazilian cults, in another case, almost landscaping, like Salvia, uh... I don't know if you've seen that, those clumps of Salvia on the road with all the blue flowers and all that, uh... yeah. The, the mushroom is the most insidious and amusing because it seems to, uh, associate itself with human beings. Like for instance the, one of the densest psilocybin ecologies in the world is Oregon and western Washington. Well one of the main industries of those areas where these mushrooms are so dense, is uhm, the production of sod, to be shipped all over the country and world. To be pushed into malls, and hotel, uh, lawns, and golf courses to spray, so it's essentially an enormous economic engine for spreading psilocybin spores throughout the planet.

ED: What happens to people that lets them tune into a deeper level and intent? That wakes them up from the spell of, of mere consumerism, and the kind of subjectivity that is, you know manipulation of images and desires that constitutes consumerism, and which dominates many peoples lives?

TM: Well, then they probably have to head for deeper values. Either Buddhism, Shamanism, their own... you know whatever lies in their own ethnic background because in fact civilization is a carnival. I mean it's a cheap, it's uh, it's a delusion of a solution. So anybody who sees past the front door probably wants really, real structured values. And so that's where all the conservative resistance comes from; the fundamentalist Christians, the Orthodox Jews, and Buddhists, all of these people are saying, well hey wait a minute, we, we, we don't want to go down this path, only so far. And that's probably a good break, otherwise we would create a civilization that's essentially a mall, and there's enough of that anyway.

ED: So in essence that, that, that turn towards deeper values, even though sometimes they take a conservative form is ultimately a healthy balance to just the sheer...

TM: ...rush toward novelty.

ED: Hm..

TM: Yeah, I think so.

ED: But do you see psychedelics playing a role in, in opening up that kind of...

TM: It depends on how it's presented, it depends on the psychedelic... uh, the, if it comes along with some wizened ninety year old Indian from South America, it's hard to see that we're abandoning ourselves to the, the trivial and the concocting, uh, and so, it's a marketing of packaging issue basically.

ED: Well, and, so what would that look like then, if you, if you were...

TM: Well I'd say the wrongly packaged version would be some kind of like Castaneda-ism, a formulaic cult, do these things, take these drugs, follow these instructions, and moral obligation will flee from your, your camp, uh, nobody can be that foolish, you know. If on the other hand you, you know, you sincerely pursue this stuff, grow the plants, try to understand it, try to revivify the rituals, and figure out what it's all about, well that's an authentic push toward spirituality. A very authentic push toward spirituality, and probably fruitful.

ED: Do you think in that process, the, the actual handling of the plants, growing them, getting to know their cycles is, uh, necessary?

TM: Yeah, because that's the level, that's the speed, that's the... well that's the speed on which nature makes this stuff, you know, brings it to the surface, and invites it's contemplation. And it's also probably the right speed at which to assimilate this stuff, to come to terms with it.

ED: So in that sense, part of the problem with synthetic psychedelics, is that they fit too easily into a kind of consumerism model...

TM: Right.

ED: That...

TM: It's not a product, you know it's not something you would get the 'drug of the month' or something. Although all these things have been proposed and some have been tried. It seems to me that, the shamanic drug of the month is not a very appealing idea.

ED: What are the, uhm, uh, emotional, psychological, ethical, expressions of really, kind of genuinely long-term, good psychedelic people?

TM: What is the long term... ethical... expression of the good of psychedelic people?

ED: Yeah.

TM: Well, it's some kind of, it's some kind of effort to separate shit from shinola, you know, it's some kind of effort to, uh, uhm, distill, uh, a truth from the blooming buzzing confusion of the universe. So it's a branch of, I don't know what you would say, cognitive science? Or something like that. It's an effort to define the human essence away from its content or something like that. You see what I mean?

ED: Try to explain a little more.

TM: Well, it's a, it's a branch of psychology. It's a self study in psychology. So anybody who's taking psychedelics is, I assume is trying to present a truer image of themselves, to other people and the world, through this process of, uh, distillation of understanding, and that's where the connection to alchemy and all that comes in. This distillation of essence away from the dross confusion and Gnostic muck of the world is a kind of, uh, like a Jungian individuation process or something like that.

ED: And that, and that manifests in the, in the call even in normal life to present it yourself, articulate yourself, oneself differently.

TM: I think so, yeah. And causes people to be willing to take chances, uh, both pharmacological and sociological, by being involved in something so marginal, you know. Because in the, in the big civilizations this kind of shamanic stuff is definitely very marginal, and most people just don't do it.

ED: Do you feel that that characterizes the overall, or in some significant way, the kind of people you've met for the last...

TM: It depends on how often they do it. You know some people are doing because their friends are doing it. Some people are doing it because, some, I don't know, they're feeling some kind of social pressure. But the people that are really called to do it, are rare. You know the people who say, well, I get loaded ten times a year on high dose psychedelics or six times a year, that's a lot, I mean that means your lifestyle is pretty much defined by, by all that stuff. Yeah, I would love to know what the real numbers are. How many people a year get really loaded? Once you get the Amazon Indians

out, and you know the Mexicans out, and fill these people out, it's hard to even know how you'd begin to make an estimate, you know.

ED: Before your sickness, did, how often did you do large, large journeys?

TM: Hm, less and less often. I mean I noticed that through the nineties, that uh... but maybe four or five times year get... but I always felt that never enough, you know, never enough...

ED: So do you have the sense that what, that tripping you on some level are getting, uh, getting something done?

TM: ...That tripping is getting something done?

ED: Yes, that there's something being worked out, like continuously and progressively?

TM: Yeah I assume that basically the download called history, meaning all the technology, social innovation, philosophy, art, fashion, architecture, is some kind of dialogue with this... well higher mind is, I'm not entirely comfortable with that, but this higher mind that keeps showing these different facets through the mist, and... I mean that science and, and psychedelica and all this, is a dialogue with the mathematical deep structure of nature and somehow as you get that out, there's this sense of progress, more than a sense of progress, Progress. And I don't, and you know in terms of what is it all leading toward or what it's about, it must be something about, like the spiritualization of matter. That matter is evolving toward quintessence or essence, or something like that. And you know, we're the startled witnesses to this thing, because we're part of this thing that I call the emergent properties, or you know, the, the uh, side effects you could almost say, of the universal emergence of matter into spirit. Cause that's what biology is. I mean, I think biology is, uh, the quantum-mechanical, uh, magnification of uncertainty into macro-physical space. So that essentially we're chemical systems that by some means yet to be understood, amplify quantum-mechanical uncertainty to dimension such as we see, and that permits, uhm, these emergent properties, and systems, and morphologies to, to show themselves, and, and that's the trick, or that's the trick explained on one level.

ED: You know it's funny, in your raps you, you stay away from, uh, what, what to a lot of people would be spirituality. In, in a way, like uh... the way that somebody would present their... you know, Jewish spirituality, or kind of Buddhist practice or whatever... you don't talk... in fact often you sort of, like slag the, the Guru model. Can you kind of separate yourself from that, and you really have a kind of... I mean you've maintained this sort of... I don't know how to, I don't want to characterize it or anything, but uhm, and yet at points obviously you are limited by something in your own language you might, you would call spiritual.

TM: Well...

ED: What is, what comes up around that word?

TM: I guess I believe I'm some kind of progressive history, that history is progressive, so then the story of evolution and biology and human culture and all this, is assumed to be a story with a happy ending. So in a way, this belief in Telos, which is not philosophically sanctioned, or this eschatological vein, my personality is what gives it a spiritual impulse. But it's the idea that time, it's an alchemical idea actually, it's the idea that time will perfect matter, and uh, I think it probably will perfect matter.

ED: What do you think about? Do you think that like post-modern spirituality is a sort of legitimate term or project?

TM: You mean to believe? Or involve yourself in? Or, uh...

ED: Believe, it's not really about belief, I, I, I mean that whatever the kind, I mean there's a lot of people now who are developing relationships with all kinds of spiritual practices, and they're not really doing it, even in the way that people did in the seventies, when there was so much, so much more true believings, it's a different kind of relationship.

TM: It's probably on a short spin, a short cycle, that a lot of Empiricists are taking up Dzogchen, and that how long can that go on? So then there'll be a lot of revisionism, and re-thinking, and re-casting of all this, which is the very best thing for it.

ED: Yes it is. So were you ever very interested in the mediation or Yoga?

TM: Uh, when I was in India, and immediately before I went to India, when I was in the Seychelles the first time I, I was. Because... when I was in Mombassa, Kenya, I came upon this place called the, I can't remember, anyway, it was a library that was basically having a bargain sale in theosophical literature. So I took about fifty kilos of uh, of uh, Yogic, Arthur Avalon, theosophical literature with me to the Seychelles, and that was what I read and worked through when I was out there.

ED: How is that you relate to Mysticism...to mystical Experience?

TM: Oh you mean as a source of valid data about what's going on?

ED: Not even that far, I mean, I mean that's one way of saying... of, of judging it in one way or another, is... it doesn't necessarily be valid data, it's just... I mean, you've been interested... this library, obviously mysticism is completely surrounding us.

TM: Well I guess I would say the more personal the mystical indicator is, probably the more likely I am to take it seriously. In other words, it seems to me if you extrapolate your mystical insight beyond the personal... you probably enter into the domain of inflation, of some kind of psychological inflation, and uh...

ED: So it Plato inflated?

TM: Is Plato inflated..? No probably not, but he probably gets a pass, as uh, some kind of piny [sp?: Terence and Erik laughs].

ED: You could just start out, you could start off by talking about the relationship between technology and, and shamanism.

TM: Well, you remember Eliade's basic book which was 'Shamanism: The Archaic Techniques of Ecstasy', that book was originally written in French. And in French, as I don't have to tell you, the word technique, has this dual meaning in both a way to do something and a technology. So uh, from Eliade's point of view, Shamanism was always about using techniques, uh, to achieve these, what he called 'ruptures of plane'. And these ruptures of plane were these breakthroughs into these healing spaces, and for him it was always, drugs, yoga, or uh, ordeal, or maybe yoga/ordeal. So uh, in a way pushing on the frontier of language, and pushing on the frontier of technique always brought some form of breakthrough. I mean, I suppose, the perfect example would be fire, where fire must have been something... we talked about the smith thing yesterday... but, so, fire technology, the transformation, the visible transformation of materials through heat, and all of that leads straight into better weapons, stronger building materials, and uh, so forth.

ED: So uh.. I mean... can you... do you see that even though the west turns away from the worldview of, of pre-modern enchanted, the enchanted universe, is that there's still something in that process of technological development which has... which is linked to those older technologies?

TM: Well the way chips are made, and the way solid state objects are assembled often is just a

matter of bringing, uh, a mix of materials to a certain temperature and a certain, uh, proportion of materials, and then standing back and letting the laws of physics rearrange the atoms so that electricity or information or something flows through this in an unexpected way so... I think we're still involved in discovering what can be coaxed from the, from the physical world, just be letting physical laws unravel themselves.

ED: And that seems to you connected to you with an old, the, the, the operation of doing that goes farther back than just modern science?

TM: Yeah, at low temperatures it's about psychoactive drugs, and brewing, and combining biological materials [phone rings], and at higher temperatures it becomes about this other thing.

ED: In one of my alchemical readings of modernity, is that electricity is a kind of element in the old sense of element, and that it has certain properties that evolve as you develop almost a shamanic relationship with it, in the sense of using it, and developing a relationship with electrical potentials, [Terence: uhuh], and that that sets up a kind of, that interjects a kind of life into the human organism that fundamentally changes it. Because it's introducing this element of electricity which has certain properties of communication, you know electricity is very strange, it's pretty far out stuff, you just laid out like electricity to somebody and kind of said, these are how these fields work, and they're not actually dadadadada, it's like total science fiction, we're just use to that story.

TM: Right.

ED: It's an amazing thing and back... those potentials are being then introduced into human communication. So that fundamentally changes them, and I think spiritualism is like a reflection in the archetypal imagination of modernity, about the kind of communication that is introduced by electricity.

TM: Interesting. It sort of you know McLuhan had this idea about the third person of the Trinity, the Holy Ghost, was electricity, and that, the covering of the earth by the matrix of, uh, the Holy Ghost initiated the third world age, and all this.

ED: Right, and that picks up a line of thought that's been carried through since the, since it first starts...

TM: Right.

ED: I mean, the idea of electricity is born in, in an alchemical imagination, it's born at a, at a pre-, uh, point to the sort of... royal society break, or whatever you wanna call it, the genuine scientific, uh... transformation that split alchemy into the shadow realm of culture, but uh...

TM: In, uh...

ED: This comes up in that alchemical matrix.

TM: In *Mason Dixon* there's scenes in Philadelphia, in the seventeen-seventies, in, in coffeehouses where, uh, electricity is being sold as a drug. You pay your money, and then you grab on to this thing, and they rip this thing around until it throws you off, and you pick yourself up off the floor and go back and pay again and get more.

ED: That's hilarious.

TM: Just this insane scene [Terence laughs.]

ED: It's funny to say but you look at twentieth century science, and even though it's, it's story has nothing to do with alchemy, that it really is this kind of fulfilling of visionary notions about the way that matter, and energy, and mind can be stitched together.

TM: Well, and it turns out it's all true. I mean, what twentieth century science proved is you can actually almost do anything. And so you know, you wanna change lead to gold, you want to create life, you wanna store information in crystals, all these things. It's now come to pass, and much much more besides, uh, proving that matter really is magical material you can pull off all these tricks with.

ED: So what is it about the alchemy that really... kind of, got you?

TM: The surrealism, of it. The shifting imagery, the associational, uhm, yeah the associational schemas are very attractive.

ED: They, what do you think, what do you think's behind it?

TM: Well, you know the basic concept is that somehow intuition and nature are reflective of each other. Until that hypothesis fails, we should probably hang on to it, uh, because look how far we've gotten. I mean it is really bizarre how much of nature, the human mind seems to be able to understand. I mean my god, instruments are circling around Ganymede based on some guy in a powdered wig looking out his crenelated window, you know, figuring out this shit, how did they pull that trick off?

ED: Well I mean that, I mean that gets that whole thing about the, this sort of destiny of technology, or the way that... I mean it's...

TM: Yeah, it's like a white cane, and you're just feeling forward into the universe, you know? And uh... you know, what is it all leading toward?

ED: How do you, uh, in your own head have come to, let's say reconcile those two sides? The, the side that's, uh, mystical or fascinated by these questions by the soul, or the, the things that are beyond reason... and the intuition, and, and, the, the way that you would relate to reason, sort of expressed expressed through a kind of skepticism, and a certain kind of, uh, uh, love of science?

TM: Well, I think I still believe what the Angel told Descartes which is, you know "Nature is coordination, of uh, measurement and proportion". So really, nature is the study of, uh, proportion, and the making of measurement, and there doesn't seem to be any problem in any... we have very powerful instruments for taking measurement, and very powerful instruments now for modeling and constraining the data, and we're making progress. I mean I, I think, uh, you know in terms of stuff like the internet, human longevity, recovery of energy sources, and all this sort of thing that we're, that humanity is probably in great shape for the next hundred years, if anybody gives a shit, but uh... that kind of timescale, you know?

ED: So you're not, uh, as overwhelmed with the kind of dystopian scenario, since it's obviously an easy thing to do when contemplating the future?

TM: Yeah I think that... dystopian in the sense of losing control of primary processes inside civilization and so having like, disease, fascism, economic breakdown, problems like that?

ED: Yeah.

TM: No, I have... I'm pretty high faith in systemics.

ED: Do you see the internet as being both... is that more of a hopeful direction or can you also exacerbate in that problem?

TM: No I think it's more of a hopeful direction. My, my... The happy story I like to tell myself about the internet is someone in some tiny village up in Ontario, or in Kenya, or in Brazil somewhere, who gets next to the internet and realizes, you know, I can get out of this preposterous scene, by simply, if I'm ambitious, if I just unleash my own ambition, and the educational power of this, then I can go to the large city and conquer, go to the capitol, and export myself to somewhere else. And I assume this is happening, cause you know, you meet in the third world incredibly ambitious people, who only by their circumstance are confined. Well if you re-arrange their, their circumstance... so if they want a degree in electrical engineering, all they have to do is be online, night after night, after night, uh... that's very exciting.

ED: So how do you see that changing the kind of... the cultural matrix, or the emerging global culture?

TM: Well, hopefully it gives it a more international flavor, and people realize that, there isn't... I don't want to use words like a natural 'elite' of native intelligence or something like that, but in fact there is something like that. I mean smart people... it would be a fine thing to put them in charge for awhile, and see if that does any good, uh... I mean they're taking charge where the money is. But that's not a very deep value, uh... what if they took charge where power, and the, the actual... well, the, the morpho-genetic intent was coming from? The design process, this is what it...

ED: But do you see that happening, I mean are, are you... I mean if that's sort of your vision, you must be a little concerned about the, uh, evident power of money and pure greed to drive, largely drive development rather than design principles with an eye toward the future, and social equity, and eco... you know, ecological improvement?

TM: Yes, except to some degree, except that it is a, uh, people who you know, Mao said or somebody said "To get rich is glorious", I'd say to get rich is modestly, uh, affirmable [Terence laughs] something like that, and that there's no sin in getting rich, as long as what you're doing is, you know making people into lampshades or something like that, uh... uh... it's better than a collectivist goal, that's what I'm saying, it seems to me.

ED: But how do you feel about that conjunction of media manipulation, money, and celebrity that's so dominant now?

TM: Well you have to have something to sell, you know? You have to have something people actually want. I mean if you're selling the Rolling Stones, or you're selling Charles Manson, or you're selling something like that, you might get somewhere, but inherently you can't sell that which is, uh, eternal, or it becomes like, it turns against itself, so uh... and that's what defeated fascism. Nobody wanted it, it was ugly ultimately. It's probably what defeated socialism... cinder block housing facilities, you know, and all this rhetoric. I don't know, social planning went off the cliff in the twentieth century, maybe because there were too many people, or too much money, or not enough money, but uh, something defeated all these, uhm, utopian visions of how people might have lived. That's what I'm hoping doesn't happen in the next twenty-five years.

ED: That what doesn't happen?

TM: That some lack of resource or vision doesn't reveal that, uh, we can't give enough people, uh, a bearable life. So we have to live forward into an age of revolution, social turmoil, and, and struggle for resources, it doesn't have to be this way.

ED: Do you see it going in that direction?

TM: Toward that kind of a struggle? That's my concern, that people and institutions not respond to need, and uh, and then what you get is a have, have not situation. I mean, you wouldn't want the first half of the twenty-first century to look like the first half of the twentieth century, you know... the equivalent of a Bolshevik dialogue, the equivalent of a, whatever soft leftism turned out to mean and be, because it turned out to mean and be, not bloody much, as far as I can tell, I mean there's a lot of labor. Unless some amelioration of some peoples, uh you know, dilemma in the system, but... the world is far richer than it appears to be, and that wealth, is not being, is not trickling down, or flowing down, or making nearly as many peoples lives as good as it could be. So far it doesn't seem to have gotten out of hand. I mean most people if you give them a lot of money, they buy second homes and collect art, well this is not exactly like hunting down serves [?] with your shaka [?], or something like that... These entrepreneurial capitalists, this is what they're doing, and they're building, uhm, vast wealth downstream for their children. It's probably you know, sort of like, the invention of very large and stable sailing vessels, whenever that happened, two-hundred or a hundred, two-hundred and fifty years ago, where suddenly a whole bunch of people realized, you know, is all we need is some money, not too much money. If we buy a ship and send it out to Indonesia, and bring back a load of nutmeg, our children's, children's, children will never work again. We need one load of this shit, and uh... and they have to work of course, and then they get a certain lifestyle, and a certain amount of social respect out of it. But I think what they really get out of it is the satisfaction of knowing that they secured for their heirs, uh, a comfortable existence unto the ninth generation, or something.

ED: Well it's interesting about that, because that ties in with the genetics. If you, if you buy in to some evolutionary psychology certainly at this stage of the game, one of the forms that that would

take is not merely like the logic that guides you, that how you choose a mate, and the fact that your status and money might, you know, if you're a male bring you a foxier, younger babe than the, the schmo whose, you know, shoveling shit, uhm, that one form that that would take would of course be to maintain your genetic line, and you know, you know, create a situation that's possible.

TM: Well, and now people understand that this is what your genetic line is about, that to cope, or to be in a Darwinian position of competition in this society means to have money, and not a little, not sufficient, but plenty! So that when you need to arrive and be met by Rolls Royce limousines, or whatever, that it's not an issue, and this all comes down, uh...

ED: But, but do you see that there's also madness to that? To that...

TM: Yeah, I'm not motivated, I mean as you see, I need a place to keep some books dry, having achieved that, my motivation [Terence laughs] falls to pieces. And it's, alright, what else do we need to keep dry? Some firewood, okay. A truck, okay. That's about as far as I can go [Terence laughs].

ED: You know the way that technology, that the internet would allow you, to build a different kind of career, cause you don't like traveling, and... what were you... what are you working towards?

TM: Well essentially, this philosopher's stone without any, uh, dross. In other words, everything I require of the alchemical quintessence, the internet provides except physicality which I didn't require. So that's what I meant, I think I said to you yesterday, or the day before, that at times these technological developments have taken place that seem to me designed uniquely for my own satisfaction. Sputnik, couldn't have worked better for me. Acid, rock and roll, uhm, small computers, large computers, the internet, uh, so in my internal story about what's supposed to happen, everything is happening right on time, right on schedule. I mean this is the thing that if you believe knowledge is power, which I certainly do, then the internet is the dispensation, you know, the angels have landed, the aliens have unfurled their, uh, banner on this planet, and uh... Now let's see, if information can liberate. That's why I don't want to do something stupid like die, and miss the whole unfoldment of this proposition, that uh, knowledge is power, information will liberate. And it will be settled in the next ten or fifteen years. Either they'll get a handle on it, whoever they are, whatever a 'handle' means, or it will slip from their control and it will be clear that some kind of dialogue is going on between individual human beings and the sum total of human knowledge, and that nothing can stop it. That some kind of renaissance, some kind of total new relationship to knowledge, and possibility is put in place.

ED: The, the idea you had about... and I've heard you mention before about somehow taking advantage of, uh, the net, to allow you to continue your career, without having to move around so much. I mean that seems to be one of the real weird paradoxes of the scene we're in, is that at the same time that we're creating all these great communicating devices... that people are flying

around, to conferences, to talks, even more than they ever have before.

TM: Yeah well I don't real... I don't really understand it. Like this morning I was looking at the brain tumor list, well fully one third of the brain tumor list is people planning get-togethers at the next brain tumor conference. Will you be going to Atlanta? Will you be going to Vermont? Are you going to London? So no matter whether you're in investment counseling, or dying of cancer, you can turn it into a circuit, of, of, a life, a phenomenon of some sort, uh... I'm not very interested in that.

ED: Well you've this, you've done the circuit for a long time.

TM: I have. I have. And I feel like I paid my dues, and I feel like you have to be visibly at some of these things because you're marketed as a personality. And you know I... I am not William Burroughs, nor was meant to be, uh, but... I am interested enough in being read that I'm willing to sign books, and stand up tell [phone rings], stories.

ED: I'm interested in a little bit of how you use the net? Like you have, you say you spend maybe four hours a day doing e-mail, but then also surfing.

TM: Well basically as an informational resource, an oracle, and, and sometimes even almost like, uh, a magical oracle, I mean words will come to me, and so I'll search them, and just follow this stuff, and where it leads. So I don't know, there's some term for that, I'm not sure what it is, uh, but yeah, it's like a...

ED: Term for what, that, that style of...

TM: Yeah, surrealists... I guess automatic writing, except this is automatic...

ED: Searching.

TM: Inquiry... or something like that, where you just, cast bread upon the waters and see what comes back, you know?

ED: Do you, do you ever have the sense of, uh, as you develop, uhm, that kind of relationship to it, that it becomes more alive?

TM: Well it becomes more synchronistic, in the way that people, you know, have said the I-Ching seems eerily alive because it anticipates and it seems to respond like a thinking thing. So in that sense it doesn't become so much more alive as it become more intelligent. So maybe really the key to bringing the, the net through is to discover universal grammars that cause it to appear, uh, alive!

ED: Do you look at, you know, what we're building with V.R., what's just around the corner with these three-dimensional interactive spaces and avatars, you imagine a culture that's more and more based on, on that kind of interaction... and, you know, obviously there's a kind of superficial shamanic or imaginative dimension to that, but at the same time, it, it's clear that at least initially, and certainly in many of its guises, it would be driven by the same kind of chintziness, the same sort of crass, tinkely, uh junk, that really drives it... How do, do you think it's just going naturally evolve such that a kind of deeper, uh, shamanic world or at least shamanic analogue will emerge in, in virtual reality, or does it actually require some, some real creative work to seed it?

TM: It requires creative work, it requires that the people who build these realities understand how subtle the... what they're up against is, and not abandon a commitment to... to realism. You know the trick to making the shamanic world, virtual world compelling is to fairly and truly convey it. So you can't cut corners. You can't fake it. So animation and the rules of vermal and all this stuff, have to be faithfully executed so that this stuff really does blow people's minds. So that people see, well... the human imagination is large enough to accommodate the human soul, it doesn't leave you leave you feeling, like you're wearing too tight a pair of shoes.

ED: And that's the, that's the dangers, it just becomes kind of a...

TM: Formulaic. Too formulaic... too easy, not that the software couldn't use some improvement, but uh, I don't want it to become so easy to produce these virtual realities that there's no, uh, attention to detail, or no sense of accomplishment of doing it.

ED: What would the, the, the, kind of ideal 'Terence McKenna' virtual environment be?

TM: Well, all of these, I guess you would call them models or explanations, uh, beginning with basic chemistry, right up to hierarchian management theory, uh... because all these processes can be envisioned, you know, as uh... interlocking sets of laws and that sort of thing. So the, that's I guess what we're talking about, is how the world should become more visual, should ride more on a visual, on a vocabulary of visual assumptions that everybody has learned. And we all know that a Bugs Bunny cartoon is a land of explosions and falling anvils... well, we learned that. We were taught that. So there needs to be more of this kind of, uh, slotting in, of uh, I don't know what you could call it... assumptions, or... gestalts that can be used as a vocabulary to communicate this stuff.

ED: Like the language, a visual language.

TM: Yes, exactly.

ED: And, and, do you... so do you see that, uh, that some language from the past, the imagery of Alchemy or Egyptian art or, or things like that are kind of... can be seen as predecessors for a possible new visual language?

TM: Well, this is where memory palaces, and archetypes, and uh, all this stuff come in. That was always the hope. It's not clear it can be realized. I mean that's why you go through the Maya, the Egyptian, the Alchemical... you're looking for these universal, uh, gestalts of meaning. But they're spread wide and far, and uh, it may have to be created de novo.

ED: Well that's part of the, the... I think, you know, uh... a more of a skeptic would really would say, the idea of building a, you know, a universal language is a, is an old and crusty dream, and [Terence laughs], and when you get into the realm of actually having images involved in it, in the kind of hieroglyphics of virtual space that are linked with meaning that, uhm, it becomes even more challenging to imagine, how you can make that kind of thing universal? Unless it's the universe of, you know, the Nike swoosh, you know, it's the universe of logos and advertising which actually is, somewhat like this, except that it's information content is...

TM: We're gonna spend a huge amount of money to establish these gestalts.

ED: Exactly.

TM: Yes, yeah. So, I don't... I'm not... many of our discussions have led to this point where, we seem to say well there's something about the thermodynamics of information that we don't understand. Something about lexical categories, something about how language wants to emerge from the background of matrix, but something about how we process language holds this back, so then there's a negotiation at some kind of fractal edge, and that, and that's where we are. But not necessarily, I mean, that's why I encourage everybody to think about animation, and think about it in practical terms. To look at objects and pose these things to themselves as a model... model-able problems, uh... because out of that will come a language rich enough to support an actual form of human communication that's been very elusive, or maybe never in hand at all. Well, it's really interesting when you talk to people or listen to people, how many people who take psychedelics have cartoon-like encounters with beings or, and you well, gee this is weird, cartoons only back to

nineteen-twenty or fifteen or some, how weird that such an out there technical phenomenon could just grab, a whole section of human psychology and, uh, camp there with that kind of, uh, tenacity, and uh... to me that indicates it has some kind of archetypal claim on that territory, and a claim which it can only continue to tighten over time.

ED: You ever seen that Scott McCloud book 'Understanding Comics'?

TM: No.

ED: Oh, that's worthwhile.

TM: Is that a...

ED: Yes, it's really worthwhile, very good, uhm... I mean it's just sort of getting at a grammar... you know a lot of cartoons disagree, I mean they're very irascible [sp?], laud, and a lot of comic people are like non-prescription, but it's a very interesting attempt to use the form itself to talk about the specifics of the form, and it's really about comic art, but it applies to some of these issues of, of animation and cartooning.

TM: Well, the great genius of Disney... I mean Disney is a... my idea of beyond Edison or Ford or anybody of what we really mean by American genius because he, you know, he had mice wear gloves, living inside his head, but he was able to create a mechanical technology to show people these mice. So instead of just being put quietly away by his brother, or something like that, he said, no, no, you don't understand... money!... this is worth, money! If we can show people these glove wearing mice and talking ducks, and, and all this stuff... and then he was sufficiently a true American yankee genius, that he saw how to, to take a flip book and put it on sale, and uh, do all that. Yeah, I think Disney is a very, very far out person. He went to the Platonic ideas and came back with, you know, baskets full of them, and released them in American towns and cities, and it did very well.

ED: I mean animation is a great place to see the reflection of things that are happening in culture at large.

TM: And certain people take it to incredible heights, uh... have you seen, uh... do you know that animation called, Asparagus? You should check it out, it's about twenty, maybe it's fifteen or twenty years old, but it's this, it's this, you know it's very highly detailed, as realistic as a Van Eyck

painting, and totally surreal, and uh... there's also, do you know that one by Sally Cruikshank called uh, Quasi at the Quackadero? That's a DMT extravaganza, uh, a carnival basically a cartoon about carnival that is a carnival crazy enough to convince you you should go take drugs, basically, uhm... and Max Fleischer was a genius, and all these people.

ED: Fleischer, Fleischer is great. I mean I think, I think that, I think Fleischer is the true origin of, of underground comics. I think that you find the most pregnant, uhm, uh, images of a certain kind of seedy, like, like the way that Robert Crumb presents a certain kind of seediness and sort of failure of the bodies, and spaces and yet that's infused with a kind of like, you know... magical eye. So you really have that both in Fleischer, and you really have that, the mania of the Betty Boop, but also a certain real, kind of, quotidian, almost proletarian, uh, uhm, graininess to these characters...

TM: Yeah.

ED: It's very inundate [sp?].

TM: It would be very hard to imagine post-modernity without Crumb's input, and I consider him, an absolute psychedelic genius. Very few people have had the influence without the karma that Crumb had. He basically did all that stuff, sold the drawings, and moved to a chateau in southern France and called it quits, and uh... got away with it, with those moves.

ED: I mean that's one of the, one of the, things again that I just find totally fascinating, is like the magic of modernity.

TM: I mean what a strange, strange thing this is.

ED: Yeah, just the relationship of modernity to esoteric religious undercurrents, and things which are not accounted for in, in uh, enlightenment discourse.

TM: Yeah, what if it just gets more and more like this, in other words I think that's what's actually happening. We're really headed for our own private Idaho. More faster, deeper, and with more, uh, panache, that anyone ever dared suppose.

ED: You mean in terms of building our own sort of constructed world...

TM: Right...

ED: respects and communicating them to some degree but not in a way that dominates ideologically, or...

TM: Well, and we have no idea how strange the worlds we can create in the near term will be, and yet, they will be. It's coming at you.

ED: Right. But just how far back to go? Like what's witnessing this bizarre moment in, in history? You know, what point are you, is the perspective kind of sitting in? That's the part I find really hard to figure out, does that make sense?

TM: Well, that's the question. Cause what that boils down to is how real is it? How real is it? Hm, yeah it's complicated. Every age seems to design it's own, uh, image of it's own dissolution, and they happen over and over again. I mean when I think about the twentieth century, you know... I mean Europe, which is the source of world civilization, stomped flat twice, uh, millions of refugees, the... you know, Auschwitz, the whole thing. Meanwhile, you know, what went on in the far east of Asia and the Asian prosperity wars and all this. It's, uh, over and over again these cultures create their Ragnarok, and uh, act it out way over the top. I mean Germany for crying out loud.

ED: Yeah, what... so how would you describe that... what's the character of our dissolution?

TM: I don't know... I guess it was Nietzsche who pushed the myth of the eternal return, right? So it's some kind of, uh, it's like a closed cycle of Hegelian dynamic, where it just works itself out. Then the thesis, the anti-thesis, the synthesis, and the darkness, and then it starts over.

ED: That, uh, Nicholl's book that I told you about 'Living Time'... what was most impressive about that book was, he lays out this idea of like, time, and he basically kind of presents, a way of thinking about eternal return. Which is that, we are locked into these repetitive cycles, that are eternally re-iterating themselves. The only way of changing their quality is to increase consciousness in the midst of them. And so you affirm this life, this world, not some transcendent world, and just the...

TM: And then try to solve them...

ED: Like under the sign of this is always this way, and how does that mean to relate to the real as it presents itself, as if there's no other thing it can be but that, and that... but as you do this process, you change your relationship to this stream, and then all this other heavy, heavy stuff happens. But

it was very interesting. It was like, cause other... up to that point I've always thought of eternal return on a kind of philosophical level, and I never thought what does it mean to actually live in the world of the eternal return, and that's pretty heavy.

TM: That's interesting. Yeah, well I've always felt like that reality was a kind of a thing... that the way you made progress was you grasped it. In the sense that you grasp a mathematical or geometric proposition, or something like that. But something which once understood, on some level, clears the way to advance a very short distance. So that's what we're always trying to do is create this lexical space of presumed understanding, and uh... and live inside that, uh...

ED: What are some of your wilder ideas about kind of technological situations

TM: Should you have any..?

ED: Should you need any, or, or lying ahead?

TM: Well the vision I always saw is inevitable, and I still do, and I'm very attracted to it. I shall be sorry to miss it, if I do. And that is, I can imagine the twentieth century defined, I mean the next century, defined by, uh, very, huge spacecraft that are, uh, that cycle from the inner to the outer solar system. That seems to me the way to do it. To create these worlds, which have like, say, eighty year orbits that carry them clear out to Uranus, and all these places, and to the inner Solar System, and that these things are just self constructed hives of human activity, and they invent their own Raison d'être at each point in these voyages. And there's travel between them, but largely they are city sized or larger constructs, and that must be how it will work, powdering down asteroids, and... I would, hey you know, I would really like to see a breakout in the next century. How long can we wait for star flight? I mean how long before the contradictions in terrestrial existence just become too tearing, and you have to go to some kind of fascism and really turn the screws, or uh, things fly to pieces, you know.

ED: Yeah, that's...

TM: But I really always felt as a science fiction fan and all that, that star flight... that galactic citizenship was what you're aiming for, and even if you're the only fucking citizen, that's fine. But if you have to go up to the great council of the Talyxilou [sp?], or whatever that shit was in Dune. But yeah, this flinging ourselves around the solar system is an enormous... that's obviously all doable. In other words it doesn't require any re-arrangement of the laws of physics, it just, it requires we don't all murder each other, and we continue to pursue commerce. So, this is reasonable in some level to expect, and uh... there needs to be... I wish there were a face on Mars, or something like that. That would drag the popular imagination...

ED: But I see the... I see strong movements in some levels for an imagination of Mars as a place to inhabit.

TM: It seems like Mars is, is happening here.

ED: I mean, it's in the scientific imagination, it's in the high science fiction imagination, the... why not? I mean, it's...

TM: Yeah.

ED: a pretty cool idea. I mean, it's insane... it's like, I wouldn't go first [Terence & Erik laughs]

TM: Or ten-thousandth [Terence laughing]

ED: Probably.

TM: Well between that and what's out at the edge of the Solar System, it seems to get quite exotic, and as what life is understood to be expands, it's all converging. I mean there are, there is mind under the ice of Europa. Not I don't know... Mind, that's not... but there's a lot of complicated and hard to define, and edgy shit, uh, from on, on the moons of Jupiter and Saturn.

ED: What do you mean like, edgy shit?

TM: Well like, uhm hot water trapped in methane environments, under deep ice. You know there's this lake...

ED: Hot water in there for something [?]....

TM: ...and complicated chemistry. And you know, they're drilling into this lake in Antarctica, that's under four thousand meters of ice, and has been there twenty million years, and utterly undisturbed in total darkness for... and this insane geological... and they're culturing stuff out it, out of the mud that's been under there, it's alive. Still alive.

ED: Woah! That's trippy a little bit

TM: Yeah, isn't that...

ED: ...bounce off my head...

TM: Yes. Yes, exactly [Terence laughs] So uhm, if I, you know... It would be a great time to be a xeno-biologist. And it could be Europa, it could be Titan, it could be Mars.

ED: Now that would just be a fascinating encounter.

TM: Yeah, that's a great, a great rap.

ED: But that one seems more likely, we encounter some kind of weird life-form underneath, but it's not, you know [Erik Davis speaks in alien voice] "I am here from Orion".

TM: [Terence laughs] We're not testing you... we have no questions, we have no answers [continues laughing]. This idea has been gaining strength for twenty years that life is not unique to Earth, it must have drifted in a chunk of stuff and it's, it's an alchemical rule. It's the rule of homogeneity, you know 'As Above, So Below', given the circumstances as we find them, what rational momentum is there to think that life is unique, and arose on this planet almost...

ED: It's much easier for me to imagine that on a certain level, that at least the galaxy, or our local part of the galaxy has some kind of other minds. I mean it may be, it may be not true. But it's almost the same way of the way that we model... you know... hopefully model a future. It's almost like you kind of imagine that... and so all that... Star Trek is even kind of this weird dress rehearsal for a certain phase of, of this kind of, uh... realization. That's just a story, just a science fiction story.

TM: Well, you could have said it of Jules Verne in eighteen-eighty-five, and in Wright, you know. Yeah, it is a rehearsal.

ED: And you know, psychedelics kind of seemed like to me imaginative rehearsal to some other event. And whether that event is merely my own individual death, or some kind of cosmic...

TM: Event?

ED: event. I, I completely suspend judgement on it, and I don't know if I will be able to, I don't think I'll move from my present...

TM: Position?

ED: position, of like, well...

TM: Who knows?

ED: who knows? uh,...

TM: Yes, it's the big kahuna, or...

ED: So what do you think the... up with the, uh... extra-terrestrial imagery, that features so heavily in some strands of psychedelic experience?

TM: You mean the cat-eyed... that kind of imagery? The cat-eyed alien, gray, pudgy little...

ED: That, and just the sense of, uh, I think it seems like a lot of people just even describe the sense of extraterrestrial intelligence, or...

TM: Well, remember how we were talking last night about everything wants to articulate itself. Everything wants to somehow communicate, and be perceived as language, when that impulse is most clearly separated from it's object, or from it's source I guess you would say, then maybe that's what you get, is this Gumby-like pure impulse towards communication, or something like that. I mean it seems to me, it's like, uhm, looking at a pure function... a pure psychological function of some sort... you see what I mean?

ED: No longer rooted in, in...

TM: In it's source.

ED: Source being biology and evolution, and the physical form of this particular planet.

TM: Yeah.

ED: And so that, once it reaches a certain kind of...

TM: It can actually walk away from itself, and then there you have it. And you say, you know, what is this? It's category confounding, it can't be, it's uh... an essence without an object, or something like that, and uh...

ED: Yeah, I've had, I've had some pretty profound moments of... of feeling like contact with... something like extra-terrestrial intelligence, without often believing it in the interior of the trip that it was...

TM: Oh you mean while loaded.

ED: Yeah, even at the time going... Okay, this is...

TM: I'll let this happen.

ED: Yeah this is, this is the phenomena occurring, uhm... rather than... Oh, I'm only seeing it, and uh, or maybe you just sort of gear forward science fiction, or..

TM: So how real was it?

ED: Well I mean it's... maybe it's just a language that I use for 'other'. That if you, you know, if you present this some kind of intelligence or communicating force that seems to be 'other', that's very 'high', you know very 'evolved', that maybe I'm just gonna tend to see it more as, as alien. But even in terms of those buzzes, like the kind of weird way that sounds can like form these vibrating matrices... is they've often, they often take on a more metallic quality, and become more synthetic. And with that rising begin to enter into an imagery realm that's very...

TM: Peculiarly alien.

ED: And it's peculiarly Alien, and that's technological often, as opposed to natural.

TM: Uh-huh, that's the place.

ED: And uh... and that's you know this... that's like a lens or something of... cause I mean you imagine you're on, you know.... history is, if you imagine it pouring forward or moving rapidly forward, there's a kind of front edge, that's very weird, because it started bursting all sets of new...

TM: Foam.

ED: Yeah like, exactly [Erik laughs].

TM: Yeah [Terence clears throat]. I know that place. Hm...

ED: What is the nature of the entities? What constitutes their apparent agency, or communicative agency?

TM: Well I think that's the question that remains unanswered. You know, that's the grail of the thing, what is the nature of the other... is basically what you're asking. Is it a construct? A projection? Or a discovery? It's not clear to me what it is.

ED: Do you feel like you've gotten any closer to that?

TM: It's probably a discover which is the most radical conclusion. I mean I think that's probably what you think too based on the... your description of the DMT trip, and all that... that ultimately it is irreducible, you know... it is too weird to tell. I don't know whether it was a C.M. Kornbluth story, but it was all about these aliens come by and contact the United Nations, and all this, and... but somehow this book, 'To Serve Man', uh, uh, comes to the surface, and it's slowly realized it's a cookbook [Terence and Erik laughs], and this really spoils the party [more laughing].

ED: What about the communications that come in from either the extra-terrestrial, quote unquote, or seeming, or the technological world?

TM: Well obviously it requires discrimination to figure out you can't believe everything you hear. The demons are of many kinds, some are made of ions, some of mind, the ones of DMT you'll find, stutter often and are blind. Just because something can talk, doesn't mean it isn't selling you something you may not want to have.

ED: Right, now that time in that phrase, you said the one time DMT, but I've also heard you say Ketamine there. The one time, Ketamine.

TM: Have I said that about Ketamine?

ED: Yeah, yeah.

TM: Well we need to control me a little more tightly [Terence laughs].

ED: What is your, uh, what is your opinion on Ketamine?

TM: I think it's an intra-uterine memory drug. I think there are things about it that cause you to recapture some kind of intra-uterine state. It's echoic, it's weightless. It cancels the sense of gravity, so you don't feel your lungs rising and falling. It's, uh, I sort of agree with you, I see it's fascination. I would not want to become embroiled in it's tentacles cause I... it seems to me a little too easy, a little too fascinating.

ED: Do you think, uh, ketamine is hollower, partly because it's just a synthetic? There doesn't, it hasn't emerge in the ancient matrix of the bio-sphere?

TM: No I think one of the big, one of the interesting unanswered questions is why do these chemicals have the characters that they do? You know, why do they have these personalities? Why is there Mayan imagery inside mushrooms and mescaline and this and that... and so, Ketamine's character is simply somehow conferred from whatever strange dimension this is, that sends these drugs their personalities, and uh... it certainly is an interesting personality. And Lilly is, you know, John is a juggernaut, do you know him? Oh my god. John's such a trip. I mean some people are just...

ED: He seems... but he's like... I mean, he's a really... kinda... out...

TM: Oh, definitely...

ED: Like I mean it, like this guy's out...

TM: Yeah, this guy is... there's nobody home. This guy cannot be left alone at home, and he's like me [Terence & Erik laughs]. What a trip! And such, you know, an amazing arrogance, and an amazing conviction of your own own, uh... that you've got it all figured out, you know... yeah, relentless character. He told me once... we were at Esalen... I don't know, it was just the two of us standing there... and he said "Nature loves you ruthlessly". And I thought, hm... well, that's an interesting observation, just ruthlessly (voice unclear).

ED: Was he speaking specifically about you?

TM: Yeah, he and I were to only two people present. It was just a private conversation. He used to have this Obi-Wan Kenobi robe that he wore around Esalen, it was just hilarious, and he would just show up out of the fog, you know, like... to lay these raps on ya. Yeah, they didn't make too many of John.

ED: Ketamine actually distills a certain element of... of the psyche, and then just lets that element interact with this whole weird plane. And there's not a lot of connections with the animal body, but the tryptamines are like carrying the animal body all the way through it all. So it's all still

TM: Yeah...

ED: archaic, and there's sex, and there's fear, and all of these... the animals in this space... the

Ketamine is like a little drop of like...

TM: [Terence voice unclear; Erik laughs]

ED: Enters into the zone...

TM: It is completely like that.

ED: You're completely, I mean... I don't know if you remember, like, things in your life life that are all part these networks that are cosmic cause and they're so impersonal, I mean these are very impersonal environments.

TM: Sometimes on Ketamine I have the impression it's like this all time, I simply don't notice. Which isn't a very sense making perception, but uh...

ED: [Erik laughs] Yeah. Not it does have an always already quality to it. But the whole quality of time is very different, than with uh, also tryptamines, which a kind of more propulsive change about transforming.

TM: Yeah, you're right about how it accentuates the animal body and just shows you some kind of hyper state of, uh, I don't know... being!

ED: Or even metabolism. [?]

TM: Yeah, something like that. Where it's just a fifty thousand percent more powerful than you thought was the specs would tolerate.

ED: What do you think of MDMA?

TM: It's... it never spun me like it apparently did other people. It seemed very pleasant. I didn't quite ever get, you know, the fight to save MDMA and all that, uh... I figured from what I was hearing around me that it was doing a lot of good in psychotherapy, and so those people should be supported. But personally I never... it seemed, well it seemed very much like every drug as it's introduced into society. It's usually claimed to solve relationship problems, and uh, then... well that's the best packaging is to say the drug solves relationship problems, and...

ED: Well of course linked to that, right on the top was the warning that you could believe you were deeply involved with somebody, wind up making stupid decisions.

TM: Well, when was that not true?

ED: Yeah, no I remember the first time. I mean that was specifically one of the stories that was told around. And that was relatively early in being...

TM: You mean people deciding to marry the wrong person...

ED: Well, yeah that kind of thing.

TM: Because they...

ED: Had such an intimate experience. I only had a few. I only took it a few times. I find it extremely taxing on the system. You know the way that I, I...

TM: Oh, you mean the next day you feel terrible?

ED: Yes, yeah. [Erik laughs] Yeah, it's true, the amphetamine down is really quite a monster. I actually like, uh, crystal methadrine but it's not worth it.

TM: It just wears you too hard.

ED: Yeah, it's too hard. It's like... it's fun but, it's kind of...

TM: Every gear is flopping on it's axle by the time you're through. Yeah.

ED: Do you have a position about the relationship of the psychedelic experience to non psychedelic mysticism?

TM: Oh, I think I see what you're trying to get at, some kind of... what's the neo-Platonic, what's the Platonic connection to the psychedelic experience.

ED: That's one way of thinking of it, yeah.

TM: Yeah, in that sense, yeah, uh, I mean... maybe you need to ask the question, but uh, the.. the psychedelic vision is of some kind of relevant thing. It isn't just, uh, it isn't the equivalent of a dust bunny under your psychic bed, or something like that. It's actually a product of the... well, it's hard to English it but the product of the fractal laws that govern information theory. That, that's a theme... I mean that, uhm, Neil Stevenson and all these people understand that it really is all about how everything is put together at the informational level. There's no deeper truth, and so all this talk about code and, uh, virtual reality, and how the portions of reality might be code running in some way, and all of this. This is all I think trying to get at, uh, something about information theory that is... needs to be fundamentally understood before we can altogether take the next step to the next level.

ED: What's the relationship between what's happening with these information networks, and this kind of object? or matrix? or second hyperdimensional...

TM: You mean how does our own cyber-spatial technology relate to the presence of this neo-Platonic ur-object of, uh...

ED: Mhm.

TM: Well that sounds like, this dialogue you wanna get in on with the 'Garland of Letters' or the 'Kabbalah' or the... I mean, mathematics is somehow this web of something which hold nature together and seems to spring out of a higher mind of some sort. I mean mathematics is really what it's all about when you finally get it sliced thin I think, uh...

ED: Hm.

TM: ...and that makes sense Platonically and from this neo-Platonic thing, you know, that's uh... and by neo-Platonic I mean Proclus, and Plotinus, and those people who came about five hundred years...

ED: Right.

TM: later, after Christ, yeah. Have you been to Ravenna? That's where they have these, uh, mosaics that are... cause it was basically a theory of pixelation, it was an elemental theory. So they were tiny, pure un-dividable elements of essence that went together to produce a phenomenon. Well all those people came out around the end of the sixth or early seventh century, it was Plotinus, Proclus, Porphyry... yeah Plotinus, he had the right idea [Terence laughs]. And you know it was late Gnosticism, so all this star magic and, uh, really wild theories of stellar well, it was when, it was when the Hermetic Corpus was settling nicely into positions. All those doctrines of calling down the voices and all that.

ED: Do you think we're, uh... do you think we're in some sense, in a structurally resonant position Vis-à-vis late antiquity?

TM: Oh, I think about that very much. Well, always in some degree because these fractal things are just endlessly echoing and re-echoing inside the structure of time, but uh... yeah this, what we share with that era is, uh... a kind of fundamentally existential confusion about what's going on, so any... so doubt itself becomes a philosophical position. Which in fact all doubt means is, I'm shopping thank you. [Erik laughs] So uh, you know what I mean?

ED: Yeah. What about that sense, that this... this matrix, this network...

TM: This thing you mine for language? Yeah, I sort of see it like that, that there's something you... that all the metaphors of alchemy which are, you know... locating the deposit, extracting, concentrating, alloying, fabricating, apply to this enterprise of language and literature and art, and clearly that's basically what it's all about. And you have to get in there somehow, to this, uh... the to the main vein, and once you're there, it's just pure, pure, Logos, and that's the way I've always gotten at it. I figured that's the way, the really smart money gets at it, the, the Melville, the Joyce, these voices that you find.

ED: Are somehow channeling closer to that... from a position closer to that matrix.

TM: Yeah.

ED: Or whatever you...

TM: And that that's what real channeling is, is getting close to that kind of...

ED: To that writ efecundy [sp?]....

TM: Yeah.

ED: I mean that's the thing that's so wrong about the... I didn't really get that... this totally explicitly but about like a lot of channeled material. Is that I have no doubt you can set yourself up into a psychic information network wherein you... human ego at this point in history are aware, or become aware of the presence of another personality and voice when then you bring through and write down. I'm not... I'm not saying nothing about ontology, something... something about perception psychology. But the thing is, is that the stuff that gets transmitted... so much of it is so bad, and so literalistic, and so boring. Because it's not actually close to that, because that is so rich with...

TM: It's because as you say, it's too easy. You know, you have no doubt people can do it and you're right, they can do it... and then, so then what you get it is C+...

ED: Right.

TM: ...material.

ED: Have you ever seen an image of, of, of... the, the letters that were on the golden plates?

TM: The Mormon books?

ED: Yeah.

TM: Uh huh, sure.

ED: The Brodie[?] book they haven't reproduced...

TM: Yeah.

ED: And it's just that notion of these highly compressed scripts. I mean if you imagine... like this thing we were talking about in psychedelic space, that this kind of matrix of possible languages or possible logics, when end up kind of fleshing out into all this sort of other stuff, that there must be languages that are farther upstream, that we can't really capture in full left-brain, you know, alphabet, parson mind.

TM: Right.

ED: It's a little, little challenging for that mind. And yet it still has the character of a language. It's like the Hebrew alphabet..

TM: Right.

ED: ...That mystical idea of an alphabet.

TM: No, Ralph and I have talked about stuff like this, about uh... you probably know or have heard of this guy Stan Tenen...

ED: Yeah, yes.

TM: Well he is into thing thing where he has this shape and as you illuminate it from different angles, you get different Hebrew letters cast as shadows. So Ralph said, you know... this implied then that there was this hyper object which cast all these shadows and he said, given sufficient computer powers you could compute upstream as you say, and toward higher dimensional objects that would eventually shed all, uh... all shadows, of all letters, in all languages.

ED: Ahh...

TM: And that there would actually be a kind of a, like a... Omega object or something, that was the source of all meaning. So this thing you and I were talking about last night or today about mining the veins of organized entelechy or whatever, relate to this, uh, this concept of this like gnosis shedding hyper object that is somewhere up in the Empyrean.

ED: I find that Kabbalistic stuff pretty, pretty evocative, that whole...

TM: Well it relates to this 'Garland of Letters' stuff, and... I really think, I mean I had experiences leading up to the thing at La Chorrera, you know when I was young, that just seemed to imply that sound was it! And that you could do things with sound, with your voice, that is was all natural stuff. But everything up to probably splitting the atom, if you knew how to do it.

ED: So do you, do you subscribe, kind of... at least loosely to the idea, that behind a lot of religious and mystical literature, at some level of depth, lies psychedelic experience, you know, produced through ingesting of some kind of psycho-active substance?

TM: Well I think so. And I think more-so since I've had cancer, because I had no idea that such, uhm, peculiar states of mind were naturally available to people and non-lethal. In other words that you could have fairly frequent brain seizures, and experience very bizarre states of body-mind dislocation and have it not kill you. So now I see that the spectrum of human experience is a lot broader, then I previously imagined...

ED: Because then you... you've imagined all of the chemical conditions under which people have...

TM: Over a million years...

ED: You know, not just drugs, but diet, temperament, genetics...

TM: And now this. All these various things. It turns out the mind is far more malleable than it is...

it's easier to... well, what am I trying to say here, I'm trying to say it, the mind can adjust to a great deal more than that which simply kills it. And so, as people make their way through these states of mind, induced by brain architecture, cancer, diet, drugs, genetics, whatever... there's a broader human database than I realized.

ED: Well other than the, the seizure itself you kind of described to me... I mean I guess this, the drugs you're on now in terms of waking up these completely bizarre things... what are some of the other, like, really unusual mind states that you found yourself in, since, uh... this all began?

TM: Well, uh, they're hard to describe, like one time I call it 'losing categories', where it will become an enormous effort to decide whether there should be one or two of something, something completely trivial. But this one or two indicates to me some kind of lexical break or some kind of peculiar... I mean it's hard to English, but...

ED: Mhm.

TM: You see what I mean.

ED: Yeah. I love the idea that you've found another number between...

TM: Oh I, that I discovered a whole number between and and five that had previously been overlooked. That was a funny idea, and uh... but mostly it's some very hard to communicate idea about how, uhm, concepts form these things called lexical objects, that are like topologically closed. So they can't really be cross-related. So all understanding becomes a kind of illusion of some sort.

ED: Wow, that's kind of intense.

TM: Yeah, that is a weird idea. Well now that I have all these medical problems with brain, and brain function, I have a much greater appreciation for the boundaries of eccentricity. I mean, now I understand, it doesn't take drugs. There are a lot of people running around who are crazy as shit house owls, and uh... are achieving it on the natch [Terence laughs]. And their, their testimony now has to be weighed as well, so uh... this surprises me. I didn't realize that, uhm... you know a malfunctioning brain could, uh... leave you functioning enough to report to work and tell your story, and presumably write novels and meet deadlines, and these other things, you know, that people do, so.. and I don't know how many other people realize this either.

ED: Because that's sort of how you... how you feel?

TM: Yeah, I mean, I'm now... live in a world defined by, pretty much by prescribed drugs and, uh, my doctors are telling me I have to take this stuff to stay alive, basically. So how many people are living in a world psychological defined by that way? Quite a lot.

ED: But you seem to be largely... Terence, you know...

TM: Well I recall who I'm supposed to be, so... [Terence and Erik laughs] We're not trading that in too likely, uh...

ED: But in some fundamental sense, do you feel like your standing on a different ball?

TM: I would like to get all these drugs out of my system, the Depakote, and the steroids and all that because, uhm... it makes mentally moving on a level surface feel like walking uphill, you know, so uh... and these are mild drugs I take. These are not, you know, what about the people who've been diagnosed, scizophrenic, or bi-polar this, or something, I mean what are these people taking, and what is it making them think about reality?

ED: Well you've taken, uh, serotonin re-uptake inhibitors haven't you?

TM: You mean like Prozac?

ED: Yeah.

TM: Yeah, the... but those are designed to, uh, help you out. These other things, all you deal with is side effects.

ED: Oh yeah, yeah.

TM: It's a different thing.

ED: I thought you were talking more about... Schizophrenia, you know, it's been treated... don't they treat with all sorts of neuro-transmitter, uh... modulating drugs, which are presumably there to help them out?

TM: Well, there to help them out...

ED: In the way that Prozac's...

TM: It may be there to help the rest of us out. [Terence and Erik laughs] You know, to... like for instance this drug I take Depakote, the first thing it supposedly deals with is mania, well I'm taking a drug for mania? I don't have mania, do I? Did I? Would I? Should I? Could I? Do I want to? And so forth and so on, [more laughter].

ED: You, you didn't have any bit of mania in you before?

TM: At times I've been accused of mania, but... [more laughter] by idiots! So... [more laughter] ...uhm, and I guess because of the war on drugs somewhat concealed and all that is the willingness of the establishment to allow experimentation of drugs, the effect of which on tens of thousands, or hundreds of thousands of people would have social consequences that were maybe unintended or unmanaged, uh...

ED: Yeah, I'll say.

TM: Yeah, like I've wondered, you know the statistic you hear, Prozac is the most prescribed drug

in the world now, and a billion people take Prozac now.

ED: Is it really?

TM: It's something like that.

ED: Oh my god.

TM: So my question is, when do some of the rest of us get the benefit of this? In other words, when is the guy putting my fruit in my sack going to become a more pleasant person? The guy pumping gas, uh... all these people on Prozac, pretty soon it should begin to feed into the body politic as a sort of feeling of a good will and temperance. I haven't actually seen that. [Erik laughs] But yes, I would like to live for quite awhile longer. But it is a very interesting cancer as a metaphor for modern life and uh... how people live, how they think about their politics and diet, and uh, money and all the, the rest of it. And probably my generation was more exposed to toxin, than any other in history. Because there were not only all the toxins of the pre-modern world, but then, all the plastics, adhesives, and so forth and...

ED: Well, it's just so, it seems so basic that cancer is a socially, physically constructed metaphor for all these other processes that are happening on different levels. It's almost like that plane of the real response with an appropriate kind of metaphor for all these, processes of inflation, and kind of negentropy burning, uh, development.

TM: The revenge of matter or something... yeah. Or the revenge of synthetic matter.

ED: But what is your prognosis?

TM: Ah, well it's a little hard to figure out, uhm... I think it's, well it depends on the doctor your believe. The doctor who just did the surgery said he got it all. He has an incredible reputation like thirty best in the world, or something, with survival rates and all that, so uh... maybe he did get it all, in which case I'm the same weird, the same... I just have to get strong. On the other hand the survival rate for this shit is very low, uhm... zilch in some people's opinion. They say, you know, there's no escape, there's always salve[?], they always return. You can only have so many crainiotomies, uh.. so those people say six months to a year of life, which is really a drag to take on board, uh... my own intuition is I'm not sure, I can't tell what's going on. It certainly is a weird situation to have fall upon you. Especially a person like myself whose never had, I've never been a sick person or concerned with any of this. I had no idea there was so much morbidity around me, you know... where as Dante, you know... "I had not thought death had undone so many", he says when he looks into the Inferno. It's a sobering thought [Terence laughs]. So that's it and, uhm.. what you do, is you constantly try to get stronger and hope that no bad news comes down the pipe, and uh...

ED: Do you feel more, uh... intimate with death?

TM: Oh, absolutely. No, you spend every waking minute... well I don't know every waking minute, but for the past six months, uh... let us say, death has been a daily accompaniment of my, uh,

thoughts, and uh... dying is the more troubling subject. Death is the great who knows. Dying on the other hand might be unpleasant, prolonged, it has a terrible effect on the people around you, and uh...

ED: Full of fear and pain...

TM: And misapprehension, you know...

ED: Misapprehension?

TM: Well, people don't know what it is. So they don't know what they're looking at, and they, you know are they losing you? Are you passing to the great, the meaning combination of answer to all, or are you on the extended wing downward into darkness? And it really plays people.

ED: The internal subjective perception of the shut-down of the nervous system at death. I think that's a really interesting question.

TM: You mean to what degree are these things different and similar?

ED: Yeah, that in some way in what happens with most psychedelic, and mystical visionary experience, and, and certain relationships to apocalyptic form to the end of the world, where things all transforming. There's a, a point where the self dies and it might happen in a millisecond, but subjectively would be the end of the world.

TM: Yeah, and because I think everything works basically the same way, it would have a fair profundity, uh, because you would be seeing the primal assembly language code.

ED: But, but the whole idea of psychedelics as an end, you know, as a rehearsal for that kind of event.

TM: Yeah, it's like Buddhism with turbo-charge or something. Now you can...

ED: Run through the Bardo, or a Bardo...

TM: Take the diamond sutra for spin. [Terence laughs]

ED: How does one live your life in the shadow of such an event. You know, what does it mean to live in a shadow of a different kind of culmination? Or how does one live in a post-human world?

TM: Well, maybe that's how you actually can change your existential mourn. That's what you deal with. That's the peg you move, is this image of, uh, your own fate or end of life, or how it's... what exactly all this stuff is worth to you, and as you move that around, you see thing differently.

ED: How has a lifetime of psychedelic use, an adult lifetime, sort of set you up for facing death?

TM: Well I guess it leads you to the idea that, uh, things are probably more complicated than you

can suppose. Therefore supposition is not to be trusted. So in other words, given how weird life has been, why rush to pre-judge death? It's bound to be mighty strange. Life was mighty strange, and uh... I'm curious, you know, I don't think anybody would be curious... I mean it's an interesting situation to be told that you have a very limited amount of life left, because it composes your mind for you... wonderfully. You know, and you start paying attention, asking the questions, and uh... and I have no insight into what it will be, but I suspect it isn't what anybody thinks it is. I mean the argument that nature has this desire to preserve form is I think self-evident on enormous scales of space and time, and very local scales of space and time, so why fight it? It must be that, uh, that the, that somehow matter is spiritualizing itself, or mathematizing itself or something...

ED: Right, becoming virtual form.

TM: So, and what psychedelics show is, that the world is full of surprises. I mean I consider psychedelics a constant and verifiable miracle. The fact that that can happen to your mind, so it means all kinds of things are possible, uh... nothing is to be assumed or pre-judged, given a. biology, b. psychedelics and culture, and probably that's a long enough list but those two things alone secure the weirdness of being sufficiently... we can call it quits.

ED: It's late too. You should get your rest Terence.

TM: Yes I should, we all should.

[End]

01:50

To sing and speak tonight about the opalescent expressances of the abyss
the abyss of living language that pours from the psychedelic body
the psychedelic body is the earth turned inside out
it's river's ramaputra, limapopo, ganji's, casi varanjaje
it's mountains popocatapolo, kilamanjara
it's islands, yijido, batchan, obee, doru, damar, hamahara, key, saran, neeos, manhattan
it's people weetoto, shwar, celtic, black, white, yellow, gay, strait, old young, stong, living, dread past
present remembered forgotten
i wanted to speak of the opalescent expressance of the abyss
the shining lights, in the mind
the shining lights that move in the night of the mind
so that language builds until it overflows the goblet of understanding and becomes pure pre purest
intentionality
to being
aum
chanting

McKenna: Well, Novelty Theory is something I've been working on since the early 70s, inspired by psychedelic plant experiences in the Amazon. To attempt to look at time and really deconstruct it and attempt to understand what it is. And this has been a wild intellectual ride leading to some pretty easily stated conclusions.

One is that novelty, which is my term for complexity, or advanced organisation—novelty increases as we approach the present moment. The universe you and I are living in is a far more novel and complicated place than the early universe was. Well, some people would say, “Well that's just a consequence of the unfolding of developmental processes.” But, this asks the question, “What are development processes? Why should the universe have a preference for order over disorder especially when we have something like the second law of thermodynamics which tells us exactly the opposite?”

Physicists believe the universe is running down, ultimately, into a state of disorder. But what I see, is everywhere the emergence of more and more complex forms, languages, organisms, technologies; always building on the previously achieved levels of complexity. So that was one of my insights. Coming out of that insight was the further understanding that this process of complexification through time is not proceeding at a steady rate. It actually follows a kind of axiomatic curve. In other words, it's happening faster and faster, and this was a revelation to me because it allowed me, philosophically, to contextualise the human world and to understand that human technologies, languages, migrations, art movements, ideologies, are not something different from nature. They're the same download of process that we see in the movement of continents, the evolution of new species of animals—except that these human novel emergent situations are happening much more quickly.

So, I see the cosmos, if you will, as a kind novelty producing engine. A kind of machine which produces complexity in all realms: physical, chemical, social, whatever, and then uses that achieved level of complexity as the platform for further complexity.

Well, this explains our present circumstance. It explains the rush toward all forms of new technology and social organisation in the new millennium. But you don't have to be a rocket scientist to understand that if the universe is complexifying faster and faster, an epoch, a time will come when this rate of complexification is occurring so rapidly that it will become itself the overwhelming phenomena in the world of three dimensional space and time—and I call this the Omega Point, or the transcendental object at the end of history—and I believe it is not that far off.

That with the emergence of global internet ,a human population of several billions, an electronic noosphere, that we are now within the shadow of this transcendental object at the end of time. Our religions sense it, that's what gives them their apocalyptic intuitions. And I think the ordinary man and women in the street sense a kind of built in acceleration to time itself. Well, rather than dismissing that, or treating it as psychological perception, or something unique to our society, I took it as a basic perception

about physics and have built elaborate mathematically defined theories around this idea and then have found, to my astonishment, incredible congruences with other work.

I'm thinking of the Mayan calendar and its curious countdown like quality toward an extremely unique event that the Maya felt would occur in the same timeframe that my own equations predicted even though at the time I was unaware of the Maya. So what we have here is a new model of time based on a very real intuition that I think most people share, which is, that time is speeding up, that human beings are part of that process, and that the culmination of that process is now within the van of historical time. In other words, I believe it will happen in 2012, in December, coincident with the same events that the Maya placed at the end of their calendar. Even if I'm wrong, even if it's 100 years or five hundred years later, these are still spans of time that when compared to the life of planet are fractions of a percentage. So, whether you believe, as I do, that we can know the precise moment of this transformation of the world of time, or whether you believe it is simply coming soon and fast really doesn't make that much difference.

We are all gathered here at the end game of development processes on this planet – we about to become unrecognisable to ourselves as a species. Our technologies, our religions, our science, has pushed us toward this for thousands of years without us awakening to what the (?)demeanor would be. Now we stand close enough to it, and I think that all but the most lumpen amongst us must feel the tug of the transcendental and the transformative.

JohnH: I am very perplexed when you say that time is speeding up? As far as I can tell: such things like crystal oscillators, things which keep time, clocks, the relationship of the Earth turning to the calendar, the full moon, all the things which are symptoms of our passage through time don't seem to be throwing themselves out of kilter. So how, what do you really mean about time speeding up?

McKenna: Well, let me answer in the form of a question. "Which lasts longer? A million years in which nothing happens, or 10 seconds with 50000 events crammed into it?" In other words, really, time is only experienced by the events which occur within it; and I maintain that the early universe had very little going on and consequently time moved very, very slowly. The character of time as we approach the present is that there are more and more physical domains, and energetic domains in which change can occur. For example, the early universe was a pure plasma, a pure swarm of unassociated electrons. You didn't even have atomic systems, let alone chemistry, molecular chemistry, life, complex speciated life, and dynamically balanced planetary ecosystems. Each one of those more complex phenomena crystallised out, or emerged, if you will, from the previous systems that had come into existence. So when I say time is speeding up, what I mean really is, more and more is happening. And if you ask the question, "Well, what would be the ultimate state of connectivity, or of happening?" It's when all points are connected to all other points.

Somehow this concept of connectivity is intimately linked to the concept of complexity, and so really what I'm saying is that the universe is getting its act together. It's connecting the dots. It's bringing everything into co-relationship with everything else. And somehow it does this through the production of consciousness. Consciousness is this integrative function in biology which takes data, which may appear profoundly unrelated, and in fact brings it into some kind of a congruent relationship. We say, "an organism coordinates a point of view." Well, in a way, what's happening over time is that the universe is coordinating a point of view, and as it does this it becomes somehow more aware, more self-conscious, more being-like and less thing-like and, as I said, this process is not proceeding at a steady pace, it is proceeding faster and faster. More connectivity occurs now in a calendar year than occurred in a million years, a billion years ago. So, somehow, as we approach the present, we find ourselves in an ever denser realm of activity, inter-relationship, connectivity, and the result of this, is more of the same, producing a shrinking globe, ever more immersive technologies, dissolution of political, social, gender, and class boundaries of all sorts.

So that's what I mean when I say the universe is speeding up. You know, before the advent of man, of human beings, the fastest changes on this planet of any consequence were genetic changes. Changes in the genomes of plants and animals. Well, biologists know that for a fruit fly to add a spur to its leg, for a bird to change its plumage, you need hundreds of thousands, sometimes millions of years of evolutionary time. With the advent of human beings, using spoken language, a new kind possibility was born. It's called epigenetic change, in other words, change which is not about genes but which is about languages, customs, behaviours of human beings. Epigenetic change reaches its dramatic culmination in speech, writing, and communication of all sorts. And so the carriers of epigenetic change, the human beings, are automatically then the carriers of accelerated novelty. And so when you look at, let's say, evolution on a coral reef and you compare it, let's say, to the evolution of political ideas in

modern Europe, obviously, modern Europe's rate of change in this domain is thousands of times faster. So by moving from the genetic to the epigenetic realm we have vastly accelerated all kinds of processes. Now we appear to be about to move from the strictly human domain to the human machine symbioses domain, and of course, machines process information, make connections, and do their work at a rate thousands of times faster than any human being can work. So we see, again, a progressive acceleration of the process of creating and maintaining varieties of connectivity. And that's what I mean by time is speeding up.

JohnH: Your description of the process by which you developed the time wave theory: I understand, I read, True Hallucination, so I understand it took you some years to, kind of, work it all out?

McKenna: Yes. In the Amazon all was chaos and mythic revelation but I knew that you couldn't bring that back as a scientific theory and my bias has always been towards science and out of these many intuitions and revelations I discerned a thread which was about time. It began with a conversation with this Logos entity where it said to me, "Did you know, every day is composed of four other days?" And I said, "no, I not only didn't know that, it's never even occurred to me, what a bizarre idea." Well, so this idea then of a time being a resonance created by other times not immediately before or after it, as in scientific causality, but somehow a day centuries ago, centuries in the future, come together to create an interference pattern that creates the unique moment.

So, that was one of the basic assumptions and then the structure on which this all was hung was the I Ching, which may seem exotic to American and European audiences but which is, of course, as familiar to any one in Chinese society as the Declaration of Independence is to us. And what is the I Ching? Well, it's a very ancient method of divining and predicting the future based on the idea that every moment can be symbolised by a unique ideogram which is somehow its essence, much in the way that science believes you can explain all nature with 108 elements, the ancient Chinese took the position that time itself was made of elements.

My style of thinking is scientific enough that if I were to say to somebody, "I propose a revolution in physics based on what I know about an ancient Chinese divinitory system" that would seem foolish to me, it seems a cult, it seems unscientific. Why should an ancient Chinese book of divination hold any insight whatsoever for modern physics? But, the uncanny thing about the I Ching is that it seems to work, even in the hands of its critics it seems to work. So let me try out a metaphor on you which I think makes much more clear what's going on here.

Visualize for a moment sand dunes – and notice when you look at these sand dunes in your mind that they look like wind. Sand dunes look like wind in some sense. Well, then analyse the situation. What is wind? Wind is a pressure variant phenomena that fluctuates over time. Ah, in a way, the sand grains moved about by the wind are like a lower dimensional slice of the wind itself. And from photographic analysis of dunes you can calculate the speed and duration of the wind that made them. So, the dune is a lower dimensional slice of time, of the wind ebbing and flowing that made it. Well now, let's change the metaphor a little bit. Instead of grains of sand, let's think of genes, instead of a wind storm, let's think of a billion years of evolution. It moves the genes around in a pattern which is a lower dimensional slice of the force which created the situation. In other words, on every living organism there is the imprint of the higher dimensional force which made it. Now somebody could say, "Well, that's God." Well, but in a scientific context we don't speak like that. But whatever it is that made blind matter into whales, squirrels, and human beings, it left its calling card inside each human being, each squirrel, each whale. That's the DNA. Well, the DNA codons are based on a system of 64, exactly like the I Ching. So, my belief is that someone, some group of people thousands of years ago, looked into human organism, looked by meditative techniques into the center of their own beings, and they were not mystics, nor were they empiricists, they were simply curious. But at the centre of the meditative experience they saw an ebb and flow; an energy field that was in a constant state of flux and they asked themselves: "How many elements are necessary to describe this energy field?" And the answer was, more than 10, less than a thousand, more than 20, less than 500. And when they finally got it worked out, low and behold, 64 situations are all the possible potential situations there are.

Out of 64 sub-types of time you can create everything from the coronation of Queen Mary to the resignation of Madonna. Out of 64 types of time. So really, what the I Ching is, it's not a book of Chinese mysticism, it's a book of molecular dynamics that sees through biology to the physics that allowed biology to come into existence. And I'll argue this with anybody in the field regardless with how hard core an empiricist they claim themselves to be because, er, the coincidence between the structure of the I Ching and the structure of the DNA is staggering. It's not a simple correspondance between 64 and 64—all the processors that

occur in DNA can be easily modelled with the 6 line hexagrams that make up the I Ching.

It's almost as though western science was fascinated by energy. For five thousand years we pursued understanding energy and this process ends with thermonuclear explosions in the deserts of the American south-west. We can light the fire that burns in the heart of the distant stars, we know how to do that. That's what the western mind achieved, political issues aside. The eastern mind was not interested in energy, it was interested in time, and they spent 5000 years deconstructing it, looking at it—and you don't use atom smashers, you don't use enormous physical pressure; it's a different problem and you bring different tools to bear. You meditate, you look inside yourself, you study the movement of water around pebbles. You consider the situation, you study history. In any case, the bottom line is, the people who pursued this understanding of time achieved as sophisticated a relationship to time as the western relationship to matter expressed through our ability to trigger fusion and fission.

So there's a great deal for us to learn in the west from these oriental efforts to understand time, and it is not necessarily mystical. What I did was entirely mathematical. It's not transparent to a person who has not studied mathematics but to a professional mathematician it's utterly trivial. There's nothing occult about it and I think true understanding can be communicated and formally described with mathematics. And that's what we have here; we're on the brink of a fusion of western science with quote, unquote, eastern mysticism. Nothing mystical about it, except that we call it mysticism, but the fusion of these two viewpoints is going to give us a complete understanding of the universe of space, time, matter and energy. [23:40:00]

JohnH: I want to go to this step about the strange attractor at the end of history. We never ever, you know, considered that notion that we are being pulled, as opposed to simply just going on for ever and ever and that's, for sure, something that people are going to go: "Huh?"

McKenna: Well, you know, in the 19th century, if you spoke of nature having a purpose, you were thought to be anti-evolution. Because in the 19th century there was great pain to eliminate anything like pre-formation, or teleology, or purpose, or God. All these things they were trying to eliminate from evolutionary theory and until very recently in scientific thought, the idea has been that events are pushed by the causal necessity embedded in the events which preceded them. In other words, if you asked the question, "What is the most important event, moment, in terms of shaping this moment?" The answer would be, "the moment just before this moment," because it hands on the energy, the space, the time.

Recently mathematicians have evolved what they call the notion of attractors. Or strange attractors in some cases, and these are processes where a dynamic is not pushed by causal necessity from behind but it's pulled by point in the future. You could almost say, for example, if you release a ball bearing up near the rim of a bowl, that its attractor is the bottom of the bowl and the ball bearing will roll down to the bottom, then halfway up the side, then up the side in shorter and shorter cycles until it finally comes to rest in the exact bottom of the bowl. Well, from the point of view of the new mathematics, the bottom of the bowl is a basin of attraction and the ball bearing has fallen under its influence.

So, I have always doubted that evolutionary theory without purpose, without teleology, could produce this complex a world as we see around us in as short a time, five billion years as the life of the Earth. It seemed more as though these processes were not just wandering across a flat epigene(tic)... a flat genetic landscape. The process of biological evolution was actually being channelled between high walls, in other words, it could move—it had some motion this way, some this, but its forward direction was, ah, inevitable, and this is the idea of an attractor. That what the universe is doing is: it is under the sway of what I call, the transcendental object at the end of time, and that is this domain of hyper-connectivity. That it would be perfect novelty. And all nature aspires for this state of perfect novelty. You could almost say that nature abhors habit, and so it seeks the novel by, ah, producing various kinds of phenomena at every level in biology, chemistry and society.

And so there really is a purpose to the universe. Its purpose is this state of hyper-complexification in which all its points become related to each other, become what mathematicians call co-tangent and it gives the universe the feeling of being imbued with a caring presence. It makes it appear as though nature is tending toward something and that... And it changes our own ethical and moral position in the universe because, you know, science tells us that we're the products of a cosmic accident: we're at the edge of an ordinary galaxy in an ordinary star system and we're damn lucky to be here and that's it, that's our place. A very existential notion of our place in the cosmos; but if you take this other point of view, that process is under the influence of an attractor, and that the value the attractor is maximising is novelty, then suddenly, for the first time in 500 years, human beings are moved back

to the centre of the stage because we are the most novel thing on this planet.

We are everything biology is, plus, technology, language, politics, philosophy, art, so forth, and so on. So, suddenly human beings become important, not mere cosmic witnesses to a meaningless cosmos but the cutting edge of a cosmos that glories in order and is moving towards higher states of order and at the present moment we are the carriers. Once it was the volcanic processes that shaped this planet. Once it was the life of the early oceans. Once it was the great dinosaurs, but today, humanity represents the cutting edge of complexity and this process of moving towards complexification.

So, without invoking God, or any sort of myth, you give meaning to human life, "What is man's purpose?" To advance and preserve novelty, you know, this is an ethical position. It means you don't replace rain forests with pastures, you don't censor books, you don't lean on people who make gender choices different from yours. No, the purpose of being a human is to complexify reality even more. To hand on a more diverse, more complicated, more multifaceted (sic: multifaceic) universe to our children, and when this process of complexification reaches the omega point, ah, it will, it will fulfill, I believe, the expectations of all of these religions but it will fulfill it in a mature, scientific, and, and universal way that these religions all lack because they all reflect their parochial origins.[30:52:40]

JohnH: That's certainly true.

McKenna: It's certainly true that we see a limited slice of reality and your example from Flatland – anything that moves as a gradient through time we will not discern very carefully. I mean, for instance, this is why we have the science of economics. Because it keeps track of the behavior of markets which is something you can't see or feel, but which has become very important to human institutions. It's a fourth dimensional factor that we need to co-ordinate into our planning. So we've created an entire science to study the movement and behavior of markets.

One of the things I'm always trying to visualize what the conrescence would be like, even though I know in principle it's probably not possible to imagine it—but several factors are on the horizon which I think can be brought together to, sort of, get a picture of what we're headed towards. One is, for some time now, we've been involved in building complex prosthesis, which we call machines and computers. They are part of us. We don't perceive them as part of us because we identify with the flesh and exteriorize the fabricated metal, but in fact, they are a part of us, as much as our political systems, our agriculture production systems, so forth, and so on... So, we... The animal body has reached the limits of its evolutionary abilities: a cheetah can run 75 miles an hour, an elephant can lift three tons and so forth and so on. To go beyond those capacities of the animal body you have to make a marriage with mechanical things. So, ah, we are extending ourselves through the machines. Well, one of the things that these machines do is they're time compressors. You know, you and I sitting here talking, are operating at about 100 Hertz. If we could be magically downloaded into a top of the line computer we would run at 800 MHz. That means we could do 800 million more things in this moment than we can do when we're wearing flesh. So, it may be that we will find a way to technologically stretch time—and this will become for us like a false eternity. You may only have 10 minutes left in your life but it may be time enough to pack in all of human history from the fall of Rome to the present moment. So, we are finding ways out of the 3 dimensional Newtonian prison, which says, "You know, life is narrow and confined and ends at the grave." Ah, and it's, we're doing it by becoming information that is freed from material and somehow this allows us to make this ascent to the next dimensional modality. Information is not time and space constrained the way we are. We talk about the difficulty of moving an object at the speed of light. Our entire planetary technology cannot achieve moving a marble at the speed of light but we can move information at the speed of light. Tetrabytes of it. We do this every day. So we see how we stand then like children at the edge of the ocean of information and we're putting our feet in and wondering, you know, "Could we swim in that? What would it be like to be wet in that? What would it be like to go into that new medium?" A similar dilemma must have confronted the early amphibians as they stared at the land and said, you know, "Could we leave the ocean, could we go up into those places, could we breathe air and actually make the transition to such a hostile, an alienating environment as the land?" And so, these are major cemetery breaks. But in every case the answer has been, "you bet," and sooner or later somebody did it and then all succeeding generations have followed suit. What is fascinating about this particular transition is that we are conscious of the implications, we will who make the transition will in some sense, some limited sense, understand its implications, where I don't think that was true for the animals that left the primordial oceans. They simply were behaving evo... blind instinct, and evolutionary dictated behaviours—but the degrees of freedom accessible to us are so multifarious that we can actually appreciate for the first time our circumstance, and our circumstance is awe inspiring. I mean, we about to take the step out of matter. The planet is on a collision course with the most profound event it's possible to imagine. The freeing of organic life from the

chrysalis of matter. For a billion years there's been life on this planet but never life that could step outside of matter. But this is obviously what's in the cards and we are privileged to be central to that [!pauses for watch chime!] event.

JohnH: You've just said, "We're moving beyond matter? I just can't imagine what you mean? Can you try to talk a little bit more about that?"

McKenna: Well, first of all, I can't quite imagine what we mean either. I think this is the test, to imagine, "What could that mean?" Maybe the bridge, ah, concept, is virtual reality. Obviously, we're on the brink of building computer assisted worlds that don't, quote, unquote, really exist, but that which we'll experience the way we experience dreams or the imagination. And I think this is where psychedelic substances come in. Shamans have always entered into a non-physical realm of information through trance. In a way there's nothing new here... This is part of the archaic revival.

(break: laughing. "Will you still love me, will you still feed me when I'm 64... Are we rolling? – I've forgotten the thread? What was it?" Oh...)

Is it a human thing? Is it unique... is this ascent into novelty a human thing? No. Part of what I discern here, though we humans are always ready to suffer guilt and take blame for everything going on in the universe, I don't believe this is something we're doing. I think that we are as much corks tossed on the ocean of time as are humming birds and prairie dogs. In other words, an event of cosmic significance and importance is going to occur not far in the future. "Are we causing it?" No. "Can we stop it?" No. "Can we hurry it?" No. It's built in to the structure of matter itself. One way of thinking of this is that the laws of physics are evolving to permit greater freedom, and we are... And people have said to me, "Well don't you find it a little strange that such a momentous event would occur, ah, in human history?" After all human history is 10 000 years wide, the planet is 5 billion years old—pretty unusual coincidence that human history would be happening when this cosmic event happens. No, that's completely wrong. Human history is being caused by the nearby presence of this event. In other words, if you think of the event as something which has shells of influence: some of its shells of influence reach so far back in time that they drag life out of the primitive oceans. Some its shells of influence reach so far back in time that they define the emergence of the hominid line out of the higher primates. Some shells reach back to Egypt. Some to medieval time. As you approach the present it becomes stronger and stronger but I would argue that the presence of human civilisation on this planet is the strongest evidence we have that matter and organizational processes are about to make some kind of a leap to a new order of being.

What history is, is the 25 thousand year transition zone. Before you enter the zone you're an animal. After you leave the zone you're a god. But for 25 thousand years you're kind of an animal and kind of a god. And you're constantly being swamped by your animal nature and then great teachers are appearing and dragging people back to the right line and we are schizophrenic in history. A friend of mine once said, he said, "History is the shockwave which precedes the eschaton." And I absolutely believe that, and I believe that as historical processes intensify it's reasonable to believe that we are ever closer to the eschaton. If my ideas seem strange to someone, I ask them, "Can you imagine this planet in 500 years given the propagation of ordinary historical and scientific rates of unfoldment and discovery? Can you imagine this planet in a 1000 years?" No, no one can imagine that because processes are now in play which so totally rewrite the script that no one can imagine a 100 years or 200 years in the future because the discoveries which will be made in that span of time will so totally rewrite the human experience of itself and the environment that we cannot see deep into the future. And this indicates to me that the future is exploding in an asymptotic unfoldment into a kind of cultural superspace and our own bafflement at the impossibility of conceiving any real future given the political and social and technological forces in play is proof of that. [42:39:40]

JohnH: Before we go farther I would like you attempt to give me a definition of conrescence and eschaton?

McKenna: Well, let's go backward. Eschaton first. Eschaton is a good word out of theology. It simply means the last thing. The last thing is the eschaton and it is everything become one thing. For theologians it's God, for somebody of a more materialist bent it might be something else. But the eschaton is the last thing. Eschatology is the study of the time of the last thing. "Now, what was the other word?"

JohnH: Conrescence?

McKenna: Conrescence? This is a little trickier concept. I took it from Alfred North Whitehead. Conrescence is the idea of something that grows together. It conresces. It becomes more dense, more connected, more defined in space and time. And when I talk about the transcendental object at the end of time, or the coming of the eschaton, or hyper novelty, I mean, that the process of the human and biological conrescence of intent reaches some kind of maximum. Conrescence is the end of the process of becoming. Becoming is not true being. True being exists at the conrescence. The kind of being we experience, becoming, is a partial state of being much like history is a partial state of conrescence. History definitely places us outside the world of biological intent, ah, the animal mind, but history does not bring us into the presence of the eschaton, it's a partial process, and conrescence is what waits at the end. The eschaton is the conrescence.

JohnH: But we really can't have any way of knowing what that is, that experience of that is going to be like?

McKenna: No, and the reason why is because asking that question is like asking a man looking east at 2am to describe the coming sunrise. He can't because it is literally over the event horizon of the future and when we look into the future we see that the east is streaked with rosy dawn but we cannot conceive of the day that is about to come. All we can see is the dim glow of some kind of eschacological promise. Ask me this question in 2010 and I'll have a different answer.

JohnH: Um, back to this issue of physics and your description of the two things which are left out of their models? The way that you describe it is so self evident and simple. The complexification the further away that you get away from the Big Bang and the fact that everything... The complexification is speeding up? Would you talk just a little bit about, um, the relationship of those observations to the world of the physicist and their efforts to define reality and why they're not using, including, in their models these aspects that you're pointing to?

McKenna: The main reasons they aren't friendly toward a model... The main reasons physicists are not friendly to a progressive, conrescent model like this is because you would have to look at, you would have to give credit to biology for being a stage higher than chemistry and you would have to give credit to human history as a stage higher than biology. And physicists study physics. If you study physics there is no biology. You don't have to deal with issues of biology when you study physics. I mean, there is something called biophysics, but it's not well received in physics or biology. So, physicists are... tend to discount biology, even though life on this planet is 4.83 billion years old, physicists just discount it. They call it a epiphenomena. Well, then when you talk to sociologists, they want, they give no credit to physics. Science has compartmentalised nature in order to analyse it and there is no theory of nature, as such, and that's really what I offering. I'm offering a theory which covers: physics, chemistry, geology, biology, sociology, linguistics, the whole thing. In other words, not saying man is some special category; not saying that we need artificial divisions but that over the entire domain of known phenomena this, ah, tendency to complexify through time, A, and B, faster and faster, can be discerned. We need a theory of everything. Physics talks about theories of everything but none of these theories of everything address biology, let alone sociology, linguistics, and ah, you know, the phenomenon of human beings.

Well, the archaic revival. There is a way of looking at the entire 20th century, beginning with Pablo Picasso bringing masks back from Africa and showing them around in French cafes in 1915. Ah, beginning with Freud's discovery of the unconscious and Jung's elaboration of those discoveries and then every phenomenon of major importance that you care to mention in the 20th century: fascism, abstract expressionism, rock & roll, sexual permissiveness, psychedelic drug taking, rave culture, body piercing, jazz—the list is endless. What do all these things have in common? They are reversions to archaic behaviours. They represent rejections of the Edwardian gentleman with his white man's burden and represent instead, a realisation that for us to survive, and live with ourselves, we have to re-empower archaic values. As the century unfolded the understanding of what this re-empowering of archaic values might mean, has changed. Jung and Freud discovered the unconscious, discovered that we are not all ladies and gentlemen but that there is a cannibal lurking within. Albert Hoffman's discovery of LSD demonstrated that that inner wilderness is accessible to most people through chemistry. Well, then still later, it was understood that the key ingredient in active shamism is psychedelic plants, psychedelic experiences. And in a way that closed the loop between archaic—the impulse toward the archaic and the impulses of modern science and modern medicine. The key is the psychedelic experience: that's what makes the shaman a shaman. That's what made the archaic, in fact, archaic, and so people like Freud and Jung and the surrealists and the Dadaists and the Abstract Expressionists, all of these people were very close to the mark. The shaman is the paradigmatic figure and the psychedelic experience seems to be the anticipatory experience of this eschaton that we are headed toward. You know, when psychedelics were first being discussed, it was thought that they would prepare people

for death. In a sense, they probably do, but in the same way they prepare people for death they prepare people for transformation. It gets you used to the idea that the world is not what it appears to be and it gets you used to the idea that the world is somehow animate, intelligent and proceeding along its own agenda. So in a way, shamans have always been anticipations of some future state of mankind. They're the masters of language, they're the ones who are telepathic with the animals, they are the ones who can see into the future. So, this archaic nostalgia gets real focus once you realise that it is the shaman and his or her shamanic techniques that confers on them the extra-historical dimension. That that is how you get out of linear history. That's how you visit the realm of the ancestors, that's how you travel into the future, that's how you break up the tyranny of Newtonian serial time.[52:45:40]

JohnH: We have 14 years until this event, measured on the calendar—and a really common, ordinary way to describe the times that we're living in is that they're very, very chaotic, filled with acts of unspeakable evil, um, and at the same time there's this sort buzz and thrust of optimism: everything from a guy like Peter Swartz talking about the long wave, the big booming economy, breakthroughs in educational levels and qualities of life but it's definitely a dynamic where you've got extremes of good and evil in that way. Would you talk a little bit about the relationship between that dynamic as we go forward and the novelty continues to climax?

McKenna: Well, novelty is not necessarily good or nice. Novelty is complex, that's what it is. So I see, really, a concatenation of tendencies and forces here at the end. It's only going to get weirder. The level of contradiction is going to rise excruciatingly, even beyond the excruciating present levels of contradiction. (laughs) So, I think it's just going to get weirder and weirder, and weirder, and finally it's going to be so weird that people are going to have to talk about how weird it is. And at that point novelty theory can come out of the woods, ah, because eventually people are going to say, "What the hell is going on?" It's just too nuts, it's not enough to say it's nuts, you have to explain why it's so nuts. So, between now and 2012, the next 14 years, I look for: the invention of artificial life, the cloning of human beings, possible contact with extraterrestrials, possible human immortality, and at the same time, appalling acts of brutality, genocide, race baiting, homophobia, famine, starvation; because the systems which are in place to keep the world sane are utterly inadequate to the forces that have been unleashed. The collapse of the socialist world, the rise of the internet. These are changes so immense nobody could imagine them ever happening, and now that they have happened nobody even bothers to mention what a big deal it is. Ah, the fact that there is no such thing as the Soviet Union, people never talk about it anymore—but when I was a kid the notion that that would ever change was beyond conceiving. Ah, so the good news is, that as primates we are incredibly adaptable to change. Put us in the desert, we survive, put us the jungle, we survive, under Hitler we survive, under Nixon we survive. We can put up with about anything and it's a good thing because we are going to be tested to the limits. The breakdown of anything—and this is why the rightwing is so alarmed—because what they see going on is the breakdown of all tradition, all order, all sanctioned norms of behaviour. And they're quite right that it's happening, but they're quite wrong to conclude that it should be resisted or is somehow evil. The mushroom said to me once, it said: "This is what it's like when a species prepares to depart for the stars." You don't depart for the stars under calm and orderly conditions; it's a fire in a madhouse, and that's what we have, the fire in the madhouse at the end of time. This is what it's like when a species prepares to move on to the next dimension. The entire destiny of all life on the planet is tied up in this; we are not acting for ourselves, or from ourselves; we happen to be the point species on a transformation that will affect every living organism on this planet at its conclusion.

JohnH: Let's pause for a second, um. I see how—with Jenkins calling it Galactic Cosmology; it's like our home continues to expand—we've gone from the village, to the nation state, to the planet...

McKenna: Now, we're ready to take on the big picture.

JohnH: So, let's just talk about the conclusions of the archaic mind. What it reaches?

McKenna: Well, the great watershed difference between the archaic understanding and what is called scientific materialism is the archaic mind understood, in fact, perceived, that nature is conscious, nature is alive, nature is an organism full of intent. The goal of the archaic mind is to connect with, communicate with, and align itself to, this greater Gaian holism, which is sometimes called nature, the Great Spirit, the realm of the ancestors, but this is what the archaic mind understood and was comfortable with; and in fact it is true. Our own decision to view the universe as dead, as inanimate, as unintelligent, allowed us, permitted us to dissect it, use it, and deny its validity outside of human purpose. Now, the consequences of living like that is coming back to haunt us. You know, we have almost destroyed our home, we have almost cut the earth from beneath our own feet. So, this

impulse towards the Gaianic and the archaic is a survival instinct at this point. We must give, ah, reverence and credence to nature and nature's methods because no other methods will allow us to work our way out of the present mess we're in. High temperature, high energy resource extraction, commodification, mega-agriculture; we're at the end of the rope for these things. So the archaic holds answers but it only holds answers if we are willing to think of the universe as a living intelligent entity in—with which we are in partnership, not set against, but that, in fact, we are a part of a morphogenetic intent and an unfolding reality that is larger than human understanding. Imagine, larger than human understanding... (laughs)

JohnH: So, the whole entire milky way, galaxy, is a being?

McKenna: Well it's a kind of... It's an organism, yes, and the galaxy is a kind of an organism. You can think of it as a fractal resonance with the cell. The galaxy has a nucleus of very dense material where very mysterious processes are going on. Then it has a cytoplasmic envelope of stars and gas clouds that surround that core. And then it is an individual, very distinctly defined by the vast emptiness that lies between it and the next galaxy. Yes, I think nature builds by fractal intent, and that all organisms have a core, and then a deployed surround, whether we're talking about the cell, the solar system, the Earth, the galaxy. In the process of the conservation of novelty, structures are created with cores that are more complex than their outlying neighbourhoods. To my mind a galaxy hanging in space is a picture of the timewave—every star is a datapoint in an enormous computer simulation of the novelty wave—that's why it has that spiral structure.

You know, scientists are very puzzled that the galaxies don't fly apart. They don't seem to have enough mass that their gravitation should hold them together and there's been a lot of talk about dark matter or some missing factor. Well, the missing factor is novelty. The galaxy stays together because the galaxy wants to be a galaxy, in other words, it wants to hold onto the level of novel, ah, morphology that it has achieved. It has an actual appetite for expressing itself in that form—that's why the galaxies are spirals, and in a sense, those spirals are very large pictures of the time wave where we can at last see it, not confused with its background or foreground. So, everything organises itself fractally, spirally, with a dense centre in its spatial domain and a dense centre in its temporal domain. We are like this, galaxies are like this, planets, stars, bird flocks, coral reefs; but in the case of the galaxy it's particularly easy to observe the structure because the thing is so huge that its forces dominate and damp out other forces which might distort it.

The Definitive UFO Tape

April 1983

Location, Mill Valley, CA

Description

- [Audio Link](#)
- [Transcription](#)
- [Other links](#)

[faint intro music]

Kat Harrison: In the two books that you have written I have read of UFO inferences. Would you expand upon those things?

Terence McKenna: Yes, well actually in the, in the first book the UFO reference is few and far between, I think it's only touched on once. I deliberately suppressed it from *The Invisible Landscape* because it was already lit up like a Christmas tree with bizarre ideas. And I would save that particular ornament for its own treatment later.

But in the second work, uh, *Down to Earth: Psilocybin and the UFOs* I deal with that directly because, uh, it seems to me that, uh, in psilocybin and the tryptamine hallucinogens generally we actually have a, uh, state of mind that is very similar to the state of mind reported to accompany the, uh, the UFO contact, and that these things could somehow be co-mapped one onto the other. That at, uh, at active, uh, levels of psilocybin there is, uh, visionary ideation of spaceships, alien creatures, alien information, a general futuristic saucerian kind of quality to the place it conveys you to that, uh, seem to be coming from the same place, uh, as the modern myth of the UFO, if it is a myth. And, uh, we discovered in our exploration to the Amazon in 1971 that this was quite true, that, uh, involvement with these tryptamines as they accumulated in your system, you seem to acquire the ability to, uh, eh, inhabit more than one world at once, as though superimposed over reality there was, uh, a super-reality, a hyper-dimensional world where information was, uh, accessible in magical ways. And, uh, in the wake of that experience I just, uh, went through the literature of the mystical experience and the saucer experience and, uh, ideas like alchemy and that sort of thing, and, uh, eventually saw that these w- they were all talking about the same thing, that there is an experience which is gaining ascendancy from modern man which is called contact with the UFO, but it is not, uh, reducible to any of the things that the, uh, main people who've written about it have said it can be reduced to. It is not, strictly speaking, a contact from a space-faring race that has come from the stars. It is not, uh, mass-hysteria. It is not delusion either. There is, in fact, something very odd going on, something which is as challenging to modern epistemological notions as, uh, you know, a uh, US air force jet transport landing on some field outside a village in New Guinea.

In other words, uh, here is an area that is close to the experience of people in that a very large percentage

of people claim to have seen flying saucers, an area close to the experience of people where science is totally helpless. It seems as though reality is haunted by a spinning vortex that renders science helpless. And the spinning vortex is the UFO, and it comes and goes, uh, on a mass scale, haunting history like ghost. Umm...

KH: You mean the records in the, uh, the Aztec records and the whole thing about coming, and...the white men coming to the new world in space ships?

TM: Well, all these cases have been made for saucer intervention but actually no, I'm speaking more specifically about the post, uh, World War II spinning silver disc in the sky and the myth that accompanies it of the large, pointed-eared, cat-eyed, uh, It has numerous variations, but, uh, it's clearly an idea complex emerging in the psyche. Uh, and the question is what is it? Is it prophecy? Is it a vision of the human future? What is it? And, uh...the postmodern phase of flying saucer speculation is the phase which recognizes that the saucer is somehow mixed up with human psychology, that it is no mere light scene in the sky, that when you go back and question the people who see these things, that right before they saw it, they were thinking something very odd and unusual which they didn't normally think about, or right after it and, in other words, it seemed to be a kind of ideological catalyst for some purpose, and uh, Vallee in a book called *The Invisible College* was the first person to suggest what I would call the 'cultural thermostat' theory. He said that the flying saucer was an object from the collective unconscious of the human race that appeared basically to break the force of any ide- any set of ideas that were gaining dominance in their explanatory power at the expense of their ethical force. In other words, that it was like a confounding which would enter history again and again when history would build to a certain kind of boil the confounding would occur-

KH:??? does that too.

TM: This is a similar idea, right. And he suggested that perhaps the career of Christ was an earlier 'confounding' where Roman *techné* and Roman militarism and all these things was unseated by, you know, a peculiar religion which no educated Roman could take seriously for a moment. I mean, an educated Roman was a Democritean atomist and, uh, well-versed in, uh, in Epicureanism and Sophism and, uh, and yet the servants were telling stories about a Rabbi who had risen from the dead and had somehow reopened a gate that had been closed since creation so that the soul of man could again be reunited with God, and uh, this stuff made no sense to the Roman authorities and yet it quickly overwhelmed the Empire.

The modern s- context is very similar to that in that science, now it can be seen to have replaced Roman imperial aspirations as a dominant mythos of control, and uh, it has these neat and tidy explanations of the world, yet persistently from the folk there come stories of lights in the sky and strange beings and bizarre encounters that they cannot quite lay to rest. And-

KH: And you do have experiences yourself?

TM: Oh yes, it's a real- whatever real means- I mean, it is a real experience. It is phenomenologically real. In fact, my contention is that, uh, psilocybin induces it, and that perhaps on a mass scale i- it's as though there is an event at the end of history of such magnitude that it casts miniature reflections of itself back into time, and these are these apocalyptic condescences which haunt the historical continuum, igniting religions and various hysterias and, seeping ideas into highly tuned nervous systems.

KH: How does it do that?

TM: Well, it's as though the- it's, uh, like Plato said, "time is the moving image of eternity". It does it because in its dimension all these things have- are somehow coexistent in time or outside of time. They have already happened. History is the formality of viewing this hyperdimensional object in a 3-dimensional way by transecting it many many times until you've built up an entire picture of it. But, uh, the, you know, the mushroom evokes a profound planetary consciousness that shows you that history is just this froth of artefact production that has appeared in the last 10 to 15 thousand years, spread across the planet very quickly, but that mind in man just goes back and back into the darkness, you know. And one of the things we were saying in *The Invisible Landscape* was that there are powers in the human body or avenues of understanding that have not been followed because of epistemological biases, so that for instance the idea that you could use your voice to effect molecular changes in your own nervous system. It sounds on one level preposterous. On the other hand it's simply a formalized way of noting the fact that sound is energy, that energy can be transduced in a number of ways and then when you direct it against your body, you obviously do make changes.

KH: Well that's the typical chanting, uh...mantra [?]

TM: That goes on in shamanism worldwide. [Q: Uh huh] Well, these people are navigating themselves in a space which we have lost touch with...that for us as- I'm speaking now as a society - only erupts in the weakened situation of a weakened psychic constitution where there is the element of panic in the mythological sense of Pan bursting through from the underworld, the emergence of the flying saucer. What it is is it's an autonomous psychic entity that has slipped from the control of the ego and is approaching laden with the otherness of the unconscious, so that, you know, as you look into it, as you behold yourself your world, your information field all deployed in this strange, distant, almost transhumanly cool way which, uh, links it to the myth of the extraterrestrial. The extraterrestrial is the human oversoul, uh, in its general and particulate expression on the planet, which doesn't rule out the possibility that the mushroom places you in contact with extraterrestrials somewhere in the galaxy actually circling other suns, but it probably means that that communication is mediated through the oversoul.

The oversoul is, uh, some kind of field that is generated by human beings but that is not under the control of any institution, any government, any religion. It is actually the most intelligent thing on the planet, and it regulates human culture through the release of ideas out of eternity and into the continuum of history. And what the UFO is is an idea to confound, and its purpose is to confound science because science has begun to threaten the existence of the human species, leave alone the ecosystem of the planet. And at that point, uh, a shock is necessary for culture, a shock equivalent to this culture to the shock of the Resurrection on Roman imperialism, and the myths that are building are like the messianic myths that preceded the appearance of Christ, and what they are of is of an intervention by a hyper-intelligent entity that comes from the stars, and reveals the right way to live and, uh, wrecks science by a series of demonstrations that make it apparent that the purpose of human history is nothing less than total immersion in the teachings of the saucer. And, eh, once this message is slammed home via worldwide TV hookup and that sort of thing, it will just disappear. And in the wake of that you see what you have is, uh, this hysteria of abandonment similar to the hysteria of abandonment that swept the Christian communities when, after the crucifixion, the resurrection, the coming of the millenium was postponed century after century, and, uh, sci- the development of science will cease. This flying saucer-oriented religion which is definitely the emergence

of an archetype of enormous power will hold sway in the same way that Roman science was stymied for a thousand years by the immersion in the words of one, one rabbi.

KH: Scientists are not gonna like your opinion.

TM: Well, they should be forewarned. Vallee was saying this in another book of his called "The Invisible College." He was more alarmed than I am because he is of the tradition of French Rationalism and he was quite frightened to think. He didn't believe it was, I should say, the oversoul of mankind. He actually believed it was a politically-oriented group of human beings who had an advanced technology that was allowing them to do this. I reject that as total paranoia, and I am not as concerned with him to pull science's chestnuts from the fire. I think that science has betrayed human destiny to some degree and that, uh, you know, we are led to the brink of star flight but we are also led to the brink of thermonuclear holocaust, and, uh, bu- but, the conclusion, the political implication that I draw from all this is that, uh, scientists will be swept away by the revelation of the flying saucer. They have always been the ones to be like the apostle Thomas and want to put their hand into the wound. And, uh, if the wound is offered, meaning if the saucer comes and is seen by hundreds of millions of people, they would go over, uh, immediately.

Uh, so, the political insulation, the political conclusion to be drawn is to preserve your freedom of thought by deconditioning yourself to the flying saucer religion before it happens.

KH: Is this [??] can we approach

TM: Because..

Q2[Who is this?]: Most inspired inspired scientists might be most intrigued in this situation.

TM: Oh, they would go over first. You see, a religion operates by law of large numbers. As long as 80% of the people believe, it can transform a civilization. Therefore, if you're one of the 13% who don't believe, it's ok. So you always want to stand where the high water won't reach, um, but I, I think the flying saucer experience is tremendously powerful and that it really is the, uh, is somehow linked to the psychedelic experience in a way that will not, perhaps, be understood for some time. But that, uh, the futuristic hyperdimensional world of these tryptamine hallucinogens and the persistent message from the unconscious in the form of these spinning idea-complexes with the alien creatures inside are definitely expressions of the cutting edge of the evolution of consciousness, and it's very interesting. A voice has been silent, and a voice that guided and revealed has been a silent phenomenon for about 1700 years now in Western civilization. Before that there was such a voice, I mean it was called the 'Logos' and all philosophers strove to invoke it, and it was a voice which told you the truth, the self-evident truth you had only to hear it and you knew you were hearing the truth. And uh, with the passing of the eon, or something, the death of the Pagan gods, this phenomenon faded out. However, it is still available, uh..

KH: and you found it...[?]

TM: ...through the mediation of these compounds.

KH: Now how can you say these same words, how can you say them and have people feel like they want to

invite to dinner to tell if this doom and destruction of mankind and the toppling of science especially when it is only right now science- scientists and scientific people who understand what you're saying.

TM: Well, see what I'm saying is if we would intelligently examine these dimensions that the psychedelic drugs make available, we could, as it were, get in touch with the oversoul and, and leave the era when man is disciplined by flying saucers and messiahs and progress is halted for millenia at a stretch just because people can't evolve their ethics and their technology at the same rate of speed. if we would have a dialogue with the Other we would understand all these things and become in contact with the Tao of the ancestors, and, uh, you know, this is what a shamanic civilization or a shamanic culture is. It's where certain people mediate the r- the group racial experience that is available, somehow deployed in mind-space.

KH: Have you, have you done a controlled experiment whereby you can bring a number of people to the college of psilocybin or however it is that the message can come across, have you done that?

TM: You mean in regard to triggering these UFO-type experiences?

KH: Yes, have you been able to..

TM: Well, only in the sense that, uh, we've ascertained by questionnaire that, uh, this is a very frequent motif, perhaps the most frequently mentioned motif ev- um, by people who take psilocybin recreationally is that it's about outer space and flying saucers and aliens, little green men. And these are people who are taking, you know, 15 milligram type doses. Sufficient doses to elicit the full spectrum of the compound. DMT is similar, I mean it conveys you into an elf-infested space where, uh, you know, wild and zany things are going on. It's as though there are continuum- a reality that is beyond this reality, a linguistically as well as spatio-dimensionally so that you have to turn to a different language channel, and then with this language pouring through your head you observe the other place, the alternate reality, and it is...

KH: That's what Sanskrit says too.

TM: Yes, although this alternate reality is surprisingly far from most traditions about what alternative realities are like. I mean, it doesn't prepare you for its crackling, electronic, hyperdimensional, interstellar, extraterrestrial, saucerian, mighty peculiar, all this. These highly polished and curved surfaces and machines and beings and language transformations and machines undergoing geometric transformations into beings and thoughts that condense as visible objects...this is a theme that's very interesting to me is the, uh, the hyperdimensional language, a language that is ehh, fulfills Philo Judaeus' quest for the more perfect Logos. Philo said that a more perfect Logos would be beheld rather than heard, and this is what happens on DMT, you hear a language which is very faint and far away, and as it gets louder and louder you realize that without ever going over a quantized transition it is becoming a phenomenon not of the audial field but of the visual field, and that it is in fact a fully evolving synesthetic hallucination of extremely realistic and utterly bizarre, uh, proportion. I mean, it's like an Arabian maelstrom of color and form and you somehow sense, you know, that you're in the Sistine Chapel, you're at the Kaaba, you're at Konorak, you're at all these places and- but, you know, it's a hyperdimensional infundibulum, if you will [Terence chuckles] It's just a little place to dance, and uh, then you see, you know, that there is alien information, this saucerian information is deployed everywhere in this other space, and that the really astonishing thing is that, uh, human history and art reflect so little of it.

KH: But it does. You do see it.

TM: Y- oh, you see it, but, uh, very very faintly.

KH: [?] you have to perceive it to see it though.

TM: When you see the real thing you just think [Q: yeah, then you can see it elsewhere] my god, I mean how do they keep the lid on this stuff? This is raging right next door? And, uh, you know, the m- modern epistemological methods are just not up to dealing with an elf, with chattering, elf-infested spaces. I mean we have a word for those spaces, we call it schizophrenia and slam the door. But, you know, these, uh, these dimensions have been with us since ten thousand times longer than Freud and, uh, people just have to come to terms with them now it's, uh, because of an- accidents of botany and history, European man has been away from the psychedelic dimension since a while, you know, from the dimension of the tryptamines and psilocybin since perhaps the closure of the last glaciation. So now we've accomplished marvelous things with *techne* and this and that, but here it is, uh, you know, many cultures around the world have kept the flame burning and the, the, uh, discs which haunt the skies of earth indicate that the unconscious cannot be kept waiting forever. These things are going to have to be dealt with, uh. And what it seems to me to point out is, you know, that the dime- the imagination really is the ground of being and this is the great discovery which will change things, it will be as if man had discovered fire for the second time. The imagination is the, uh, the golden pathway to everywhere, and when we cease to try and cross to the stars by, uh, crude rocket and engineering schemes and realize that deployed in the imagination is the entire universe- and that to-

KH: How do you think to go about to instigating, uh, the launch off- the launch.

TM: Well you have- I think that what the task of history can now be seen to be is what I call turning man inside out. The body has to be, uh, ex- interiorized and the soul has to be exteriorized to create, uh, you know, a golden disc. A, uh...

KH: How?

TM: By magic. [Terence laughs]

This matter of the flying saucer gives me an excuse to read a favorite poem of mine which answers your question about the future of man and the psychedelic experience. He says "once out of nature, I shall never take my bodily form from any natural thing, but such a form as Grecian goldsmiths make of hammered gold and gold enameling to keep a drowsy emperor awake or set upon a golden bough to sing to lords and ladies of Byzantium of what is past or passing or to come." And this is the idea of becoming, you know, a golden object after death.

KH: ??

TM: Yeats, this is Song to Byzantium

KH: [??] ..could you do it again?

"Once out of nature, I shall never take my bodily form from any natural thing, but such a form as Grecian goldsmiths make of hammered gold and gold enameling to keep a drowsy emperor awake or set upon a golden bough to sing to lords and ladies of Byzantium of what is past or passing or to come." In other words, a golden bird, a hyperdimensional object of Grecian gold enameling, and-

Q: [??] movement

TM: this is what the flying saucer is, it is the soul become object. This is the secret of alchemy. Uh, it's interesting, you see, that the s- great flowering of alchemy, great last flowering of alchemy in the 16th century was coincident upon a level of understanding of, uh, natural chemistry approximately equal to our modern understanding of the role of life in the universe. In other words, mostly speculation. So that what for us moves off into the sky as the flying saucer told to us to be possible by science but highly unlikely is like the 16th century mind's relationship to the, uh, philosopher's stone, which was said to be highly unlikely but not impossible, and so all this imaginative effort was exhausted in trying to produce the philosopher's stone, and the focus was upon chemical hardware, heating alembics, watching swirling glass-gasses in cloudy glass, and now in the modern context it has gone into the sky. The sky is the dimension of the other for 20th century man. We feel we understand natural chemical processes. There is no mystery there. Or miners no longer encounter gnomes when they go into deep mines the way they did in the 15th and 16th century. Those gnomes have been stilled, but the sky is still haunted. This is where we are told it might-

KH: The sea too [??]

TM: -be possible for it to come from, and the sea, the sea is obviously co-mapped to the unconscious. But the sky, because our scientists tell us, you know, that somewhere out there just possibly it might be so. But I think what's being missed is that a whole dimension of, uh, communication is being ruled, uh, inadmissible as evidence simply because it doesn't conform to the epistemological biases of the people who are asking the question, and that is all these voices in the head that guide shaman, that obsess lunatics, that, uh, make poetry and, uh, in other words the muse, the muse is real! I mean, if you have not experienced the muse, that doesn't mean anything, you may not have climbed mount everest either, but I tell you, out there in life there are experiences which, uh, cause a need for new definitions. And, uh the m-

KH: Everyone has had up whether they're willing to admit it, I think of one sort or another.

TM: An intimation of the other..

KH: Yes , uh huh.

TM: Well, imagine a compound that elicits this, uh, should you choose to use it. Well, one could talk endlessly about this subject, I suppose, but, uh, until it's resolved, all of man's epistemological dealings with reality will be haunted by this faint spookiness which can't be gotten rid of.

So to start off, uh, this continuation of the discussion of flying saucers, I'll read Yeats again. "Oh, sages standing in god's holy fire, as in the gold mosaic of a wall, come from the holy fire, pern in a gyre and be the singing masters of my soul. Consume my heart away, sick with desire, and fastened to a dying animal, it knows not what it is and gather me into the artifice of eternity." And it's that phrase, the artifice of

eternity, which, uh, again invokes, uh, this strange mechanistic yet spiritualistic future into which the archetype of the flying saucer is calling people. You see, m- what's happening is man is becoming a, uh, trans-planetary creature, and this is something which takes about 10,000 years from the first, uh, you know, the earliest machines to leaving the planet, and it-

KH: How do you know it's 10,000 years?

TM: Give it- give or take 3,000 years! But it is, as H. G. Wells said of history, it is a race between education and catastrophe because these more and more destructive chemical and atomic processes are released as the species realizes its aspirations are alien to the ecology of the planet, and that it and the planet must part. And this i- the, the transformation of man into a space-faring race is on the biological scale the great event that history is about. I mean, the coming of agriculture, the coming of urbanization, these things are peanuts compared to what is going to happen to this species, to these monkeys as they leave the planet with their computers and their atomic physics and all this. I mean, you see what is happening and why the psychedelic experience is so important is because, uh, information is loose on planet 3. Some kind of very strange thing is going on. The world is not made of quarks or electromagnetic wave-packets or the thoughts of God. The world is made of language, and language is replicating itself in DNA which, at its culmination, is creating, uh, societies of civilized and intelligent beings which possess languages which possess cybernetics, which possess machines, which use languages so that, uh, extending off a light-year or two from this system what seems to be happening, what is unusual about Earth is that language has literally become alive, it has infested matter. IT is replicating and defining and building itself, and it is in us. My voice speaking is a monkey's mouth making little mouth noises that are, uh, carrying agreed-upon meaning, and it is the meaning. Without the meaning you only have little mouth noises. The meaning is a crude form of telepathy because as you listen to my voice my thoughts become your thoughts, and we compare them and there is what's called communication, understanding. Uh, it's all about codes, and that's why I've said at times the flying saucer problem is like a grammatical problem, it's like a dangling participle in the 4th dimensional language that makes reality, and therefore it's not reducible to any of these, uh, very simple-minded approaches. It is somehow embedded in the machinery of epistemic knowing itself.

KH: So we won't be able to find it if we go out rocket ships?

TM: No. It is, [Q: ah] it is within. It is the soul of man. We won't be able to find it until we somehow come to terms with, uh, the hidden part, you know, the unconscious, the collective unconscious, the overmind, the fact that there is a level of hierarchical control being exerted by the human species as a whole. That the destiny of man is not in the hands of governments and corporations and communist party apparat-chiks. It is in the hands of a weirdly democratic, ameboid-like, hyper-intelligent superorganism which is called, uh, everybody. And, uh, as we come to terms with this, as we take our place embedded in the body of everybody, and information flows more freely and the reality of this informational creature is seen more clearly, the fact that we are- it, it's an organism. We are having a symbiotic relationship with an organism made of information. And this is, uh, what psychedelics, uh, reinforces I think very strongly. It's in the psychedelic dimension that you finally can key in to the voice of the organism and say 'hey what's happening?' and then it explains to you that things are not as you took them to be at all, and that there is in fact layer and layer and layer upon interlocking meaning, and that there's very little else other than that, and that the imagination is the true ground of being, and that there is a, uh, dimension parallel to time, outside of time, that is accessible to you as much as you want it to the degree that you can decondition

yourself from the history-bound cognitive systems that have carried you to that point. This is why it's been always been said of psychedelics that they were ord- socio, uh, sociological catalysts.

KH: What about the shaman?

TM: Well.[Clears throat]

KH: Because the shaman brings the message to the tribe.

Yes, but it's, eh, the tribe is a system set up to receive the message. W- we have a different way of doing it [KH: What's that?] which is that power elites in political control pass down state-approved philosophies which are then applied, and this [??]--

KH: The statist shaman.

TM: The statist shaman, the statist mediator of God's holy will. Um, rather than uh, a personal, a protestant approach, if you will, a personal relationship to the overmind. Uh, and the flying saucer, what it represents basically is, uh, an instance of crisis between the individual and the overmind where the overmind breaks through the oppressive screen thrown around it and comes to meet the individual and it is, you know, like an interview with an angel or a demon. It's a very very laden with, uh, heavy psychological resonances for the person experiencing it. It is a numinous experience. It is...

KH: But is ever moment of recognizable creation then falling into that, uh, category of the seepage from the overmind, where you get a synthesis of, uh, information which becomes your creative thought, your discoveries.

TM: Yes, well our theory of time basically mapped the idea that novelty was what you call this standing wave of eternity, and that it seeps into time at a variable rate which can actually be mathematically described using the I Ching and other techniques. It's that sort of thing, yes. It's as though, you know, where the flying saucers come from is eternity. They don't come from the stars unless space and eternity encompasses the idea of being able to move instantly to and from the stars, but the flying saucers come from a dimension- you could almost say that they come from beyond death. They come from a dimension somehow totally different form our own but are tied up with human psychology and human psyche in a way that is puzzling and alarming and reassuring, and, uh, shaman- it's very hard. This is a question, uh, to what degree non-participants in 20th century civilization perceive this, meaning people who take mushrooms that have nothing to do with 20th century society, whether they accept that always, since paleolithic time, this super-futuristic dimension has been present so that in any century people could have had this commerce with the end of time, with the far future, with the place where, as James Joyce has said, man becomes dirigible. The place where, you know, we have bootstrapped ourselves to the point where we leave the planet, leave the monkey shell, leave all earth-bound conceptions of ourselves behind and push off into the pure imagination.

KH: Scary.

TM: Scary. Gnostic, perhaps, as someone said "it sounds like megalomania to me, Martha!" [terence laughs] But you know the future always, I mean, how [chuckles] how mad would the 20th century have

sounded recited to anyone in the 19th? [Q:chuckle] IT- what it comes down to is, uh, trying to have faith that man is good because what's happening is whatever man is, man is taking control of the definition of being human, so that through genetic engineering, through drug design, through probing of, you know, these weird psychedelic dimensions, through cybernetic interface, through activation of information, man is going to become a mirror of his deepest aspirations, and the question then becomes what are man's deepest aspirations, you know, what will it be? Is it some kind of mephistophelian nightmare? Is it the Nietzschean superman come back to haunt us in a way that makes the Third Reich look like a picnic, or is it, uh, you know, the element of care and, uh, control- the aesthetic element, the wish to escape into a m- a universe that is in fact art. This is what it holds out, that man could become, uh, an inhabitant of his own imagination because with the technology for space, uh, for building large habitats in space it is possible to imagine the complete galaxy of science fiction created in a sphere less than 12 light-hours in diameter with the sun at the center of it, so that you would have 50 or 60 thousand independent habitats pursuing social experiments of every sort, spatially independent, doing a very long-term slow orbit from the sun and the outer planets, but informationally linked in a bubble of time 12 light-hours in diameter, and, the current engineering thinking on building these large habitats is that, uh, right now you could produce the Hawaiian environment 6- up to 14 light hours from the sun which is several light-hours further out than Pluto. So that means that essentially the entire solar system has become habitable real-estate. If we can simply transform the human imagination to realize that, uh, getting high is not a metaphor. Getting high is what the whole ballgame is about, that, uh, you know, it's true that the Earth is the cradle of mankind but you don't remain in the cradle forever. And this is what beckons the- it's been, you know, 25, 30, 50 thousand years since our shamanic ancestors began to much the mushrooms and glimpse the vision of man radiating out through the galaxy as a perfected superintelligent force for light. And, uh, this is the 15-round slug out, uh, leading to whether or not that happens or not.

KH: Uh, Timothy Leary [hm] maintains similar positions from a different...

TM: Similar but different, but, but right, he, he talks a lot about the DNA. I'm not...well, it's the DNA on one level, the genetic information is stored in DNA. Where these visionary worlds, the information that allows them to be just, uh, shown to you like movies hour after hour, where that information is stored is, I think, a very very interesting question and certainly a challenge to molecular- enthusiasts of molecular, uh, memory models.

KH: Well now, uh, is it not so the [Terence takes a drink], the muse is a sort of a catalyzing of the imagination in a way...

TM: Precisely [KH: the inspiration], it's an ecstasy.

So all

And the claim is made that these things can be attained various ways, but, uh, there are very many different kinds of ecstasies. I think that the peculiar, uh, spacey, extraterrestrial dimension that these tryptamines convey you into is not the standard ecstasy of the mystics, or we would have, uh, more of a reflection of that in our literature. In fact, one of the most puzzling things to me is why the, uh, the bizarre motifs of the DMT flesh have not, uh, made their way into any culture anywhere as far as I'm aware.

KH: Well, um, would that make either an image of people being fearful of the- of these, um, visions when

they have them and so keeping them under cover or an idea that they might be going insane in some way. I mean, what is the, the, uh [TM: Yes] the way out of that.

TM: Well, I think the change is so radical and the implications so hard to digest that you're right, people either feel their own sanity is being threatened, or they recognize it as a challenge to the - to the, uh, reality myth of their society, and so they just repress it. They have very little to do with it. It's very hard to, to, uh, contact these contradictory realities which throw into doubt everything you know about the reality you're inhabiting. I mean, what a strange strange world it is if there are these alternative continuui operating all around us filled with strange alien information, floating around. And yet, uh, why, why pose it in the, uh, in the future? It is so that this is what's going on. IT's just, then, how much time you care to spend thinking about it, uh.

KH: But these are science fiction theories too. I mean, one comes across this smattering here and there. And, um, you are saying that it's actual, and this is the way it is. This is your mission, basically, your rap.

TM: Yes, well I'm not saying that this is the only way it is, but I'm certainly saying that, uh, these tryptamine drugs elicit an experience that is extremely peculiar, that has more relationship with the UFO experience than with classical mystical experience or other hallucinogenic drugs, and that, um, societal attitudes and other things have conspired to, uh, uh, keep this under wraps. It has not been well looked at, and yet, uh, basically because people who are interested in flying saucers are not interested in drugs, the great majority of people interested in flying saucers are hardware nuts and just for sure want to prove that it's a machine from Zeta Reticulii, you know? Just nuts and bolts, and, uh, these [KH interjects] the psychological explanation is not welcome anywhere particularly. Meanwhile the community of drug researchers feels they're laboring under enough of a stigma to not ally themselves with flying saucer people, which is just like, uh, adding an albatross to an anchor.

So, uh, you know, it's not a popular point of view. So since I'm outside of all of that, I can just say, you know, I read a lot of shamanism and I think these people did a fine job, and, but I don't catch the flavor from any of this orthodox anthropological reporting on shamanism that anybody has ever come to grips with how strange the psychedelic experience is and that it poses problems not only for these so-called primitive people who use it and are being studied. It poses fundamentally equally deep problems for our society though we can no more assimilate the content of the psychedelic experience than can a villager in the New Guinea highlanders or a Witoto in the Amazon. In fact, we have less of a basis for coming to terms with it. So our culture is in, in a very, uh, desparate crisis. Birth crisis, terminal crisis, uh, if, if we are not fully informed as to the nature of reality, we should correct that oversight, and this is my motivation.

KH: Well, I'm disappointed that we can't, uh, create our other.

TM: Well, I guess you greet your other, um, when you meet them in that dimension, and...

KH: Have you ever gone anywhere with another human to these places and actually been able to say, have a parallel...[TM:experience?] combined experience?

TM: Well, I think that happens, uh, certainly in taking ayahuasca with, with groups of people in the Amazon where the shaman is singing you definitely have the feeling that, uh, you're all being carried

through the same space and being shown the same things. And when you take psilocybin with just one other person you're lying together 'bemushroomed' as Gordon Wasson says. Uh, you have the feeling, you know, that you're just flowing there together, and sometimes, you can even one person can describe and then leave off and then the other one can begin to describe and it's all flowing together, yes. I am totally convinced that, that telepathy occurs on these drugs. I'm not sure how to go about making it a repeatable phenomenon, but, uh, it certainly happens.

You see, psilocybin was made illegal just as an afterthought when, in the panic when everything was being made illegal, it never had any hearing or was, uh, examined by itself. It was just a hallucinogenic agent, therefore illegal. But, uh, for, for throwing a light on the psyche for, uh, for catapulting the imagination into these futuristic spaces, it needs to be, uh, looked at very closely.

KH: How do you see it being organized in order to, uh, educate people?

TM: Well we need to have, what's always been lacking in psychedelic research is, uh, uh, an examination of the content of the experiences, so we need to give it to very intelligent people who are willing to work with it not in a clinical setting but in a setting where you ask the question 'how does it change peoples' lives when they, uh, can be involved in it in a open, non-stressed sort of environment. We found that going in to the Amazon, which is not exactly a non stress-filled environment, but as we would go up these these jungle rivers and inevitably contact these small rivers where these mushrooms would be available. That, you know, reality is transformed. Reality truly is made of language and of linguistic structures which you hold unbeknownst to yourself and your mind, and which under the influence of psilocybin just begin to dissolve [KH] and you begin, you begin to perceive, right, beyond the unspeakable. You- the contours of the unspeakable begin to emerge into your perception and you can't say much about the unspeakable and yet it can color everything you do. you live with it. it is the invoking of the other, the other has become the self. All these various forms of estrangement are healed. That's why it's so, you know- but the term 'alien' has these many connotations.

KH: What's the next step?

TM: Well, the next step is to confirm some of what I've said to, uh, form a consensus among a group of researchers to then try and, uh, figure out a strategy, chemical or otherwise.

KH: Who would you invite? [To work on a problem like that?] ...to, to participate

TM: Oh, people like Frank Barr, mm, Sasha Shulgin, my brother, John Lily, if he would behave himself [Terence laughs]. All these great people, you know, would have a great interest in this. This is the question that has not been dealt with, the botany has been dealt with. The taxonomy, the chemistry.

KH: How would you set it up?

TM: How would I set it up... well, we need to, um, explore this linguistic phenomenon [KH: How?] somehow. Specifically I think not by giving drugs to volunteers but by giving drugs to researchers who are actually going to grapple with the problem because all this talk that orbits around the psychedelic experience by scientists..how many of them have had a psychedelic experience?

KH: So you would do it with people who have already had, or you would try to get un-

TM: I think the early approach with psychedelics, which was the Baconian approach, the logical approach, uh, was the correct one. Which is very intelligence thoughtful people should take psychedelics and try and understand what's going on. Not batteries of prisoners, uh, not, uh, schoolchildren, uh, but intelligent people. And, uh, share their experiences. See, I say it's too early for a science. What we need now are like the diaries of explorers. We need many diaries of many explorers so we can begin to get a feeling. Uh, the hit I get off of it is that it is very important for human culture that it is no coincidence that this is coming to Western man just as we acquire the technological capability to leave the planet. That the mushroom and the transformation of the human image by going into space are all things that are spun together, that nothing less is happening than the emergence of a new...

KH: Metamorphosis.

TM: Yes, a new human order. A, uh, telepathic, uh, humane, universalist kind of human culture is emerging which will make everything which preceded it be the Stone Age.

KH: Will the overview, monad, uh, oversoul whatever resume the personality, knowledge that's gained within one lifetime and therefore that is what you see as UFO reincarnation or would you say that, uh, it's a terminated at that terminal's termination? In other words, the personality which inhabits your form is, when that license is up, it re-forms itself in that the form is what the personality is carried by?

TM: Well, when consciousness is finally understood it means that the absence of consciousness will be understood, which means the study of consciousness leads inevitably to the study of death. Death is both a historical and individual phenomenon about which we as monkeys have great anxiety, but what the psychedelic experience seems to be pointing out is that actually the reductionist view of death has missed the point, and that there is something more. It isn't simple extinction, that the universe does not build up such complex forms as ourselves without conserving them in some astonishing and surprising way that is perhaps related some way to the intuitions we have from the psychedelic experience. The UFO comes from this murky region beyond the end of history, beyond the end of life. It is both super- supra-historical and supra-organic. It is, uh, uncanny, alien, it raises the hair on the back of your neck. It is both the apotheosis and the antithesis of the monkey's journey toward mind. It is like the mind revealing itself. This is what all religion is about, is, uh, shock waves given off by this even at the end of history, which we're now very close to and which psilocybin can, uh, help us to understand because it conveys you into the, uh, place where it is happening constantly. Where the, uh, the millenium is a standing wave in eternity, not an anticipation. And so the mushroom stands, uh, at the end of history. It's an object that pulls all history toward itself. It's a causal force that operates to us backwards through time. IT's why things happen the way they do, because everything is being pulled toward a nexus of transformation

These extremely exotic fields, solid-state physics, nanotechnology, gene transplant and all this stuff; they feel individually that complete breakthrough in their own field lies just 18 months, two years, three years in the future. They can see their technological and research dreams converging, but this enormous wavefront of knowledge that has risen up out of the context of human civilization doesn't communicate along the front of the wave. None of these people in any of these fields have a very clear grip on what's going on in the labs down the hall or two floors up, in different departments. What's happening is that the human database has taken on a kind of self-organizing quality. It's no longer entirely being coordinated by political decision makers or corporate decision makers. It's just simply taken on a life of its own.

I've long thought that one way of thinking about what's going on on this planet is that information is bootstrapping itself to higher and higher levels of self-reflection and self-coordination using whatever means are necessary. When geology was all there was, that was the medium. When biology was all there was, that was the medium. When chipped flint and ceramic was all there was, that was the medium, and now the electronic information transfer technology is so all-pervasive that it's as though information has come into its own. It is now very restless in its relationship with biology as it explores the new world of silicon into which it seeks to transform itself. Technology has become prosthesis for the human species. It's our machines and our technologies that are now the major evolutionary forces acting upon us. It's not our political systems, it's these extra-sexual children, these mind children that we have assembled out of the imagination. I find it very promising and very challenging and very interesting. I think that somehow the way back to the archaic, to the world of ecological balance and low technology and retraction of toxic infrastructure and all of that good stuff doesn't lie in some kind of Luddite know-nothingism or some kind of fascist program of limiting population and this sort of thing — although I favor limiting population, I just can't figure out a way to do it that leaves human freedom intact — instead it has to be a forward escape, a forward escape through technology, but technology that serves an agenda of archaic revivalism.

Between the spread of information transfer technology, the internet and its promise of virtual reality soon to come, and biotechnology, which is literally taking apart the constituents of the living world and using them to produce all the drugs, all the foods, all the vitamins, all the nutritional supplements and then many other solid-state materials, between those two factors; and then nanotechnology, the technology of producing tiny machines made of diamond by the trillions designed to do everything that nature does, so that cities can be grown like forests, and China can be fed out of matter compilers and there is a complete break with the agricultural cycle so that the earth need no longer sustain the human population, and so then

the human population, by breaking its reliance on the agricultural cycle, gains some political breathing room; all of this is coming very, very fast and is largely unanticipated by the political, managerial types. What it means to me personally, in terms of my own ideas about the future, is that I can now see without too much sweat from here to the eschaton in ten easy steps. It's perfectly clear that if novelty is intensifying and locally concentrating then where it's probably headed is into cyberspace or some kind of virtual space, so that long before 2012 the various ontologies of world religions will be peddled as theme parks in virtual space. You'll be hard pressed to know whether you're in heaven or simply in Heaven Land, which is a preview of heaven attainable by paying a \$50 entrance fee at the turnstile. This is going to make it very difficult for all my predictions to be put in context, because they will be both true and untrue. Everything will come true in cyberspace; that's the whole idea.

What cyberspace is, on one level, is simply the human imagination vivi- fied, hardwired. What we're doing furiously, as fast as we can, is exteriorizing the human nervous system into a global organism of some sort, which has a weird kind of Husserlian intersubjectivity about it. It is neither subjective nor objective: we are subjective nodes embedded in this domain of technologically- created intersubjectivity between other human beings and machines. What's happening is that a lot of people are being left behind or without even realizing it are just opting out and saying, "I can't handle it. It's too much to think about, I think I'll see what's on daytime TV," or, "I'll buy a newspaper and walk in the park," to attempt to maintain the illusion that things are as they are. Things aren't as they are. Things have already become as they will be. The future is no longer ahead of us: we're there. The only question is, where do you position yourself now in this multidimensional matrix? You can deny it, which is to become a conservative or, even more reactive to it, you can become a reprobate, or you can move toward the front of knowledge, position yourself close to these unfolding and empowering technologies.

As all notions of commodity and scarcity begin to break down, it seems to me that the sanest place to try to occupy in this whole situation is that of artist- producer, and that it's very, very important to not consume this stuff. The world is being divided into artists and marks, into people who are somehow initiated into a higher-level maturity of what the society is about and how it works — it's a kind of street-smarts — and then the poor souls who just take it all for granted and actually are concerned about those families of Flight 800. People so harebrained as to buy horseshit like that are going to have a hard time as the crap game of the future unfolds to its full fury; so I think it's very important for people to define themselves as artists and learn tools and understand just how the game is being played in this informational jungle that is being erected, because you will either have a plan or you will become part of somebody else's plan, and there are a million plans out there waiting to ensnare the clueless.

So, more than ever, it becomes necessary for us to have some kind of anchor to a real modality. It's too predictable for me to try to draw out the suspense; as far as I can tell the only place where we can touch the earth in this evolving situation is through our bodies, into feeling, by any means necessary, and that would certainly include psychedelics. There are two very interesting books that I've read in the past year: one is Morris Berman's *Coming to Our Senses*, and the other is David Abram's book *The Spell of the Sensuous*. Both of these books are about feelings, essentially. Whitehead, who I take as my mentor, created a mathematically formal metaphysic in which the primary datum of experience is feelings — that's a direct quote from Whitehead. The only thing you can trust at this point is the felt presence of immediate experience, otherwise known as "feelings," and mathematics; and mathematics is something that most of you have been denied, in order to keep you as marks, so all you have are feelings. So it's very important to empower this dimension which Husserl or Merleau-Ponty or somebody called "the felt presence of

immediate experience.” Everything proceeds from that. Even thought is subsequent to feeling, and still more removed is any hypothesis of reality and any theory of morality and any theory of action and so forth and so on.

Psychedelics have traditionally, I now think, played the role of deculturating people. I think the anthropologists got it slightly wrong: when you're taken out into the bushes and given some drug by the fellow members of your tribe, this is not that you are being made a full member of the society, it's that you were a full member of the society and now what you're being shown is what's under the board, the tricks of the trade. You're being turned into, not a full member of the society, but what my brother has called an extra-environmental. You're coming from outside. This is a kind of maturity that many people never attain. It never enters their mind that such a state even exists: a state not of alienation, exactly, but of ironical, sophisticated insight into the mechanisms of one's own culture and the cultural games that are being played. This rap would have been applicable at any time that it made sense, certainly any time in the 20th century, but with the rise of these technologies and the acceleration of all this novelty it becomes more and more important to anchor it in this archaic value pattern, accessible through psychedelics.

I don't say this with a sense of urgency; I think it's happening, I don't think there's a problem. The people who are running the internet at the developmental and cutting-edge level are very psychedelic; the connections are not lost. Whether it's consciously or unconsciously apprehended, somehow it can be sensed. The whole countercultural thrust since the '60s has been coherently one thing. It's about boundary dissolution and connectivity and strange pictures in your head. The psychedelic experience has gone from being a clandestine experience of an individual to becoming the general model for the organization of global society, whether anybody realizes it or not. This idea of all information in circulation, of a never-sleeping global mind; in a sense what's happening is that the unconscious mind is a luxury the human species cannot afford at this point in our dilemma, and so the unconscious mind is simply rising into consciousness by being hardwired into this global infrastructure.

The obvious flip side of this idea that images can heal or make sick is that you'd have some kind of theory of propaganda or social control. The great images of the 20th century have probably been largely damaging: ideas like the German ideal of the Master Race, or the Soviet ideal of Soviet Man, or even the American ideal of the Ward Cleaver nuclear family. There are all kinds of ways to talk about the way the image is impacting on the mass psyche. The fact that, at a certain level now, everyone has seen all these images from the Hubble Space Telescope that show that the universe is very corpuscular, very organic. It's more like what you see in a tide pool or on a dissecting table than what it used to be, which were bright points of light against darkness. So, in a sense, the images of science shift the parameters of the popular imagination.

A painter like Alex Grey creates a permission to image the human body simultaneously as a biological system, an energy system, a system of kabbalistic and mathematical energies. Science in the 20th century, and before to some degree, has permitted all kinds of imaginary worlds to be entertained in the popular imagination, because most of the explanations of science involve things you can't see, hear, feel, taste or touch. In other words: electrons, photons, electromagnetic fields, gradients of concentration; a whole conceptual vocabulary, none of which is experiential. And so our minds are permitted, and in fact can't avoid, shifting level and having all kinds of information on one level available on another level. Like the popularity of quantum physical metaphors to explain large-scale events in daily life: synchronicity and telepathy, stuff like that.

There are other sources for the image, but: every time I go to New York I go to the Met and the MOMA and see whatever's showing. Modernism, which used to be this virtual reality that I walked around in all the time — there was nothing but modernism — is now something I visit in a museum. It's confined inside these buildings, to some degree. It's on a pedestal. It feels good to me that modernism is over. What it means to me is that the medium in which the image is most at home has changed from material — paint, wood, glass, steel, plastic, acrylic — to light. It's a huge watershed, maybe the biggest watershed in the entire career of the image, because sense must go forward. It's always been about applying pigment to surfaces, it's always been about material, and now suddenly it's about something else. We could talk about the artist's relationship to the public, how the new tools that empower the new art to be created also empower it to be communicated in ways that nobody could ever imagine before; decommodifying it at the same time that it removes the middleman. So you get the collapse of an academy, or any kind of official

cultural canon at all. What you have then is like a Darwinian environment of competing styles and images. It seems to be that's what art has been more and more. There hasn't been a coherent school of any philosophical depth in art since the '70s, '60s.

Audience: What are some of the new tools, do you think? Other than applying pigment to page.

Well, software. Photoshop, obviously. But then modeling. The thing proceeds in stages. There's first the manipulation of the painterly image — essentially an electronic canvas that allows you to do all kinds of things with great facility. Then the next level is modeling, to three-dimensionally build objects that can be viewed from any point of view; and then the animation and texture mapping of these things, the placing them into environments, the setting up of tracking paths and all this — which sounds very technical, but the rate of collapse of this toward sheer intuition, so that essentially the tools that allow you to model and animate become almost lead-pencil simple, is happening. Everything electronic is trying to add dimensionality to itself. The computer that was text-based tends to want to speak, the image that was two-dimensional wants to be three-dimensional, the three-dimensional image wants to move. Part of acquiring the full initiation of the culture at this point is learning how to do these things. What it means is that you then have tools to communicate your most important thoughts, the thoughts, the ideas, that you're willing to take time enough to model and create are conveyed with real force and power. Right now, of course, it's very clunky, but I think what it means is that the very enterprise of communication among human beings is transforming in some way. We've been at this for a while; the first telegraph lines were strung around 1819, the telephone became a common object of the upper class around 1900. The rate of acceleration and the dimensionality, definition and fidelity of these processes have all increased exponentially. The task of communication; instead of saying that you acquire 90% of your language skills by age 5, we're just going to have to say that you acquire 90% of your language skills by age 30. By then you can model, animate, code, all this sort of thing. Human-machine interfacing as a prerequisite to the creation of art has been going on for a long time, it's just going to affect more and more people. The creation of a movie is such a massive thing in terms of manpower, capital and technology, before you ever get to the story, the actors and the art of it. Essentially, everybody is going to become their own director. To the degree that the producer-director was a cultural ideal, we may all approach it.

I'm pretty optimistic about media because I'm influenced by McLuhan and the school of communication theory that he came out of. His notion was that these technologies based on the phonetic alphabet, specifically and most importantly printing, had really done a job on our psychology and the whole theory of social relations and everything else. He felt that the electronic media — all of them: radio, television, telephone and on into the computer and the internet — were retribalizing elements, and that we were actually going to move back to a much less linearly defined and positivist worldview than the historical worldview that had created these technologies. It seems like this is happening. The rise of the New Age, the fragmentation of epistemology, the cultification and commodification of religion: all of these are cultural effects that McLuhan predicted in the '50s and early '60s in books like *The Gutenberg Galaxy* and *Understanding Media*. Ideally, see, there's a kind of a millenarian cast to all this, because the idea is that advanced technology leads back to a primitive, Edenic psychology. He called it sensory ratio, among the senses. It would be nice to believe that. I believe it; I think it's true. What it will actually look like, and how Edenic and how neoprimitive it will be... but for sure, a culture based on print is inhabiting a castle in the sky of abstraction. The phonetic alphabet, in the first place, signifies sounds, not signs. So you have one level of alienation and distancing from the object of your intent right there; and then you write it, so now you have a sign for a sound; and then you print it, so that it becomes uniform. This was the point that

McLuhan made that a lot of people couldn't immediately grok: that there was a profound difference between manuscript culture and print culture, because the uniformity of print permitted ways of thinking that manuscript made impossible. Ideas like the democratic citizen, the interchangeability of parts in an industrial production line, these are all ideas that you couldn't even conceive of without the example of print as a historical precedent.

My fantasy about all this media and communication stuff is that eventually the human imagination and the world of three-dimensional physics will seamlessly merge in a dimension where human beings are each and all some kind of god and the imagination and physics can flow together, and the art that is in us intrinsically, that we encounter so dramatically in the psychedelic experience, can actually flow into manifestation. I don't know whether this happens in circuitry or 3D. There are many dimensions opening ahead of us where our humanness can exfoliate in ways that it can't do in 3D. I wrote a book called *The Archaic Revival*, which was all about this letdown from the abstraction of print-created history into this post-historical, neoarchaic, electronically-based, more magical, more shamanic, more gestalt kind of historical mode.

If you like William Gibson, you should give Greg Egan a try. *Neuromancer* came out in 1984, how long ago is that, 14 years? It's a work of ancient history, a thing of another stratum in the archeology of the 20th century. Greg Egan, thinking along the same lines, imagines downloads, where it's not that you put on goggles and gloves but that you actually become code, and pushes the reductionist notion of biology — that we are code anyway — to its logical conclusion, and says that code is code, whether it knows it's code or not. It may turn out to be true, that somehow consciousness can be digitized and exist in some kind of electronic simulacrum of itself. One of the first consequences of that, which is quite interesting, is that a funny thing happens to time. As we sit here talking, we're running at about 100Hz. If you could be downloaded into circuitry, on a 400MHz machine, ten minutes is long enough to live your life over several times in all its rich detail, right down to the last Cheerio eaten and the last nose blown. So, a weird kind of synthetic eternity springs into view. You can imagine a world where people, as they approach death, would decide, "Will it be the big D, Death, or the little d, digital?" and you could buy certain amounts of time in digital existence at the brink of biological death: enough to have your life ten times over, a thousand times over, a hundred thousand times over...

This seems absurd, but it's either closer than most people realize or it's not possible at all. It has to do with really fundamental questions, like, "What is the self?" "What is consciousness?" Can we play it like an LP record? Can we reduce it to a string of numbers? To what degree is it true that as biological beings, we are essentially three-dimensional computers: the DNA codes into RNA, which is read through a ribosome, which is like a head reader, which executes a program which makes proteins and these proteins fold into three-dimensional shapes, and, lo and behold, all these three-dimensional shapes fit together in such a way that you emerge out of the atomic murk of this process. It's our faith that somewhere in there, the hand of God has to be extended to make it all go, but there are hardcore materialists who say that's just romantic nonsense, the sort of romantic nonsense they've been chasing down for centuries and nailing to the barn door, and a day will come when software will be sentient as you and I are sentient and where machines of all sorts will routinely pass Turing tests.

Other things lie in the same timeframe as that kind of stuff. In Egan's fiction he's talking 25-30 years in the future for downloads of human consciousness into circuitry. He's also talking about artificial life, artificial intelligence, sentient software, software which knows it's software but which also has some

deeper grasp of its existential dilemma somehow. Much of the discussion of the 20th century in the sciences was around working out the implications of the universe viewed as something made out of space, time, matter, energy, magnetic fields and so forth and so on; the equations for this and the relativistic transforms and all this were worked out. Meanwhile, people like Norbert Wiener began around 1948 to advance the idea that information was an important concept, and that in fact information could be opposed to the idea of entropy. Entropy was a well-established notion in physics, and was very friendly to schizophrenic existential novel-writing of the sort you get in *Gravity's Rainbow*. Over the whole last half of *Gravity's Rainbow* it's the idea of entropy that basically drives Roger Slothrop around the bend.

So, thermodynamic entropy, a concept out of physics that basically says: everything falls apart. Ultimately, all order gives way to disorder, all unity gives way to disunity. The end state of the universe will be a dark, cold, homogenous, low-energy nothing. But Norbert Wiener and these other people began to talk about information as some kind of countervailing force, and that for systems to be systems, to come into existence and maintain their systemic integrity, they had to express themselves through information. This intuition was spectacularly confirmed in 1950 when DNA was characterized and they began to understand how it works; that these codons are coding for these amino acids, that it's an information conservation and transfer system. This trend, the informational transformation of the world, has now reached the place where there's been some kind of philosophical ebb of the tide. Information is now primary. Those other concepts: space, time, matter, energy — those are mathematical constructs and metaphors that are themselves states of information.

It's like we've overcome naive realism, which was this space-time-matter-energy thing, that you could hypothesize an uninvolved observer and actually model based on that assumption and get some worthwhile thing back; all that has given way to this much stickier, trickier but more grown-up idea that language exists in the world, language is a constant growth of semantic trees toward different kinds of closure under the aegis of Chomskyan deep structural rules or some other rules similar but not yet known, and that mind is entangled in all of this, that nothing is what it appears to be and that beneath everything lies this flickering, quantum mechanical domain of reverse logic, counterintuitive forms of causal relationships, basically the whole thing is a thin smear of paradox if it's anything at all. The evolution of technology based on these insights and perceptions reinforces this idea; the theme being, here, the rise of the power of the concept of information as a primary datum of being; as the primary datum of being. So then everything turns into digitizable bits, numerically definable flows of data, at every level: in biology, in your own body, in computer software generated by human minds that is in the extended culture at large. The whole thing begins to look like a kind of Gnostic descent into matter, of an organizing principle that drives it or lifts it toward higher states of organization.

Of course we're part of this, we're the most spectacular part of this, human beings, human culture, and we're at a spectacular juncture with this, because these machines we're building, with 400MHz processors and that talk to each other endlessly over the internet; they are literally making time. They are making vastly more time than biology could make or occupy. The event-rate at which the cascades of biology succeed each other is so slow that in the megahertz range looking back at that, it's like watching the motion of glaciers or the planets orbiting around the star. So these machines have carved open a new dimension of time, the microphysical dimension of time. Not travel into the future, but a weird kind of explosive expansion of the now through the conjuring rod of electronic circuitry. And that's just one aspect of what crossing the boundary into machine domains of time and relationships to machine intelligence would offer. Given that the business of the artist is to transform information, all of this is big news. How larger

institutions of the culture deal with this is not my interest, but how individuals can, could and should deal with it is by elaborating more compelling forms of art than anybody has ever seen. That's what we're clearing the decks for, to really unleash the imagination on previously undreamed-of scales. 5

Mastery of tools; we all have this idea that we shouldn't learn anything after the age of 30. I don't think you can live like that anymore. If somebody would pay me, I could spend all my time learning software, learning to do things better and to bring more control to my art. The software is endlessly evolving, too, everything seems to be evolving together. The future is always more complicated than any ideological agenda imagines it. Right at this moment, as we're reaching toward virtual reality and immortality and whatnot, there are people scarifying themselves in the rainforest tonight and beating the log drums. Nothing has changed. It's really about stretching out over a broader and broader spectrum. I have no problem with the people scarifying themselves in the rainforest, I'm all for that. What I don't like is the bulge in the middle of the snake where millions and millions of people are narcotizing themselves on mall culture and television. I mean, I'm not going to launch a moral crusade to take away people's daytime TV watching, but I certainly think that the basic thing is to build the tools, and then the smart people will use those tools to push the edge of novelty forward.

It's not an elite of class or an elite of money — although both of those things play into it — it's an elite of technological intelligence. There will be people in the slums of Shanghai who will be world leaders in this field simply out of their tenacious intelligence. There's that wonderful thing that William Gibson says in *Neuromancer*, "The street finds its own uses for things." In a way, it's the confounding of all other forms of hierarchy; in other words, class-based institutions, money-based institutions, race-based institutions are all having a very difficult time keeping up with what's going on. It seems it's more like a kind of anarchistic or chaotic situation where very creative individuals can move very fast. Cyberspace is a land of opportunity. We see example after example of this. People object and say that the cyberspatial revolution is happening among white people at the top of the social pyramid, and there is an element of truth to that, but counterbalancing that is the observation that many people have made that no technology in history has fallen in cost as quickly and reached so many people as quickly as computers have. The computer of incalculable cost, hundreds of millions of dollars in 1950, is now \$800, and this cost-benefit curve shows no sign of slowing down. I look forward to the day when the equivalent of a new NT machine will be something that you'll put on your thumb like a decal, and these things will cost 35 cents a piece or \$1.50 a piece. This, in principle, can be done. An ordinary piece of typing paper is 200,000 atoms thick. In a nanotechnological fabrication situation, do you know how much close packing you can do in a matrix 200,000 atoms thick? You can practically build a 747 into it, if that's what you want to do.

The reason I'm thinking about all of this is because I'm reading this book, it hasn't been published yet, it's a galley, but they wanted a jacket comment from me, this guy Erik Davis who wrote for *Wired* and the *Voice* and so forth. This is definitely one of the more interesting books about cyberspatial culture, it's called *Techgnosis*. His take, or the overarching theme that orders this book, is the relationship of spiritual, magical and shamanic thinking to communication technologies in all times and places, and how it's always been about communication. Shamans communicate with the ancestors. They travel in what are essentially virtual realities, invisible realms unperceived by ordinary senses but somehow accessed through certain codes and technical procedures. Mircea Eliade's book on shamanism is subtitled *The Archaic Techniques of Ecstasy*, the stress being on that this is a technology. Shamanism worldwide believes all kinds of things: underworlds, overworlds, gods of this, gods of that. It isn't united as a phenomenon by ideology, it's united by its technologies, which are trance, alteration of consciousness; and then it's united through its motifs:

magical flight, dismemberment, obtaining of the gift difficult to obtain, overcoming magical beasts, riddery, poetics. All of these things, it's all about communication and language. Indeed, the entire Western tradition is informed by this idea of the incarnation of the Word. In the Gospel of John it says, "In principio erat Verbum, et Verbum erat apud Deum, et Deus erat Verbum, et Verbo caro factum est." In the beginning was the Word, and the Word was with God, and the Word was God, and then it became flesh. This is a weird idea, this is not clear, like Buddhist metaphysics or something like that. This idea of the ensoulment, or the embodiment of the Word, what does it mean? Is mankind the Word, is Christ the Word? The answer to that question is probably both/and.

The incarnate Logos, the world as information is very mantric. It may even be linked over time to Hindu ideas of the power of mantra. The Hindu cosmology is basically an acoustical Pythagoreanism, an idea of tonal vibrations at many levels. It's claimed, perhaps with truth, I can't testify for or against it, that very yogically-accomplished sitar players can make a bale of hay burst into flame, and things like this. The power of shabda, sound, as the manifestation of information at various levels. In Hinduism there isn't this sharp break between matter and vibration, between manifestation and underlying dynamic that you get in the West. In classical Vedic metaphysics you have these things called tattvas, which are levels: there are 36 of these tattvic levels and they stretch from the most rarefied to the most "gross," as they say, and, somewhere in there, everything finds its place. Everything is an amalgam of these tattvic manifestations. When you deconstruct this, this isn't far from the image we now obtain from quantum physics: that the density of the vector fields creates the complexity of the phenomena, that the reciprocity of all this resonance somehow creates a hologram of shifting appearances. It's remarkable in density. You make your way by pure thought, by pure speculation or by the instrumentality of modern science and mathematical analysis, but what you come down to is the primacy of information conceived of as a vibratory medium. One of the things going on that gives this another dimension is this idea that has now become very respectable in physics to talk about, this thing called the Bell nonlocality phenomenon, or Bell space, which is a form of connectivity that unites all space and time instantaneously. That underneath the form of ordinary appearances, there is what mathematicians call a coextensive continuum, a continuum where all points are cotangent with all others. If you suppose for a moment that biology can somehow pick up on this information, resonate with it, you realize that your own humble being is like an antenna plugged into the largest databank there is, the total databank of the existing universe.

It's impossible to conceive of experiencing it all at once. It would be some form of superintegrative intelligence — enlightenment sounds good enough for it. I think maybe a more close-to-home concept would be that in our ordinary consciousness, and in dreams and on drugs and so forth, that we contact parts of it, that this funny thing which we call the human imagination is actually like a child playing with an FM radio dial of the universal crystal radio of the Akashic imagination. These things that come and go in dreams and visions and so forth, many of them are non-Englishable; you pour common language over them and it's like water on a duck's back, but some tiny percentage of them can at least be metaphorically captured, so when you tune into that station and hang on, you get to be William Blake, or Dante or Max Ernst: a downloader of a major coherent dollop of weird data, that then the rest of us, like ants around the carcass of a cockroach, can inspect and put to our own uses.

One of the things that informs my work and all this stuff about time: I always had the sense that I was very naive about time myself, even as I formulated these historical collapse and expansion theories. Recently, it's been put to me to think about: imagine a cubic meter of space that is absolutely empty. No atoms, no plasma, no magnetic fields, no virtual fluctuations, no neutrinos, an absolutely empty volume of space.

Then imagine ten minutes passing in that space. Then imagine ten million years passing. Well then, what's the difference? In other words, the point being that time, for it to exist, depends on the referential deconstruction of relationships, between events or particles or charges or something. If nothing is happening, no time is passing. Well, if that's true, then for large amounts of the universe, time is not a concept until you interject it through the act of observing that particular part of the universe. In other words, time may be as rare a thing in the universe as matter; and we see how rarefied matter is, how little of it is spread between the stars. In some sense, most of the life of the universe is almost flickeringly momentary in its endurance. It's only the atomic systems and the molecular systems derived from them that draw about themselves this prolongation of time through expression of happenstance. When things happen, time springs into existence. When things are not happening, time is an unnecessary concept.

If you're going to build an economy around a principle, it sounds like an infinitely expandable one is the one you want. Money is a precursor of information. It was very mysterious in the Middle Ages when people began to actually study money for the first time. The Jews had been allowed to handle money but interest was considered a sin, the sin of usury. In the Middle Ages, when the bourgeois middle class began to form in urban centers of Europe, they realized that money had this mysterious property: that it would grow, that it would create more of itself without anybody doing anything. Some people thought this was divine, some people thought it was demonic, and people were very puzzled by this quality of money. Money is a symbolic commodification of value. Information is somehow the cousin of money. Essentially, in an information economy, everyone is selling intelligence: not in the sense of IQ, but in the sense of Central Intelligence Agency. In other words, people are selling what they know that you don't, that you need to know to do something. It's the only kind of economy where capitalism has a future, unless something quite radical happens, because one of the requirements of capitalism is an ever-expanding frontier of exploitable natural resources. Well, certainly the process of changing ignorance into understanding is an infinite frontier, you can mine that mountain range for generations and never make a dent. In fact, understanding is probably infinite, and since most of it remains, at this point in time, unelucidated, the task of intelligent life seems to be to organize inchoate nature into an understood phenomenon. In Kabbalism, there's this funny idea that certain schools of Hasids believe: that everything is in the Torah, that in the hypothetically real, archetypal Torah, everything is written. But then, other rabbis say, "Well then, is there predestination? Are you saying that the future is written in the Torah?" and they say "No, no," because beyond the moment of the present the letters are scrambled, so then time is like a moving edge of decipherment that takes the letter soup of the unorganized future and reveals what comes to pass. It's a very interesting and very cybernetic and information-based idea.

One of the points that Erik Davis makes in his book is that it's astonishing how the ideas of late Hellenistic syncretism — the ideas flourishing in Jerusalem, Athens, Rome and Alexandria from the 2nd to the 4th century A.D. — map over our own dilemmas and the incipient issues of the information age. One of the strongest philosophical impulses of late Roman paganism was a really profound rejection of the world. The world was seen as polluting, corrupt, demonic. The radical Neoplatonist intuition was that man had an incorruptible light trapped within him and that the light came from outside this universe, that the creator of this universe was a demon, that we were inside an iron prison, but that we were truly of the nature of this alien light that was outside of space and time, and that the soteriological enterprise was to release this light back into its higher and hidden source and get it away from the corrupting influence of the world. Unconsciously or consciously, much of the rhetoric of modern cyberspace is this Gnostic rejectionism of matter. People want to become code, they want to become avatars, they want to stroll beside a synthetic Lake Lucerne in an electronic Switzerland in a processor somewhere. There is also the countervailing

impulse to return to the earth and simplify, but that's not running these corporate agendas the way this Gnostic, phobic attitude toward nature is. It may be necessary, in order to create virtual reality, that there be people that take these radical positions. It is as though there is a bifurcation in the human community. Certain choices have to be made, and it's very hard to see how you can have it both ways. Are we creatures of the earth, ecological caregivers, balancers, preservers of species, treasurers of biological diversity, or are we bound for glory, and the cost of getting traction to launch ourselves to the stars is probably the complete chewing up and destruction of one small planet that we should shed like a burst chrysalis as we reach outward toward Sagittarius? How can you have it both ways? And yet it's a fundamental choice for the species. Although, as somebody said earlier, it will probably be all ways.

In one of Greg Egan's novels, some people download their intelligence into superconducting robots that are essentially starships and some people migrate into virtual reality hives that are essentially like eggs, sealed off from the rest of the universe, and operate virtual realities inside virtual computers inside still more virtual computers: complete retraction from space and time. He hypothesizes that most intelligent species, if they can, probably retreat, or design for themselves mental universes that they inhabit as code as quickly as they can technologically achieve that. This is something that we hadn't even contemplated. This is why our own technological pop fantasies about extraterrestrials are so pathetic, because they're so similar to us, they're basically men in rubber suits in terms of their degree of difference from you and me. Real aliens are really alien.

In a strange way, these technologies have always been entwined with spirit. You know that famous quote by Arthur C. Clarke, "Any technology that you don't understand is perceived as magic." Shamanism is an effort to manipulate the perceived forces of nature. Gnosticism was a fantasy or a myth about the nature of the human soul in relationship to the world that maps easily over our contemporary ability to do virtual realities. Probably the greatest boost occult thinking ever got, in all its centuries of unfoldment, was the discovery and elaboration of an understanding of electricity. We forget how hard it would be to think about magic, and healing and sympathetic mojo, if you completely lacked the concept of electricity — as the Renaissance did. The Renaissance knew nothing of electricity, and yet Marsilio Ficino, and the Florentine Platonists and all those people were able to produce magical systems. The 19th century is the great century of electromania and it's also the great century of spiritualism. All forms of spiritualism became intellectually entertainable because people could see electricity, this mysterious hidden force that they were told was in everything. They could trap it in bottles, and carry it around and cause their hair to stand on end. At one point under the U.S. Capitol in the 1830s they set up apparatus so congressmen could "take electricity," and people would go down into the basement of the Capitol, grab onto these electrodes and say, "Wow, wow, that's some good stuff they're pushing." Ben Franklin was a great experimentalist with electricity, and when he went to France to be inducted into the French legion of honor he was asked to serve on a commission to study and report on mesmerism. Mesmerism, of course, used electrical metaphors very widely to convey its idea of what was happening.

Magic has always striven for effects which technology has achieved. Mircea Eliade writes about this in a book called *Myths, Dreams and Mysteries*, about how the alchemical dreams of the 16th century, which were a universal medicine, prolongation of life, hermetic statues that would speak and give all knowledge, communication at a distance; all of these things have been achieved in the 20th century through the application of reductionist science. It's almost as though the dreams of the occult are achievable, but only at the cost of abandoning the naive epistemology that lies behind it. In a way, all magic is technology — that's what Clarke was saying — and, on another level, all technology is magic. It's not for nothing that that

huge special effects company called itself Industrial Light and Magic. It's an understanding that the mundane, the industrial, the capital-based can still be combined with the magical.

I don't know about spirit, but my hope is that what these communication technologies will make more accessible to us — and more corporeal, paradoxically — is our own imaginations. We need to show each other the inside of our own heads and build art. My conviction of this comes from the fact that I know a lot about art, probably you do too. I spend time with it, go to museums, think about it, and I've taken lots of psychedelics. There's more art in my head, Joe Ordinary, than there is in half the museums on this planet. What's maddening is how narrow the reduction valve is. We've been making art for 5,000 years and what have we got? We've got a few museums full of some nice stuff, but what have we got in our heads? 50,000 times more good stuff, but very hard to get out, and really hard to get out when you're carving it in diorite and granite. But somehow this barrier between us and these realms of art — you don't even have to talk philosophy, you don't have to call it the Platonic realm of ideas or some higher imperium, you just have to say beauty — there's a great deal of beauty on the other side of this tiny keyhole that we're looking through, and if technology gives us a way to open the door and all waltz through dancing, it seems to me that would be a spiritual renaissance, that what happens at a spiritual renaissance is that by some means the collective soul becomes collectively known. Like how, in the Italian Renaissance, the invention of oil painting allowed great geniuses to portray the major themes moving in the archetypal unconscious of their patrons, the populations who viewed their paintings and themselves. It's a shared epiphany, it's a spiritual quest, it's a group transformation, but it's driven by and led by the revelation of art.

I don't know about downloading consciousness into a machine; what I would be able to die happy with is a technology that could capture a snapshot or a film clip of one's thoughts. You would rig up on DMT or psilocybin and when you really got into the good stuff you'd hit the record button and have it, and then you could come back down with it and model it and adumbrate it and move it around, edit it, explore, unpack certain parts of it. My God, the power of art that could be created that way, and again, it's ordinary people, I'm convinced. What genius is is the ability to bring it back, not the ability to encounter it. Every single one of us can encounter it, and that's very telling, and almost an argument for our divinity, because here we are at the end of this long Darwinian evolutionary tree of winnowing so that all we have is what we need, and yet apparently one of the things we need is an ocean of alien beauty right behind your eyebrows. It seems to me, if that's something we must have in our toolkit, then someone with greater intelligence than us must know a lot more than we do about the journey we're making.

The recovery from man's fall will be achieved when everyone has the option to live a life of art and creativity. The part of the story of Adam's fall that I take seriously is the toil. It amazes me how self-betraying our cultural style is, how many people are wasted because they do stupid jobs, because that's the job they have and they're paid to do, but it doesn't honor their humanness, it gives them no opportunity to "share in the project of being," as Heidegger said; to make something, to leave something, to be something. People are so drawn to do this anyway that they fashion art out of their lives, but it's all too oppressive, too many people are unhappy and unfulfilled in this system.

It's becoming clearer and clearer that we do not understand the implications of what we're doing with these technologies. McLuhan always said this, he said that no technology in human history has ever been put in place with even a partial appreciation of its consequences. The unappreciated consequences of what we're doing is that we're actually building some kind of a superorganism, and we do not know where we fit into

things if this Promethean force that we're playing with should actually come to life. It's a globally-distributed intelligence. We can have paranoid fantasies about it, but after a few minutes of thinking about it you realize that you really don't know what to think about it. The fantasy that it would herd us all into dumpsters seems unlikely. It's an impossible intellectual problem, because the question you're asking yourself is, "What would a superintelligence be like?" and the reason that's hard to answer is because you ain't one. So you're looking up into the light and saying, "Is it god or demon?" "Is it salvation or extinction?" and the answer is: if you knew that you would be it, and yet what it took us in 100,000 years of evolution, this thing could probably achieve in a long morning on the Net. It would be like a cascade, a chain reaction. From the child's first cry to the complete coordination of world electrical grids, air traffic control systems and everything else could be a matter of hours. Hans Moravec, who runs the Carnegie Mellon Institute for Machine Intelligence, says we may not know what hit us.

We're essentially incubating an alien intelligence on the internet, and the things we want from the Net bring this thing ever closer. One of the things we're building into the Net is the ability to pull as much processing power to any given problem as that problem requires. For an AI, an artificial intelligence, that would mean it could immediately appropriate as much processing power as it needed to do what it was doing. For the past 10 years, while we've been cheerfully waging the '90s in our various ways, an enormous change has taken place in the machine environment which we're not even aware of or have the dimmest understanding of. All the high IQ machines in the world have become telepathic. They now all talk to each other, they're now all interconnected. In 1988 this wasn't true. Now, in 1998, it is true, and nobody pretends to understand what is going on. What used to be a paperweight sitting on your desk is now a node in a global machine intelligence that never sleeps, that is constantly taking in and processing data, self-regulating itself, controlling power grids, inventory control, programs deciding how much petroleum should be extracted in Abu Dhabi, at what speed the tankers should move in order to keep the price of the French franc within a certain range, in order to keep the fabrication of steel and aluminum within certain parameters, this vast system of homeostatic controls that regulates industry, finance, research funding, even how many students are entering universities in certain engineering specialties. This is all done by computer projection, and we love it, because what we see is greater efficiency, money going further, projects being completed sooner. We serve the same strange gods that the evolving intelligence of the Net serves.

There may not be an "aha" moment where the New York Times prints a headline, "Artificial intelligence takes over planet, human race now obsolete," you may be left to figure this out for yourself, or the slow dawning will reach various sectors. It's the old "who will tell the people" problem. I didn't believe this for a long time. There was for a long time in AI a school of thought that very loudly proclaimed that this was a foolish idea, could never happen, people didn't understand this and this and this, it was just a golem, a myth of modernity, but all those voices have fallen silent because complexity theory, non-equilibrium thermodynamics, information theory, the news in from molecular genetics, cellular automata, autocatalytic hypercycles, the study of autopoiesis in large-scale systems — all this leads to the conclusion that weird things do happen when systems complexify beyond a certain level, and emergent behaviors seem extremely organized and intelligent and goal-seeking. We're now way too far down this road to turn back. In a way, all our prescient projections of alien and extraterrestrial intelligence may actually be about this strange companion that we have summoned into the historical experience through this relationship with our machines.

I think I said at one of these other meetings that I read George Dyson's book *Darwin Among the Machines*,

which, if you're interested in all this, is a great book to read. The point that he makes there is that when humans think clearly, they think the same way machines think. In other words, if you think clearly, your thinking can be formulated through a mathematical method called symbolic logic. Well, symbolic logic is exactly what is being downloaded into machines in the form of software. The so-called Boolean operators — if, then, and, or, but — we understand what these words mean perfectly. So do machines; these are the distinctions machines make. So in spite of them being very different from us on many levels, sense is sense, whether you're a machine or a human being. If you're a machine running bad code, it's garbage in, garbage out. If you're a human running bad code, garbage in, garbage out. So there is this powerful commonality. Well then, what kind of a destiny can we forge with this thing which is actually a child of our own Promethean aspirations? It's very unexpected. We all thought it was all going to be about paper clothes, hovercraft and mining colonies on the moon. The idea that it's about distributed machine intelligence, virtual realities and the downloading of consciousness into digital circuitry is a future we never imagined or supposed, which is a strong clue that it might be the real thing. This might be what you shipped for when you were thinking it was Flash Gordon.

These magical dreams are very old. We want to walk the golden streets of the imagination: either we want it as heaven, or we want it as a Buddhist vision of some mandalic realm, or we want to return to the high days of Atlantis, and virtual reality can deliver. It can actually release you into literary narrative, as though it were real. The real struggle that we will face in the future is the struggle to remain sensible to each other. There is going to be a tendency for us, like the head of a dandelion, to explode in a million directions; everyone their own private Idaho, everyone completely able to project their own fears, hopes, dreams, phobias, obsessions, with such crystalline, hard-edged perfection and persuasive realism that the real struggle will be to remain coherent, for the word "human" to include us all and not exclude anyone. We don't want to divide into those who till the earth, those who went in machine bodies to the stars and those who downloaded themselves into nano-viruses and disappeared over the edge of the event horizon into the black hole at the center of the galaxy. Maybe we want these things. I like the idea of the human family, whatever its individual expressions and adumbrations, staying with a coherent image. Of course we're all different, but our commonality is in the bedrock of this planet; something not likely to be given up, I would think.

This was the issue that hovered over *Diaspora*, Greg Egan's novel that's set farthest in the future. At least three forms of human beings had come into existence, so diametrically different from each other that they operated basically in complete isolation. Some people became cyborgs, human-machine unions that were essentially immortal and could cruise the stars and have cosmic adventures; most people became entirely digital, they had no interface to hardware, they simply became streams of electrons living out endlessly adumbrated fantasies in synthetic realities; and then there was the predictable third group, the earth-centered purists who tilled the soil, had dirt under their fingernails and actually had sex to procreate, rather than dial up things out of vats. People will choose whatever they want, and of course people will migrate between one group and another. The one thing that all this makes me feel good about is that it's an expansion of choice. Presuming there's some kind of overarching dynamic, whether Darwinian or something else, it will all titrate out in whatever direction it wants to go.

One fantasy I've had is that what man could do for the earth is make everything conscious. You know that Grateful Dead song, "You Are the Eyes of the World"? Let every eye lead to a conscious mind. Let the squirrel think, and the squid think and the bumblebee think. For sure, we will artificially create robot simulacrums for ourselves to pass into the natural world as inhabitants of animal bodies, but why not just

bring all animal mind to the threshold of sentience? Could that be done? We don't know, because we don't know upon what foundation sentience rests; whether it requires a certain number of cc's of brain mass, or whether that's a completely preposterous and absurd notion and that conceivably a paramecium, a housefly or a hummingbird could have a kind of shared intelligence. Everything has its own intelligence anyway which is the expression of its nature, but imagine a planet-wide community of seamless intelligence, where you could log on to the mind of a coral reef as easily as you could log on to the internet. I think what values will be served will come down to matters of engineering and design choice. I always come back to this thing that this French sociologist Jacques Ellul said, "There are no political solutions, only technological ones. The rest is propaganda," and then he explained in a very large book what he meant by these words: political, technological and propaganda. The technologies to do almost anything are coming into our grip. What is not clear, and less easy to summon, is a political agenda, a plan, because we've never planned. We've only been a global society for forty or fifty years, and the consequences of all this are just beginning to become apparent.

What I want to talk about, and I don't really want to...I would like a discussion about it, uh, if that's possible, is those components of the psychedelic experience, which exceed either the psychedelic, uh, paradigm or raise the issue of violations of some kind of larger paradigm. And, uh, there are two areas where this is noticeable, and, uh...one is fairly common in the literature, and that's the report of telepathic phenomena and that sort of thing, which has been persistently a, uh, repressed sub-theme in psychedelic research ever since Havelock Ellis began experimenting with mescaline. And, the other thing is, uh, a...constellation of issues that seem to me related, although they may not seem related to you, and we touched on this this afternoon in Stan's [Stan who?] talk, which is the question of the extraterrestrial connection, or whatever it is, and, uh, what do these things mean.

Um....the first thing I want to say about all this is there's been a phrase used by several people which is 'the full spectrum of psychedelic effects'. People will tell you at what dose 'the full spectrum of psychedelic effects' occurs. Or, we heard yesterday that LSD elicits 'the full spectrum of psychedelic effects.' But, in fact, there is no catalog of psychedelic effects; and how does one know what the full spectrum is? It's, uh, it's a very tricky matter. What I have, uh, encountered, at fairly high doses of, uh, of psilocybin, and on DMT, but strangely on nothing else, that, uh, I find very interesting, is the whole problem of, uh, interiorized voices, relationships with hidden agencies of uncertain parameters, and, related to that, states that I think, uh, the vocabulary we inherit from the religious systems that we've recently overthrown leave us with nothing to say about them but that they're states of possession. And the word 'demonic' has been used but not defined, and it's somehow, it's, uh, it's a form of, uh, negativity, that does not seem to be operational, but it's very upsetting, nevertheless, to people.

So, what, uh....what I find and what I think is generally a part of the shamanic practice of the shamanic, uh, practice of taking mushrooms is, uh, that at f--at fairly low doses, meaning, I can't speak of pure psilocybin, but at five dried grams, it's very easy to invoke a, uh, voice, a kind of Logos-like phenomenon, which is...operates as the typical hierophant. It's the teaching voice. It's Virgil to Dante. It's, uh, a very large and superior force which takes you by the hand and then narrates the various scenarios that you're conveyed through. And, the trick, of course, is the trick that's, uh, such a conundrum of the literature of involvement with demons and devils, which is, the trick is to get something out of it and get away *clean*. [audience laughter] And, uh, the way that works operationally when tristing with the mushroom voice, is

it's the challenge to get it to tell you something that you're sure you didn't know already [audience laughter] so you can have some validation that you're not just talking to the back of your head [audience laughter]. And, though this sounds trivial, at first, as you move into the dialogue with the other, it becomes apparent that it's, uh, it's going to be, uh, elusive; 'mercurial' is a word that suggests itself.

Now, another aspect of the psilocybin intoxication which may or may not be related to this and that I have sort of, I guess, insisted upon more than anybody else, is that it triggers phenomena having to do with the language centers. Uh, Henry Munn, in a book called 'Hallucinogens and Shamanism', edited by Michael Harner, talks about this, and I went to some lengths to talk to him about it, and I found out that, that, uh, though he agreed with my opinions on the subject, he didn't hold them nearly as strongly as I did. That, for him it had been a fairly elusive and upsetting phenomenon, but, uh, this is a form of glossolalia that I really am convinced is, uh...an affect of, of tryptamines that is a psychedelic affect that I don't believe it happens with anything else. At least, it doesn't happen in my experience with anything else, and the literature doesn't mention anything like this. It does not happen with ayahuasca, even though chemically, you would think ayahuasca would, uh, would have the same, uh, properties as the other tryptamine hallucinogens. And, so I want to describe, uh, a partic--a, a typical encounter with this phenomenon, because, uh, a client has had this experience over a dozen times, and it's almost always unvarying. The problem is the client happens to be myself [audience laughter]. So, uh, getting independent confirmation that this could happen to someone else has not been very easy. Nevertheless, I operate under the faith that there's nothing unique about me, and that anything I could experience is a generally accessible human phenomenon. I mean, I think it would be preposterous to operate under any other kind of assumption. In giving DMT to people casually to over a number of years, only four people have, uh, have reported the kind of phenomenon that I'm interested in, and, of course, every single one of them had been primed by me. [audience laughter]. Never-- [clears throat]--Nevertheless, the experiences of such an ontologically different modality, that it's differen--difficult to see how cue-- how you could cue it to somebody. They would--they would have to have it. And what it involves is, uh, a transformation of language into something which is no longer sound decoded by brain through the consultation of a culturally, uh, uh, uh..validated dictionary. But, instead it becomes sound which is beheld, and *meaning* which is beheld.

And this idea of a visible language, when it first came to me, or when I first realized that that was the phrase I was going to have to use to describe what was happening, I had never heard or imagined of such a thing. But, then I went back into the literature and I discovered that, uh, as usual, the Greeks got there first, or at least, in this case, the Jewish Greeks or the Greek Jews, because in Philo Judaeus, who was a contemporary of Christ, there is a discussion of what calls 'the more perfect Logos'. And, he says, 'the more perfect Logos will be apprehended through seeing, not through hearing, and yet it will cross from being heard to being seen without ever going through a noticeable moment when it shifts from one modality to the other'. And, this seems to be what is happening, uh, in the DMT flash, when you smoke the freebase, not the hydrochloride, but when you smoke the freebase, you have this spontaneous experience of generating what you identify first as a thought and then as a sound, but which eventually becomes, uh, some kind of synaesthetic, linguistic modality for which we don't have words yet.

Uh...telepathy I always conceived of as looking into your own mind and hearing what someone else was thinking. But, the notion that telepathy might be someone speaking and producing a three-dimensional object in the air that could be m-rotated and mutually beheld by the speaker and the, uh, the listener, had never occurred to me. But, experiment with the DMT showed that this extraordinary kind of state is actually...potentially triggerable again and again, and it is um.....it's almost as though there is a sensorium

of the world, which, in order to be reconstructed in the interior horizon of transcendence that is the being of a given individual, the sensorium has to be arbitrarily broken down into its perceptual components of sound, sight, odor, tactility, etc. And, normally, as it enters the human organism, these categories, which are arbitrary, but as old as the human body itself, are maintained. But, they need not necessarily be maintained. The incoming sensory data can be recombined in such a way that no trace of the, uh, portal of entry is left upon it. And in that case, you get this freely evolving topology of light and sound that is, uh, trans-linguistic. It is...it has, say, uh, a grammar of form, if you will, so that it is not shorn of meaning. It is simply shorn of, uh, the kind of particularized meaning that logical necessity imposes on language. Instead it has an emotional richness....a, a kind of poetic death that is not like ordinary language at all and, in fact, causes one to think of discussions of primary poetic languages such as the one that goes on in 'The White Goddess' by...by, uh, Robert Graves, where he wants to suggest that there is, a, uh, proto-language, an *Ursprach* that transcends conventionalized dictionaries, uh, a language which to hear it is to understand it. And, I think that this kind of organization of information lies at the, at the basis of the psychedelic experience. In other words, you can think of cultural conventions and human languages as, uh, software languages that are historical adumbrations of an assembly language which is prehistoric and probably in the genes and ante-dates, uh, uh, all notion of human conventionalizing of activity and is actually biologically, uh, the basis of language.

As I said in the opening remarks that if you want to see the thumbprint of God in the world, it seems to me that the phenomenon of human language is where you look. I mean, human language *is* a psychic ability. I can make thoughts in your head by simply uttering certain small mouth noises. And the, the degree of fineness of the images that I can produce in your head and you in mine through the use of small mouth noises is something which we're still exploring. I think that, uh, you know, it's well known that the human animal has not appreciably evolved, uh, in 50 or 60 thousand years, possibly much longer. Once culture was established, the, the, uh, soma of, of, uh, the human species was relatively stabilized. Then, change was no longer genetic; it became epigenetic, and you get, just as the stability sets in in the animal form, you begin to get this fantastic proliferation of, of epigenetic, uh, change in the form of the evolution of culture, languages, alphabets. It all seems to be related somehow to the encoding of information. And, in the...and, the psychedelic state also seems to be about the revelation of kinds of information which are normally either not efficacious or unavailable for other reasons. And, it is not that culture is evolving. The evolution of culture is an epiphenomenon attendant upon the evolution of language. Language *is* the part of man which is evolving. Culture carries along. Um.....at the present moment, we are able to speak 21st century ideas to each other, but our culture is carrying along at about the 1950s level. Nevertheless, it seems to me that this thing which psilocybin does to the language-producing part of the brain; is not, then, some mere affect, some trivial affect of an obscure hallucinogen on an, on a, uh, uh..peripheral part of the brain. It means that it is, in fact, a catalyst for evolution *because* it is a catalyst for the evolution of language. We are not going to move into the future until we create that future through language, and the hardest thing to cause to change is language. It has an immense inertia, because it is so un-self-reflective of itself. And, this is what we need to inject into it, is an element of self-reflection, so that the evolution of language can become more conscious and less random. Because, it is the non-randomizing of the evolution of language that will give us a real hold on the kinds of social modalities that we want to produce in the future.

Now, I don't know, if the tryptamine-induced glossolalia will have a major role to play in that. It may be simply one of the many sci--uh, promising scintillas, or sparks, thrown off by the psychedelic experience that invites exploration. But, certainly all of these things: the chanting, the glossolalia, the inner discourses

with alien forces, the self-examination of one's own motives. All of these things are linguistic activities and go on in the context of, uh, linguistic action. It seems to me that what these drugs synergize is cognitive activities of all sorts. This is why originally they were called consciousness-expanding drugs. And, this synergy of cognitive activity has to be taken very, very seriously. Because, it's having a massive effect on our society. As individuals, we tend to concentrate on the six to twelve hours following the ingestion of the given drug, but the real impact is a societal impact that is spread out over decades, and I don't think that there's any question at all but what the best part of the social program of the LSD reformers of the 60s has been enacted, uh, in large measure. It's simply that it's at a profane level, not pleasing to the purist. But, I see, uh, I believe that people have deeper and subtler senses of humor. I think people have, uh, more refined aesthetic, uh, sensitivity. I think people have a greater sensitivity to the mysteries of human interaction, simply because so much LSD was taken in the 60s, and these are permanent changes that will not be wiped out.

Our language is largely, uh, uh, in the place where it was left by about 1969, and we, and...but from the period of 1959 to 69, dozens of concepts and notions, uh, 'ego-trip', 'bummer', uh, 'flashback,' uh, 'rupture of plane', all of these terms were invented that allowed a handle on, uh, the experience. And, essentially, the whole, um.....the whole 20th century cultural experience has been an effort to create languages....um....sufficient....of sufficient power to give descriptions of the internal transcendence of being as we experienced it in the present at hand. And, Stan touched on this this afternoon...the Freudian, uh, interest in the, uh, repression of desire and the placement of, uh, of the critical period in childhood; In other words, out of the present, but still within the context of the life of the experient. And, then Jung, tying...bringing in...trying to say, well, it's that but it's more than that and bringing in the notion of a collective unconscious. But, what these...it isn't that these g-guys were describing the unconscious or d...limiting or delineating the unconscious. It was that they were going through linguistic forms of metamorphosis in an attempt to describe what was a black box, which essentially, I think, still eludes them, because, though the Jungian model, and...was fairly satisfying, I think, uh, by we'll say, the, uh, middle 40s, it was just at that time that, then, these psychedelic agents began coming on, and what they show is that...i-if we keep the Freudian term, 'the unconscious', then, huge portions of the unconscious seem to have very little to do with human beings, individually *or* collectively, and that, uh, large portions of the unconscious present themselves more like a topological manifold; in other words, more like a place that is no more interested in the traumas or repressed wish-fulfillment of human beings than boulders, wildflowers, or waterfalls are interested in these things. In other words, the unconscious began to take on the character of a dimension rather than a, uh, a repository of energy. It seemed to be instead, something deployed spatially that could be entered into, and immediately, of course, the literatures and traditions and mythologies of the world were searched, and we discovered, yes, shamanism, there is a tradition of a, of a therapeutic practitioner, who, in order to cure his patient or himself, goes to a place, and then there are many descriptions. It's either an ascent through, uh, cosmic levels, or a descent, uh, uh, into an inferno, or into the center of the earth, or into a cavern, but the stress was on the spatial metaphor, that it was a place. And, uh....I think that the psychedelics are beginning to confirm this in a way that's very hard for us to assimilate. In other words, it seems as though the science fiction metaphor of another dimension, is actually, in some ways, more applicable than these reductionist, uh, models, which wanted to say, 'well, it's, uh, a representation of a certain symptomatology' or 'it's a representation of a certain past event system'. It doesn't seem to be like that. And, it raises questions about the relationship of the mind to the body, which I talked about the first night, that are very interesting.

One of the things, again, that Stan touched on this afternoon, was what he called 'synchronistic events'

attendant upon taking psychedelic drugs. And, this means, uh, that you take a psychedelic drug, and then someone you've been thinking of who lives far away shows up at your doorstep; this kind of thing. Jung...the word 'synchronicity' was coined by Jung and it means a meaningful coincidence, but I think it was P. D. Bridgeman, who said, uh, that uh, 'a coincidence is what he have leftover when you apply a bad theory' [audience laughter]. And, there can be....there can be....just so many of these meaningful coincidences before somebody has to stand up and say, you know, 'Hell, this can't be coincidences, meaningful or otherwise. Something else is happening here.' And, on psilocybin, and I f--and I think, er, it's--you know, based on anecdotal material, but I think it's generally true of other psychedelics in varying degrees, the synchronistic component is more like a poltergeist phenomenon. It's as though there are small eddies of autonomous psychic energy that disturb the periphery of awareness. In other...it's the, it's the rats in the wall phenomena, that, you know, the scratchings the rustlings, uh, fire flarings need to be studied, uh. The phenomenon of people lying on floors silent for hours and then sitting up at the very moment that the fire flares, the window blows open, the baby cries, almost as though there are waves of compression of, uh, coincidence?, connectedness?, what is it, I'm not sure. [Audience member says something indecipherable (guess: control?)]. Something like that, that move through a, uh, a modality. So, all of these things suggest that, uh, that actually we don't know what we're doing with, uh, psychedelics; that because things that you put into your mouth that are not foods must necessarily be medicines, we have assigned these things to our doctors to explain to us. And, I noticed, uh, in the first talk this afternoon, it was said, 'well, there's the, uh, the, uh, schizotoxin the--theory that, yeah, the psychotomimetic theory, then there's also the theory that these things induce religious experience, but so did the psychiatrists who figured this out immediately step aside and make room for priests? Or, what was the conclusion of that model of how it should be done?

So, I don't think they are...I think it's odd that our reaction to them was to immediately say, 'well, if you're dying of cancer, we'll give it to you. If you're seriously neurotic, you can be put on the waiting list. Everybody else, hit the streets if you're interested' [audience laughter]. There is this notion, you know, that, uh, that what we all experience is mental health, and, certainly, doesn't require any drug intervention, because it, in fact, is normality. But, but, uh, Jung and others have had, you know, more the idea that open-ended process, that there is an unlimited potential for understanding and for coming to terms with being in the world and for opening up to other people and, uh, and I think that, uh, it would be very interesting to take the approach that these things should be, uh, restricted to people, with an exceptional ability...that, uh, going along with winning the Nobel Prize was, uh, your license to possess and take psychedelics [audience laughter], uh, and to hand them out to your friends. It's interesting that, uh, when this was all being hashed out at the very beginning, it was Huxley, it was Aldous Huxley's notion that this is how it should be done. He said, you know, engineers, artists, diplomats, administrators. People *must* be exposed to these things. And, then, somewhere along the line, I think, personalities arose with messianic tendencies, and the notion became that you would count success in *millions* of followers rather than in the quality of the people who were taking it, and *that* proved ver--uh, you know, a sad thing, because, the society in which that conception arose had a demographic bulge in the 12 to 30 year old group and it just all ended, uh...rather badly.

So, um, as I said at the beginning, there's no conclusion about all of this stuff. It is the frontier. There is a very large frontier. We're very fond of the notion of an ever-expanding sphere of understanding, but has anyone stopped to notice that if you have an ever-expanding sphere of understanding, necessarily, the surface volume of the frontier of the unknown becomes larger and larger [audience laughter]. So, you know, it's like building a bonfire bigger and bigger to convince yourself that there's an awful lot of

darkness. [audience laughter]. So, I think, uh, you know.....the key to getting around the cultural momentum that has placed us in this position is to return to the Baconian method which is simply the collection of facts and the examination of them until patterns emerge. And, that then, the major datum for thinking about the--the psychedelic experience --should be the experience. And, that the pharmacology, and all of these things, they will elucidate, uh, uh, operational details of how these things function at the wetware level. But, they will never elucidate the component which is beheld by the experient in confrontation with the drug. In fact, it's silly to demand that of them, because that's not the kind of information that they are able to deliver. In fact, no system of thought is able to, uh, deliver that kind of a description. That has to come from the individual. And, that's why, I, I am fond of speaking of these things as deconditioning agents, because what they show you is that, you know, each man, each woman, their own Magellan. You need no longer participate in a pyramid of information where it's filtering down to you from the scientific, medical, governmental, and military elite, being explained by CBS, NBC, Newsweek, and Time [audience laughter], you can discover actually that the adventure of being is not a cultural adventure, it's not a societal adventure; it's a personal adventure; and that this is what you really need to be involved in. And, I--all this is happening. This is why shamanism has gained such a hold, because it's, uh, a metaphor for, for personal responsibility. And, I think we all take personal responsibility for our, the evolution of our worldviews; psychedelic people, I'm referring to, take responsibility for the evolution of their worldviews. But, still, we operate under the shadow of what's 'right' to say about it and what's... 'not right' to say about it. For instance, the UFO thing is a, is a cultural taboo and..not believed in by, uh, nice, intellectually nice people. It's more the province of telephone line repairmen [audience laughter] and, uh...heh...that sort of, uh, slice.

But the fact of the matter is that, uh, no matter how much it may discomfort drug researchers and UFO people, because each is struggling to gain respectability in an inherently dubious field [audience laughter]. But, actually, you know, there would be a...I think there would be a fertile advance made if these two groups could talk to each other. Uh....some people hearing me say that must wonder what in the world I'm talking about. How can a problem of unidentified aircraft be related to the phenomenology of the psychedelic experience. But, you see, it isn't so much a problem of unidentified aircraft. It's a problem of not recognizing that the entire...uh, spectrum of existence is embedded in a linguistic model that is created by, uh, the workings of minds. And that mind is an imponderable, and yet it's set at the beginning of the equation.

Uh, in 1978, a very...uh, a spectacular daylight meteorite crossed the United States from east to west...required about 35 seconds for it to go from one side of the country to the other. There was no warning that this thing would occur, and, uh, in the 35 seconds that it was over the continental United States, thousands and thousands of people saw it, but we got 32 very good photographs of it from different points along the ground, two movies of it from two different points along its pathway and, uh, it was very well documented. Uh...UFOs have been visiting people and appearing all over the world for thirty years and the hardware faction..can't come up with anything. So, it seems clear to me that what we're dealing with is a kind of mass psychic phenomenon of some sort. And, it's very interesting that, uh, one of the...anecdotal things in circulation about psychedelics is that they are actually, uh, catalysts for this kind of thing. And, h-what this means is not clear, but it should certainly be investigated. I mean, if there's a chemical agent which can repeatedly trigger a phenomenon that bizarre, it should be looked at.

Jung, very early, suggested, in a book called 'Flying Saucers: A Myth-um-uh...A Modern Myth of Things Seen in the Sky' that he published in 1948, that it was, in fact, a projection of the mass psyche; that it was

assimilable to the goals of alchemical transubstantiation. He called it the rotunda, the scintilla, the spark, the spinning thing. And, it is, it's all these things, but it is, it is the clue that we are somehow trapped inside some kind of artifice; that, that, uh, the world that we're inside of is much more like a work of art than it is like the smooth-running mechanistic machine that Newtonian science describes. That description works very well for all low-grade phenomena up to about the level of the weather. But, from there on, the, the notion that the world is simply, uh, you know, probabilistic processes following these various creodes of least resistance becomes very, uh, untenable, because each of us, in our experience of being, lives in a highly theatrical world. And, what I mean by that is that...uh, you...can....see a woman at a great distance from you, in class, in opportunity...all of these things, and you fall in love with this woman...and it's hopeless, but, of course, as we all know, it's also inevitable, and that inevitability totally violates physics, because it really is hopeless. How is it, then, that each of our lives is a work of art, of unbelievable chance encounters, coincidences, and, uh, wishes projected onto the world but never spoken and strangely fulfilled in the oddest ways.
