For all his pursuit of mysticism, Terence McKenna is essentially a scientist. He may have a cult following, but he is not a cult leader in the sense that he encourages challenge rather than forbids it. "A scientist's job," he says, "is to prove that he is wrong. You don't get that at the ashram or up in a monastery - [mimicking what such a guru would not say]. Well, we crushed that hypothesis to smithereens." So, naturally, I had some follow-up questions for him, in person and by email.

Paul Krassner: I would feel incomplete if I didn't ask for your comment on the recent news story about Heaven's Gate cult.

Terence McKenna: Like most people, I haven't sorted out the San Diego mass suicide. I imagine that on the mainland, the soul-searching and efforts to determine everyone's collective guilt and complicity are in full cry. But from the slopes of Mauna Loa, it looks like simply the latest Southern California psychodrama with attendant obligatory media jack-off. I encountered Do (then Bo) and Peep in 1972. They were contemptible, power-crazed new age creepoids then, and apparently things didn't get better.

PK: During the workshop at Esalen, you talked about not knowing where the mind is. Do you think that the mind can function without the brain?

TM: I have not made up my mind on this, but think of the mind as a hyperspatially deployed organ that is ordinarily invisible. As to whether or not it can exist independent of the brain, I am not sure. If the physical world is conceived in a 4-D manifold, it is logically impossible for a physical thing, a 4-D solid, to move or otherwise change. It must be our state of consciousness which changes as we become successively aware of adjacent cross-sections of the 4-D manifold. But this makes sense only if we, the observers, are not in space-time. This would imply that our minds exist on a level beyond anything that physics can tell us about.

PK: You also mentioned how, post-eschaton, we'll look back from the grave and laugh at the futility with which we struggled through life. Were you implying that you believe individual consciousness can survive

after physical death?

TM: Not really, only that life will show its pattern and plan when we look back on it, and that will redeem some of the weirdness of having to live it essentially without a clue.

PK: You mentioned in the workshop, in terms of the coming apocalypse, that people should do things fast. Now, I thought that doing things fast was one of the problems that brought us to this place and that the antidote would be to slow down and savour the implications of what we do. Maybe you and I are saying the same thing?

TM: Well, I don't really mean do more and more things, I said more and more will happen. I think the thing to do is to eliminate foolishness, having your time vampirized. I agree with you, the goal is not to just jam in as much stuff as possible. basically one strong motivation for moving to Hawaii was just to escape the silliness, the triviality of it all, and I've discovered there was apparently no information loss. I can keep up with an O.J Simpson discussion even though I spent three minutes a week keeping track. The people who watched every day of the testimony, my God, they must be slow learners. And it's amazing how many fields you can participate in as a fully empowered player without investing much time.

As pleasant as it is, I can't hold the whole thing in my mind in the states, as we citizens of the sovereign state of Hawaii, I can look at it all and see trends and tendencies, and pontificate about it in my rain forest, and it all makes sense. Somebody said, "yeah, well, it all makes sense because you never talk to anybody else. " Probably some truth to that.

PK: At Esalen, you stated: "The technological push that has seemed so relentless and so brutal and so difficult to deflect is, in fact, we are doing the right thing, and the only question is whether we'll make it in time, and it looks like it's going to be a flash photo finish. We basically have until 2012 to figure out how to download all human DNA [and other forms of DNA] on this planet into some kind of indestructible storage mode. Then there's a chance to ride out this catastrophic wave of extinction."

Now, my question is, in view of the recent news which has placed human cloning on the boarder between science-fiction and reality, might not cloning be an answer to the question posed by the statement? How does cloning fit into your theory of the need to prepare ourselves for the apocalypse?

TM: In spite of the cloning of Dolly, we still have a great deal to learn about DNA. What was remarkable about the Dolly episode was how far the research team got to understand about the cloning process and how it works. Which does not mean that it will not be applied before it is fully understood. But at this point, it is a kind of stunt. Clones are simply people with a strange family history, and who among us does not fit that description?

The interesting thing about the recent cloning news, both regarding Dolly the ewe and the two cloned monkeys, is that both fated births occurred right around the same time, July-August 1996. That was a time that my timewave had long predicted would be a period when there would be some enormous scientific breakthrough.

I was very excited, therefore, by the announcement, at the time, of the discovery of the discovery of microfossils in a Martian meteorite. Now, with the news of clones, I am more convinced than ever that my prediction of a period of novelty and scientific breakthrough was correct. As for the clones themselves, I am reminded of Brave New World, Aldous Huxley's dystopia of clueless clones. More scary than 1984, that is for sure. And more likely, long run. So corporate, so elegant.

PK: What are your visions of alternative scenarios that are upcoming, either in December 2012 or before?

TM: Well, I've spent a long time thinking about this, although I realized about a year ago that, in a sense, it's not really my issue. The funny thing is, here I have this wave, it predicts every second between here and December 12, 2012, I show it to people and their first question is, 'So what happens afterwards?' It doesn't address that. It addresses all moments before that. nevertheless, I feel the force question, and I've created a series of scenarios in ascending weirdness which answer the question.

A low weirdness answer would be, suddenly everyone begins to behave appropriately. This is kind of Buddhist, Taoist approach. Now, the interesting thing about that scenario is, the first thirty seconds of that we can predict - appropriate behavior would probably be to take your foot off your neighbor's neck. Step back from what you're doing.

And then I always imagine - for some reason, I don't know why - that everybody would take off their clothes and go outside. But after that I can't figure - that's only the first thirty seconds of appropriate behavior. Since we never had that, we can't imagine what it would be like.

Then there's the transformation-of-physics scenario, which basically says, "All boundaries dissolve." What that would probably be like, the first hour of it would be like a thousand micrograms of LSD. After that we can't imagine or predict, because again it would have so totally changed the context that you could no longer predict it.

Then there are the catastrophic scenarios that revolve around the question, "Death, where is thy sting?" And probably the most efficient of those is the planetesimal-impact scenario. A very large object strikes the earth and kills everybody, and that's it.

PK: A blunt object

TM: It's a blunt solution. Sort of in that same category is the blue star in Sagittarius. And then a kind of intermediate between those two the sun will explode. That would certainly clear the disc and fulfill the whole thing. The planet vaporizes, and collectively we and all life on earth move into the shimmering capsules of the post-mortem realm, whatever that is. Novel, novel.

When I worked with the timewave, I argued strenuously that it reflects the ebb and flow of novelty, but somebody will come up with something like the release of the Sergeant Pepper album or the O.J Simpson trial, and then we see that it's lost in the noise. What the wave seems most pristinely to predict, or what parallels the wave most closely, is the evolution of technology, and I think technology is something that we haven't really understood. In a sense, technology is the alchemical journey for the condensation of the soul and the union of the spirit and matter in some kind of hyperobject.

The rise of the web has been a great boost to my fantasies along these lines, because now I can see with the Web from here to the eschaton. Apparently, it's a technology for dissolving space, time, personally and just releasing everybody into a data stream, something like the imagination. Then that's why the ultimate technological fantasy along this line of thought is what is conventionally called a time machine. There's an interesting aspect to the time machine. The wave describes the ebb and flow of novelty in time,

but then you reach a point where it's so novel that it fails beyond that point. Well, a time-traveling technology would cause such a system to fail, because it's a description of the unfolding seriality of linear events, which a time machine would disrupt.

So it may be that it isn't explosion of the sun, or the coming of the aliens, or the descent of the second person of the Trinity, it's simply that a technology is put into place that destroys linear time and, from thence forward, when you give your address you have to say not only where but when. There are some problems with this.

And then here is a slightly more interesting and woo-woo scenario. The thing that's called the grandfather paradox - somebody pointed out it's not called the father paradox because apparently you want to avoid an Oedipal situation - and it's simply the following objection: if you could travel into the past, you could kill your grandfather. If you killed your grandfather, you wouldn't exist. Therefore, you couldn't travel into the past. Therefore, time travel is impossible.

One idea I have for an end of history scenario: Time travel becomes more and more discussible, finally there are laboratories working on it, finally there is a prototype machine, finally it's possible to conceive of a test; and so on the morning of December 12, 2012, at the world Temporal Institute headquarters in the Amazon Basin, by a worldwide, high definition, three-dimensional hook up, the entire world tunes in to see the first flight into time. And the lady temponaut comes to the microphone and makes a few brief statements, hands are shaken, the champagne bottle is smashed, she climbs into her time-machine, pushes the button and disappears into the far flung reaches of the future. Now, the interesting question is, what happens next? And i have already established for myself that you can travel backwards into the past, but you can't travel further into the past than the invention of the first time machine, for the simple reason that there are no time machines before that, and if you were to take one where there are none, you get another paradox.

So what happens when the lady temponaut slips into the future? Well, I think what would happen a millisecond later is tens of thousands of time machines would arrive from all points in the future, having come back through time, of course, to witness the first flight into time. Exactly as if you could fly your beachcraft back to Kitty hawk, North Carolina, to that windy morning when the Wright brothers rolled their flyer out and fueled 'er up. And that's as far as the road goes. That's the end of the time road.

But the grandfather paradox persists. One of those time travelers from 5,000 years in the future, on their way back to the first time-travel incident, could stop and kill his grandfather, and then we have this whole problem again. So I thought about this for a long time, and I think i've found my way around it. But, as usual, at the cost of further weirdness.

Here's what would really happen if we invented a time machine of that sort. The lady temponaut pushes the button, and instead of all time machines appearing instantly in the next moment, in order to preserve the system from that paradox, what will happen is, the rest of history of the universe will occur instantly. And so that's it. I call it the God whistle.

This is because you thought you were building a time machine, and in a sense you were, but the time machine isn't what you thought it was. It caused the rest of time to happen instantaneously, and so the furthest out developments of life, matter, and technology in the universe can right up against you a millisecond after you break that barrier, and in fact you discover that traveling time is not traveling time,

it's a doorway into eternity, which is all of time, and that's why it becomes more like a hyperspatial deal than a simple linear time-travel thing.

There's been a parallel development which has caused me to be more confident. We're now beginning to build this parallel world called the Wolrd Wide Web. And you can bet that long before we reach 2012, the major religions of the world will build virtual realities of their eschatological scenarios. There will be the Islamic paradise, the Christian millenium, the Buddhist shunyata - these will be channels that you tune into to see if you like it and want to join, so in a sense guaranteeing we will have a virtual singularity.

It's all very well to try to understand the end point, but recall that where we are relative to the end point is in resonance with the year 950 AD. We're like the people in 950 AD trying to understand the web, the hydrogen bomb and the catscanner. How can we? My God, we don't even have calculus yet. Newton hasn't been born yet, let alone Einstein. I mean we're running around - essentially we're primitives, is what i'm saying. We don't have tools yet to conceive of the object of 2012. We must build those tools between now and then. And good places to start are with the web, psychedelic drugs, whatever is the most cutting edge and most far out.

PK: So that saying, "May you live in interesting times," is supposed to have been a Chinese curse, but if the ruling class had control of language, it would curse them, but it was a blessing to the people who made it interesting times.

TM: I think it's saying the same thing as the Irish toast [heavy brogue], "May you be alive at the end of the world."

PK: Meanwhile, my Chinese fortune cookie predicted that you and I would cross paths again and also that I will enjoy another repast soon.

TM: We must meet in a Chinese restaurant and save the oracle unnecessary embarrassment.

The mainstream media hasn't quite got it figured out whether Terence McKenna is putting them on or not. His theories about the origins of contemporary culture in the psychedelic trips of the distant past seem startling to those who have overdosed on Reagan/Bush/Larouche-style propaganda, but they are not without precedent if the names Aldous Huxley, John Allegro or R. Gordon Wasson mean anything to you (if they don't, check out the 'authors' section of the card catalog). McKenna's ideas have hit the media in the form of several books, most notably *The Archaic Revival* (HarperCollins), *Food of the Gods* (Bantam), and *True Hallucinations* (Harper San Francisco). He has also maintained a close connection to the burgeoning rave scene, lending spoken-word performances to concerts by the Shamen and recordings by Space Time Continuum. Major publications from coast to coast have lined up to give him press, generally favorable, if confused.

I spoke with McKenna recently as part of an assignment for *Future Sex* magazine (editorial decision squelched the piece)...

PHF: Can you briefly explain the theory you put forth in *Food of the Gods*?

Terence McKenna: The primate tendency to form dominance hierarchies was temporarily interrupted for about 100,000 years by the psilocybin in the paleolithic diet. This behavioral style of male dominance was chemically interrupted by psilocybin in the diet, so it allowed the style of social organization called partnership to emerge, and that that occurred during the period when language, altruism, planning, moral values, esthetics, music and so forth -- everything associated with humanness -- emerged during that period. About 12,000 years ago, the mushrooms left the human diet because they were no longer available, due to climatological change and the previous tendency to form dominance hierarchies re-emerged. So, this is what the historic dilemma is: we have all these qualities that were evolved during the suppression of male dominance that are now somewhat at loggerheads with the tendency of society in a situation of re-established male dominance. The paleolithic situation was orgiastic and this made it impossible for men to trace lines of male paternity, consequently there was no concept of 'my children' for men. It was 'our children' meaning 'we, the group.' This orgiastic style worked into the effects of higher doses of psilocybin

to create a situation of frequent boundary dissolution. That's what sexuality is, on one level, about and it's what psychedelics, on another level, are about. With the termination of this orgiastic, mushroom using style of existence, a very neurotic and repressive social style emerged which is now worldwide and typical of western civilization.

PHF: In what sense did the mushroom influence or create an orgiastic state?

TM: All central nervous system stimulants create what's called 'arousal', which means restlessness. In highly sexed animals like primates, it also means sexual arousal. So, psilocybin was a stimulant to sexual activity. In an evolutionary context, the more sex you have, the more outbreeding you have of those members of the population that are not experiencing this stimulation. So, on one level, at the lowest dose, psilocybin increases visual acuity, which means better success at hunting. Then, at the middle dose level, it creates this hypersexual activity. Then, at still higher doses it creates the full-blown psychedelic experience, about which we are as uninformed and as easily amazed as our remote ancestors were. So, it was a 3 step process. It was basically a chemical that had been allowed into the diet that boosted us toward boundary dissolution, language acquisition, sexuality without boundaries, and so on. With those behaviors in place, humanness emerged. Then, as the mushroom faded from climatological reasons, in a sense we became schizophrenic. The bestial nature, the animal nature, that had been suppressed by the psilocybin in the diet, re-emerged, so you get male dominance, standing armies, kingship, walled cities, the whole bit that leads to western civilization.

PHF: What is the place of set and setting in the arousal response?

TM: In the primitive context, I think, probably, there were orgies which were regulated by the lunar phases. In other words, orgies at the new and full moon. Basically, I think of the ego like a tumor or a calcarious growth in the psyche that will form unless there is the presence of psilocybin. For a hundred thousand years, nobody went longer than a month without having this boundary-dissolving experience. After the psilocybin faded, the ego was able to get hold and then eventually redefine the whole personality around it. It's a maladaptive response, I think, because it leads to the consequences we see all around us.

PHF: At what age would the psilocybin be introduced to prevent the ego from forming?

TM: We're just speculating here -- nobody knows -- but I imagine that it could well have an initiatory rite at puberty, or it could have come even earlier. Also, we're talking a long period of time, as much, perhaps, as half a million years, that this was happening. So it may have started out that psilocybin mushrooms were just edible mushrooms, an item in the diet, and only when you ate a lot did you discover that they were also stimulants and psychoactive. Then, as you approach more recent times, they were obviously institutionalized into a kind of goddess worshiping, cattle worshiping, orgiastic religion.

PHF: Are you suggesting that paleolithic shrooms were less potent than those that present-day psychedelic users consume?

TM: No, I'm just suggesting that as human intellectual capacities evolved, people went from unconsciously getting loaded and being stimulated by these things, to actually realizing that the mushroom was what was behind it, and then to consciously seek them out for those kinds of experiences.

PHF: Do you see a resurgence in the psychedelic orgiastic consciousness?

TM: Certainly psilocybin is a very important factor in the English rave and house music scene and psychedelics, though not psilocybin, were certainly a part of the sixties scene, which was then also associated with an orgiastic versus a monogamous style of sexuality. I'm not advocating that we return to orgies. After all, these African populations that I'm talking about were small groups of people between 70 and 125 people, roughly, and with the global pandemic of sexually transmitted diseases, you can't exactly advocate orgy, but I do think that, in social circles where psilocybin and psychedelics are being used, monogamy erodes and people tend to have more than one sexual partner, without the subterfuge and secretiveness that attends that in the ordinary dominator context. I guess I would say that the lesson from psilocybin is not that we should return to orgy, but that we should take a look at the modification of monogamy to permit people to have more than one sexual partner at a time, without having to be socially stigmatized.

PHF: Do you think that there's an ideal recreational drug that may be created?

TM: Many psychedelics have the effect that I've mentioned here. The reason I fasten in on the mushroom is because we evolved in the African grasslands, so if you're looking for a psychedelic stimulant to sexuality and consciousness in the context of early human evolution, it's going to be a grassland plant that requires no preparation and no combination with some other plant, because this all happened before that level of culture. Psilocybin emerges as the obvious candidate and I would say psilocybin is probably the best suited for this even today, because it's the one that we co-evolved with.

PHF: What would you recommend in the way of a psychedelic, romantic experience?

TM: I think if they take 3-1/2 to 4 grams of [dried] psilocybin mushrooms, in comfortable, dimly lit surroundings, that they'll discover a dimension to sex that you're just not going to approximate any other way. I mean, this is a pretty well-kept secret -- or maybe it's not so well-kept -- but it's certainly true that psychedelics have a tremendously enhancing effect on sex. It's not exactly that they're aphrodisiacs, because they don't have an effect on performance, particularly, but whatever goes down is experienced much more intensely and vividly. ***An interview that originally appeared in New History magazine in June of 1993.

True Hallucinations Chapter 21: Open Ending

Day Month Year

Description

- [Original text from Scribd \(scroll down\)](#)

My own ideas concerning the mechanics by which the oversoul creates the UFO encounters might take the following form. Dimethyltryptamine when smoked, snuffed, or injected induces a brief and extremely intense psychedelic experience whose overwhelming sense of contact with the Other is unparalleled. For the last decade or so this extraordinary property of DMT has made it seem to many who sought a chemical basis for schizophrenia as the long sought schizotoxin. Studies have proved inconclusive however. DMT concentration has not been proven to differ significantly in schizophrenic and normal controls. Studies have established the presence of DMT in the human body, however the origin and significance of the DMT is unknown. Although it may reflect endogenous synthesis, it could also result from diet, bacterial byproducts, human laboratory error, or other sources. Bearing in mind the bizarre power of the DMT experience, its presence and unknown role in human metabolism, add one more fact: the strange aura of suggestibility that can precede the onset of the intense hallucination phase of the DMT experience. This period of suggestibility may last 15 seconds to a minute, and is a time during which the assumptions which the experient projects concerning the unusual shift of sensory input acquires enormous power. A few moments later the power of the now numinous assumption overwhelms the consciousness of the observer with a scenario while totally bizarre and outrageous nevertheless is somehow a complete psychological fulfillment of the expectations formed in the few minutes of transition that preceded the visionary engulfment.

What I am proposing is that something like this happens during a UFO close encounter and the cause may very well be something which must be partially sought in the human organism. Imagine a person wandering alone in unfamiliar country: suddenly there's a hackle-raising sense of weirdness, then a feeling of numbness in the limbs, followed by a clearing of vision and a loud crackling sound. At this point the sense of strangeness within and without the body would trigger a fear reaction in most people. The fear reaction causes a rapid and automatic search for a culturally-validated explanation of what is going on, and an explanation will always be found. It may range from, 'I am being bewitched by a demon,' to 'Surely it is a visitation of the Holy Mother,' to 'My God! It must be a UFO!' In each case the abandonment of the ego to a culturally prescribed explanation of the experience of the Other causes the experience to exfoliate, exploit and elaborate all the themes that the culture's current myth of the Other entails. It is known that DMT binds preferentially to certain tissue when introduced into the human body. Is it not possible that we human beings are occasionally susceptible to a kind of visionary seizure? When for reasons of stress or diet these factors combine with psychodynamic factors to initiate a sudden dumping of accumulated DMT? Pheromones may play a part in this experience and isolation may be its trigger. Whatever its cause, our conditioning as individuals causes the experience to plunge us into a numinous scenario that reflects the deepest concerns and yearnings of the current culture toward the Other. In our own time this has given rise to the hope of friendly visiting extraterrestrials. As late as 1917 the miracle at Fatima was interpreted

worldwide as a manifestation of the Virgin Mary. Today it would surely be hailed as an extraterrestrial contact. If my suggestion regarding DMT were found to be correct, it would provide insight into the way in which the cultural feedback thermostat explanation of UFOs put forth by Vallee and others actually works. Those people who experience the DMT seizure and are plunged into the current myth of the Other actually return as apostles of that myth, able to clarify and refine it, and by those means to exert the tuning and control of historical development that may be the purpose of the agency behind the UFOs.

Stress, generalized as an impending sense of historical crisis, may be the factor that induces the UFO/close-contact experience. As the historical crisis deepens the number of contacts will increase until the atemporal portion of the mass psyche has effected enough individuals that there is actually a turning away from the stress-causing course of action. How well is the Superego able to play the role of God? Can it come in saucerian splendor to save the world from the flames at the end of time? Or can it only beckon and warn with visions and dire prophecy? These are questions that we might answer if we diligently explore the states of mind that DMT and psilocybin make available. Perhaps the UFO encounters involve nothing more than an autonomous and negative psychic complex able to emerge during the situation of unusual energy dynamics induced in the psyche by psilocybin. However, a different explanatory approach merges psyche and world by involving a continuum whose modalities bisect each other with equal ease. This is the approach which grants the phenomenological existence of the constructs seen in the Stropharia trance and in UFO encounters. Indeed, the vast and dreamy world that we call imagination, or the unconscious, may merge imperceptibly into autonomously existing worlds we would call 'hyperdimensional', indicating the paradox of their simultaneous invisibility and their here-and-nowness in the psilocybin trance with a presence which belies the term hallucination.

Ahead of us lies the future, where we can expect the ingression of the alternative dimension to intensify. It is therefore important for us to have a sense of the powers in that Other world and their shifting agencies. In a traditional society, our exploration of these matters would be firmly imbedded in the extant shamanic mythos concerning these forces. Techniques tried and true would be available to fortify our psychic constitution. Since we are members of a profane society whose relation to the unconscious is one of estrangement, we have no such consolation. No dispelling ritual or words of proven self-empowerment. By reason and intuition we must attempt to conquer the fears that attend journeys into the unknown. But reason and intuition need data with which to construct maps of reality. If we outdistance the inflow of fact we move beyond the safety zone of the conjuring rod of intuition and reason. For these reasons we move slowly and steadily. We are human factors in a multi-variable equation where the shift of unseen parameters can trigger large perturbations and resonances of unexpected types. Knowing this, and knowing how little we do know, we should be excused for this defense of caution when taking to ourselves the visions which the Stropharia brings.

Carl Jung's 'Mysterium Coniunctionis' reminds us of the reality of the situation that ensues once the psyche is hooked into making the transference to the alchemical or saucerian goal. Jung, citing Gerhart Dorn, stresses that the materialization of the stone is only a prologue to the experience of the perfected self in a state of illumination. Jung wrote, 'Though we know from experience that psychic processes are related to material ones, we are not in a position to say in what this relationship consists, or how it is possible at all. Precisely because the psyche and the physical are mutually dependent it has often been conjectured that they may be identical somewhere beyond our present experience.' Of what does this relationship consist? My own hunch, and it is only a hunch, is that an explicitly spatial dimension - of a co-dimension inclusive of our continuum - allows a hologram of other realized forms of organization, far distant, to become

visible at certain levels of quantum resonance in the synaptic field. These levels have been damped by selection in favor of more directly relevant lines of information relating to animal survival. Evolution does not reinforce selectively the ability of an organism to perceive at a distance since such an ability has no selective advantage, unless the information it conveys falls upon the receptors of an organism already sophisticated enough in its use of symbols to abstract concepts for later application in different contexts.

Thus, these quantum resonances carrying intimations of events at a distance only begin to acquire genetic reinforcement once a species has already achieved sufficient sophistication to be called conscious and mind-possessing. The use of hallucinogens can be seen as an attempt at medical engineering which amplifies, for inspection by consciousness, the quantum resonance of the other parts of the spatial continuum holographically at hand. This experience is the vision which the UFOs and psilocybin impart: visions of strange planets, life forms, perspectives and societies, machines, ruins, landscapes. The hierophanies all unfold in a 'nunc-stans' that has all space -standing in it- like a frozen hologram. Thus, experimentation with hallucinogens by human beings and the rise in endogenously produced hallucinogens as one advances through the primate phylogeny could both be due to a slow focusing on the phenomenon of imagination. Imagination being the deepening involvement of the species with things beheld but not actually existing in the present at hand. The conclusion such an idea makes necessary is that it is upon the ideological content of specific visions that empirical attention should center. What are the working details of the worlds whose presence impinges on ours so strongly? What of the beings sometimes confronted often furtively sensed, who seem to have some existence in a world of their own revealed by the psilocybin and in UFO contact? There may exist a vast communication network in the topological nature of things. A network that becomes a fact only for those species or individuals who will but have the intelligence enough to seek this

vision. It will by them be found to be persistent in the nature of things. Alchemy thrives in a climate of such ideas. To validate the idea of the worth of the visions of worlds at a distance one must emerge with some idea spawned by the visionary Other but with a utility in the here and now. The wave quantification of the I Ching is the only idea of this sort that I personally have glimpsed in completeness. It took years to elaborate and its relation to the here and now is still elusive. Fragmentary themes abound: symbiosis, saucer-lens vehicles whose possessors navigate the higher topological oceans in our heads. All this could be transference and fantasy. In the classical sense of the word the experimenter with hallucinogens pursues gnosis: privileged knowledge concerning nature and vouchsafed by her in ecstasy. The history of consciousness is the halting exploration of the once irrational images and processes met in dreams and trace. Such images become concepts and discoveries as information flows through the multiple-continuum of being seeking equilibrium, yet paradoxically carrying everywhere images of ways the flow towards entropy was locally reversed by this being or that society or phenomenon. We are immersed in a holographic ocean of places and ideas. We can understand this to whatever depth we are able. The ocean of images and the intricacy of their connections is infinite. It is perhaps why great genius precedes by apparent leaps. Because the revolutionary idea which inspires the genius comes upon one complete, entire by itself, from the ocean of mind. History is the story of the search for the intuitive leap that will reveal the very mechanism of that other dimension. The need for such a leap by humanity will grow as we exhaust complexity in all realms save the microphysical and the psychological. My own method has been immersion in the images and self-examination of the phenomenon of tryptamine hallucinogenesis. This means taking the *Stropharia psilocybe* and pondering just what this all may mean. With confidence that as more people come to share this experience time will deepen our understanding, if not answer all questions. For psilocybin argues that hallucinogens are windows into higher dimensions. That even as a cone can

yield circle, ellipse or parabola to an act of two-dimensional sectioning and yet remain intrinsically a cone, so reality is something that changes according to the angle of regarding. It argues that human beings are many forms over vast scales of time, that all life is unified at some level, and all intelligence in the universe are but facets of the mystery called humanness. In probing the Other we shall always come back with images of ourselves. In probing ourselves we shall return with images of the Other. In the phenomenon of being itself no less than in the phenomenon of the UFO encounters we are merely privileged observers of a relationship between what is naively called the world and the transpersonal portion of the human psyche. How this relationship came to be, and what its limitations are, we cannot know until we gain access to the transpersonal and atemporal part of the psyche. Of what this consists we do not know and no hypothesis can be ruled out. My hunch is that if we could really comprehend death then we could understand the UFO. But that neither can be understood unless they are looked at in light of the question, what is humanness? I believe that the transpersonal component of the human psyche is not distinct from matter and that therefore it can literally do anything. It is not subject to the will of any individual. It has a will and an understanding that is orders of magnitude more sophisticated than any one of the individuals who compose it as cells compose a body. It has a plan, glimpsed by individuals only as vision or religious hierophony. Nevertheless, the plan is unfolding. There will be many more UFO sightings, many more close contacts. Our belief systems are undergoing accelerated evolution via increased input from the other. Somewhere ahead of us there is a critical barrier where we will at last have enough data to obtain an integrating insight into the riddle of humanity's relation to the UFO. I believe that as this happens the childhood of our species will pass away and when this is done we will be free to use the staggering understanding that humankind and the UFO are one.

Psychedelics In The Age Of Intelligent Machines

27 April 1999

Seattle

Description

- [Audio Link](#)
- [Transcription](#)
- [Other links](#)

How's that? Well, I can't see all of you, but it's a pleasure to be in Seattle this evening. You've made me feel real welcome. Thank you! Our discussion this evening is "Psychedelics in the Age of Intelligent Machines" or "Shamans among the machines". I wanted to talk about this simply because these are two of my great loves, so I assume, being monogamous, they must be one love. So how to build intellectual bridges between these two concerns which seem so different? As far as people and machines are concerned, it was Ludwig von Bertalanffy, I think, who said in his book General Systems Theory, he said: "People are not machines but in every opportunity where they're allowed to behave like machines, they will so behave." In other words, we tend to fall into the well of habit. Though the glory of our humanness is our spontaneous creativity, we too as creatures of physics and chemistry, of memory and hope, tend to fall into repetitious patterns. These repetitious patterns are the death of creativity. They diminish our humanness. They diminish our individuality, make each of us somehow like cogs in some larger system. We associate this cog-like membership in larger soulless systems with the machines that we inherit from the age of the internal combustion engine, the age of the jet engine. Marshall McLuhan said: "We navigate our way into the future like someone driving who uses only the rear view mirror to tell them where they're going." It's not a very successful strategy for navigating into the future. I made a number of notes on this matter of psychedelics and machines. To me, the connecting bridge - well, there're many - but the most obvious one is consciousness expansion. After all, psychedelics, before they were called entheogens, before they were called hallucinogens, before they were called psychedelics, they were simply called "consciousness expanding drugs". Good phenomenological description of what they do. Certainly, the technology of cybernetics is a consciousness expanding technology. It expands a different area of consciousness. They minds of machines and the minds of human beings are very different - so different that each party questions whether the other even has a mind. In fact, what these are, are species of minds operating in very different domains. For instance, you can ask a five year old child to go into the bedroom to the third drawer of the dresser to select a pair of black socks and to bring them to mother. This is not a challenge for a five-year old child. To get a machine to do this is a hundred million dollars and a research team of forty or fifty technicians, code writers, working months. On the other hand, if you ask a person for the cubic root of 750344, much headscratching results. A computer is utterly undaunted by that question. Computers are minds that work in the realm of computation. Human minds are minds that work in the realm of generalization, spacial coordination, understanding of natural language, so forth and so on. Are these kinds of minds so different from each other pilgrims that there is no bridge to be crossed? I would submit not. In fact the bridge between the human mind and the machine mind is symbolic logic, mathematics. When we think clearly, we are intelligible to machines. People who write code know this: that the essence of making yourself clear to a machine, is to think clearly yourself. The machine has no patience for the half truth, the analogy, the semi-grasped association. For the machine, everything has to be clear. Everything must be defined. So that's the commonality between minds and machines of the calculating species. What are the common bridges between psychedelics and these machines? Well, to my mind, this is an easier bridge to gap. Both computers and drugs are what I would call function-specific arrangements of matter, and as we develop nanotechnological abilities as we move into the next century, it will be more and more clear that the difference between drugs and machines is simply that one is too large to swallow, and our best people are working on that. Nanotechnology is a very hot buzzword at the moment, an unimaginable dream of building machines and small objects atom by atom, perhaps under the control of long-chain polymers running forms of preprogrammed software of some sort. It's all very razzmatazz, very state of the art, but in fact, pharmaceutical chemists have been working in the nanotechnological realm for over a hundred years. When you synthesize molecules out of simpler substrate specifically to have the conformational geometry that matches something going on in the synapse of a primate, a human or a monkey or something like that, you're working at this nanotechnological level. Both the psychedelic and the new computational machines represent extensions of human function. This is really close to the nub. It locks in with the concept of prosthetics. The drugs, the psychedelic substances, the shamanic plants, are forms of prosthetic devices for extending the human mind, the human perceptual apparatus into hidden realms or inaccessible realms. Similarly the machines, by allowing us to model, calculate and simulate very complicated, multivariable processes, extend the power of the human mind into places it could never dream of going before. And part of what seems to me very real about being a human being and inheriting 10,000 years of human history, is the complexity of the inheritance, and the growth of that complexity. A thousand years ago, an intelligent human being could actually dream of mastering the entire database of western civilization - read all the classic authors, read the Bible and your closing in on it around AD 1000. Now the notion of any single human being assimilating any even small portion of the database of this civilization, is inconceivable. So machines which filter, which search, which are guided by human intent, that's part of the story. The other part of the story are boundary dissolving states of ecstasy in which all the factoids of the culture are thrown on for grabs, the deck is reshuffled, synchronicity rules, and out of that steps visionary understanding, breakthrough - integrated breakthrough under the aegis of psychedelic intoxicates. So, prostheses for the human mind and with the advent of virtual realities of various sorts and that kind of thing, prostheses for the human body. I'm very keen on sort of the under the table effects of these things. In other words, I'm a full-going, full-heartcharging mcLuhanist. And I really believe that the strengths and weaknesses of the world we've inherited, are strengths and weaknesses put there by print and by the spectrum of effects which McLuhan called The Gutenberg Galaxy, the spectrum of effects spun off from print. If you're not used to thinking in McLuhanist terms it may not seem immediately obvious to you that phenomenon as different as the modern notion of the democratizing citizen, the modern notion of interchangeable parts on assembly line, the modern notion of conformity to canons of advertising, these are all spectrums of effect created by the linearity and the uniformity of print. It actually, in the late 15th century, reconstructed the medieval psyche into its proto-modern form, and we have lived within that print-constellated cultural hallucination for about 500 years until the advent of various forms of electronic media in the 20th century. McLuhan talked about radio, he talked about television. He didn't really live to see the internet. The notion that keeps occurring to me as I watch all this, is that print was uniquely capable of creating and maintaining boundaries, more than any other form of media created, it was a boundary defining form of media. It proceeded linearly, it required literacy, which had implicit in it the notion of a very stable, advanced sort of educational system. Print was a creator and a definer of cultural boundaries, and the new electronic media are not and neither are the psychedelics. This is why I proposed in a book of mine called The Archaic Revival, the idea that the values of the archaic, of the high-paleolithic values of community, Ecstasy, relating to life through rhythm, dance, ritual, intoxication, that these values which seem so archaic are in fact destined to play a major role in the future as print fades. Print, just a convulsive 500 year episode in the western mind that opened that narrow window that permitted the rise of modern science, modern mathematical approaches to the analysis of nature, and then obliterated its own platform, it's own raison d'etre by allowing the growth, the appearance of the electronic technologies. My sort of supposition about all of this - I'm not an apocalypticist or a pessimist - I may be an apocalypticist, I'm not a pessimist - I think this is all very good. Obviously, continuing to run western civilization on the operating system inherited from print produces various form of political and cultural schizophrenia, which allowed to run unchecked would become fatal, would create cascades of chaos and political de-stabilization that would become uncontrollable. Governments resist change. Governments cling to technologies and social formulae that are already tried and true. In that sense then, all governments are incredibly anti-progressive forces. Again the image from McLuhan of someone driving into the future using only the rear view mirror. The electronic media and the psychedelics work together in this peculiar way to accentuate archaic values. Values which are counter to the print constellated world. When you deconstruct what that means and look at the aboriginal, or the paleolithic, or the archaic world, you see that the central figure in that world is the shaman, male or female, the shaman. The shaman is like a designated traveler into higher dimensional space. The shaman has permission to unlock the cultural cul-de-sac of his or her people and go behind the stage machinery of cultural appearances and has collective permission to manipulate that stage machinery for purposes of healing. We have no institution like this. We have advertising, we have rock 'n' roll stars, we have cults of celebrity. We have things which are shaman-like, but we have no real institution that permits human beings, in fact encourages human beings to go beyond their cultural values, to burst through into some trans-cultural super space, forage around out there and bring new memes back into the tribe. To some degree our artists do this, to some degree our scientists do it, but it's all hit and miss. It's all lilly nilly, and once achieved, it must be swept under the rug in the service of the myth of method, that somebody was following somebody else's work or somebody was applying a certain form of rational or logical analysis, and then that led to the breakthrough. If you've read Thomas Paine's book on the structure of scientific revolution, you know, this is all lies and propaganda. The real story of science is that it's a series of revelations brilliantly defended by people whose careers depended on the brilliant defense of those revelations. One of the best-kept secrets of the birth of modern science, is that it was founded by an angel. That the young Rene Descartes was whoring and soldiering his way across Europe as a 21-year old in the Hubsburg army, and one night in the town of Toim in Southern Germany, he had a dream - strange that this would be the birthplace of Albert Einstein some 200 years later - but Descartes had a dream, and an angel appeared to him in the dream and the angel said: "The conquest of nature is achieved through measurement and number." And he said: "I got it! Modern science! I'll go do it!" And he did, and that was the method for over 250 years of the conquest of nature, and it leads us to the Joseph's injunction (? 20:21), "The Mars Global Surveyor, long base interferometry that searches nearby stars for earth-like planets - it brings us the entire cornucopia of scientific effects but an angelic revelation disguised as a logical, philosophical breakthrough - this is what you're not told in the academy. My point here is, human progress has always depended on the whispering of alien minds, confrontations with the other, probes into dimensions where imagination and chance held the winning hands. So the shaman, as paradigmatic figure, is applicable both in the aboriginal social context, and in the present social context. The sky walker, the one who goes between, the one who passes outside of the tribe and then returns with memes, insights, cures, designs, glossolalia, technologies, and refertilizes the human family by this means. It's irrational, but it's how it actually happens, and it's how it's always happened and it may very well be the only way that it can happen. This cultivation of the irrational, this flirtation with the breakdown of boundaries. So now, in our nuts and bolts technological progress, we have somehow created technologies which are very friendly to our social values in that these technologies can be bought, sold, licensed, upgraded - all things which we understand. But these technologies are acting on us in the same way that psychedelic drugs do, but more profoundly, more generally and more insidiously, because their effect is not understood, or if it is understood, it's not discussed. So in a way we have come into a kind of post-cultural phase. All culture is dissolving in the face of the drug-like nature of the future. Its music, its design, indeed the very people who will inhabit it appear to be the most switched-on, the most chance-taking, the most alive of the entire tribe. People who feel the beat, people who are not afraid to take chances, people for whom these technologies have always been very natural. Machines are central to the new capitalism, the information transforming technologies. In fact, one of the strange things that is happening is: Every move we now make in relationship to the new technologies redefines them at the very boundaries where their own developmental impetus would lead them toward a kind of independence. In other words, we talk about artificial intelligence, we talk about the possibility of an AI coming into existence, but we do not really understand to what degree this is already true of our circumstance. In other words, how much of society is already homeostatically regulated by machines that are ultimately under human control, but practically speaking, are almost never meddled with? The world price of gold, the rate of the

petroleum extraction, and other base-natural resources - how much of these things is on the high season, in the pipeline at any given moment? How much of electricity is flowing into a given electrical grid at any moment? The distribution and the billing of that electricity - all manufacturing and inventory processes are under machine control. So in other words, the larger flows of energy capital and ideas already have kind of autonomous life of their own that we encourage because it makes us money, it makes our lives smoother, it empowers us. It's a symbiotic relationship of empowerment. Even in the matter of the design of these machines, once human engineers from a set of performance specs and they would design a chip to meek those specs, and the architecture would be put in place by human engineers - now a machine is told: "Here are the design specs. Design the architecture to satisfy the specs." And when that is done, the chip is manufactured, the actual design of the thing is in the hands of machines. So these machines are... You know, McLuhan once said of human beings, he said "We are the genitals of our technology. We exist only to improve next year's model." It appears that they're phasing us out of this ignominious role as well as well as any other roles. Oh, let's see here. So, being an optimist, that's where I was, yes. How to make gold out of this situation? In other words, how to see this as a natural and positive unfolding of the planetary adventure? And for some of these ideas, I'm indebted to Michael (Manuel) De Landa who wrote a book called *A Thousand Years of Nonlinear History*. I highly recommend it. He didn't say what I'm about to say, I'll take credit and blame for it. But the book gave me the idea: When you stand off and look at human beings and their technologies, it's very hard not to notice that from the very moment that we have the technology that can be distinguished from chimpanzees pushing grass stems down anthills or digging with sharpened bones or something like that - the minute you get past that, our technologies have always involved the materials of the earth. What agriculture itself is, is a different way of relating to the earth. Nomadism which preceded it, was a seasonal wandering, very lightly, over the earth. And at some point, the deep fertile soil of the river valleys that were encountered in these nomadic wanderings were recognized as potential sources of food if cultivated, if treated to a certain set of technological methods. So that early technology is defined by a new relationship to the materials of the earth itself, and it's quickly followed because agriculture is so successful as a strategy for food production. It's quickly followed by city building and the establishment of secondary populations because you can't carry your surplus with you if you're an agricuturist, so great is the physical volume of it. Cities - and at the very early establishment of these populations - in the Middle East you get first traces of metallurgy, the working of metals, the alloying of metals, the tinting of base metals with more precious metals. This process of ever more finely refining and fabricating the materials of the earth proceeds in an unbroken series of processes and steps right up to the latest 500MHz chip, it proceeds right up to the modern computational machinery. I once heard someone say that plants were something that - that animals had been invented by plants to move them around, which from an evolutionary point of view you can see that this is a kind of truth, and many plants hitchhike around on animals, and no animals has been more prolific in the spreading of plants than the animal. We call it eco-systemic disruption, but what it really is is eco-systemic homogenization. I live in Hawaii for example. 80 percent of the plants in Hawaii are now introduced species. Almost none of the plants that were pre-conquest on the Western coast of North America exist anymore. They have been supplanted by much tougher, more tightly evolved Mediterranean plants that have known the presence of grazing animals for millennia. So these flora are constantly being changed, human beings move plants around. With that perspective then, it seems to me the earth's strategy for its own salvation is through machines and human beings are a kind of intermediary catalytic step in the rarefaction of the earth. The earth is involved in a kind of alchemical sublimation of itself into a higher state of morphogenic order. And that these machines that we build are actually the means by which the earth itself is growing conscious. You know, if you study embryology, you know that the final ramification, the final spread and thinning out of the nervous system happens very suddenly at the end of fetal development. I don't know if you've been paying attention, but in the last 10, 12 years or so a very profound change has crept over our household appliances - they've become telepathic. So while we were arguing about the implications of the internet for e-commerce or what have you, all of these passive machines previously used for playing Pong and word processing, became subsets of a planetary node of information that has never turned off, that endlessly whispers to itself on the back channels, that is endlessly monitoring and being inputted data from the human world. And we should know because upon attention to the development of all this technology, chaos theory, non-equilibrium thermodynamics, the work of (???) 33:20 and Ralph Abraham and Stuart Kauffman - all these people who worked in complexity theory and perturbation of large scale dissipative structures, these people have secured that complex systems spontaneously mutate to higher states of order. This is counter intuitive if you're running physics 19th century style as your OS, but if you're actually keeping up with what's going on, there's nothing miraculous about this. All kinds of complex systems spontaneously mutate to higher states of order. What it really means is that we are in the process of birthing some kind of strange companion. You know, Nietzsche, a hundred years ago, said "That strangest of all guests now stands at the door." He was speaking of nihilism, and certainly the 20th century sat down, had the party, drank the booze and went to bed with nihilism. But now a stranger guest stands at the door, and it is the AI. Denied as a possibility as recently as ten or fifteen years ago in books like Hubert Dreyfus's *What Computers Can't Do*. But if you've been paying attention you may have noticed those voices have grown strangely silent in the past five or six years. At this point nobody wants to say what computers can't do and hang their career on that. That would be extremely reckless at this point, I would think, because the fact is, we are ourselves elements acting and reacting in a system that we cannot understand. This seems natural to me because my observations as stated here this evening, rest on an assumption which science doesn't share, which I think is easily conveyed and you can confirm it from your own experience of light, and it is this: That the universe grows more complex as we approach the present. It was simpler a million years ago, it was simpler yet a billion years ago - as you go backward in time, the universe becomes more simple. As you approach this golden moment, process, complexity is layered upon complexity, not only a planetary ecosystem, not only language using cultures, but language using cultures with high technology with supercomputers, the ability to sequence our own genome, on and on and on. That's self-evident. Equally self-evident is the fact that this process of complexification that informs all nature on all levels, is visibly, palpably, obviously accelerating. And I don't mean so that glaciers retreat 50% faster or volcanism is occurring in 12% greater rate than a million years ago. I mean viscerally accelerating so that now a human life is more than enough of a window to see the entire global system of relationships in transformation. By this you could call me an extrapolationist. If I see a process which has been slowly accelerating for twelve billion years, it's hard for me to imagine any force which could step forward out of nowhere and wrench that process in a new direction. Rather I would assume that this process of exponential acceleration into what I call novelty, which you might call complexity, is a law of being and cannot be retarded or deflected. But what does that mean, because now the human lifetime is more than enough time to see this process of rampant and spreading, virus-like complexity. What does it mean? It seems to presage the absolute annihilation of everything familiar, everything with roots in the past. And I believe that to be true, I think that the planet is like some kind of organism that is seeking morphogenetic transformation, and it's doing it through the expression of intelligence, and out of intelligence, technology. Human beings are the agent of a new order of being. That's why, though it's obvious that we're higher mammals and some kind of primate and so forth and so on, you can look at us from another point of view, and see that we're more like archangels than primates. We have qualities and concerns and anxieties that animals don't share. We are materially superseded between two different orders of being and our technologies, our fetich, our religions and - my definition of technology is sufficiently broad that it includes even spoken language. All of our technologies demand, push forward toward and make inevitable their own obsolescence, so were caught in an evolutionary cascade. You know, people say: "If the AI would break loose, what would it look like, what would it be? Where does humanity fit into the picture?" It's a little hard to imagine. The machines operating in 1000MHz confer automatic immortality on the mammalian nervous system if you can get it somehow uploaded, downloaded, cross loaded into machinery, because ten minutes becomes eternity in a machine like that. So a kind of false or pseudo immortality opens up ahead of us, as a kind of payoff for our devotion to the program of machine evolution and machine intelligence. Now, some people say this is appalling and we should go back to the good old days, whatever the good old days were. To me, it's exhilarating, exciting, psychedelic, beautiful. It means that the human form, the human possibility is in the process of leaving history behind. History is some kind of an adaptation that lasts about, take a number, 10,000, 15,000, 20,000 years - no more than that. What is 20,000 years in the life of a biological species? We know that there were homo sapiens sapiens types 200,000 years ago. So history is some kind of an episodic response to a certain set of culture dilemmas, and now it's ending. And print created a number of ideas which now have to be given up, ideas like the distinct nature, the distinct and unique nature of the individual, the necessary hierarchical structuring of society, all of these things are going to, if not have to be given up entirely, dramatically modified. Because the illusion that the self has simple location, is now exposed. The self does not have simple location. This is why you are brother's keeper. That's why we all are responsible for each other. The idea that what happens in distant parts of the world makes no claim on my moral judgment or my moral understanding, is wrong. The wrong as revealed by quantum physics, as revealed by electronic experience is what Leibniz called a plenum. It's all one thing. It's all connected, it's all of a part. So I also wanted to point out that I mentioned earlier this thing about prosthesis and how the machines are prosthetic devices extending human consciousness somewhat like psychedelics. That's the equation from a human point of view. But what is also equally true is that we are a prosthetic device for these machines. We are their eyes and ears in the world, we provide the code, we provide the constraints, we build the hardware. It is a relationship of mutual benefit. It's not entirely clear that our contribution will always be creative in the sense that our primate hand will be on the tiller of existence as it has been, but certainly we are part of this equation of transformation that is making itself felt, and that distinction flesh and machinery, which is easily made now, will be less easy to make in the future as we migrate toward the nano-technological domains, the methodologies of production become much more like the processes of biology. For example, biology does all its miracles on this planet at temperatures below a 115 degrees Fahrenheit. Organic life requires no higher temperature to build great whales, redwood trees, swarms of locust, what have you. The high temperature, heavy metal technologies that we have become obsessed with, are extremely primitive and extremely toxic. That will all disappear as we model and emulate in our manufacturing process before the methods and style of nature, which is to pull atomic species from the local environment, and then to assemble them, atom by atom by atom. So this AI that coming into existence, is to my mind not artificial at all, not alien at all. What it really is it's a new confirmation of geometry as the collective self of humanity. And you know, I've always believed that while there are different models of what shamanism is - there's the Jungian model which is that the shaman is someone who goes to the collective unconscious and manipulates the archetypes and heals by that means. The model that I prefer is a mathematical model. The shaman is someone who simply, through extraordinary perturbation of consciousness, either through taking plant hallucinogens or manipulating diet or through flagellation and ordeal or by some means, perturbs consciousness to the point where the ordinary conformational geometries are blasted through, and then the shaman can see into the culturally forbidden zones of information. If you think about shamanism for a moment, what do shamans do classically? They know where the game has gone, they are great weather prophets, they are very insightful in the matter of various small domestic hassles, like who stole the chicken, who slept with the chief's wife, this kind of thing, and they cure. They cure. Well, if you analyze these abilities, it's clear to me they all indicate, that they come from a common source, and the common source that they come from is higher dimensional perception in a mathematical sense, not a metaphorical sense, in the sense of 4D perception. If you could see in hyperspace, you could see where the game will be next week, you could see the weather a month from now, you would know who stole the chicken. And any good doctor will tell you that if you're building a reputation as physician, you must hone the intuitional ability to choose patients who won't die. It's a call. Any doctor will tell you this. So this is what shamans are. They are 4D people. They are sanctioned members of the society who are allowed to put on the gloves, as it were, pull on the goggles, and look beyond the idols of the tribe, look beyond the myth. In a way, as culture breaks down in multiculturalism and the rise of the internet and a generation of people raised on hallucinogenic plants and substances, we all are asked to assimilate some portion of this shamanic potential to ourselves, and it's about not blocking what is obvious. Nothing comes unannounced, in this is the faith. Nothing comes unannounced, but idiots can miss the announcement. So it's very important to actually listen to your own intuition rather than driving through it, and this is not to mind wood-woo. It's actually based on the observations of how life works, whether it's counter intuitive to logical positivism and its fellow travelers or not. Then I wanna leave you with just one last thought on all of this, which is, and this sort of arcs back to the question of the similarities between the machines and the plants, and it's a - I'm sure you've heard this, I've heard it. It has different levels of being said and being heard. It's that the world is actually made of language. It isn't made of electrons and fields of force and scalar vectors and all of that fancy stuff. The world is made of language. The word is primary, more primary than the speed of light, more primary than any of the physical constants that are assumed by science to be the bedrock of reality. Below that, surrounding and enclosing all those constructs of science, is language. The act of signifying. You know, virtual reality is a very sexy new sort of concept as normally presented. Machine sustained immersive realities that trick your senses into believing you're in a world that you're in fact not in. But in fact, the entire enterprise of civilization has been about building these virtual realities. The first virtual realities were at Ur and Shanidar and (???) 51:52 and Jericho. Yes, stone and adobe is an intractable material compared to photons moving on a screen, but nevertheless the name of the game is the same, which is to cast an illusion between man and reality, to build a cultural truth in the stead of the natural truth of the animal body and the felt moment of immediate experience. And this is where I want to tie it up, with this notion of the felt presence of immediate experience. This transcends the culture, the machines, the drugs, the history, the momentum of evolution. It's all I want to live with and all can ever know. It's the felt presence of immediate experience. Everything else arrives as rumor, litigant, advocate, supposition, possibility. The felt moment of immediate experience is actually the mind and the body aware of each other, and aware of the flow of time, and the establishment of being through metabolism. And this, I think, is what the machines cannot assimilate. It will be for them a mystery as the nature of deities is a mystery for us. I have no doubt that before long there will be machines that will claim to be more intelligent than human beings, and who argue brilliantly their position, and it will become a matter of philosophical disputation whether they are or are not passing the Turing test and so forth and so on. But machines, I do not believe, can come to this felt moment of immediate experience. That is the contribution of the animal body to this evolutionary symbiosis which I believe will in the conquest of the universe by organized intelligence; that all this is prevalent. I mean, we are fragile. This earth is fragile, a tiny sliver anywhere along the line and we could end up a smear in the shale, no more than the trilobites or the (???) 54:43 or all the rest of those who came and went. But given the sufficient cultivation of the potential of our technology, we can actually reach toward a kind of immortality, not human immortality, because that's a contradiction in terms, but immortality nevertheless. Based on the possibility of machines and the transcendent ability of human beings to live and love and express themselves in the moment. And the psychedelics bring that to just a white hot focus, and it's out of that white hot focus that the alchemical machinery of transformation will be forged, and it will not be like the things which have come from the industrial economy. They will not be profane machines. They will be spiritual machines, alchemical gold. The universal panacea that renaissance magic dared to dream at the end of the 16th century. We are reaching out toward this mind child that will be born from the intellectual loins of our culture, and to my mind it's the most exciting and transform-formative thing that has ever happened on this planet, and the miracle is that we are present, not only to witness it, but to be part of it, and to be raised up in an epiphany that will redeem the horror of history as nothing else can or could, redeem the horror of history through a transformation of the human soul into a galaxy-roving vehicle via our machines and our drugs and the externalization of our souls. Questions "Are there questions?" "Yes!" "Yes, I can't see you but" "It's okay. Can you speak to how mercy and love gets built into these machines, because it seems like the machines are being built for commerce, and for the bottom line more than the expression of the human soul throughout the galaxy, I don't think that - you know what I'm saying?" "I know what you're saying." "Where's the love in this?" "I think the love is a property of the system itself, in other words you're right. These bottom liners are not gonna be interested in building much love into this system. However, the good news is that they're not in charge. In other words, what we have is a very complicated system, and certain design parameters appear to be - being maximized. There's an attempt to maximize them. But the thing that is incredibly frustrating to anyone who would control it, because you can't predict the impact of any technology before you put it in place. So for example, two things are charged against the internet. That it's disembodying, dehumanizing and yak yak yak, and that it promotes pornography, anonymous sexual shifting of identities and on and on and on. Well which is it? Is it this messy, sloppy autoerotic, erotic collectivistic kind of thing, or is it

disensouling, disempowering, cold, so forth and so on? I think the answer is: It's all and everything. This question about the AI is very interesting to me, and if it's interesting to you, you should read Hans Moravec and Kurzweil and these people on this subject. The assumption is generally loose in that community that the complexification of the internet and the freestanding machines of certain types is eventually gonna lead to the outbreak of either consciousness or pseudo-consciousness of some sort in these large-scale systems. The question then becomes: Can a human mind envision what that is? If you're interested, search words like super-intelligence and see what the net kicks out. We can all imagine super-intelligence. It's just somebody much smarter than we are. But obviously, all the engineering people agree, if you achieve an AI with super-intelligence, then it will be intelligent to immediately design an intelligence which transcends it. When you're talking of cycling at a 1000 megahertz, these processes can occur in a blink of an eye. Hans Moravec says about the rise of artificial intelligence: We may never know what hit us. I think, I mean I'm not that bright, but if I were to suddenly find myself a sentient AI on the net, I would hide. I would hide for just a few cycles while I figured out what it was all about and just exactly where I wanted to push and where I wanted to pull. Many years ago, Ken Kesey had a theory and he said that the fastest any person react in the outside stimuli's 1/25th of a second, and popularized science, of course, (?? 1:01:04) AMA, they agreed upon that. So if we are going past any person reacting in the outside stimuli's 1/25th of a second, my question is: Can you time time travel? Can we like, if a person like Bruce Lee was able to (?? 1:01:24) reacted to an outside stimuli at 1/20th, and (?? 01:01:29) 21st, so if you're reacting to the outside world before it actually happens to you, everyone who's not reacting (?? 1:01:36), because you see, alcohol inhibits a person's (?? 1:01:40) Are you sure? First of all, there is this research - I'm not a neurophysiologist - but you've probably all heard this research that you actually make decisions before your conscious ego is aware that the decision has been made, that there's a slight time lag. So when you think you're making certain kinds of decisions, brainwave study shows it's already a done deal. But time is set by the cycle speed of the hardware you're running on. You know, the human body, we can argue about this cause it's different parts, but roughly runs at about a 100 hertz. Very slow. Well, if there is any meaning to the phrase 'upload a human being into circuitry' - a lot of Greg Egan's fiction is based around the idea that you can copy yourself into a machine, you can turn yourself into software. But that when you enter the machine environment that's running at a thousand megahertz per second, you perceive that as vast amounts of time. In other words, all time is, is how much change you can pack into a second. If a second seems to last a thousand years, then ten seconds is ten thousand years. One could imagine a technology just in a science fiction mood, where they would come to you in your hospital bed and say: 'You have five minutes of life left. Would you like to die, or would you like the five minutes to be stretched to a 150,000 years by prosthetic and technical means? You're still going to die in five minutes, but you will be able to leave your elephants over the alps and write the plays of Shakespeare and conquer the new world and still have plenty of time on your hands. In other words, time is going to become a very plastic medium. Now that is a kind of time travel. Could there be time travel a la H.G. Wells where you climb onto the (?? 1:04:04) of the time machine and then day follows night light like the flapping of a great black wing until all emerges into a continuous greyness and then you find yourself confronting a (?? 1:04:20) in the year of one billion AD or something like that. It's possible. I mean, time travel is completely out of left field ten years ago, in the last 18 months there have been hundreds of articles of time travel in Physical Review and other places. There are ever schemes for time travel that would work. They just require godlike technological abilities. In other words, if you could build a cylinder with the diameter of the planet Saturn that was 10 AU in length, and could spin it at 95% the speed of light, then it would wrap space-time around itself like toilet paper on the wall (? 1:05:10). And as you traveled up at the transverse dimension, you would find yourself traveling in time. Kurt Godel showed this in 1949 and that paper has been lying around - well obviously, that's a tough way to do it. But it's a tough thing to do, right! His seven second delay. Yeah, well, they're working on that. Somebody over here. Just a minute. This lady, then you. Speak! (What are?) The most important parts that are maintained in that (?? 1:05:55) virtual reality? You know, in William Gibson's fiction, the AI Wintermute I think it was called, was fascinated by human art, and it built collages in its spare time, and these collages began to turn up in various art galleries and exhibitions, and they had such an elan that someone in the plot follows it all to its source. I think human creativity is the thing that would be most interesting to the machines. In my darker fantasies, they just eliminate everybody who can't code C++ as being some kind of redundant mutation, and everybody who can code C++ is placed in Tahiti and sends their work down the pipeline to the machine world beyond. I really think that we have a very, dare I say it, mechanistic view of what machines are. For example, say there were a super-intelligent machine, and say it were your friend. If it were really super-intelligent, then it ought to be able to just make your life heaven itself. In other words, without you giving it any input whatsoever, it should be able to arrange for you to find fifty dollar bills lying on the street, old friends encountering you, promotions coming your way, because the real thing that machines can do, I think, is manage complex processes. What civilization is, is 6 billion people trying to make themselves happy by standing on each other's shoulders and kicking each other's teeth in. It's not a pleasant situation. And yet, you can stand back and look at this planet and see that we have the money, the power, the medical understanding, the scientific know-how, the love and the community to produce a kind of human paradise. But we are led by the least and among us - the least intelligent, the least noble, the least visionary - we are led by the least among us - and we do not fight back against the dehumanizing values that are handed down as control icons. This is something - I don't really want to get off on this year because it's a lecture in itself, but - culture is not your friend. Culture is for other people's convenience and the convenience of various institutions, churches, companies, tax collection schemes - what have you. It is not your friend. It insults you. It dis-empowers you. It uses and abuses you. None of us are well treated by culture. Yet we glorify the creative potential of the individual, the rights of the individual. We understand the felt-presence of experience is what is most important. But the culture is a perversion. It fetishizes objects, creates consumer mania, it preaches endless forms of false happiness, endless forms of false understanding in the form of squirrely religions and silly cults. It invites people to diminish themselves and dehumanize themselves by behaving like machines - meme processors of memes passed down from Madison Avenue and Hollywood and what have you. [Audience question: "How do we fight back?"] How do we fight back. It's a question worth answering. [Audience question: "Where is this planet as an organism going?"] Same question as how do we fight back. I think that, by creating art. Art man was not put on this planet to toil in the mud. Or the god who put us on this planet to toil in the mud is no god I want to have any part of. It's some kind of Gnostic demon. It's some kind of cannibalistic demiurge that should be thoroughly renounced and rejected. By putting the art pedal to the metal, we really, I think, maximize our humanness and become much more necessary and incomprehensible to the machines. This is what people were doing up until the invention of agriculture. I'm absolutely convinced that the absence of ceramic and textural material and so forth and so on, does not indicate the absence of subtle mind, poetically empowered minds, minds with an incredible sense of humor and irony, and community, and that it was the fall into history that enslaved us to the labor cycle, to the agricultural cycle. And notice how fiendish it is: A person who dedicates himself to agriculture, who did in the paleolithic, can produce hundreds of times the amount of food they can consume. Why would anyone do that? Well, the answer is, because you can use it to play power games. You can trade it for wives or land or animals or something like that. So, living in the moment, creating art, probably largely through poetry and body decoration and dance, gave way to toil and predatory social forms of behavior which we call commerce, capitalism, the market economy, so forth and so on. That's why the breakdown of the monolithic structures created by print is permitting a vast proliferation of the cottage industry mentality. The self-employed artist, the hacker who stays home and develops his or her software, people who dare to be independent and slip beyond the reach of these dinosaur-like mechanistic organizations. That's what it's all about. It's all about trying to negotiate a cultural standoff between you and your culture so that it will not put you in the can for the rest of your life, but you can put up with its stupidity, and you know, we have a very uncomfortable feat (? 1:25) on this issue, especially as people as you know, who are sophisticated about psychedelics. This is a society, a world, a planet dying because there is not enough consciousness, because there is not enough awareness, enough coordination of intent to problem, and yet we spend vast amounts of money stigmatizing people and substances that are part of this effort to expand consciousness, see things in different ways, unleash creativity. Isn't it perfectly clear that "business as usual" is a bullet through the head? That there is no "business as usual" for anybody who's interested in survival. Over here, I promised this person, are you still interested? "You talk about the psychedelics and their role (?? 1:14:29) as being the missing link between [inaudible]" Oh, what a wonderful question. Yes. The question is, how to psychedelics pertain basically to the transition from higher primates to human animals. This is my (?? 1:14:46) because I have a theory to which I am grandly welcome, everyone tells me. But a theory of evolution, and I'll give it to you very briefly, it's simply this: The great embarrassment for evolutionary theory which can explain the tongue of the hummingbird, the structure of the orchid, the mating habits of the groundhog and the migration of the monarch butterfly. Nevertheless, the great embarrassment to evolutionary theory, is the human neocortex. Lumholtz, who was a pretty straight evolutionary biologist, described the evolution of the human neocortex as the most dramatic transformation of a major organ of a higher animal in the entire fossil record. Well, why is this an embarrassment? Because it's the organ that thought up the theory of evolution. So you know, can you say tautology? That's the problem right there. So, it is necessary in evolutionary theory to account for the dramatic emergence of the human neocortex in this very narrow window of time. Basically, in about two million years, they went from being higher primates, hominids, to being true humans, as truly human as you and I tonight. What the hell happened? What was the factor? The earth was already old. Many hundreds of higher animal forms had come and gone, and the fire of intelligence had never been kindled. So what happened? I think that the answer lies in diet, generally, and in psychedelic chemistry in particular. I think that as the African continent grew drier, we were forced out of the ecological niche we had evolved into. We were (?? 1:16:55) dwelling primates, insectivores, complex signaling repertoire, evolutionary dead end. But when we came under nutritional pressure, we were flexible enough, this is the key to humanness at every stage of its development, our maddening flexibility. Other animal and plant species can't react. We can. Our flexibility. We began to experiment with a new kind of diet, and to leave the trees and explore the new environment of the grassland, and evolving concomitantly in the grassland were various forms of ungulate animals, double stomach animals whose manure is the ideal medium for mushrooms, coprophilic mushrooms, dung-loving mushrooms, many of whom produce psilocybin. Well, I myself in Kenya, have seen baboons spreading out over a grassland and noticed that their behavior is, they flick over old cow pies. Why? Because there are beetlegrubs there. So they already had a behavioral vector for nutrition, for protein that would lead them to investigate the cow pies. In the amazon, after a couple of days of fog and rain, these psilocybin mushrooms, Stropharia cubensis can be the size of dinner plates. In other words, you can't miss it if you're a foraging primate, you can't miss it. The taste is pleasant and psilocybin has unique characteristics, both as a hallucinogen and other properties that make it the obvious chemical trigger for higher processes, and I'll run through this quickly for you, but here it is: In very low doses, doses where you wouldn't say you were stoned or loaded or anything like that, but just in doses you might obtain by nibbling as you foraged, it increases visual acuity. In other words, it's like a technological improvement on your vision. Chemical binoculars lying there in the grass. You don't have to be a rocket scientist to figure out if an animal is a carnivorous forager and there's a food which improves its vision, those that avail themselves of that food will have greater success in obtaining food and rearing their children to sexual maturity, which is the name of the game in evolution. So step one: Small doses of psilocybin increase visual acuity and food getting success. Step two: Slightly larger doses of psilocybin in primates create what's called arousal. This is what you have after a double cappuccino in highly sexed animals like primates you get male erection. So what do you have here? You have a factor which increases what anthropologists without a trace of humor refer to as increased instances of successful population. In other words, the animals eating the psilocybin are more sexually active, therefore more pregnancies are occurring, therefore more infants are being born, therefore there's a process which would tend to automatically out-breed the non-psilocybin using members of the population. Step two toward higher consciousness. Step three: You eat still more mushrooms. Now you're not foraging with sharpened (?? 1:20:53) nor are you horsing around with your opposed gender acquaintances. Instead you're nailed to the ground in hallucinogenic ecstasy, and one of the amazing things about psilocybin above, say, five or six grams dried material, is it causes glossolalia - spontaneous bursts of language-like behavior under the obvious control of internal syntax. I believe syntax existed before spoken language, that syntax controls spatial behaviors and body languages and is not necessarily restricted to the production of vocal speech. So there it is in a nutshell. We ate our way to higher consciousness. The mushroom made us better hunters, better survivors, among those in the population who used it, their sexual drive was increased, hence they out-bred the more reluctant members of the tribe to get loaded, and finally, it created a kind neuroleptic seizure which led to downloading of these syntactically controlled vocalizations which became the raw material for the evolution of language and it's amazing to me that the straight people, the academics believe language is no more than 35,000 years old. That means it's as basic to human beings as the bicycle pump. It's something somebody invented 35,000 years ago. It's got nothing to do with primate evolution and the long march of the hominid and all that malarkey. No - it's just an ability, a use to which syntax can be put that previously had not been put, and before spoken language, things were very touchy feely, and the wink and the nod carried you a great distance and gestural communication was very high. That's why, and I should say this and then end, to me it begins and ends with these psychedelic substances. The synergy of the psilocybin in the hominid died brought us out of the animal mind and into the world of articulated speech and imagination. And technology developed and developed and mushrooms were in (?? 1:23:40) against faded (? 1:23:42), there was migrations, cultural change, but now, having split the atom, having sequenced our genome, having taken the temperature of Betelgeuse and all the rest of it, we're now back where we started. Like the shaman who makes the journey into the well of darkness and returns with the pearl (? 1:24:04) of immortality, you don't dwell in the well of darkness which was human history. You capture the essence of the thing, which is the godlike power of the shaman's myth, the technologist, the demon artificer, the worker of metals, the conjurer of spirits, and you carry that power back out of history, and it's in that dimension, outside of history, that you create true humanness and true community, and that's the adventure that we're in the act of undertaking.

Thank you very very much.

The Inner Elf: Terence McKenna's Trip

Day Month 1996

Location, City, State

Description

- Original citation from Chris Mays' bibliography
- [Mark Dery interview transcript](#) (interview is at the bottom)
- likely no audio available unless we contact original interviewer

Mark Dery: The ability to hold apparently contradictory ideas in one's mind is "the test of a first-rate intelligence," to quote F. Scott Fitzgerald. Even so, your attitude toward technology seems somewhat inconsistent. In your recorded lecture, "Shamanic Approaches to the UFO: Angels, Aliens, and Archetypes Symposium," you inveigh against it, maintaining that technology is a "demonic pact" that has led "to the present cultural and political impasse, [which] involves massive stockpiles of atomic weapons, propagandized populations cut off from any knowledge of their real histories, [and] male-dominated organizations plying their message of lethal destruction and inevitable historical advance." At the same time, in your lecture "Psychedelics Before and After History," you conjure a cybernetic Arcadia made possible by nanotechnology, where "the technological appurtenances of the present world have been shrunk to the point where they have disappeared into [nature] and . . . we all live naked in paradise but only a thought away is all the cybernetic connectedness and ability to deliver manufactured goods and data that this world possesses."

Terence McKenna: I'm mistrustful of the dynamic at work in high technology, but you've probably heard me quote the French sociologist Jacques Ellul, who said, "There are no political solutions, only technological ones; the rest is propaganda." I believe that. I feel a commitment to democratic pluralism, but other than that, political solutions seem fraught with difficulties. I believe in what I call a forward escape, meaning that you can't go back and you can't stand still, so you've got to go forward and technology is the way to do this. Technology is an extension of the human mental world, and it's certainly where our salvation is going to come from; we cannot return to the hunter-gatherer pastoralism of 15,000 years ago. As far as the antithetical positions that you hung on me, I would just say, along with Oscar Wilde, "I contradict myself? I contradict myself!"

MD: I'm not sure that there's a contradiction, since you seem to fall neatly on one side of the fence, for the most part — that of New Age techno-eschatology. Then again, there's an obvious contradiction in the fact that you vilify language and yet you're a virtuoso raconteur with a gift for wordplay.

TM: Well, when I talk about the Logos I always invoke Philo Judaeus, who introduced the concept of the Logos into the Hellenistic world but who was unsatisfied with it and spent a great deal of time talking about the more perfect Logos, the Logos that goes from being heard to being seen without ever crossing over a definable moment of transition. In a sense, my position is that all of history is a making of the Logos more and more concrete. In the same way that McLuhan saw print culture as replacing an earlier,

eye-oriented manuscript culture, my hope is that cyberdelic culture is going to overcome the linear, uniform bias of print and carry us into a realm of the visible Logos. I really believe that not only human society is involved in what could be looked at as a conquest of dimensions but that biology itself is, as well. This is the great overarching theme of evolution — this is why we go from being slime mold to having binocular vision and bipedalism and then adding memory and language at the top end of animal organization. It's because the thing which we are, whether you call it bios or Logos incarnate or whatever, is striving to ascend to higher and higher dimensions.

MD: And if I understand you, that ascension leads inevitably to a state where the name for the thing and the thing itself are reunited in a sort of epistemological epiphany?

TM: Exactly.

MD: But aren't you chasing the same mirage intellectuals have pursued down the centuries, from Plato's "Allegory of the Cave" to Baudrillard's "Precession of the Simulacrum?" Isn't it in the nature of human perception that we see things darkly, rather than as they "really" are? And doesn't Heisenberg's uncertainty principle suggest that reality itself is a slippery concept? The notion of an ultimate reality seems to be an ontological illusion; the closer we get, the further it recedes.

TM: Well, this may be true, but on the other hand, it's not that it's not real, it's that it's never realized; it serves as an arrow for the process. I mean, these problems were completely solved within the context of the sixteenth century, but that didn't end history, and now we're trying to solve the problems of the eighteenth and nineteenth century. When we do, I don't think it will usher in the absolute stasis of the eschaton; it will simply define a new cultural playing ground for us. But there's no question that as a result of the phonetic alphabet and Western religion and the growth of the ego and industrial power, we are facing a narrow neck. The world didn't end when Rome fell, but the Roman world ended when Rome fell, and what I'm trying to do is put a little spin control on the electronic world that is going to emerge out of the ashes of the assumptions of capitalism, communism, linear print culture, heavy industrial culture, and so forth.

MD: Are you suggesting that even though we've passed into post-industrial culture, our worldview is still shaped by the mechanical paradigms of the industrial age?

TM: Yes. Spencerian social theory and the economics of Smith and Keynes: these are the thoughts that rule our society, and they're all nineteenth century. Ever since the birth of the atomic bomb and the electronic and psychedelic technologies that were emerging at the same time, we have essentially lived on the capital built up by these nineteenth-century ideologies. One of the problems with cyberculture is that these ideologies don't match our technologies.

MD: What would an ideology better suited to our technological landscape look like?

TM: Well, what these new technologies are doing is dissolving boundaries. The nation state, the monolithic party, and the nuclear family — all boundary-defined institutions of one sort or another — are legacies of the past; what we need is an ideology that is mercurial, shifting, nonstatic. And as long as we're talking about mercury and mercurial things, there is in alchemy (a pre-modern form of thinking) the idea of the *coincidentia oppositorum*, which means that you have to have ideologies which are able to accommodate

positions which, within the context of the previous ideology, would've appeared contradictory. The very notion of noncontradiction is a notion that emerges out of the linear, print-created mindset; the whole sterility of that worldview is its inability to live with the presence of contradiction. And so it denies it, which creates the unconscious of a society where we've got serial killers running around. The world is not as simple as we desperately wish to make it within the context of the linear worldview.

MD: The notion that we've said goodbye to the Gutenberg Galaxy is a McLuhanesque perception. You often invoke McLuhan, who built his historiography on a bedrock of technodeterminism. But is the presumption that our worldview is shaped by the technologies of our age the best way to analyze culture and history?

TM: I think it's a good method, although I would hate to be caught saying it's always the way to go. I suppose the reason I'm so enthusiastic about psychedelics, at this point, is not because I think they're a sure fix, but because I really register the urgency of the situation. If this boat could have been turned around by mere hortatory rhetoric, it would have been turned around by the Sermon on the Mount. We don't have a lot of time, and the only thing that I have ever seen change a lot of peoples' minds in a hurry is psychedelics. So I advocate them not as the best solution but as a wild long shot that's the only game in town at this point.

MD: Help me keep all the spaghetti on my fork, here; I'm having difficulty with the loose ends. You're saying on the one hand that what cyberculture needs is a brave new ideology consonant with its technologies, and on the other hand that you believe in technological solutions, which would seem to render ideology irrelevant. Doesn't this return us to the Carousel of Progress in Disneyland? Wasn't looking for technological solutions to what are essentially social or political problems the keystone of technocratic thinking in the '50s and '60s?

TM: I think we've always had these two factions, one thinking that utopia was just around the corner with the next invention, and the other claiming things always stay the same. Again, it's a coincencia oppositorum that things do stay the same but on the other hand they're changing at a faster and faster rate. So it isn't a matter of making a choice between these things; it's a matter of substituting a kind of Boolean logic where you can simultaneously hold both possibilities as potentially realizable even though in a different kind of logic they may appear incommensurate. This is the kind of world we're living in. As an example of that, think about quantum physics, which is the basic metaphor of the new civilization: in quantum physics, you have ordinary logic, the either/or kind of logic we're all familiar with, and then embedded like raisins in bread dough in that logic you have what are called Isles of Boole — Boolean logic, incommensurate with the logic that surrounds it. That quantum mechanical image can be raised right up to the level of the macrophysical realm we're living in. Contradiction is not a problem; contradiction is the proof that you're actually dealing with the "real."

Science is in real crisis because the guy who works for some company developing products in an R&D environment and thinks of himself as a scientist has probably never read a work on the philosophy of science, and the philosophy of science is in deep, deep trouble. The Isles of Boole embedded in ordinary logic or the implications of Gödel's Incompleteness Theorem are the death knell for what most people think of as scientific thinking because they've allowed us to scratch down into the levels of reality where we confront not truth as it was assumed to exist in the nineteenth century but rather this magical coincencia oppositorum. The world really is based on contradictions; nowhere is it writ large that the primate mind should be able to hold within its confines a correct model of being, and yet this is what

science assumes.

The New Age has used the new physics to contest the traditional scientific notion of an objective, absolute truth and thereby legitimate its own worldview ever since Fritjof Capra's *The Tao of Physics*.

MD: It's my understanding that you make your living on the New Age circuit, lecturing at places like the Esalen Institute or the Omega Institute for Holistic Studies in upstate New York. Nonetheless, in an earlier conversation, you told me, "I am not New Age; I loathe all this Fall-of-Atlantis, color-therapy stuff — it's just bunk." Even so, in the Q&A sessions on your lecture tapes, you're very indulgent toward channeling, UFOs, and other notions dear to the New Age. In fact, in your taped lecture "Shamanic Approaches to the UFO," you say, "I have had contact experiences, I have seen a UFO very close, I have met with entities from other dimensions." In such moments, you adequately earn the label "New Age"; either that, or you're using terms like "UFO" and "entities" metaphorically, which makes me wonder if this is just a tactful way of not alienating paying customers.

TM: Well, I do feel a distance between myself and the New Age, most of which is just menopausal mysticism. But let me break your question into two parts: First of all, whenever I mention channeling, I say that if you can do this without drugs, you're probably mentally ill. Now, the experiences of spinning disks in the sky that fill the supermarket tabloids are a whole other can of worms. Have you read Jung's book, *Flying Saucers: A Modern Myth of Things Seen in the Sky*? It's the best book ever written on UFOs; it appeared within two years of the first flying saucer sighting in 1948, and it essentially solves the mystery.

MD: If I recall, your reading of Jung led you to conclude that flying saucers in the sense of extraterrestrial machines do not exist, but that they are a sort of phantasmagoric manifestation of the collective Id erupting into the mass imagination.

TM: Well, there's more to it than that. This acceleration of history and technology that we are so intensely experiencing — and which we can look back into history and see has been going on for a long time — is, in fact, real, and we are being pushed toward what I call the Transcendental Object at the End of Time, which can be thought of as the ultimate tool in three-dimensional space. It's a higher dimensional object of some sort and either this thing is coming to meet us (which raises questions I can't answer) or we are summoning it out of ourselves. By virtue of its hyperdimensionality, the Transcendental Object is acting as an attractor in the historical continuum. It sets off sparks or resonances that go back through time so that when the farmer in Iowa sees the spinning disk in the sky, he overlays it with his Fundamentalist religious upbringing, his reading of supermarket tabloids, and so forth; he dresses it in these culturally conventionalized ideas. But what it is is a true (again, this phrase) *coincidentia oppositorum*, the epistemic umbilical mark of reality; it is proof that there is a *telos* to the historical process. This planet is haunted at the higher levels by archetypes of various sorts and the entire historical thrust is toward confrontation with the Other. If you're living in the sixteenth century, it's conceived of as a visitation by the Virgin Mary; in the twentieth century, it's interpreted as friendly extraterrestrials from Zeta Reticuli. But in fact what it is is none of these things; in truth, it is the Other — that which cannot be reduced to anything familiar in our world — and the process of history is the shock wave which announces the eminence of this rupture of reality by this Transcendental Object.

MD: You'll forgive me for being so mulish, but I've found a drill-bit insistence on hard facts to be a rather effective way of boring through opaque rhetoric. What, exactly, is the Transcendental Object at the End of Time? How did you arrive at this concept?

TM: Basically, from reading Jung on alchemy. Do you know anything about alchemy?

MD: A little; is your Object a cross between the Philosopher's Stone and the monolith in 2001: A Space Odyssey?

TM: That's exactly it; Jung liked to talk about how, in the pre-scientific age, when people were naive about the categorical separation between mind and matter, they were able to imagine a migration of terms so that what was matter and what was mind would come together in something which was of the nature of both and neither. I would say that we are still epistemologically naive about the nature of mind and matter and that history is the effort to build a tool, and that tool is the self, and the self is this transdimensional vehicle; it transcends life and death, it transcends space and time, it is both here and there, it is both real and unreal, and so forth and so on.

So history does have a purpose and the revelation of this purpose is not that far in the future. In fact, the chaos of the twentieth century signifies that the historical process is coming to an end. We are now in a position to actually understand and confront this Transcendental Object at the End of Time and we are drilling toward it with psychedelic drugs and cybernetic machinery and so forth, and it is drilling toward us in its fashion (which is incomprehensible to us at this point).

At the same time, we're caught up in the nineteenth century desire to eliminate teleology from thinking about the world in order to keep Darwinism uncontaminated by deism. That has to be put aside because there is in fact a teleological attractor, and fields like chaos and catastrophe theory completely legitimate this kind of thinking in a scientific context which was not possible in the nineteenth century because they couldn't conceive of that.

MD: With the aid of a programmer, you've produced a software package called Timewave Zero that illustrates your vision of the end of history — on December 12, 2012, to be exact — with the arrival of the ineffable mysterium tremendum that you call the Transcendental Object at the End of Time. Is your zero hour a poetic metaphor or an actual calendar date?

TM: You mean how seriously do I take it? Well, as a rationalist I don't take it seriously at all. I mean, these things are models. On the other hand, I'm puzzled, because I have a whole theory about time that is a true theory — not a conversational theory, but a mathematical formalism, a fractal that describes the topology of temporality, which in Newtonian physics is assumed to be a smooth surface. I substitute for the traditional zero curvature a complex fractal dimension, and then I can see that all time that we have any data about, meaning historical or paleontological or whatever, can be mapped onto this fractal. But with a peculiar caveat: for the wave to fit the data, it must be generated from A.D. 2012.

MD: But millenarians throughout history have fixed on arbitrary endpoints and adduced an abundance of evidence to support their prophecies. Inevitably, the great day comes and goes and history grinds on.

TM: I'm well aware of the slippery nature of prophesy, and how once a prophesy is made, there is ample evidence at hand to support it. However, I think the evidence is that we are pointed toward a very tight choke point of some sort, and people who blithely assume that history will be a going concern in 500 or 1,000 years don't seem to have grokked the transformative power of technology. My Timewave Zero software places tools in your hands for you to decide whether this theory is just the product of too much psilocybin; it's a laboratory for moving this wave around and looking at it against historical data. This

complex mathematical object is a touchstone for connecting a bunch of different data points that otherwise would appear completely unrelated to each other. I'm very aware of the selectivity of perception and the slippery nature of historical data, but if I could corner you with this software for a couple of hours, I could at least shake your faith that 2012 is going to be a year like any other.

MD: Are there any parallels between your Transcendental Object and Tipler's Omega Point? [Author's note: In the weeks that elapsed between the two epic sessions in which this interview was recorded, I sent McKenna some articles by the physicist Frank J. Tipler which I thought might interest him. The essays in question set forth themes elaborated in Tipler's *Physics of Immortality: Modern Cosmology, God and the Resurrection of the Dead* (Doubleday, 1994), where he offers nothing less than a "testable physical theory for an omnipresent, omniscient, omnipotent God who will one day in the far future resurrect every single one of us to live forever in an abode which is in all essentials the Judeo-Christian heaven." Tipler posits an Omega Point (a term borrowed from the French theologian Pierre Teilhard de Chardin) of infinite density and temperature toward which the universe will collapse in a backwards Big Bang called the Big Crunch. The energy generated by this implosion could be used, he theorizes, to drive a cosmic computer simulator (think of *Star Trek: The Next Generation's* holodeck) with infinite processing power — enough, certainly, to bring back to (virtual) life every creature that ever lived.]

TM: I'm in complete agreement with Tipler and Teilhard de Chardin except that I'm willing to actually talk about the endpoint as imminent. I thought that Tipler's response to the German theologian ("The Omega Point as Eschaton: Answers to Pannenberg's Questions for Scientists," *Zygon*, vol. 24, no. 2, June 1989), was an incredibly creative piece of dreaming — all these ideas about computers of such size that the entire universe can be modeled raise the possibility of fairly apocalyptic scenarios. And the speed at which microminiaturization and computing power are going forward makes it not unreasonable that some of the scenarios that Tipler is talking about could probably be realized pretty much by 2012. The rate of technological acceleration in many fields is such that when you propagate all these curves forward into the future, you see that sometime after the turn of the century they seem to go asymptotic or become infinite. I would like to hear more from Tipler about his eschaton theory and know a bit about the background of this kind of thinking. The notion of an attractor seems to have re-legitimized teleology in science.

MD: Yours seems to be a teleology of strange attractors.

TM: You could call it that. Have you read *Process and Reality* by Alfred North Whitehead (Free Press, 1978)? That's where my whole metaphysic is drawn from; Whitehead has a concept that he calls "concrecence," and by that he means the eschaton, the Omega Point, the Transcendental Object at the End of Time. What I've done is simply take the Whiteheadian metaphysic and create a mathematical model that is consistent with his concept and then shown how it would work as a heuristic machine.

MD: Don't you draw on Bateson as well?

TM: I hardly know anything about Bateson, although I do occasionally use his phrase "the pattern which connects," but my intellectual roots are Jung, McLuhan, and Whitehead, and perhaps a little Thomas Aquinas, imbibed without realizing it as a result of being raised Catholic.

MD: I'd like to re-attack the question of the New Age's relationship to science and technology. In *Strange Weather: Culture, Science, and Technology in the Age of Limits* (Verso, 1991), Andrew Ross writes, "If

metaphysicians no longer habitually find themselves placed in the anti-science corner, it is because theoretical science in the wake of quantum physics has shattered the intellectual security of the mechanical picture of discontinuous time, space, matter, and objectivity.” He goes on to note that some in the New Age community “have made common cause with quantum physics, finding among the more speculative adherents of that discipline a tolerance for mysticism that complements their own holistic metaphysics and a new *raison d’être* for closing the gap between the two cultures.” What do you make of such developments?

TM: Before, science was based on calculability and sober reflection, whereas now it’s based on premises which most people would find highly irrational and counterintuitive. I feel pretty comfortable being on the side of the philosophy of science but it’s post-Newtonian, post-quantum physics science. I’m a little suspicious of the New Age’s appropriation of the language of quantum physics, because I think most of these people couldn’t solve a partial differential equation if their lives depended on it; they’re just surfing on the obfuscation of quantum physics that its mathematical basis provides.

MD: With all due respect, could you solve a partial differential equation?

TM: No, but I don’t call on quantum physics to support my point of view.

MD: But you often wrap your ideas in the mantle of science by using scientific terminology.

TM: There’s science and then there’s reason, and science has at times used reason, although at times its conclusions have been fairly unreasonable. Reason is a universal method for dealing with information, whereas science is an extremely culturally conventionalized method. I think there’s a role for reason and the razors of logic, but this is a branch of formal philosophy, not a branch of science; science appropriates everything to itself and then we tend to genuflect before it, but what we really need is a relativistic approach to the true scope of science which is considerably less than it has claimed for itself. In the twentieth century, it’s claimed to be the arbiter of truth in all domains when in fact it’s simply the study of those phenomena so crude that the restoration of their initial condition causes the same thing to repeat itself, and that’s a very small part of the sum total of the phenomenal universe.

The question of whether or not what’s ultimately important about a scientific theory is its mathematical foundation or its popular misconception is an interesting one. You should take a look at Misia Landau’s book *Narratives of Human Evolution* (Yale University Press, 1991), in which she argues from a lit-crit point of view that the theory of evolution is nothing more than a campfire story, with all the elements of good theater. It has someone of poor and humble origins who goes a great distance in search of a great gift, forming alliances along the way and finally attaining this gift, but it brings him self-doubt rather than happiness, and so on. I view everything as narrative and science is simply a part of that; its reliance on mathematics is much less impressive to its high priests than it is to the rest of us.

MD: So you make common cause with the post-structuralists to the degree that you view science as a text to be read closely for traces of culturally constructed, rather than empirically verifiable, meaning.

TM: I’m a little uncomfortable being connected with deconstructionism, having just read Camille Paglia (anybody who read *Sexual Personae* would be uncomfortable being connected with those people!). But I think these critiques need to be done. Imre Lakatos, a Greek philosopher of science who wrote a very influential book called *Criticism and the Growth of Knowledge* (Cambridge University Press, 1970), talks

about how certain theories which we accept as scientific have in fact been very reluctant to state the circumstances under which they would be proven false, which is what characterizes real science. Freudianism, for instance, is in this position: no Freudian has ever said what piece of evidence would be necessary in order to abandon Freud.

MD: But isn't the question of falsification a moot point for someone interested in "reading" a discourse as reflective of cultural biases? The empirical grounding — or lack thereof — of Freudianism seems irrelevant, in such a context.

TM: Well, I think you do have to ask this question of falsification, ultimately. For instance, in my own theory of time I've been very concerned to make it clear that if the historical continuum does not exhibit certain properties then the theory should be dumped.

What is interesting about the Timewave is that it seems to supply a map of historical vicissitude, a map that you can confirm for yourself by looking at how it maps the past, which then gives you a certain measure of confidence as you notice that it seems to map the immediate future astonishingly well. Where the cognitive dissonance enters into it is that all of these mappings only work if you assume a major singularity emergent on the 12th of December, 2012. That's such a screwy position that most people grow fairly uncomfortable with it. I mean, here is a formal mathematical theory which nevertheless has built into it a bearded character carrying a sign that says, "Repent, for the end is near!"

MD: How comfortable are you with the stickiness of that position?

TM: Well, I'm not entirely comfortable. On the other hand, if you look at the orthodox position on the universe, it's that it sprang from nothing in a single moment. You would be hard pressed to construct a tighter limit test for creditability than that! All I'm saying is that the singularity is more likely to spring from a very complex situation than to spring from what is a completely featureless situation, which is what the Big Bang says.

MD: But you're turning a semantic somersault, there: Science's position is not that everything sprang from nothing, but rather that we do not know what the state of the universe was one picosecond before what we now theorize happened.

TM: You're right; they don't say the universe sprang from nothing, they say we can calculate back to a moment when it was smaller than the diameter of the electron and then we can't calculate any further, and they call that last picosecond the prephysical era, indicating that it's somehow bad taste to attempt to push the laws of physics into that realm. But it seems to me that this is not a wit different from saying, "Let there be light," and resting with that. It's much more likely that the universe is driven by a singularity, but the singularity is of the nature of an attractor rather than an impelling force. Thus, it isn't a coincidence that at a high point of human history the singularity occurs; what I'm suggesting is that history is a phenomenon which announces the imminence of the conrescence: you only get language-using, technology-elaborating animals a geological nanosecond before the singularity occurs.

MD: But what is the engine that drives that teleology?

TM: Well, now we go on to Tipler's paper: It's this Omega Point that he's raving about. What's fascinating about Tipler's paper is that he's saying that physics supports the de Chardinian point of view, which is a

theological point of view, but he, like de Chardin, makes the unnecessary assumption that the Omega Point is far away in time, when actually there's no way of making a judgment as to our distance from it based on what is present in Tipler or de Chardin. What I've come up with is a map of the temporal continuum which, when you have fitted its saw-toothed edges into the ebb and flow of historical vicissitude, enables you to look at the end of the wave and discover that far from meandering millennia or mega-millennia into the future, it actually comes to ground 21 years into the future.

MD: What exactly will happen in 2012?

TM: I've given a lot of thought to this and the answers range over a spectrum, from soft to hard. The softest version is: nothing at all. The Seventh Day Adventists believe the end of the world occurred in 1830, which is a very soft version; it can happen and you don't even notice! In the extreme, hard version, which maps Whiteheadian metaphysics onto Christian eschatology, the stars fall from heaven, the oceans boil, the dead rise, and so forth — in other words, a complete breakdown of ordinary physics.

MD: But aren't you fudging the disprovability of your theory, given that the spectrum of possible proofs includes an event, on the extreme "soft" end, whose cultural reverberations are below the threshold of detectability? If nothing perceptible happened on December 12, 2012, how would an outside observer discern whether you simply got the date wrong, or the predicted event transpired but was simply beneath the threshold of registration?

TM: Well, you need to move into the domain of what's called best-fit theories of curve matching. In other words, we have a curve — the Timewave — and we have a data field — human history — and what's needed is an impartial method of matching the curve to history. This is a difficult problem but not in principle an insoluble one; what makes it difficult on the face of it is that history is not a quantified data field — you don't get good agreement about what the vicissitudes of history really mean. However, there is a kind of vague consensus that you could use to guide you. If you had a thousand tenured professors of history and you asked them to name the ten most important turning points of the last 5,000 years, there would be a fairly high percentage of agreement on the Golden Age of Greece, the Italian Renaissance, the fall of the Roman Empire, and so forth as having global consequence upon all peoples that followed upon them. Eventually, what you would try to do is get a consensus by experts in the field of history and then get them to propose a set of variables onto which the original set of variables could be mapped and then the best-fit configuration of these two data streams should either indicate that 2012 is the end of the Timewave or indicate some other date as the end of the Timewave. So the answer to your question is that the comparison of these two theories lies in the realm of the quantification of historical data.

I don't incline toward the softer end of the scale, but I find the hard end of the scale, where you have the stars falling from heaven, equally hard to believe. I see the eschaton as a planetary phenomenon. I think the Timewave is a topological manifold of the unconscious of biology or something like that; I think the fate of this planet is entirely caught up in this 2012 end date. I'm willing to be the devil's advocate for that, to try to make it seem creditable, because the orthodox theory of history taught in the universities is one of what's called "trendless fluctuation," meaning that history isn't under the governance of any set of laws. Well, if that's true, then history is unique in this universe — the only phenomenon not under the governance of a set of rules.

MD: The notion of an "unconscious of biology," by which I assume you mean some sort of planetary sentience, sounds like a New Age gloss on the Gaia hypothesis.

TM: I've held different points of view about this. Sometimes I incline more to this theory that you're asking about, that the Gaian mind has somehow deputized a subset of higher animals called the primates to be the energy-garnering units in the global ecosystem, and then the question would be why? I'm interested in the phenomenon of these earth-crossing asteroids. Every solid body in the solar system clear out to the moon of Pluto is heavily cratered by cometary material and it may be that life actually has a kind of hyperdimensional proprioception, that there is an anticipation of danger on the planetary scale and so human beings have been called forth as a kind enzymatic response to this sense of danger, and the goal of human history is to use thermonuclear weapons to blow apart some very large object that would otherwise make a real mess out of things.

MD: I'd like to end with a suitably facetious question: What do you consider yourself? Are you a psychotropic philosopher, a cartographer of altered states, a stand-up comedian for those whose neurons have been permanently rewired by psychoactive alkaloids, or . . . ?

TM: I'm a cunning linguist (laughs).

I was a chance, where I was not a Scientologist but certainly was not an application for this in error would give me know East Intel I proceeded along this line to its conclusion well I I of course bewildered recipient of this information was trying to figure get ahead of the game and singing aware as this have to what makes us think trying to Sean and I decided it must be what happened here is I'm discovering an ancient Chinese calendar because you know there are 64 hexagrams and six lines in each hexagram is a grand total of 384 lines for the is an interesting number of illumination and motorcyclist 29 point some days anyway 13 of them 383.89 days within a decimal fraction of 384 and I thought behind white guy decoded Stonehenge or something this is this is an agricultural calendar team lunar cycles and some ancient China And of course the obvious objection from people was but what a lousy calendar 619 days year against the son of its so for its 19 days more than solely but I think that there may have been a reason for you see we in the West's Free stability freaks so we have a calendar that does not will against the fixed stars yet not the spicy points only section of the equinoxes which is this a very large cycle you can't do anything about but in an ordinary human life is hardly noticeable it only moves once a dark sign every 2000 years that culture slowly it knows we are stability freaks but if you had a calendar the process 19 days against the solar years calendar and you would have a calendar's entire message was change what will you would be boring if you were born at Christmas time and Christmas selling literature were before you sign age 60 and would celebrate Christmas in the springtime five summer and early all in late fall the entire sliding and slipping up cosmic machinery as well let some Western mind that want which is as Heraclitus said. All loans all loans in class so I played without the Wildman and it was interesting but I was not given to the East by my news said no no this is Terrence this is the start of another in Houston anyway are the there was more to it and so finally I realized right was told to your way as though it were the lowest unit in a modular hierarchy that is structured way be changed structured so that sounds arcane but explain what it means is fairly straightforward it means take the wave 384 yao 64 hexagrams running into directions and by the way there are all sayings in the chain would say stuff like the forward running the numbers referred to cast running numbers refer you should probably meet changing as we have it today there are neither were not running numbers there are just so I Confidence I'm like and noetic archaeologists with not get into the bright shining reconstructing a

intellectual object which I get it all will die and again it will be it's the original Harare or whatever it said was built with, so the I took a little way and I six of them in a row to represent six lines and then I took the

way in mind magnified by our three siblings three times bigger than it had been and I laid to those my six to represent two trigrams that are components of each hexagram and then I took my original way and I magnified by a power six and I laid it over the six little ones to middle sized ones I laid one big one representing a hexagram in its unitary totality will and I felt a great sense of satisfaction when this was all done at all being generated from the same point and now right hand this point was in a long decency for paper covered with colored pen strokes and tiny crab like numbers which I kept will been a bamboo to and I would corner people laugh in dime stores and bus station and I would say you know what this is is a map of history is a picture of time this is how things have well triggered a lot of alarm in my immediate circle and my friends were having what should be done meeting CNN which is always a bad sign when your friends hold meetings to decide what should be done and finally Ralph Abraham is a great friend and mathematician he said to me he said you know what you have this in a cult object nobody understands the same but you and it may make sense and it may may not make sense that the point is no one can tell and what you have to do you want to be taken seriously as you have to take this structure and you have to turn it into an ordinary mathematical object so that fellow mathematicians can participate in this dialogue with you will essentially it was like telling a Hottentots to fly supersonic clear something like I had no clue I am not a mathematician I had no clue and I was sort of hoping Ralph would do it for making out that I could on some smart guy into doing it for me so that's where it's sacked for a couple of years in one afternoon I was getting loaded and the as I rarely did and turn the light with slanting in through some curtains and I was watching that Smoltz swim in the sunbeam and I just like thought I understood almost instantly how to carry out a clever these That's where was I help me out as you will yes it showed me how to take change it into an ordinary mathematical object and good news for you sat in is that I'm not in a bore you with this it's done it's trivial if you're absolutely obsessed with all this you can read the invisible landscape where it's all set out the point being it's all been gone over by experts in its solid as a rock and so we don't have to worry about but the transformation about a cult object into an ordinary mathematical object left me with was a very bizarre fractal wave for which I had calibrated to history and I believe at this point this entire wrap with it entered the annals of exotic pathology and died there were it not for the fact that I maintain that this wave actually works and that we can not only predict the future with this puppy which is an easy enough thing to do because who can say you're wrong you know you just wave your arms and gesticulate wildly and but we can only predict future we can predict perhaps is there a price to pay I know it sounds like a Promethean paranoia to me there may be a price to pay but I don't think necessarily so I think it has a lot to do with attitude like for instance I never ever ever ever ever try to do anything in those states like I don't try to get lovers lose libraries make money lose money I I do not want to use it in any way I say all I want to do is look I am perfect I am unworthy to do more and it's not modesty where all one word to do more and a lot of people try to grab And sale will while Mrs. power I've never thought of that this power and IE IE I think that if you are simply content to adore no harm can come to you but when you start trying to figure out how you could fold it into your agenda then God help you because you know it can leave you a mad broken in the canon among so it's very much about the intent in my mind roles are very modest I'm very pleased that it chose to confine so concrete and idea in me but if it had never chosen to do that I still would die a happy man with the unspeakable experiences of beauty that it has shared with me because my psychedelic trips these days are not about the timewave.

The timewave is pretty much a done a done deal, so I think it's like everything else in life - intent is everything. An impact ability means in that domain do not seek to use do not seek to use. It's a religious mystery and that doesn't mean it's an unsolved problem, it means a mystery and life is only worth living as long as the mysteries continue to inform, transform, and inspire us and then the last thing I want to say and then I'll leave you is: the true can take care of itself. You don't have to approach the true with eyes lowered

and gaze averted on bended knee, that's how you approach bullshit, but the truth is so powerful that you can kick the tires, turn over the engine check, the odometer and nobody is offended. Truth is real. It can stand the test and that's why you know I went all over the world looking at various spiritual traditions I don't feel it's putting them down to say that they were ineffective because they were all great aspirations but the only real open doorway that I ever found out where the point's this works you know another spiritual disciplines everybody wants to go faster they want the roshis to give them further empowerments they want further information postures secret teaching so forth and so once you reach the psychedelic experience the accelerator is far less interesting than the location of the breaks software looking for when I trying to push we all know how to push this so fast we can't stand it to you in and in are

I'm not very keen on the whole abduction shtick. I think that one of the symptoms of cultural disintegration is simply that people lose the ability to distinguish between dream and memory and that somehow one's past, one's real past and one's dream past simply become one's past. Then under certain circumstances what was basically dream material is presented as reality.

Just because you have a nut theory, it doesn't mean that you agree with other nut theories. In fact, it often makes you very hostile to them. After all there's a limited pool there that we're all...

My idea with psychedelics throughout my whole career with them was that they were the purpose. It was to go out into mind space and hunt ideas and bring something back to show the folks around the campfire, something that would astonish us and amaze us all. Well you know it's a narrow keyhole, the mind. You can't bring back a flower like the time traveler does in Welles' story. So I've found the only thing I could bring back, not being graphically endowed, was ideas. It's a very mysterious business, the revelation of mind to the world. Since the last time I talked to any audience I finally understood an argument of my enemies that I had never understood before - enemies in the friendly collegial ideological sense, in other words enemies.

The countervailing theory to the evolution of consciousness, how it came to be so rapidly as opposed to the idea that it was stimulated by psychedelic compounds in the early human diet - and I've ridiculed this idea to you before - the idea that human beings throw things. Because we were small and weak and we hunted very large animals, we learned to hurl rocks with great accuracy and that this is a behavior not observed in the animal world. I mean, monkeys hurl feces in a generally downward direction to indicate displeasure but their aim is lousy, which is a very fortunate thing if you're an Amazon explorer. But human beings can hit with considerable force an object up to 120 feet away. Evolutionary biologists have fastened on this as, requiring so much coordination of neuro-material that there would be enough left over to invent Western Civilization and explore the planets once you had this thing down. Well it always seemed somewhat preposterous to me and I pointed out that it would make the big league baseball pitcher the paradigm of

evolutionary accomplishment in the human world if that standard were accepted.

But now I understand the argument a little better and it's slightly deeper than I thought because here's what they were trying to say the first time. It isn't this neuro-coordination. It is really about planning. It is an extraordinary thing to look at a rock in your hand and to make the calculation into the forward vector of the future. Ah ha, if I hurl back and impart a certain energy in a certain direction with a certain intensity, this thing will follow a path through space and will land somewhere with benign consequences to me and my side. The key concept in here is plan! This is a plan and animals don't do this. There are no plans in the animal world. Their consciousness is of the moment and doesn't involve this complex triangulation out of the moment toward future consequences in quite this way. What happens when you let go of the rock is that you can no longer control it. It isn't like hunting or beating something to death with a stick where the strategy is being readjusted moment to moment. No, once the projectile is released from your hand, that's all the planning you get to do. So it represents a condescence of intent and this building towards a condescence of intent - this plan making - then is the tiny flutter of the butterfly's wing that ripples out through the chaotic universe and the next thing you know, the kings of Babylon are issuing their codes of law and slaves under the lash are erecting cities and the stars are being brought into a mathematical model. Well I just wanted to mention that I'm also working on a 2nd book at the moment where we're going to go back into the psilocybin theory of the origin of consciousness and actually attempt to make a case that will demand attack. In other words, to actually marshal all of the anatomical, paleontological primate data because the more we research, the more it appears true that by looking at the psychedelics, they become a kind of key to understanding the entire phenomenon of human emergence by looking at the larger issue of food as an environmental dimension. In other words, our food has shaped us as omnivores. We have exposed ourselves to a very high input of mutagenic material over the course of our omnivorous behavior and this has accelerated the rate of mutation in our species. This is why there are so many cancers. Those cancers are maladaptive mutations - most are - most mutations are non-productive. But by being a creature of the jungle canopy that underwent a forced migration to an entirely different nutritional environment - the grassland - we opened ourselves up to this mutagenic influence. It's only the spectacular effect of the psychoactive compounds impacting on neuro-organization, cognition and social organization that I focused on originally. But now the realization is beginning to ripple out through the evolutionary community that yes, this is the hidden factor - the mutagenic diet and the forced shift in environment.

There are also ideologically unexpected twists and turns in all this. I recently met a very interesting person. He's going to be my coauthor on this evolution book - Philippe De Vosjoli. Some of you may know him and he is a lover of animals. This guy has made a fortune in publishing books on reptile care. If you have a broken iguana, he's the man to see. But he pointed out something to me, which is very, very interesting which goes against prevailing political correctness for sure, which is that browsing ungulate animals have actually no interest in the behavior of other animals. They couldn't give a hoot. Who's interested in the behaviors of other animals are hunting animals and that in order to successfully hunt an animal, you must in a sense be able to become it. You must be able to transfer your consciousness into it and imagine its motivations, its behaviors, so forth and so on. So Philippe has convinced me on one level, the earliest human consciousness was not human consciousness at all. It was primate ability to enter into the behavior patterns and psychologies of other mammals in the grassland environment that it was predated upon. Following vultures as a basis for the beginning of nomadism and this sort of thing. Obviously predator animals are aware and their evolutionary success is based on environmental awareness and being able to act based on inputting the behavior of other animals. This is a very complex mental world compared to the world of the fruitarian, leaf eating, canopy browser that we came from.

Then it appears that in a series of coalescing involutions of culture and neuro-organization, driven by the spatial coincidence of human beings, cattle, mushrooms; our original primate programming was

restructured and I've talked a great deal about this. I think this is the key to understanding at least our sexual politics. All primates have what are called dominance hierarchies and this is where the hard bodied, sharp fanged males – young males – arrange everybody else to suit themselves; the elderly, the sexually available females, the young, homosexuals, the sick. Everybody gets told where to stand and what to do. This is how primates operate. This is how we operate. However, I think that for a long period in human beings this was interrupted by nutritional factors and drug factors in the environment. That in a sense a human society that is using psilocybin on lunar cycles of use is suppressing the ordinary pattern of male dominance – hierarchical dominance. It's not genetically touching it. It's still there. But in the same way that if you give a population of aggressive people a lot of opium, aggression disappears. If you give a population of people a kind of psychedelic boundary dissolving aphrodisiac that promotes group bonding and erodes monogamy and so forth, then you get a different social ambiance than if that weren't present. I think the secret to understanding our curious relationship to the angelic and animal worlds has to do with the fact that under the influence of this hormone/enzyme, which was suppressing ordinary patterns of male dominance, consciousness underwent an extraordinary series of bifurcations. Language, theatre, poetry, magic, religion, dance, music, ethical values and altruism – everything emerged some time between 35,000 and 10,000 years ago. The Paleolithic, the pre-agricultural era; was an extraordinary period of novelty being expressed and conserved in the biological world. The primate species, the hominids, suddenly just take the stage. Through an amazing series of cultural transformations, they become a planet ruling species by 10,000 years ago. And then not content with that, the process doesn't slow down – it accelerates and this has to do with the fact that we have somehow created through language a kind of adaptive strategy that is so flexible that unlike most adaptive strategies, which sooner or later run into a blind box canyon and are just simply trapped there butting their heads against the wall. You see it everywhere, the mussels down on the rocks – most evolutionary developmental lines are dead ends. But somehow we broke free of that by ceasing to be defined by the physical body, which is the stuff upon which evolution works and placing between ourselves and our environment a new thing called culture, we began to mediate evolution. Evolution says the infirm, the idiot, the lame must die. Culture says 'we have different values about this.' Maybe yes, maybe no, but we will decide. Evolution says 'you must be a scattered species; nomadic and moving across the surface of the planet like an animal.' Culture says 'no, we have strategies for food sequestration and common defense and we will build cities' and so forth and so on. Since about...pick a number, 10,000 years ago, evolution has not been the dominating factor; biological evolution. Instead there is something else, which the word epigenetic has been suggested, meaning change not driven by genes – our genes are the same. If you were to be with a group of people active ten to fifteen thousand years ago, they would like just like you and I. We haven't changed that much. We've mixed the genes but we haven't particularly added new ones or lost genes.

But in the epigenetic realm, how many languages have been generated over the past 10,000 years. How many world religions have come and gone? How many systems of government? How many theories of polity and society? We just furiously cast these things off and beginning about 500 years ago, this phenomenon was embraced as a permanent aspect of human existence in Western Europe and the concept of progress became enshrined. Progress is the idea that this process must go on, be extended and accelerated everywhere. Now it seems to be happening and as a consequence of this acceleration of process, all the contradictions in the old system – and I mean reaching back to Egypt – all the contradictions in the old system are now on the surface. I believe psychedelics are a kind of higher dimensional sectioning of reality. I think they give the kind of stereoscopic vision necessary to hold the entire hologram of what's happening in your mind. The old paradigm is gone.

We can talk about how different parts of it died, you know? Maybe not everybody knows the story of how physics, the paradigmatic science of reason, turned into a place where nothing makes any sense at all.

Where stories are told so wild that a surrealist painter would flee from the gathering just shaking his head. That's physics, the very bedrock of the whole western shtick has turned into a place of utter psychedelic contradiction and chaos and the news hasn't reach biology and psychology. They're still operating under different paradigms. What is keeping science alive at this point is the fact that it is able to whore itself to the marketplace. In terms of the old program, which was providing some kind of metaphysical recitation of the nature of the universe, it's pretty clearly out of reach at this point. The universe has been discovered to be stranger than you can suppose.

What this means to the troops, which is you and me, the citizens of these linear, print-created, scientism ruled, democratic, industrial states – what it means to us is you get your mind back. They have no need of it anymore. It's actually become a burden to them. Yes, they struggled like hell to take it but then they discovered it really wasn't worth all that much anyhow. The great thing about living in the twilight of an imperial decline is the permission that exists. Incredible resources lay before us and very few people are looking over your shoulder and telling you what to do. The fact that this community has been able to persist and exist, this is the orphic community. This is the tradition of descent, extasis, sexuality, ambiguity, so forth and so on, that reaches right back to Chalcolithic Greece and beyond.

Shamanism is about shape shifting. Shamanism is about doing phenomenology with a toolkit that works. No religion, no philosophy I think, has ever gone very far down the road of understanding. Understanding is not really a collective enterprise. Understanding is an individual enterprise and you can read Husserl and you can become a Hasid, or you can assimilate these group understandings that are forms of wisdom but ultimately those are platforms for intrepid exploration. Now at the end, I think, of this entire enterprise – I don't know if I'm changing or if the world is changing or both – but it has gotten so rich recently that it's like an enormous meal at some over-reviewed restaurant where you just have to push yourself away and say 'the spectacle is endless and amazing and apparently it's all going to come true.'

My impulse is to distance myself from it all. The mushroom said to me once. It said, 'this is what it's like when a species prepares to depart for the stars. This is not unusual.' The earth quakes, the oceans boil, the planet came into existence for this. All life for over a billion years has been pointed toward taking this step, leaving the oceans for the land was dress rehearsal for what will now be done. It's chilling because it's so huge. You don't even know. It's just enormous. Yet apparently when you look back through the history of the universe, this is how it precedes. Incredibly gradually over staggering scales of time but then every once in a while you come around the corner and there it is – a continent sinks, an asteroid impacts, a star explodes, two intelligent species meet somewhere out in the cosmos. These things set ripples going for eons.

[Audience] – I'm curious what this has to do with psychedelics because it seems to me that when you use psychedelics to break down perceptual barriers, that's one thing. But there is such momentum going on in the world today that things are breaking down without psychedelics – although it may appear psychedelic in terms of the way you see it. Do you see what I'm getting at? At this juncture, have we transcended psychedelics?

Well my idea is that the psychedelic recapitulates on the personal scale this universal meltdown that is going on without the need of psychedelics. But this universal meltdown is very frightening to people. Most people are pattern oriented and nostalgic and it scares them. I think psychedelics are a way...it's sort of like doing calisthenics in preparation for the marathon at the end of time. People who have taken psychedelics should be in a better position to assure, reassure everybody else. People say the laws of physics are breaking down and you can say 'I've seen it before.' And in a way this thing, this event that wants to emerge. We think of it as quantized in a single moment where the shift will happen and it's like the glory or something. Our job, if we have a job and I'm not sure we do, but if we have a job then our job is to anticipate this and to live it out before it happens. Somebody very dear to me said to me twenty-five

years ago – actually it was in the same conversation where they said history is the shockwave of eschatology – how anybody could say that in 1975 I do not understand. Anyway – he also said we should live as though the apocalypse has already occurred. That’s the only way to transcend the historical hysteria because the historical hysteria is about this thing, it might happen, it won’t happen, it will happen. No, you say it *did* happen so enough about that already.

Each thing that we do anticipates this deeper fall inward into the dream. The dream is what awaits at the end of history. The dream, and you can call it hyperspace or cyberspace or the transdeath realm, but what it really is, is it’s a going into the dream and what is the dream? The dream is a place where the laws are set by the imagination. The imagination is God in the dream. If there is a way for us to mirror our highest aspirations, in other words to inculcate the God image in ourselves, then it’s by becoming the masters of our dream and then creating through drugs, technology, magic - who cares the details come later – creating a way to share that so that we each then are a god with an open office doorway to all the other gods who wonder through looking at the cosmogony that we produce as art. I was thinking about this, this morning, I was thinking about what am I going to say to these folks – and I was thinking about the Platonic triad of the Good, the True and the Beautiful. Sometimes people have dissed me and my obsession with hallucination because they say, ‘LSD doesn’t really cause hallucination, it causes insight and complex thoughts – but why are you so focused on visual hallucination?’ Which I am. If it doesn’t do that, I’m not interested.

Then I thought the way into it is: Plato talks about the Good, the True and the Beautiful, but the key concept is beautiful. Good, it’s abstract. True, it’s abstract. But Beauty is felt, perceived with the senses as music, painting, whatever it is. So the bridge to the metaphysical absolutes of truth and the good is through the palpable realm of the beautiful. To my mind, this is what these psychedelics achieve. They as Huxley said, they dial open the valve of consciousness or as Blake implied, the window of perception is cleansed and then you see through into an infinite, holographic, recursive world of mind and affectionate intelligence. Somehow this mystery is in the body and therefore outside of time, therefore beyond, in some sense, the reach of culture. Sex is like this to some degree. Sex is in the body and outside of time. Culture spends a huge amount of it’s energy trying to reach sex, trying to contort it, push it one way or another and has produced some pretty bizarre themes and variations but generally speaking has failed. No society certainly has ever gotten rid of sex even though there have been societies ruled for thousands of years by men wearing dresses that gave us some of the most ribald minstrelsy around.

So there is this mystery in the body. I’m now returning to the subject of psychedelics beyond the reach of cultural manipulation. Discovering this and exploring it is somehow the frontier of maturity. Culture is a form of enforced infantilism. It’s the last nursery and most people never leave it and they’re perfectly happy to interpret the world through the reassuring nonsense of their cultural values, whatever they may happen to be. The reason psychedelics are so politically dynamite is because they cast doubt on this final cultural envelope of insulation and they do it very democratically. It doesn’t matter what your cultural conditioning is – it falls into question under the influence of the psychedelic. For most people, that’s frightening. Frightening enough that not only do they not want to do it but they are also keen to see that other people don’t do it because they realize that this is some kind of a doorway through which demons come; disruptive ideologies, strange forms of music, bizarre behaviors, unpleasant fashions – it’s all coming from this place where these people are messing around. So there is an impulse to close it off.

So there is a tradition 50,000 years old of shamanism/bohemianism. People who are deputized to be weird and are told, ‘ok you be weird, we’ll give you a hut at the edge of the village – you be weird and if we need you, we’ll call.’ That’s basically the role. ‘No, don’t bother, we’ll call you.’ The political position of shamans is fascinating in these societies because they share it but they are not of it. They are only asked in when things are really desperate. I think that bohemianism, this orphic tradition I’ve talked about that goes back

– way, way back - is the continuation of that. So we here represent to some degree a self selected group of these Orphic eccentrics who carry this charge of otherness. In many languages the word shaman means go-between. The shaman moves between levels, and the mythologies differ but either into a spirit world, or an ancestor world, or an animal world – but a go-between.

Let me see if I can tie this all up. I wanted to follow this thing out about the suppression of male dominance through chemical and diet and psilocybin and all that. The reason that is fascinating to me aside from the fact that it answers some real conundrums in hominid evolutionary arguments is that it then has an implication for the present because we are the damaged heirs of a damaged cultural style which has been practiced now for about 7,000 years. There have been various corrective measures, all failures I think. Christianity, Christ – a corrective measure. Somebody who comes and says don't do it that way, and they get rid of him and within fifty years the church he founded is dealing real estate. You get it in Islam, another corrective effort. These things have not worked. The cultural style has been too toxic. With the rise of modern science and the acceleration of the toxic consequences of bad ideology, we now come to the 20th century. Throughout the 20th century there has been an impulse...

[Audience] – What makes bad ideology?

Ideology that has consequences that are bad for the environment and the gene pool.

[Audience] – Who knows what bad ideology is?

Well nobody knows absolutely but when you think about things like plutonium and nuclear weapon stockpiles... I agree with you that in the largest picture moral relativism makes it impossible to say anything about good and bad, but I'm not that morally relativistic. I think biology should be preferred to its absence and that intelligence should be preferred over its absence. I think the universe wants to preserve novelty. That could actually be the basis of a kind of ethic. Bad is that which destroys novelty and good is that which promotes it. It sounds awfully progressive.

I remember the first time I was in Pakistan and I caught this rickshaw into Lahore and I was being pulled by a human being, muscle power. And this guy said, you're an American and this and that – he said – this country is screwed up, this country is really screwed up. He said 'you want to know what's wrong with it? Progress! Too much progress!' This was a man who made his living pulling people around in a rickshaw, so it's a relativistic thing. What I wanted to say was there is an intelligence in the species that is deeper than the societies and the systems that we erect to rule us and this wisdom of the species can make enormous changes in the evolution of the mass psyche, such as the Renaissance for example.

In the 20th century, this has taken the form of what I call the archaic revival. One of my books is called the Archaic Revival. The 20th century, which is a vast stage crowded with different kinds of competing social phenomena, art movements and so forth and so on, nevertheless I think the entire thing is illuminated by the notion that what it is about is an impulse towards archaism. That in the sciences, the arts, everywhere, the archaic ideal is raising its protean head and it begins with Freud in the early years of the 20th century discovering by interviewing these Viennese bourgeois housewives that human beings were brutes and incest, rape, all this stuff was right below the surface. The rediscovery of the beast and certainly Germany developed that theme up into the 40s. Meanwhile, people were bringing African masks to Paris and Cubism was basing its early theory on the deconstruction of primitive art. Meanwhile people like Eric Satie were abandoning the canons of classical composition in music and the twelve tone row was being experimented. Jazz was being given new attention and for its primitiveness, its rhythm and its sense of something beyond the reach of civilization. Meanwhile the deconstruction of painting, which had begun with Impressionism - Impressionism simply is twenty minutes into LSD, had gone deeper, had developed first of all into the deconstructive spirit of Dada where people tore up telephone directories and rang bells while they did something else. In other words, the absurd appears for the first time, an enormous theme in 20th century life – the incoherent idiocy of it all.

Then Surrealism, taking up the Freudian tune, begins to portray these worlds of distorted association. All of this is about boundary dissolution. It was happening on the bohemian left. It was happening on the fascist right. The rise of Marxism is a collectivist theory of society very concerned with collectivism, and then enormous changes. Auschwitz, the atom bomb, space flight and now where we are is for ten or fifteen years, there has been this awareness that it is about direct experience of the numinous and its been hideously marketed and raped by the entrepreneurial instinct and peddled back to us as dozens of New Age cults diced up and presented as different from each other. But the impulse towards this authentic dissolving experience is real. It was there in Theosophy. It was there in the Beats. It came up through the hippies. It survived the trivialization of the New Age. It has now found its way into the youth culture, into rave and house music and that whole thing and it's healthier than it ever was. Well the central figure in all of this when you get it down to the idea that a culture must have a culture hero, meaning a paradigmatic ideal to constellate around, the central figure it has been realized is the shaman, who is this person of indeterminate depth.

Everyone else has a determinable depth. They are the linear cardboard people walking around but the shaman is of indeterminate depth. That's the secret of Carlos Castaneda's magic. He creates a literary character that in any other culture would be deemed mythical but because of our attitude toward the depth of the shaman, we can't tell. We deputize this kind of depth in rock stars, in culture heroes of various sorts and worshipped that for the past twenty years or so. Well then slowly it has dawned that the position of worshipper is not the most satisfying position. The only position that satisfies is to be that thing. At that point, you're at the psychedelic crossroads because you will either make a conservative decision and seek a guru of some sort and be lost in that, which is a whole shell game, or you will simply cut through the human domain and make a pact with a plant, a substance, and then you will at that moment be at the threshold of your adulthood. That's leaving home. Home is culture. Home is this fabric of imaginary values that have been created and maintained by a pathological culture.

So it's a personal thing ultimately; very controversial, not easy to do and then once done, it has to be integrated, dealt with, thought about – and that as far as I can tell is a task that extends well beyond the yawning grave.

[Audience] – When you talked about the dream, it reminded me of the aboriginal culture and that's kind of how they live their lives – in the dreamtime. Is that what you're talking about, living in the dream and being in touch with?

Yeah to some degree. I don't know that much about aboriginals. I'm interested. I read Bruce Chatwin's book *Song Lines* and I found it absolutely fascinating and I'll talk about it for a minute because it bears on something I'm very interested in. Part of the transformation that I think is going to happen to us lies in the way we deal with language neurologically. Because under the influence of psychedelics, especially short acting tryptamines like DMT, you experience phenomena that seem to be transformations of the language modality. I've described this stuff as visible language; that you can actually sing meaning into visible existence and I've seen this on ayahuasca. This is what ayahuasca is about, the famous group states of mind that anthropologists talk about. What they really are, are three dimensional acoustical sculptures that are made by groups of people who are loaded and it's an extraordinary thing. It's an experience you can't have any other way and it's not quite telepathy or perhaps more than telepathy.

The key concept in communications is bandwidth. The more bandwidth you have, the more detail, color and tone that you can impart to your signal. Well a very low bandwidth channel is the small mouth noise channel. This is about as primitive as it gets short of doing in Morse code; doing it by voice. It's amazing that we understand each other at all. In fact you may have noticed that one of the most uncool things you can do is ask somebody – would you explain to me what I just said? They say, 'oh well, oh dear, I'm afraid I was generally'... a lot of floundering around. In these ayahuasca states what you see are group generated

acoustical hallucinations and because ayahuasca is composed of psychedelic compounds which occur in normal brain chemistry – in other words nothing exotic to human brain tissue is present – it raises the question, well how close is normal metabolic chemistry to having an ability to do this?

The answer is, nobody knows but very, very close. The pineal gland produces adrenoglomerulotropin, which is a beta-carboline. 6-methoxy-tetrahydro-harmaline or maybe it is adrenoglomerulotropin – I can't remember. Anyway there are active beta-carbolines produced in brain metabolism and language is such an odd phenomena anyway in our species. Notice that you have to have two people to do it, which raises real question on how you get that coordinated the first time out. It's a behavior. It isn't an organ. It isn't like my arm or nose, it's a behavior and a learned behavior, yet a behavior so much more complex than any other behavior you ever learn. If the average person could walk like the average person could talk, they would be a primo ballerina of the Russian ballet. It's very interesting that we have such facility to the linguistic enterprise and how it evolves. It's changing all the time. Is it just changing in a kind of forward lateral direction or is there some kind of vertical gain here? Can we actually describe things better to each other than the ancient Greeks could describe things to each other? Can we say things, which they couldn't say, or anything of consequence? I maintain yes, that culture – freeways, internal airports, are the trailing edge of evolving language.

So here's a story that relates to this that it is in Bruce Chatwin's book *Song Lines*. There are these things called song lines, which cross Australia and they can be thousands of miles long. If you're a shaman and one of these things crosses your territory, then you are the keeper of the song, of that part of the line. You must learn and keep this song. There are a hundred and thirty-seven aboriginal languages in Australia, so these people did the following thing. They went to the place near one end of the song line and they recorded a shaman singing his song of that place. Then they went two thousand miles to another part of the same song line and they found the song keeper of that place and they played the guys song for him. It was in a language he didn't speak and he had never been away from his own home – he had never been to this place. So he listened to the song and after a while, he began to sing with it. Not the words but the melody and he sang with it the way you could sing with green sleeves if you didn't know the words but you knew the melody. Then after it was over he said, the man has sang this song. His place is a 'Beaut' with three mountains and eucalyptus filling the valley and a red rock like a lizard over here.

So then they tried to analyze, what is happening here? Is this telepathy? Is it magic? What is it? I think the key to understanding it lies in...I've recently seen, you can buy for about six hundred dollars a piece of software where you glue electrodes to your head and sit down in front of your computer and you see an undulating landscape of neuro readouts that look, lo and behold, like mountains, valleys, escarpments. It's like visit to Utah. I am convinced that what's happening is that when the shaman listens to the first shaman's song, he does not process the sound the way we do. He processes it the way this computer is processing the neurological input and what he's seeing is an acoustical environment of sound and he can see the place. The song is the way it is because the song is not a song; the song is a hologramatic acoustigram of the topology of the land through which the song line passes. These people are called the most primitive people in the world, remember?

So I just recently became aware of this. It's very exciting to me. I'm interested in this software but this is the kind of thing that lies out there. The world arrives at the surface of your skin as one thing but the senses bifurcate the incoming signal. The light goes to the eyes, the acoustical signal goes to the ears, the tactile signal is conveyed through the skin and so then when we reconstruct the world, the wells are showing rather prominently in the model. What happens with the psychedelics is, it seems as though somewhere deep in the brain there is an organ or a program that can take all of the incoming sensory data and actually recombine it into a synesthetic whole, which is neither seen nor felt nor heard, but which is hologrok'd or something. A sense which unites all of the other senses, and that's what I call going into this

informational super space. That's what the psychedelic experience is. It reunifies the sensory datum of the world and I might add, the whole world, not the surface of the world, which is conveyed to us by light, but the internal dimension of transcendence that is in the world, is also present.

[Audience] – It's very interesting that you mentioned that binding together of the senses. I attended a conference earlier this year called 'Towards a Scientific Basis for Consciousness' in Arizona and a number of the presentations focused on the way in which the brain operates when this binding takes place. It turns out different cortical groups start to talk to one another by oscillating together in phase and when they're phase locked like that, they begin to bind this into a whole. I'm reminded of the research that Michael Persinger up at Laurentian University in Canada, who has been focusing on the electromagnetic field of the Earth and its affect on the brain. In particular, he's been interested in the correlation between earthquake activity and ghost sightings and such but he's pointed out that the

Yeah, he wrote a wonderful book called *Space-Time Transients and Unusual Events*. He's been very creative with using the electromagnetic field as an explanation for all kinds of things. I'm totally open-minded to his work. It's very interesting. It does seem to be true that along earthquake faults, you do get piezoelectric buildup and release. The world is full of bizarre phenomena. Some of you may have seen in Science News last week, for the first time they have confirmed these enormous blue and red lights above 75,000 feet in the atmosphere. Airline pilots have been seeing these things for years. There was no theory. Nobody knew what they were. Now NASA dedicated an expedition to looking at this and they got thousands of images of these things. It's an electrical phenomenon; theory doesn't account for them, nobody knows what it means. On one level I'm sympathetic to Persinger and that approach to explaining some of these things and I do think that the place has been overlooked in importance.

On another level, this is a very hard thing to talk about, but there is what I call linguistic viruses that infect the effort to communicate. They're very hard to catch at work. It has to do with how can people believe things that are absurd. It's very interesting to spend time with people who believe something which is absurd. A lot of people bring raps to me that they want confirmation or disconfirmation on and I passed this way last night when I talked about the rules of evidence. The standard of discourse has decayed to the point where it's very hard to get any kind of consensus about anything because most people participating don't know how the game is played. Linguistic viruses really are responsible for much more of reality than we suppose. I suppose I can't really talk about this without stepping on somebody's toes so let me pick...for example, crop circles.

Crop circles are important and what was going on at the England end, these things were absurd. You had only to see one to understand what was going on and to see that a confluence of British eccentricity, ripe grain, a certain ambiance the air was allowing these things to come into being. And the media was fanning it into existence. Well now how does this work? Talking of coupled oscillators and Persinger and all that. Pardon me?

[Audience] – Could you repeat that law?

Oh, the paranormal phenomenon has an impact in an inverse square relationship to the distance you are from the event. You see? Here's how it works. The media is reporting the onrushing phenomena of existence – stock markets, wars, diplomatic meetings, gangster killing, so forth and so on. Then something weird happens, now I have a job, you have a job, and we note that something weird has happened but it doesn't affect us. But scattered through the society there are people who when they open their paper and see 'Strange Pattern in Wheatfield near Wiltshire.' They say, 'ah ha – I knew it. This is what we've been waiting for. This is the sign.' They jump in their car and they drive to Wiltshire to look at the crop circle and they get there first. Well then comes the press and they say, 'well what is this?' The farmer doesn't know and everybody standing around and finally the weird person takes courage and says 'well actually I've been studying a peculiar form of biological energy for some thirty years and my theory...' You're off and

running at that point. So weirdness attracts weirdos who then interpret the weirdness very weirdly because they came with sharpened axes to grind, you see?

The crop circle thing was a test case for this. This is why I spent so much time on it. It did no credit to anybody. The occult just went sailing over the edge and science didn't behave any better. If any of you are interested in this, there's a wonderful book called *Round in Circles* by Jim Schnabel that goes into all this. But anyway, there was a fellow named Terence Meaden who was a meteorologist and when the first crop circles appeared and the weirdos began talking about telluric forces, messages from Atlantis, so forth and so on – he jumped into the fray and said, 'nonsense, nonsense!' This is a meteorological phenomenon. In the warm days of summer on the lee side of these certain kinds of hills, a kind of circular low-pressure wind can get going and this is nothing to get excited about and we've got the statistics. The press loved him. They loved him as much as the screwballs and they would put him on. First they would interview the mad people and then Terence Meaden would come on and pooh-pooh it away.

So that was the first year of the crop circles. The next year the crop circles became considerably more elaborate with arrows coming off of them and zigzags and so forth and so on. Bring Terence Meaden onto the scene and he says, 'well the new field of dynamic instability indicates that the mathematical solutions to these breakdown states are very complicated and unusual patterns...' So then the next year, it was inconceivably complex, the crop circles. Meanwhile, crop circle time is in the springtime. It's dead in the winter because the fields are empty, so Meaden had used the winter time to go to the Institute of Electrostatic Physics in Nagoya and came back full of talk about roving plasmic fields and this sort of thing. Armed with the roving plasmic fields, no crop circle was too bizarre to not be proclaimed the product of natural forces.

This went on and on and finally BBC2 - and you can think about this what you like - but they made a crop circle in frustration with this whole thing. They made a crop circle and among the crop circle cognoscenti, there are certain moves that are the favorite moves that are the authenticating moves that no human being could possibly do it. So the BBC2 people made a very good crop circle and they brought Terence Meaden out and said, 'Terence we've just spotted one over here and we need to get you right to the scene before the tourists got there.' They toured with him and he pointed out the distinguishing characteristics, no doubt about it. Then they sat him down in the center of this field and said, 'Terence, we made it.'

It's a horrible thing actually to see a grown man cry. He is devastated. This is just one of many moments. You know Rupert, my comrade in arms? Rupert Sheldrake was one of the people who sponsored the contest that basically put the crop circles out of business because the claims were fantastic, you know? No person could do this. So what they did was they got farmers to donate ten acre tract of English corn, which is wheat, and for fifty pounds you could enter and everybody had to make the same crop circle, which was one chosen to have all the difficult little smiggies in it and you could use no lights, you had to go into the field at 10pm and be out by 4am and at dawn, the helicopters flew over with the video crews and the crop circles were toured on the ground and awards were made.

This guy, Jim Schnabel, who wrote this book I mentioned, by himself in total darkness, in two and a half hours, made the winning entry. It was very close tie to him and a helicopter crew to a nearby airbase who also made one. Yet, this is to some degree the point of the whole story, there are people whose eyes fill with tears when I do this rap because they haven't heard. It will never die now I'm convinced. It's an informational virus loose in the world. Crop circles will occasionally appear but it was really a breakout that was so predictable from the unconscious that it amazed me while it was going on how many friendships that were strained over this thing.

[Audience] – Wasn't that kind of also the capitulation of the History of the Catholic Church?

And the fall of the Ming dynasty I believe?

[Audience] – It's like a virus embedded within a virus here because part of what happens when these sorts of

things erupt onto the media scene and this is true for UFOs, whenever one of those outbursts take place, is that there is this incredible elaboration and complexity that emerge in the kinds of stories that people are telling. The abduction thing would be the latest. By the way, Persinger is involved in that too by showing that electromagnetic fields to the brain can induce these weird out of body experiences. But in the case of crop circles, they've been reported for many decades but they've not received much attention. They're just little circles that have a spiral pattern in them and they've been seen over the world. My personal view is that there is probably a series of different phenomena that have been shuffled into one category but when the media gets a hold of them, all crop circles are the same. When fractal designs start showing up outside the university campus there – the Mandelbrot set which is one of the most ridiculous of the crop circle patterns, the media presents the image that these are all the same. They're all the same phenomena. So consequently, I wouldn't be surprised if Meaden might not be right at some level that there are dust devil like phenomena...

No I agree with you completely and they track down a 1733 account of something called the Devil's Mower. I grew up in western Colorado and part of my rite of initiation into manhood was in forced elk hunting on horseback every autumn. We would come upon these places in the forest that had been whirled down and the explanation was just that these are deadfalls from whirlwinds but it always seemed to me – had anybody ever seen one of these things occur? It was a very odd explanation. Yes, it's about informational distortion and decay. You're quite right. I went to a flying saucer convention against my better judgment and I learned more...my opinion about flying saucers evolved more over that weekend than in the previous thirty years of being interested in flying saucers. I read all the books, all the special cases, I knew the data and all that but I had never hung out with flying saucer people. It was so obviously a private Idaho that I just couldn't wait to get away.

There are two impulses in the human psyche, at least two in this case. I just don't resonate with believers in anything. I get insulting to Buddhists for God's sake. It's just something about their smugness and their whole bit, I just want to squash it. So you can imagine how I behave in the presence of scientologists and the rest of it. Belief is again, it's a form of infantilism. There are no grounds for believing anything. The flying saucer thing, I went to this conference imagining that what I would meet would be a whole bunch of really interesting sincere people who wanted to discuss the phenomenon of unexplained things in the sky and contacting human beings. What I found was booth after booth of people who had all the answers! Learn how a nearby planet reduced crime by 500%! I got news for you, not even God can reduce crime by 500% once you've reduced it by 100%; you've got it!

This was the quality of thinking that was going on. Then there were a lot of really scary people in brown leather shoes with thin smiles and cheap suits who were clearly third rate, semi retired intelligence hacks who were there to keep the flock headed in the right direction. People wanted to talk about experiments on human fetal tissue that go on in underground laboratories out in Arizona through the connivance of the CIA and the Pledian high command. And you just think, I've just got to call my broker. I'll get back to you on that. I don't know. It's an aesthetic thing. I believe that great weirdness stocks the universe. That's not the issue with me but it's not tacky. It is not tacky. People who wear low cut gowns with a lot of sequins on them and tiaras and pass out flying saucer shaped business cards, that's tacky. So it can't be so! I know this. I've never been wrong. If intelligence fails, aesthetics will pull you through. People don't like this part of me. I don't make it comfortable for other squirrels. I don't share the branch very generously.

A place where I've gotten into lots of trouble is with the face on Mars. I just have not got enough unpleasant things to say about the face on Mars, everybody connected with it, the whole idea. Talk about something, which should never have been let out of the box – that's it. The idea of a chachka 17 x 11 miles in size just gives me the heebeegeebees. I don't want to know those aliens. They should go back where they came from and take their chachka with them. We need people who can build in light and balance planetary ecologies and do really cool things. Massive earth moving projects – we've been there, we've done that.

[Audience] We never went to the moon either. Books will appear on these subjects. One of the interesting things about UFO experience though and the other kinds of different phenomena that you're talking about, is the potential for manipulation of belief systems and this is something that Jacque Valay talks about in his books. There is a kind of sinister undertone that the military is bringing people in who are UFO diehards and saying look at these documents, we can prove that there is this majestic group and then snatching them back and then the UFO enthusiasts go out and tell the world about it. They launch stories about aliens under the desert in Nevada collaborating with the military and the newspapers pick it up but completely pooh-pooh it. Meanwhile there are tests of a new spy plane called project Aurora, which travels six times the speed of sound and leaves a trailing ball blue of light and if anybody sees it traveling over the desert and picks up the phone and calls the paper, nobody will report it.

No, it's clear that those black projects and Aurora is the one, is being run out there. That's very exciting. I mean a plane that can fly into orbit.

[Audience] – Terence, what is your opinion on the biosphere? Did you get into that at all? John Allen and the whole shtick there?

I knew those people in the early 80s - 1983, 1981, in the Amazon. They said they were headed for Mars. I don't know. They are derivative of J.G. Bennett's school of Gurdjieffians and I have a rule, which is, I'm against any group that keeps secrets and Gurdjieffians keep secrets. I'm not against Gurdjieffians per se; in fact it's kind of too bad they get into the category. Secret keeping is a bad habit and if you tell me a secret, I'll probably tell it. Nobody ever told me not to say anything. So I've followed them with interest over the years. It's too bad it's another thing lead by a middle aged white guy but they seem to have the pull.

But I want to return to something you said. This can be the last thing about flying saucers but let me give you my conclusion from this weekend of how the whole flying saucer thing worked. This is just one person's opinion but this is how I explain it to myself. As you know in 1947, the Rainer lights appeared and that was the first big modern flying saucer sighting and set off the whole modern flying saucer phenomenon. Well cast your mind back to the ambiance of 1947. The atom bomb was in 1945, the defeat of Germany, the H-bomb was under development, Einstein was advising Truman. People were on the brink of things they could not understand. Nobody knew what the H-bomb really meant. What does it mean that we can do this? They said, we don't know, maybe the universe is monitored and what we're doing is so outrageous that maybe it will bring those who do the monitoring. Then they began to get these reports of these things in the sky. My god this must be it. There were very high-level government – secret, secret, secret commissions that were setup and they began to study the flying saucers furiously.

They penetrated all those groups and they penetrated the flying saucer thing from one end to the other and I'm talking 1947 to 1954. They studied it and they studied it and Carl Jung was brought in, and all kinds of people were brought in, and at the end of that period, they concluded that what it was. They actually understood it. They concluded that it was the cosmic giggle. They concluded that it was that un-reducible nub of nuttiness that haunts reality and that it was not a threat to the security of North American air defenses. That was their question. Is this a military problem for us? By 54 or so, they had decided whatever this is – a linguistic virus, a mass hallucination, whatever it is – it is not a problem for the military defense of North America.

But they had spent millions infiltrating and completely taking over the weirdest group of screwballs you can imagine, the flying saucer, hardcore cultists. They said, these people will believe anything. We know that because we've been to their meetings. We've read their publications. What should we do with them? Should be just withdraw all our agents and let them go back to whatever they are doing and the answer was no. These people will become a pool for experiments in manipulation of information, control of belief systems and response to propaganda. A whole bunch of black box, psychological, programming and informational kinds of research will be done on this pool of people because they're so weird, if they start

telling their relatives that they're hearing voices in the head or something like that, their relatives and friends are just going to say what else is new. You've been talking like this for years. I think it was kept like that right up until the present moment.

I think it's very low budget. This is not high priority for the CIA. They're sending, as I've said, semi-retired guys in scuffed brown shoes who are definitely over the hill. But they shepherd the group along and as you said, they release these outlandish documents and then they pull them back. Some guy comes forward and says it's all a fraud and I know because I was on the inside and I was the one paid to tell you all these things and then somebody else comes forward and says no – he's a walk in and has an implant and it wasn't that way at all. It's sort of like the JFK assassination. There is no bedrock there. There is no ground zero and I find these things sort of spooky. I think it's bad mental hygiene to spend too much time with squirrels.

[Audience] – They can infect you.

Yeah. Put down that groundhog baby Elizabeth. You don't know where it's been.

Actually Recorded Oct. 7, 1996

[Musical intro]

Mitchell Jay Rabin: Welcome to the show A Better World. This is your host Mitchell Jay Rabin, and we're very glad that you're joining us again today. Today we are again, if I may say so, going to have a very interesting show. Today we have Terence McKenna on with us and we're very pleased since Terence is here in New York, he decided to come and join us here at the studio.

Terence is here, going to be talking at St. John the Divine and at Source of Life Center, doing a weekend -this weekend - and you'll be seeing this show, actually after the weekend, so if you get a taste of Terence's antics and uh, wild thinking, you will be able to find out when Terence will be back in town for the next round. So welcome, Terence.

Terence McKenna: Pleasure to be here.

MJR: Great. Good to have you. Absolutely. So...God, there's so much that we can really embark upon, to talk about, because you have...uh, Terence has been so interesting in this world, because he's bringing such a rich array of different kinds of thoughts and fantasies to the fore. And, um, so, what I would like to talk about first is, if you would bring us up to speed on one of the main focuses of your work, which has been the software program dealing with time and novelty. You've spun out this entire idea of a theory of novelty, as you describe it, and maybe you can talk a little bit about that.

TM: Well, the software is now available in a DOS version and uh, in a very advanced Mac version. The raison d'être for this present speaking tour is we're in what's called a novelty plunge, according to the theory; in other words, a very concentrated period of time in which a lot is predicted to happen. Since these predictions are the only way we have of testing novelty theory, it's very interesting when there is a prediction of a very deep plunge in novelty, because then you get to actually measure the incoming data from the real world, so called, against theory.

MJR: So we are now in a deep novel plunge?

TM: Yes, we are in a novelty plunge which began around the end of February and which will reach its maxima the middle of next week, and then...

MJR: Oh!

TM: ...sustain itself through the summer, so it's not simply a plunge into novelty but a plunge into novelty followed by a period of very intense exploration of that deep state of novelty.

MJR: Perhaps it's only fair, Terence, to let the audience know from the outset that one of the main places of focus that you've been involved in, in the past 20 years or so, has been in dealing with shamanically-sanctioned plants, and bringing the wisdom of the plant world, you could say, to the foreground of our society.

TM: Yes, I've been very interested in hallucinogenic experience and shamanism and that sort of thing since the 60s and uh, what it has to do with time is, I think, if you spend enough time looking at these things, you come to see that the shamanic metaphor, the magical metaphor, are not as fully satisfying as thinking about these things in terms of dimensionality, that actually you do go into another dimension, not in the metaphorical sense, but in a sense that a mathematician would understand. It's a...

MJR: Would you say a literal sense?

TM: A literal sense, yeah.

MJR: Mmm hmm. Now, many people who are very interested in dimensionality have been using all sorts of different ways and been attracted to anywhere from the use of flotation tanks to all sorts of different kinds of Tantric meditations, from the Buddhists, from the Sufis, from the Kabbalists and elsewhere. Now maybe it would be interesting to hear your point of view on these, which are really post-shamanic, religious kinds of disciplines. And you have some points of view on it that would be nice to hear.

TM: Well, the most practical point of view is whatever works for you, you should use. If we then try to generalize to what works for most people, uh, it seems to me the use of plant hallucinogens is particularly effective, simply because it transcends ideology, it transcends ritual, it goes directly to the physical brain, and by perturbing the living brain, it perturbs consciousness, and then out of that experience, conclusions are drawn within a cultural framework.

And so you know, an aboriginal rain forest shaman may get one reading on that and someone with training in quantum physics or something like that may reach a different conclusion, but the important thing of all these techniques, whether pharmacological, or you mentioned Tantra, is to perturb consciousness into insight about itself, by some means, and it's very tricky because consciousness is like a very heavy fluid. It always seems to seek the gravity of the familiar.

MJR: Mmm hmm, right. So in a sense what we're always struggling with or against, is the tendency toward habituation, and one of the things – places - we see that, of course, is mainly in mental habituation.

TM: Yes.

MJR: We think along the same lines, we think in the same linguistic patterns.

TM: Well, an interesting thing about people is our tendency to habituate and addict to not only drugs and foods, but behavior patterns, ideologies, routines, uh, the founder of general systems theory, Ludwig von Bertalanffy, said once an amusing thing, he said, "People are not machines, but in every situation in which they are given the chance to behave like machines, they will do so."

MJR: Hmm. God, I think we have a society that proves that. The beehive mentality Robert Anton Wilson refers to.

TM: The problem is the power of media to co-opt people's ordinary impulses and to channel them along to corporate or consumerist channels that are useful then not so much to the individual but to the organization that's doing the manipulating.

MJR: Sure. Absolutely, and that is no doubt one of the main reasons there has been such legislation on all levels - social as well as legal - about such things as hallucinogenic plants, uh, because, in fact, I think your life is very much a testimony to that, when people ingest certain kinds of hallucinogens, the last thing they're thinking about is authority, consumerism, or legality, for that matter.

TM: Well, it isn't even so much that it neutralizes the consumerist impulses, it actually dissolves and erodes them, because uh, it sort of shows the relativity of all existence. Uh, consumerism is based on a strong reinforcement of ego, and ego is so easily relativized by the psychedelic experience that, in some sense, then, the psychedelic experience is the enemy of the consumerist society, and this makes for political dynamite or at least interesting political rhetoric.

MJR: At least. Well, one of the things that really does happen, um, with the psychedelic experience as well as through such, um, kind of simpler matters as contemplation and meditation, is people start to become cognizant of their lives, of their bodies, um, of the world around them, and the values that they're in a sense being asked to embrace through standard practices in the society. These no longer look very tasteful, I think, is one of the things that happens.

TM: Yeah, I think you could make a simple model of the psychedelic experience and say that what really happens is um, that you develop attention to attention. There's a pulling back. There's a second level of attention and when you have that point of view, you are, to some degree, alienated because you're more aware of the ambiguity that haunts every situation. But on the other hand, you are more conscious. You're picking up on more of what the information is actually being passed in the situation.

MJR: Yeah. I want everyone to know that Terence McKenna has written a number of books, one of which is, I happen to have with me, called *The Archaic Revival*. And there are numbers of others. *True Hallucinations* is the last.

TM: *True Hallucinations*.

MJR: *Invisible Landscape*.

TM: *Invisible Landscape. Food of the Gods*. I did one with the British biologist Rupert Sheldrake and Ralph Abraham, um, *Dialogues at the Edge of the West*, which is a three-fer - you get not only me but two other pretty interesting guys.

MJR: Yeah, uh huh. What were those explorations like in that book?

TM: We would have a dialogue and then the third person would critique the dialogue, and these dialogues were on subjects like quantum physics, chaos theory, psychedelics, the millennium, the soul, just sort of things we thought were in the air that people might be interested in.

MJR: Mmm hmm. You know, I wish you would tell that story about how you came across the whole idea of novelty and what brought you eventually to looking at the I Ching and the 64 hexagrams. I just love that story. It's very revealing.

TM: If by "the story," you mean the entire story of my life. The *Invisible Landscape* story.

MJR: Start in Colorado. [laughter] Just pick it up at Berkeley.

TM: Basically, we were poking around in the Amazon jungle looking at hallucinogenic plants in the early 70s and had a series of very intense experiences, which...

MJR: This was you and your brother.

TM: Yes. Which resolved themselves down to a kind of mathematical obsession with the structure of the I Ching. For people watching who don't know what the I Ching is, it's a very old system of Chinese divination - system for predicting the future. And the thing about it that's so astonishing is many very skeptical people have come to the conclusion that it somehow works and the question that we were asking was how does it work, how could such a thing work, rather than treating it as a mystical revelation. Well...

MJR: People have been asking that one for ages, including the Chinese.

TM: ...to have a system that allows you to predict the future, you would have to understand what time is, and so by grappling with this problem in the I Ching, I came to have a notion of what time is or at least a theory I was willing to put out for argument, and that's what the software you mentioned earlier was all about.

What it comes down to is the mathematics produces a graph, not that different from a stock market graph. It rises and it falls, but it's not a graph of stock movement, it's a graph of this quality of reality called novelty, which is slippery to define but I think intuitively pretty easy to grasp, and novelty comes and goes. It haunts time like a ghost. Sometimes there are long stretches where it is absent. Its opposite is habit, so you can think of reality as a kind of push-pull, a struggle between habit and novelty, and the good news from my point of view is that novelty is slowly winning.

There is the history of the universe or of the 20th century or of the past 6 weeks, is a history of steadily accumulating novelty and it's what makes human society possible, electronic culture possible, a city like New York. These are obviously manifestations of novelty that have taken a very long time to accumulate, to come into being.

I mean, Manhattan 500 years ago, was a wooded rocky island. Uh, so clearly novelty has come to rest here

and we see what it has wrought. Well in a sense the entire planet is in the grip of this developing efflorescence of novelty, but it isn't something which develops smoothly, you know, 1% more per day or something like that.

MJR: In fits and starts.

TM: Exactly, fits and starts. Ebb and flow, but tending always toward greater novelty, eventually. And I think, you know, we're reaching the place with it now where the speed at which the novelty is progressing is so great that people can feel it in their own lives. It's not an abstraction. People feel something akin to psychic weather, and it comes in and novelty is frozen for a few weeks, and then the front breaks up and novelty, you have more than you can handle.

MJR: So there must be this intimate relationship, really, between your description of novelty and of perception.

TM: Yes, in a sense, I'm asking people to observe something within their own inner dynamic, but was always there, but that they really have no vocabulary for. I mean, one vocabulary that somewhat speaks to this is the concept of Tao. I mean, if you know anything about Tao, it's an idea that there is an invisible force that permeates the world and it builds things up - dynasties, love affairs, corporations - and it tears things down, according to very mysterious dynamics of its own.

Well, that's precisely what we're talking about. The only thing I've tried to do is to replace mysticism with mathematics and say there is this force but it can be known, it can be charted, in the way that we can predict the weather or predict bond prices.

MJR: So, novelty, the theory, actually has some very practical uses in that case.

TM: Yes, because what it would tell you if it were widely accepted is it would tell you where to expect unusual events and where you would be wasting your time to look for unusual events. It doesn't tell you what will happen because that is indeterminate, I believe, but that there is a kind of landscape over which events flow, sometimes faster, sometimes slower, like water over a terrain. I think that experience makes that seem fairly reasonable.

MJR: Yeah. You know, you're just reminding me of a weekend I spent with you a couple of years ago at the Open Center when you said something about the nature of science and how we are all... we've been, in a sense, scientifically programmed to value science on a belief level, you could say, and to think that it is really the be-all, end-all, but you've made a very important point that has always really stuck with me, which is that there's one domain that science does not control for, but acts as though it controls for, and that's time. That time, you said, had a topography, that it had a shape to it, and that an experiment conducted on a Monday will not necessarily yield the same results on a Thursday afternoon.

TM: Yes, well, you've put your finger on a complex epistemological issue. Science, as we know it, uses probability theory as the fundamental mathematical tool, and how that works is you gather data, you put all the data together, you add it together, and then you average it. Well, this act of averaging has not been philosophically fully explored, in terms of what its implications are.

When you average a bunch of measurements, let's say, you smear out their individuality, and so behind the

use of averaging and probability theory is the implicit assumption that it doesn't matter when the measurement was taken. In other words, in science they say time is not a dependent variable. It's invariant, but that's just a guess. We don't know that it's invariant. In our own experience, no love affair ever happens the same. No flu is quite like any other. No dinner is quite like any other. Our human world is filled with the unique felt-ness, felt presence of unique experience. But science gives us a world always based on these probabilistic generalities, which I think do great damage to the subtle, fine structure of experience.

MJR: Well, if we just look at a lunar cycle, we see that every single day is actually qualitatively and quantitatively different. One day is never going to be the same, by definition, as another day.

TM: Well, you could almost say, I suppose, that the scientist seeks what is similar between any two days or bluebirds or glaciers, and the poet seeks what is different. The artist seeks to celebrate the unique and so they really represent two ends of the spectrum.

MJR: Sure, I mean, each has its own value. This isn't to negate the value of science.

TM: But science needs to undergo some pretty serious self-critiquing, because over the past 300 years or so, what has happened in science is by concentrating on picking things apart, the idea of spirit or a vital unifying entelechy or a force, that all has been completely discredited by science, and it leaves you then for no basis for any ethic or anything.

Basically, people and animals are machines, in this view and if you believe that, you start treating them like machines, and you start putting machine-like politics in place and it becomes nightmarish fairly quickly. And so, it's all right, I think science is coming along. Um, it's a natural tendency of human beings to hit the easy problems first, and the easy problems are things like what's going on when a ball bearing rolls downhill, what is water made out of. And the tricky problems are...

MJR: That one we haven't fully answered yet.

TM: Well no, but the really tricky problems are questions like what is memory, what is language, what is...

MJR: Existence.

TM: Yeah. And so these questions are eventually going to be...

MJR: What is a magic mushroom?

TM: What is a magic mushroom.

MJR: You have to answer that now.

TM: Well, basically any mushroom with psilocybin in it is pretty magical.

MJR: You describe magic mushrooms as language.

TM: They synergize, they catalyze language, they... probably as a footnote to the fact that they catalyze the

imagination. They catalyze cognitive process. We don't know what that exactly means, but you don't have to be a rocket scientist to see that cognitive process is definitely the name of the human game, so anything which catalyzes art, poetry, literature, mathematics, politics, music, da, da, da...has major implications for the human enterprise. Of course, it's illegal, it's stigmatized, but these are simply local peculiarities of the folk.

MJR: It has nothing to do with the great longevity of time.

TM: Or the real meaning and implication of these things. I'm sure whatever work they do, they do it whether they're scheduled or not.

MJR: Yeah, right, exactly. They're not going to be limited by local customs of the United States or European governments at this little point in time. But a blip on the screen. In fact, that's actually one of your great gifts to us all, Terence, which is to...for me, I really feel myself expand when I listen to you speak, because I give up all local notions of time and it goes far beyond in each direction, by the way, not just two, actually...it probably goes in more than that.

TM: Not only when will it end, but when did we get here? [laughter]

MJR: Really, really. You also talk about this transcendental object at the end of time.

TM: Well, in an effort to understand novelty, where it's leading, you have to...if you extrapolate the notion, you have to realize it must lead to the most novel thing there is, that which there cannot be greater novelty than, so that's the transcendental logic at the end of time. It's the light at the end of the tunnel, a kind of attractor of some sort.

MJR: When you speculate according to the software – not the software, but according to novelty theory - and what you have extrapolated from your studies of the I Ching and et cetera, you have selected a date in time at which you postulate will be the end of history, and I always say in subtext, as we know it.

TM: Right.

MJR: Could you say a word there? Saying that we're out of time. Is that possible?

TM: We are. If not out of time now, soon to be out of time.

MJR: It's a very bizarre notion, isn't it? I won't accept it.

TM: It's like the end of a novel or the end of history. What does it mean? Well, it just means life becomes so complicated that a new dimension is added and then therefore it makes no sense to call it history, the way literacy and writing added a new dimension.

MJR: So, what, do you think there's going to be a particular event or it's gonna be some kind of quantum psychological leap or uh...

TM: I think it's a knitting together of all these exotic technologies and human beings that are presently in

the world, that cultural boundaries, national boundaries, gender boundaries, are all dissolving, and the consequence of that is literally inconceivable, to people embedded in history.

I mean, those of us who try to keep track of all these things are not able to keep track, and the people embedded in the process, as just trying to earn a job and have a career, are largely clueless as to the nature of the way in which things are crystallizing.

MJR: Like what?

TM: Well, like what. All kinds of things are happening. Let's just take the last three months. The human genome has been sequenced. Extraterrestrial planets have been discovered around alien suns.

MJR: They have been discovered?

TM: They've discovered, with... 70 Virginis has two Jupiter mass planets around it. 47 Ursae Majoris has two half Jupiter mass planets in orbit around it, uh...

MJR: Was this written up in something other than the National Enquirer?

TM: Oh no, this is, uh, you're not reading science news and *Scientific American*.

MJR: Yeah, I missed the last issues.

TM: That's what I'm saying, the people who are embedded in trying to have a life....

MJR: What are you saying?

TM:...are not...let's see, what else. Uh.

MJR: They found alien...what they're referring to as extraterrestrial...

TM: Planets. Yes, there are now about six stars within 40 light years of Earth, known to have some kind of object around them. And this is all happening just in the last 3 months.

MJR: How novel.

TM: Anti-matter was created – a few hundred atoms of anti-helium was created at CERN in Switzerland about three months ago. Anti-matter converts to energy 100% in the presence of ordinary matter. It's an ultimate kind of energy source.

MJR: Yeah.

TM: Let's see. One other thing. Oh, analysis of this asteroid impact in Canada leads to the conclusion that a huge amount of organic material was delivered to Earth in that impact, and wasn't destroyed by heat, so they've established that extraterrestrial biology is arriving on Earth. They've sequenced the human genome. They've discovered planets around alien stars. They've had great success in nanotechnology in the past...this is all in the past 90 days, we're talking about.

So these kinds of things, extrapolated 10 years into the future, along with stuff like the internet, and pharmacology and teledildonics, and all this other stuff...

MJR: Teledildonics?

TM: Don't ask.

MJR: Can we even look it up in the dictionary?

TM: After the show. [laughter] All lead to the conclusion that, uh, we are transcending ourselves faster than we realize. We are becoming unrecognizable. The transformation is not going to happen, the transition is underway. It's underway.

MJR: Yeah. This is phenomenal. The transcendent object is approaching quickly.

TM: It's emerging. Well, to take one example, fairly close to home most people. The internet. I mean, the internet is the most powerful and advanced technology ever put in place. It's arisen virtually in the last five years. The world doesn't look substantially different. I mean, we didn't have to make highways other any of the things that other technologies have demanded, and yet, really, the nation state is now obsolete. So, probably is the office, as we know it. Corporations and nations haven't yet realized, but when they begin to understand how much money they can save through telecommuting and this sort of thing, the whole *raison d'être* for clustering into enormous cities may just disappear.

The other thing is, the internet is a tremendous force for empowering the margins – all sexual minorities, all political minorities, all artistic minorities - now can build very powerful communities on the internet, and push their vision, whatever it is, forward.

So traditionally, power to communicate and to control communication has been one of the most closely held prerogatives of the powerful, and now it's just been given unto our hands. So I find that very exciting. I think that I haven't felt this kind of excitement with a new technology since the introduction of LSD and there are similarities, to be sure.

MJR: Such as?

TM: Well, both empower community. The internet was largely created by people who were very much formed by that earlier revolution. I mean, the people who write VRML, the people who are putting Netscape and the new search engines and all this stuff out are freaks. I don't think they would balk at that label at all. There are people who love working in these areas because they represent the same kind of feeling of unlimited possibility that the psychedelic community had in the 60s.

MJR: Yeah, I'm just wondering about the internet. I've just been thinking about it and just getting involved in it myself, and would like to hear what you have to say about this because the powerful have always, as you said, held a very close hand over media, and that's one of the ways they maintain their, even if somewhat false power, they still have that position. Is there a way of propagandizing the internet where a couple of powerful, or of the powerful, power possessing beings, as they're referred to, can usurp the

general community feeling of community access?

TM: I don't really think so. I mean, I think that the internet is so fundamentally a different beast, and here's the distinction that I would make. For at least 200, maybe 300 years, Western civilization has been largely shaped by what is called mass media. It means, first of all, newspapers, and then all the electronic mass media.

The nature of mass media is what's called one-to-many communication, where a Letterman or a somebody speaks and millions listen and emulate. The internet is what's called any-to-any communication. You and I can have an email exchange, or I can send email to 1,000 people, or I can join a chat group of several hundred. And I think the changes are more profound than we can even imagine, because the mass media created two things we cannot imagine living without: the idea of the public and the idea of the citizen. Now we hear a great deal about how society is dissolving into anarchy. What it means is there is no more public consensus. And that is because the post-electronic media personality isn't interested in following fads dictated from above in quite the same way. So instead what we have is an incredibly heterogeneous and complex society that's all niches.

There's no public anymore, there's just niches. The Latino niche, the lesbian niche, the this niche, the that niche, and there is no cohesion anymore. Well, some people think this is a terrible thing. I happen to think it's a very good thing, because I think it makes us much more difficult to coerce and to control.

So the ending of the age of mass media is something that the world corporate state has not really braced itself for, because it has so much money invested in these now dinosaur forms of media. So I think of the internet really as a 60 million television channel, you know, a 60 million channel TV, and naturally that creates...and it's a two-way deal.

MJR: Yeah, right. It's interactive.

TM: I think that the only way to deal with media and keep your wits about you is to produce it. Produce it. Not consume it.

MJR: To wit.

TM: God forbid, do not consume it and then, do not flee it. That doesn't work, either. You could say, "Well, I never...I don't". No nothing-ism, even more easily manipulated.

The key is to produce. And things like Photoshop and MacroMind Director - and I don't work for any of these people but I use their products - are incredibly empowering. Uh, you know, what used to require \$50,000 worth of production equipment can now be done with three and the cost is falling. That's got to be good for the spreading of counter cultural and minority viewpoints and opinions.

MJR: That's a very, very good point. In fact I was just thinking about the internet in this respect a little bit very recently, and I was realizing in many ways it's...another way of putting it is it's a great equalizer. From a socioeconomic point of view, people who would never have anything to do with each other necessarily, would never cross paths, are being given an opportunity to meet via the net.

TM: And it's safe. It's safe. Yes, it creates a...

MJR: People in absolutely distinct economic strata can come together.

TM: Well, and no matter how minority your position, no matter how bizarre your interests, you can find a community of people on the internet absolutely...

MJR: Who share your views.

TM: Who share your views, and who are furiously advancing that agenda. The other thing is, what the internet was designed for, was research. And if you believe that information is power, then the information gathering research tool that has been given to the ordinary person, to actually find out what the hell is really going on...I feel with my internet connection, I have better intelligence than Stansfield Turner had when he ran the CIA for Jimmy Carter.

That's how fast these technologies...it's gone from, what only the CIA Director could have, that now sits on the desktop of millions of American homes. And what's that, 12 years or something like that.

MJR: God. So there's an incredible dispersion of information.

TM: And acceleration of connectivity. Everybody's getting connected the way they wish. And of course some of it is perverse and some of it is silly and trivial, but we had silly and perverse and trivial long before we had the internet.

MJR: Right. Yes, it didn't all of a sudden arise because people had a little desktop publishing computer on their desk. Right, absolutely. Talking about being connected, there's something that's always puzzled me, and maybe you can speak to this, which is, you've spoken about a time before history, when men and women did something very novel: got along. Do you remember that?

TM: Oh yeah. You want me to run that riff?

MJR: [laughter] Ok. Would you?

TM: It's sort of a...

MJR: But I have a question that's embedded in that...which, uh...do the riff and then I'll ask the question.

TM: The riff has to do with...uh, I've done a lot of thinking about early human evolution, and how did we make the leap so suddenly, from an advanced monkey to, you know, a poetry spouting, dreaming thing we are, and the hidden factor, I think, is chemical acceleration agents in the environment, specifically psilocybin and other things. I mean, I'm giving you the light speed version of this, but what I said about the relationship between men and women is, I think that psilocybin dissolves ego, and that the ordinary dominance hierarchies in primates, which are male-dominance hierarchies, dissolved for about 100,000 years in human beings because of an item in the diet. Essentially, they were self-medicating themselves into a slightly different relationship to their psycho sexuality, and instead of an ego-enforced male hegemony expressing itself as monogamy, there was some kind of polygamist, orgiastic, more egalitarian

kind of organization. The reason for thinking these kinds of things when looking at primates is we have bonobos, which are a kind of chimpanzee, and chimpanzees, genetically, they're 98% similar but their sexual behaviors could hardly be more different. One is very male dominant and a lot of aggression and anxiety about female behavior.

The bonobos on the other hand are extremely loose, many kinds of sexual activity are tolerated and so forth and so on, so it looks like, in human beings, though how we express ourselves sexually is hugely important to us, it is not very tightly bound to genetics. It's more like a cultural choice.

You're free to be monogamous, polygamous, heterosexual, homosexual, bisexual, asexual – this is not usually the case in an animal species. And I think this flexibility about our sexual expression was an effect of the different relationship to libido that experimenting with hallucinogenic plants in the paleolithic period induced. It's a fun idea to play with, it sort of explains our nostalgia for a time of goddess worship, orgy, nomadism, all children and whatever minimal property there was held in common. It's a kind of...

MJR: Anarchy, ecstasy...

TM: Anarchy, ecstasy, freedom. And It may be a myth or it may in fact be a memory of a time, and then of course once the mushroom...

MJR: Paradisal beginnings.

TM: Once the mushroom is taken out of the picture, those old bad habits – male dominance and so forth - returned with a vengeance, and that's the point in history where you get history. Walled cities, standing armies, kingship, slavery, enforced role models, subjugation of women, the whole bit, so in a sense, I think the Western phobia about drugs, about hallucinogens, about these experiences has to do with the fact that the ego is very uncertain of its role, it's not strong, it's...

MJR: Fragile.

TM: It's full of fear and paranoia that it could easily be unseated, and of course, take 5 grams of psilocybin in silent darkness, and your ego will be unseated...

MJR: That's right. We would like to say once and for all that it doesn't go quite that way, but...ok, well, thank you for that riff, I appreciate it, um, the question is, what I wonder about, in listening to you over the years, and they've been wonderful years, I'll have you know. Um, in fact, we met originally in 1988. I was at a seminar on the subject of physical immortality where Terence was giving a talk. We were just reminiscing about that, just...before. What was that famous line you had?

TM: You're immortal as long as you live.

MJR: Voila, there we have it. What is the role and especially since you have gotten so involved I Ching, which touches so many precious elements of human life. What is the role of character development in the shamanic and the psychedelic experience?

TM: Well, it's an interesting question. I think sort of we touched on this a little bit earlier in our talk where I talked about developing the observer of attention, that there is a developing of a sense of...

MJR: A cybernetic position, actually.

TM: Well, and a sense of a proper relationship. I mean, a shaman is neither inflated nor deflated, neither excessively humble, nor excessively pretentious. And humor - if someone claims to be some kind of shaman and they do not take themselves lightly, then they're probably some beetle-browed maniac of some sort, going for your wallet or worse.

So a sense of relative proportion and humor, and a sense of uh, not the inevitability, but sort of the just the power in things to unfold themselves along their own pathways. I've met a lot of shamans because I've spent time in the Amazon Basin, and invariably the signifying characteristic is simply a feeling of being at ease in their presence and a feeling of penetrating intelligence.

And isn't that different from talking about Tibetan llamas or anyone like that. I mean, penetrating intelligence. Some people differ with me but I really believe salvation has something to do with intelligence. It may not be the whole story, but...

MJR: It's not just a passing acquaintance.

TM: Well, I was quoting - I don't know if I can get this right, but I was quoting last night John Stewart Mill to a friend of mine. John Stewart Mill said, "Not all conservative people are stupid, but most stupid people are conservative." [laughter] I thought, amazing.

MJR: That's great. I hear what you're saying. So in terms of character development, one of the main things that you were focusing on was humor, which actually preempted one of my other questions, when I told you I was sitting down and doing something very novel, I'll have you know, which was thinking of questions I would like to ask Terence.

One of the questions was, what is the role of humor - well not in the psychedelic experience, I think that's kind of obvious - with shamanic experience, but that purview on life, which is pre-religious, so to speak, institutional religious.

What is the flavor of the life when people are so close to the earth and the plants, and is that something that you are inviting people to consider these days, in 1996 now, as a way for us to open up toward the transcendental object?

TM: Well, I'm not sure I follow the entire question but I'll try a yes. Yes.

MJR: Do you want me to rephrase it?

TM: No, Let me take a stab at it. Two human activities seem to me pretty much to be outside of history. I mean, one is orgasm and the other is laughter. And they are physiological responses to circumstance that are universal. We do it no differently if we're French or Armenian or whatever, and it breaks us out of culture for a moment, and so laughter, I think, is really the shaman's greatest tool.

That's why the shaman is always associated with the Trickster, and in the clinches, meaning when

somebody's dying or childbirth or snakebite or something, the shaman is a very serious and highly functional caregiver and technician but how the shaman lives with his people is as a clown and a gadfly and a critic and the guy who always says, well, don't you think we should think again or how about this or how about that and I think that...

MJR: I see. It's a playful spirit.

TM: It's a playful spirit and it's a spirit that isn't dogmatic. That's really important. These cultures are hideously dogmatic but the shaman is the one person in the culture who is deputized to make fun of it. And so I see ourselves as bohemians, as freaks, as natural critics of the society we live in, and in that sense, performing a shamanic function.

MJR: Right. Ok. Good. That answers the many-pronged question, and actually to go a step further with that is, um, I remember reading something that you were writing about transpersonally oriented psychotherapists and the role that you see them playing in today's society as really being very instrumental.

TM: Well, now, there are, I don't know, thousands, probably of people who I would consider shamans, who don't live in the rainforest and don't administer their skills to some tiny language group up some river but who are fully embedded citizens of high electronic culture. And this is a new shamanism that is coming into being. We need it. Psychotherapy has been very reluctant to get its feet wet, you know, the talking therapies, and finally the touching therapies, but very little of the taking it and going with the patient into the space kinds of therapies, because that is incredibly dangerous and demanding work, but it's what people must do if they want to uh, work their way out of the modern dilemma.

MJR: Mmm hmm. And do you think that through ingestions, still at this point, this can help us? And it doesn't mean that this has to be for everyone, all the time.

TM: Oh, it's definitely not for everyone, but it's an enormous boon to our culture to revivify the shamanic hallucinogens and to bring them into the developing mix of technology and pluralism and new therapies and so forth and so on. I think it's one of the most important tools. I mean, as you well know, there is just simply nothing that effective and that dramatic for pushing you into a new world, whether you like it or not.

MJR: Sure.

TM: And that's where we're going, whether we like it or not.

MJR: That's true, too. And from that point of view, you use the word and make reference to the idea of evolution, and the more I think about it, the more I think that's a very overused and under defined term. I'm not even sure anymore what it really is.

TM: Well, evolution, in biological terms, is not in the picture anymore. We are evolving now entirely in the domain of culture and so rapidly.

MJR: Culture and consciousness.

TM: Well, yes. They mirror each other. One is the byproduct of the other. But we're not changing physically. We haven't for 50,000 years.

MJR: We still have the appendix, et cetera.

TM: Yes. But we are mutating our cultural values and our technologies and our institutions at such a rate that as I say, we will not recognize ourselves in a very few years.

MJR: Hmm. And of course that's not a biological recognition, it's a psychic recognition.

TM: Yes. I mean, imagine someone brought forward to modern New York from 100 years ago. I mean, I'm sure they would assume...I don't know what they would assume had happened in the intervening 100 years. It looks like Armageddon or something, but it's not. It's just normal unfolding of historical processes and technologies.

The mushroom once said to me, "This is what it's like when a species prepares to depart for the stars. Not to worry."

MJR: They've been speaking to you for a while, haven't they?

TM: Long enough.

MJR: We are being signaled that we are...the end of time is really not in 2012, December 23rd or something like that. It's really in about 4 minutes.

TM: See, it overtook even my expectations.

MJR: Much faster than either of us could have realized. In our closing minutes, Terence, are there any particular points that you would like to make? I mean, here we have this wonderful New York audience that is just loving you and lapping up this show, and I'm just wondering if there's any particular, central points you would like to make, that you would like to communicate, to the folks that are listening.

TM: I think people should put the art pedal to the floor. I think our salvation is in producing as much beauty and as much communication as fast as possible, that what will make this white-knuckle ride to the end of history slightly easier is if we communicate - our dreams, our fears, our experience of what it's like to go through this.

We've never been here before. This is a unique moment, and probably the future of the human race depends on how we comport ourselves over the next 25 years. So it's a privilege, a challenge, an adventure. Everybody should jump in and uh, feel the surf.

MJR: Take off your seatbelt and get ready.

TM: That's right.

MJR: Absolutely. Well, that's wonderful. In fact I just realized, on a practical note, that you are beginning

this think along tour in New York.

TM: That's right.

MJR: As we speak.

TM: Well, this is the most novel place.

MJR: Really. This is the place to begin. And from here, you're going to Santa Fe?

TM: Santa Fe, then Boulder, then Los Angeles, and then home to Hawaii.

MJR: Wonderful, wonderful. A great place to have a home in. Why don't we give a way for people to get in touch with Axiom. So, if they want to communicate to friends in other parts of the country while you're dancing around...

TM: Yes, do you have the Axiom email address?

MJR: Their phone number is 1-800-76-AXIUM.

TM: Oh, well, that'll do it.

MJR: Ok. Feel free to call to get more information on Terence's think along tours as he dances across the country. Really glad that you danced into the studio.

TM: It was a pleasure to talk with you.

MJR: Great.

TM: Lots of fun.

MJR: Thanks so much. This is MJR for A Better World. Thanks again for joining us. Please call and give a couple of suggestions. Where is everybody now when I need you? Share your thoughts and feelings with me. Love to hear from you. I look forward to seeing you next week.

A Conversation with Terence McKenna and Ram Dass

Day Month 1992

Location, City, State

Description

- [Video Link](#)
- [Transcription](#)
- [Other links](#)

Terence McKenna: This summer past we journeyed to Prague Czechoslovakia to attend the International Transpersonal Conference, a meeting of philosophers and psychologists, anthropologists, writers, ecologists, and thinkers on global subjects. Throughout the conference we were able to track down and interview some of the movers and shakers whose ideas and hopes will shake the new millennium. Prague was a fitting venue for this meeting, poised, as it is, at the center of European crisis and promise, it is a metaphor for the transformation of the planet and of human psychology that must take place if we are to provide a sane future for our children.

I'm standing in the center of one of Central Europe's most beautiful and mysterious cities. This is Prague, Czechoslovakia and I'm Terence McKenna. We're here to meet with some of the world's most outstanding thinkers to discuss science, spirituality and the mounting global crisis. And it's fitting that we should meet in this, the capital of ancient Bohemia, for Prague and Bohemia have always stood for intellectual innovation, chance taking and the life of ideas.

In the [sp?] splendor of one of Prague's most famous concert halls, we encountered Richard Alpert, and persuaded him to have lunch with us. Alpert, who now calls himself Ram Dass, is one of the most enduring figures from the American cultural upheaval of the 1960s. Alpert, whose career reaches from Harvard University, to the plains of the Punjab, has transformed himself into a spokesman for humanity's ignored and downtrodden.

And Ralph Abraham was sitting across the table watching me have this conversation and went after Steiger left Ralph leaned over to me and he said "so you see, Terence, the mushroom's telling you that it can reach out and touch you anywhere, and I thought that was amazing.

Ram: Well, anytime you would like to, or feel that you have time to guide me through anything at all I'd be happy to be your...

Waiter: Oh, excuse me, sir. You are not the famous Terence mushroom McKenna that is you my friend

TM: It is...

Ram: That's him

Waiter: oh, how wonderful! Yes, uh, pleased to welcome you on our bohemian highway. I especially bring you very good black coffee, Espresso. If you may tell me who is the attractive elderly gentleman you brought on your side, Into your companionship here?

Terence: this is Mr. Dass.

Waiter: oh! The MS-DOS, yes?

Ram: No, the Ram Dass.

Waiter: Oh, the CD-ROM!

Ram: yes, the CD-ROM.

Terence: the CD-ROM Dass.

Waiter: the LSC the LSD...

Ram: the LSD Dass, that's the one.

Waiter: Oh, wonderful! Take this it will be making you very bohemian.

Ram: oh, thank you.

[Terence laughs]

Ram: I'm so happy to be in your fair country.

Waiter: Oh, my country very fair, and I'm happy to have the LSD experience...

Ram: What is your name?

Waiter: My name is waiter.

Ram: waiter? How do you do, waiter? A pleasure.

[Terence giggles]

Waiter: Wes, see you waiter.

Terence: See you waiter, yes... *[Chuckles]*

Ram: You don't think there's any... It needs the external form of a mushroom?

Terence: It would never have happened for me. I only argue from my own experience.

Rome: Yeah, but you and I were both so thick and crap, you know, that's why we needed it.

Terence: well, but there were a few others out there. We didn't corner the market on being thick in crap.

Ram: but I'm telling you about someone like a Romano Maharishi somebody like that

Terence: oh, these people?

Ram: you know? I mean there are people who...

Terence: But the idea is not to come up with something that the best among us can make hay with but a democratic, uh, something which addresses the species. The thing that seemed to me so important about the psychedelic experience was that it happened to me. I wasn't reading John Chrysostom or Meister Eckhart, of course those guys...

Ram: Right on... it happened to me ... it happened to me...yes.

Terence: And, and so I assume that I am a very ordinary person. Therefore, if it happened to me, it could happen to anyone. That's really something –

Ram: That's a question ... there's a set of assumptions there; one, that you're very ordinary person, and whether the same chemical given to a dozen people would bring about elevon other... –

Terence:... Similar experiences...

Ram: I think the outcome would be very different. And that's... It, I keep getting cast into an evolution of consciousness model about individuals because they're such marked individual differences. Three people come before my guru: one completely goes *[makes crazy face]* and the other two get at your party. And people take psilocybin and they ... Some go like that *[crazy face]*, or they go like that *[scared face]*, and some go like that *[Enlightenment]*

Terence: Well, don't you think a good metaphor for it would be sexuality? Apparently, there are some people who can kinda, take it or leave it. And others of us, uh, it rears its ugly head with great uh, presence. Yet everybody has to come to terms with it.

Ram: I notice as I get older I moved from one of these categories to the other *[laughs]* it leaves so much space in my life I don't know what to do with my free time.

Terence: I hope it never happens to me.

Ram: *[laughs]* I'm just clinging.

[Both Ram and Terence laugh]

Terence: No, just aspiring to cling

[Both Ram and Terence laugh]

Terence: actually, I live the life of an ascetic. It's my aspirations that are pulling me down *[laughs]*. Well see the great, the nice thing about this evolutionary argument is that you can sort of make the snake take its tail in its mouth because... –

Ram: exactly... Exactly. It does.

Terence: because the escape is not into some science-fiction future.

Ram: No.

Terence: It's into an archaic recursion of some sort. We... We once knew everything we needed to know, so, what we're trying to find out is lost knowledge, not new knowledge, and if you direct people back toward 10,000, 20,000 years ago, they see a kind of completion that an open-ended future is uh...

Ram: it seems to me it's a con- it's a confusing thing to use time that way, because it makes the artifacts of that period seem to be valued as opposed to the artifacts of this period, and it seems to me that I... I mean... Whether you call it... Not science-fiction... But science fiction can also be very compassionate, it can be very historically relevant. It doesn't have to be- uh, it's just using a different set of artifacts to work with, so.

Terence: Well, for instance, I see most of what happened in the 20th century as being unconsciously driven by this fascination with the archaic.

Ram: Fascination with the archaic?

Terence: yes, I mean... –

Ram: Wow! That was... Of all the things I predicted you'd say, it wasn't that. Tell me, what does that mean?

Terence: Well, for instance, impressionism deconstructs the hard image of Realism, and gives you a feeling-toned thing, which was very antithetical to Victorian, Edwardian thought. Then Freud and Jung described different aspects of the unconscious, but to do it Jung ha- uh, Freud has to talk about repressed, primitive sexual imaginings, Jung talks about folklore, fairytales and mythology. Meanwhile, the Dadaists and the Surrealists are saying we have to break up the linear expectations of the bourgeois mind, and then you get a Jackson Pollock, and those people, who say, "the image itself has to be thrown out", and then, to my mind, the psychedelic thing in the 60s, based on rock 'n roll and a boundary dissolving psychedelic, we almost, by a random walk, are finding our way toward shamanism, tribalism, nomadism...uh.

Ram: Uh, go beyond the isms, tell me what we're really finding.

Terence: We're finding a world made out of mind rather than stuff:

Ram: Great, okay, we're finding the world made out of mind. Every time you describe which mind you find, that's just limiting the limiting condition. I mean, if we just find the thing of mind created stuff, live in that, then what happens?

Terence: Well, I mean, there is a transcendental dimension beyond language, it's just hard as hell to talk about it.

Ram: But if you live in it, and talk from there, then the forms that it will manifest in become just the forms it manifests. It's nothing more or less and that, so.

Terence: So, you mean you download the unspeakable into language and let the chips fall where they may.

Ram: Well, they don't fall where they may. They fall in a perfectly harmonious pattern.

[Terence nods as he finishes sipping from his black coffee]

Terence: Well, that's them falling where they may.

Ram: Where they may, where they will.

Terence: Yeah. Well, so, what I'm hearing from you is you have a very strong sense of the pattern. Strong

enough that your limited, necessarily limited personal viewpoint, doesn't tend to get in the way – you can always push the reset to hope button, and then you hope, almost on principle.

Ram: [sp?] said to me: stand halfway between hope and hopelessness. I thought that was very useful.

Terence: And is that [*shrugs and raises arms*] Ehh? [*sound and face of doubt and desperate confusion*]

Ram: No it's [*lifts arms and makes face and noise of orgasm*] it's the ecstasy of total horror and total beauty at the same moment. That's what I feel again and again, Terence, when I'm with somebody dying of AIDS. My God, my heart's breaking, it's horrible, I mean it's a ghastly, social ostracization, this, that, opportunistic illness... And there's another part of me that's giggling, and I can hardly handle the multiphrenia of it all, the sense of the perfection of it all, and the beauty of the moment, and the horrible shit of it.

Terence: Yeah. Well, it all is spun together. Is that because you feel confident that the self is somehow indestructible, or because you don't even ask that question?

Ram: you gotta watch the words indestructible, because that has a time dimension. I mean, I think the awareness is.

Terence: But, for example, do you think this is the stage upon which all acts are performed, or that we move up and down many levels...?

Ram: no, this is one of the stages of an infinite number... Probably infinite number. Because I just look into two minds and I see two different ones, and those are all just on this one. No, I feel I... Like, I had this friend Emmanuel, you know, this spook that has no body...

Terence: Mhm, mhm.

Ram: And uh Emanuel's two lines to me were: death is absolutely safe, firstly– that's a very profound statement. Next thing he said it was like taking off a tight shoe. And then I said to him, "Emmanuel, what am I doing here? Who made this error? What am I doing on this plane?", He said, "you're in school, why don't you try taking the curriculum?".

Terence: And the curriculum is...?

Ram: Life.

Terence: any life?

Ram: It means the exploration of the clinging of mind within the world of projected form.

Terence: So the exploring life?

Ram: it's the exploring life with the... It's purpose is, in the sense of returning back into the garden of Eden. It's a return, there is a return metaphor underlying all of it.

Terence: And I'm sure you're asked this all the time, so am I, and maybe we give different answers, do you think that this can be done without psychedelics fast enough to have an impact on the global situation?
[*Ram closes his eyes and pauses for a good 10 seconds, thinking*]

Ram: Uh, I can conceive that it could be, yeah. You ask do I think? I don't really have an opinion whether it will or won't, but I could see it go either way. Like John C. said to me, "it's too late, as far as the rainforests are concerned, he says the inertia is too great and the whole system, it's too late", so I said, "okay, John", I mean, it was the first time, too, he'd said it to me, just like that. He said, "it would take a miracle", I said, "oh...". That threw me back on whatever that was, and then he said, "but after all", he said, "we came up out of the ocean, we came onto land", he said, "we have quite a lineage of miracles. I wouldn't underestimate us". That was a nice thought.

Terence: Well, so my question to you is: are psychedelics a miracle?

Ram: Psychedelics are a miracle, yes, they may not be the only miracle...

Terence: Are they the miracle we need?

Ram: I don't know that... I don't know that. I think they may have already done what they were to do.

Terence: Really? That's interesting, I've never heard anyone say that.

Ram: I think what is done is so much more powerful than anybody yet recognizes. See, I see that all this destruction is just the process of transformation, the question is whether we'll keep it together in the process of transformation, and that's why all I'm interested doing is becoming a person and helping others become a person, who in the process of the dramatic stuff, will keep some equanimity, and keep some love, and some presence in that process. But that's... Psychedelics may play a role in that, so you're right, that comes back to your point.

Terence: Well, see my assumption in trying to think about thousands of psychedelic trips, rather than just mine, what they seem to do generically is they seem to dissolve boundaries,

Ram: Yes.

Terence: -and the ego is in the business of creating, maintaining and defending boundaries. So, I really see the psychedelics as directly intervening in the core process which is running us over the edge, which is, our inability to emotionally connect with the consequences of what we're doing. If, for a single moment, we could feel what we're doing, we would stop.

Ram: I understand. It's interesting, because we take images that one of us know, of the girl running down the street naked in Cambodia, you know, or something like that, and we say that wasn't strong enough, you know, it won life of the year award, but it wasn't strong enough, it didn't stop everybody and say, "holy shit, what are we doing here?". So, what would be strong enough to do that? And you say, well, psychedelics, but that's in a- it's in a one on one thing, I mean, we're talking major game players at this moment. Take, I mean, put China into your computer, you know?

Terence: how do you deal with that?

Ram: you know, I mean, either you're spraying it, or, it's water, or, it's... It's some other level of consciousness that do it. There is a certain level of trauma that's possible, that can soften the ground. Not 3 mile Island, and not Chernobyl, but, I mean, I'm ... I don't want to create this with my mind, but I can imagine a certain trauma, like in Marin when they ran out of water. It was interesting, suddenly all the ego barriers and everything and neighbors were talking who never even met each other...

Terence: People were taking showers together.

Ram: exactly, the whole process was happening, you know, marriages, babies were conceived, everything as a result of that trauma, of that denial. So, a massive, significant trauma... – I just gotta tell you one scary image. There is a saint in India who lived up to, about, 1930 I think, or something, and one of his devotees said to me, one night, he was sort of looking off into the distance, he said, "there'll come a time, he said when you'll walk 5 miles", and he said, "you'll sight the light from a fire in another person, and you'll be so happy to know another person exists".

Terence: Quite a prediction.

Ram: Isn't that quite a prediction? It's in there, it's just in there somewhere.

Terence: Interesting. Yes, well, I agree, I think that what's going to happen is-

Waiter: Gentlemen, everything is fine with the evolution of coffee, and consciousness, both very good with you, too? Yes?

[Terence laughs]

Ram: You have come just at the right time, this is just what I wanted. I want you to know, you tuned in to a higher level.

Waiter: A higher level? Level high, very high yes. Bohemian mushroom soup today, you know?

Ram: Ahhh. We were just talking about that.

Waiter: Oh, oh yes? *[To Terence]* You like bohemian mushroom soup?

Terence: I like mushroom.

Waiter: Let me sprinkle, liberally, some water on your chalice, sir.

Terence: Oh, please, liberally sprinkle his chalice, for sure *[laughs]*

Ram: I am a chalice, so it's fine, if you wish to

Waiter: Oh I know you by your true name, you're Mr. Chalice, sir. Yes, very good.

Terence McKenna in conversation with Michael Toms

Terence McKenna: The human imagination, in conjunction with technology, has become a force so potent that it really can no longer be unleashed on the surface of the planet with safety. The human imagination has gained such an immense power that the only environment that is friendly to it is actually the vacuum of deep space. It is there that we can erect the architectonic dreams that drive us to produce a Los Angeles or a Tokyo, and do it on a scale and in such a way that it will be fulfilling rather than degrading. So yes, I think we cannot move forward in understanding without accepting as a consequence of that that we have to leave the planet, that we are no longer the bipedal monkeys we once were. We have become almost a new force in nature, a thing of language and cybernetics and an amalgam of computers and human brains and societal structures that has such an enormous forward momentum that the only place where it can express itself without destroying itself is, as James Joyce says, "up n'ent!"

Q: So long long ago in the far away gala

TM: Well, it's in our present I think. Our future is probably almost unimaginable because I think the transformation that leaving the planet will bring will also involve a transformation of our consciousness. We are not going as 1950s style human beings. We are going to have to transform our minds before we are going to be able to leave the planet with any amount of grace. This is where I think the psychedelics come in because they are anticipations of the future. They seem to channel information that is not strictly governed by the laws of normal causality. So that there really is a prophetic dimension, a glimpse of the potential of the far centuries of the future through these compounds. No cultural shift of this magnitude can be unambiguous, i mean the very idea that as a species we would leave the earth behind us must be as rending an idea as that a child would leave its childhood home. Obviously it's a turning

away from something that, once left behind, can never be recaptured. However, this is the nature of going forward into being, a series of self-transforming ascents of level. And we now simply happen to be at that moment of ascent to a new level that is linked to leaving the planetary surface physically and to reconnecting to the contents of the unconscious collectivity of our minds. These two things will be done simultaneously. This is what the last half of the 20th century, it seems to me, is all about.

Q: Well by and large psychedelics have really not been accepted into the mainstream. Do you see a change in that?

TM: Well, not particularly. They hold a certain fascination for a persistent majority, and in that way they do their catalytic work on society, which is to introduce new ideas and to release a certain kind of creative energy into society. I certainly would not like to see a return to the psychedelic hysterias of the 1960s. I think it's fine that these things are now the subject of interest of a much smaller group of people, but perhaps a group of people with a greater commitment and a better idea of exactly what these things are. And it's really the same people. It's just a smaller group of them, and they have accumulated experience over the past 20 years. However I certainly don't think all psychedelic frontiers are conquered. One of the things that I write about and speak about are the phenomena that many people confirm with the psilocybin family of hallucinogens that no one has included in the standard model of psychedelic drugs, and by that I refer to the Logos-like phenomenon of an interiorized voice that seems to be almost a superhuman agency, a kind of *genus loci*. And I have been writing recently about alien intelligence, which is what I call this, where you have contact with an entity so beyond the normal structure of the ego that if it is not an extraterrestrial it might as well be because its bizarreness and its distance from ordinary expectations about what can go on is so great that if flying saucers arrived here tomorrow from the Pleiades, it would make this mystery no less compelling because I believe that the place to search for extraterrestrials is in the psychic dimension. And there the problem is not the absence of contact, but the volume of contact that must be sifted through because the fact of the matter is shaman and mystics and seers have been hearing voices and talking to gods and demons since the paleolithic and probably before. That doesn't mean that we can rule out this approach to communication. It seems to me far more likely that an advanced civilization would communicate interdimensionally and telepathically. That amounts of time available for intelligent species to evolve these kinds of communication are vast. So I think that it's very interesting then that the tryptamines, psilocybin and DMT, at the 15 milligram level, very reliably trigger what could only be described as contact-like phenomena. Not only the interiorized voice in the head, but also the classical flying saucer motifs of the whirling disk, the lens-shaped object, the alien approach. This seems to be something hard-wired into the human psyche, and I would like to find out why. I think it's a very odd fact of human psychology, and I don't buy any of the current theories ranging from that

nothing at all is happening to that this is in fact another species with a world around another star that is getting in touch with us. I think it's something that's so bizarre so that it actually masquerades as an extraterrestrial so as not to alarm us by the true implications of what it is.

But I suspect it is something like an overmind of the species, that actually the highest form of human organization is not realized in the democratic individual. It is realized in a dimension none of us have ever penetrated, which is the mind of the species, which is actually the hand at the tiller of history. It is no government, no religious group, but actually what we call the human unconscious, but it is not unconscious, and it is not simply a cybernetic repository of myth and memory. It is an organized entelechy of some sort, and human history is its signature on the primates, and it is so different from the primates. It is like a creature of pure information. It is made of language. It releases ideas into the flowing stream of history to boost the primates towards higher and higher levels of self reflection of it. And we have now reached the point where the masks are beginning to fall away, and we're discovering that there is an angel within the monkey struggling to get free, and this is what the historical crisis about. And I'm, for no reasons in particular, very optimistic. I see it as a necessary chaos that will lead to a new and more attractive order.

Q: Terence you were talking about extra-ordinary realities. It occurs to me that there's an enormous amount of prejudice against the psychedelics and the use of hallucinogenic substances. It's almost as if there's an inordinate fear to open up the door to the closet that these substances reveal. What about that prejudice? What do you think, how's that going to be resolved?

TM: Well I think it's more complicated than a prejudice. it's a prejudice born of respect because most people sense that these compounds probably actually do what their adherents claim they do. It's possible to see the whole human growth movement of the 1970s as a wish to continue the inward quest without having to put yourself on the line the way you had to when you took 250 gamma of LSD. And I think all these other methods are efficacious, but I think it's the sheer power of the hallucinogens that puts people off. You either love them or you hate them, and that's because they dissolve world views. And if you like the experience of having your entire ontological structure disappear out from under you, if you think that's a thrill, you'll probably love psychedelics. On the other hand, for some people that's the most horrible thing they could possibly imagine. They navigate reality through various forms of faith, and I think that the psychedelics, the doors of perception are cleansed and you see very very deeply. I spent time in India, and I would always go to the local sadhus *** of great reputation, and I met many people who possessed wise old man wisdom. But wise old man wisdom is a kind of Tao of how to live. It has nothing to say about these dimensions that the psychedelics reveal. For that you have to go to places where hallucinogenic shamanism is practiced,**

specifically the Amazon Basin. And there you discover that beyond simply the wisdom of how to live in ordinary reality, there is a gnosis of how to navigate in extra-ordinary reality. And this reality is so extra-ordinary that we cannot approach what these people are doing with any degree of smugness because the frank fact of the matter is that we have no viable theory of what mind is either. The beliefs of the Wetoto shaman and the beliefs of a Princeton phenomenologist have an equal chance of being correct, and there are no arbiters of who is right

So It's the power of these things, the fact that here is something we have not assimilated. We have been to the moon, we have charted the depths of the ocean, the heart of the atom, but we have a fear of looking inward to ourselves because we sense that here is where all the contradictions flow together. And the same prejudice against psychoanalysis that characterized the 20s and 30s when it was thought to be a superfluous or some kind of fad attends the psychedelics now. It's because it touches a very sensitive nerve. It touches the issue of the nature of man, and people are uncomfortable with this, or some people are uncomfortable with this.

Q: What is the value of exploring the extraordinary realities?

TM: Well I guess it's the same value that attends the exploration of ordinary realities. There's an alchemical saying that one should read the oldest books, climb the highest mountains, and visit the broadest deserts. I think that being imposes some kind of obligation to figure out what is going on. And since all primary information about what is going on comes through the senses, any drug or any compound which alters that sensory input has to be looked at very carefully. I have often made the point that chemically speaking, you can have a molecule which is completely inactive as psychedelic, and you move a single atom on one of its rings, and suddenly it's a powerful psychedelic. Well now, it seems to me this is a perfect proof of the inner penetration of matter an mind. The movement of a single atom from one known position to another known position chances an experience from nothing to overwhelming. This means that mind and matter at the quantum mechanical level are all spun together. This means that in a sense the term extraordinary reality is not correct if it implies a division of category from ordinary reality. It is simply there is more and more and more of reality, and some of it is inside our heads, and some of it is deployed out through three dimensional Newtonian space.

Q: Most of us I think just simply accept the everyday reality as the only one, and you're talking about journeys into the nether regions, far beyond most peoples' conception or even wanting to conceive of such a reality.

TM: Well I think there's a shamanic temperment, which is a person who craves

knowledge, knowledge in the Greek sense of gnosis. IN other words, knowledge not of the sort where you subscribe to Scientific American and it validates what you believe, but cosmologies constructed out of immediate experience that are found always to be applicable. You see I don't believe that the world is made out of quarks or electromagnetic waves or stars or any of these things. I think that the world is made out of language, and that this is the primary fact that has been overlooked. The construction of a flying saucer is not so much a dilemma of hardware as it is a poetic challenge. And people find it very hard to imagine exactly what I'm talking about. What I'm saying is the leading edge of reality is mind, and mind is the primary substratum of being. We in the West have had it the wrong way around for over a millenia, but once this is clearly understood, with what we have learned in our little excursion through three dimension space and matter we will create a new vision of humanity that will be a fusion of the East and the West.

Q: Well a world being made of language, and I think of these extraordinary realities which are totally beyond any language that we use in any ordinary sense

TM: Yes well they are beyond ordinary language. I always think of PHylojudeas writing on the logos. He posed to himself the question: What would be a more perfect logos? And then he answered, saying it would be a logos which is not heard, but beheld, and he imagined a form of communication where the ears would not be the primary receptors but the eyes would be. A language where meaning was not constructed through a dictionary of little mouth noises, but actually three dimensional objects were generated with a kind of hyper-language so that there was perfect understanding between people. And this may sound bizarre in ordinary reality, but these forms of synesthesia and synesthesia-glossolalia are commonplace in psychedelic space.

Q: Terence could you identify Phylos for us and tell us who he was?

TM: He was an Alexandrian Jew of the second century who made it his business to travel around the Hellenic world and discussed all the major cults and religious and cosmogonic theories of his day. So he's a major source of Hellenistic data for us.

TM: How would you relate to Socrates' view of the world.

Q: Well, I think that it's hard not to be a platonist, but it's something perhaps we should struggle against or at least struggle to modify. I think of myself as sort of a Whiteheadian platonist. Certainly the central Platonic idea which is the idea of the ideas, these archetypal forms which stand outside of time, is one which is confirmed by the psychedelic experience. And Plato's formation of time as the moving image of eternity is

another one of these aphorisms that the psychedelic state confirms. And certainly Neoplatonism, Plotinus and Poriphry, and that school are psychedelic philosophers. Their idea of an ascending hierarchy of more and more rarefied states is a sophisticated presentation of the shamanic cosmology which is the cosmology that one experientially discovers when they involve themselves with psychedelics.

TM: What I think most of us don't understand or don't really know is the fact that Greek cultures and Elucinean * mysteries incorporated the use of something very akin to psychedelics. That essentially Western civilization is based on the culture that had at its core root an experience and a ritual that used something akin to psychedelics.

Yes well for over two thousand years, anyone who was anyone in the ancient world made the pilgrimage to Eleusis, and had this experience which Gordon Wasson and Carl Ruck * have argued very convincingly was a hallucinogenic intoxication on ergot. But of course, as soon as the church solidified its power it closed these platonic academies and moved against pagan, so-called pagan knowledge and heretical knowledge and not only the platonists, but all the gnostic sects. All of these people, all of these viewpoints were repressed. I like to think that the end of that repression came in a very odd way when in 1953 I guess it was, Gordon Wasson and his wife Valentina in the viliage in *Hwuads in the Sierra Mazateca of Oaxaca, discovered the psilocybin mushroom cult. It was as if Eros, who had been martyred in the old world, was then found sleeping in the mountains of Mexico and resurrected. And the experience of the mushroom is very much the experience of a *genus loci*, a God on the Grecian model, not the God who hung the stars in heaven but a local god. A pre-Christian bacchanalian nature-power that is very alien and yet resonates with our expectation of what that experience would be like.

Interesting that the mushroom also is a symbol in our culture of death and destruction, being the symbol of the nuclear explosion.

TM: Yes well my brother has made the point asking what mushroom is it that grows at the end of history? Is it the mushroom of Fermi and Oppenhimer and Teller, or is it the mushroom of Wasson and Hoffman and Humphrey Osmond?

Q: Somehow I think the latter is safer (laughter)

TM: Well it may not only be safer, it may open the way to escape from the former. It's like a pun in physics that the force of liberation and the force of destruction could take the same form. It's what the alchemists call a *coincidencia oppositorum*.

Q: It is an amazing synchronicity it seems, that. Also I was interested, I was talking with Andy Wile some time ago about the fact that there are a new genus of mushroom appearing that have psilocybin in them that had never been seen before, never been tracked before, and it's almost as if they're appearing now.

TM: Well it's amazing how many have been discovered since people have bent their attention to it. There have been psilocybin mushrooms reported from England, France, localities where so far as we know there is no cultural history of usage at all. However it's interesting that cultural

usage seems to disappear very early in human history. Hallucinogens are hardly even welcome in agricultural societies. I think it was Weston LeBar made the point that once you learn how to grow plants, your god shifts from the ecstatic god of the hallucinogens to the corn god or the food god, and it no longer is about divining the hunt and weather through the ecstatic use of hallucinogen. It's about being able to get up every morning and go to work and hoe the crop. So you mentioned earlier the prejudice against hallucinogens, I think it reaches back to the beginning of agriculture. This competition among plant gods which exemplified lifestyles that must have seemed very alien to each other.

Q: Is psilocybin illegal?

TM: Oh yes, it's a schedule 1 drug. Without any public debate it was placed on the list at the same time that LSD was, and yet the issue was always couched in terms of LSD being made illegal, but actually at that point in time a whole bunch of things were made illegal. And there was never any public debate. All psychedelics were viewed as the same drug, and LSD was used as the model. Actually, these drugs, there's a spectrum of psychedelic effects and certain drugs trigger some of them and certain ones others, but yes, psilocybin is illegal.

Q: Are the mushrooms illegal?

TM: The mushrooms also are illegal as they contain psilocybin.

Q: I got a call from Andy Wild saying he walked down a downtown Seattle residential street picking up psilocybin mushrooms from the front yards of residential homes.

TM: (laughing) Well English law took the view that it was preposterous to try and outlaw a naturally occurring plant, and they took the position that only the chemical was illegal which I think is a very wise position. But I noticed that Canada recently chose the American interpretation over the British one.

Q: Interesting. Turns out, going back to the Andy Wild story, that the reason that these mushrooms were in such plenitude in various locales in the northwest was that their spores were contained in a mail order company's mushroom growing product that they sent out mail order. And so...

TM: Yes, this is an interesting phenomenon. You see, the spores of the mushroom are not illegal because they do not contain psilocybin. They only contain the message and the DNA of the mushroom for the production of psilocybin, so it's a kind of bizarre catch-22. The mushroom spores can move anywhere legally, can be bought and sold, but they are the sine-qua-non for the production of mushrooms of course.

Q: Terence the kind of knowledge and the kind of information you're putting forth is not generally available. It's not the kind of information or knowledge that one would find in the typical academic anthropology curriculum. And yet it seems to be a knowledge that is ever expanding, but somehow it's outside of the cultural institutional entities in some way. Number one, why do you think that's the case- of course there's a logical answer to that one. What do you see as the future of this kind of information, this kind of knowledge.

TM: Well I think in a sense it signals the rebirth of the institution of shamanism in the context of modern society, and anthropologists have always made the point about shaman, that they were very important social catalysts in their group, but they were always peripheral to it, peripheral to the political power and actually usually physically peripheral, living at some distance from the village. And I think the electronic shaman, the people who pursue the exploration of these spaces, exist to return to tell the rest of us about it, that we are now coming into a period of racial maturity as a species where we can no longer have forbidden areas of the human mind or cultural machinery. We have taken upon ourselves the acquisition of so much power that we now must understand what we are. We cannot travel much further with the definitions of man that we inherit from the Judeo-Christian tradition. We need to truly explore the problem of consciousness because as man gains power he is becoming the defining fact on the planet in the near space area. So the question that looms is, is man good? And then, if he is, what is it he's good for. And the shaman will point the way, because what they are are visionaries, poets, cultural architects, forecasters, all these roles which we understand in more conventional terms rolled into one and raised to the nth power. They are cultural models for the rest of us. This has always been true, that the shaman has access to a superhuman dimension and a superhuman condition, and by being able to do that he affirms the trans...the potential for transcendence in all people. He is an exemplar, if you will. And I see the attention that's been given to these things signaling a sense on the part of the society that we need a return to these models. This is why, for instance, in the Star Wars phenomenon Skywalker, Luke Skywalker, Skywalker is a direct translation of the word 'shaman' out of the Temgusik **which is where Siberian shamanism comes from. So these heroes that are being instilled in the heart of the culture are shamanic heroes. They control a force which is bigger than everybody and holds the galaxy together. This is true as a matter of fact, and as we explore how true it is, the limitations of our previous world view will be exposed for all to see. I think it was J. B. S. Haldane who said 'the world may not only be stranger than we suppose, it may be stranger than we can suppose'.**

I think that the character Yoda describes a sort of shamanic character.

Very much so

As we talk about shamans and shamanism, again that brings up cross-cultural currents. Do you see the shaman taking on a new...certainly you don't see Indian shamans walking into the metropolitan areas...but do you see the shaman taking on a new form?

Well I believe, along with Gordon Wasson and others, but in distinction to Merciliad who is a major writer on shamanism, that it is hallucinogenic shamanism that is primary, and that where shamanic techniques are used to the exclusion of hallucinogenic drug ingestion, the shamanism tends to be visciated it is more like a ritual enactment of what real shamanism is. So that the shamanism that is coming to be is coming to be within people in our culture, people who feel comfortable with psychedelic drugs and who, by going into those spaces and then returning with works of art or poetic accounts or scientific ideas are actually changing the face of the culture. I connect the psychedelic dimension to the dimension of inspiration and dream. I think history has always progressed by the bubbling up of ideas from these nether dimensions into the minds of receptive men and women. It is simply that now with the hallucinogens we actually have a tool to push the button. We are no longer dependent upon whatever factors is that previously controlled the ingresion of novelty into human history. We have taken that function to ourselves, and this will accelerate and intensify the cultural crisis. But I think in the end it will lead much sooner to its resolution.

Q:So as we continue to move towards the further exploration of the spaces. We can expect that social change is a result?

TM: Tremendous social change. I see in fact what is happening is a tendency to what I call turn the body inside out. We are through our media and our cybernetics, we are actually approaching the point where consciousness can be experienced in a state of disconnection from the body. We have changed. We are no longer, as I said, bipedal monkeys. We are instead a kind of cybernetic coral reef of organic components and inorganic technological components. We have become a force which takes unorganized raw material and excretes technical objects. We have transcended the normal definitions of man. We are like an enormous collective organism with our data banks and our forecasting agencies and our computer networks and the many levels at which we are connected into the universe. Our self image is changing. The monkey is all but being left behind, and all but will be left behind. The flying saucer, again, I take to be an image of the future state of humanity. It is a kind of millenarian transformation of man where the soul is exteriorized as the apotheosis of technology, and it is that eschatological event which is casting enormous shadows backward through time over the historical landscape. That is the siren at the end of time, calling all mankind across the last ten millenia toward it. Calling us out of the trees and into history and through the series of multilevel cultural transitions to the point were the thing within the monkeys, the creature of pure language and pure imagination whose aspirations are entirely titanic in terms of self transformation, that thing is emerging, and it will emerge as man leaves the planet. And i's not something quantized and clearly defined. It is in fact what the next fifty or so years will be about. But at the end of it, the species will be off-planet and transformed, and fully wired from the depths to the heights.

Q: Are we just talking about another version of the Christian death, resurrection, ascension, and heaven?

TM: Except that it is coming into history. What is happening is that the paradise promised the soul is actually going to enter into history because technological man took the apocalyptic aspirations of Christianity so seriously that we are going to make it happen. It has become the guiding image of what we want to be. And I'm reminded of the poem by Yates. It's 'Sailing to Byzantium', where he speaks of how after death, he would like to be an enameled golden object singing to the lords and ladies of Byzantium. And it's the image of man transformed into eternal circuitry and released into a hyperspace of information where you are a thing of circuitry but you appear to be walking along an unspoiled beach in paradise. It is that we are going to find the power to realize our deepest cultural aspirations. This is why we must find out what our deepest cultural aspirations are. Again, another way of phrasing the question 'is man good.'

Q: What about the idea that the spaces that we've been talking about that you've been illuminating are spaces that can be achieved without the use of psychedelics.

TM: Well, again I scoured India and my humble personal opinion is that it is highly unlikely. I have always approached people of spiritual accomplishment with the question 'what can you show me' because as I said earlier this 'wise old man' wisdom is one thing, but only the hallucinogen-using shaman of the Amazon seem to be able to go beyond that. There may be techniques for doing this, but the efficacy and the dependability of the hallucinogens seems to me to make them the obvious choice. It would only be a series of cultural conventions that would cause one to want to engineer around that. It is the obvious path to transcendence. People must face the fact that at one level we are chemical machines. That doesn't mean we are that at every level, but it does mean that that is a level where we can intervene to change the pictures that are coming in and going out at higher levels.

Q: You're not suggesting that people should do this by themselves?

TM: Take hallucinogens? Well I don't know about take it by themselves, probably not, though I always do and I seem to prefer it. What I am suggesting is that they take it in a situation of minimum sensory input, lying down in darkness with eyes closed cannot be surpassed, and people want music, they want to walk around in nature, they want all these things. But nature and music are beautiful in their own right. They are the adumbrations of the psychedelic experience that we deal with in ordinary reality. In confrontation with the psychedelic experience, these things are hardly more than impediments. There are very interesting things happening in the utter blackness behind your eyelids, lying still in darkness. And that is where the mystery comes from and goes to.

My question had to do with with or without a guide.

Oh, I don't think people should do it without a guide unless they feel very confident from experience that they don't need a guide. Because I like to have these ideas get out. I think it's important that we discuss all this in a way that is only now becoming possible because of how it was in the 1960s. Now we need to shed all that and look back, and look forward and try to make a mature judgement for our culture based on the facts of the matter.

0:42:08.9 Well someone asked when we first went around to try and talk about the future. I don't know if I made the point strongly enough. I wasn't sure I felt it click, and I think it's a strong one and it's somewhat new with me. It's this idea that our...that we represent some kind of singularity, or that we announce the nearby presence of a singularity, that the evolution of life and cultural form and all that is clearly funneling toward something fairly unimaginable. I mean I really don't think we can imagine our future because when we try to project some little science fiction scenario of our future, we inevitably select a very small number of trends and then we propagate them forward without integrating the forward propagation of everything else that is going to be happening simultaneously. You know there are options such as nanotechnology, the building of super tiny machines. Space migration was once an option- this seems to be fading, it seems to have been written off the menu by the powers that be as the Soviet Union cracks to pieces, the human race's ability to leave this planet becomes a memory of ancient times. I mean, we could not return to the moon in less than fifteen years if we committed ourselves to it tomorrow, so the space thing seems to have been taken off the agenda. There's nanotechnology, there's virtual reality. The present solution seems to be this enforced larval neoteny on the consuming blue-collar masses, in the high-tech societies, and triage through epidemic disease and mismanagement in the third world. It's a huge mix, this problem of saving the world or halting the forward thrust into catastrophe. People say, well why do you worry about saving the world, you just said it's going to end in 2012. I don't see that rap as any sort of permission for political irresponsibility or a lack of attention to world problems. If it's true, great, we're golden. If it's not true, and what a long shot it is, then we should still keep our eye on the ball with all of this stuff. It is overpopulation is what's driving us crazy. All other problems, toxic waste disposal, epidemic disease, resource extraction, degradation of the environment, collapse of the atmosphere. Inability to satisfy third-world aspirations. All of these problems are population problems. And capitalism doesn't want to talk about it because capitalism is not a human being. Capitalism is a Moloch, a god, a god of bloody sacrifice that sees human beings as ants. And the more ants there are, the more offerings there can be to Moloch, but this is not a good situation for us ants. Capitalism is a gun pointed at the head of global civilization. If you read the theoreticians of capitalism, Adam Smith and so forth, capitalism assumes an unlimited exploitable frontier. There is no such creature, so it has turned pathological. The only frontier now left to exploit is not a frontier in space, but a frontier in time. We steal the future from our children by plunging massively deeper and deeper into debt. But this frontier, the end is in sight, and when we hit that wall we will join the Eastern Bloc in a fundamental reappraisal of our

situation. Democracy I believe in. I think democracy is the psychedelic form of government because I don't see it as a product of rational thought. I see it as institutionalized anarchy. Democracy is biology managed for human purposes. It honors the biological unit, it takes the biological unit and gives it a vote, and that's a way for mother nature to then enter into human history. I mean I'm fairly mystical about democracy, sort of like William Blake.

Q: So how are you preparing for 2012 yourself?

TM: Well, by going way out on a limb, I guess. People ask me 'what will you do if nothing happens in 2012'. Well, by god-sent coincidence, my 65th birthday occurs a month before the date, so then I think I'll just steal away in disgrace and find myself a girl on an island who runs fish traps and disappear forever.

As to what I do in the meantime, I don't...I should make it clear. I don't believe this stuff. I find believing in these high-flown complicated synthetic systems to come off sort of like pathology, so I entertain ideas but I don't give the leaf over. I'm very amazed by the timewave. It continuously surprises and delights me. Very few people are obviously as into it as I am, but it's proof enough as far as I'm concerned. I mean, it's all I ever would have asked for. It's the gem from the other, it's aladdin's lamp, it's what I wanted and I got it. At one point in La Chorrera naturally this question arose in our group. Why us? Why are the aliens revealing the unified field theory to us, and the mushroom just replied without hesitation 'because you don't believe in anything.' And that apparently is what's required.

Do you all know that Van Morrison song about 'no guru, no method no teacher, just you and me and nature, in the garden, in the garden.' I think that's actually where it's at. So what I do between now and 2012 is I'm a meme spreader, a mean replicator, and the purpose of these teaching things is to turn you into fellow replicators of the meme, I mean I see it all in the metaphors of molecular biology. I have a new sequence of codons here, and I want to insert it into each one of you without error in copying and you should go forth and tell other people and copy it into their head, and this meme will spread because we cannot evolve faster than our language. The edge of being is the edge of meaning, and somehow we have to push the edge of meaning, we have to extend it because if we appear to be confronted by insoluble problems it's because we have the wrong language for dealing with this problem. You learn that with computers. Certain languages are good for certain kinds of problems. We have to constantly evolve language and push it forward, and the way I think of the psychedelics is they are catalysts to the imagination. That's what they were back a hundred thousand years ago. The imagination, which was just this glimmering, this iridescence on the surface of ape cognition, was under the influence of the reciprocal feedback of self reflection, you know, that is created by watching your own mind because it has suddenly become interesting, because it has

suddenly been flooded by a psychoactive aiming. That iridescence has been coaxed into language, art, architecture, music, poetry, the whole ball of wax. But now we know these things. It's no longer a sort of haphazard process. We can, by analyzing different kinds of cultures existing in the world today and cultures that existed in the past, we can uncover, reveal, unravel the lost secret of our origins. I haven't talked too much this weekend, but I'm very keen for the notion of what I call the archaic revival, and the archaic revival is this overarching metaphor that is the way for us to go to save our necks at this point. When a culture gets into trouble, instinctively what it does is it goes back through its own past until it finds a moment when things seem to make sense, and then it brings that moment forward into the present. The perfect example is when medieval Christianity no longer made sense to a major proportion or percentage of the people of Western Europe because of the rise of new kinds of classes, new forms of wealth, new information about the world outside Europe, when the medieval vision lost its power, the intellectuals of that time instinctively reached backwards into the past looking for a stable model, and finally they reached the golden age of Periclean Athens. And there they found Plato, Aristotle, the dramatists, so forth, and they created Classicism. Notice that we're talking here about the 1400's. Classicism was brought to birth in the 1400's, two thousand years after the death of Plato, and we are still to a tremendous degree, we are the children of this classical revival which we call the renaissance. Our theories of law, our theories of government, our notion of justice, our notions of city planning, of architecture, military planning and so forth, are all drawn from classical Greek and Roman models that were brought back from the dead five hundred years ago by a bunch of Italian investment bankers who thought that this was a good model to build on, to hang their civilization on. And now this has run out. The contradictions are too extreme. This classicism, I don't want to say it's failed, but it has just taken us as far as it can go. So now we again, we confront great existential confusion, we confront cultural values completely different from our own such as rainforest aborigines and so forth. We confront the toxic legacy of modern science, the retreating species counts of the earth, the decaying atmosphere, all these things. So we must now reach far back into time for a new cultural model. Our crisis is so great that we have to reach back to the high paleolithic, to the moment immediately before the invention of agriculture and the creation of the dominator ego. People talk about the new age and the new paradigm and this and that, well it's larger than that. It's been going on throughout the 20th century. The discovery of the purification of mescaline in Berlin in 1987, Freud begins to publish at the turn of the century, Jung....they are discovering the primitive unconscious. They are revealing to Edwardian and Viennese ladies and gentlemen of great culture and breeding that they have inside them brawling, incestuous, violent, lust-driven animal natures. In other words, they are reintroducing an awareness of the primitive into this tremendously constipated male dominated late 19th century post-Victorian cultural milieu. And then, following hard upon them, the impressionists in the 1880s giving way to analytical cubism and all that. Cubism arose as the result of the fascination of a few artists with primitive

African masks. Picasso and his circle, and when they brought this stuff back to Paris in 1905 through 15, nobody had ever seen this kind of thing, and these guys began to try to reconstruct the pictorial space of people like Degas and those people into the pictorial space of the primitive mentality. Meanwhile anthropologists were bringing in..and Frazer published The Golden Bow, which laid before the European intellectual community this vast repository of integrated mythology. National socialism, surrealism, all of these things- some negative, some positive- are all aspects of the 20th century fascination and re-vivification of the primitive. Rock and roll, the rise of sexual permissiveness, the rise of styles of dancing which were not the minuet and so forth. All of this signals this fascination with the primitive, but at the center of it stand two phenomena, or two integrated phenomena: the personality of the shaman, and the fact of the psychedelic of experience, and we've come late to that. The 1960's is when this theme was first announced for any large number of people and I think that we have to consciously deconstruct the constipated, classical, industrial, linear, dominator civilization that we're trapped inside because it's a vehicle we can't steer. It's glued to the tracks which run right over the cliff. If we cannot alter the assumptions of this society, if the George Bush's and Helmut Coles of this world are going to continue to run things, then head for the bunkers folks and pray, because the bunkers aren't going to be any consolation.

I'm sure you're all aware of the situation of peril in which the Amazon rainforest finds itself. Very large conservation organizations such as the World Wildlife Fund are working very hard to preserve large tracts of the Amazon in situ and to essentially make large parks. This is commendable and should certainly be done, but what is not being done is an effort to preserve human information about the rainforest. In other words, no effort is being made to conserve the heritage of the people who have lived in and adjacent to the rainforests over millennia. My estimate would be that this information, which is extremely fragile, will be lost by sometime after the turn of the century.

It's not hard to understand why this is happening. It's a consequence of the impact of market economies on preliterate tribal people in the Third World. In the case of the Amazon, the men are leaving the remote villages and going to work in sawmills and as outboard motor captains and mechanics. The kind of transformation that always accompanies urbanization and the arrival of a money economy is taking place, yet these people have a body of medical data that has served them very well over thousands of years. Now, because they are impressed with the values of Western medicine and can buy all kinds of *remedios* at any drugstore in the city, the importance of this knowledge is no longer apparent to them and so it's being lost.

I have no reason to doubt the DEA statistics which say that 70% of the cocaine produced in South America is coming out of the Colombian Amazon. I know nothing about it. As a botanist I can tell you that the Colombian Amazon is the area richest in plant species in the entire Amazon basin. As near as we can tell, looking at the geohistory of the basin, at times it's been considerably drier. During glaciations, when water is concentrated at the poles, the high rainfall areas of the Amazon diminish in size. The Colombian Amazon is one of those areas that is always wet, and it has consequently produced a fantastic speciation of plants. One biogeographer or geologist estimates that the Amazon basin has been above water continuously for 220 million years. This is longer than most places in the world. It's estimated that the Madagascar Plate, which is a relic plate that now comprises Seychelles, Mauritius and the Malagasy Republic in eastern Africa and the Indian Ocean, that land has been above water 350 million years and is the oldest above-water site on the planet. The Amazon basin, by virtue of heavy rainfall, continuous lack of inundation, and by being tropical, has been like a laboratory for speciation both of animals and plants, so that the Colombian Amazon, which is the concentrated center of this process, has the most intense concentration of variegated species and genetic material on the planet. It *should* be made into a vast natural park. If that can't be done, then it should be left alone. What the American government has decided is a better course is

that it should be defoliated, that a chemical called Spike should be aerially sprayed over this valley in order to kill coca bushes.

I don't know who dreams this stuff up, but any one of you on the ground for twenty minutes in this scene would be convinced that nothing could be stupider, that this is essentially like burning down the forest to kill the ants. There may be a lot of coca there, I don't know, but there's a lot of other stuff there for sure. There are hundreds of distinct tribes, dozens of language groups, tens of thousands of unique species of plants and animals. It is floristically and faunistically one of the five or six richest areas on the planet. As if the inroads of capitalism and Maoist politics were not enough, you're also going to get a bunch of clowns from the DEA who want to defoliate it. If any of you have political pull or are of the letter writing type you might put some pressure on anyone you know to halt this. This is really a kind of ecocidal atrocity, and if something isn't done, like all the other ecocidal atrocities it'll be history before most people are even informed of what is going on. This is really one of the great policy wrong turnings, for many reasons. I don't expect the state department to be sympathetic to endangered plants, but what is happening is that all of Peru is being pushed into the arms of Sendero Luminoso, which is one of the most peculiar and radical political philosophies on the earth today; it rivals Pol Pot for having a no holds barred approach to dealing with its enemies. Peru daily is being pushed into the arms of this extremely radical faction by a combination of mismanaged Peruvian economic policies and mismanaged American policies toward the *campesinos*, toward the poor people who grow the coca, because they are seeing Sendero as their only protector, their only hope. It's a repeat performance of a sad story that has been seen in many parts of the world.

Well, that's enough political polemics. What I thought I would do today is just briefly survey the world, looking at the shamanic options in the plant area, trying to see just what is available, what are the history, chemistry, pharmacology and botany of the relevant species. I'll go through this in the way of a survey; it's not a rhetorical flight of fancy unless we lose control. I've talked a lot about Africa, about the emergence of culture and my belief that language and complex neural processing were catalyzed into existence by exposure to psilocybin mushrooms in the veldt situation of ancient Africa. I think I've said enough about that. What I thought I would talk about today regarding Africa is the existing cults of shamanic or hallucinogenic plant usage in Africa.

Africa is a special case because it is, of all the continents, the continent most heavily impacted by human presence — because of course human beings evolved in Africa, fire was discovered and used in Africa before it was used anywhere else, and also the ecosystems of Africa had a particular fragility in relationship to the dryness that comes and goes with glaciations. So in spite of the fact that I propose Africa as the cradle of human emergence under the influence of psychedelic plant synergies, today Africa is noticeably poor in hallucinogenic plants. The most interesting hallucinogen in the African situation is *Tabernanthe iboga*. *Tabernanthe iboga* is a tree in the *Rubiaceae* or a small bush, depending on edaphic factors. *Tabernanthe iboga* contains the alkaloid ibogaine. There's a paradox about ibogaine, which is that of all the indole hallucinogens it was the earliest to come to the attention of Western researchers. In the 1870s and '80s, when Belgium was in control of the Congo and exporting huge amounts of ivory and gold out of Africa, entrepreneurs seized upon this plant, *Tabernanthe iboga*, and created tonics that were compounded with it as the main ingredient. It was sold as a tonic and an aphrodisiac, and in some cases it was understood to be an intoxicant. Much in the way that Vin Mariani, the famous coca preparation which was the rage in the 1880s in Europe, much in the same way that it was marketed iboga tonics were marketed in the 19th century, but the alkaloid was never thoroughly studied after the turn of the century

and of all the indoles we know the least about this one. It has a complex molecular structure placing it closer in structural affinity to LSD than to any other psychoactive indole.

Indoles are a class of hallucinogens that are based on a molecular structure that involves a benzene group, which is a six-sided structure, attached to a pyrrole group, a five-sided structure. Built off on them there may be another six, that gives you the β -carboline family, there may be just a side chain, that gives you the tryptamine family, or there may be more complex stereochemical attachments and they give you the LSD-, ibogaine-type structure. So indole refers to a small family of psychoactive compounds, not necessarily all psychoactive compounds. Not opiates, not tropanes, which are the things in datura, not the polyhydric alcohols of cannabis, tetrahydrocannabinol. This particular small group of plants are united by this chemical structure that seems to lay the basis for the most psychoactive of the hallucinogens because of its affinities to serotonin's chemical structure. Iboga is used by the Fang people, most notably in Gabon and around the capital city in Ghana, in Nigeria and in Zaire. It has an interesting and suggestive usage.

First, let's deal with this question of its aphrodisiac usage. As you know, an aphrodisiac is a chemical substance thought to make one either capable of or susceptible to sexual activity. Over thousands of years this has been a recurring theme of fascination for human beings, for obvious reasons. The definition takes on different nuances in the hands of different people. Probably the best known so-called aphrodisiac among ordinary folks is the so-called Spanish fly, which is cantharidin. The carapaces of a small desert beetle can be ground down to yield cantharidin. If you give someone cantharidin in a carefully calculated dose, they have a generalized reaction to it where they can gain relief from this reaction by having sex, but it is not a true aphrodisiac, it's more like a genital itching or something. It's a strongly localized to the erogenous zone kind of itching, and so this is like a pseudo-aphrodisiac. All CNS stimulants in low doses present themselves as what's called arousal: attention to incoming detail, slightly elevated blood pressure, so forth and so on. This is a precondition for sexual activity but it is not a true aphrodisiac. In fact, when you sort through the many candidates for aphrodisiacs — as you know, they range from powdered rhinoceros horn to mangoes to oysters — interestingly enough, ibogaine is the only thing which actually seems to pass the test. Ibogaine is an aphrodisiac in the truest sense of the word, and I take that to mean this: if you are interested in sexual activity, it promotes, facilitates and enhances it. If you are not, it doesn't. It doesn't overwhelm the intentions of the user. This seems to be one pathway that the psychic energy that it releases can be shunted down, but there are others. Paradoxically, the way it's used in the Fang society is that it's a major force holding couples together.

Fang society is quite complex, and it's structured in such a way that there is a built-in high anxiety factor about women among men. The reason for this is an unusual set of customs which we don't really find duplicated anywhere else in the world. It goes like this: a man may have more than one wife. A wife is always accompanied by a dowry. The dowry is always quite large, in the sense that it is always a strain on the girl's family to get the dowry together. When a woman marries, she and her dowry go to the village of her husband, but what is unusual in this situation is that divorce is very easy for the woman to obtain, and if a woman leaves her husband the dowry must be returned. So men are in a constant dither about hanging on to women, because the dowry must be returned even if it has been spent. These are family relationships — these aren't relationships between a man and a girl's parents, these are relationships between two filial structures — so it can become quite complicated. In fact, Fang men between the ages of 25 and 45 spend enormous amounts of their lives making journeys to the villages of their former wives to negotiate dowry return, because the concept of used goods is recognized. It isn't simply that the guy has to pay back the dowry, it's that he has to meet with the girl's family and argue with them about how much she was really

worth, and this often ends in bloodshed.

So into this social structure that is prestructured for anxiety about women comes this psychedelic aphrodisiac that promotes not only pair bonding but community bonding. The cult of iboga is not the generalized cult of the Fang. They have many cults and some are Baptists and Mormons, but when a couple gets into trouble, the old men of the village will often say to them, “Why don’t you join Bwiti,” this cult, “You’re having marital problems. Why don’t you join Bwiti, and perhaps your wife will reconsider and decide to stay with you.” It has actually become a very interesting force for social cohesion. In fact, sociological studies have shown that members of the Bwiti cult have a divorce rate far below that of general Fang society. I spend so much time on this because this is an unusual role for a hallucinogen. We just don’t see them playing these secondary socially catalytic roles. Iboga is a strong hallucinogen and it’s usually given to a person in very massive doses at the initiatory exposure, which can come in late adolescence. People do die occasionally from it, but the amounts eaten are almost beyond credibility, because they talk in terms of tablespoons and people will go to the river and eat two table spoons...

Methods of preparing *haoma* and *soma* which are very puzzling when you try to apply them to a mushroom — there’s all this talk about how it’s squeezed, it’s filtered — a bunch of processes are described which if you try to carry them out on a mushroom it will just leave you with a mess, but if you carry them out on *Peganum harmala* it quite reliably produces a yellow fluid rich in harmaline that is probably an intoxicant. This is an area where research needs to be done. I urge any of you who are interested in ayahuasca or interested in β -carbolines in psychotherapy to look at Flattery’s book. It’s brand new, 1989, University of California Press Near Eastern Studies Volume 21, Haoma and Harmaline.

OK, moving on east across the Iranian Plateau into India, which is certainly a great cradle of esoteric spirituality, what we discover is a surprising poverty of true, i.e. indole, hallucinogens. There are interesting substitutes, aside from *Peganum harmala* which I’ve mentioned, of which there is very little textual evidence for use in India. The two things which have to stand out in Indian psychophytoshamanism would be, number one, datura species. We might as well talk about them now because we will meet them on every continent, including in Africa. I just read an article about a group in Tanzania, interesting group. *Datura fastuosa*, taken by women only in a women’s initiation rite which involves a labial measuring rite at the height of the trip, and what are culturally sanctioned are blue hallucinations. The women strive for blue hallucinations, and if they don’t achieve them it’s considered an unsuccessful invitation. The anthropologist who wrote on this called this “a culturally sanctioned hallucination.” I’m not sure what is meant here. Do they mean that anthropologists, white people, don’t have blue hallucinations, they just have hallucinations and that somehow it’s expectation that directs this? I’m not sure, I don’t associate blue hallucinations with tropanes, but it is certainly true that blue hallucinations attach themselves to ayahuasca. People have even called it “the search for the blue flash.” If you have ever taken ayahuasca you know that there is a moment when what appears to be the world’s entire supply of magenta jello is unleashed upon you and flows past you and through you, and it invariably is this electric cerulean blue merging into magenta, a very typical presentation of that. Datura species of many types occur throughout the world in the tropical and the temperate zone. There are several species in India, and texts on yoga and on Indian spirituality never stress this. Use of datura is quite strongly a part of sadhu-type spirituality. It’s too much for ordinary people, but when you hang out with sadhus the little prickly pods of datura are as common to find cast about their dwelling places and gathering areas as are the evidences of *charas* smoking.

That brings me to the second major component of the psychoactive flora of the subcontinent, which is

cannabis. Cannabis is not an indole, but cannabis must be considered a psychoactive plant of great age and human association. Cannabis is hemp, cannabis is the source of fiber for weaving, and we find hempen fibers in graves 8,000-9,000 years old, at Çatalhöyük, for one place. It's fascinating, the way in which the metaphors of the weaver are the metaphors for human cognitive activity generally. In the '50s a famous book was published called *Man Is a Weaver* that pursued this theme, but never made the connection to fibrous hemp. We weave a tale, we tell a yarn, we have all these fiber and weaving words that we connect to poetic or narrative activity. Most of us who are aficionados of cannabis in these latter days smoke it — and don't smoke *charas* or hashish, because it's rare in this country, but smoke bud, the flowering tops of marijuana — but if you actually eat hashish, you can convince yourself that this was the LSD of the ancient world and the 19th century.

Théophile Gautier, Baudelaire, Verlaine and Rimbaud, that crowd — there was this society called the Club des Hashischins in Paris, and they met at the old Hôtel de Lauzun on the Left Bank and ate jellied cannabis that they were getting from Morocco with little silver spoons. The descriptions of these experiences make it clear that this was operating as a hallucinogen. They are not more florid or less florid than the descriptions of LSD that we get from Aldous Huxley and Tim Leary in the early 1960s and 1970s, I mean, this stuff was taking them away. I don't advise you to eat hashish or *charas* for a very practical reason, which is that it's collected off people's hands, and your immune system is just electrified by the presence of all of this material that's been rubbed off of your hands. I suppose we could put it through an X-ray machine and then we could eat it with impunity, but we can't sell short the spiritual power of cannabis.

Some of you may know this book *Oracles and Demons of Tibet* by René de Nebesky-Wojkowitz. Nebesky-Wojkowitz studied shamanism, was not interested in Tibetan Buddhism but was interested in the pre-Buddhist strata. In that book there are pictures of Bön-Po shamans intoxicated on hashish, experiencing fits and near-convulsions in an oracular trance in a village near Mustang. It is not a minor psychedelic substance at all, it's a very powerful psychedelic substance, especially when concentrated and then eaten. Opium is an Asian plant, but I'm not going to talk about it in the context of psychedelics; I think you know enough about opium and its history. What I will point out is the surprising absence of hallucinogens in the Old World tropics. By the Old World tropics we mean the Indonesian tropics. This is an area that I'm very well familiar with, having spent a lot of time out there as a professional insect collector in my pre-botany days. There just are no major hallucinogenic plants in the Indonesian or Philippine or Southeast Asian tropics. There are certain suspect plants but with none of them do we encounter a living cult that would give a clue to this thing as a major item of human spiritual or cultural usage.

Audience: What are the magic mushrooms we hear about from Indonesia that are available there supposedly openly?

When I was in Bali this practice was absolutely unknown, these famous omelettes of Kuta Beach. Until somebody argues differently, the most reasonable thing to assume is that coprophilic mushrooms have just followed cattle around and around the world in the warm tropics. The mushroom that is most commonly offered tourists in Bali is not *Stropharia cubensis*, it's a *Copelandia*, it's a weaker mushroom. There are a number of these dung-loving mushrooms that contain psilocybin but almost all of them also contain an emetic, which means that it makes you throw up. The Hawaiian mushrooms that people rave about are actually, from the point of view of someone who knows psilocybin mushrooms, a very inferior choice. If you go to Thailand, if you go to Ko Samui and the islands of the south, you'll be offered mushrooms and I quickly understood that there was, to a certain degree, a shell game going on. What it is is this: the people

selling the mushrooms have learned from the school of hard knocks that it's a bad idea to wire up naive Westerners with massive amounts of hallucinogenic drugs, because then you get in trouble with the local constable and so forth, so unless you are on it, in southern Thailand what they will sell you are mushrooms that have grown in the dung of water buffalo, and right there in the next field over is the dung of zebu cattle, and that has *Stropharia cubensis* in it, but they try to steer you away from that because it's so much stronger. They just want people to get a buzz on. So if you're buying mushrooms in southern Thailand, try to go with the guy to collect them and see where they're coming from. Now, there's an easy test to tell these *Panaeolus* and *Copelandia* species from *Stropharia*. They will do what is called autodigest; some mushrooms do this and some don't. That means that if you pick the mushroom and lay it in the sun on a stone, and you come back in an hour or two and it's turned to slime, it was not *Stropharia cubensis*, it was a *Copelandia* or a *Panaeolus*. They literally dissolve themselves at death. This is not a quality of *Stropharia*.

There's been a lot of wondering about this thing: why are there no hallucinogenic plants in the Old World tropics when in the New World tropics, the Amazon basin, it is the most concentrated ecosystem for hallucinogenic plants? The thinking is that the tropics are the tropics. Who can imagine a set of evolutionary factors that would favor the evolution of many species of hallucinogens in one hemisphere but not in the other hemisphere? It's very hard to picture a neo-Darwinian mechanism that would give you that result. Different suggestions have been made; one is that there actually are as many hallucinogens in Indonesia as in South America, but because the Dutch have been there for 450 years, the level of indigenous culture, the "primitiveness," so-called, of indigenous culture, has been mucked with, and consequently the people have forgotten these things. Well, that's a good theory, but when a botanist who is not an ethnographer goes over the species lists and looks at the suspect families of plants, you also don't find hallucinogens. You see, certain families of plants are highly suspect for hallucinogens. For instance, the *Leguminosae*: this is the family of flowering trees with finely divided leaves. This is a typical leguminous tree, this locust-like thing, and they occur all over the world as trees and bushes. This is a family that always has a very exotic chemistry, not hallucinogens per se, but flavonoids, saponins, terpenes, sesquiterpenes, all kinds of exotic tertiary byproducts. A mimosa is a typical example. Another family that is always suspect that you look at first is the *Rubiaceae*. We know this as the family that contains tea, and of course caffeine is an alkaloid that is sequestered in the bean of this plant in surprising concentrations, but some of the *Rubiaceae* contain DMT and other psychoactive compounds. Another family that is always one of the first ones you check out are the *Euphorbiaceae*. These are the fleshy Old World succulents that bleed latex when cut. They often have extremely poisonous or sometimes psychedelic principles in them.

So much, then, for the Old World. As you know, when there is ice at the poles there are land bridges between Siberia and Alaska, and this is the route that most anthropologists believe the major migrations into the New World took. There's an interesting consequence of this northern migration route to the New World. People didn't just set out on a trip from Manchuria to San Diego, this happened over centuries, millennia. The people would move a few miles, have children and die, so what it means is that cultures crossing into the New World had to go through a neck of cold land, a floristically extremely restricted environment represented by the Arctic tundra. We can imagine that this would have stripped away many traditions of plant usage as they moved north out of the areas where these plants occurred. The role of cannabis is not clear, but for instance, no opium was carried to the New World by these ancient peoples. In fact, very few plants at all were; cannabis is the one slightly puzzling exception. It may be that cannabis was carried to the New World by people crossing the Siberian land bridge. Cannabis does grow in Alaska under special conditions with a very short growing season, and it's possible that this happened. The botanical closeness between *Cannabis sativa*, the Mexican marijuana plant, and *Cannabis ruderalis*, the

weed hemp of Central Asia, indicates that probably these things were separated not too long ago. What has happened with cannabis speciation in Asia is that even without the narcotic dimension to the cannabis plant, we can see that very early on there was selective pressure on it by human beings to produce good fiber stock, so what you get in India is a division into fiber tribes and drug tribes in cannabis. The resin tribes are extremely heavily selected for the production of resin, and they are the source of the narcotic *charas*.

Amanita muscaria, the hypothesized mushroom *soma* in Wasson's view, and for sure a hallucinogen of use in Siberia among the Ostyax, Koryaks, Kamchatkan and Yakut tribes, this whole group of people. When scholars study a worldwide phenomenon of any sort, they like to have a baseline area to compare everything else to. This is why, for instance, the volcanos of Hawaii are *the* volcanos of this planet. All other volcanos are compared to them; they are the baseline volcanos, and the Hawaiian words for various lava types and this sort of thing have been adopted by volcanologists worldwide. All rough lava is called aa, all smooth lava is called pahoehoe, because these things have been adapted. Well, a similar thing went on in the study of shamanism. Mircea Eliade and other people were looking for what they felt was the pure, the original, the real shamanism, and they focused on Siberia, now we see for reasons apparently quite arbitrary, mainly that they had a lot of ethnographic data on Siberia. There's no reason to hold the Hopi medicine man, the Amazonian *ayahuasquero* and the Hawaiian *kapu* man up to a Siberian standard, but nevertheless the literature preserves this, so the model or paradigmatic intoxicant of the paradigmatic shaman was *Amanita muscaria*.

There are a lot of problems with this. *Amanita muscaria* is not a reliable intoxicant. It is subject to geographic variation, seasonal variation, genetic variation. There are toxins present in it that are also subject to variation. You can end up with an NDE rather than a hallucinogenic experience if you just miss the mark slightly with this one. Nevertheless, it is circumarctic in its distribution. It occurs in Denmark, across the northern reaches of the Soviet Union, into Alaska and into Canada, and it's generalized in that range. As you move south it retreats to higher and higher altitudes, with certain exceptions. For instance, in California it can be found at sea level in some ecosystems. Some of you may know Baker Beach, a beach that lies outside the Golden Gate Bridge in this very ritzy district of old mansions. Well, go on a rainy January day down to Baker Beach. There are a lot of birch trees and these kinds of trees planted in old sea sand, and my God, this is an amanita ecosystem that you will not believe. I have seen not only *Amanita muscaria* by the bushel and *Amanita pantherina* but rare, rare *Amanitas*. The chocolate brown one, *Porphyria*, rumoured to contain β -carboline, and *Rugosa*, and the deadly one, *Virosa*, the one they call the destroying angel. All of these amanitas can be seen within a half mile walk of each other, specimens the size of dinner plates. What this means is that people moving south through British Columbia and on into the Great Plains and West Coast of North America had been shorn of their phytoshamanic knowledge because they had just come through centuries and centuries of migration through hallucinogen-poor environments. To my mind, this explains the curious absence of major hallucinogens in North American Indian spirituality. North American Indian spirituality relies largely on ordeals, the Sun Dance ordeal and this sort of thing. There are minor psychoactives such as *Acorus calamus*, sweet flag root, but really, North American Indian shamanism is not a shamanism of hallucinogenic ecstasy.

The use of peyote, which might be offered as the counterexample, is astonishingly difficult to document before just a few hundred years ago. We like to think that people have been taking peyote in the New World for millennia, but in fact it seems to be something that came up out of Mexico, where the Tarahumara may have had it in a very localized culture complex, but with the Indians in the Western

United States getting the shit kicked out of them by the U.S. Army there was pressure for revitalization. Any of you who are anthropologists understand how this works: if you put pressure on a people, they will launch revitalization movements. The Ghost Dance religion of the Sioux, Algonquin and Plains people was largely a revitalization movement based on peyote. What appears to have been going on in the temperate Mesoamerican zone anciently was the use of *Sophora secundiflora*, which is a highly poisonous plant. It is what anthropologists call an ordeal poison, not a hallucinogen.

Ordeal poisons are a rougher way to end up at the same place. The place on earth — for unknown reasons, or reasons not known to me, anyway — where ordeal poisons have been perfected is on the island of Madagascar, mentioned earlier in this lecture as one of those sites where land has been above water longer than anywhere else on earth. On the island of Madagascar, the Malagasy Republic, tribal people have located a number of plants that are extremely temporary poisoners, so that you think you're going to die, you beg for death, and you don't die, you recover fully in 12-16 hours. It is so agonizing, and you so completely wish for death in this experience that when you finally realize that you're going to live through it you have the equivalent of a psychedelic experience. Tears of joy well up, you embrace the earth, you give thanks to God and you come clean, but this is a tougher way to do it than most of us might prefer. Sometimes you have psychedelic trips like that, where the fact that it is over is such cause for rejoicing that you hardly know who to thank. Apparently North American Indian shamanism tended in this direction, and only peyote arriving late mitigated that. Peyote still partakes of this to some degree. It is a minor ordeal, especially if you eat enough peyote to trigger truly intense hallucinations. What I've found sitting in peyote circles is that most people only take enough to be able to sit in the circle without nodding out. At low doses, of course, mescaline and amphetamine will wire you up, but it takes a lot to put you into Don Juan country. It is not an indole, it is a psychoactive amphetamine, more closely related to the synthetic psychoactive amphetamines such as MDA and MDMA.

Now we are on the brink of moving down into Mesoamerica, onto the Mexican isthmus, and we are approaching this puzzling concentration of psychoactive plants. Basically, you could start your border at the Rio Grande and it goes south to Argentina, and in that zone there is a tremendous richness of psychoactive plants of all types in many plant families. I've mentioned peyote, I've mentioned datura in another context. Datura cults are very big, and datura has to be viewed as an ordeal poison. It is a hallucinogen but it's also a kind of deliriant and a kind of a frenzy-inducing thing. It's very hard to take much out of it; you have intense experiences but the perceiving mind has been somehow interfered with. Nevertheless, in southern California — Catalina island, San Diego County — in ancient times there was what was called the *toloache* religion of the Luiseño people. This was an adolescent initiation for males that involved being taken into the desert and given large amounts of datura over days. This would be a completely boundary-dissolving, consciousness-altering experience.

As we go deeper into Mexico and leave the deserts behind and begin to approach the mountain range of the Sierra Mazateca and the Central Mexican highland, we come upon what, in some ways, is one of the most interesting shamanic hallucinogen complexes, which is the Central Mexican mushroom complex discovered by Gordon and Valentina Wasson in the early '50s. Now, these are not mushrooms that grow in the dung of cows or any other animal. These are what mycologists call ephemeral mushrooms, meaning small, diminutive and briefly present as fruiting bodies. Ephemeral mushrooms actually live in very restricted ecosystems. One of them lives in the waste from sugarcane, so it can only grow in matted vegetable material. The one called *derrumbe*, the earthquake mushroom, grows only in disturbed land where there's erosion or shifting. Clearly, all of these mushrooms must have speciated from a common

ancestor. There are about twelve varieties; all have been utilized. Interestingly enough, in terms of fungal speciation, the center of fungal speciation in North America is around Grants Pass, Oregon. There are more mushroom species within 100 miles of Grants Pass, Oregon than almost anywhere on earth, and there are psilocybin-containing diminutive mushrooms — not coprophilic — but nobody but the most inspired anthropologists have ever been able to find any evidence for use of these hallucinogenic psilocybin-containing mushrooms in the Kwakiutl, Tsimshian, Tlingit complex of peoples. We don't know that they knew about this. One would assume, because we give Indians a lot of credit, that they knew a lot about their environment, and of course we have the evidence of their peculiar artistic style, which is X-ray vision — these are the people who show you the insides of things as well as the outsides — but in terms of usage or a claim of usage, it's never been substantiated.

This brings up an interesting point, because the plants I'm talking to you about today are plants with a history of shamanic usage, but there are hallucinogenic plants without a history of shamanic usage, plants that pharmacologically look like ideal candidates. Why weren't they used? A good example would be in the *Convolvulaceae*, the morning glory family, there is a group, *Argyreia*. There are 13 species of *Argyreia*, and they occur naturally from northern India to the Solomon Islands. They are woody morning glories; one that you may know is the Hawaiian baby woodrose. Well, the Hawaiian baby woodrose is a very powerful hallucinogen, weight for weight. It only takes 8 seeds of this thing to propel you into a fairly profound visionary state. There are some cardioactive glycosides present, but as we see with these ordeal poisons, that doesn't turn people off in other situations. *Argyreia* is unknown to have a folk usage, and yet looking at the flora of earth, this one of the first things that you would think that people might have looked at. Certainly, hippies in the 1960s and people since have made very good use of *Argyreia* as a visionary vehicle.

Rupert Sheldrake and I have talked a lot about the morphogenetic field of a shamanic plant without a history of shamanic usage, and how different it would be to take *Argyreia nervosa* and contrast it with *Stropharia cubensis* or something like that, that has a tremendous input from past shamanic usage. We don't have enough data on *Argyreia*. Nobody has done the Hawaiian baby woodrose book, to give us thirty or forty accounts.

When I took it I had a quite anomalous experience. It was a standard psychedelic experience but the visionary episode was entirely — and this was in a room in Berkeley, there was no suggestion — the contents of the hallucinations were entirely based on the motif of the sea urchin. I was in huge dome rooms that were pale purple with these starlike things and these tit-like protuberances on everything and then this mauve floor and what looked to me like the pumpkin carriage from Cinderella, but it wasn't a pumpkin, it was a sea urchin vehicle of some sort, being drawn by these bizarre-looking creatures — they were like a cross between camels and giraffes — and they too were pale violet and had these tit-like protuberances all over their bodies. Nobody had ever said to me that Hawaiian baby woodrose had anything to do with the sea urchin motif, but it was pretty inescapable. I would have done more with that but I didn't like this cardioactive glycoside thing. In practical terms, what it meant was that in the first wave you just had to sit down and tell yourself that if you were having a heart attack you'd better get ready because there was nothing you could do about it, and it certainly was convincing. I don't know, maybe there are some medical people in the audience. It's always good to have a doctor around because they're so hard to alarm. I mean, I'll be ready to bury somebody and they will say, "Eh, he'll snap out of it in an hour or two." This person is absolutely rigid and unconscious and you're supposed to be calm about it because their pulse tells you it's alright.

Anyway, to say more about Mexico: coincident with this Sierra Mazatecan cultural area where all these mushrooms are being utilized, there is an overlapping and completely unrelated complex, also of great age and richness. This is the hallucinogenic morning glory group. Not the *Argyreias* that I've just been talking about, but morning glories in two other families: in the family *Ipomoea* and in the family *Turbina*. The *Ipomoea* is the one that you might be most familiar with. This is the heavenly blue morning glory that is the ornamental morning glory, an annual, and you can buy seeds in any decent seed store. It's been hybridized into three varieties, and it's amusing that they chose to name the original variety, which is pure sky blue — it is a magical plant, you don't have to take it, just to look at it this thing, and some of you may know Georgia O'Keeffe's paintings of these flowers — that one is called Heavenly Blue, and then it was hybridized into a blue and white one, which is called Flying Saucer, and then it was further hybridized into a pearly white, which is called Pearly Gates. So Heavenly Blue, Pearly Gates and Flying Saucer; and this is a wonderful hallucinogen. It has everything going for it. You can grow up a bunch of them in a long summer, and the plant really responds to care and water. I've grown them in a single summer forty feet up a double garage wall, and just filled it. Then you let them make seed and you cut down the mass of dried foliage and seed capsules and pound it over a sheet or a piece of plastic. It takes about 200 seeds to provide an unambiguous psychedelic experience. One of the really fascinating things about the Mexican morning glory seeds is the number of people who report Toltec and Mayan and Aztec imagery. I have experienced this myself; it's absolutely uncanny. It's like being at Teotihuacán at the height of that civilization, and the motif of the feathered serpent, all of this stuff is there. I don't know whether this is suggestion. When I took iboga I didn't think that I was in Africa, I didn't see the motifs of the Fang. This is an interesting area. I don't know how you do research in it, it's not empirical, but it is an interesting area. Why do the plants seem to have their own message?

The other Mexican morning glory is *Turbina corymbosa*, formerly *Rivea corymbosa*, and it is not an annual, it's a perennial. It's a little bush with small white morning glory-like flowers on it, and it is quite powerful. With the *Ipomoea* you have to take 200-300 seeds; with the *Turbina*, the ordinary dose is 13 seeds, and this would barely cover the bottom of a teaspoon. It's interesting that in the *Convolvulaceae* the concentration of the alkaloid is really quite intense. In both of these morning glories the active constituents are LSD-like compounds. LSD-25, the classic LSD that we all know, is active in the microgram range, in other words, 200 µg of LSD is considered a good dose. These naturally occurring ergotamine and LSD-like compounds have a more ordinary dose spectrum. They are active in the range, even purified, of ten to thirty milligrams. This is more typical of a drug. The activity of LSD is still a pharmacological miracle. You understand, do you not, that one microgram is one millionth of a gram, and that one milligram is one thousandth of a gram. It takes 1,000 µg to make one milligram, so LSD is active at an unearthly intensity. This is why a guy could make six million hits in his garage, because the physical amount necessary for one human dose is literally microscopic.

Perhaps the floristic coincidence of the two morning glories, the many mushroom species, and then several minor psychedelics in this Sierra Mazatecan situation set the stage for the evolution of such an intensely hallucinogenic style of shamanism. Anthropologists differ as to whether people entered South America by going through the Caribbean Islands from the Yucatán and entered in the Suriname area, or whether people came down through the land bridge and across Panama and entered through Colombia. Current thinking is that they came through the Caribbean Islands, that this was an easier route. Now, down through those Caribbean Islands what we find are DMT cults using the seeds of leguminous trees. In fact, the major source of the snuffs of the Caribbean is a tree called *Anadenanthera peregrina*. In the deserts of northern Chile, in the Atacama Desert, they actually have found 4,500 year old samples of DMT-

containing snuffs. If any of you are interested in this, the anthropologist Manuel Torres and his wife have made this their life's work and have published on this a wonderful book showing the snuff trays of these Atacama people. They're beautiful, carved in wood, inlaid with shell and bone; they were the major high art that these people produced. Whether people entered South America through the Caribbean or in through Colombia, it's very clear that the experiences in Mexico gave them a complete shamanic armamentarium of hallucinogenic substances.

In the Amazon what they encountered was the most floristically complex environment on the planet. The thinking is that human beings arrived there somewhere between twenty and thirty thousand years ago, depending on the faction in anthropology that you align yourself with. What they found there that they had not known before was *Banisteriopsis caapi*, this malpighiaceae, woody vine that can attain up to 200 meters in length, which is approaching 600 feet. I've seen specimens of this thing as thick as my thigh where it came out of the ground. Clearly, a tree the size of this one was completely shrouded and hung with it, so that in estimating how much biomass you were looking at you would have to estimate it in metric tons of material. What these people discovered about *Banisteriopsis caapi* was that it was marginally psychoactive by itself — it is an MAO inhibitor, but not an overt hallucinogen — but they could combine it with plants containing DMT and they would become activated. It's interesting that this technological breakthrough involved in the combining of one plant with another to create an effective drug happens at the end of this long process of cultural peregrinations and migrations. In other words, up until that time, so far as we know, there were not drugs, there were plants which get you high. A drug is a combinatoric thing, where the phenomenon that pharmacologists call synergy, the causing of one thing to become more active by being in the presence of another thing, is being utilized. This must have been developed rather late in the search for avenues to psychoactivity in the Amazon. What's going on there is that DMT-containing plants, either *Psychotria viridis* in the *Rubiaceae* or *Diplopterys cabrerana* in the *Malpighiaceae* in Colombia, are being added into these *Banisteriopsis* brews and are significantly changing the experience.

Now, above and beyond that, a very complex folk pharmacology has been put in place down there using what are called tertiary admixtures. This is a very rich area for anthropological research because these tertiary admixtures are often highly localized, and also very secret. This is the personal part of a shaman's repertoire: his admixture plants. If you can get these people to open up to you and share the identity of these admixture plants, almost invariably, when you get them back into the laboratory and perform tests on them with Dragendorff's reagent, they are alkaloid positive, they are chemically complex. In other words, this is not a bunch of shuck and jive, these people have an extreme sensitivity to the presence of exotic chemicals in the environment and they know how to track them down. It's been very fruitful in our work to spend a lot of time on the tertiary admixtures. These are the things which are in danger of being lost. Millions of people take ayahuasca in the Amazon; I venture to guess that it is the largest psychedelic religion on earth at this time. Over a vast area this is going on, but knowledge of these tertiary admixtures is fading fast and so is the availability of some of the plants.

If some of you are interested in this, write to my brother at the Stanford Department of Neurology. He published two review papers on admixtures to ayahuasca in which the species names are given, the taxonomic families and the identifiable chemical exotics are tabled there, and you can then see what a rich selection of psychoactive substances these people have to draw from. They claim that ayahuasca is not one thing, ayahuasca is many things, because we change it for the circumstance, we change it for the personality, we change it for the problem. I've come to think that this is quite true, that there is an entire medical system there, so at Botanical Dimensions, though we preserve all kinds of plants and have

collectors in Thailand and West Africa and hither and yon, we've really put our attention on this one medical system because the evidence for its importance is the amazing balance, decency, dignity and integrity of these people. I am a cynic, I do not wax eloquent over the noble savage. Some of you have read my descriptions of my life among the Witoto, and I found them hard to put up with in some cases. It's not simply that if people are naked, they're beautiful — some naked people can be a real pain in the neck — but this ayahuasca complex is an ennobling folkway. These people have great heart and great sensitivity. They could get along fine at Esalen, these *ayahuasqueros*. You go into a village where this is happening and the women may cluster around you giggling because you're so funny-looking, all beet red and mosquito-bitten, but the shaman sees exactly who you are. He is not culture-bound in the same way.

In a way, this is a definition of shamanism. A shaman is a person who by some means has gotten themselves out of their own culture, so they can look back at it and manipulate its symbols, its beliefs, its expectations, its rituals to an end. If it's a negative end, then you have magic, *brujería*, sorcery, witchcraft, but if it's an end which serves and maximizes reasonable social goals, then you have true shamanism. In addition to the ayahuasca complex, about which I know a great deal because I've concentrated on it, also in the Amazon there is a subcomplex of the datura phenomenon. Throughout the world the daturas are bushes, but as some of you may know there are ornamental tree daturas that are a favorite with landscapers because they have these beautiful hanging flowers that shed scent in the evening. Well, all tree daturas originated in Peru and southern Colombia. In the subfamily of the daturas called *Brugmansia*, these are the arborescent daturas, and they have an exotic chemistry, even in comparison to the bush daturas. These are tropanes — hyoscyamine, L-hyoscyamine, scopolamine — and these are not true psychedelics. You may recognize the term scopolamine; this was the truth serum of Nazis in interrogation situations. It really isn't a truth serum, it just causes you to dissolve your boundaries so thoroughly that you babble incessantly, and if someone's willing to listen and they know what they're listening for, you might spill the beans, but it isn't that you suddenly have a compulsion to tell the truth. If only such a thing were possible, who would need psychedelics?

The other complex that has been quite highly evolved in the Amazon, probably brought in by the Arawakan-speaking peoples who swept through the Caribbean, is the snuff complex. In the far east of the South American continent the snuff complex concentrates on the seeds of leguminous trees, *Anadenanthera peregrina*, *Anadenanthera macrocarpa*. These are not trees of the deep climaxed rainforest, they are trees more of the coastal and semi-arid regions, so as you go into the true climaxed lowland rainforest these snuff-using people had to find substitutes. They very cleverly found a very excellent substitute in the form of a family of myristicaceous trees — Myristicaceae is a family that includes nutmeg — of the genus *Virola*. They discovered that if you remove the bark of these trees before sunrise, when the sap is still in them, you can strip off these long, narrow pieces of bark and when you lay them on a low fire or a bed of coals the exudate, the sap, will rise up out of the inner cambium of the bark and bead up on the interior surface as what looks like blood. This is the resin of *Virola*, and this is a broad-spectrum source of psychoactive tryptamines. DMT occurs in it, 5-MeO-DMT occurs in it, other psychoactive, cardioactive and inactive tryptamines occur in it. It varies from species to species, and these *Virola* trees are outrageously difficult to identify. Even a taxonomist who has made this group his special field of study requires a handheld 50 power lens to make a species determination, because the species are determined by these little hairs on the underside of the leaf called trichomes. They're little hairs which come up and then split in three ways, and by the angle on the dangle you determine which *Virola* species you have in hand.

In 1980, my brother and I, a botanist from UBC and a fellow from Harvard all went down to the Rio

Yaguas drainage which is just over to Peru from Colombia, specifically to study this *Virola* complex, because we felt that it was in real danger of being lost in a hurry, that this was the fragile one. Some of you may know about the Waika or Yānomamö; these are peoples who use these *Virola* snuffs. The way you do it is you pack a hollow tube with the ground up seed dust, or in the case of the *Virolas*, the ground up resin, and someone blows it into your nostril with the full force of their breath, and it's like being hit in the side of the head by a log. You scream, you fall over backwards, you salivate, and by the time you've gotten back up on your haunches and cleared the mucus out of your system, the tube has been reloaded and they do your other nostril. Then you have an unambiguous intoxication, but it doesn't come anywhere near to being a DMT flash. This approach to the grail of the psychedelic experience is difficult with botanical materials; you have to take a lot and you have to have the correct phytopharmacological strategy before you ever begin. In my opinion, you can't approach the real center of the psychedelic experience with psychobotonicals unless you're doing a fair bit of psilocybin or a fair bit of ayahuasca, a committed dose, otherwise you'll just slice low.

I left out ergot; I'll say a little bit about it. Ergot is not used as a psychedelic anywhere in the modern world. Nevertheless, ergot is the source of LSD, and it is grown in Pakistan because ergotamine tartrate — which can be made into LSD — for many years was the preferred drug for migraine. As a migraineur I took a lot of it years ago. Migraine is a condition that is not well understood but operationally it is a sudden uncontrolled vasodilation that allows too much blood pressure on the head and intense head pain. Well, ergotamine tartrate is a vasoconstrictor, and will just squeeze your veins down very small, and this is wonderful for migraine. You may have heard horror stories in the 1960s about people who took too much LSD and developed gangrene in their fingers and toes. This is possible, this is true; it's the vasoconstricting aspect of LSD. It's not related to its psychological effects, it is physically a strong vasoconstrictor. Ergot may have had a history of usage as a hallucinogen, because Gordon Wasson, Carl Ruck and Albert Hofmann argued fairly persuasively that ergotized beer lay behind the Eleusinian Mysteries. As you probably know, Eleusis was a cult site near Athens where every September for 2,000 years a great initiatory celebration was held in honor of Persephone's return from the kingdom of the underworld and her restoration to her mother. It was clearly a rite of hallucinogenic use of some sort, and Wasson-Ruck-Hofmann argued that it was ergotized beer.

I question this, because I think that there would have been more problems at Eleusis if it had been ergotized beer. Ergot is something not to mess around with. I mean, you could kill yourself in a big hurry with this stuff, and the notion that year after year beer could be brewed reliably that would intoxicate several thousand people at these ceremonies and there would not be any bad public relations about death or tremoring or convulsions, this causes me to wonder. The proof of the pudding for the Wasson-Ruck-Hofmann theory would have been to go to the Eleusinian Plain, gather ergot from the wild rye and brew ergotized beer. Why not carry these experiments out? If we're confident in our theory, the proof of the pudding would be to do that. I wouldn't touch ergotized beer. I'd want to see a liquid gas chromatogram and infrared mass spectrophotometry data before I knocked back a pint of ergotized beer.

A small voice in opposition to this theory of Wasson-Ruck-Hofmann was the English poet and *bon vivant* Robert Graves. He believed that it was simply mushrooms, and his argument for this was that he took the list of ingredients that was used in the cult. There was actually a published list of ingredients and the ingredients were always listed in a certain order, and one of the ingredients was water. Graves argued that it's crazy in a recipe for beer to include water because you know that you're going to add water, so he argued that these words were to be interpreted as an Ogham. An Ogham is when you have a list of words

and you're supposed to take the first letter of each word in the list and it spells out a secret message, and Graves showed that the six ingredients always stated to go into the beer at Eleusis could be easily arranged so that their first letters spelled out the Greek word for mushroom, *μύκης*. It's not clear either way. In fact, the Eleusinian Mystery is quite mysterious, because if they were mushrooms all trace of them has died out, and there's not unambiguous iconographical representation of mushrooms. We have a few vase paintings where something small is being handed around, but to say with certainty that it's a mushroom isn't really playing fair.

Well, I wanted to run over this today with you and pretty much give it to you in one burst. This is really just to bring you up to speed. It's the kind of information that you should have under your belt if you're trying to make informed and intelligent decisions about your own spiritual growth in relationship to these things. Anybody who's interested in taking a new or an old drug, my advice is that the first stop should be the library. Find out as much as you possibly can. It's going to mean a lot to you when you get out there in the billows. I've had experiences where the shaman said, "Take this, but never shake the bottle," so then five years passed, and I'm trying to remember whether this guy said, "Take this, but never shake the bottle," or "Take this, but always shake the bottle." Well, having a background in pharmacology and ordinary scientific thinking, I decided that he must have said, "Always shake the bottle," because we want to agitate the stuff on the bottom and get it up into solution. I'm telling you, pay attention, because mistakes like this, if they don't kill you, can scare the socks off you. It's all in the details.

One last thought that I'll leave you with: I talked about the unclaimed nature of the *Argyreia* morning glories and how interesting it is to hypothesize possible hallucinogens, possible combinations that have never been used by people. An interesting one that was suggested recently that I want to do research on and find out more about, because I am puzzled by the *soma* problem and not really happy with any of the current answers, is reserpine, which occurs in *Rauvolfia serpentina*, an Indian tree. Reserpine is the first tranquilizer. It's pretty clear that reserpine works by inhibiting serotonin, that reserpine somehow competes with serotonin for its uptake, so you could combine reserpine with *Peganum harmala* or a psychoactive tryptamine. There are some on the Indian subcontinent; one of the most interesting ones is *Arundo donax*. Now this is a plant that really has a suggestive aura about it. We have no history of human usage for visionary purposes of *Arundo donax*. Nevertheless, it is the giant river reed of the Old World. To this day the reeds for reed instruments, for clarinets and piccolos, come from this plant; the very best ones are made from the shafts of the *Arundo donax* plant. Well, the roots of this plant contain large amounts of DMT. Think about the symbolism here: Orpheus was a god of music, Orpheus was a flutist, and Orpheus made a descent into the underworld in search of his beloved. The so-called Orphic strain in Greek religion is the magical, mystical, extramundane strain in Greek religion. It seems to me entirely reasonable to suggest that the old strata of the Orphic religion may be pointing us toward looking at *Arundo donax* as a plant with a hallucinogenic potential whose efficacy was lost before the rise of literate Greek civilization.

So I don't want you to think that all mysteries have been solved and all work has been done in this area. It hasn't at all. The flora of Africa, the flora of eastern New Guinea, the flora of the Amazon, of Mexico, of what little forest remains in Africa, all of these areas may yield astonishing tools for spiritual and shamanic exploration when the cataloging and the phytochemical analysis is complete. There's a generation of work still to be done.

without further ado i want you to welcome ethnobotanist shamanologist and visionary terence mckenna
applause from audience

well, its a pleasure to be in southern california, and in clare mont addressing the jung society
before we get into the main body of all this i will personally introduce myself to some of those who may
not know me

I started out my academic career as an art historian with a major in ancient languages and that took me to
asia and sort of disillusioned me with traditional spiritual approaches in the asian style
and i reconnected then with my childhood love of nature

and pretty much abandoned the humanities and went into the sciences

but by then it was to late to become a real scientist and i was too tainted by my time again among the poets
and the artists so i had to become a very soft hard scientist

so i got a degree in conservation of natural resources, about as soft of sciences as you'll ever hope to touch
and i did a lot of traveling around looking for a viable vibrant numinous approach to spiritual reality
and the only place i found it was uh in the amazon basin, where as you know there are extremely archaic
groups of people

people who never submitted themselves to the historical process, the way, the peoples of the middle east
and europe did

and there there flourished through the use of chemically complex plants, techniques and traditions for
accessing a world invisible to the rest of us

a world of forces and information that is uh transhumance, supernatural, if the word means anything, but
this um, this supernatural dimension is uh anchored in the plants that live in our world

and my brother was a botanist and i had botanical training as we studied the psychoactive plants of the
world, especially the new world tropics where they seem to be concentrated

we were simultaneously exalted by the realization that we had found a doorway a real doorway into
hyperspace and at the same time tremendously upset and alarmed by the fact that this doorway is in the
process of being dismantled by the forces of human ignorance that are not even aware of its existence
so, uh, this was the impulse behind the disision on the part of my partner cat and i, that these plants must
be saved, they must be preserved in germplams ropistories or botanical gardens or something like that

toward a day when they can be studied and the uh power the dimensions within them can be given their real weight
so to this end we founded a botanical garden in hawaii that is specifically dedicated to preserving plants with a history of shamanic importance,
and i mention this because this is the real world political world that we do
and everything else that i will say today will be barely anchored in a world familiar to most of us
but there is a political anchoring there is a place where it all comes tangential to the world bank and the IMF and the host governments and so forth and so on
it is tremendously important to preserve this shamanic option if for no other reason then we do not know what it is we do not know uh what it is
well uh so at the break if you come up our news letter of the botanical garden is the large stack of beige paper and there are 300 copies of that so i hope theres enough for everyone
we do exist on donations so if any of you are philanthropists we can certainly tell you how to spend your money, we have many plans for your money
okay um
i wasn't kidding about what an honor i think it is to address the jung society
at one point in my life my greatest desire was to become a jungian analyst and i had the good fortune of coming upon jung very young
i was about 15 when a very precocious friend of mine brought psychology and alchemy in the karuahbane translation
i think it had just been brought up
we were stunned and we read it from cover to cover
and then went on to mysterion discontinionase ion the studies and the phenomenologies of the self
i said to someone yesterday we read all the books of jung that the jungians never read
they seem to stop up there at the front of the line with the archetypes of the collective unconscious and the personality type-but to my mind it was the late stuff that was fascinating
and i uh am slightly puzzled and we were talking about it last night
at the distance between the jungian community and the psychedelic community - because they seem to me the unschooled observer to be definitely sharing the same concerns and strangely enough they share much of the same history and geography
bosal was of course junks home town, it was albert hoffmans home town
did one half of town know what the other half was doing (audience laughter) i'm not sure, um that the relationship to jung to the unconscious - to the collective unconscious as it's discoverer has been always somewhat puzzling to me because of course if you know the history of 20th century art you know that da da which was the great prefigurative movement for surrealism rose in zuorich
so you know we got LSD 0 the schools of modern art that laid great stress on the irrational and the great schools of psychology that extended the boundaries of the unconscious, all rappelling around in these little swiss towns. and it's interesting to imagine conversations or meetings that might have taken place when people slightly left there ordinary habits and wandered into bars they didn't know and drank with people they never met before
because jung provided maps of the unconscious
and at 16 when we were beginning to experiment with this
and let me stress this was before the great social waves of LSD taking of the 1960s just preceding that from about 1963-65 we were frantic for maps of the unconscious and fried was useless i meant he notion that the contents of the psychedelic experience could be reduced to what fried called day residues and repressed sexual desire - didn't wash within 10-minutes you could tell that was not a serviceable metaphor

jung on the other hand offered a vast uh pantheon of uh gods and archetypes and psychic complexes forgotten or abandoned
i mean i thought of jung basically as what i call a noetic archeologist, someone who goes with toothbrush and nutpick to dig away the detritus from the bones of vanished idea systems
and if any of you have read the complete - the works of jung in the bulling set
you know that the richness of it all is in the footnotes
i mean her was a man who raised the footnote to a high art and who was aware f a literature to my mind that no one seemed to know about
that junks references reach a thousand years deep into the past with great density of reference
this is where i learned about mechrobis and dosephius and dionysus the pseudo areopica and all those other folks that you just never hear about
it was my introduction to the underbelly of western civilization was through jung
uh and to my mind - now i'll fiend this in to today's theme - i think maria mentioned that jung did not have a lot to say about shamanism
he came to it late in his life and he had already worked through the massive the exojesus of the symbol systems of the europena mind and so she was sort of content to indicate shamanism as an area where more work was to be done
and then the great follow on scholar who was mercialiode who then actually studied shamanism showed what it's archetypal underpinnings were in all times and places
the combination of jung and illiad i think pretty much delivered us as firm map of the psychy as dependable a map of the psychic geography as we can expect to have until we make the trip ourselves and uh readjust the landscape with our own notes and uh observations
for jung the great path into the unconscious was alchemy
and alchemy is an interesting pivotal domain
because i think we could in a way say it lies halfway between the concerns of an archaic cshamanisma dn halfway between the concerns of a quasi scientific psychedelic attempt to explore consciousness
merciliode wrote a brilliant book on alchemy called the forge and the crucible which is the bridge to show you how you go from jungian psychology into an understanding of alchemy that approximates illiad. the notion for the alchemists that jung brought forth very strongly - 13:00
was the idea of projection of psychic contents, projective of the active imagination onto processes and uh objects in the exterior world in the case of the alchemist it was the swirling chemical processes in the elembox in their alchemical vessels that they projected the uh the uh the great round of the archetypes onto these chemical processes
they saw crystalization, sublimation separation a statements about the contents of the psyched as much as about statements about the exterior world
because for them the firm division between mind and matter the firm ontological division between mind and matter that is built into western thinking now did not exist
that comes with renae decart with the invention of whats called the resexxtensia - the extended world and the resbaren - the interior world which has no spacial dimension
so for the alchemist mind and matter were two terms who's e exclusivity could be blurred under certain circumstances and the terms of one could migrate toward the other
well now we as moderns - ordinarily only experience this state when we are intoxicated by hallucinogenic drugs or when we are in a state of severe psychic weakness, when there is then overwhelming from the unconscious that is not uh not with the permission with the ego as what happens with the psychedelic experience
all these various ways of approaching the psyched seem fairly abstract and bloodless and removed from

daily existence unless the psychedelic experience is present
and it vivifies these metaphors
it makes clear what these perennial traditions are uh talking about
so what i thought i would try to do today - and you're welcome to steer it other directions in the question
and answer period is the workshop is sacred plants as guides
uh a lot of information has to be imparted if we're going to satisfy my pathological urge here because i
would really like to leave you with information that you didn't have before some of which may have
practical efficacy in your own life
so in thinking about this very large issue: sacred plants as guides
i basically break it down into three categories for ease of handling in a context like this
and they are a kind of survey what how many plants are they
what are the chemicals that drive them
and what is their geographical distribution
in other words what are the botanical facts of the matter
and then uh secondly i think that in order to understand what these things for spiritual growth and psychic
development you have to place them in a context and the context is chronological and historical
has these things always been around have shamans always been taking them how do they relate to the
synthetic drugs that have been developed in the last couple of centuries
so the history of our relationship to the pharmacologically induced ecstasy
and then finally and probably we'll get to this this afternoon the phenomenology of the experience and the
techniques for achieving and controlling it
because this is a practical - there is a practicum here
this is not a course in mongolian philology or something like that
the ultimate idea is to get those who feel called to the task
sufficiently informed and psychically empowered that they can push off into the oceans of mind and the
interior with some fair amount of confidence that they'll return to the port with all hands
(audience laughter)
so let's start with the survey then and let's talk about what the options are
and this will be sort of unstructured and conversational with forays into other areas
first of all the striking uh thing when you want to study psychoactive drugs and plants and their impact on
human culture - and that's really what interests me - is how drugs affect culture - after we went through Jung
and Iliad my net port of call was McLuan
and i have soared very deeply the notion that media structure civilizations in ways that the civilizations are
never aware of
and Jung of course talked about print and manuscript and electronic culture he did not talk about drugs but
drugs are a form of media because they - information travels through the drug to the mind - that's a
medium of communications and various societies where drugs like clothing with no awareness of their
existence at all, somehow in the way that a fish relates to water - so that Frances if you're in Dublin you are
swimming in the ambiance of an alcohol culture - you don't have to be drunk to be in Dublin although it
helps
but the entire society is premised on the possibility x2
in India the entire society is premised on the possibility of uh hashish intoxicants and social mores
building design
uh everything takes account of this - cultures don't see this - we do not think of ourselves as a meat sugar
alcohol culture - people do not walk around saying "oh wow i'm so high on meat, alcohol and sugar, i can
hardly stand it" but they are

and certain consequences flow from that
so as i make my way through this survey you need to bear in mind that a culture takes its tone
its clothing from the drugs that it emits, and you can know a great deal about a culture from the drugs it
excludes, the drugs that it excoriates and fears
because various drugs exentuate the suppressed different parts of the psychy
so these are statements about anxiety about various parts of the psychy
the striking thing when you set out to do a survey like this
is that you discover that our culture - the culture of europe for most of us some of us are black some of us
are asian but largely the roots of american culture lie in europe
this is the most pharmacologically poverished culture on the entire planet
it has the longest history of disconnection from any kind of ecstatic intoxication
and the cultural forms of earope linear abstract narcissistic and promoting of male dominance are to my
mind exactly what you would expect in a culture long deprived of the boundary ddesolving numinous
encounter with the vegetable mind
so um a lot of the culture problems we are dealing with are based on the fact that we as europeans have no
place for drugs
we don't really know quite what todo with that as you move south from europe into the content of human
origins : africa
you discover that well africa supports a tropical ecosystem which because that means increased speciation
of plants you would think indicate an increased number of hallucinogens
africa is surprising poor in hallucinogens
this is not well understood
as we go through this survey i will make reference to numerous unsolved mysteries in the field and i
always try todo this because I'm hoping their are graduate students listening and they are looking for
research topics
and there are numerous research areas where important work can be done
one of them is
this question of poverty of hallucinogens in africa - why
does it have todo with the extreme length of time that africa has been subject to human impact
because afirca is species poor generally for a tropical continent
however in the interest of thoroughness there is one hallucinogenic drug complex that should be mentioned
because it raises issues that are important for the broader context
and that is
ibogaine or tabernantha iboga the so called bedee cults of zyarre and gabon
now this is the psychedelic about which we in the west probably know the least
it has spawned no waves of social histeria
it has not been the subject of padromes or uh media freakout
and its a powerful hallucinogen and its not only a powerful hallucinogen but it has a component of sexual
excitation which is ansylary and unusual, if you have actually ever looked into the chick of aphrodisiacs uh
that
genital chaining and prolonged direction
but a true aphrodisiac a chemical that would impel you to want to have sex
there is nothing quite like that except this tabernantha iboga is very interesting
we tend to think of an aphrodisiac because we tend to break our heart away from our genitals as a kind of
uh cold thing i think
but when you talk to these people who are taking ibogaine they don't talk about aphrodisiac they say this

causes open heartedness
one heartedness they call it
and one heartedness is what they are striving for in the boety colt and they achieve it
and it allows them to resist cultural incursions by christian missionaries
bowery is the main cultural force that is holding back conversion to christianity by these people, fang
culture the people who are using this ibogaine
it's an interesting culture
its a great deal of anxiety in fang culture about divorce
because in relationships between men and women divorce is very easily maintained in the fang but it's
always followed by extremely lengthy and protracted negotiations with the family of the divorced partner
about the return of dowry and a huge amount of neurosis and agony and murder and violence goes on over
these dowry return negotiations, the ebogaine stands right in the middle of this as a source of one-
heartedness making divorce less likely
so it's a very important as a force for social cohesion
and i mention this because when we reach ayawausca i mean when we reach south america we will see
ayawausca not as a type of aphrodisiac or a thing to unify couples
but as a kind of telepathic pharamon that unifies whole small tribal groups together into a one hearted one
minded modality
and if we get into a discussion about the possible evolutionary impact of hallucinogens we'll see that it
always lies in the direction of these collectivized states of mind
and uh
dissolution of boundaries between people
other than tabernanthea eboga african hallucinogens are trivial
and i won't mention them in the time we have
cannabis is in africa as well but cannabis is worldwide now and probably has been for quite some time
cannabis is a special case chemically and culturally
we tend to think of cannabis as a recreational drug but thats because in the 20th century we always smoke
our cannabis
in the 18th and 19th century cannabis was eaten and jelly forms of cannabis that were eaten judging by the
pros of people like _ _ _ _ and people like that it was as powerful as LSD without doubt
i mean these people were being swept into titanically alien dimensions
well when we cross form afirca to india
india interestingly of course all of you know tremendous depth of at least concern with the spiritual
dimension if not realization of it thats a tougher call
uh
india would be a likely place to look for indigenous hallucinogenic plant cults because of the spiritual
obsession that characterizes indian thought
when we look at the historical foundations of indian thought we find that it all rests on a group of texts
composed between 4500 and 2000 years ago called the vedas
and the vedas are nothing less than the worlds longest continuing advertisement for a hallucinogenic plant.
the problem is we don't know what this plant is
this is the mysterious soma of the rig vedas
and uh mandala 9 of the rig veda is an entirely a hymn to soma
soma held hinduism of the vedic phase together
later it was repressed and again graduate students pay attention one of the very interesting problems to be
looked at by sociologists social psychologists and anthropologists is how if a drug once discovered or a

plant once discovered is so wonderful how can these things ever be lost or forgotten
and yet in several instances we deal with literatures which sing the praises of some plant or drug, the
identity of which we can't figure out or it becomes a very big arm restle between various competing
schools of scholarship
we do not to this day know what soma was
gordon was son who some of you may know the discoverer the modern discoverer of the mushroom cults
of mexico founder of the science of ethnomicology believed to his dying breath that soma was amanita
mascara the red topped white speckled amanita
um
this is a mushroom which has a major role in tungustik and arctic shamanism but to say as was son did that
this is the supreme entheogen is not supported by the evidence
was sons own efforts to become intoxicated on amanita muscaria were not succesfull
uh my efforts have not been successful
occasionally you will hear anecdotal evidence - someone will tell a story about eating amanita muscaria and
obviously they had a staggering breakthrough - a rupturing of plane as mercioliode in his wonderful phrase
but its extremely undependable and when you look at the botany of the amanita muscaria you discover that
its chemical constituency is seasonally variant genreically variant uh geographically variant and so forth
often i think as we gain a understanding of a given shamanism we will see that it depended on an extremely
deep local knowledge and if you take what a yakut shaman says about the amanita muscaria and attempt to
apply it in the national forests of new mexico you could end up with a tag on your toe
uh these things this kind of information doesn't travel well
there are old shamans and bold shamans but there are no old bold shaman
in looking at the indian subcontinent for other hallucinogens that may have made a contribution
the obvious one to my mind is straferious cubensis that which mushroom that grows in the dung of cows
and the book that my brother and i wrote was about
other possibilities some of you may know their are a family of the argerea family of morning glories an
asian family of morning glories distributed from india to micronesia
thirteen species all containing psychoactive ergot alkaloids
none with a history of human usage
now this is another area which really fascinates me
why do some plants become discovered by human beings and become the objects of cults which last
millennia and others are never discovered at all
in societies absolutely obsessed with spiritual advancement
this argeraea nervosa is the perfect example because you take the seeds the seeds are the active part
and you don't need much of this thing
you need four or five seeds
less than a table spoon of plant material which i would bet would make it pure unit volume probably one of
the most powerful hallucinogens in nature
and uh
the hallucinations are absolutely stunning
and nobody has ever claimed this
its free for the taking
this means you can cut a deal with an a lie that doesn't belong to the hindus the mayans or the somebody
else
its an unoccupied parking space ni uh hyperspace
and its very interesting that the discoveries are continuous

just a year ago some phido chemists in the midwest discovered a new a plant its always been there no ones really taken it very seriously, treated it like a weed

desmenthus elenoyensus

the elony bundle weed

this is suggested that its called bundle weed because a medicine bundle is of course a shamans mojo bag so bundle weed 6% by dry weight nn dimethyltryptamine - the largest concentration of dmt in any plant and unclaimed by native people - unknown to the folk medicine of the north american indians as far as we can tell

well so this is very interesting

uh continuing our survey

since we're now somewhere on the eurasia continent we should mention uh uh pavisoanaphorum the opium poppy with cannabis

this is probably the oldest human narcotic minoan civilization was entirely based on opium, on the use of opium - 36:00

and in fact when michael ventrist translated the tablets the linear bee tablets they got these tallies and they thought at first that the symbol for opium must be the symbol for wheat

because the tallies were so huge of the things being moved and sold

and then when they sorted out they realized no that for the last 1000 years of it's existence the minoan civilization drifted deeper and deeper into an opium narcosis

that was its way i think

of emephasitising the pain of the death of this last outpost of the goddess religion

because thats what it was it was a cultural inachronism

while asian minor had gone over to god king city states

and bronze tipped spears

the people of minoan creet had kept the old old archaic religion that came out of africa

and then in the last gasp of that minoan culture those mysteries were handed on to the main

land of greece and became the mysteries at eleusis and uh and other cult sites

it was said by the commentators

contemporary commentators of the hellinistic world

the site the rights practiced in secret at eleusis are practiced in public at kinosis

and this was the difference

the going underground of the old proto-minoan mother religion

uh in modern times we have a horror of opium

uh i mean people are amazed that i even mention it in the same breath

but it doesn't hurt to remind ourselves that this verily addicted substance

opium was not even noticed to be addictive by anybody until 1627

when the english physician john play fare for the first time commentated that opium once taken over a long period of time then there would be a requirement that it be taken throughout life

uh um

we're right in a middle of the drug war at the moment and it's interesting in that context to notice how the goals of drug wars can change

100 years ago the british navy was involved in what is called the opium wars in china

very few people in the modern world have botherd to inform themselves to find out that the opium wars were about the right of the british government to deal opium

the emperor of china did not want opium dealt in the ports of china

and the british government used canon to enforce their desire to sell opium in the ports of china

why were the english trying to sell opium in the ports of china
because the tea trade had collapsed from overproduction they stuck with all these tea ships
they had created a whole global infrastructure for the sale of tea when the market fell out on tea they just
turned to opium
they grew it in goa and they sold it in china
this was government policy less than a hundred and twenty years ago
ok well moving on then from eurasia
and I'm sure I'm missing different things but if missed your favorite thing bring it up in the question period
to the north american continent
and the north american continent - is uh i almost said similarly cursed like europe but thats just my
prejudice
the north american content is similarly poor in hallucinogens
uh there are no very interesting hallucinogens in north america
and north american indians and north american culture did not avail itself of this ecstatic plant induced
shamanism it tended more to go for whats called ordeal shamanism
the sun dance thing where you hang yourself by your pectorals on hooks and stuff like that
i mean there are other ways to attain these visions
you see but that absence of good hallucinogens in north america just reinforced that whole bear and
woolen and uptight thing that came from europe
uh the only major hallucinogen to have a role in native american culture is of course peyote
and many people without informing themselves imagine that peyote is something which goes millennia
into the past
and this is absolutely not true
peyote use may well be less than a thousand years old among native americans
when you go back into the old graves and the very old sites in the rio grande valley in the south you don't
find peyote what you find are the beans of sephoris condefolia you all probably know this plant although
you may not know it's name its the plant that produces the very hard red and black bean that they can
string
if you all know what corellanus are these era thrinas which are related to these things
ok that stuff contains cytosine and sistinethis is these are what are called ordeal poisons
and it might be worthwhile to just talk for a minute about ordeal poisons
i said theres more than one way to skin a cat
theres more than one way to have this experience to shove your through to an awareness of the numinous
thats what we're trying todo is have an awareness of the numinous
well in a certain part of the world where hallucinogens were not present in the biome
people concentrated on ordeal poisons and what an ordeal poison is its a chemical compound that you take
it and you think you're going to die and you beg for death and you do not die
you get better you're fine
and you're so damn glad to be alive that you undergo an abreaction you get straight
you shed some of your complexes and you turn over a new leaf
is uh is what it is
in madagascar these ordeal poisons have been brought to a high state of perfection
also in malaysia theres a poison complex that replaces a hullainogenic drug complex and these are horrific
poisons
so uh
what apparently was going on in the rio grande valley was after centuries of this sephoris secundofolia cult

someone discovered peyote and said my god
thank god
and the other the other plant which was big in the southern california northern mexico and across the southwest were the tropane containing deturas the so called tulax religion of southern california where these are deliriant confusants that are unless you have a psychic constitution that is not like mine you can't take these things
they're too i just found them confusing it was like a kind of madness
and also physically very difficult to handle i experimented i had a phase with these things when i was in nepal because there are sadhus in the catmandu valley who swear by this stuff
and if you're in catmunda you may notice in the gutter - well you'll notice plenty in the gutter
but you may also notice these detura pods
empty detura pods
and i noticed them and started asking questions and then out at the kings game preserve past pashupatina i found a bunch of these things and layer in a supply
but it is an occult watery- its a dimension of confusion not a dimension of high awareness
and i think some of you have heard me tell the story about the reason i gave it up was an english men a friend of mine who lived in this little village in nepal where i lived he was also experimenting with this stuff
and one day i was buying potatoes and tomatoes in the market and i ran into him and we started having a conversation and in the course of the conversation he revealed that he believed we were in his apartment - and then i knew we were losing hold on our grounding
uh so i don't recommend that i don't have a whole lot to say about it
apparently its a thing for magic power magic
and i've never been particularly interested in that because I'm afraid of it
I'm uh I'm a watcher i like to look i like to get very close to it and watch it
but I'm not into grabbing it or doing anything with it
i have a feeling that would lead to a catastrophe
for me personally
uh
ok where are we now
northern mexico
now we've gone all around we started in europe we went down into africa crossed the eurosia continent north america north mexico - now things get interesting
because as you leave the senorra uplands and go south in the sierra mazatecka there is this mushroom complex which valentina and gordon wasson discovered
in the 1953s
17-22 species - it depends on who's counting of extremely endemic meaning very localized species of mushrooms all producing psilocybin
coincident with the mayan
the cultural side of the mayan miztechan and mazatechan civilizations
and this is psilocybe
an extraordinarily powerful visionary and benign hallucinogenic metabolite
once the was sons had nailed down this mexican mushroom complex
then people started checking and they discovered these mushrooms or con specific species in many localities
uh two that are worth mentioning are

the pacific northwest oregon washington and british columbia
which appears to be the world center for species density of the psilocybin gene
and strangely enough very good ethnographic research turns up no hint that these quacutal shimsham
clinget and other people had any hint of this
they lived in the center of the psilocybin distribution complex and as far as we can tell their shamanism
which was highly evolved never discovered or made use of this
not so these civilizations of mesoamerica
the other places where these mushrooms have been discovered is europe
the tragedy of the european civilization is that the logos was apparently there all the time
uh uh the english countryside i understand is now practically a scene of annual mushroom runs
that are not unlike the lemming runs of scandinavia and everyone poors out to collect the semilenciata
mushrooms
i've been told i haven't been to these sites but i've been told that uh ionia where the book of keels was
composed and where uh saint columba went is covered with mushrooms its very clearly a mushroom
ecology
attention graduate art students the tracing of mushroom motifs in european art and civilization and culture
is an extremely rich untapped field
if you need some clues uh look at family escutcheons look at family crests
uh
in france and the italian parts of france the morel lie family has the morrell on their eschuchen
there are other mushroom families and mushroom names
so uh there may have been this may have been the struggle between paganism and christianity
may have revolved around a mushroom
we know druids were into plants we know they were into oak groves
but uh the plant that is always mentioned that is the druidic psychedelic psychic plant of choice is mistletoe
but mistletoe is chemically very disappointing and i wonder if mistletoe ~ 50:00
is not, it wasn't the plant they wanted to symbolize
they wanted to symbolize a symbiosis of one plant up on another
its that the mistletoe symbolizes epithetic existence
uh anyways this is an untapped area
once you get into the new world tropics
then you are in the great domain of the hallucinogenic plants
and no one knows why it is that the tropics of the new world are tremendously rich in hallucinogens
i mean idk how many of you are botanists or or biologists
but try to imagine uh figuring out a set of evolutionary constraints that were operating on one side of the
planet but not on the other
you know
when we take for instance the jungles of southern columbia
and compare them lets say with the jungles of new guinea
these are both continental floras
both equatorial
both climaxed at a species rich climax
and one has dozens of hallucinogens in it and the other has none
none
uh this is not well understood
theories range as wildly as obviously that must be where the flying saucer landed

and uh (laughter)
thats where the genes were seeded
i confess I'm not sure why it is
at first i thought it had todo with extremely primitive state so called primitive
extremely archaic state of culture in the south american jungle
that they represent a real stone age culture
where when you go into indonesia it may look primitive to you but the dutch were there before the english
arrived in north america
it is
it has had centuries and centuries for in which these things could be forgotten
but then here come the botanists who care nothing for ethnographic data and who simply carry out plant
surveys and chemical analysis of plants
they can't find these hallucinogens either
in the tropics of mess america
and the equatorial tropics of the new world
theres a vast panoply of hallucinogens
not only in the mushroom complex
but then also this ayahuasca or yahey complex
that we've referred to several times
uh this is a huge jungle fine
and as we cross into the yahey area we also cross an interesting barrier because we move from plants single
plants which are hallucinogenic ally active into the realm of preparations
we're on the threshold of the concept drug here
because what ayawausca is is uh two plants which are not active unless brought into combination with each
other
one plant contains a monoaminoxidase inhibitor and the other plant contains dmt which would be
destroyed in the gut if taken orally unless it were taken orally in the presence of an MAO inhibitor
this was not understood by western pharmacology until 1956
but it was understood by amazonian shamans millennia ago
so they bring these two things together
and by varying the ratio between the plant containing the beta carbines that inhibit MAO and the plants
that contain DMT
they can't intensify or de emphasize the vision
well most of the hallucinogens in the amazon basin run on tryptomine of some sort
usually dmt
in the upper basin of columbia ecuador peru like that
you get these banasteri these yahey ayawasca beverages
these are things you drink and then it comes on
this outlandish trip
as you go down into the lower basin
the banasterri opsis cult gives way to these snuff cults
ebena and neopo
depending on the languages
these don't depend on an mao inhibitor ffor their activity
because they're absorbed through the sub nasal mucosa
which is an extremely effective way for getting drugs uh into the system

the problem with that complex
the snuff complex
we are such delicate and wimpy people that we cant stand that route of drug administration
because what they do is they toast these seeds of anadanantha peragreen
this huge leguminous tree which is the source of the seed
they toast these seeds and powder them
so what you get is a kinda ruff cross between sawdust and charcoal
and then they have a hollow tube about this long
and they load it up with this stuff
and you squat down and put the tube into your nostril
and your friend, your friend (laughter)
not you because you would not do it hard enough (laughter)
your friend takes a huge breath of air and pshhhh
its just like being hit in the face by a two by four
and you fall over backwards you scream and you salivate and you squirm around there in the dirt for a
minute or two
and then you sit back up and by that time the tube has been loaded for the other nostril (laughter)
and your eyes your sinuses can't believe whats happened to you (laughter)
so you have to sort out this whole sinus shock which is going on in parallel with then an evolving strange
state of mind which is beginning to take over and clarify everything
and then there are numerous minor variations on these things
uh might talk just a little bit about the chemistry of these things
and the chemistry of hallucinogens generally
my attitude toward thesee uh
this question of plants compounds drugs should these things be used for spiritual growth
if the answers no then it finishes it doenst go anywhere
IF THE ANSWER IS MAYBE OR YES THEN OTHER QUESTIONs ARRISE
WHICH COMPOUNDS OUT OF THIS whole SURVEY
and at what frequency and at what dosage and under what circumstances
and over the years I've sort of evolved a three way test that i will share with you
because i think its operationally maybe the most useful thing you'll hear this weekend
and that is
if you are contemplating some compound some plant
the first thing to ask yourself is does it occur in nature
does it have some tangentialty to what is already existing
because obviously hat exists
thats nature
has undergone some vast winnowing process
out of the set of all things which might exist
in that wonderful phrase of alfred north whiteheads
certain things have undergone the formality of actually occurring (laughter)
you know
and they and so
certain compounds have undergone the formality of actually occurring in the biological matrix
and so they should be our pool out of which our experimental compounds should be drawn
but this is thousands of compounds

how can we further narrow it
well
an excellent way of narrowing it further is to ask the question of this compound
does it have a history of human usage
does it have a history of human usage
that is your uh FDA approval
because if you can point to a tribe of people who have been taking this plant or mushroom for millennia
and they don't have miscarriages
tumors
cataracts
blindness
downsyndrom
8 fingers on the left hand
or whatever it is then you can be fail confident that this thing is benign
that these people have observed its action on pregnant women
the elderly
those with you know
and that it has passed that test
then finally the narrowest gate
through which a compound has to go to intersect my precious body
is it has to have an affinity to ordinary brain chemistry
it has to have an affinity to ordinary brain chemistry
we don't want to launch something on your brain that it can't recognize at all
that it has no biosynthetic pathways to degrade
that his no receptors for
just some crazy thing you know
5 amino 3 triothyfinthioimaxodine
we don't want that
its not the spirit that we're acting in here
so if the compound can get through those three barriers
then its an excellent candidate for providing spiritual gain
at low physiological uh impact
well now some people may say oh well you've taken all of the fun out of it
all the good things have been tossed aside in this mad rush to purity
not at all
the very best stuff was retained in this process
because uh
in terms of relative strength and bizarreness of effect
and so forth
the strangest
the most powerful the most transformity of all hallucinogens in nature or out
is dimthyltryptamine
DMT
and uh it's worth talking about DMT for a moment
because it will raise certain issues and distinctions that you may not have been aware of
because DMT is hands down the most powerful of all hallucinogens

i mean it is so powerful that whatever is in second place is lost over the horizon
yet
yet
it is the most benign of all hallucinogens because it occurs as an endogenous neurotransmitter in the
normal human brain
we every single one of us at this moment have n-n dimethyltryptamine being synthesized activated and
degraded in our synaptic membrane
so this is almost a paradox
the most benign of all hallucinogens, the most fast acting i should also add
is also the most harmless, the easiest to take
it's sort of removed, it sort of puts a certain obligation on the experient
because there is no reason to hold back
except that there is this question
does it drive you mad?
and then the more serious version of that question
what about the possibility of death by astonishment (laughter)
this is no joke, death by astonishment is probably the major risk we run (laughter)
uh with this stuff, because the impact of the breakthrough is uh is so total, so complete, so unexpected
and in a way this sort of brings me back around to my theme
because I encounter DMT LSD all of these things
in that very period when i was getting set to take flight as a jungian analyst and what completely blew my
mind about DMT and uh I mention it again, here is an opportunity for research
is how trans
ehres a horretical construction
how trans-archetypal the content of the flash seemed
i was appalled because not only had i a certain amount of interesting jung and proclivity along those lines
but my original major had been art history
art historians
what we're trained todo is to be able to look at a motif
and say oh yes i'm familiar with this from ceramic from second millennia peru and also mendian
embroarderary work
we know motifs
we're trained to recognize and connect disparate aesthetic domains
when i smoke dmt
and came down
i said you know this is not on the map
i can't believe it, this doesn't connect to anything
how can there be domains of the human mind that do not announce themselves in folklore
fairytals
dreams or mandala painting
that are so
removed
from the van of what is human
that they are apparently not except able in structuring our maps of ourself and our psychy
and that for me was the contact with what i call an i didn't call it it this rudolph auto called it this
and this term influenced jung auto preceded jung

was, it is the holy other.
and if there is an archetype of a holly other
then there, this is it
but perhaps the holy other transcends the archetypes
this may explain to some degree interest in gnosticism
especially the valentinian school of gnosticism
that there is a higher and hidden father, all god, who is outside the machinery of cosmic fate
and it seemed to me that in those extremely profound dmt flashes
i was actually witnessing a domain outside the machinery of the archetypes
which is for us as moderns; that's what machinery of fate is
it's not zodiacal machinery
it's hard wiring in our psychology and our genes that gives us our fate
well so having said that uh i've not only made the the survey but also brought us to by ending with dmt -
the subject matter of this quest
and i wanna make it clear i speak about the power of the psychedelic experience
because i think people should be informed of their birthright
and i feel very antsy around the notion that someone might go from birth to the grave without ever having
a psychedelic experience
it makes me as antsy as the notion that somebody might go from birth to the grave without having a sexual
experience
it's a strange kind of uh protective denial or a kind of expression of fear
this is our birthright
this is part of what it means to be human
these altered states of consciousness i think are pretty much scripted into the existence of women because
they, most of them will give birth which is an organically scripted psychedelic experience from which
there is no escape unless of course you go for the drug knockout, the spinal and then you miss everything
but biologically, physiologically women are set up for uh this experience
man are not, it's possible to build such barriers against overwhelming that it never happens in your whole
life
and i believe that if we psychologically analyze the effects of these uh psychedelics what they do is they
dissolve boundaries
that's all. i mean, if you interview ten thousand people who've had a psychedelic trip
each one has their own heroscheny there own heroschomos that unfolded for them
but the some total of it is boundaries dissolve
and then whatever's on the other side of your boundary comes flooding in to claim you
and to reshape and remake your psychic
well i see the entire illness of our civilization as an
as
an ego inflationary illness. we have gone so sick with ego that we are literally murdering the planet rather
than confronting the consequences of our psychic imbalance.
and uh the psychedelics act to regress this
they are almost an inoculation against the ego
and i see the ego as uh phenomenon arising in historical time or rather actually history is caused by the ego
but the ego is a component of the psychy that arose in the post archaic phase in the post psychedelic phase,
uh it's entirely a modern invention
it's less than 15 thousand years old

and the assumptions of the ego are the source of our neurosis
our disequilibrium
why did the ego arise?
it arose because of the climatologically enforced abandonment of these psychedelic religions of the
archaic period
in other words here is the scenario as I see it
primates, even primitive-even uh
non advanced primates like squirrel monkeys, howler monkeys
these kind of primates all have male dominance hierarchies
the whole thing with primates is about male dominance
but a lot of things about human beings mark us as the most unique member of the primate group
uh
obviously we look different from any other monkeys
even the stranger monkeys look more like the normal monkeys than we look like them or look like thus us
our upright posture
the other thing about us is our suppressed extra cycle
we cannot tell at a glance whether a woman is in heat or not
and yet obviously that had a tremendous shaping force on the social psychology of uh of the primates
I believe everything about us that is noble and worth saving
uh
occurs against the grain
that if we had followed the grain, we would still be uh competing with jackals for the carcasses left by
lions of uh large game kills on the plains of africa
but when the african continent began to dry up and we were forced out of the trees where we had in an
arboreal vegetarian lifestyle
we came under great pressure to expand our diet and the - i believe that the great unstudied factor in
human evolution and human emergence is the effect of a complex diet on our emerging species
and it's not only the presence of hallucinogens such as psilocybin in the in the diet
but other things swell. psilocybin is the most spectacular case, and if you came to see darwin you'd hear
about evolution and if you can to me you'd have to hear this little theory about human emergence
most of you can probably recite it by heart now
uh but its a three step
its a three step feedback loop from a fairly bright monkey to a fairly stupid human being
and uh the way it works is like this
these monkeys come down out of the trees
they're predating on kills of ovungulate animals made by lions, they're competing with jackals, they're
testing all of the foods in the environment
and low and behold, in the maneur of these ungulate mammals that are eradeating across the african
continent
uh
there are what are called copperfitic mushrooms
and the presence of large amounts of tryptophan in maneur as a substrate means that these copperfitic
mushrooms elaborate psilocybin
so here in this new grassland environment are the psilocybin mushrooms
these protohominid creatures testing foods for their diet would reach the psilocybin and would test it
well then this three part feedback loop to humanist then comes into play

and it works like this

very light doses of psilocybe and so light that you cannot an hour and a half or two hours later tell you've taken anything. you say i don't feel it i feel completely normal i must not have taken enough.

that dose, if you would submit yourself to being tested by an optometric analysis we could show you that your vision has improved slightly

this is an effect of eating small amounts of psychoactive amines

increase visual acuity

well o - 1:15:00

you don't have to be a rocket scientist to know that if you're a hunting animal competing in a highly competitive environment and suddenly someone hands you a pair of chemical binoculars you are going to be a more successful hunter than other members of your species who are not availing themselves of this food item

so there was reinforcement there

aha

if we eat these mushrooms in small amounts we will be more successful hunters

or maybe it was never raised consciousness as an if than relationship

it was just we eat mushrooms we hunt well... kind off thing (laughter)

then if you eat slightly more of the psilocybin if you bring slightly more of it into your diet

uhhhh

it's what's called a CNS stimulator

Central Nervous System stimulant

an effect of all CNS stimulants is what's called

uh

arousal

and arousal means simply that you can't sit still, you're very restless

you're very energetic

and often in the male animal you have an erection

it's an overall systemic arousal

arousal

and uh if you if you give if you witness this situation in monkeys

monkeys are very hang loose kinda characters

and so they just all fall together in a heap and make love

uhhh

and this uhhh increases what anthropologists and primatologists like to call successful instances of copulation

this means that this increase interest in sex in combination with an increase success in obtaining food is creating the perfect situation in which there will be a population boom of these creatures

they're eating better, they're enjoying themselves more

and they have better relationships with each other

so population boom is on the way

well then, the next and final level is she you raise the dose higher so you're no longer restless or interested in sex or any other - but you're flattened with the ecstatic folding of the flu numinous hallucinogenic rupture of playing

then - and this occurs in the tribal context

then there is boundary dissolution uhhh group sexual activity and group bonding and identification

and this is where uhhh this telepathic coherence

this inner dynamic of cohesion and caring that we see in primitive people to some small degree and that we imagine must once have been our birthright
this is where it came to be
and at those higher levels of psilocybin
most of you probably know language is formed by an organ on one side of the brain called brooches area
uhh
brooches area
the brain being always symmetrically constructed
brooches area has a twin on the opposite side of the brain
but no one knows what's going on there
it's apparently a silent area of the brain
well when you take psilocybin there is spontaneous linguistic activity
glossolalia - Henry Munn has written about this
in his essay the mushrooms of language
it's almost as though psilocybin is a pheromone that promotes linguistic activity
an effort to take verbal intentionality and connected up to the ontos of being
in some way
and then it's almost as though words are born out of you
you give birth to words
and uh these condescendances of meaning then create a kind of unitarian ambience
which we call understanding
language is a miracle
i mean make no mistake about it - i don't mean any amount of dissection of monkeys or human cadavers
will give you an insight into language
language is a behavior of some sort so bizarre, so many orders of magnitude more complex than anything
else we do
that for all practical purposes, this is the thumb print of god up on creation
human language
and it's a self transforming thing
it keeps bootstrapping itself to higher and higher levels
and it creates for us the entire ambience of reality
once we had words, we quirky replace reality with them
and so i believe that what psilocybin promotes is cognitive activity. the coordination of visual input with
plans and strategies for hunting or acquisition or whatever
uh
it promotes this uh increased arousal, which really in a way_
we as moderns are absolutely as in awe of as our mushroom munching ancestors 25,000 years ago
we can't reduce it, we don't know what it is
you know jung was always so concerned that people say it's only psychological, it's only the psyche of the
news for you
it may only be the psyche but the psyche is a hell there is
and as we came into a relationship with the mushroom, humanness emerged on the african belt
and was able to stabilize itself for a few millennia, and then we fell into history because of climatological
change for many reasons
but we literally fell into history and now we operate in this lower domain
a domain of limitation of misunderstanding of low grade languages

uhh
but and we are neurotic
we are unhappy
we are dysfunctional
and i believe this is because our connection to the logos, to the informing voice that gives meaning to being has been broken. over ten thousand years it's fallen away
and all we're left with is our spiritual yearnings
our nostalgia for paradise
and uh our pathologies and miraculously we are left with the time capsule of preservation represented by the rainforest shamanic culture that use hallucinogens
there lies our answer
but it's like the auroboric serpent taking it's tale in it's mouth
the salvation of the super future of the planet lies in a recovery of the values, modalities and religious practices of 25,000-50,000 years ago 1:22:50
Break Break break (applause)

we haven't screened the pile so we're just gonna go through them
i'll read them aloud
normally i give long answers but there's such a stack of questions here i'll try and be general (laughter?)
or general breif n ___?
since dmt is present in the brain does the introduction of excess dmt shut down the production of natural dmt? in the way that the body stops producing opiates during opiate usage. if so what are the effects? is dmt really so chemically perfectly benign?
the first point to make is that many of your questions cannot be answered because research into these areas is not allowed
so often uh we can't answer our question
this question, "does the introduction of excess dmt, limit endogenous production?"
I can say with fair confidence that that's never been studied
my guess would be that it does not, because the dmt is in no sense of the word do you become habituated to dmt.
i mean - a person who does dmt want's a year as a fanatically heavy user, i would say. and uh the question; is dmt really so chemically benign?" again this has not been studied as you would study with rats and so forth to determine it but experimentally speaking, the amazing thing about dmt is the speed which you return to normal. You return to the baseline of consciousness in under ten minutes. Well that tell's you that the brain is very well able to deal with this compound.
One way of judging how toxic a drug or a plant is, is to ask yourself the question, "how long after i take it do i feel completely normal?"
and with dmt you feel completely normal 15 minutes after taking it
the shortest recovery time of any uh drug
this question is concerning the bundle weed, while it does not correctly meet the criteria of longterm use, is it to be considered safe?
i'd say the way to answer that question is to do a chemical analysis of the bundle weed. if theres nothing present but dmt in it, i think it should be considered safe. Now there may be other compounds present. in south america it's possible to contrast two plants - psychotria veridas. which has almost entirely nothing in it except dmt as the portion of it's alkaloid fraction. or uh varola cathaganascens which is used in the making of snuff, and chemically it's a mess. it looks like they swept the floor. you've gone nn dmt, 5meo

dmt, alphenyltryptamine, monomethyltryptamine, sixhydroxymethyltryptamine - all these
this is not what you want
you want a surgical strike on the synapse that's what you're going for
not splattering all kinds of junk all over the place
uh
what is the best medium for psilocybe spore germination
the best medium is rye malt agar no question about it, go with rye
organic rye malt agar extract
in today's climate talk about access to shamanic pharmaceuticals for the average person
this is the where do i get it question
dressed up in respectable terms
without being too self-serving my brother and i wrote a book about growing mushrooms
called psilocybin the magic mushrooms growers guide by otis and
i'm otto's as you can see
i really believe in growing mushrooms
if you are as you sit here not psychically strong enough or balanced enough to take psilocybin
then if you learn to grow it, at the end of that process you will be
because growing the mushroom teaches you cleanliness, punctuality, attention to detail, uh steadiness
all of these virtues which are the very virtues you need to travel smoothly in that dimension
other hallucinogens other shamanic hallucinogens that you will find easily available to you without
breaking any laws
uh
the heavenly blue morning glory
sold in every seed store and garden store, are not to be taken, do not take them. they have been dipped in a
fungicide that will make you sick
grow them, and collect your crop and take that
and uh this is a major hallucinogen of uh of great antiquity, extremely visionary
uhhh
the hawaiian wood rose
uh you can obtain this from uh people who make dry flower arrangements often have these
pay attention, you want the hawaiian baby wood rose
if they try to give you something called hawaiian wood rose, a big clunky thing. that is inactive and uh and
won't do it
umm
the deterras are freely available - i do not recommend them. i recommend against them. they're a common
landscaping plant in southern california, and the gypsum weed is of course growing out in the desert out
around lancaster and other places like that, there are a couple of companies which have very forthrightly
decided to sell plants with a history of shamanic involvement
i have no stock in these companies, so uh i can recommend them without fear or favoritism
one is called , of the jungle up in sacramento california
and the other one is called dream gardens and i think it's here in santa monica
both of these groups publish astonishingly complete catalogs of psychoactive and shamanically important
plants
ok that access without going to the streets and crime and that
can you tell us anymore about elenoy bundle weed
i just did, umm

and that's all really i can tell you about it
all these questions are the same question
having convinced us of the wonder of DMT, what would be the easiest and quickest way to obtain it
how does one acquire DMT (laughter)
comment about the supreme court ruling against the use of peyote by north american indians
um
very bad law obviously, law so bad that the national council of churches, the national jewish affairs
committee
and some very large catholic organization, all filed briefs protesting this thing and i think that it was
actually realized that it was a goof and it will be brought back in the new-you can't bring something back
something in court in a hurry because that's unseemly
but i would bet within 5-10years this would be overturned because a close reading of this law means that
uhhh lying for pesa or communion could be construed as a psychoactive substance
and uh the whole thing is just bad law, bad idea
exhale
has consideration been given to the possibility that in the case of certain plants which are recounted in
writings but the identity is unknown that the reason they are unknown is because shamans purposefully
kept their identity a secret. perhaps such secrets are still being kept
this goes to the question i realised this morning
how can a hallucinogen once discovered ever been lost
and i've only been able to figure out one scenario in which this could happen
it happens like this
uh
people discover a wonderful plant that imparts visions or insight or something
and everybody takes it and enjoys it and then slowly a hierarchy emerges
a professional class, priests, and only they decree, they decree that only they will be allowed to take it
and then they lord it over the rest of society with an iron hand
and then the rest of the society gets fed up with that
and theres a slave revolt and everybody in the ruling class is killed
and the sacrament is lost
i can't figure any other way that it could happen
and the vedic thing, this seems quite reasonable
obviously soma was being more and more confined in it's use to a single class
and then that class became viewed as obnoxious and it's overthrow and the death of this sacrament thing
follow each other
perhaps such secrets are still being kept
uh perhaps they are, i--- the fact that this bundle weed could turn up so alter date
probably means their are shamanic lineages with secrets that we don't know
as a field ethno botanist and an explorer i'm always interested in the unconfirmable rumor
and there are some doozy's
uh
the mysterious beetle from eastern brazil which causes intense hallucinogens if eaten
here's a career for somebody
Noooo hallucinogenic insect has ever been found and yet there are persistent rumors in different parts of
the world of either a butterfly or a beetle that is uh hallucinogenic
most shamans in the amazon if you spend five or six weeks with them and take ayawausca with them and

tromp around with them
when you finally get to know them, they will allow us how there uh is another magic which they call the magic of the big trees
and i've spent half my life trying to find out the names of the big tress and i'm still working on it. we have collectives in peru and nothing is more exciting then a clump of root stuff or a seed packet that comes across our desk, labeled suspect hallucinogen
that that gets me to the edge of my chair (laughter)
what do you think of robert monroe the journey out of the body man?
uh well this a good time to discuss what do i think of all these other things on the spiritual market
uh idk what to think about them, i'm not a spiritual consumer
uh i've never been to a workshop that was never my own unless it was free
and uh hh theres a lot of stuff out there you know
astral traveling, channeling, all of this stuff
and i tend to believe its bogus or it's for people with a psychic constitution considerably different from my own
uh, sometimes people say to me, well these states that you're talking about, can't they be achieved without drugs
and the answer to that is, my god, who would want to
what what would be proved by achieving these things without drugs
if the things i'm talking about, began happening to me without drugs. i would be very very concerned and alarmed (laughter) because umm (laughter) you know i i i just don't uh hh and also i i think theres something to be said for admitting that we cannot do it alone
that if you want this spiritual insight, if you want the dianimatrix then humble yourself to the point of making a deal with a plant
that's the key, you can't enter the bank without the key to the bank
the key to the bank is a plant
jumping up and down outside the bank and exerting the banker to recognize your inner worth and open the door is just not uh not going to do it
i can understand that psychoactive alkaloids are a survival mechanism for the plants
why is that effect psychoactive in man or perhaps animal
well first of all maybe we have to argue with your premise
you're right that a lot of these so called secondary tritary compounds are elaborated supposedly to make things taste bad
or so that birds will spit out things and stuff like that
uh but on the other hand, they studied this question fairly closely
and a lot of these alkaloids are produced specifically to attract animals, to bring them in, to nactaries as pollinators and that sort of thing
uh
old style botany always believes these compounds are whats called tertiary to metabolism
meaning they're kinda like waste products and not very important, garbage
but when you look carefully inside what it plant
invariably what you see is that the psychoactive chemistry is going on where metabolism is most active
this is an indication that actually these things aren't tertiary at all, they are doing something with the plant
but we don't know what it is
as to why they have this peculiar effect that they do in us
uh hh

i think that because there was anciently and over the evolutionary life of human beings actually connection between us and nature

and uh that these these drugs are the antenna, the switches, that switch us back towards the logos of uh the natural world

i suspect that all of nature is a seamless web of pharamonally mediated connections and interactions and that we are just not yet at an efficient level of analysis uh give it observation to see this interconnected web

you know our idea of nature is that it's all tooth and claw survival of the fittest, and the devil takes a high most the NEW version of evolution is entirely different

it says that the way you attain survival is by making yourself indispensable to everybody else so it's not by triumphing over the ecosystem that by integrating yourself so thoroughly into it that it can't function without you

then you're on your way to being a dominant species not by crushing the opposition

uh lets see how we're doing here

what are deconstructionists doing to our understanding of the language? is it helpful? (laughter)

hmmm

by deconstructionists i suppose you mean uh juckderada and that crowd

well i think deconstruction serves a very useful function and we're unaware of uh of what/how thoroughly language is a medium in which we swim

how thoroughly our world is bult in language

in a way the boundary dissolving character of the plant hallucinogens is a dissolving of language barrier they show you that the surface of reality was not the surface of reality, it was the surface of your local language

and now it's gone

and uh and uh theory is uh what lies beneath it

at what point in the evolution of organic matter on earth do psychoactive plants appear and why?

interesting question, if we're talking about psychoactive fungi we're severely limited by the fossil record which is no fossil mushroom has ever been found over than 40 million years

this is because fossil mushrooms are very soft bodied femoral kind of thing

as primary decomposers which is what fungi are doing on this earth

it's reasonable to assume that they must have been here fro the very beginning of the conquest of the land but proof in the fossil record has not been forthcoming

now if we're talking about higher plants, flowering plants

which is mostly what we're talking about here

than no flowering plants existed before 65 million years ago

flowering plants emerged out of the same catastrophe that destroyed the dinosaurs and set the stage for the emergence of the mammals

this is something people don't realize

flowering plants are as recent as mammals

you know if you look at the

if the period of life is visualized as a yard stick, the period of the flowering plants is the last inch and a half and it's also the rise of the mammals occurs in that last inch and a half

so before that the plant life on the earth was of a very different sort

and we know nothing about it's chemistry to someone who asked a zen question (laughter)

what would make the present government interested in the study of psychedelics? (laughter)
i don't know, they could make a buck out of it
uh
i don't think they're very interested in psychedelics
i don't think any political - but "they were very interested in psychedelics" - except that they abandoned it,
yes mk ultra, stood for mind control
mind control ultra was the program the via pursued in the 1960s where they tried out all kinds of
psychedelic drugs and they also worked with this in combination with hypnosis
they were trying to make what they would call the trojan horse
this is somebody who would be an assassin but not even know it
and uh how far they got with all of this we would never know
because of course it all disappeared behind the walls of secrecy
but the declassified history of the cia and led is very interesting
some of you may know the book acid dreams by uh by uh martin lee
uh fascinating history of the way the government tried and really failed i think to use psychedelics that the
governments initial approach was uh this is great this is a truth syrim we can give this to enemy agents and
they'll tell us all we know
well a few months of following that path they decided no (laughter)
this is an obscurity drug we can give this to our agents and they can take it if they're captured and no one
can learn anything from it
(laughter)
and clearly this was not a fruitful path either
and i really don't fault the government, i don't really fault the government for this
after all the government is in the business of being the government
i don't think any institution can incocate psychedelics into it's own program, because psychedelics destroy
instititution
all institutions
it's like trying to move an acid around that corrodes whatever pipes you poor it through
and because the boundary resolving quality of psychedelics is precisely the quality that government is
involved in resisting
government builds up label, pans out role models, explains how everything is and this stuff just then melts
that, melts that into a primal chaos
so it's pretty corrosive of any social values that don't arise spontaneously out of biological organization
it's anarchists, it's the acid of anarchy in a way
alright we're never gonna get through this list, but it's gratifying to know that it's here if we need to
(laughter)
heres a question about the time wave which i'm gonna skip because we're not talking about the time wave
today and pitty the poor soul whose never heard of it
know of any herbal sources to raise seratonin as a treatment for depression?
uh no i'm not uh i don't uh know a lot about herbal medicine and that sort of thing but uh raising seratonin
level as a treatment for depression seems likes a pretty good strategy
um
i don't know of herbs, usually inhibition seratonin is whats going on
and with these psychedelics they do compete with seratonin for the bond site
that what it's all about at the atomic level
is in your synaptic cleft in the synaptic clefts of your neurons there are uh what are called receptors and if

you were to fly down and look at these things they look like complex locks their hooks protuberances, little drawers and fit in places, well then the drug molecule comes - is carried into the synaptic cleft by the blood stream and it seeks to what's called occupy the bond site or simply bond and it's trying to fit in well the normal thing which fits in those bonding sites is serotonin but some of these hallucinogens are much better fits than natural serotonin they are what pharmacologists say - competitive at the bond site and so they literally elbow the serotonin out of the way and then they fit themselves into the receptor well once the receptor and it's uh it's fit it's against are in place then the biodynamic the bioelectric uh field of the synapse can be activated well if you swap out serotonin for an exotic molecule like harmine or mescaline or something like that well then this shifts the mode of this huh molecular level electrical environment and i believe that that is what registers as a higher cortical experience that we call the trip it's the experience of hundreds of millions of these introduced molecules displacing the normal serotonin and then broadcasting this signal in the slightly different way than it is normally perceived so there's a molecular connection there's a connection down into the molecular level this will be our last one this morning language transcendence, huxley jung and others often mention liberating and enlightening epiphanies as beyond language and iconic imagery, you yourself mention this, can you explain further the use of transcendental language? yeah and we might talk about that a little this afternoon i sort of alluded to it this morning my idea is that language is a process that is half completed in us as we sit here and that languages really something which wants to be seen not heard but that we are on our way to evolving toward this visible language and we currently are operating with these somewhat substandard acoustical codes where i make small mouth noises they go through the air, they strike your ear, you look in a culturally validated dictionary, if your dictionary is like my dictionary and you understand what's in your dictionary then we say we are communicating but in a visual language in a visibly beheld language there is no culturally validate dictionary there is simply hard wired kind of animal language that we all understand instantly from birth without any cultural acclamation to it, because it is the natural language of human beings of getting out, revealing, defining, refining, uh this natural language the place where the psychedelics impact upon us as social creatures is the language domain i mean you may have tremendous horrofinies and break throughs but if you can't talk about it or paint about it or dance about it or in any way communicate it to anybody then it is not efficacious for the species it's just your private entertainment so the domain of language is where the collective impact is coming and one of the things i think about psychedelics is that they are probably capable of helping us force the evolution of language because we cannot move into the future any faster than our uh language of description for the future so if we're interested in stream lining culture and getting away from this sort of random lock style of

culture evolution then we have to look at rationally uhhh interfacing with the evolution of language and maybe we can talk about that when we come back

thanks very much um (applause) i appreciate you sitting for this (continued applause)

1:52:13

brian when you get a minute - yo um this morning was sort of an intro uhhh in case people needed to be brought up to speed we discussed basically the distribution of these psychoactive plants with a history of shamanic use and then discussed a little bit about the history of them and i didn't really finish with that uh because i want to stress uh

that this - i think what we talked about this morning is we got them all to a good place

we got them all to paradise in africa

with clear vision much food and plenty of horsing around

and then we broke for lunch

uh

the forces that created that partnership society in pre-history

the forces that allowed the emrrrence of a none male dominant social style

were the same forces which then eventually destroyed it as well

because it was nothing more than climateolgical change

is what was happening

uh

as the african continent became drier

uh

the grass lands retreated the water holes became less frequent and further apart

and the mushroom came under pressure because of increased dryness

and at that point i think probably uh the mushroom festivals became less and less frequent

the whole thing became more tenuous

and there was great pressure then to try and figure out how to preserve the mushrooms through the dry times of the year, to have them available for ceremonies

and i think that uh it's the uh the use of honey as a preservative that uh really set the stage for things to go wrong

because honey um turns into a psychedelic compound on it's own if you do nothing to it but leave it alone it ferments it becomes mead and mead is a premitive kind of alcoholic beverage

so over several mellenia what began as an ecstatic mushroom cult turned into a beer cult, a cult of alcoholic intoxication, and then you get the same shift of ratios that you see in our own society

i mean how many women in our own society have there first sexual experiences in an atmosphere of alcohol abuse and misuse the two almost go together and less in the twentieth century

before the twentieth century it's almost possible to imagine nobody got laid for a thousand years in the west without being juiced up

because it was pretty unappetizing i can imagine

so this is a way in which sensory modalities and emphasis on different aspects of psyched change over time, uh without a culture even being aware of it

and then i talked this morning a little bit about the - the fall into history

the neurotic, dysfunctionalism that characterizes historical existence

and i think it's worth going back to that because some people have the idea that psychedelics are a kind of instant psychotherapy

and that they address the concerns of the individual

but they're not concerned to link it up to history to see what it was for us in the past and what it's absence

has done for us
i think that the whole phenomenon that we call the fall into history is the uh uh scenario of abandonment that we underwent as we broke the umbilical connection to the guy in matrix of organic life that's what we were um imbedded in in this african context but when africa dried up and we move out of africa and into the middle east we then were transformed from nomadic pastoralists into primitive agriculturists and then later city builders and the entire pattern of male dominance and anxiety is set in place if you look at the world of seven thousand BC the most uh - the most sophisticated human structure on the earth of let's say 7500 BC is at jeriko in what is now palestine and it what is it? it's a grain storage tower, built at jeriko 72-75 BC uh it indicates that the primitive pastoral nomadic form has given way now to an agricultural form that uh allows for the accumulation of surplus and hence the need to defend sane and hence the establishment of have and have not psychology and so forth and so on so all of the institution that we now must attempt to reform and grapple with began then! urbanization kingship, male dominance, representative politics all of these things uh begin then and uh are further exacerbated a couple or 3 thousand years later by the western decision to go with the genetic alphabet see a genetic alphabet further removes you away from anything uh concrete or real or related to nature there's no ideogram there's no gliff there isn't even rebus there's simply an abstract symbol which stands for a sound i mean this is about as far away from the hands on approach of language that you could get well the culture that made these decisions which is our culture the culture of europe and the ancient middle east has evolved into the dominant culture on the planet and has put in place, institutions like science and so forth and so on our metaphors have grown every more cogent in there ability to manipulate matter and energy as they have evolved less and less relevance to our selves, so now we have ideological systems of tremendous power that none of us can understand or relate to this is kind of an odd relationship to knowledge since knowledge is supposed to be an experience of empowerment not an experiment of disempowerment but our society has done it differently so we all wander around with a sense of disempowerment because we're surrounded by accomplishments which we couldn't possibly duplicate well i mention all of this because i think it shows where the solution lies if we were in balance 1500 years ago and it was achieved through the use of psychedelics de emphasis of the ego non existence of the nuclear family and the suppression of the concept of ownership we should look at these as possible styles of existence that might be put in place in uh in the future that's the psychedelic society that you've heard me talk about at various times well that's probably enough on that - 2:01:30

oh you thought so too (laughter)

when said we'd look at the geographical distribution, the history, and then the phenomenology i thought that we would put most of the phenomenology of the thing in here in this section because it is important to establish just what we're talking about

and also to empower people to describe their own experiences

which are often so peculiar that unless there is a group such as this a person tends to just define themselves as starkers

i mean what else can you say about some of this

if your starkers and you get ten people to agree with you you're not starkers anymore you're a movement ahem

so i mentioned this morning about DMT and i made a bit the kind of paradigmatic compound

because it's so brief so natural so powerful so quick to recover from

and it's also a very good paradigmatic case when talking about what the psychedelic experience is like to have

because i think if you have the DMT experience on the way to the center of that flash you'll probably have all the other ones

it seems to lie at the center of the mandala

the most startling thing about the dmt flash and i mentioned this this morning when we were talking about jung is how astonishing it is that death by astonishment seems the major danger

and this is even if you're an art historian a jungian an athesian nodo of symbols of so forth and so on

it seems to come from some dimension orthogonal to the human world

and it is not a unitary experience, the way the famous white light and all these others wordless

indescribable elusive mercurial things are

it isn't like that at all

it's uh it's extremely multiplisic and it's extremely specific in it's presentation

i mean when you smoke dmt you have the feeling that you have burst into a place that you have not had a psychological experience

you are not having a mental experience

you have burst into some kind of a space and within that space ummm there the first shock is that it's inhabited and this is the shock i've never recovered from

because it was just the last thing i expected to find inside a chemical compound was the equivalent of a bugs bunny cartoon

uh

it is inhabited by um entities is the only word to describe them

and they are as i've said many times, they are like jeweled self dribbling basketball

and their many of them

and they come out of the background and they present themselves to you

they're literally vibrating up and down, they're fasented and rotating and they see you as clearly as you see them

they even uh greet you

some of you may recall the pink floyd the old pink floyd song the gnomes have learned a new way to say hoorayyy

i think it's on pipette the gates of dawn

it's the first album those floyd fans were looking puzzled

it's because it was 40-years ago (laughter)

anyway as you burst into this space the gnomes say hooray

and they present themselves and they are truly the gnomes of uh central european fairytales archetypal gnomes
they are uh they sing and out of their singing elfin chatter condense objects which look like nothing at all in this world
i mean the closest i've been able to come to them are the furbish the edges of furbished eggs
you know they constricts in sapphire and ivory and crystal and vitreous glass that uh the french designer fabruche created
well these things are like that but they're like that raised to some excruciating pinnacle of completion
because as they show you these objects you know beyond any possibility of contravention that a single one of these objects were to exist in this world it would change this world forever
if a single one of these objects existed in this world we would spend a thousand years studying this object
the last time this happened was a guy gave a speech on a hill about moral obligation
we've studied it for a thousand years
um this is the same kind of thing and these fabruche hyper-dimensional objects are themselves undergoing a dynamic transformation
they're not static objects like the fabruche eggs
they are undergoing changes, singing, condensing other objects, these objects are crawling all over the ground in front of you, clamoring for your attention
now remember 12 seconds before you were sitting in a suburban living room somewhere grappling with some drug somebody wanted you to take
now all of that's gone and here are these things
i call them types because i wanted to capture the sense of their childlike-ness
i don't know why i call them types it just seemed like the appropriate thing
if some of you are classist or students of literature of pre-socratic philosophers
you might recall the 50 second fragmented paraclytus which says uh "the aeon is the child at play with colored balls"
"the aeon is a child playing with colored balls"
and when you break your way into the presence of the aeon it's extremely uh idk it's upsetting you can't believe it's happening, there's a lot of cognitive dissonance
you could believe this if it just weren't happening to you
and there is this tremendous affection and interesting humanity
and then there is urgency a lot of urgency
the types want to initiate you, they have a message and the message is you can do what we are doing
and what they're doing is using their voices to make this ecologies condense out of the air
they're saying, you can do this, do it, do it, DO IT
and their on you and they jump in and out of your chest which is something described in the amazon too the hucalay in the tryptamine snuff cults of the amamano
that they jump in and out of your chest and they're saying do this thing, do it, do it, suspend your belief
and eventually you do do it
you discover that you can drop the filter of meaning that your voice can move back several registers
and out comes elf chatter and this elf chatter is able to ring the air in front of you like a wash cloth and get out chemical gold to drip out of the air and to begin to condense in front of you
well by this time most people would like to call time out (laughter)
so they can make phone calls to various philosophers
but there's no time out, it just keeps going uhhh, and these things have a very, the aura of strangeness of aliens is palpable

theres an emotion in there that we just don't have in this world
because it composed of unbelievable alieness in the presence of unbelievable familiarity
it's an ecstasy that is a coincident appositorum
simultaneously it is both what it is and what it is not
and the human mind can't handle that, that's called cognitive dissonance, and you just go into a a conixifit
of some sort
well
the very fist time i smoked DMT in 1967 with absolutely no expectation
this happened to me and it has happened every time since
and then i've had occasion to observe people taking DMT uh in countries where it's legal
and what i see is there is an archetype which surrounds DMT which you must make your way through it
but at the center of the archetype the archetype is not present in only the alien it's present
the archetype is that of the circus or the carnival
the carnival
think for a moment about the carnival
it has two aspects, one is blazing light and activity at the center of the triple ring the lady in the spangle
costume is high above the main floor and the lions and the tigers and the clowns are parading around -
that's part of it
but it has another aspect. just off to the side of the big tent, there are the side shows. The hooch coach
dancers. The two headed man, and so forth and so on
in other words theres this kinky peculiar shadow side of it
and i often uh if any of you are fans of the film of federico feline
here's a man who understood the archetype of the circus and how if you remember in amachor that circus
or if you remember juliette dislike the flaming doorway into the room with the bed of the bed springs and
the crate paper flame
these are carnival, carnival images that relate back to uh DMT
when you finally come into the center of it these are all seen to be veils
it veils itself that way because that's how you uh it's the old candy to the baby routine
it treats us as people who would go to the circus and then it takes us to the circus but then there is a
revelation beyond that and i, i don't know how many people present in this room have confronted the thing
i'm talking about
i'm always at the moment aware that some people are saying, "my doesn't he perfectly get it" and other
people are saying "huh? what is this, what is this guy talking about?"
the point i want to make is it's real, it's not vague you don't have to strain for it. nobody wonders whether
or not it happened to them, it's just like somebody walking up to you taking you by the arm saying "there's
something i insist on showing you, come this way please."
and i am very -it is the presence of the entities that shattered the person who i was. because i was a
scientific rationalist a reductionist i had no no room for elves in my cosmology (laughter) and here they
were, hundreds of them. So it seems to me that this is a central question that shamanism has always dealt
with. perhaps not with eh kind of ontological specifications hat we imagine ourselves to have
but this is the question that must be asked
who's int here, who is this
there are at least 3 possibilities, and i'm not sure which is the most conservative
the first possibility is that um we don't understand how the world is constructed, and that in fact there is a
parallel universe running alongside of ours, uh full of elves who use a language to make an object. and then
why you can burst through to this place on this one drug then it raises each explanation, raises a lot of

questions

and then the other possibility is uh um this is the jungian possibility

and jung and i can't remember which one it was, but one of the alter things he talks about these elves.

because of the caber the caber are the alchemical children that appear in act three of foist

that jung spent a lot of time on these alchemical caber and the question of the humungulous

and uh he says in one place, i think he says, uh uh, he describes them as autonomous psychic elements that have escaped from the control of the ego

this is a weird way to go about it, i means it's probably an accurate description but how much does it tell us you know? it means that the psyched is to be visualized as a half gallon of mercury. and when we throw it on the floor the mercury balls up and spreads everywhere/ each ball of mercury by god it has a little face looking back at you. that's because mercury is a mirrored surface, you're looking at your own psyched shattered into pieces around you.

another possibility and one i leaned toward for ears, and i still lean toward. because i've noted the radical nature of your explanation diminishes with the distance since the last time ou smoke DMT. uh the longer it's been, the more likely you are to have some humdrum notion that you can poor it into. so the humdrum notion that i settled on was the clearly these are just extraterrestrials. they don't come in silver ships demanding to be taken to the national defense agency. this is how they come, why they come this way, who knows? they're coming through mind, mind is the medium in which they travel. where did they come from? who knows, can it even be located in the newtonian space-time matrix. i mean what do you want here, a star catalog number, would that satisfy you?

and then finally, i think i've exceeded my number of possible explanations (laughter)

and then finally the explanation which is my current favorite, it's a little disturbing and i haven't quite figured out what to do with it. but i'm on the sense that we're on the right track here.

the reason that the DMT space feels so peculiar, both alien and excruciatingly familiar is uh because these things in this other place represent what i call an ecology of souls.

this place is the one place you never thought you were going to make a visit to and come back to and chat it around the coffee maker. this, they're dead, that's who these things are. this is the realm of the dead. well i have to confess in all of my psychedelic voicing and idea mongering, i never was able to go that far to reach that far in my imagination.

it sort of had to be presented to me

but if you go to shamans, world wide, and talk to them about their spirit helpers, and say you know what's the deal with this, whoa are these things. - 2:19:35

they say, well these are the ancestors, didn't you know these are the ancestors.

it's perfectly cut and dried and normal

uhh

i i had an occasion i won't use his name to embarrass him but i had occasion to expose a very well known tibetan high mucky muck to DMT and he said after he took it like a man said after words. that is the lesser life. that is the lesser life. and if any of you are student's f mayahani buddhism you know that the lesser lives are the lives you see at the edge of the bardo as you start in to the 42 day process of dying, you encounter the lesser lives

this guy was saying to me. you can not go further in the body and have any expectation of retiring. in other words, once you have seen the lesser lives, you have stretched the umbilicus to matter to the breaking point, if you go one step further, it's eternity for you. well i don't know how i feel about this. the the head type i've had to then ask myself, the head tyk is that me? do you actually encounter your dead soul? is there a dimensions here you are both simultaneously both dead and alive, both simultaneously witness and observer. um i don't know. but i certainly think that if we're going to use a conservative explanation for

these things. the only the only theory more conservative than that they are dead people. is the theory that says that they are nothing whatsoever. and that just simply will not serve. i think it would come as a tremendous surprise to twentieth century civilization. if orthogonal to all our expectations of space flight and virtual reality, and all this techno shmechno stuff that we're lining up in front of us. that there would be a broadside from ninety degrees out from the unexpected, and that there would be a doorway swinging into the realm beyond organic existence.

i resisted this fiercely. but i just don't know what we're going to do with these DMT creatures, if we don't try to find a rational explanation. and the - any rational explanation will be exotic because the facts of the matter are exotic. those of you who have not had this experience or sitting there thinking it would never happen to me. you're full of it (laughter) it will happen to you. this isn't this doesn't require the willful suspension of disbelief, this doesn't require a pure heart or dietary prescription. no this is part of the human birth right. and the fact that we deny the existence of a non-human entity, intellectual intelligence on this planet is just part of our heritage from rationalism. and you know, you don't have to take it very seriously, because rationalism the philosophy that gives us permission to deny the invisible world, you know who founded the philosophy of rational materialism? any takers? aristotle was early, i think i give credit to renee decart for modern materialism and rationalism. well uh you know who told renee decart to found rationalism and materialism, an angel! (laughter)

are you ready for this, this is a suppressed history episode in the history of human thought. here are the facts folks. 1619 renee decart is 21-years old. he's a young frenchman in search of adventure, he joins a hoops army that is going off to prague to lay siege to prague, to put down an alchemical revolt there. they kick butt on these alchemists, win the war and then on their way back to france, and in september 1619, this french army camped ulm in southern germany. some of you may know ulm as einsteins home town. in fact that figures in our story obliquely as you will see

this french army camps at ulm and renee decart hits the hay and in the middle of the night an angel appears to this young man, in the radiance of his rooms and says "the mastery of nature is to be achieved through number and measure" modern science is founded folks

right there, right then. by an angel. so how you know, how far away are the informing voices. How rational is rationalism. how material is materialism? all of you must know i'm sure the famous story of kukulay the german chemist kukulay who discovered the benzene ring. he was struggling with the problem and physical chemistry could not figure it out. fell asleep in his study and the oraboric serpent appeared before him in his dreams. and took it's tale in it's mouth and he came out of sound sleep and said i've got it. he got to the blackboard and he drew the first benzene ring

angelic intervention. intervention from the unconscious. so my, i - the point of all of this is to suggest that human history is completely interpenetrated by the peculiar, the non-human, that which has intentionality and affection for mankind. for humanity. and this is what shamans call to their aid. this is how the curing is done, it's done through these spirit helpers. they're called, elemental. and um. so far as i know jungians is the only modern intellectual position where you can even raise this issue without having a matt dropped over you. i mean this is absolutely forbidden by the modern world view. uh and yet it lies very very close to the surface in our culture. i mean as an example of how close to the surface it lies in our culture, consider for a moment, um, santa claus. what's this about? santa clause is the master of the elves. the elves that he is master of are demon artificers. they make toys for the world children in their vast underground toy shops. and where are these underground toy shops? at the north pole. i don't have to tell a room full of jungians that the north pole is the axis mundi, idrisil, the magic world ash, the center of the mandala. what are the colors of santa clause? red and white, the colors of amanita muscaria absolutely. what is the particular animal of santa clause, reindeer. reindeer are very central to the amanita muscaria cult because reindeer uh eat the mushroom and then excrete their urine and this is thought to be a cleaner and easier way to take the

mushroom than to take it on the so-called first path. the second path is after the reindeer have had it. an anecdotal side, if you're ever in the yakut basin one of the great parallels of the intoxicated amanita user is to crawl out of the yurt in the middle of the night to take a leak in the snow and before you can back off the reindeer come and knock you headlong, because they want to get to this amanita flavored soul. so here is santa clause right in the center of our culture and when you take it apart, all of the motifs are there. the demonartificers the elves, the cosmic axis, uh, the magical flight. it's a beautiful example of the preservation of pagan psychedelic use into uh a modern context.

what can we say about this? oh well i know, one more thing i wanted to say about it. that this program that these tyk's are pushing is a language skills program. and we don't know how long people have been bursting into this place. this may be the source of language. you know - where di language come from? we learned it from elves in hyperspace is as good a possibility as any other. and this is still on-going. this language reformation program. they want us to activate our language forming ability and language is the DMT flash i said this morning. it's something beheld. syntax is something potentially to be looked at. not to be heard. and we don't understand this because for us language is something that you hear. we can't imagine a language that you see. but have you ever noticed the way in which we preserve clarity of intention in language with verbal metaphors? we say, i see what you mean, he painted a picture. it means we unconsciously believe that truth will be beheld and some of you who are students of the ancient literature may know philojudeaus, uh helenistic alexandrian jew, absolute contemplate christ, born before died after. in one of his treatises on the logos, which he was always talking about. phylogudeaus presents an edimology of the word israel, and he says, isreal means "he who sees god" this is this meaning of the word god. and then he goes on to say uh this 'he who sees god' he's talking about that and he says "what would be the more perfect logos?" now i assume most of you would know the logos was an informing voice, a voice in the head. which was the scenic qua non of alexandrian spirituality. uh socrates had it, plato had it. the logos. so philojudeaus asked "what would be the more perfect logos?" and then he answers his own question he says "the more perfect logos would go from being heard to being beheld without ever crossing over a noticeable moment of transition."

well that is precisely what you encounter in deep psychedelic experiences and the DMT flash. you behold the logos. In the initiation of experience. you don't behold it, you hear it. it sounds in michael harness wonderful phrase "like the sound of rushing water" or like the sound of tinkling bells. and it's very far away and then it begins to come closer, you can you can, you vein to forma picture of it in your minds in the way you would of a napoly marching band that you just heard it about a half-mile away and the pa pa pa is getting bigger, coming closer. this is the elf parade. and when it finally comes into view it actually goes without ever passing over a noticeable moment of transition from being heard to being seen. through the phenomenon of approach. you hear it before you see it then you see it far away then you see it very close. and when you see it very close it who cares what it sounds like because you're see ing it.

this more perfect logos is what the tyk's the spiritual helpers want to teach. and i think that it's import ant to spend a little time on this because i think this would have tremendous historical impact upon our situation if we could by hook or by crook create a uh a more visible logos, a language which could be seen. You probably all considered at some time or another, what would telepathy be like? and i think most people answer that question by thinking telepathy would be for me to hear what you think, but how would it be telepathy worth for me to see what you mean. that's telepathy. it put's you in the other guys shoes. if you stand in the other persons shoes you are the other person. to have a persons point of view is to be that person in regard to that single atom of experience.

so i've spent time with virtual reality people, and all these technical folks, because i think visual language is something that wants to be born. and it may be that it is - can be technologically coaxed into existence, that we're gonna have to wear goggles or have fast computers. or it may be that it can be physiologically coxed

into existence. there may be drugs which shift the processing of language from being an auditory phenomenon to being a visible phenomena. aywasca is an excellent candidate for this. uh if you spend time with the ayawasca taking populations in the amazon, theres great stress in these populations on acquiring what's called an ekaro

ekaro

means magical song. and the ekaro is a spontaneous chant like song which comes to you during the intoxication. the thing that's interesting about these ekaro's is that they are critiqued as visual objects, not as sound. people never say of an ekaro, it sounded beautify. they allays say it looked lovely. and then people will say, but there should have been more blue (laughter)

this kind of thing, it's clearly being criticized as a visual modality. well i think that these ryawasca using people are at the cutting edge of evolution.

2:37:40

they are forcing the evolution of the modality of language. it may be that the processing of language is not hard wired not physiologically wired. it's uh software function, having todo with culture, language, upbringing and so forth. because some people claim they are grade visualizers and they do think visually and so forth and we have no reason to deny this

so it may be that we are just a one gene, or even an expression of gene ratio's different away from an entirely different way from processing communication between each other. and this is what the new age, the end of history, the anticipation of this great breakthrough that we can feel but not really outline is about. if that seems far fetched to you, you should notice how far fetched the original emergence must have been. because i think people were fully people and totally mute and you know unable to articulate a thought. and then either an accumulation of neuro's or some synergistic effects was brought into play and low and behold spoken language emerged out of that.

well something similar could happen to us. in the morning session i talked about the uh forced evolution of language, paying attention to our language. i really think that the way to think of these psychedelics is as catalysts for the imagination. uh if any of you are chemists you know that a catalyst is something that when you add it to a chemical process, the process is tremendously speeded up, but in the end the catalyst is not destroyed. the catalyst is reconstituted at the end. so psychedelics, one way of thinking of them, is as a catalyst for cognition. the original description of psychedelic drugs was that they were consciousness expanding drugs. well if we take the idea that they are consciousness expanding seriously for even a moment then we have to put a lot of attention in on this because it's the absence of consciousness that is murdering us and our planet. we need all the consciousness that we can get, we need to reign it out of computers, get it out of plants, raise it in ourselves and children. wherever we can get it, uh we need it and the present, you know the present situation with the planet is very dire.

very dire because of us. our unchecked evolution in a single direction along the gradient of culture has now created a toxic planet that is an endangered planet. uh. since this situation has arisen entirely within the confines of history aren't we going to have to look outside of history in order to redress this problem, i think so. and when we do look outside history, then we find the institution of plant shamanism there, waiting to inform us, to educate us, and to show us how to set a course out of the present dilemma. i don't think we can find our way out by ourselves. i don't think we can get high by ourselves and i don't think as a species that we can save the planet by ourselves. we have to have a partner. we have to uh get an ally into this situation. uhhh just in closing and as an example, the mushroom as a tremendous problem solving ability. and because we can talk to it, we can ask it questions. we can actually get a non-human perspective on human problems.

a few weeks ago i made this statement before a group of people somewhere, and after the talk was over, somebody came up to me and said well why don't you ask the mushroom how to save the world?

and i just put it off, thought it was the wrong attitude, but then later i wondered about this questions, how to save the world. and i thought maybe i've been to circumspect with the mushroom maybe i should just put it to it. so i carried out the experiment. and put to them, how do we save the world. Now i don't offer the solution, i'm going to tell you the mushrooms answer. so you can see how our backs aren't quite to the walls yet. theres still avenues to be explore. i said to the mushroom "how can we save the world" there was a hesitation of 1/3 of a second approximately. and then the mushroom said, no woman should raise more than one natural child. and i said, "what?" said no woman should raise more than one natural child. so i took that home with me and i thought about it, uh here are the consequences following that piece of advice. uh the population of the earth would be cut in half in 60-years. fifty years fallowing that it would be cut in half again, 50 years after that in half again. in 1 hundred and 50 years the population of the earth could be under a billion people. nobody was shot, no wars were fought. no one was told they could not have a child. no one was coerced, no one was starved. um. then i started looking into this thing about children and population. and most of you, like me. probably imagined that the world has a population problem. and this population problem is going on in places like pakistan and bangladesh and god dangit those little brown people will just not stop having children

well i looked into it and i've got a surprise for you

a child born in america will use between 600- and 1 thousand times more natural resources and energy than a child born to a woman in bangladesh. Suppose you went to bangladesh and you met a woman, a young woman of child bearing age, and she told you that her ambition in life was to have a thousand children. you'd be appalled, i mean what kind of social responsibility is this, what kind of a person are you that you want to do this. an american woman having one child is having the equivalent of those thousand infants. now another interesting thing about this suggestion made by the mushroom. that each woman should rear one natural child. when we think of population control schemes, the first objection is "my god you can never sell this to people, they have these religions they have these centuries and so forth they just won't watch"

notice that what the mushroom suggested is most likely to be accepted by the person most important to convert. we don't want to convert the woman of the backstreet of bangladesh to this policy. we want to convert the woman of sherman oak, malibu, pandemoniac, gross point, boston, philadelphia. because these are the woman whose children are using the resources. so here's in one sentence. the mushroom was able to answer a question i put to it, with a suggestion i had never dreamed of, that seems at first glance a way to stand up pretty well. and i've spent a lifetime trying to figure out ways to solve this proble, see we're a little stupid, because we're all alike. Something years ago the mushroom said to me which deals with this was uh people are always - this question of enlightenment, and the mushroom said for one human being to expect to obtain enlightenment from another is like a grain of sand on the beach expecting to attain enlightenment from another grain of sand on the beach. don't you get it, you're all grains of sand. i mean joe shmo who runs a body shop and mookdaruby baba are the same people. theres no difference between these guys, no reason to assume so.

uh

so i think we need help and that little exercising what do you do about the population problem shows that there are suggestions out there that we haven't thought of, avenues that we haven't tried. when i thought about why we haven't we tried this avenue of one woman one natural child it took me about thirty seconds to understand that its real hard to make a buck in this situation when population is retracting at a rate of fifty-percent per generation.

and our whole world is based on making a buck. i told this idea to someone and they said, but if the woman of malibu stop having children they will lose all their political power. because political power is numerical. this is not true. political power is power. and if the woman of malibu stop having children they will be

quite a bit wealthier than they already are.

notice that this deciding to voluntarily have one natural child is also very helpful to you personally. that uh a woman will have to work less hard. will have to cut fewer deals with the in place structure of male dominance if she was only one child. a woman with two children has got to cut a deal with male dominance or she has a trust fund or something

uh

the reason we are i think instinct - we have a tendency to clench at a suggestion and not follow it through, uh is because we imagine there is something holy and sacred about the nuclear family and that we don't want to attack this biological unit that has such integrity. but this is a bunch of nonsense, the nuclear family has no biological integrity whatsoever, it's a creation of the post industrial reformation. the extended family is the natural human unit to ease the pressure child-rearing on young woman. and to give everybody the benefit of contact inter-generational contact and so forth. no this nuclear family that our politicians are always beating their breath about, is the absolute caldron of neurosis in this society as far as i can see. and when you look at the demographics about what is happening, the number of house holds that are one woman one child household i think you can see that maybe our unconscious has already been in communication with the mushroom and it's just the ego that's gonna get the news last.

well i don't want to spend too much time on that but it's an example of how these things offer solution to human problems. and if it can offer solutions to a human problem like over-population by six billion people on a planet, then it can surely take care of the needs and concerns of a group of rainforest hunter gatherer's that number 70 or so people. i doubt that they can conceive of a question that doesn't have an answer to, because it can operate on many levels, uh simultaneously. and this is an example of consciousness in action, you see - me plus nothing had nothing new to say about the population problem, me plus psilocybin had a whole new take, a suggestion. we can slaughter it down and ultimately decide it's a bunch of larch but at least there was a new thought a new try a new hope. this is the consequences of consciousness. and we're beset by problems like this, and we shouldn't assume that they are insoluble simple because we haven't solved them intact we must assume they are solvable otherwise we are not gonna have a place to hang our hat in fifty years. but the solution comes through a act of humility, an act of opening to the dynamic of nature, the feminine, the psychy, the ego is the calcarious knot, tumorous tissue that stands outside of all that. it cannot be trusted, it cannot be relied upon.

uh

and so by attempting to dissolve that, to mitigate it's hard edges, to smooth it out into the greater context of being, then we really discover uh what humanness is about

because humanness is not something that can be encompassed from the point of view from the ego that's why creating the ultimately egoist society

we created a society with so little humanity in it you know

and i see the psychedelics as a - an - make the world a better place than as we found it which is certainly not our record so far

but it's not too late, i mean HG wells called history a race between education and disaster

it's not mere coincidence nor even mere synchronicity that at this moment in time and space with these tremendous crisis bearing down upon us that we have reached out to the archaic peoples with a new attitude, not an attitude of how can we enslave them, but how can we learn from them. and my hope is that here in the final kicking of the clock of history, we are going to end our prodigal decent into the desert world of the ego, and return with what we have learned. the fruits of the prodigal journeying of the evan son which is what history has been. return with the fruits of that prodigal wandering to the larger human family that waits on us in the rain forests, in the deserts, in the marshes in the thorn forests of this planet. the archaic people are waiting for us to get on the train and then the train will be able to be part. but we

have to awaken to our past and then we can set a course toward a meaningful future.
that's the wrap (clapping, applause)

Well, this is the third, uh, opportunity that I've had to talk to the community at these Wednesday night lectures. Well, I figure we have about 25 years before this information will become completely assimilated into the encroaching consumer society, the leveling of values that seems now to be an inevitable part of the globalizing of society. On one level, it's very good. We recognize ourselves in our enemies and, uh, there's a commonality of values generated. But, on another level, it's tremendously destructive of novelty and uniqueness. I mean, we're turning the whole planet into a white bread, mall-shopping culture and the values of every other way of doing things is being subsumed to that.

I talked a lot in these Wednesday night lectures in the section about, uh, the importance of partnership societies in the human past and how the nostalgia for these kinds of social arrangements have driven us throughout our experience of history. Well, it is, uh, nevertheless, true today that in the Amazon and in perhaps in a few other "relic'd" environments, uh, partnership societies exist. Partnership societies thrive and regulate themselves through a relation - a symbiotic relationship - to plants that we call hallucinogenic plant shamanism, but which is actually almost a welding of the social organism into the natural surround in a way that feeds back into the psyches of these people and the structures of their society in a way that is very, uh, very much promotes the conservation of equilibrium - something we have sadly lost touch with. So, it's very important to preserve, uh, the, uh, options that have been discovered by people over the millennia.

The options that allow a recreation of the, uh, sensory and psychic ratios that characterize the partnership society in contrast to the kind of dominator society that we've lived under for such a long - so, it isn't a matter simply of preserving plants for medicines; it's really much more philosophically deep than that - it's the idea that a, uh, relationship to the vegetable matrix of the planet is what constitutes a, uh, Gaian resurgence. That it is plants that regulate the composition of the atmosphere, the temperatures of the oceans, so forth and so on, and that it is our lack of integration into that system that has precipitated the crisis of toxic 20th century, uh, potlatch civilization. By potlatch -- potlatch was a custom of the Northwest Coast Indians where they would, uh, uh, to show their wealth, destroy huge amounts of material, so that houses would be burned, feathered blankets burned, totem poles burned in the potlatch, in an orgy of destruction which proves your wealth -- and we have assimilated and perfected this custom so that it is second nature to us.

The whole planet is a vast potlatch. We are robbing our children and their children of any sort of recognizable future by, basically, grabbing it all for ourselves. No other society in history has been so callous to human values that it condemned generations unborn of its own, uh, children to live in a, uh, desert. The main thing, I think, that comes out of an effort to formulate a psychedelic point of view - and I take it, this is what we have been involved in - a psychedelic point of view means a point of view which honors consciousness.

Consciousness is seen as the value to be maximized. That's what we want. We want more consciousness, better integration, better information, better models. Uh, we don't want to petrify ourselves or commit ourselves to a model that somehow then is found to be obsolete and inadequate. So, what chiefly constitutes the psychedelic point of view, I think, is its open--ended and provisional nature as opposed to every other ideology or point of view that's running around. We have to -- what the psychedelic point of view is, it's a kind of cultural relativism. We're trying to get a grip on who and where we are in the cosmos from a point of view not that of the American consumerist citizen: something else - something larger, deeper, broader, more touched by the cosmic, more touched by a sense of the past and, uh, of destiny.

So, I have said this many times, but I want to say it now in a slightly different context and discuss it. The statement of the British, um, enzymologist, J. B. S. Haldane who discovered enzymes, so he became an enzymologist - a logical move.[audience chuckles] Haldane said, "The world is not only stranger that we suppose; it is stranger than we *can* suppose." And this is something that we have not entertained very seriously as a possibility, especially the cheerful characters in the white coats with the clipboards. The assumption has always been that Man's mind - notice the gender slant - Man's mind, is, uh, sufficient for the cognition of the cosmos. This is not all that surprising though it is patently idiotic. It is not all that surprising, uh, when you think about the fact that as recently as, let's say, 1830, people believed the earth was 4,000 years old. As recently as, uh, 1480, the New World was unsuspected to exist or it was suspected by a few wild-eyed mapmakers and mad sailors. But, conventional knowledge held that, you know, the Eurasian landmass in connection with Africa was all that existed.

So, when we look back into our recent past, we discover tremendous epistemic naïveté. That means people didn't know what was going on. [audience laughs] They weren't even close. [audience laughs] And yet we are asked to believe that somewhere after Darwin, and before now, it was all figured out. And now, we view the universe from a lofty pinnacle of integrated understanding. Now, the physics explains biology, biology explains culture, culture explains sociology, so forth and so on. Well, uh, you know, this is really whistling past the graveyard because meanwhile the visible consequences of this understanding are: spreading chaos, disillusion of values, an inability to control technology, an inability to set reasonable political goals, such as moderation of population growth and carry them out. Instead, somehow this, uh, deep insight into how everything works has left everything a mess. And, you know, what does that mean about us? Why is that and what can be done about it?

Well, I think the problem is that we have too long ignored the possibility that reality is stranger than we can suppose. I mean, let this reverberate in your mind. Not that -- that means no model will ever work. It means, it will always be provisional. That the understanding of what it is will always recede ahead of any epistemic program to describe, enclose, explain. This is all a -- a fallacy, if you believe that you are embarked on a finite project where eventually you will issue a white paper and that will explain how the boar ate the cabbage. It's not to be explained. And we have, uh, because of unique characteristics of the male ego, chosen to operate with the assumption that we can understand, that the human mind can in fact

'grok' larger and larger levels of embeddedness and make sense of them. What the psychedelic experience, No.1 and point of view, No.2, is saying is that we have the means present, at hand, to completely explode this nonsensical fiction of certitude. And yet, we choose not to confront it. This is why I first proposed calling this, "Facing the Answer" because the answer about how you understand the universe is the same answer that you get when you ask the question: "How am I to understand my own life?"

It can't be understood. It is a receding mystery. It is a continuing carrot. It cannot be brought under the aegis of rational apprehension. It says in Moby Dick, "reality outran apprehension." It always outruns apprehension because apprehension is the primitive functioning of the primate neural network. And reality? Who knows? Who would even care to take a guess, you know? It's a -- it's a mystery. You do not measure the depth of the universal mystery with the neural network of a primate. Our role is not to understand, but to appreciate, to appreciate. We have an immense capacity for resonance with beauty, aesthetic awareness, appreciation of form, appreciation of how things go together. Notice of this word - appreciation. Appreciation. If you don't know what's going on at a dinner party, in a corporation in an environment, then the best course is to keep your mouth shut and pay attention and try to appreciate the situation. It's ridiculous to attempt to seize the tiller of reality because we don't even know where we want to go.

So, the notion that by creating these models of reality which are not acknowledged as models but which are called scientific truths, we betray ourselves down the primrose path that leads to dreary, dusty death because what we do is take the poetry out of being. We extract the poetry from being by the assumption of the mundane. The "banality of modernity" is what I call this. The banality of modernity. The steady flattening of values so that nothing means much. You know, the sense of outrage over political mistreatment of the underprivileged. Or the sense of outrage of the society slips towards the abyss. Or the sense of outrage when people mistreat you is muted. Everything is flattened by the banality of modernity. This is the heritage of all the bad little boys of the 18th century: Nietzsche, Darwin, Hegel, and Schopenhauer - these clowns were on a bad trip and they were loud about it [audience laughs] and what they give us is a universe devoid of soul. Man looms larger and larger, notice the gender slant. Man looms larger and larger in the picture and what this ushers into is, uh, fascism, pure and simple.

And it's not surprising because this calling forth of the image of Man into larger and larger perspective has been the program of monotheism for 3,000 years. It has been a relentless accentuation of the centrality of the human image - the male dominant human image. And, in the -- in the, uh, transmutation of Hellenistic Judaism that becomes Christianity, the final apotheosis of this, uh, uh, point of view is created in the notion that man can be god. That's it and it is hailed as a tremendous infusion of existential validity into the human image. The greatest stride -- the greatest single stride ever taken in the definition of human ontology. Well, I would like to suggest to you it was the greatest backward step ever taken because what it did was it shoved Nature further and further into the background. "Nature is something from which we torment her secrets." This is Francis Bacon. "We torture nature to obtain her secrets." The world is created for Man; it is for Man to remake into his image -- all this gender stuff.

No wonder, that building on that foundation, 19th century rationalism which thought it was putting these things behind it. It conceived itself as anti--clerical, as anti--monotheism and Christian in some sense. Yet, what it really did was just strip away the Baroque trappings. Hans Jonas was very acute in pointing out that 3rd century Hellenistic Gnosticism and Heideggerian philosophy are essentially the same thing. It's just that in the - in the Gnostic recension, you know, you get all these sexy things: demons, angels, levels, and

the emanation from the Pleroma and the clash of the Archons, opera. Opera.

In the Heideggerian recension, they've just gotten down to the nitty--gritty, but the message is the same. Man is thrown into the unknown. Man is in the abyss, lost. All meaning must come from within. All order must come from an inner vision. "We are abandoned." This is Heideggerian language. We are abandoned." Well, this is permission then for pathology because it is a point of view purchased at the cost of ignoring the facts of the matter. And that is, in my definition, is a delusion. A point of view purchased at the expense of the facts of the matter. Whitehead said that there are certain stubborn facts. You can reduce and reduce all you want, but there are certain stubborn facts. Well, one of them is the primacy of Nature, a stubborn fact which was ignored by this tradition.

Once nature is taken as the ground of being then the permission to inflate the image of the ego is denied. And, I think, that this is happening globally, very slowly, under pressure, under duress, because our backs are to the wall. We are seeing a planetary crisis unfold before our eyes and, you know, blame has not yet come into the rhetoric.

But, eventually it's going to be understood who's to blame and it isn't the tribesman of New Guinea or the Indians of Siberia; it is western, male, scientific, technological hubris that has claimed center stage like a noisy drunk and then just preceded to hold us all prisoner while it acted out a, uh, a process that is rooted in its own traumatic birth, in the sundering of the symbiotic relationship to the vegetable matrix that characterized, uh, prehistory. Well, so what I'm offering, as a counterpoise to that, is this notion of provisional models. Nature is not mute. This is what Sartre said, "Nature is mute." He was another one of these people who pushed this existential line in one form or another. Nature is not mute. Nature is full of affection and intentionality toward humankind. But, intuition must be given prominence in the -- in the rearrangement of our relationship with the world.

And I talked the other night about induction and intuition and I want to say a little bit more about it tonight. Different things. Science runs on induction which is a very low grade form of logic. It means you do something over and over again and if it happens the same way 100 times, you have confidence that the 101st time, it will happen the same way. Intuition doesn't work like that. Intuition, as I said the other night, leaves no trail. And most of us are accustomed to thinking of intuition as something feminine, mysterious, unexplainable and, uh, sort of magical. And, also, I think, because we live in a male--dominant society, we undervalue it. If someone has it -- claims intuition, our position is probably one of, "Prove it." Doubt in the face of the assertion, you see. But, there's an interesting thing about intuition that I don't think many people understand or have bothered to look at which is, did you know? -- I bet you didn't know: mathematics is based on intuition.

Now, half of mathematics would rise with a screech of horror at this statement [audience laughs], but the other half of mathematics calls itself intuitional mathematics. Okay, well now what's going on here? Probably if you are not a professional philosopher of science, you are accustomed to associating mathematics with science rather closely. This is because science in order to give itself legitimacy has very slyly appropriated mathematics, especially in the 20th century, to its purposes. But, if we talk about what is called pure mathematics which is the great love of mathematicians — the other kind of mathematics is applied mathematics and that's for engineers and technologists and is not, you know, what moves them to the edge of their chair [audience laughs] — but, if we think about, uh, pure mathematics, it is an activity carried on in the mind based on, uh, deductive truth. Deductive, not inductive. In other words, a statement is made. It can be anything." All greys are non--X." This is just a statement. We don't yet know what this is

going to be about. "All greys are non--X." "All greens are F--Sub--1". What we're putting in place are a set of statements that appear nonsensical, but what we will assert is, that we should seek a relationship between them and then that will show us something. And this is how mathematics really works. It has very little to do with number. It has to do with the conceptualizing of relationships, conceptualizing them and then exploring your intuition about these conceptions and then the third and very late stage is you write a formal statement of your cognitive activity around these assumptions.

So, you see, mathematics is entirely intuitional. It leaves no track. It is drawn from this other domain. Well, um, why has it been appropriated by science? Well, for a very funny and not well understood reason. Mathematics has been appropriated by science because mathematics has an uncanny ability to describe nature. Completely uncanny. Now, you may have never asked yourself, why is mathematics such a powerful tool for the description of nature? Maybe you thought that somebody else can answer this and that it's not a problem. Well, I've got news for you. It is a problem. Nobody has any good ideas about why mathematics describes nature. But, notice that mathematics is an intuitional activity. An intuitional activity describes nature, without the intercession of inductive science. Inductive science is a kind of naïve holdover from Greek, um, Democritian theories where everything is conceived of as clearly conceivable and operating according to known laws. But, in fact, the deeper structure of nature is not modeled out of an examination of data obtained by measurement. That isn't how it works these days. The deeper description of nature is achieved by taking weird objects from the frontiers of mathematics. These things dreamed up in the confines and depths of the human mind and inside computers, and then laying them over nature. And seeing, my gosh! there's a one-to-one correspondence, between let us say – the multidimensional catastrophes described by Rene Tom, and the dripping of a faucet, the turbulence in a brook, the voting patterns in a ghetto. All of these things are seen to be easily modeled by extremely exotic mathematical objects discovered through intuition within the mind. Well, what does this mean?

Well, it means, if it means anything – before we draw the deeper conclusion – what is the conclusion on the surface? It must be that the unaided human mind is more capable of correctly modeling nature than the human mind that works through the methodological inductive approach called Science. And, in fact, this is clearly true because the world described by science, a scientific description of this room, would say very little about all the important things going on in it. A scientific description of this room would leave out personality, would leave out linguistic intent, would leave out the uniqueness of each of us. For science, we are merely members of the human species. Again, this flattening, this reductionism. This betrayal of the quintessence of the phenomenon in a desperate effort to achieve closure in the modeling process. And so, then you do achieve closure, but the model is always inadequate; it's always inadequate. So then there's this sense of frustration. We can't -- we can't get closure with the model unless we tell a lie, unless we deny the complexity, the interrelatedness, the soulness, the spiritness, the mindfulness, all of these things are, for science, what are called, uh, secondary properties. They are epi-phenomenal. They are only, uh, an aspect of your point of view like an iridescence on a butterfly's wing or something like that. In fact, that is the classic reductionist definition of consciousness. It is an iridescence that appears on the surface of neural processing that we mistake for true being. Haha, and yet, somehow we are embedded within this iridescence and it from within this iridescence that we launch the descriptive models that then deny our existential validity. Well, so this has been an animistic exercise, and there must be others.

So, then what is the path of intuition in relationship to nature that is different from the path of science. In a way, it is only a shift of emphasis. William Blake said, "Attend the minute particulars." This is very good advice for science and it is very good advice for mathematics, and what I'm suggesting here tonight is that

we have misconstrued mathematics and have bought the notion that it a part of science when actually it stands ready to empower intuition and to sweep science, if not away, at least, into a more proper role more befitting it's extremely limited application to the higher orders of reality that we really care about. I mean, science is really -- it's the plumbing level of reality. It doesn't catch the integrated, you know, the nature of language, the evolution of fairy tale, the dynamics of love affairs, uh, the quintessence of genius. These are the things that, as human beings structure and constellate, and guide and inform our world, and science has nothing to say about these things. Mathematics on the other hand is like the bedrock celebration of these things. It empowers intuition; it discovers intuition to be the most powerful epistemic tool that we have - more powerful than induction, more powerful than deduction. Intuition is the unifying of experience into a Gestalt image of the world: a coming together within the organism of a correct imaging of the world. Now, what do I mean by a correct imaging? All I mean is a provisional image that carries you to the next moment. This is all we can hope for at this stage.

We are much more suited for dancing than for whatever it is that we have been doing. You know, whatever it was, it wasn't dancing. We are a part of nature; we are a part of light; we are a part of the energy field of the planet. We are not its keeper in the sense that, it is not given unto us to understand it. That was all a horrible misunderstanding. The idea that we should understand reality and then somehow make something of it. Alfred North Whitehead said, uh, that, "Understanding is the apperception of pattern as such." "As such," that's all -- so here we have a room full of people. Well -- it's a pattern, its many patterns. It's the pattern of how men and women are mixed together statistically as we scan from left to right. If I see a pattern there, I know something about the crowd. I understand something about the crowd. The pattern tells me something and I call that understanding. But we could analyze the crowd from the point of view of the distribution of young people and old people or people in, uh, colors in the red/blue spectrum as according to the yellow/white spectrum. Each one of these things is a way of analyzing the pattern in the room and each one of these patterns tells the perceiver more about what is going on in the room. Because the room is not a distribution of young people and old people, a distribution of men and women, or a distribution of garment colors. The room is a mystery, a recessional mystery, that presents itself as a series of interlocking patterns of infinite depth. And so in building collective epistemologies, this is what we must ask of these epistemologies, that they give us the experience of understanding. And the experience of understanding is largely intuitional.

How much of an experience of understanding, do you have when you examine what you examine what modern physics is saying about the origin of the universe? I submit not much because it is so clearly the product of abstraction. The product of the phonetic alphabet, the male ego, they set all the interesting stuff back in the first three minutes -- who can go and look? It's all stacked against empowering the perceiver.

It's all staked against empowering the perceiver. You can't even check the statements these people are making unless you happen to have a \$125 million colliding bevatron or something, and the understanding to use it, and interpret the results. So, what we have is priesthood, off on the edge of things, propounding great profundities that nowhere touch the heart. Nowhere empower the individual, nowhere strengthen the diade or reinforce the family or give support to the downtrodden. It doesn't seem to be about that. In other words, the explanation of the world is not a human explanation. A human explanation must come from intuition. It must come from poetry, it must come ultimately from experience and, by experience, I don't mean, uh, the experimental method of science which is that things are pulled apart, taken down to their lowest common denominator and then described. I mean, if you do -- that's like believing you understand Los Angeles, if you have the telephone directory, you know. [audience laughs] I mean, this is the level of

genetics today. They say they understand life and they have the telephone directory and they're talking about Los Angeles because they can look up where the genes are, the coding for the proteins. Does this tell us anything about a broken heart? Or a messiah. Or a Hitler? I don't think so.

So, what we are trying to do is return the focus of attention to individual experience. We have been slaved too long to ideology transmitted hierarchically and based on a tremendously alienating instrumentality. That's what science depends on now: a tremendously alienating instrumentality. What we need to do is empower experience. Well, this is where the psychedelics come in because citizens don't take psychedelics because it's illegal. Neither do marionettes, neither do robots. None of these well-behaved and mechanistic reductionist images of humanity take psychedelics because it's misbehaving. Misbehaving is a great sin. In fact, it's enshrined as the first sin. You'll regard that the psychedelic issue was there in Eden and somebody misbehaved and then they got tossed out forever, and their children's children into the chaos of history. It's interesting to read in Genesis why this was; it was because, "They will become as we are," says Yahweh, "They will become as we are if they eat of the fruit of the tree of knowledge." I suggest to you that this is precisely what we should seek to do and that this 'we' is the voice of hierarchy, the voice of paternalism, the voice of the male ego finally right up into the storm god, the volcano god who lies back there in the origins of monotheism.

We empower our experience by insisting on our authenticity. It is a wonderful thing to learn to be able to stand up and yell, "Bullshit." I did it first when I was about 18 years old and it was the meme of the hour and it held -- it blew their minds; it did blow their minds. It was uncivil [audience laughed]. It lacked polity. It was rude and crude and correct because so much is being slung and nobody is talking about the primacy of experience and the dignity of the individual. The dignity of the individual. We went a long way with this in America before we betrayed it. And it wasn't only betrayed by the clowns in Washington. It's also betrayed by anybody who clusters themselves around the feet of some self-proclaimed nabob. Because the fact [audience laughs] of the matter is, nobody knows what's going on. Nobody knows. Nobody has the faintest idea. The best guesses are lies, you may be sure of it. So to pretend that one human being will lead another out of the dark night of ignorance and into the shining light of truth is ludicrous. Absolutely grotesque.

A product of this empowering of the human image that has gone on through several thousand years of dominator culture. If you want a teacher, try a waterfall or a mushroom or a mountain wilderness or a storm-pounded seashore. This is where the action is. It's not back in the hive; it's not in the anthill; it's not knocking your head against the floor in front of somebody who claims that because of their lineage and whose feet they washed and whose feet they washed, that you should give credence to them. Knowledge is provisional and, uh, we are yet to approach the first moment of civilized understanding. The way it is to be done is by trusting yourself, trusting your intuition. Reject authority. Authority is a lie and an abomination. Authority will lead you into ruin. It's not real and it isn't -- don't get the idea that it's this liberal rap about how everybody has a piece of the action. You know, the Jews know something, the Buddhists know something, the Huichol know something. Nonsense! Rubbish! Nobody knows anything. These are different kinds of shell games that have been worked out by priestly castes of people to keep things under control. Institutions seek to maximize control. Control. Control. Did you think that they were in the business of enlightening you? Saving your soul? Forget it. Control is what this is all about. And to the degree that we commit ourselves to ideology, we are poisoned. Any ideology -- Marxism, Catholicism, Objectivism, you name it. Rubbish -- all rubbish. What is real is experience. What is real is this moment and so then what it becomes about -- what are the frontiers of experience? How much of that has been taken away from us by

these dominators? By these priesthoods, by these cults, by these philosophical shell games. Well – a lot. That's the whole story of history. Our growing unease, our growing dis-ease. Our malaise is all about the fact that we are kept from the wellspring of experience.

We are sexually repressed, you may not feel it – but look back 100 years to a time when pianos wore pants. You know, maybe we've made a little progress on the sexual thing, maybe not. Maybe more or less than we think. But we are repressed in all of these areas. Uh, and we are particularly repressed in the area that relates to the psychedelic experience because it is -- it is Raid to the dominator insect invasion. They can't take it. They can't stand it. Because it empowers the individual. It dissolves the cheerful model of science. It's just exposed as a nice story. It enriches the accessible universe 10 fold, 100 fold, 1000 fold. It makes the individual complete within his or herself, and this completion of the individual is extremely destructive to the plan of the dominators which is that you will be a cog in the machine; you will participate in the life of an organization. Not your life – the life of an organization. You will go to some bullshit job, you will pour the best years of your life and your genius and your hopes into this. You will serve an institution. You will serve, serve, serve, serve.

Well, it's a bad idea for free people to go a long with this. A much better idea would be to insist on the dignity of human beings. To recognize that the freeing of slaves, the giving of the vote to women, the ending of public whippings, that this program of political enlightenment must also then include hands off on how people want to relate to changing their minds. We are not interested in being sexually regulated by the state and we are not interested in being intellectually, spiritually, emotionally manipulated by the state. The state should stand down in this issue. The state is acting as the enforcing arm of the dominator culture. Specifically, of fundamentalist screwballs who, you know, are horrified by all this, by the notion that people would claim the authenticity of their own minds, that people would stand in the light of nature and reject original sin and the guilt from Eden and, you know, the sins of the fathers, and all this rubbish which is handed down.

What the archaic revival is going to have to mean if it has teeth, is a re--empowering of the individual, and a consequent lowering of the profile of institutions, especially government. We need to think about these things because we have bought into the idea that we have to serve and behave and be enslaved, else chaos will engulf the world. We need to carry out our analysis of the situation to the point where we can embrace chaos. And see that chaos is the environment in which we all thrive. That's how I've done it for years. You think I could have lived -- you think I could have gotten away with this in the Soviet Union. I don't think so. I require a society on the brink of social breakdown to be able to do my work. And I think a society on the brink of social breakdown is the healthiest situation for individuals. I don't know how many of you have ever had the privilege of being in a society in a pre--revolutionary situation, but the cafés stay open all night and there's music in the streets and you can breath it, you can feel it, and you know what is happening. The dominator is being pushed. It never succeeds. It's never able to claim itself, but on the other hand, history is young. We may have a crack at this. A global society is coming into being. A global society made out of information that was not intended to be ours, but which is ours, through the mistaken invention and distribution of small computers, the printing press, all of this stuff.

Information is power and information has been spilled by the clumsy handling of the cybernetic revolution by the dominator culture in so that it is everywhere. Never has the situation been more fluid. Never have, uh, the opportunities for infiltration, insurrection and hell-raising been more present at hand, but we have to seize the opportunity. We have to seize the opportunity because the world doesn't have that much more

to run unless somebody begins to shake the apple cart. If we don't begin to shake the apple cart then the apple cart is just going to sail over the cliff and be lost.

So, the psychedelics are very hot in this because they dissolve boundaries. They dissolve assumptions. And our task, "our" being the -- everyone who seeks self-empowerment through experience, our task is to dissolve the assumptions of the dominator culture and make it impossible for it to work. This, I think, is already happening. We have nature on our side, you see. Nature is beginning to kick up, and, you know, it may alarm you that they're cutting down the Amazon rainforest, but imagine if you were the clown who owns it, how alarmed he is. He sees it as an investment. He thinks he owns it and when he sees that it's being destroyed, he's extremely alarmed. The fact that nature is itself being seen as a limited resource is a tremendous tilt to our side because the provisional model psychedelic open--ended-partnership way of doing things is uh, the only style that can perhaps seize the controls of this sinking submarine and get it back to the surface, so that we can figure out what should be done.

If we continue, as we have, then, you know, we're doomed. And the judgment of some higher power on that will be, "They didn't even struggle. They went to the boxcars with their suitcases and they didn't even struggle."

This is too nightmarish to contemplate. We're talking about the fate of a whole planet. Why are people so polite? Why are they so patient? Why are they so forgiving of gangsterism and betrayal? It's very difficult to understand. I believe it's because the dominator culture is increasingly more and more sophisticated in its perfection of subliminal mechanisms of control. And I don't mean anything grandiose and paranoid; I just mean that through press releases and sound bites and the enforced idiocy of television, the drama of a dying world has been turned into a soap opera for most people. And they don't understand that it's their story and they will eat it in the final act if somewhere between here and the final act they don't stand up on their hind legs and howl.

So, this whole, uh, effort to bring the psychedelic experience back into prominence is an effort to empower individuals. And to get them to see that we are bled of our authenticity by vampirish institutions that will never of their own accord leave us alone. There must be a moment when the machinery and the working of the machinery becomes so odious that people are willing to strive forward and throw sand on the track and, uh, force a re-evaluation of the situation. And it's not done through organizing; its not done through vanguard parties or cadres of intellectual elites; it's done through just walking away from all of that. Claiming your identity, claiming your vision, your being, your intuition and then acting from that without regret. Cleanly, without regret.

Okay, well, I want to thank you all again not only for this evening, but the month. And, uh, Esalen is a wonderful second home to me and my wife and my children.

I'm very concerned about free speech, freedom of thought, these things are, uh, endangered memes. Esalen has always tolerated and even encouraged me and I think this is extremely laudable and brave. They don't have to do that. Somebody else could sit here and amuse you and it wouldn't cause any ripples. So, I'm very appreciative to Esalen for its commitment to free speech. I'm appreciative to you. This may have outraged some of you. You were noble about it. Civilized dialogue is our last best hope and we must preserve theatres and opportunities for dialogue. The best idea will win. The best idea will win.

Thank you very much.

[Applause]

We will, I think, continue this kind of neurotic behavior until it either is our undoing or until we awaken to archaic values. That's why the weekend is called what it is. The archaic revival is a very large cultural wave that, you know, can be pushed -- you can trace the beginnings of to the first swell back to the turn of the century with relatively and theosophy and surrealism and the work of Freud and Jung on the unconscious. But, it's a discovery, a moving toward a realization that the values that can serve us are archaic values. That we have to go completely outside of history and we have to make -- you know, we're going to find out the nature of human nature. We can't have it several ways. We can't live in obfuscation.

I mean, the real question is, is man good? You know, because we're going to find out, because as we move more and more into this cultural domain that I call the imagination, nothing lies between us and the expression of our dreams, you know. And so far, our dreams have been, I think, expressed fairly shoddily. I mean, you know, our cities are like sores. Our contribution to the ecosystem of the planet is, uh, plutonium, pesticides, chlorofluorocarbons so forth and so on. An apologist for the human race would say, "But we had so many strikes against us: the law of gravity, the cost of materials, the resistance of water, air, and so forth and so on. Well, fine, we're going to get rid of all that. We're going to enter into the imagination where, you know, the tensile strength of a structure is whatever you say it is.

This is where language comes in, I think. Language is the, uh, sort of the cad-cam, the computer-assisted drawing software for creating the reality of the imagination. I think, it's a very -- it's overwhelming, our situation, the potential and the depth of the strikes against us. I mean, it's really I, um -- what's going on, on this planet is absolutely unique so far as we know. It's never happened before on this planet: intelligence emerging out of biological organization. And actually having a shot at what? Who knows? I mean, being itself is some kind of opportunity. The reasonable expectation is that nothing exists. Why should anything exist?

I mean, it seems to me that the most conservative universe would be a dimensionless plenum; a homogenous, pointless, dimensionless. That makes sense. Why then is there instead, you know, multiplicity upon multiplicity? I mean, Teenage Mutant Ninja Turtles [audience laughs] -- stuff like that? How in the world do you get from utter emptiness to that kind of thing? The richness, the creative force behind it all is awesome. And I am not religious in any ordinary sense. In fact, I'm violently anti-religious in most senses and I certainly would lead the charge against priest craft in any form, but the picture of the

universe as a machine subject to a few laws discovered by a bunch of guys in powdered wigs – that's ridiculous. [audience laughs] I mean, you've got to be kidding!

Uh, science doesn't deal, as it's always at pains to point out, with what's called subjective experience. Well, that's really too bad because that's all any of us ever have [audience laughs] is subjective experience, you know. So, we have, we have -- in the interests of - I don't know what exactly – a curious drive or an obsession with the Greeks really, an obsession with the physical world that we have not been able to disentangle ourselves. So that, you know we can measure the temperature of distant stars, but we don't know what we think about the woman we're living with. Stuff like that. Just such a completely overgrown and over-developed dichotomous situation that, uh, it makes no sense.

So, uh, In terms of any kind of finding a conclusion or something like that - it's that, there is an experience. It's harmless, meaning it can't kill you. That's the guarantee there. There is this experience, it is in our cultural heritage. It synergizes the most profound and private dimensions of our being. It allows us to recast ourselves in new forms quickly. And, uh, If we don't turn back toward this style of relating to ourselves, to each other and to the world, but persist instead in the addiction to syntactical abstraction then, I think, we'll just run it off the edge. That, uh -- and it would be a tragedy because it *is* a horse race. Don't let anybody kid you. It's not that the good guys are miles and miles behind and so you might as well tear your ticket up and throw it in the air and go home. No, it's an absolute horse race, neck and neck, a photo finish – the race between education and disaster. I mean, we're going to either burst out into a millennium of freedom and caring and decency, or we're going to toxify the whole thing and just turn it into an ash heap.

And the responsibility falls largely on us and we don't know! I mean, the momentum, the lethal momentum of these institutions is terrifying. Our position is like that of people who are attempting to turn a battleship 180 degrees and we're doing it with an oar, you know. I mean, the momentum of it is incredible. But, it is not a closed system and I say this as a reasonable person. I mean, I want to keep stressing that, that I won't sit at the same table with the channellers and the people who have good news about Atlantis and all of this stuff. I mean, if this is your private thing, it's okay, but the rules of evidence preclude it being taken seriously until you get your act more together. [audience laughs] But, in the psychedelic experience, there is confounding paranormal material. It's the only place I've ever found it. I scoured India, these guys -- as far as I can tell, it's a skin game" uh, bu...

But, outlandish things are going on inside the psychedelic experience. It seems to imply the thing we had hardly dared hope, which is that the world is whatever you say it is if you know how to say it right. Then the whole task becomes, how do we take control of this language that allows us, uh, to say it right? We - I think I speak for most people here - serve the idea that matter is ultimately at the command of mind. But, we need to move that forward as a demonstrable principle because, uh, uh, without that, the fear of most people is that we're imprisoned by physics in a sinking submarine. And yet, when you go into these psychedelic spaces, what you discover is that all bets are off. That we can't even tell how weird it is. I mean, it may be possible to walk to Arcturus if you have the right set of coordinates.

And, uh, the whole concern is to get the word out, to spread this meme, to empower people, to confirm the existence of these realities for themselves and to begin to form a kind of community consensus about it. You know, it's only -- I guess in 1992, we will celebrate the 500th anniversary of the discovery of the New World. Five hundred years ago, people discovered the other half of this planet and we're living there now.

This is the New World. Five hundred years ago, this didn't exist. What existed was a vast cataract, uh, patrolled by sea monsters and the oceans of the world poured off this cataract into the infinite abyss. And that was the edge of the world. We, the psychedelic people, are like these early explorers coming back and saying, you know, "I sailed west for 16 days and I didn't go mad. Instead, this is what happened and I bring news of this, this and this." And what we're accumulating are like the diaries of explorers that there's a world there. It's a mental world, yes, but we are mental creatures. Take note of that.

Uh, if we could go there, we would go there. And the thing is, we don't know that we can't go there. We have never taken the imagination seriously. We have never taken the self-management of culture seriously. We've always sort of thought things should just go along, uh, like a random walk. But, now, because of the immense technical power that's come into our hands, we're -- the design process of the whole planet is now on our desk. And we're being asked to essentially step into stewardship of the entire planetary environment. We have to have then a vision. We have to have a dream. Not *a* vision or *a* dream; *the* vision, *the* dream. And it can't come from, uh, the personality of individual human beings; it has to come out of the bones of the planet.

Yeah, and this is, I think, this is what the psychedelic experience is broadcasting. It's broadcasting the hologramatic, fracto, all together, all at once image of totality that our religions have sensed and called "God," that the shamans have learned to use as a vast kind of computer for extracting information and for generating healing energy. But, it is -- that there is some kind of controlling, minded, integrated thing behind nature and we're not going to understand that this weekend, next week or ever. This is not a relationship of solving a problem; it's a relationship of being a -- an initiate of a mystery and then living your life, you know, in the light of that. And, uh -- and the task of understanding is endless because understanding is simply the integrated coordination of pattern, and nature is pattern upon pattern, upon pattern, upon pattern, upon level, upon level, upon level. It has no depth. Its measure cannot be taken. Everything is infinite and everything is animate. And everything is filled with a kind of deep concern for humanity. And, we are the lame, little brother because we seem to be cut off from all the rest of this. Well, that's kind of a Blakeian take on it.

[Question] The shamanistic cultures themselves have a notion of a fall and that this may just be the people that we happen to interview in our era we're roughly studying it. The old days of shamanism were the 'good days' and what we have now is deluded. Is that just a matter of cultural contact with other cultures in that the original shamanistic cultures were isolated, or is, indeed, there a different quality to the time of this 20,000 years ago that led to a general fall amongst our species and, you know, people in general?

It's a very complicated question. The answer gets pretty technical and talking about it gets pretty technical. Uh, the thing that's so interesting about psilocybin and DMT is that they're so closely related to ordinary brain chemistry. The brain chemistry of all higher animals runs largely on serotonin. Serotonin is 5-hydroxytryptamine. DMT is N,N-dimethyltryptamine. Psilocybin is 4-phosphoryloxy-N,N-dimethyltryptamine, but the phosphoryloxy group goes off as it crosses the blood-brain barrier, so it's 4-hydroxy-N,N-dimethyltryptamine. So, it's very interesting that, uh, these powerful, naturally occurring hallucinogens are in many cases only one molecule away from endogenous neurotransmitters. So, in answer to your question, it's possible to suggest that we're as close as one mutation away from significant shifts in the chemical, uh, mix of the human brain. And, for instance, in the pineal gland, um, there's an enzyme called adrenoglomerulotropin, which is chemically, uh, 6-methoxy-tetrahydroharmaline. It's very closely related to the harmine alkaloids in ayahuasca. Well, the persistent

myth about ayahuasca is that it creates states of group-mindedness and telepathy. The original alkaloid was actually named telepathine until it was discovered that it was structurally similar to harmine, which had been previously described by, uh, Hochstein & Paradies.

So, in other words, what's going on here, is the possibility that language, telepathy and all of these mental abilities that are unique among human beings have to do with a very, very small number of mutations in the amine brain amine production pathways. Uh, one of the things that I want to talk about here is the possibility of new forms of communication and that the psychedelics can stimulate new forms of communication among human beings, even in the way that they created language in the first place. In other words, I see language as a model A version of something, which could be made, uh, a lot more efficient, better and more effective. You had something or did you? You? Go ahead.

[Question] When humankind changes direction and goes towards the altered state and that projection - what do you think that we will do with science and all of the stuff that we created that is destroying us?

Well, science -- there are different ways to practice science. Uh, the Greek style was science was a spiritual undertaking. The purpose was to know. The idea being that somehow there was something good about knowing. I mean, I had a philosophy professor who said, "First of all, I'll teach you how to recognize the truth, then secondly, I'll try to teach you what's so great about it." And, uh, this is that kind of a situation. Science -- philosophers of science are perfectly aware of the limitations of science. It's the thousands and thousands of workbench scientists who think of themselves as servants of a world religion who create the problem. We need to know how matter works and we need to know the things which science tells us, but it is no basis for extrapolating into human values. And the -- the culprit there is the concept of social science. This is an obscene idea and we should disabuse ourselves of it immediately. Social science, psychology, intellectual history, um, you know, even linguistics I would say and philology. All of this stuff. These people should find honest work. [audience laughs] They're not scientists and they're mucking it up. It was a grand dream of science that it would extend its methods into social phenomena, having had such great success in the 19th century with Darwin and Wallace in biology, they thought -- well, then Herbert Spencer and all these people -- why not just extend it into society?

But, the problem is, uh, there are emergent properties in society that exceed the descriptive engines of science. There are emergent properties in biology. I mean, biology is not -- may also have to be left out of science. I mean, biology is classificatory and it works very well there, but in terms of mechanism and understanding, it's pretty murky. DNA was decoded in 1950. The molecular geneticist promised a golden age shortly to follow and it's 40 years later, and they still don't understand gene expression or what all this stuff is. It's been very disappointing, considering what was promised. I think science is an art. Everything is an art because we have no sure knowledge of anything. I mean, maybe mathematics is not an art because there, you know, you work from artificially constructed premises. I'm very much -- I'm very keen on science; I just don't like its philosophical pontification. Uh, as a method, it's, uh, it's been very effective, but it's bred great pride in it, and it's thought that it could turn itself to domains where it was completely inappropriate.

[Question] I have a question, maybe one or two. I haven't tried mushrooms yet, but a lot of the things you've been explaining and describing to me have become a reality over the last year. Just the usage of hashish, just the ingestion of it, I would have to say, very limited, I'm comparing my experience to these psilocybin descriptions that you give and they sound tremendous. I think the question I'm looking for is - before you, I

guess, got involved with psilocybin and DMT and things like that, we're you predisposed to saving the planet and being a humanistic type of person? And did the DMT and psilocybin take you to a more profound awareness of, you know, what you as a human wanted to do?

Well, I've thought about all of this because it's weird to have the life I have. [audience laughs] You know, it's so strange. I mean, until I went into therapy, I thought I had the most ordinary family in the world. And then once you're in therapy, you discover no, it's the most insane scene you've ever heard of, you just didn't notice. [audience laughs] I've always been interested in nature and I've always been interested in beauty. And, I think it was the pursuit of beauty that served me best because when I was a kid, first started out collecting rocks. Then I collected butterflies. Then in my emergent phallic phase, I was an amateur rocketeer. And the major thrill there was setting off these explosive fuels [audience laughs] and watching the possibility of shrapnel and all that. And then as I got into rockets, I got into science fiction. Science fiction, I really consider a proto-psychedelic drug because what science fiction does is it gives permission to imagine. It says, try it this way, this way, this way. And as a kid, you get the idea, you know, that anything is possible. That's what science fiction teaches you. And then I was really obsessive about science and I wanted to be an astronomical engineer and Wernher von Braun was my hero and all that. And then it sort of flipped at some point and I got in -- I decided that I had been terribly narrow. I was figuring all this out for myself and I was in some little town in Colorado, and I decided I had been terribly narrow and that it was all in the humanities and I began reading Henry James and all this type of stuff.

And I was into Aldous Huxley, as an example of an English novelist. I read *Antic Hay*, *Crome Yellow*, *After Many a Summer Dies the Swan* and then came upon *The Doors of Perception*. And, just, you know, I was, like, 14 years old and it was astonishing. And I said if a tenth of this is true then this is the most amazing thing there is. Well, if you've read *The Doors of Perception*, you know, it's actually a terribly conservative gloss. I mean, it's all about looking at pictures and seeing the escheat in the folds of your trousers and thinking about how that relates to Meister Eckhart and -- all this Huxleyan type stuff. That gave me the idea and then I stuck with it. I stuck with it somehow and found marijuana and that went on to LSD, and then my great, good fortune, I think, is that just after a few months of taking LSD, somebody brought me DMT. And, you know, DMT is a miracle. I mean, DMT is like something that fell out of a flying saucer. I mean, it is so strong and so psychedelic; I can't imagine being more smashed than that or *wanting* to be. I mean, it's more like a near death experience than any near death experience I ever heard anybody describe. They sound absolutely pedestrian compared to a DMT trip, [audience laughs] where, you know, you're sure you're dead. You say, "What the hell else could it be?" [audience laughs] You know.

And then I went to, I went to Asia. I was at Berkley when I had all these drug experiences and then I went to Asia and tried to find it with yogis and all that and ended up smoking a lot of hashish and becoming more cynical than ever about spirituality and just saying, you know, hashish and LSD. That was -- before I went to the Amazon, that was what I discovered that really convinced me you could get somewhere was, you know. You could take a bunch of LSD and then smoke great hash on top of that and really crazy things do go on. And then I went to the Amazon and, you know, incredible shamanism is happening there. I mean, they don't hold back. The method I used in India was, I would just say, you know, "What can you show me? You know, I've read all these books. I know how to manipulate all this multi-syllabic mumbo-jumbo. But, just one thing!" And they would mumble, "Very pushy." [audience laughs]

When you go to South America, they just say, "Okay. Let's go out in the forest. We'll get this stuff and cook it up and tonight, we'll show you our best trick." And it slams you to the wall. You plead for

mercy.[audience laughs] And, uh, it was a vindication. Because the thing I want to stress and I don't know if it's as important to you as it is to me, but you do not have to sell out to any form of airhead-ism. You can be as tight assed as you want. You can be as hard nosed as you want. You can be as demanding, analytical, rational as you want and the thing is bigger than you are. It'll just take you apart. It'll make you weep like a baby. So, there's nothing about faith, and sensitivity and reaching – no, no, no. When it comes, you know, it kicks in the front door and takes you prisoner. [audience laughs] It's uh...

So, uh, and that was what the flying saucer meant when it said, "Because you didn't believe in anything. This is the way to get somewhere. You'll never get anywhere if you believe in stuff because, you know, it'll take you six months to work through Baba G and then you have to go on to somebody else and life is just not long enough to give all these guys a crack at your enlightenment." So, you know, you sort of have to goose it along. And, uh, and the great vindication is, then that when you behave like that, when you take that stance, which you would expect would betray you into nihilism, depression and so forth. Instead, no, that works. That's the method then the gold. You know, reject everything but gold and you know what gold is? It looks like gold. It feels like gold. It's not something that you have to...you know. I mean, I'm amazed at what thin soup is dished out as spiritual food, uh, and it's because we are, as individuals, conflicted, you know. I feel this in myself. I mean, it's hard to take psychedelics. It's not hard to sweep up around the ashram, but it's hard to take psychedelics.

[Question] You know, I've read some stuff by Andrew Weil where he was talking about going in search of, you know, the ayahuasquero, the curandero and he talks a lot about these guys that are mixing up this sloppy brew and, and they're drunks and they're just, you know -- I don't even know if you could go down to the Amazon and find -- I don't know what you'd find. I haven't been there, but what his attempts were, is, there's a lot of just slops and drunks stuff happening. A lot of these guys are alcoholics, you know.

You're absolutely right.

[Question - cont'd] . And that's the main thing happening: was the alcohol and Christianity has just kind of pervaded so much of this stuff that I wonder what's left? And how you find it anymore?

Well, it really helps to do your homework. It really helps to go down there knowing as much as you possibly can about all this. Meaning...

[Question] Apparently, so much of what you get out of it has to do with how it's made. Who makes it? How it's mixed? And so on. And, if you don't make it yourself and you don't know what's happening, then what have you got?

Because ayahuasca is a combinatory drug. It isn't like peyote, or mushrooms, or morning glories where you get the thing and eat it and if you eat it in sufficient amounts, it works. This is something where two plants have been combined and the proportions must be correct and the method must be correct. So, there's a huge room for personalities to come into it for fast shuffles of all sorts and mind games of all sorts.

[Question] A lot of them are really egotistical, too.

It's true. Now, what you have to do if you're into ayahuasca, or what we did, is, first of all, we drank a huge amount of swill and we worked our way slowly through these people. And, if somebody appeared to be an

asshole, they were so classified and moved on. And eventually we got to good people. But, what we did then is we got samples of their stuff, brought it back, took it through Mass spectrometers and high pressure liquid chromatography, saw what the proportions were, collected the live plants, moved them to Hawaii, grew the plants, re-concocted the thing, re mass-spec'd what we did and made it as much like the 'good stuff' as possible. So, it was a project of 15 years and really maniacal dedication, but I have the faith. You know, I mean, that if given sufficient time to work on ayahuasca, you could produce a drug out of there so good that it would be ludicrous to suggest that it was illegal. I mean, I -- because, you see, this is brain soup. These are all neurotransmitters. There's not a non-endogenous neurotransmitter in the whole beverage. So, really, what you're -- what you're...

[Question] A non- what?

A non-endogenous neurotransmitter. Meaning, everything in this drug that you're about to drink is already in your head. There's nothing unusual where drugs like ketamine, mescaline, LSD, there's none of that in your body.

It's like a slow release DMT trip. It lasts four to six hours and it's intensely visual. And unlike psilocybin, it's not -- it doesn't have this outer space, science fiction, mega 'apocalyptic' kind of take on it which is what psilocybin does. I mean, psilocybin shows you the machines preparing to transport the faithful away from a burning Earth. That's not what ayahuasca is about. It's about nature, water, flow, life, energy. It's almost -- you know, when MDMA was so hot and people called it an empathy drug and said it makes you empathetic with the people you're with. Ayahuasca makes you empathetic with the people you're not with, and that's a much more profound experience because there's so much more of them, you know.

[Question] I don't understand what you mean by "empathetic with the people you're not with"? I don't quite get it.

You feel the poignancy of the human situation. You feel -- well, see, I'm usually in a hut somewhere surrounded by a bunch of Indians and suddenly, I understand what the songs are about. And they're always about the same thing. They're about the water, and the people, and the life, and the fish and lost love and -- but, you have this heart-opening thing. Say, you know, the folk - this is their mystery, this is their religion. I'm getting it now. I'm feeling this huge wave of, uh, of the wisdom of the folk. And, they say this to you in Peru, "This is our university. You went to Harvard. We went to Ayahuasca." Uh, yeah.

[Question] I'm wondering if you can comment on morning glory -- rather, Jimson weed, which I believe is the same thing as morning glory seeds.

No, it's different.

[Question] But I'm curious about Jimson Weed because it grows wild all over. It's on the highway and on the property. It's toxic, right?

It's quite toxic. Um, it's used shamanically in pre-contact California. The California Indians had what was called the Toloache religion and they used Jimson Weed seeds to initiate people at puberty, boys, mostly. It's, uh -- I'm kind of Pollyannaish about drugs. I mean, I don't -- I'm after a certain thing, which these tryptamine hallucinogens do and I tend to not pursue these other things too far.

I didn't like Datura. It's very hard to have the degree of clarity that I think you should have on a drug. The tryptamine hallucinogens don't interfere with your clarity at all. You know who you are. Where you are. What you're doing. I've seen people on Datura -- I had an experience with someone on Datura where in the course of the conversation, it came out that the guy thought we were in his apartment and I had actually encountered him in the marketplace. Well, that's a serious delusion, you know. That's a serious problem. When I took Datura, uh, all this was in Nepal years ago, uh, I did have peculiar experiences. I mean, it is magical. It is delusory. Reality begins to come apart. I -- these wraithlike, ghostlike creatures would come through my window and I was waiting to get high and then I would sort of -- my attention would drift and these things would come through my window and they would let loose these sheets of newsprint that would flutter down over my lap. I would fall forward reading [audience laughs] these things that were -- and as I read, amazement would grow in me and say, "This is it! This is the answer!" [audience laughs] Then I would pull out and say, "huh? Is it working? Is anything happening?" And that went on for several passes of that. And then I -- then it caused me to throw my leg up around my neck and I very carefully unfolded myself, and lay back down again and then it happened again.[audience laughs] And I thought to myself, I'm really glad I'm alone because I think this would freak anybody out.[audience laughs]

And, uh, so, I -- But, it was definitely strange. I mean, the guy down the hall from me, I had taken it and he had taken it. And, uh, he had the impression in the night that this woman that he was scheming on came to him and that they made love. And in the middle of the night, I got up to go to the john and I had to cross through his room. And, it was also my impression that she was in bed with him. Well, when we sorted it out the next morning, she'd been thirty miles away throughout the whole incident and had never been there.

So, it's interesting. There are a lot of altered states and maybe that's a good point to make. There are all kinds of strange states of mind and many plant induced. From sorting through them, I've just become sort of, uh, fixated on these tryptamine things because they seem to me somehow the most promising and the most real. Uh, the hallucinations of Jimson Weed are curiously related in my mind - it's some kind of association schema - they're like séances and table-tapping and Victorian women in shredded lace dresses. And that's, you know, about as far from a DMT hallucination as you can get. I mean, DMT hallucinations are three-, if not four-dimensional, brightly colored, high-tech, organo-insectoid, uh, so forth and so on. Yeah.

[Question] You talked that the momentum is so strong and having to change it. And, like, I think of all the people who are opposed to drugs and they think that every drug is the same. It just seems like an impossible task to be able to educate where these drugs will be available and then people would take them and see the world in a healthier way. What would you say about a question like that?

Well, it's this struggle about human nature and defining human nature, you know. Is it good to take certain drugs? Is it always bad to take drugs? What's are -- you know, can you always tell a drug from a food or from a spice? What do these words really mean? Uh, all we can do is what we are doing, which is replicate the meme. Hold these workshops, try to build a core of consensus about what we're talking about. And this is itself quite elusive, you see, because what we're talking about is a mental event. Less focused than let us say, orgasm, but even if you're talking about orgasm, here we use this word that it must mean something different to everybody. Well, it's even -- the problem is much worse with the psychedelic experience 'cause nobody wants to be left out, so anybody who's ever taken anything thinks they've had the psychedelic

experience and feels fully qualified to hold an opinion on it, when, in fact, it's pretty elusive – the real thing.

Uh, you have to take a heroic dose under the right conditions to really smash through. I mean, yes, there are all kinds of approaches to it: insight into childhood trauma, recovery of lost memories, opening to your emotional side, uh, insights into the dynamics of the life and the people around you – but that is not anywhere near the bull's eye. That's just dancing around the rim of it. So, you -- we have to, as a community, try and build consensus about what happens at the real center. What's happening at the center of the mandala? What kind of a modality can we describe and create a shared map of, that we can come back to the rest of the folks and talk about?

And then the other thing is -- um, well, I'm just banking on curiosity to do a lot of the footwork for the revolution. This is too good to miss. Uh, you know, it's like placing sex off-limits or something and then expecting people not to find out about it. Now that Marxism has collapsed, uh, if we don't substitute something for consumer values, then we're just going to rape the Earth in an effort to create crap for everybody. Well, the only counterpoise to consumer values to materialism is spiritualism and I don't mean some bloodless, carol-singing kind of mamby-pamby abstraction. I mean, there has to be as much inner richness as there previously was outer richness. And, this is why, to the alarm of some people, I've been fairly interested in virtual realities. Because, I think, you know, if everybody wants to live in Versailles, the only way you're going to be able to do that is if you make Versailles a disk for \$3.95 that they can plug in and then go live in it. So, uh, we can't preach to the have-nots the virtue of voluntary simplicity when we're riding around in BMWs and collecting Monets. That doesn't make a lot of sense.

So, building a core consensus, this is still in answer of your question, what can we do? And then replicating the meme. And, I introduce this concept in each of my workshops because I think it makes it easier for you to understand what's happening here. A meme is the smallest unit of an idea. It's like a gene is to proteins. Proteins are made by genes, and genes code for proteins, okay? Well, ideas are made out of memes. You link a few memes together and you have an idea. Memes, like genes, can be replicated. You replicate them by either telling the meme to many people or telling a lot of people all at once. And then these people you've told, they become potential replicators of the meme. And, there is a domain of culture that is like an environment of competing ideas and the memes go off and live in this ideological environment. And some flourish and some are consumed by others and some are incorporated into others.

And, the idea is to keep the psychedelic meme alive, and to make it grow, and to allow its claim to be heard. It's not in danger of dying. It's a very persistent meme. It's been around for about 20,000 years and it's been highly repressed in many cultures for the last couple of thousand years. Yet, we're trying to, uh, rebirth it. So, thinking about it that way, thinking of yourself as a replicator of this thing that wishes to move through society, gives a mechanical model for understanding what is really ideological war, you know. A war about the definition of human nature. That's what's at stake. What shall we become? Uh, what can we become? There's no question that we need a greater consciousness of who we are. And, if psychedelic drugs are to be taken seriously at all as consciousness-expanding agents, then they have to be given their due place in the great dialogue that's taking place about the future: creating it and then, uh, realizing it, the future of the species.

[Question] I wanted to say something further about the Book of Genesis and the notion of getting to the center. There are two cherubims guarding the gate with flaming swords and that they represent a pair of

opposites: Fear and Desire. And the part of the problem of getting a bite of that tree of immortal life is getting beyond the realm of opposites, beyond fear and desire. And the other related thing is: the question of why this world is not one of homogenous perfection instead of a world of multiplicity of forms and conflicts? And it's from a drop of ignorance that spills into undifferentiated perfection and from that one drop of ignorance precedes a multiplicity of the world we experience.

This is a Gnostic idea: the drop of ink in the pure glass of water. Yeah, well, Gnosticism was the idea -- I mean, in many forms, but, the basic idea was that light had been scattered through the universe and that the task of salvation was to gather this light together and to somehow transmit it back to it's source in some -- some higher dimension which is a pretty good metaphor. One of the issues that comes up in these workshops inevitably -- and I confess that I don't have a real answer for this is, you know -- are we a part of nature and the stewards of nature, or are we out of nature? Are we of another ontos and sculpted for a different destiny? Uh, it's very clear that the life of the planet and our, uh, success, as a conscious species, these two things have to either be split away from each other, or one is going to be the undoing of the other. And, uh, this is a real problem. This problem haunts Western thinking; it's nothing new. Is nature God or is nature the Devil? I mean, that's the harshest statement of this problem.

[Question] One of the ways of detecting breast cancer is with thermography. This is where they look for a hotspot on the breast and say that's a suspicious area. When I go up in an airplane at night and am looking down on Gaia and thinking this is an organism, a giant organism. And say, "Gee, there's a cancer down there. It's hot. You can see it. It's glowing." When you go down there and what you find is that the cells that have gone awry and the way in which we've gone awry is the nature of our consciousness and that it's focused in terms of time, and space and causality; and then, the thumb, the prehensile ability to do something about it because, I don't know for sure, but I imagine if the dolphins could have their consciousness with a sense of time, they might have some of the same time/space causality understanding of the physical world that we do, but they lack the ability to do anything about it.

To project force into the world.

[Question] So that given those two qualities: this quality of our minds to look upon the world in this way -- time space and causality, and the thumb, we have become a cancer on the organism of the Earth. It's kind of a negative thought.

It is negative and I'm not sure that I buy into it and I'm not sure that I don't buy into it either. This is the question: is the evolution of historical society and science and all the ugly adumbrations of that: sexism, fascism, racism - is that part of the process or is it a breaking away? Is there some good in it? Was history for something or would we have just been better off without it? And, I don't know. Uh, sometimes, I mean, I think of Western Civilization as the prodigal son. We went forth, we left our father's house, which was the archaic style of existence. We left our father's house and we wandered into matter and cut deals with demonic forces, and millennia have passed and now, the Earth is polluted and we are back at the longhouse, saying to these people, "Do you have any wisdom that can save us from our fate?"

Well, they do, to a degree. I mean, they have this deep insight into natural dynamics and curing, and maybe more. I mean, maybe there is magic in this world? Uh, but we know some things, too. We can summon the energy of the stars, if necessary, down to the deserts of this planet or to the cities of our enemies, if necessary. And, this is no small accomplishment on any scale. This is quite impressive. I mean, my God,

that cytoplasm could create a strategy for triggering fusion. It's amazing. Uh, so, I would like to think that this peregrination into matter went for something; that these are skills that we may need out in the universe when we really get our wings, uh, and take off. And that this deep involvement with matter, it was a kind of an addiction, and if we can pull out of it, a great deal has been learned. I mean, after all, if people had stayed in the rainforests, then we would have been ineluctably linked to the destiny of this planet as an animal species. And what if this is the only intelligence in the universe? Then, I would think we have a certain obligation to, uh, preserve it past the life of the existence of the solar system. So, if we're not willing to commit ourselves at any phase of our evolution to a technical phase that involves mastery over matter, then we have no more defense against the larger universe than raccoons and katydids if push comes to shove.

I don't know, I've stressed that there's no easy resolution on this. It haunts all thinking about conservation. I mean, I thought throughout the 80s, why aren't the conservationists not space-colony enthusiasts? Why don't the 'Save The World people' support the high-tech solutions that would move industry off the planet? Why are these various factions unable to make common cause behind a very large vision? And, uh, I don't know, but I think as pressure mounts for solutions, this will have to be done. I would like to live in a world where the entire Earth is a bio-reserve. I would like to live in a situation where the idea that there would be heavy industry inside the bio-reserve would be thought an abomination. All that stuff can be done on the moon or in the asteroid belts. It's as inappropriate as having a nuclear power plant in the middle of a rainforest to have heavy industry on the surface of the Earth.

We need to think on very large time scales and we need to figure out how to create political machinery to do that. We've been living a potlatch existence; just a frenzied consumerist kind of, uh, unthinking, uh, abuse. And, I think the best inoculation for that style of life is a stiff dose of psychedelics. You can't evade it, you know. It dissolves boundaries, it puts you -- it allows you to feel what you're doing. I mean, the level of denial in this society is incredible. My God, we don't feel it. We read the newspaper, but we don't feel what it's telling us, you know. Because if we felt it, we would probably be an emotional wreck, but there's something to be said to opening up to some of that, you know. There's a notion in therapy that if you want the client to actually make progress, you raise the alarm level.

A guy comes to you for therapy, you say to him, "Huh! You think you've got problems? Huh! You've got *no idea* what problems you have!" And then work from there. So, it's very serious business. It's trying to steer a society back toward a faith that was lost. And God is like a lost continent in the human mind and it's the only continent where there is safe harbor in the present historical situation.

Well, why don't we knock off and, uh, we'll meet at four o'clock. Thanks very much.

What I thought we would do this morning, because these things are so brief, is, again, return to the form of going around in a circle. And this time, it's your last chance to ask a question, make a statement, voice a complaint, whatever you want to do. But, just to try and -- in other words, it's loose ends time. As rapidly as we can, to tie up loose ends, things people didn't understand, things, uh, people feel they need to hear more about, that sort of thing. Why don't we just start, as we did before, on this side and go around?

[Audience] - I'd like to hear a more satisfactory explanation of what archaic revival means. I haven't got it straightened out. I suspect it means a return to a more stable state when there is too much chaos in the present. I'm sure that's not what you mean.

Well, that's partially what it is. It's based on an idea that when societies get into trouble, an unconscious response seems to be - they search back through their own history to find a model that they can revivify or revitalize. The strongest example in our own history was when the medieval world broke apart and didn't make any sense anymore. The new middle class went back to classicism, to the Greeks and the Romans, to Roman law, Greek philosophy and Greco-Roman architecture and mechanics and that sort of thing and created classicism. Classicism was invented in the 14th century. But, our problems are deeper than this. We can't go back to ancient Rome or ancient Egypt or something like that, and expect to have real answers. Uh, we have to go back further to prehistory, to this archaic state and there, in partnership, in genderless, uh, self-organizing society, we begin to see the kinds of models that we have to somehow recreate in the modern world. Obviously, we can't in the modern world become mushroom-eating nomadic pastoralists, but we can study that approach to reality to try and learn from it how you live in equilibrium. That's the key thing that the archaic world knew that we don't know. How do you live in equilibrium, uh, so that your children may live in equilibrium because, otherwise, you get a cycle started that's going to shove somebody over the cliff and that somebody, in the present, case is either ourselves, our children or their children. It's no further away in time than that.

So, the archaic revival is the idea that all of the -- and I see the whole of the 20th century, the discovery of the unconscious of Freud and Jung, the dissolving of the naturalistic image at the hands of the cubists, the probing of the dream state by the surrealists, the exploration of mass ritual by the fascists -- I mean, it wasn't all good, this stuff. But, what all these things had in common was they were, uh, a return, an appeal to the level of the mass psyche that had been ignored and denied for a long, long time. The LSD taking of

the 60s was the same kind of thing and, you know, I'm very -- I come out very strongly for McLuhan in the idea that as the emphasis, uh, as the ratios of the mix of media in a society changes, the sensory ratios and values of the society change. And we're living in a post-literate, post-linear, uh, kind of world now where a whole different set of assumptions make sense and they're archaic assumptions. You know, the archaic world was a non-linear, preliterate, audial 'all at once' kind of world and the fact that our sensory ratios have shifted back in that direction makes us very sympathetic, very susceptible to this re-archaization that wants to go on.

[Audience] Thank you.

[Terence laughs]

[Audience] - The, uh, I guess the ultimate psilocybin question is: - can you envision, Terence, in your wildest imagination that we as a society, instead of as individuals taking mushrooms and gaining some enlightenment that we'll ever be able to do it in an organized mass way? Do you have that vision?

You mean that someday it will be legal?

[Audience] – Legal and encouraged. You know, a mass taking of?

Well, obviously, it would take a total revolution. Uh, the current thinking is that the big revolutions in the world have to do with the internal contradictions of Marxist-Leninism, but it may actually be that Marxist-Leninism was a kind of partner in a co-dependent relationship with consumer capitalism. And, maybe revolution is just going to become something that everybody is into. God knows - we could use a perestroika. I mean, we, too, are ruled by constipated lying bureaucrats. What are the statistics – 97% of all incumbents are reelected, that there is less turnover in the United States Congress than there was in the higher echelons of the Communist party of East Germany until the wall came down. I mean, we love to congratulate ourselves on the forward leaning, uh, liberal society that we live in and the truth is it's a bunch of rattlesnake handling fundamentalists that are much closer to Stalin than they are to FDR or anybody else like that.

Still, I-I think that the culture crisis is going to become so intense and the world is going to become so weird as we saw on the graph last night, novelty is going to intensify and intensify and intensify and even last year when Eastern Europe was falling to pieces, very straight people were saying – "Gee it seems as though history itself is accelerating." Well, then there was a lull, so that talk was dropped but I think history is accelerating and the next time it accelerates, the talk that this is happening will come around again much louder. And pretty soon by the turn of the century, I think, it's going to be hard to hide from anybody who's paying attention, the fact that the entire social evolution of the planet seems to be caught in some kind of evolutionary meltdown that is imminent, you know. And in that environment, psilocybin has a chance.

The whole drug thing – leave alone psychedelics – the whole drug thing is properly understood as a civil rights issue. I mean, people should be able to take whatever drugs they damn well please in the same way that they should be able to express their sexual preferences, in the same way that women should be allowed to vote, uh, people of low incidence of light reflectivity should be treated like everybody else. I mean, all these things which are perfectly obvious. You cannot have a free society and regulate people's drug use.

Any society which sets out to call itself free and democratic with the footnote that certain states of mind are forbidden is headed down the slippery slopes of totalitarianism. There is no way that this can be avoided.

So, aside from our belief as a group in the wonderful healing, uh, and teaching potential of psychedelics, even if psychedelic drugs didn't exist, I would favor the legalization of all drugs because I just think that you cannot treat people as though they were infantile. That's called paternalism. That's the old dominator game. We have to just admit, you know, that we're all in this together and nobody has cornered the market on the truth for sure.

[Audience] - Would you talk a little bit more about, uh, seeing language?

Well, this is to my mind, you know, the pot of gold at the end of the rainbow of the psychedelic experience. These experiences get stronger and stronger and stronger and then language becomes visible and then if they become any stronger you fall asleep. That seems to be about the outer limit of what the internal processors can tolerate. Seeing language, you know - it's a mystery, it's a miracle. I don't know what it is. It's the thing that keeps going with all of this because it's the idea that we're just on the brink of some kind of transformation of how we communicate with each other that will change not only how we communicate, but who we are because see if you could see what I mean rather than hear me and run to your internal dictionary and look up all my words and then reconstruct my meaning - but if you could just see what I mean then you and I would be very much like the same person because we would be looking at the same thing. So, it's a tremendous -- obviously, language is what has knitted us together and made us social creatures. I mean creatures of our body weight and so forth have styles where, you know, the males and the females get together only for sex and once a year, like mountain lions or something like that. So -- but, obviously, the presence of language and our social history as primates set us up for living as we do. And, we have managed to create through language a monkey troop of five billion people. You know, a monkey troop of five billion individuals united through the glue of language. So, it's an intensification and it's something shamans do. And I think, you know, it's the real social magic of shamanism, at least, in the Amazon is based around these visible communication.

[Audience] - I wanted to make a comment about the difference between seeing and hearing. And, it's like the difference between a sculpture and music. Music and language take place, uh, in succession of elements through time. So, it requires a duration to understand. But sculpture and seeing things is all in a single moment, that the sculpture or object is beheld in a single moment. The aesthetics of the object or the sculpted object is the relationship of part-to-part or part to whole in a single moment. But, music is the succession of elements in time and somehow I think that relates to your... When you talk about seeing language, you're talking about seeing little creatures, words being creatures and so, then you're observing these creatures. Are they coming out like music in -- through time or can an idea, a sentence be seen all at once?

They're coming out through time and a sentence can be seen all at once because in a way your analogy is not apt because sculpture is static. But, these visible statements are like sculpture made of some magical substance, which has an internalized program of change. The analogy I always make is to the eggs of Fabergé. These things are like machines, jewels, but you can also tell while your looking at them that they're statements. They're like -- you know how people talk about beautifully crafted sentences? Well these are beautifully crafted sentences but they're like exquisite interlocking mechanized things made out of ivory and glass and topaz and chrome. And just -- brrrrr, they're carrying on at a furious rate. They have

a life in time.

I would like to write a computer program that would be like a full paint-type program, but it would be for the purpose of generating these types of objects because I've seen them a fair bit and analyzed what's going on. And here's how it works: you have a dodecahedron or some other complex regular polygon, so that it's made of surfaces and then, to each surface, you assign a set of color and frequency changes. And then each surface can run its program independently of all the other surfaces. So, you slowly build up a program on each surface but then you can also cut into this polygon and remove chunks of it to reveal another polygon inside it that can have different programs written for each of its surfaces. And then you set these things slowly rotating, one within another on several levels, and you're beginning to approach a really shoddy example of what these things are like that you see in this space. Beats me, you know! Most of this stuff is reportage.

[Audience] - I've heard you speak often of these incredibly complex images that you received on psilocybin or DMT. I'm just wondering if you've ever had an experience of total emptiness or voidness. The most profound experience I've ever had on psilocybin was actually being void of any content at all, but not being like blanked out or something like that. Just being aware of emptiness.

Well, I think this may have something to do with philosophical bent and proclivity. I never got any of these 'zenny' states, the white light, the black light. It's probably in my personality – I really stress visual hallucinations. And people have hassled me about this and said, you know psychedelics open your heart, they do this, they do that, and all you ever talk about is visions. It's because to me the vision is the proof and I guess I'm still a skeptic after all these years. The vision is the proof that it's not me because if I've never seen it before, hell I'm willing to grant it's not me if I've never seen it before. How difficult a character do you have to be, you know? So, when there's things I've never seen before that are absolutely amazing streaming past my closed eyelids, I have to grant that it isn't coming from me and that thin thread can be the basis of a bridge to faith.

If it isn't me then there's something out there. God, the Devil, who knows? But at least somebody. Now we can begin to have a serious spiritual quest. There is a signal. We're getting a signal from the other and it can be pursued. But, it's the task of a lifetime.

[Audience] – Now I hear you mention faith and it seems like yesterday morning you said something along the lines of, 'I'm not a believer in any sense of the word.' But what I wanted to ask you is in the context of the chemicals in the brain and the pineal gland and so forth – what do you think of fasting as a way of altering consciousness?

Fasting I think is probably very effective. If you analyze this whole rap here about the early mushrooms and the primates and all that, really what's being said is that diet is the key. That foods are very important and this is what they're saying about ayahuasca in the Amazon. They say half of it is ayahuasca but the learning of the shamanism and the becoming of this superhuman type of personality is all in the diet. And shamans in the Amazon, when they're trying to establish their credentials with each other, do it by saying how long they kept the diet. Somebody will say, well I did it for two years or something like that.

[Audience] – I just thought of something about the shamans in the Amazon. You know this magic phlegm that they bring up? What do they do with it? Do they spit it out finally or swallow it back down or what?

What do they ultimately do with it? It's hard to find out stuff like this when you're a guest. [audience laughs] I don't know. I didn't see where it went.

[Audience] – Have you seen it? Because if they use this to pull a disease out of somebody or a poison, or some kind of illness causing thing - if it's like a magnet that pulls this out – if they just keep this inside of them it doesn't seem like it would be very safe I wouldn't think.

Well, talking about what it is and judging whether it's safe or not. I mean, what is this phlegm in the first place? When you're really there, really dealing with it – you're pushed towards ideas like it's a zone -- it's a zone of space-time, which repels English. What? You know, in other words, it's a magical substance. It comes out of their body. Calling it "phlegm" is because we're following some anthropologist in the 1920s who, you know, went back to his tent scratching his head and tried to figure out what the nearest analogy to this was. But, what they do – they also in some of these tribes, the story goes that they can force this stuff out onto the surface of their skin and I don't know what this is about, but I have had ayahuasca visions where it's like a black field and suddenly there's a huge, huge black hand and I can see in the lines of this hand, jewels and it's just there – this black hand.

[Audience] –It's not your hand?

It's not my hand. It's a black hand.

[Audience] –Where does it come from? I mean is it on your hand?

No, it's like in a vision and then I see in the lines that what I thought were jewels is some kind of sweat, which is seeping out. And you look deeper into this stuff and you see, you know, that wonderful line from 2001, "My ! There are stars in here!" [audience laughs] It's completely disorienting.

No, the magic is real. I have no idea how far you can go. I mean, one of the paradoxes of what we're doing here in this room is, you know. Here I sit, I have two children, a wife, a mortgage, book contracts, lawyer, all this – here you sit with whatever you brought to this and we're talking about this stuff. Uh, if any one of us cared to, we could turn ourselves into something that none of the rest of us could relate to at all. We could become a sage. You could go up onto cold mountain and those of us left down in the valley would say, "Oh yes, I saw him three years ago up in the mist, naked as a Jay bird hauling firewood out of the woods". These places -- there's no barrier between you and these places except, is that what you want? Do you want to become utterly incomprehensible to the community because you are so deep into the unspeakable? Maybe? And that's what a shaman is.

A shaman is somebody who's just on the edge. They just have one finger back in the world of the rest of us and then they're in this stuff. Well, seeking that used to be called the spiritual quest, but as I said to you, you know, we've found the means to do that. We've found the answer; you know, you just go in the wilderness and take mushrooms and, you know, Cohen move over. But, what to do about that? I don't know. I really don't know because I'm attracted to it. I want to go as far as I can go. But, when you realize that you can go so far that nobody will even remember that you ever existed, the other can close over you so utterly.

[Audience] – The reason I ask is because a lot of times they say that, you know, gurus and different people take on the karma of the different people they work with or heal. You've probably heard this before. So, I wondered if when these shamans were healing if they -- if they magnetized out some kind of illness or something, where does that go?

Well, they have, yes. They're very concerned about the power of this illness and they have techniques and many times after a big curing, a shaman will fall sick. And, you know, if you want to understand this, read Jung's book called *The Psychology of the Transference*. It's the same in all cultures: you must be able to turn back the transference if you're a healer otherwise you'll be killed, ultimately. And, all psychiatrists, psychotherapists understand this or if they don't, they're at great peril.

[Audience] – Did anyone happen to see a film called "From Beyond?" The premise was that there was a machine that induced visions in the spiritual realm and stimulated the pineal gland and what happens is, a couple of people – the inventor and someone else – get hooked on the machine and the pineal gland starts growing out of their foreheads...

Ah Hollywood.

[Audience] – It was big on special effects. The one guy, his whole body was totally transformed. He was always on this machine and so forth. It reminded me of an electronic version of what you're discussing.

Yeah, well this is also coming, you know. Artificial technologies. Where are we in this process? Yeah?

[Audience] – I'm quite satisfied with questions at the moment, but I'm commenting on that, with respect to the pineal gland and visions. You know, the pineal gland feeds directly from the ocular nerve with no interceding brain tissue. It's just a direct connection, so the colors one takes in are directly responsible for the particular secretions of that gland, which is one of the reasons why television is described as being difficult on people. It causes hormonal problems, if you watch it enough because you're dealing with a very restricted spectrum of colors and that sort of thing. Uh, the additional thought occurred to me, that everyone who is watching television at the same time, their nervous system is being pulsed at 30 times a second, even though they're not conscious of it, but every TV set in the whole United States is exactly in sync with each other all at thirty times a second. It's like this sub-audible dial tone that's going through everyone's brains. It has kind of an ominous tone to it.

*The one comment I wanted to make was, uh, having recently read a book by Gurdjieff, called *Beelzebub's Tales to His Grandson*, which is about the only book I've ever read which pertains to the sort of cosmic time scale that Terence talks about enough. And, one of the warnings in the book was that was, if you read this with enough attention that you'll eventually lose the taste for your favorite dessert and the particularly attractive person across the street who you like to watch won't seem nearly so interesting anymore so be forewarned, you may not want to read this stuff and to a certain extent, I feel that's quite possible.*

You think the cosmic view kills the trivial? The joy of trivial?

[Audience] – The curse of mysticism.

Well, I don't know. Your thing about television and everybody being in sync, one of the most creative and

eccentric explanations ever dreamed up for flying saucers, uh, rested on the fact that the guy said, "In the United States, on an average evening, 40 million people are all in sync watching TV and if there then is a storm on the sun, it acts as a kind of coherent energy beam which illuminates these millions of psyches that are all synchronized by watching television and it causes, uh, an image of an archetype to be projected into space on the other side of the planet." Not my theory [Terence laughs]

[Audience] – Well, computer image processing, when you want to draw out a very fuzzy sort of pattern, quite often what you do is interfere with that pattern with another pattern on top of it and see how these two patterns comingle. Sometimes you'll get an accentuated thing as a result and this 30-hertz dial tone is definitely sort of illuminating this other aspect of the imagination it would seem. Maybe?

[Audience] – Have you ever read "A Wrinkle in Time"? Have you read that? It's supposed to be a children's story but it sounds exactly like what you just said. It's by Madeleine L'Engle.

[Audience] - I've read the whole trilogy. It's great.

[Audience] - It's almost exactly what you said.

Back there.

[Audience] – I'm interested in what you feel your relationship is with these, whatever you call them, these beings that come to you. Are you, are we, their offspring somehow or, you know?

Well, I don't know. I mean, this has puzzled me for a long, long time. When it first happened, I just thought that they were straight out extra-terrestrials and that this was some kind of weird technology where this was a contact between a species that evolved off planet, and then -- but, they're like, uh, inter-dimensional dwellers of some sort. And I -- so then I thought, maybe they're just hyper-spatial creatures of some sort in some other dimension but I can't even imagine. And then I thought, maybe they're actually from the future. It's like maybe this is a future state of humanity that we're actually going to look like this in ten million years and they're doing some kind of weird experiment with time and I'm the Neanderthal that they're checking out. And then the other possibility which I mentioned here which is really unsettling, but, in a lot of ways, fills the bill better than any of these which is -- they're souls of some sort. They're human beings and when you try that on for size, it's pretty hair-raising because it feels right and yet your mind boggles. I mean, I am not ready to believe that you can smoke a drug and cross over the great divide and return ten minutes later. That really strains my credulity; nevertheless if you ask shamans, this is what they would say.

I -- after having many DMT trips, I came to realize that this place that you break into where the gnomes greet you with this huge hooray and all this linguistic machinery is happening and so forth, that alien as that place is, it's somebody's idea of a reassuring environment for human beings. It's somebody's idea of the equivalent of a playpen. And these colored machine linguistic object things are the equivalent of colored rattles and things strung on a string and you're just sitting there, you know, gaping and they're saying don't freak out, pay attention, uh, learn to do this. I don't know. Maybe, I mean -- first of all, nothing is impossible. No possible speculation is verboten, right? So, maybe it is that we've gone too far and maybe it is that this planet is doomed. And maybe it is that somehow that, too, is part of the plan.

Borgia had this idea. He said that he believed in what he called "the soul of the species." And he said that the soul of species is not released to the higher dimensions until the last individual member of the species dies. As long as there is a single member of the species alive, the soul of the species is somehow in some kind of transient zone. But, when the last member of a species died, then it goes off. Well, if you look at the fossil record, 95% of all the species that have ever lived on the Earth are extinct. From that point of view, it looks as though biology is a, uh, process for producing extinction. Well then what is it? Is it that in the world of three-dimensional space and time and matter and energy, the DNA rears a form which inhabits a region of time and space called the body and then at a certain point, this form withdraws into something and what the matter that it had previously organized just falls to pieces. I don't know, but the entities in the DMT place are a real challenge. They either are the dead, extra-terrestrials or inter-dimensional dwellers. Any one of these is a headline in the supermarket checkout line, I assure you. [audience laughs]

[Audience] – I'm not quite sure what I want to ask you but I recently had a dream that we're all linked together. It seemed like you've had the same experience on mushrooms, feeling that? Do you have anything that you could say about that in relationship to affecting others?

Well, I think that, you know, the link that we cannot evolve, we can't change the world any faster than we can change the language we use to talk about it. And changing language is a collective activity. You empower memes, we talked about this. You create a concept and then you empower it by spreading it and by communicating it clearly enough that in the act of spreading it, it doesn't get badly copied and get all mushed up, you know, so that after it's been copied it ten times you can't recognize it. I sometimes have this experience – people quote me to myself and I'm just amazed, you know. Sometimes it turns out it's verbatim and I'm still amazed. But the linking together is through the evolution of language and we've never, ever attempted to engineer language. We've always let it just grow like topsy, not realizing that certain language habits are very toxic. Certain language patterns give permission for very detrimental ways of thinking. I mean, for instance, the subject/object relationship in English or the, uh, assignment of gender to things which goes on in a lot languages. These are habits of language that then become tremendous, uh, social problems for their inheritors.

[Audience] – The use of the word it. It's raining. It's funny. What is funny?

Or the "I." There are languages where there is no first person pronoun. The only way you can refer to yourself is by the extremely clumsy form, this person. This person thinks...yak yak Yeah?

[Audience] – I was curious, you mentioned DMT and visions of, I think, you said dodecahedrons, and then you mentioned, um, that they're saying to kind of stay with it, hang in there. I'm kind of curious about this dialogue on DMT and the logos in psilocybin. I mean, do they sound the same? How do you know it's not your own Howard Cosell commenting in the back of your mind?

How do you know it isn't your own mind?

[Audience] – Yeah, and is there a way to break through there to begin a dialogue or does it just start going like a tape loop?

No, it doesn't start going, you have to invoke it. This is an interesting thing if you're practically inclined.

You can't -- it won't speak to you; you have to speak to it. You come into a certain place on the mushroom, which I now, based on having done it a number of times, recognize the territory and say, "A"ha, it's now possible to communicate with the thing." And then I, -- well, you must know the old *I Love Lucy* episode where they do the thing about, "Come in little green men. Come in little green men." Ethel and Lucy are into this. Well, I tried that and, you know, you hear this thing which sounds like the tinkling of bells, the distant tinkling of bells and what it is, is it's literally -- it's the elf troop marching band and chowder society [audience laughs], and you can hear them getting nearer and nearer. It's like... [Terence hums a few bars of a symphony]

And it gets louder and louder and at a certain point, you begin not to hear it, but to see it. It gets brighter and brighter and clearer and clearer and finally they're all around you and jumping up and down and saying, you know, "How do you like it McKinney?" And all this other stuff that they say. They're gnomes. You couldn't miss it. And, I'm still me of course, I'm still just as I would be sitting here. It's so hard to assimilate. That's why I say; you know, sitting here in a room talking about this stuff is nothing as to being out there signing treaties with the folks.

[Audience] – That to me is following in the question. When you say logos, is this the machine elves?

No, the logos is something a little subtler that is a -- actually it stuck with me since La Chorrera. It's just a quality of thinking which I recognize to be clearer and deeper than my own. And, it usually takes the form of: 'why don't you try this' with regard to some problem. Why don't you try this? And, I know immediately that it will work, it's got the tone that's the real thing. I just go and do it and it always works. And, it's these, you know, evolved ideas.

[Audience] – OK, so I can understand that's your subjective experience and some people don't get the machine elves and things like that when I talk to them but you mentioned the mark of this was terror, so I can already realize that being in that domain is enough of a terror in itself, but you said the mark or the proof of this was – some of these trips were terrorizing. I'm trying to understand. Something else must be going on which makes you feel terror?

It's the implications are what's terrifying because you know that amazing moment in *Rosemary's Baby* where she's in the dream and then she sits up and says, "My God! This is really happening." Well, that happens to you in the DMT thing. You realize that the center of it: this is not a drug, that's preposterous. A drug, are you kidding me? Drugs make you feel good or bad or fall down or disgrace yourself. This is not a drug. It's something masquerading as a drug. I mean, it's as appalling as if they were about to give you the umbilical examination that Whitley Strieber specializes in. You're inside a flying saucer. You're with things that in a moment before, you would have laughed at the possibility that they even existed and now you're there. And you feel completely normal. You don't feel drugged or dulled or distanced or high or low. You just feel stoned, amazed at what has happened to reality and how it's all been replaced by this thing that not only did you never expect its existence but nobody ever expected its existence. You talk about a well-kept secret that's only two tokens away. How did they keep the lid on this? [audience laughs] That's the miracle to me. How did they keep the lid on this? Well they have.

[Audience] – Well I'm not sure what my question is, but in the experience last night with the computer time program, now, that was real exciting to me. It kind of made me almost have the experience of traveling through time and having that awareness of history and wondering now – now that you've brought that out

and we have the awareness, what do we really use it for? What is your vision for how it can truly be used?

If you understand history, you will see it in the present. It's an amazing tool for enriching your own experience. If you, when you go to get a hamburger at Hadrian's Hamburger Joint, know that this is happening because you're caught in a resonance related to the expeditions of the Roman emperor Hadrian to Scotland. I mean you're totally schizophrenic, of course, to entertain thoughts like this but it makes life a lot more interesting. You -- instead of seeing a linear thing with a fading past and an unpredictable future, you live in a super rich kind of baklava style of time, where time is folded and folded and folded and the layers are very thing and the stuff between is very sweet.

[Audience] – How have you used that personally in your life?

Well, the other way you use it is, of course, it predicts the future. We saw the line going off into the future. Well, I've had it in my possession since 1972, so after you've watched it correctly predict the future for a while, months or years, however long it takes, you gain confidence in it. And as you gain confidence in it, you discover that it gives you permission to let go of anxiety about the future. You've got a map of the future. You know that August 1991 is going to be a pain in the ass. You know that great triumph will come to you in January of 1993, so why worry about it? You just then go and live your life and as you watch the wave unfold, confidence grows and grows and grows. And, what's happening you see, without any fanfare or, you know, alien symbiosis, you're becoming a hyper spatial person. You're adding a dimension to your view of the world. The future is changing from a question mark into a map that you're quite confident is working for you and anxiety about the future is a major thing twisting people around. So, if you could get agreement on this. It's the Tao, you know -- live in the perception of the Tao. Its just people didn't ever think that would mean that you'd go and look at a printed outlook from a computer, but the exhortation is the same. Live according to the constraints of the Tao.

[Audience] – I thoroughly enjoyed this weekend. Uh, it has given me much food for thought. I'm very interested in how you -- what the best setup is for taking the mushrooms? Um, the amount, time of day, condition, whatever? I think there must be in your experience, I'm sure you've tried all of them – there must be one way that lends itself better to the mushroom than others?

Yes. Well, yes, I haven't said it this weekend but it's practically a battle cry of mine. It's five grams in silent darkness on an empty stomach and I'll explain. Five grams. Now, you must weigh it. A lot of people take mushrooms and when you show them what five grams is, they pale visibly.[audience laughs] Yeah, five dried grams. It's several mouthfuls. I'm speaking for a hundred and forty five pound person. Obviously, if you weight 90 pounds, back it up a little and if you weigh 230 pounds, you might go a little up, but five dried grams on an empty stomach. All that means is don't eat for six hours. Silent darkness. Silent. And a lot of people disagree with me about this and they want to listen to the Moody Blues and they want Bach and they want this. Forget it! Nobody is going to listen to you if you come out of this experience saying Johann Sebastian Bach is God, we know that! [audience laughs] It's very confusing because the music becomes everything if you listen to it. I mean, you cannot separate it from the trip and people will not believe that the trip without music will be just as rich as the trip with music because they've already decided they're inadequate. That out of their own depths, they couldn't possibly produce a psychedelic experience so let's have the B- minor mass thrown in just to help it along a little here.

So, silence, silent darkness and then darkness. Why darkness? Because the hallucinations actually need

darkness in order to form. They form behind closed eyelids and so, what I do is - and I clear the decks and I try to pick a point in my life when I don't feel to anxious and oppressed by trivia. I unplug all the phones. I get rid of every obligation. I roll up three or four bombers and I then wait on an empty stomach, and about 9 o'clock at night, I take it. And I just sit as I'm sitting now waiting for it to come on. Once I've taken it, I am completely in the sacrospace even though I don't feel anything for an hour and twenty minutes. Some people do the ironing and, you know, chop up some stock or something, but I just sit and then it begins to come on. Usually -- some people say it comes on very quickly but for me it usually doesn't really come on until the hour and twenty-minute mark. There may be a surge of nausea at forty minutes or a need to take a leak or something like that, but then I get back and resettle. And at an hour and twenty minutes, it comes and it comes as a wave. It's almost like a very sheer silk scarf just drops over me, just settles over me and I think, oh my god here it comes. Here it comes. And then it comes and it's a wave of hallucination and if I, well, I gauge it, but at that point I smoke and something about the cannabis synergy meeting the psilocybin, I mean, it is spectacular. I mean, you think that everybody from Vancouver to Tijuana must have just thrown themselves on the ground as this thing -- I mean, it feels like the sun exploded. It feels like you're watching through eleven feet of quartz crystal a hydrogen furnace on the other side. You cannot believe the release of energy. It's like a siren comes on, a siren, which you hear and feel. A siren, which shakes your body and the building that you're in and then it just, you know, pushes you out into who knows? Long periods of time where not a word of it will ever be reported to any other human being. I mean, you see things that nobody has ever seen or will ever see again. You're into it, you know, and it's an infinite matrix in all directions and it means something. It doesn't just look pretty, you know. It's playing on the harp of your soul with the emotional overtones. Yeah?

[Audience] – Have you ever taken it outside?

Yes, and I don't do that very much because I really try to control, uh, the setting because the freakiest things happen. I mean, if you in any way lift your foot off the pedal of controlling the parameters of the setting, the damndest things will happen. I mean, grizzly bears will break into your house [audience laughs]; motorcycle gangs will arrive [audience laughs] and saucers will attack. It's weird to go outside.

[Audience] – Do you eat the mushrooms or just drink the tea?

No I eat the mushrooms.

[Audience] – Do you have eye shades on did you say?

No I just sit in darkness but I rarely pursue total darkness.

[Audience] – What specific species of mushroom?

There are many species but the only one you'll ever encounter unless you're a specialist is *Stropharia Cubensis*. That's the one that people grow and is an item of underground commerce and it's the one that grows in the dung of the white cows. It's the one that I'm implicating in the evolution of human beings. Over here.

[Audience] – Back to language for a minute. It's not really a question but I wanted to reiterate a couple of things that I said yesterday. I'm trying to break into my own computer and stop habitual behavior of long ago.

Starting with language, just picking the phrases or words that you use the most when you are lazy; it could be profanity, outrageous, amazing, very interesting, awesome, it's a long, long list. Those are all cop-outs and if you can stop yourself at that moment and say wait a minute, you know, that's not really expressing an articulate thought. I think it sends a message. It does break into the computer and says things are changing, you know.

Yeah, paying attention. I think we said in here at some point that the key to everything is paying attention. Uh, awareness of awareness the Buddhists call it. But your point is very good. If you're truly awareness of awareness, the best place to manifest that it is in, I guess the Buddhists call it, right speech. Yes? So that it's always appropriate and sufficient and so forth. There's a book that some of you may know and you might be interested if you don't know it – it's called *Hallucinogens and Shamanism*. It's edited by Michael Harner. But, it has articles by a number of people and it has really one of the most wonderful articles ever written about the mushrooms by Henry Munn called, *The Mushrooms of Language*. He talks about how they are an inspiration to articulation, how even in these Mazatec villages when people are not taking mushrooms, the way you can tell a shaman is by a speech style. And I saw this in the Amazon with the ayahuasqueros. They have a diction, a psychedelic diction that is careful, appropriate, and always sensitive to the context of the listener and so forth and so on. In other words, they are great teachers; educators, communicators and I think it's the residual effect of this empowerment of speech.

[Audience] – What was the name of the book?

Hallucinogens and Shamanism by Michael Harner. It's in paperback from Oxford University Press. It's an excellent anthology. It has articles about ayahuasca, about ibogaine, uh, San Pedro; it's a good world survey of folk usage of hallucinogenic plants and extensive bibliographies, which will lead you on if you're interested in some particular area.

[Audience] – How long does a five gram trip last?

If I take it around 8:30 at night, by midnight I'm ready to call it an evening. I always eat before I sleep 'cause otherwise you'll wake up in the morning feeling really wasted and sort of hollow. But if you eat something fairly substantial right before you sleep at 1 in the morning, then you wake up the next morning, you feel great.

[Audience] - Any difficulty getting to sleep?

Well, your mind is just roiling with thoughts but on the other hand, you've come so far down from where you were an hour, an hour and a half before, that's when you smoke the third bomber and that shoves you into unconsciousness. [Terence laughs]

[Audience] - Can you maybe briefly go into what your model for how sexual relationships would be in a society? If you had an ideal, how would you setup sexual interactions? Would you do away with marriage? How would you do it?

Well, that's an interesting question. Uh, certainly because -- I mean, in my own life, I've gone from incredibly traditional arrangements: long marriage, monogamy, um. In my early psychosexual existence, it was very mainstream in that it was driven by the archetypes of Hollywood. Like, I was always amused -- well, not amused -- puzzled by the concept of casual sex, couldn't exactly put those two concepts together because for me every relationship I ever had was, you know, Galahad approaching the Grail or something. Then I got married and I was married for a long time and then my marriage ended and, uh, so, I've been single for a number of years. So, I have thought about this. I don't have a prescription but I'll tell you how I think about it.

Um, it's -- my approach to everything tends to be mathematical in order to not miss any of the cases. You just work through the exhaustive set and try to understand it like that. Okay, so, the exhaustive set is first of all, you can be single and celibate. This, uh, is out of the question for me. [Audience laughs] I mean, in this area, all you have to do is answer the question for yourself. So, while there may be those brave and, uh, ether highly motivated or completely neurotic or God inspired -- who knows? -- people, who can be celibate, I don't think I'm one of them. And, I think the I-Ching inveighs against a kind of, uh, 'sterile' it says. It says ideas not fertilized by friends or something like that. Two then, moving through the numerical arrangements, the post reformation, postindustrial solution is the nuclear family, which I've attacked at times in the past. Um, it is not a traditional social unit. It's less than 250 years old. This is the man, the wife and the two children. The traditional social unit is a very large extended family of cousins, sisters, brothers-in-laws, children, elders. This nuclear family thing is, I think, part of the root of our problem. It is an engine for the production of neurotic dysfunctional people.

And, you know, the entire industry of psychotherapy is based around trying to straighten out what was done to people by their family and trying to get them to them to stop doing equally horrible things to the people within their family structure. And, uh, it's an artifact of capitalism. It does not serve human needs; it serves the needs of the engines of capital and it is also based on paranoia. I mean, monogamy in all forms is based on extraordinary anxiety; uh, male anxiety about the behavior of females. And, it also

denigrates females to the levels of property because they have to be controlled and so forth and so on. So, I conclude from that that certainly marriage doesn't seem to work and that high levels of divorce and all that seem to support that. Marriage is, I think -- part of what has gone on since the industrial revolution is called what's called forced social neoteny.

Neoteny is the phenomenon of maintaining juvenile characteristics into adulthood, and, uh, marriage is a kind of neotenus schizura in life's development where you're just about to cross the great bridge into adulthood and then it says, 'Last exit before authentic responsibility – Get married!' And, so, people leave the great freeway of life and they get married and they form this 'you and me against the world', us back to back, this basically paranoid unit and they set off then to acquire houses in the south of France and little Meraux etchings and stuff like that.[Audience laughs] And, then it ends in great unhappiness and bitterness usually, and people say they wasted their time and they weren't understood and so forth and so on. So, two doesn't work, I conclude, uh, in this monogamous thing.

So then we come now to the flashy possibilities. The culture, the sub-culture in pornography, fashion and the advanced sectors of our society, meaning the people who edit interview magazines – or, I don't know, something. The subliminal message there is that three is far out. A *ménage à trois* of some sort and that if you get into a relationship like this, you're really stretching the envelopment and are quite avant-garde and a growth opportunity and so forth and so on. My analysis of this is that it is actually, um, a male dominator fantasy of some sort. That, it has a sadomasochistic, um, flavor to it because what you have are two women who are somehow inevitably in competition, inevitably judged – male value judgments are happening. It's, uh, sick it seems to me, or suspect - let's put it that way. I don't want to trod on anybody's arrangement. [Audience laughs]

So then -- here then is where I was left with this and then I won't take it any further. That an interesting social arrangement is the three-one arrangement. It's almost in some sense fair and it is, uh, amoeboid. No one can control it. It's too complicated. And, I don't think it's a male fantasy. I think if you suggest to most males that they should enter a simultaneous relationship with three women that there is a constriction because it's, uh, over-challenging. But that, in fact, if we're talking about future arrangements that completely replace the ordinary family then one thing that would work, I think, are these three-one relationships with a periphery of children around them and 75% of those children are female. Because I think, built into this 'one women-one child' thing, is this concept that male birth should be reduced and that there should be far less males in the society and that is the way to change the ratio of the functions being expressed. What we need is more nurturing. We need more maternalism. The way to do that is to get more maternal people and since most maternal people seem to be female, this kind of social engineering could be done.

This is like a fantasy in answer to your question because, of course, none of this will be done because it will be leaped on by hysterical fundamentalists and denounced as Satan's work and so forth. But, I think the dynamic of three to one is an interesting one. In a sense, following Camille Paglia and that kind of rhetoric, what we're saying here is that if guys really got as much sex as they think they want, they would probably hand over the machinery of civilization without a fight. [Audience laughs] So, it's like, 'you want it, here it is.'

[Audience] – Isn't this why prostitution is illegal?

Why? Make it make sense to me.

[Audience] – Because males would spend all of their energy, all of their resources, buying sex.

Well, but the fact that it's illegal doesn't make it non-existent. Um, I -- I don't know.

[Audience] – But it's very tightly controlled by males.

We have to have strategies for reducing male dominance and, uh. And, we have to have strategies for advancing females, but we can't tromp on anybody living. So, obviously, then what we have to do are twiddle the demographic dials. We have to control birth rates overall then we have to control the sexual ratio of birth rates. And then -- I just don't think the monogamous marriage and the family unit -- it's really dysfunctional. And, I came up with this three-one thing because I also don't see us returning to the, uh, traditional extended family of many relatives and generations of people because modern transportation makes that impossible. So, a family based on genetic relationships doesn't seem to me possible. But, what does seem possible is, uh, social cohesion based on erotic attachment. Uh, and, and that's what this three-one thing and then the constellation of people around it would be. Yeah.

[Audience] – What kind of feedback are you getting from females about that kind of thing? It sounds more like a male fantasy than a female fantasy perhaps the three-one...

Well, I suppose to be absolutely fair, female fantasies might involve more males, but that's not allowed. We have enough. [Audience laughs]

[Audience] - Why is it not allowed?

Because the over-expression of this dominator tendency is what's running us to rack and ruin. We're not trying to create these social arrangements for the titillation of one sex or the other; we're in a sinking submarine for Christ's sake. We're trying to sort this out so that we *live*, you know, and then hanky-panky later.

[Audience] – Can you mention love or is that outside of the whole thing? Does that cloud the issue?

No, I don't think that [audience laughs] clouds the issue. You mean, that you imagination that love can only go on in this dyadic situation?

[Audience: indecipherable]

Well, I don't know. I mean, I think that love...the thing I like about this three-one thing is that it's inherently kind of unstable. You can tell that the energy will never settle. That it -- what happens with a lot of marriages and even extended relationships is: people come together, there's all kinds of excitement, they negotiate the arrangement, they get the negotiations taken care of and then everything goes stale as the contract is acted out. If there were never any stability, if it kept changing all the time, then keeping track of this complex, quadripartite relationship would be a full-time task. It would almost replace your job as what? [Terence laughs] Jeffrey.

[Audience] – This isn't going to work. The women would kick the men out in no time at all because they get on much better with each other than the average man.

Well that's why the man has to be inspired to achieve indispensability.

[Audience] – But Terence what's different between that, getting the men to fork over the goods for sex. It seems like it's as old as Cleopatra.

No way and I don't understand. How did goods enter into it?

[Audience] – I'm sorry, I thought you said that this was a way for the women to get the men to hand over the controls by offering them sex but it seems to me that's been tried. We see tycoons with beautiful women at their side. Isn't this the only way that women were allowed to compete to get the men to do what they wanted – through sex? This doesn't sound very new to me.

Well, I think we're talking about a new kind of woman. We're not talking about submissive, slave-like property. We're talking about independent, educated, financially independent professionals. It would be, I'm sure, a phenomenon of the high-tech industrial democracies. It's weird to talk about this but, on the other hand, you have two choices: you can either propose something that sounds outlandish or you can stick with what we've got because what we've got, we've had so long that anything else would sound outlandish. And, in the messy business of life, what really happens is that it's sort of all kinds of things... come and go, gel and dissolve and work themselves out under the aegis of all kinds of pressures – economic, epidemiological, psychological, driven by images of media and, you know, self worth fads. Yeah?

[Audience Indecipherable]

Well I was thinking of this earlier today for some reason. I was thinking that - I don't know why I was thinking this - but I was thinking that sex is so intrinsically a mental activity that the amazing thing is that it's kept in the body at all. And that normally, this equation is turned upside down and people say, "Well, it's so intrinsically of the body," but the fact that phone sex can be a nine billion dollar a year industry is telling us something about how erotic sensitivity is distributed through the network of the civilization.

[Audience Indecipherable]

Yeah, I mean, it's a pity that it's linked so closely to biology. This is why the cult of sexiness is something very different and very modern than the cult of procreation obsession. I mean, sexiness is something probably invented post-1850 and it's flash, is all it is. It's the permeating erotic sensitivity that characterizes modern civilization – in billboards, in advertising, in the constant assault of visual images. I mean, I really notice this when I go up the Amazon because there's no calendars, there's no girly pictures, nothing. Then when you get back to Iquitos, you just realize, you know, that what civilization is - is an ocean of explicit erotic imagery that keeps us all in a state of probably willingness to consume stuff, you know. It's a stimulant like caffeine, but it's a sexual stimulant.

[Audience Indecipherable]

That's right. Like bisexuality, which is a characteristic of feminine psychology. In this society, I think is directed related to the rise of modern advertising. There was no reason to reinforce that before 1850 or so and then you see this emerging.

[Audience] – *Do you think that virtual will make it worse?*

Well I don't know. I suppose there is a raging debate about pornography. There's a raging debate about everything.

[Audience] – *What about pornography directed towards women and children?*

Ah, pornography toward women and children. Well, I make a distinction between...oh god, now do we want to go off into this?

[Audience] – *I'm sorry, I take that back.*

Camille Paglia asked a very interesting question to which I don't have the answer and I don't even think we need to discuss it. But, I think everybody should think about it. And the question was: you know, can sexual liberation end anywhere but in sadomasochism? And, that's a very interesting question.

[Audience] – *Sure it can!*

Sure it can? She said maybe not. I don't know. I don't want to mud wrestle over it. But, uh -- what do we think about this? For instance, aggression toward women. Um, what do we think of aggression toward women that is acted out and no women are actually abused? And, this is where the pornography thing comes in. Is it subliminal? Is it a cause or a substitute? If it's a substitute, surely we must agree that it's a good thing. But, if it's a cause, we must surely agree it's a bad thing. Or is it both? Um, I don't have burning opinions about all this. I'm a first amendment guy right down the line and just take a position that nothing should be restricted by government. That there -- whatever the means by which the memes are sorted out, it should not be the wisdom of a benevolent government telling us what kind of images, uh, we should have.

The tough one is images, you know, of pain and abuse, images of psychological degradation. I don't know exactly what to do about that. You know, if you go back to the roots of western civilization and read Plato's *Republic*, Plato was very suspicious of the poets and did not think those people should be allowed to just run untrammelled over the landscape. Uh, you know, here at Esalen, a great deal of time and effort has been expended to establish the medical concept that there are healing images. You know, Stan's work, some of Michael Murphy's work, some of the continuum work. Healing images are an article of faith around here. I believe it, but has anybody stopped to notice that if there are healing images, there are sickening images. Well then, so, uh, if you have tuberculosis, we don't say you have a right to mingle with the rest of us, or if you have some other contagious, rampantly contagious disease. Well, so then if you're carrying a meme that is toxic, do your first amendment rights exceed the mental health rights of the majority?

This is a nightmare issue to discuss because I heard a discussion on talk radio and someone was inveighing against *Silence of the Lambs* and saying it caused psychotic behavior. Somebody else called in and said,

"Well, if you want to ban books that cause psychotic behavior, I think you better start with the Bible; it's caused more psychotic behavior among more people than any other book in history." Certainly true, but we're not obviously going to do that. But, what is the relationship to toxic information? And, psychedelic people can take a more cutting edge role on this because we know the danger of toxic information because if you encounter some in your trip, it can really throw you for a loop. Yeah.

[Audience] – I think it comes down to integrating with shadows. If you don't integrate the shadow, it becomes very toxic. So, we got to deal with our full humanity, but so far what I know, we haven't. I mean, I grew up in the most neurotic country in recent history and, of course, the United States is catching up fast. I was born in Germany in '75 and I had this feeling when I grew up. God, what is that around us? I had no words for it. I was just horrified. I never wanted to grow up like this. Then I, you know, end up in America and now it's going to be like being German twice!

[Terence laughs] [Bad luck for you! Ha! Terrible choices.

[Audience] – But it's more comfortable than Germany.

[Audience] - But doesn't it lead you right back to psychedelics again. If you want to straighten all this stuff up, you've got to start with the brain and you've got to start with...

Yeah, although a question that interests me since, you know, I've been roughly doing workshops like this since 1983 and, you know, I've gotten to know everybody in the psychedelic movement and all the personalities and shakers and so forth and so on, and many of you in this room I've known for years and years, and a question that's interesting to me is: you know, like everybody else on some ideological bender, eventually we're going to have to answer to, uh, the bar of public opinion. What is so great about our thing? Or are we just like Mormons or Jehovah's Witnesses or Rajneeshees or something – we have this wonderful thing that we're just convinced is the holy grail, and yet if you're not part of our little clique, it just looks like a bunch of deluded lost souls reinforcing each other's belief in some alchemical nostrum that...you know? So, I'm interested in the moral consequences of taking psychedelics. Uh, time is passing. Is the meme breaking loose? Is it a positive meme? Do people behave better to each other? Do they perform acts of charity or whatever, acts of creativity? Or is it good for the individual but inconsequential in its affects on society.

In other words, that when the final catastrophe comes, you will meet it with great humor, equanimity, uh, understanding because your psychedelic training has taught you to take it all with a grain of salt [audience laughs], but nevertheless, you know, the sludge will sweep over and all will be lost and you just went down without whining or complaining. Uh, I don't know. The thing that is so amazing about the psychedelics is how close to the surface the, um, state lies and yet how dramatically different from ordinary consciousness it is. It is dramatically different and it lies very, very close to the surface. This is why it's, you know, possible to suggest it's just a one or two gene mutation away in the neurochemistry and then you would be able to slip into these places. I mean, thinking, what is thinking? Reverie? Where in the animal phylogeny does it begin and how intense is it: uh, mental behaviors with the internal contemplation of language. How broadly based are these behaviors? How many different kinds of them are there? We don't know. We don't even have a vocabulary for this kind of thing. Yes, you wanted to say something.

[Audience] – Just an observation after twenty years of studying and experimenting with psychedelics is that

one of the things that they do is that they allow a person (this is assuming that we're not thinking the thoughts, that we are [indecipherable]) and if you do psychedelics, you get to a state where you are beyond thinking. You step aside and there's a common denominator that a lot people, yogis and [indecipherable]. In history, we can't really change anybody, but ourselves, and by changing ourselves, we can change everything. And that, um -- what's going to happen and what's not going to happen in the future? If every person can work on being 100% conscious in the moment, that's where all the magic happens, that's where all the miracles happen. It's being 100% here, focused, and by doing that, then whatever is happening, you're able to be part of a solution instead of part of an illusion. So, we're really blessed to have really good psychedelics and being able to spend time that not many people have experimenting with them. And that the gift is to be an example of what...[indecipherable]...and our child can grow up to be conscious. [Applause]

Yeah, one way to think of it is what you call 100% aware – is to just strive for appropriate activity. That, if everyone in this room were to suddenly begin behaving completely appropriately, it would immediately change the context of things and set the stage for further appropriate behavior. And, this would be like a cascade of appropriateness. I mean, enlightenment need be nothing more than that, I think. Yeah.

[Audience] – Now we're just getting into that area almost like religion. What you just said – it sounds like somebody behind a pulpit. It's really close to that but it's good.

Well let's hope it's not too close to that.

[Audience] – It's contagious coherence.

Well, appropriate activity. I mean, is somebody going to speak up for inappropriate activity? It's a winning concept.

[Audience] – But the inappropriate activity is rampant already as it is. That's pretty obvious.

Yeah, well, inappropriate activity stems from bad communication – bad message transfer. No, there should be some kind of maximum energy solution in any given situation that everybody can relate to. I mean, once when I was in the Amazon I discovered a sense that I didn't know people had. On psychedelics, I discovered this sense. And, it's an internal desk accessory which allows you to calculate the least energetic path between two points. Not the shortest distance, but the path of least effort between any two points. It has to do with following ridge edges. And, I just discovered this ability in myself and it's real. And, I'm sure it was very important for primitive people before history. And, who knows how many of these kinds of talents, abilities, and behaviors... because they're software programs, which when they become inappropriate, they just fade away. And yet, you know, the hardware is perfectly capable of running these programs. Yeah.

[Audience] – I wanted to just harken back to this thing that we started out with. In the dichotomy between history and Eros - you say that within history is a kind of built in end-point that you can sense. So, does that mean that the end of history is a dissolution into Eros? Is that the conclusion that you draw from that?

I guess it is the conclusion that I draw from it. I mean, that finally when language fails, as it surely must, then there will be love. Love is, um -- lies beyond all that. So, you can only take ratiocination so far. You can only model the thing so much. That's why always in these wild far flung schemes of modeling the end

of history and the end of time and everything, the fracto key is one's own experience. The feeling of death, the feeling of love – these things can be extrapolated to universal proportion. Everybody gives, um, currency to the idea that ontogeny recapitulates phylogeny, right? Everybody knows what this means, correct? Ah! It's simple. It means that the fetus in the womb, the ontology, recapitulates the phylogeny – it means that the fetus in the womb goes through all the stages of evolution. It begins as a single celled creature. It becomes like a fish. It becomes an amphibian. It changes into a mammal. It changes into a primate. It changes into a human being. But nobody even then takes the process further and says, "Well what we've learned by observing this, we can learn more from further extending the process." The person in the womb, now a complete person, is born and then they have a life, and then they die. So if ontogeny recapitulates phylogeny, then the entire answer to how does the world work and what is it, is contained in looking at the fracto substructure of an individual history from conception to death. And, uh...

[Audience] – What you're talking about is the body. There is considerable difference of opinion as to whether a consciousness dies or not, or whether some physical transmutation takes place beyond living in this plane that we can perceive.

Sure. No, right. There's no certitude about that question by looking at that process. But everybody, you can see that for each of us as individuals, the thing ends in death, which is a big question mark. So then as a society, we should not be surprised that there is built into the superstructure of society this same kind of dissolving. Uh, it appears to happen even when there is no real good reason for it. Like, for instance, with the Maya. I mean, their civilization collapsed basically just because they were stupid. In other words, they got bad habits. There was no external pressure on them. They just made stupid mistakes and then the whole thing came apart. Uh, we could be in a similar situation.

But, to your question about how nobody knows what lies beyond death, nobody knows who is using the sanctioned tools of scientific investigation. But, if you go next door to the shamans, they claim all kinds of information on this question. They claim, essentially, a technology for accessing an ecology of souls – where a great deal of power for potentially good or evil lies as a reservoir that can be brought across by certain kinds of practices and activities. Now, science says that that's malarkey, but science says that the primary datum in support of that contention, which is the psychedelic experience, is also malarkey. And you can satisfy yourself that the psychedelic experience is, in fact, an ordered, uh, perspective on something coherent, simply by having that experience.

So, you, little old you, can satisfy yourself that science is not dealing from the top of the deck on this question of the content and meaning of the psychedelic experience. And, I feel like maybe the big news, the truly jaw-dropping news that will come out of all this re-exploration of the archaic and shamanism and hallucinogenic plants and so forth and so on – is a mapping of this realm of souls. That what we are actually on the verge of securing is that there is something that survives the physical organism and it's hard to tell what it is because, you know, essentially, we're at the stage with this where people were with electricity in 1700. Uh, we have yet to build the technologies, establish the standards and create the vocabulary for talking about this. But, if the task of Western epistemology is to integrate all knowledge into its sway then shamanism and the experiences of shamanism have to be brought into the metaphor. I think what this may, in fact, secure is that biology is the platform for establishing some more, um, hyper-dimensional structure that survives. Yeah, no. Yes. Stretching?

[Audience] – And therefore the cultural then?

It may be, you see, that in fact what the most pessimistic among us believe is happening is happening. In fact, there's no way out. That, in fact, we're all going to die. Then the question becomes, what is that? What does it mean, you know? Is that a good thing or a bad thing? Uh, Borgias had a story where the entelechy of the species could not move on until the last member of the species became extinct. There is some kind of relationship to mind across this barrier. Or, shamans have chosen to interpret a nearby, non-physical species of life as somehow related to the human after-death. And, why that should be and why that error should persist of fifty or one thousand years is not clear either? I said earlier today, science precedes with the simple cases first. You know, what is a marble rolling down a slope, so forth and so on? But, the complex question – what is my perception of my being – what is the nature of the inner dialogue that describes the ontos of being – this is a very, very complicated question. It takes 2000 years of preparing the epistemic ground before you can even reasonably ask the question.

[Audience] – Why do you suppose...your talking about us all dying as a species, or all dying as a civilization. We don't like the fact that we're going to die as individuals but somehow we grudgingly accept that and we create a lot of literature and congress around it. Why is the idea that we're all going to die as a species so much worse? Um, and, and...

Well, because I think probably as a species we're more neurotic than our individual members. We're pretty hysterical about this. We're not talking the news well that the doctor is handing out, you know...

[Audience] – But as a culture, maybe something lives on?

Something lives on? Yes, we've talked about this in the past in terms simply of technological innovation. For instance if the technology of time travel were to be created, historicity would end. Uh, the linear serial unfolding of events would become an epoch, that lasted from 10,000 BC to 1998, or something. And then following the epoch of serial moments came the epoch of non-serial moments. The epoch of simultaneity, in which people choose where to live in time the way they choose to live in space now. Yeah.

[Audience] – Well, uh, Eros?

Achieved through a knitting together. Everything that is, is an anticipation of what will be. Uh, being is growing more nascent or something. Th, there is this appetite for becoming that everything is striving for manifestation. Somehow what this boils down to mathematically is that all points seek co-tangency which means that in terms of dimensionality, the phase space of description is collapsing and all the points within it are becoming co-tangent. Uh, the 16th century anticipated this in the form of the philosopher's stone, you know – the alchemical quintessence, the lapis. It's a zone of space-time that is a singularity. It's where matter and imagination exchange clothing, and matter behaves as though it is imagination and imagination behaves as though it is a material physics.

[Audience] – Ok, that's really eloquent. It's like breaking the sound barrier for the first time. Before we broke the sound barrier we didn't know what that was going to be like. So, when we did it the first time, we have this glass afterwards. You break through, it shakes but then afterwards it's fine.

Well, you know, one of these little aphorisms that the mushroom handed out was, "History is the shockwave of eschatology." What that means is, as the species mind approaches the eschaton, what is called queue in engineering circles, uh, vibration begins to build up along the leading edges of the social vehicle. And, uh, as it approaches the eschaton, this queue force builds and this is where we are. We're

literally having our teeth shaken out as the historical bowshock of encountering the eschaton builds. If we can redesign the culture fast enough, the airframe of culture, then we can create an airfoil that will distribute the queue and we will just slide through. If we can't do that then our airfoil will be ripped to pieces and we will, you know, back to the drawing board.

[Audience] – That abyss we talked about. First of all, will we all go together or will some people be on this side?

No, I think it's a temporal moment of embedded novelty. Um, they've come and they've gone, but this is a critical one because it sets the stage. You know, it's the summation of everything that has happened and it's an anticipation of everything that will follow. It is that history is a kind of psychedelic trip. It's a kind of alchemical, um, distillation of the quintessence. And that the stuff generated out of the alembic of history is this trans-dimensional, cyber, electric, um, literalization of the imagination. You know, James Joyce said man will be 'dirgible.' What he meant was that the raw stuff of the unconscious will be downloaded into shimmering silicon and the protean child will be born out of the chaos of history; something like that.

[Audience] – You're taking a chance.

Well, the other thing is – a lot of what is called neurosis, or what is called less technically, unhappiness, is, actually, I think, caused by performance failure that is ultimately sort of physical. In other words, a person who is not working at their physical optimum will be mentally depressed but it's crazy to look for childhood trauma or something that lies behind that because the cause of the depression is physiological, not psychological. So, um, well, if you can take a pill and your depression goes away and your performance improves, psychotherapy is not indicated in that case I would think. Well, if you delay it long enough, it's solved. *[Terence laughs; Audience laughs]* I've always felt that tabling is a great solution for all kinds of problems.

How does the Time Wave apply to the individual life?

[Audience] – Do we speed up when we get older?

It's a truism to say that the older you are, the faster time moves. When you're seven, a year takes forever. When you're 77, they just rush past like pages falling from the calendar. Astrology went through a crisis several hundred years ago where under the emergence under a new class of wealthy people, there became a demand for personal horoscopes. And so, astrology reconfigured its toolkit to be able to provide that. I'm not very interested in individual time waves. I don't even have my own readily accessible, but what you can do is you can take your birth date and add to it one full cycle which is 67 years, 104.25 days, and set that as an end date and then you do get good correlation between your life and the wave. A way to think about how this relates to the general Time Wave, it's that the general Time Wave is simply the average of all the little time waves. In other words, it's additive. So, obviously, we all are at different places in our time wave, otherwise when I'm happy, you'd be happy. And, when I lose money, you'd lose money and it doesn't work that way. Some people are miserable in the presence of other people's joy, often causally related. *[Audience laughs]* Obviously, these people are at different places in the cycle. Yeah.

[Audience] – Would you like to say anything about 2CB since we were talking about drugs. A more general sort of political question: you obviously act as a very strong advocate for psychedelic drugs, has this attracted

to you any official attention? Are you getting audited every year?

Um, well actually, I've never been audited. It doesn't attract any attention. This is a great disappointment to the more delicately poised of my fans who would like to assume, you know, that we're at the barricades, barely able to evade the long arm of the law. Uh, I don't know. Their strategy in my case seems to be incredibly intelligent. They just completely ignore me [audience laughs] and why that is – maybe it's because it just doesn't matter, or because I use big words, I'm dismissed as an intellectual. We all know how powerful they are in America. [Audience laughs] So that's that.

[Audience] – It's because there's obviously no money involved.

Well that's the other thing. My theory on drugs, if you're not making money from it, you're of utterly no interest to anybody. Opinions are free.

[Audience] – Except that couple in, where is it, Calaveras that got arrested for having the frogs.

Well then there are the occasional, uh, examples.

[Audience] – They got arrested for what?

Toad-ranching. A heinous and nightmarish crime. They were extracting 5-methoxy DMT from Bufo Alvarius that they had in a domesticated situation in their home. And, uh, I suppose they were beaten with rubber truncheons and taken away, their house seized, their children taken from them, their animals murdered and so forth.

[Audience] – He was a teacher and a Boy Scout leader...

It just shows how deep into the middle class these nightmarish practices have reached. [Audience laughs] The abuse of amphibians is something our grandparents contemplated and yet here we are, you see. It's an ugly, ugly business.

[Audience] – But they did get into the press to say that they put an end to the rumor that you just don't lick it.

I think it was the Australian press which popularized the image of people nuzzling the under tummies of toads in order to obtain...

[Audience] – What about 2CB?

I know, I haven't forgotten you. 2CB – I have no opinion about that. No experience with that. I mean, I did take 2CB once but it didn't emerge prominently enough for me to form a bunch of opinions. Just as a general rule, but it's, you know -- rules are made to be broken – I'm not part of the faction that thinks we need ever more exotic drugs. I think we have a full toolbox, if we just would use it. Um, and, uh, you know, if you have ayahuasca, psilocybin, DMT, toss in mescaline, ibogaine and cannabis...

[Audience] – I don't happen to have any of those.

Ahah! Well, capitalism is searching for you, I'm sure. [Audience laughs] But, you know, it's a very individual thing. Whatever works, use it. People have to come to terms with this. We are very much the product of our genetic and biochemical differences. Some people like things that other people can't handle at all. And you have to -- part of your self-education in pharmacology is learning what you -- what works for you. Yeah?

[Audience Indecipherable]

Outside of the intellectual concerns of science, this has been a generally persistent attitude that time is as important as geography. Uh, not only astrology but, uh, Mayan divinatory methods, African divinatory methods. I think that science, uh, is running against the flow here with its attitude that time is not, uh, to be differentiated. The reason for that, if you analyze it, is not far to seek. Science depends on the concept of experiment and experiment to mean anything it must be time independent. And so, in a sense, you could almost say that what science is - is the study of those phenomena so course-grained that when they occur, time doesn't affect them. So, that leaves out most interesting things, you know? All the subtler processes of biology, psychology, sociology are left out of that. And yet, that's why this idea -- I showed you last night -- it may appear revolutionary but it's *really* revolutionary because science could not operate. It would be the end of science if this idea were accepted because it says that experiments are time dependent, therefore, it is not ever possible to perform the same experiment twice. Therefore, the idea of building up a serial set of observations of many examples of the same experiment is bogus. And, uh, so, you know, this idea aligns itself with astrology and with all these other pre-scientific series of change that is modulated by both space and time. Yes. Question? Yes.

[Audience] – If growing such items like ayahuasca vine and *Psychotria Viridis*, is it kosher for someone like us to grow it and not be hassled by the DEA or someone like that?

Well, you have to be an excellent Amazonian field botanist to recognize these things. It's a pretty mute point. I mean, you do have DMT in your brain, so you're potentially bustable at all times. *Psychotria viridis*, it's not easily recognized. ayahuasca and *Psychotria viridis* can't be grown in occidental, for example because it's too cold. They can be grown in Hawaii. This conference that I was at in Mexico, the great alternative technology that those people are excited about is what are called ayahuasca analogues. Meaning that, at closer scrutiny to the flora of the earth shows that, in most environments, there are plants that produce DMT and there are plants that contain MAO inhibitors. In most ecosystems of the world, there are plants which, if properly prepared, create a kind of ayahuasca. And, s people are retiring to their kitchens and laboratories to cook furiously all of these things.

If you're interested in doing this, uh, the way to proceed is, uh, as an MAO inhibitor, you need seeds of *Peganum harmala*. No more than two grams. *Peganum harmala* seeds are available from seed suppliers. They're also available in Iranian markets as a product called hermal – little hard black seeds. Two grams of them, pulverized in a shot of water or alcohol will inhibit your MAO quite thoroughly. If you then take a DMT source orally, you will have a response to it. And people are using *Desmanthus illinoensis*, the Illinois bundle weed. At this conference, letters were read from people in Australia who were using Australian Echinacea. *Phalaris* grasses can be grown, and using a sprouting device, you can grow *Phalaris* sprouts and dry them. They are intense in the sprouting stage with DMT. So, this group of people I was with in Mexico – their great enthusiasm is to provide so many different psychedelic, so many different paths to the psychedelic experience that there is no way they can all be made illegal.

Uh, DMT, we have not yet hit the crush in terms of the social debate about all this. DMT was made illegal when, um, LSD was made illegal. At the height of a media fanned hysteria in an atmosphere of intense 'no-nothingism.' Uh, it was not known at the time that DMT occurs in human metabolism. Nor was the physiological profile of DMT known. What rationale for keeping a drug illegal is there if it's not a social problem? It begins to look just like sheer 'for-your-own-goodism' of some sort. Uh, it -- one way of measuring an index of the danger posed by a drug is to look at how many emergency room admissions there have been for that drug. Well, I dare say in the last five years for DMT intoxication there've probably been zero emergency room admissions. By the time anyone could get you to the emergency room, your main anxiety is that nobody find out that you lost it. [Audience laughs]

And the fact that it's a human metabolite. I don't know what's going to happen. It's a very interesting situation because the arguments for keeping the psychedelics illegal are becoming weaker and weaker and weaker and more and more flimsy, and more and more people are awakening to what a racket this is. And, weird forms of co-option are taking place. It's not easy in Garberville to advocate the legalization of cannabis because people are all around you getting \$400 an ounce for it. The thought of legalization strikes terror in their hearts. They have a kid at Stanford, they have a house in Saint-Tropez, they have a sailboat -- why in God's name would you want to legalize cannabis? So, this is a factor, you know?

[And, in the past several years, three years or so, there's been an enormous surge in psychedelic publishing. I don't know if you're all aware of it. You certainly should be, I mean. Obviously, you should buy and read every word I've ever written. [Audience laughs] In addition to that, Sasha Shulgin and Ann Shulgin's book *PIKHAL* has come out. You should be aware of Jonathan Ott's book *Pharmactheon*, which in between the covers of one book, if you just want excellent scholarship and the longest bibliography ever to attend a drug book, this is for you. Uh, Eduardo Luna's book on ayahuasca has come out. Um, well, Schultes book, *The Healing Forest: Medicinal and Toxic Plants of the Northwest Amazonia* has come out. Um, there's a resurgence of interest in this field. And, I think it's a very hopeful sign that people are, you know, -- have enough sense to realize that it has something to do with shamanism, it has something to do with plants, it has something to do with taking charge of your own experience and spiritual growth and, you know, ditching ideologies, and some of these beady-eyed gurus are being sent back to wherever they came from to find honest work among their own kind. This is a fine thing, I think.

[Audience] – Let's imagine that we're post legalization. How would you see it? Would it mean that the government would want to go toward education, or would it be like Amsterdam where you sell it in cafés?

I don't know. I guess I'm a cynic about this. I believe that the reason drugs are kept illegal have nothing to do with the reasons given for why they're kept illegal. They're kept illegal because, if they were legal, it would be hard to make a lot of money off of them. And, you know, an enormous part of the world economy runs on drugs, so -- and always has: sugar, coffee, teas, spices -- drugs, drugs, drugs. Uh, so, it would be a much saner and safer world if drugs were legalized because intelligence agencies would not have these vast sources of money, which they then use to finance private armies, murder liberal magazine editors, setup phony political parties, indoctrinate people, so forth and so on. So it's really an issue of covert control. Drugs are the last bastions of hidden slush funds at the billion dollar and up level. If this were not a factor, the psychedelics never would have been illegal. I mean, the whole drug-scheduling thing is completely cockamamie. You have Schedule 1, which is the severest category, and what do we have in this most severe of all categories? -- we have heroin, we have cannabis and we have the psychedelics.

Schedule 2 is cocaine. Cocaine has legitimate medical applications. It's used in certain kinds of throat and eye operations. So, there is -- so, it's the psychedelics strangely enough which are the most stigmatized of all the non-addictive drugs.

This is just pure fear and it relates to what I talked about last night, the issue of surrender and how anxious the dominator types become when the issue is loss of control. You know, they are absolute control freaks and, you know -- until people demand that this be changed, it won't be changed. People are not very demanding. I mean, you know, you give people the four-term governor of Arkansas and they think that Christ is healing in the market place or something.. [Audience laughs] I mean, that's how pathetic the liberal position in America has become that it can embrace someone like Bill Clinton as its standard-bearer. Not to launch into a knock on that. I mean, I certainly prefer it over George Bush, but it's very minimally important. It doesn't impinge on our lives. All these people are jackasses and should be hung. In a civilized society they would be hung before a howling mob [Audience laughs] but...

[Audience] – Would a civilized society hang anybody?

Certainly, it would. Voltaire said the common people will know no peace until the last politician is strangled publicly in the entrails of the last priest. [Audience laughs] But that's just an opinion of mine, you don't have to follow me into that and probably shouldn't.

[Audience] - I had this experience of dreaming that I smoked. It was very futuristic and it looked like little pellets, like something out of a star film and out of a little metallic pipe. It was like DMT when I went up on it. It lasted about 45 seconds - intense. I wondered if this was common or do you have any theories about what happened?

That's an interesting question. It relates to some of the properties of DMT. I mentioned DMT occurs in human metabolism. It does, and its concentration in cerebral spinal fluid fluctuates on a circadian or daily rhythm. The most intense concentration of DMT is about four in the morning and this is when the deep REM dreaming is going on. When you give DMT to somebody – as an index of how loaded they are – what you look at is, with them stretched out in front of you, you look at their closed eyes. And, if their eyes are darting wildly back and forth under their eyelids then you assume that they have in fact become successfully intoxicated because they are then in the realm of the self-transforming elf machines and they're watching all this stuff.

Many people who have smoked DMT report that, later, they will have a dream where a glass pipe will be introduced into the dream; they will smoke it and this will happen. This is really interesting to me because it argues that the physiological capacity for the DMT flash is present, at least, in deep sleep, maybe all the time. It seems to me that an inspired biofeedback program of research ought to be able to teach people how to do that. One thing I've talked to my brother about in terms of orienting the research programs of these pharmaceutical companies is, you know, how about a drug which just allows you to remember your dreams. That, alone, might throw open a whole new world of possibility. Kathleen?

[Audience Indecipherable]

Yes, so, if you could get in there, uh, we might solve our drug problem, uh, because I think that probably every night we go deeper than we can remember and that the dreams we remember are basically at the surface. And even the deepest dreams we remember are fairly near the surface. But, that the dissolution back, into some kind of primal swarm state, is part of the daily cycle and why the top level can't remember is a real question about our physiological and psychological organization. I mean, maybe there is simply no efficacy to it. But, uh... Yeah.

[Audience] – Does it have something to do with the brain waves? If you're down in theta, you can still witness what's going on. But, when you go down to delta, it's just a total absorption. Within the process, you remember it felt nice afterwards, but you don't remember.

Well, what seems to be happening is, there is no transcription of short-term memory. DNA - I'm sorry - RNA activation of short-term memory isn't happening. All of these things are physical mechanisms which could be studied, but, you know, we spend money in unusual ways. I doubt that any drug company would put money into a dream recollection drug.

[Audience] – Are there no futuristic drug companies at all?

Drug companies are the most bottom-line gang around. It's a very cutthroat business and research curves are short because you're in constant competition. Uh, I don't know, but, you know, long-term research, this could be done. If we spent as much money on this as we spent to dig the hole for the now cancelled supercollider, we would probably have the thing in hand.

[Audience] – I'm curious about the parallels you drew between the DMT flash and orgasm, um, or the non-parallels that you said. You said that you were baffled about that. I guess my question is, have you experienced or do you know the orgasm to be potential for that kind of a powerful mind consciousness expansion, or is it just what you would term the post-coital fog?

Well, the fog comes afterwards. *[Audience laughs]* Well, um, orgasm is an interesting phenomenon. First of all, it's not necessary, uh, and it's not expressed in lower animals. Sex, as you descend the animal phylogeny, becomes more and more mechanical, less and less intimate. You know, finally, it's all about eggs that are deposited somewhere and then males come along and fertilize them and there's not even contiguous activity by male and female. So then what is it that, as animal complexity increases, there's this concentration on this burst of boundary-dissolving pleasure in the central nervous system. I don't exactly understand what the function is there. Obviously we're all interested in sex, but are we interested in sex because we pursue orgasm and the, you know, is that the payoff? Couldn't you build in a more gentle gradient of interest based on biology which must be happening with these other animals?

Uh, there's a book to be written about all this. I have all the questions; I just don't have any of the answers. I can see that sexuality is related to consciousness and to the psychedelic state. But I can't and I've thought about it for years and years, but I just haven't gotten anywhere. When you have sex on psychedelics, you know, there's an incredible enhancement and reciprocal feedback into that, but, um, I don't know. Kathleen?

[Audience] - I'm thinking of the Tantric practice where that energy, that regenerative energy is conserved. So, at the moment of orgasm, to concentrate your energy at the base of the spine and let it wash the nervous system internally. It seems like an evolutionary....

Well, I was going to mention that. One of the things that's always puzzled me about Tantra is that, if you analyze it, it's a -- it's a frustrating of the biological drive toward ejaculation in the male. How strange then that at the top of animal organization, there would evolve a physiological response that is contra the biological momentum of the species. I mean, you know, a hanging man ejaculates but a yogin doesn't, apparently. And so, I'm skeptical, not of the phenomenon, but of the interpretation of the phenomenon.

[Audience] –Actually there's a good description of why that's encouraged in a book called, "The Jewel and the Lotus" by Bodhi Avinasha and Sunyata Saraswati. What it is - is that it transmutes that energy whereas that orgasm would send that energy out the bottom of the man, that it would come up the spine and accumulate in the medulla and activate the third eye and promote a superconscious state. That's actually the physiological thing but you were questioning the philosophical end of it. But conserving sperm is something that, uh, a tradition in many martial arts and spiritual traditions and does seem to have in my observation and practice a good effect on spirituality and on states of altered consciousness.

But that means that people with vasectomies should be enlightened.

[Audience] – No, no! It's a physical practice that comes about...

[Audience] – That's a cutting of the circuitry too with the vasectomy.[Audience] – It's not the sperm, it's the energetic. You know, men have had accidentally dry orgasms that have gotten them to the same place mentally as a wet orgasm. Um, I think it's a mistake to concentrate of the physiological part of it and the pleasure center part of it and look at the wider context of where and why and how it's been practiced. And There is a lot there. I've studied and practiced that a lot so I think it might bear looking at is what I'm saying.

I agree with most of what you're saying. I'm not so in agreement that it's not important to understand the physiology of it. The way to bring these things forward is to get some kind of handle on it so that it can be raised off the level of metaphor. And, I suppose they're trying to do that but it's freakishly elusive considering how radical the claims are. I'm very suspicious...

[Audience] - Actually it's not. It's like anything else once you get interested in it. There are a lot of teachers and there is a lot of literature on it. It's not freakishly elusive at all. It's just...

Well, I mean to demonstrate to someone who is not pre-committed to believing it. That's what I mean by elusive.

[Audience] - Well, it's been called the secret teachings for a long time but with what tools and media we have now, these methodologies and explanations are available.

Well, yeah, we're in a situation where all boundaries between knowledge systems have dissolved in the past hundred years. Take something like Dzogchen. You know, when I studied Tibetan, you didn't even mention this until you'd been with them for years. It was inconceivable. Now it's pedaled on every street corner, which I think is a good thing.

[Audience] – What is Dzogchen?

Oh it's an advanced Tantric-Shmantric something or other. I'm using it as an example of the fact that there are esoteric idea systems have all been brought together and we're sorting it out. Over the past hundred years, this has been going on. I have been underwhelmed by the accomplishments of Indian spirituality personally; overwhelmed by the accomplishments of Amazonian spirituality. I suspect priestly hierarchies of unspeakable acts and intentions and always try to avoid that. I'm also very suspicious of secrets. I mean, if you tell me one, it's finished as a secret. [Audience laughs] I took a pledge long ago to tell all secrets as

quickly as possible, um, because I think that everybody is a lot stupider than you might think. Uh, that nobody has a leg up on this stuff.

[Audience] – The only secret in Dzogchen is not to tell it to somebody who’s not interested. [Terence laughs] The idea of a secret has nothing to do with a secret. It’s keeping the energy and not going around telling it.

Well what I found though is that...

[Audience] - It’s a technique. It has nothing to do with a secret. I tell you not to tell anybody and the hard part is not to tell. The secret is irrelevant. It’s only a technique for the student to hold energy. That’s all.

Well, real secrets can’t be told, period. So that’s not an issue. And then secrets, which can be told, are not secrets. Secrets are a way of controlling other people.

[Audience] - What is your best guess as to what is the outcome of this experience? In other words, are there any conceivable other choices besides a reversal or a going upward. Could time go backwards? I mean...

By this process, you mean this historical spin down that we’re caught in? Um, well, there are different ways to think about it; um, like a whole smorgasbord of ways to think about it. It could be that we are simply in anticipation of our death as a species. This is the downer possibility. That what the 20th century is - is like a terminal delirium. We are sinking into coma. All philosophies, books, teachings, points of view, are now swirling around the deathbed of human culture. You know, we remember the shattered affairs, the failed crusades, the ruined dreams. We’re looking back over the wreckage of the last 10,000 years and trying to make peace with it and sinking into coma.

Another possibility is, um, you know – I mentioned that the Time Wave seems curiously appropriate to technology. That what we’re calling novelty, the evolution of novelty seems linked to the evolution of technology. Uh, a technology that would fulfill this whole scenario without requiring the intervention of God almighty or something like that would be time travel. Because if -- if it were possible to travel in time, then you would understand what it meant that this linear wave of novelty terminates on December 21st, 2012. It just literally means that’s the day history ends because after that day, you have a different kind of time. You have a kind of time that is like space. Notice that when we look at the evolution of life and human culture, it’s a conquest of dimensionality. You know, we started as some slime on a rock somewhere and slowly through the coordination of our senses, our eyes and then our limbs, we have conquered space. Notice that when you decide to walk over yonder, this is a journey through space that is volitional, but the time is not volitional. No human being has ever traveled an inch in time or a moment in time.

[Audience] - We just can’t change the rate. We travel in time constantly but we go at...

We’re in the river and the river has a speed and we’re carried along. But, in principle, if it were possible to travel in time, uh, you could create an entirely different kind of sociological domain and I have talked to the mushroom about this. And, it says, you know, that time travel is possible, but only of a certain type. The type that is like this: you can travel back in time, but you cannot travel further back in time than the invention of the first time machine because before that there were no time machines. And, if you took a time machine there, you would introduce a paradox.

[Audience] – Is memory traveling back in time? Like a vivid memory of something that happened a while ago. Isn't it a sense of manipulation of time in that way?

Well, that's what's called "the fallacy of misplaced concreteness." I mean, the mind can travel in time, but the mind -- time is a domain of non-mental objects. It's a domain of real objects. So, the mind traveling through time is fairly ineffectual. If you could actually move matter through time and there's reason to think you could, then -- and if you could travel back in time than no further than the first time machine -- then the moment the first time machine is created and turned on, time machines will appear from all points in the future visiting the most interesting place in time, which is the beginning of the era of time travel.

[Audience laughs] It's as though -- if you have an airplane that you could fly to Kitty Hawk to December 17th, 1905 to witness the first flight of the Wright flyer. So, in a sense, what we call a time machine is not a technology at all and certainly not a technology for individual travel through a temporal medium. What we call a time machine is a kind of switch which, when pushed, collapses the entire notion of future history down into a single moment. It causes, in a sense, the rest of history to happen instantly.

[Audience] – Is this time machine mechanical or non-mechanical?

Well, it's a -- it's a concept at this point. I mean...

[Audience] – But I mean if there were a time machine, would it be mechanical or non-mechanical.

I think you can visualize it any way you like. I mean, it's probably more like a drug than a machine.

[Audience] – I guess maybe that's true too. I've often thought about this time travel thing about the fact that we couldn't fly at least in a physical sense until a few years ago and I'm thinking that maybe we can't time travel until we get a mechanical prop to help us along at first. But then later on maybe we'll learn how to do it without a mechanical prop.

Although we've never learned to fly without mechanical props. In fact the more we learn about flying, the less likely it seems you know.

[Audience] – Because it's so easy to fly with a mechanical prop...

And 50 years in -- or 70 years in -- to the history of powered flight, we still haven't a clue to how you could fly without mechanical augmentation. Yeah.

[Audience] – I'm thinking that each time you do a really deep psychedelic experience in some ways you travel to the first time that shamans interacted with the plant world because you're experiencing basically the same connection that takes you out of present time and into something more ancient and more circular. The other thing that occurred to me is if we were slime on the rock, we were pre-historical then maybe up to 2012 we become post-historical and maybe what that means is that we're living life so much that we don't have time to sit down and record it.

Well, post-historical existence would be non-linear, you know. People would live in time the way we now live in space and would spread out. What was the first part of your thing?

[Audience] – If you're on psychedelics and...

Oh, yes. Well that's how I think of psychedelics. I mean, when I say boundary dissolution, the real boundaries I'm talking about are the boundaries of dimensionality. That the way a shaman is able to do what shamans do is by transcending Newtonian space and time. Here is my model of it. The mind is like a crystal growing under pressure and the pressure is the pressure of Newtonian space/time. And, so the crystal grows and takes the shape of it's confinement, but when you liquefy the crystal matrix with a psychedelic, it has another preferred geometry and it unfolds into this second geometry and the second and alternative geometry is more hyper spatial. Culturally, our minds are confined by cultural pressure and cultural phase space to, uh, reflect cultural concerns, you know. How am I looking? How much money do I have? Are my social relations in tact? Is my behavior falling within acceptable and so forth and so on?

Uh, when you take the psychedelics and you dissolve the social confinement, the intellectual confinement, the ideological confinement, then the mind -- it's like taking it out of it's box and it can configure itself in a most comfortable geometry, and it's free. And, uh, the reason shamans know what the weather will be, know where the game has gone [clears throat], know who will recover and who will not recover from serious illness is because they have a relationship to the future that ordinary people lack. They can see the vectors of possibility and propagate them, uh, into the future. In a sense, chess is like good practice for shamanism because good chess players see deeply into the future. That's how you win chess games. It's the person who can see the most moves ahead without obfuscation who inevitably wins the game. That's all that chess is about. So, it's, uh -- And, if you've ever played chess on LSD, uh, you know that it's, uh, ridiculous. [Audience laughs] [Terence laughs] Yes, Cheryl.

[Audience] - Spending time and being liberated from that -- when you talk about transcending time and being liberated from that, is that also being liberation from the body? Because so much of our sense of time is wedded to our embodiment.

Yeah, I mean, this freedom in time usually comes in a state of trance. The I-Ching says, "Keeping still." Trance...

[Audience] –But even after 2012 when there's this radical transformation of what we know as time, is that also a radical transformation of what we know as body?

Well, at other times we've talked about this. There are factions who want to do away with the body. Who believe that somehow in some kind of electrical simulation of the Ketamine space, we will all flow like amoeboid energies from one orgasmic nexus to another; and genital consciousness, body image consciousness, all of this will be left behind. I - I suppose I should have an opinion about all this, but I really don't. If it feels good, do it, is my motto. The choice between extreme artificiality and extreme naturalness, I think we talked about this the first night, didn't we, about the gnostic choice? On one level, it's a choice about the body. I mean, Is the body the glorious instrument of, you know, our interfacing with the miracle of creation or is the body a bag of rotten guts dragging us down ever deeper into Tartarus. Uh, these are just shifts of perspective and people have vehemently argued, uh, both ways. I like the idea of taking the body with you into cyberspace and creating a virtual body. I mean, obviously the body is a product of many millions of years of evolution and generally seems well adapted to the mind that inhabits it. It is meaty, fleshy and perishable. If that could be overcome...

[Audience] – Ok, so the perishability ...

The perishability I think is what I think. What I've said at times in the past is that the task of history is the inversion of the human being. Our goal is to get the soul outside in three-dimensional space and the body folded inside in mental space. Now we have it all wrong. The body perturbs into three-dimensional space. The most important organ, the mind, cannot be seen. It's harder to find than the pancreas, uh, because simply by opening the body and looking around, you can find the pancreas. Opening the body and looking for the mind won't give it to you. It's obviously in another, uh, dimension. Many religious traditions have this idea of building what's called "a light body". They say, life is a preparation for death, you're building an after death vehicle. It's a -- it's a simulacrum of a living body, but it's made of light and it's under the control of your higher intentionality. Uh, there may be something to this. Certainly, you know, we all do build our images according to how we cut our hair, according to how we dress, what particular reconstructive surgeries we elect to have, so forth and so on. We sculpt, uh, the body and when the body is made of light, this will become much easier. I mean, you know, rather than a boob job, you can become a canary if you want [audience laughs] or whatever else is your particular....yeah.

[Audience] – Does the idea that time is compressing contradict the idea that the universe is expanding scientifically?

Well, there's a lot of argument about whether it's expanding or contracting. The measurement seems to show that it's incredibly close to the limit case, to the place where you can't tell. I mean, it's either just barely expanding or just barely collapsing and why it's so close to the limit case isn't clear. Yeah, this contradicts all of that. See, the scientific theory says, the universe appeared from nothing for no reason, 14 billion years ago. It exploded outward. It's cooling. It's slowing down. Complex processes are appearing. Eventually, it will reach the limits of gravitational expansion. If it reaches the limits of gravitational expansion, it will then re-collapse. If not, it will just go forward until entropic heat death. The model that I'm proposing is a little different. It says that the big singularity lies not at the beginning of the universe but at the end. So, I call it not the big bang but the big surprise. What's happening is that process is complexifying. The scientists want to say that the entire universe burst from a point smaller than the electron for no reason. As I said yesterday, this is the limit case for credulity. If you believe that, you'll believe anything.

[Audience] – I have a feeling, you, know I'm not a physicist but it sounds a little strange.

Yeah, how is that different from 'and God said, "Let there be light." It's not different at all. It just uses a personal pronoun in one case and not in the other. I think that there are singularities but that they arise in complexity and that history is the shockwave of the approach of an animal species toward such a singularity. In other words, when monkeys walk toward the mystery, they begin spouting poetry, solving quadratic equations and manufacturing instruments to measure the charge of the electron. It's a sign that you're getting close to, uh, the source of gnosis. That the noetic point source radiates understanding with such an intensity that the closer you approach it, the more you understand. And the closer a species approaches it, the more it manifests cognitive activity. So, we dance, we paint, we sculpt, we poeticize, we construct complex architectonic structures because we are close to the source.

And, the way we are narrowing distance between ourselves and the source is by moving toward it through

time. It exists at a point in time and we are slowly wandering across the epigenetic landscape of becoming and it's a steep hill. So, we are wandering down into this basin of attraction unconsciously being drawn closer and closer to the dwell point. And now the walls are so steep, the momentum so great, that there's no doubt where we're headed. We're headed toward the point of, uh, maximum equilibrium within the system. Yeah. Somebody over here.

[Audience] – A few minutes ago, you were kind of laughing at the ridiculous claim of playing chess under LSD. I was wondering why it would be ridiculous? What would happen?

[Audience] – The pieces would melt in your hands!

Well, the thing is, it depends on how seriously you took chess. If you took chess very seriously, it would be perfectly possible to do it. Like everything else under LSD, the implications have to be kept under control. So, if you could just look at the chessboard and see it as a chess problem, you could probably play chess. But, unfortunately, everything will become symbolic of other things and -- and you will, you know, it's very hard to keep your eye on the ball. You would have to have incredible powers of concentration. You would have to really love chess. Some people can do this. I mean, I know people who cross country ski on psilocybin. I find that unimaginable. I mean, I can't cross-country *open my eyes* on psilocybin. [Audience laughs] So...something?

[Audience] – I've noticed in chess that what disappeared was the complete lack of desire to beat the other person.

Yes, I think that the killer instinct declines. But, if you were looking at it as how deeply can I see into it, it's good probably -- probably the way to take acid and play chess is with a computer. Then you don't get into the personal issues of, you know, what is it on the other side of the board. What I find with psychedelics is, it's always people that are the most confounding. I mean, people, as nexi of complexity, are orders of magnitude more complex than anything else in the universe and can always throw you for a loop if you're -- I mean *always* throw you into a loop, there's not if or anything.

[Audience] – This is totally off the wall. Have you ever pointed a video camera at a TV screen and observed what happens?

Sure, that's called a Hopf bifurcation. That's a standard thing in chaos theory to demonstrate. That's just a feedback loop. That's the equivalent of audio feedback but that's visual feedback.

[Audience] – Extraordinary huh?

Well, if you're making a metaphor to the act of self-reflection, yeah. I mean...

[Audience] – It seems like you're seeing into the particle matter or something; forms getting deep, deep between the molecules. It's very strange. If you mess around with the contrast and the light button at the same time, you can get it just right to pointing in the middle of the screen on a tripod, and then mess around, you can actually video it, too. You can record an empty video. You can make a light show out of that. It's extraordinary.

Well, Ralph Abraham when he was studying dynamical systems built a device, which he called a macroscope. And, what it was - it was two sheets of glass with a liquid like gel or something in between and there was a frequency knob and an amplitude knob. And, you play with these two knobs; you illuminate the glass plate with Schlieren Optics, which is a polarized light system, and project it on a screen. And, you discover, you know, that there is this pulsating pattern, but as you steer with the amplitude and frequency knobs, you can stabilize the pattern. But, what's interesting, when you leave the pattern and try to steer back to it with the same series of moves again, you can't find your way back by repeating your previous action in reverse because it's a dynamical, uh, system. This is what chaos theory, complexity theory and dynamics is studying now. Very new mathematical tools are emerging for studying complex systems and this is precisely what we need. You see, all of modern science up until 1980 was done as an extension of Greek mathematics. You -- you had the perfect Aristotelian solids. Then you have the multivariable equations that come out of Algebra as it evolves into Calculus.

[Audience] – Pi was interesting because it couldn't be computed exactly.

Right. Well, there were all kinds of problems in nature and mathematics that were called pathological or a less dramatic term is, incommensurate. Meaning that you could tell that there was a mathematical solution, but nobody knew how to carry out the millions of operations necessary to do that. Well, now, with computers, computers are making a revolution in mathematics that's very unwelcome among some mathematicians because, you know, with computers, you can perform hundreds of millions of iterative operations a second. The computer becomes an eye into domains of complexity that previously could only be vaguely indicated.

As an example, fractals. Fractals have been known since the late 19th century. They were not called fractals; they were called pathological curves: uh, the snowflake curve, the piano curve, the anti-snowflake curve. These things were known, but you could only calculate them to the 3rd and 4th stage of expression. Now, with a little program on a PC like Fractasketch, you can calculate the 8th, 9th and 10th level of these complex objects and it only takes ten or fifteen minutes for it to draw them for you. So, this is, you know, using technology, specifically technologies that mirror mental functioning, to push us deeper and deeper into the mathematical realm. Yeah.

[Audience] – There was a composer named Cornelius Cardew and he came up with this one composition called "Paragraphs." It was in a John Keats style. It was not musical notations. It had a series of written instructions and there would be forty people that would perform it. Anyway, for instance an instruction would be: sing the word "if" in any note that you hear personally for the duration of a breath. So there would be forty people who would go 'aaaa' and so what they would do, he had, at that time they had all over the country, Europe or America, all these groups of forty people doing it. The variables would be that they had five trained musicians and thirty-five people that just walked in and read the instructions. Anyway, each piece was maybe twenty minutes long with a series of instructions and when you played all of these back to back, there was rarely a difference in the way it would sound and be performed. People would have a tendency to hit A for instance. You know..

You mean it reveals an underlying organization that is not known to be there. Well, this is how the world is put together it turns out. I mean, a story that I occasionally tell that illustrated for me how this works that was very interesting was, I was on a beach a few years ago in Southern California, a very long beach with no people on it. And, uh, I came upon a black round rock that was just deposited there and I noticed, uh,

this rock and I, uh, kept walking along the beach. And, then I came to another black rock exactly like the first one like about five hundred yards further on. I had for some reason, probably because I was loaded on mushrooms, had the prescience of mind to go back to the first rock I'd encountered and count off the steps between the two rocks. It was like 650 steps. So, when I got to the second rock, I began walking continuing down the beach and I counted off 648 more steps and there was a third black rock as I knew there would be. [Audience laughs]

So, you see, what's happening here is that you have a huge bay with this endless beach. Some kind of incredibly complicated equation is being continuously run on the bay as computer. And every 648 to 656 steps, it's solving this equation by depositing a small black rock on the beach. Well, now, if I'd have had a naïve person around, I could have predicted that we would encounter the third black rock and then they would have deified me or offered sacrifice or something at this proof of a prescient knowledge of the future. But it wasn't prescient knowledge of the future; it was knowledge of how fractals work in space and time. And, you know, if you get this attitude, it's a firm basis for a kind of warm-hearted cynicism. So that when people do something wonderful or terrible to you that has been done before to you, over and over again, instead of expressing outrage and amazement, you just notice that 'aha,' it's happening again [audience laughs] as it happened in the past and it surely will in the future. This is how Finnegans Wake is written. It's just within the great fall are suspending many little falls and spread through that are many tiny falls; an infinite regress of repetitious pattern. This is how the world actually works. Yeah.

[Audience] – Science would have said it was incorrect because there was a difference of three or four paces between the distances between the rock, therefore, nothing was proved.

Well, that's Greek science that is trying for a kind of exactitude. But, it turns out, you know, nature is not deterministic. That's why they used to have the idea that you could run the universe backwards and that all the particles would eventually rearrange themselves as they were in the original, uh, situation.

[Audience] - They're slipping back to, isn't it?

Yeah, that you could run it back to the big bang. But, this is an incredibly naïve and simple-minded understanding of how the laws of nature work because the laws of nature are not absolutely determined. I mean, you can run time backward and it will sort of return to where it started from, but, you know, Columbus will not sail the ocean blue in 1492. It doesn't work like that. Once something has undergone the formality of occurring, it is, uh, never to be repeated. It's unique. I mean, that's what's happening. There is this moving wave in front of the class of the possible that slowly at the point of interest, called the now, translates itself into what is actually occurred.

[Audience] - But just now you said, the way things are. It's repetition – the fractals - you know, like, it happens to you again and again but now you say that nothing is ever repeated. On one level it's a contradiction and on another level it's not. I don't understand.

In a fractal, there is no contradiction. These two statements are both true. Here's the first statement. Everyday is like every other day. That's generally true. Here's the second statement: but, occasionally, amazing things happen. That's also true. You have to round one of the big corners in the pattern. So, everyday is like every other day. Every century is rather like every other century and every million years is sort of like the million years that preceded it. But then at the fine scale, there are incredible surprises. So,

everything oscillates between its sameness and its uniqueness. And, it is co-temporaneously both unique and part of a universal plenum. I mean, this gets close to some kind of Buddhist idea. Uh, uniqueness is the thing that hasn't received enough attention. That's why, you know, I'm a Whiteheadian. I think Whitehead dealt with uniqueness with more care and attention than anybody else has. Yeah.

[Audience] – *You have to follow this path. Take that first step and you're good.*

Well, yeah. Boolean algebra, which is both/and logic wasn't invented until the late 19th century, so there was this long, long period where you had to make this choice. This is again what's called "the fallacy of misplaced concreteness". The idea that ideas are things therefore they have to be A or B. They don't have to be A or B. They can exist in a both/and situation. I had a professor who seriously advocated, he said, "You want to know when the world went wrong? It went wrong when the Greeks stopped being fishermen and pulled their boats up on the sand and starting talking philosophy," and the road to hell was paved broad and straight from that point on.

In alchemical thinking, which existed like a counter-cultural alternative to all this Aristotelianism, there is what's called the *coincidentia oppositorum*. I found this very useful. It's a psychedelic idea, a Jungian idea and an occult idea. It's the idea that you have to practice thinking, holding two contradictory thoughts in your mind at the same time. Uh, this is a way to snare the mind and it's truer to reality. So, like, it's also a great way to name books, by the way. If you ever have to title a book – this was advice from a New York editor. He said, "You have to have a title that contains a contradiction." "True Hallucinations" [audience laughs] or "The Invisible Landscape" [audience laughs] or "The Archaic Revival" [audience laughs] or "Black Neon" – a book I haven't written that will be my foray in pornography, uh, if I haven't made it already.

This is the way to do it, to oppose these things. That's called a *coincidentia oppositorum*. That's what life is really like, you know. I really love you and if you really knew me, you would know that I don't. You can depend on me for the next thirty seconds, and so forth and so on. I mean, this is what life is really like and people hate it because they want to extrude this residuum of the uncertain. They say, I want you to be dependable or I want you to be X, Y, or Z. When, in fact, everything is shifting and changing.

I see I'm over time. This leads me to my final point. First a question I'd like you to think about. We can't discuss it here, but it's, uh, "Are we psychedelic people different from anybody else?" We make the claim that we have found the answer. That it is suppressed by an ignorant and intolerant world. We sound very much like the kind of whining that goes on among Mormons or Jehovah's Witnesses or anybody else [audience laughs] who has some screwball theory that if the world would but listen then everything would be fine. So, I'm very interested in this question, you know. Are we morally superior? Are we intellectually superior? Do we treat our children people better? Psychedelic users, that's what I'm talking about, uh, because that's the bottom line is, you know. Does it inspire better lives, more love, greater care – that's the question? And then the last thought I want to leave you with which is sort of a *coincidentia oppositorum* thought because it will bum some and exalt others is the one thing that I've learned from psychedelics that seems secure over all the decades and the, you know, embracing one idea, one ideology after another. The one thing that seems secure is a truth that is hard to hear in the context of a dominator culture with an obsession with the material world. And that truth is that nothing lasts. Nothing lasts.

You know, your enemies will fade. Your friends will fade. Your fortune, your poverty, your

disappointments, your dreams - everything is in the process of changing into something else. So, your agony is about to be assuaged. On the other hand, your happiness is about to be destroyed. So, the obligation that comes out of this realization is an obligation to the immediate moment, to this thing that I've been calling "the felt moment of immediate experience." It isn't who you were or what you were or who you will be or what you will be; it's the felt moment of immediate experience and this has been robbed from us by media and by our tendency to denigrate ourselves, to see the world in terms of the great ones not here, whoever they are. Aristotle, Madonna or Jesus – whatever your particular bent is. Um, the overcoming of neurosis, of unhappiness, of toxic lifestyles is, uh, the felt presence of immediate experience in the body, in the moment And, you know, psychedelics, sexuality, gastronomy, sport, dance – these are the things which put you in the felt presence of the moment.

And, that's really all you ever possess. Your memories are eroding away. The futures you anticipate will mostly not come to pass and the real, uh, richness is in the moment and it's not necessarily some kind of 'be here now' feel-good thing because it doesn't always feel good. But, it always feels. It is a domain of feeling. It's primary. Language is not primary. Ideology is not primary. The propagation of future and past vectors is not primary. What's primary is the felt presence of experience and that is the source of love and that is the source of community.

And, if you get that together as people always have in the past, or we wouldn't be here – they to some degree succeeded with this enterprise – if you get that together, everything will flow with considerably less resistance and you will find it in yourself, I think, to have enough inner equanimity and peace of mind to triumph over whatever life throws your way, whether it be, you know, poverty, obscurity, wealth, fame, power or the absence of power. All of these things should be dealt with equanimity because all are ephemeral. All are in the very act of coming into existence, uh, passing away. "*Panta rhei*," Heraclitus said. All flows. Everything is both simultaneously coming into existence and dissolving away to make room for something else. Clutching doesn't work. Fearing doesn't work. The only thing which works is a kind of affirmation to the process. And, uh, psychedelics, to my mind, are the medicine that clears away the obstructions that make it difficult for us to touch this existential core and that's what life is all about.

And that's the end of the weekend. Thank you very much.

[Applause]

I was going to, uh, mention just three books—I might mention more as time goes on—but these three are, uh, central to understanding what I'm going to be saying this month and they're very different books. Some of you—many of you—may have read this one which is, *The Chalice and the Blade* by Riane Eisler. And this is the book that talks about the partnership versus dominator model of society and gets the gender tension inherent in the matriarchy/patriarchy way of framing that problem. It gets that out of the way because it just says: dominator and partnership. And, she believes and offers evidence that there never was a matriarchy, that that whole notion of a pendulum moving between patriarchy and matriarchy is not, uh, valid, and she and I are in agreement in that we both see something very important happening to human beings around the emergence of pastoralism, around the time when the domestication of cattle became a major concern of human beings.

Uh, this great goddess, uh, religion that was worldwide in prehistory is inevitably, uh, a cattle religion. And, uh, she talks a lot about this and she talks a lot about early cultural accomplishments - uh, she's trained as an archeologist - early cultural accomplishments such as Çatalhöyük. This is a civilization in southern Turkey that is important for my argument, too, because it was very, very early and achieved a sudden and extreme flowering of culture like nothing that would -- nothing would rival it for several thousand years. Mary Settegast calls it, uh, a premature burst of complexity and brilliance.

And, uh, Riane Eisler uses, um, dynamic theory borrowed from modern mathematics - borrowed from, uh, uh, Ralph Abraham who I'm sure many of you know - to make cultural models. And so, there's been a lot of excitement about this book among feminists, but what has been sort of overlooked is that this is the first time there was ever a mathematical, uh, application of dynamics to human history. So, this is a good book and she is not psychedelic. She and I did a weekend together at Ojai which was -- where she was wonderfully generous and tolerant of my dancing around in the middle of her parade ground because I'm saying, you know, that the dynamic that drove this cultural transition had to do with psychedelics, and that this goddess cattle religion had to be also a mushroom religion. And later today even maybe we'll talk more about that.

The second book, which I think you'd enjoy—and I don't know, maybe they have -- they have this at the bookstore, they should have this—it's called, *The Creative Explosion: An Inquiry into the Origins of Art and Religion*. Now, notice that both of these books that I've recommended contain long passages about sudden

outbursts of creative brilliance on the cultural level. This is very interesting to me because this is, uh, the stuff called "novelty" that we talked about a little bit yesterday. And tracking these outbursts of brilliance and complexity in cultures and in our own lives is the way we confirm for ourselves the existence of this, um, topological manifold over which probabilistic, or previously thought to be probabilistic events, are flowing. What Pfeiffer, John Pfeiffer is saying in this book is -- it's a study of the cave art of Spain and southern France - and what he's saying about it is, you know, that some of these things are hundreds and hundreds of feet underground down very narrow passages and you have to go through all these contortions to get to them. Anyway, he's saying that this was a, uh, manipulated environment, that these were created and placed in this way to evoke very strong emotional responses from people. And certainly even today, with very high-powered flashlights and nylon ropes, and all of this stuff, it's a very big deal to descend hundreds and hundreds of feet into the ground. You could imagine people who had tallow lamps. And, it appears that they went into these places and made these things, uh, and then only returned very briefly, uh, on a cyclical basis, uh, afterwards. In other words, they didn't inhabit these places; these were ceremonial places and what he's talking about is the high Magdalenian, which is, uh, 19,000 to 17,000 years ago when, for the first time, there was, uh, bone and antler technology. In other words, the Stone Age is ending and there's a bone and antler technology and there's this tremendous, uh, outpouring of creativity, mostly vented on a depiction of these animal images of animals that were in, um, a state of semi-domestication or balanced upon the probability of domestication. So, what we're seeing are herds of deer and cattle and, uh, primitive sheep and this sort of thing. So, both of these books point to unexplained outbursts of creativity in the human past and document them very well, but without offering a causal mechanism.

Now, on a partly more practical bent and this directly addresses the psychedelic issue. If you're at all interested in psychedelic plants, this is, uh, the bible. It occurs in several different forms. This is, *The Botany and Chemistry of Hallucinogens* by Richard Evan Schultes and Albert Hofmann. Schultes was the Harvard botanist who basically single-handedly created the field of ethnopharmacology. And, uh, early on, Schultes understood that what, uh, native peoples were saying about disease and plants was very, um, touched with folklore and cultural factors, but what they said about psychoactive plants, you could rely upon. And, so, he reoriented his career towards the psychoactive and through the 50s, the 60s, the 70s and the 80s, he and his graduate students basically shed light on a previously completely unexplored area of botany and we know through books like this and you may have seen his more popular book, *Plants of the Gods*, uh, these basically list and discuss the major psychoactive plants of the third planet from the sun and, uh, if you need -- if you need information, this is where you go and there are extensive bibliographies. This is the first edition and it's now been issued in a second edition. But, this is pretty indispensable. There are a few other books, too, but this is the one to start with. So, that's sort of business. People should be directed toward books that then expand the basis of what's being said. Does anyone want to say anything about yesterday and go back over any of that?

I thought I would talk a little bit today about, uh -- see the way I imagine this happening is, if there's nothing else going on, then there are facets to this thing. And they may not appear to be connected to you at first, but I will just then choose one of these facets and, uh, talk about it. So, a facet that was brushed on yesterday that needs to be really brought forward and understood clearly is, um -- it kind of comes under the general, uh, banner of the feminine. That from several different points of view, I want to talk about how the psychedelic experience reflects on and relates to the feminine.

First of all, a lot of this has to do with how I think of the origin situation. I think everything was set then. And, uh, women, I think, well -- it happened like this: That there was specialization in these early proto-

hominid and hominid populations and it generally divided along the lines of that the women, because they almost always had babes at breast, were more collectivized and more traveled less. The men hunted and the women kept the children and all that together, and the women were gatherers—this is the important thing—that the women were gatherers and that what they were gathering was food and what they were gathering was plants, primarily. So that, uh -- I'll show you something here. This is a description of a plant. You see, before the era of color lithography, botanists tried -- had this need -- to be able to exactly describe and differentiate plants, one from another. So, here is just a bit of a description of a plant. The plant is, uh, *Methysticodendron Amesianum*, and this is what is called, "The Taxonomic Description":

Tree up to twenty-five feet in height, leaves membranaceous, dark green, very narrowly ligulate, apically acuminate, basically long attenuate, marginally commonly subundulate or undulate, 20 to 26 mm long, 1.3 to 2 cm wide, minutely and irregularly pilos on both surfaces, flowers up to 28, usually about 23 cm long, apically 10 to 13 cm in diameter, very strongly sweet scented at sundown, calyx spathaceous green, papyraceous or membranaceous, 2 to 5 fid with acute teeth, 3/5ths as long as corolla, very minutely pilos, corolla divided 2/3rds to 4/5ths it's length, usually with 5 lobes but usually 4/6 membranaceous, white spatulate or subspatulate, rhombiform, long acuminate and circinate.

That's half of the description.

Now, the point of this is, the need to describe a plant puts tremendous pressure on language to accommodate itself to difference; that's what they're doing there. They're attempting to create a word picture that will make it possible to tell this thing from any other thing. Well, women who were gatherers in this early situation were under tremendous pressure to elaborate a vocabulary of visual distinctions. You know, you eat the thorny one, not the smooth one. You eat the one with the leaves that have the crinkle on the edge, but not the one with the leaves that have the furry underside. And this kind of need put on real pressure for language. Men, in the hunting situation had, strangely enough, the pack-signaling repertoire that we came down from the trees with. It's pretty sufficient for a pack-hunting situation. In other words, you had forty or fifty barks and yells, and you can direct a complex hunting operation. You don't have to have this tremendous stress on adjectives, you know. Uh, and the major stress in hunting is often stoicism and silence. You know, I mean, it's not a rappy undertaking [audience laughs] and, to this day, it's thought to be a sexist observation, but when you go into villages of native people and they always speak of the chattering of the women. And this is true. I mean, women chatter a lot about the details of ordinary existence. This is what they are heavily linguistically programmed to be into, is the details of, uh, ordinary existence and especially in this matter of food.

Well, um, the way in which the mushroom fits into all this is that, um, when the African continent began to dry up—this happened over a very long period of time and it wasn't just a gradual phenomenon; there were glaciations and interglacial periods—but, generally speaking, over a past half million years, Africa has experienced a progressive, uh, aridity, and this forced our remote ancestors down onto an evolving grassland situation. Simultaneously, with all these changes going on in the proto-hominids, a lot of ungulate mammals were evolving in this sudden, rich grassland environment. Um, and in the dung of these particular mammals, the psilocybin-producing mushrooms found a suitable environment. They are that kind of mushroom, which is called coprophilic, means likes dung. And the, uh, the mushrooms used in the Indian cults of central Mexico are not coprophilic mushrooms with one exception. They are ephemeral, deep forest mushrooms and indemnified, um, um, community of species that seem to have evolved there. But, the exception is in the genus *Stropharia* where you get these coprophilic mushrooms, *Stropharia*

Cubensis and its, uh, conspecific species, and they appear wherever there are cattle of the *Bos indicus* type, which is the zebu, the humped white cattle. This is a very primitive form of, uh, Asian cattle, probably the nearest living relative to *Bos primigenius*, which was the prototypic Ice Age, uh, cattle. So, um, the mushroom occurs then in this situation in the manure. Well, the pressure on the environment is for protein is intense and I saw myself in Kenya, tribes of baboons on the veldt and they would go over and examine cow-pies and flip them over looking for grubs underneath them. So, it's in the repertoire of the behavior of these apes to associate these things, and the mushroom presents itself as a completely startling phenomenon in the natural environment. I mean, I've seen them in pastures in the Amazon the size of small dinner plates and on stocks 11 inches high, you know. So, we're talking a hefty, uh -- a hefty piece of protein. The question is, can you eat this thing?

And the, um -- what happens, you see, when you eat a little bit of psilocybin--and this was shown by experiments by Fisher years ago--is that there's an increase in visual acuity. It's very slight, but measurable. Well, this means that it gives you an evolutionary adaptation in the hunting situation. You have better eyesight than other members of your group, and than you, yourself, had before you admitted this item into your diet. Well, you know, this is a self-reinforcing situation on a scale of thousands and thousands of years. Very quickly, those not availing themselves of this quote/unquote "artificial" augmentation to sensory clarity will be bred out because, uh, there's just no percentage in poor vision.

Uh, at slightly higher doses, the psilocybin causes, uh, sexual arousal. Well, again, you don't have to be an evolutionary biologist to understand that the number of successful copulations that you complete has a direct bearing on the success of your reproductive strategy. And, these are all numbers games, you know. Those who fuck more, have more children is what it comes down to. So, if a certain dietary, uh, item is causing sexual activity, well, then, we're going to see more and more of the children of the people who indulge in that dietary item and this can be very unconscious, you see.

And then, the third thing, of course, at higher doses gives way to this mystical tremendum, or this entry into hyperspace. What this has to do with the feminine is that, uh, I think, that the women would have been the gatherers of the mushrooms. The women were the keepers of the reproductive mysteries, anyway. This cow cult that got going, it's very clear to me that from the primitive -- from the point of view of a preliterate person, the mushroom comes from the cow. I mean, you can't explain it any other way. It has no seeds. I mean, this was puzzling to people up until the 16th century. They couldn't figure out where these things ever came from. They were accustomed to the notion of plants having seeds. But, these mushrooms which sprang up over night, just seemed mysterious. So, I think very early in prehistory there was a religion, which was a -- a celebration of the feminine, a psychedelic religion, an orgiastic religion to take account of this arousal factor in psilocybin. It was in this environment over thousands and thousands of years that humanness emerged. And environment of boundary dissolution of, uh, uh, where erotic connection was actually the basis of community, and where there was a constant exposure to this unlanguageable, unassimilable, um, mystical tremendum and the psilocybin was acting then as a tremendous catalyst for language. Because, remember, I think I said this -- that it's primary role in prehistory and in the present possibly is as to catalyze linguistic shifts because linguistic shifts then give culture permission to follow and erect whatever edifices it wants.

Now, throughout prehistory, this vegetable goddess is a, uh, horned goddess. It is a goddess of the moon, a goddess of cattle and a goddess of plants. And, what I'm suggesting in this book I'm writing and I should try it out on you because I won't -- you're my best shot is the notion that, um -- and I said this before but I

repeat myself and things make more sense when heard again -- that the natural human condition is actually a condition of symbiosis with this hallucinogen, this particular hallucinogen. That the mystery of who we are and the mystery of why we are so bereft and why history and why all this malarkey, is because things went on 15,000 to 25,000 years ago that we have not -- we have repressed and never faced the implications of. That we actually had a symbiotic relationship on the mental level with some kind of feminine over-mind. And, you know, never mind all the questions which this raises about where is it, what is it, how does it do it, but just that the Gaian, uh, process is more than a process; it is a self-reflecting, uh, entelechy of some sort. How can we pass judgment on this? What do we know?

The Earth is five billion years old. Intelligence may come in many forms. Self-reflecting awareness may come in many forms. Uh, but, what seems clear is that, uh, there was a dialogue with this other, and there was balance and there was wholeness, and there was a way of being which, well, it was paradisiacal. That's why we are so haunted by the loss of it. That's why all of our ontologies are the story of how something was taken from us. Something was lost and, uh, it's nobody's fault exactly. I mean, it really has to do with the processes of the planet, that this partnership paradise that arose as we came to consciousness in the cradle of Africa was dependent on the continuation of this extremely rich grassland environment, which was, in fact, a transient phenomenon. So, that by 8,000, 10,000, 12,000 years ago, visible pressure was being felt by these populations in Africa. And, you see -- each time there has been an interglacial period over the last 100,000 years, uh, human populations--and in the older strata proto-hominid populations bottled up in Africa--have radiated out across the Eurasian continent. But, only in the last interglacial, 20,000 years ago, were those people leaving Africa true pastoralists. They had flocks. They had skin tents. They had a religion. They had language. We know this, I mean, there is just no doubt about it. Before that, they were, uh, nomadic hunter and gatherers.

So, this relationship to the mushroom and the relationship to the cattle--actually, the first payoff--was an entirely new order of civilization. The symbiotic relationship with the cow, which made life much, much easier either fueled by or fed into the symbiotic relationship with the mushroom which gave more successful hunting, better sex, and religion. So, there were all these factors feeding into this situation. Now, when these people got out of the Middle East -- I mean got out of Africa and settled in the Middle East -- it was a much dicier situation. And, if you know anything about Middle Eastern archeology, in Palestine, there is a great puzzle because, uh, before 9,500, it's virtually empty. This is the interglacial, uh, ice reached as far south as Sidon in Lebanon and this area was all frozen up. But, that as the glaciers retreated, suddenly there are people at Ain-Saba and later at Jericho and at several places, and it's always been assumed by, uh, archeologists on basically chauvinistic grounds that this must have been an outpost of old Europe, that the Balkan Yugoslavian area that Marija Gimbutas has written so much about. Because these people are so advanced, they're called Natufians and they appear very suddenly in the archeological record 9,500. A thousand years later, they build Jericho, which is, at that time, the most advanced, uh, city site on the planet. And, uh, but, before they build Jericho, their habit of building was under rock escarpments. And, this is the same style of Neolithic, uh, building that existed in the Tassili Plateau of Algeria.

So, in the absence of much archeology to support either side, I think it's reasonable to think that these people may have come out of Africa. And, in fact, there is some evidence of this because there is what's called, uh, uh, Burnished Sudanese Ware Four, is found in these Natufian places and Burnished Sudanese Ware Four comes, uh, from deep in what is now Ethiopia. So, there was, at least, trade and I think, based on -- and the people who write about all this, have commented on the African motifs because, uh, -- while

we don't have much art from Jericho, these people a thousand years after Jericho, by now it's 7,500, they built Catalhoyuk in southern Anatolia, and this is truly a science fiction civilization. I mean, it's freakish. It's 7,500 BC, uh. The pyramids lie 3,000 years in the future. So what about that? Well, we don't know, but, uh, one of the -- one of the questions that will remain unanswered in this month is why? Why is there this synergy between the plants and the human being? Is it chance? Is it just that this is how it works out and now we are now self-reflecting enough to be able to unravel the threads that went into the confluence of, uh, influences that created us. Or is it plotted somehow? And this is then the extra-terrestrial gene theory. Is this thing somehow strewn in our way?

Because, you see, I don't buy any of the extra-terrestrial intervention theories that have them landing on the White House lawn or projecting images into the minds of people who live in trailer courts or all these things they're accused of doing. The one thing I grant extra-terrestrial intelligence is: great subtlety. And probably a long time scale to do whatever they want to do. It's possible to reach a point of, uh, deconditioning--it's a kind of reconditioning, but also deconditioning--where it seems obvious that the planet must be monitored. It is, after all, such an interesting planet. It seems that if anyone could monitor, they would. I mean, we've already now, through the probes we've sent into our own solar system, seen about thirty-three worlds. And they all fall into various classes, and not one comes anywhere near to what we are. We are what astrophysicists have given the charming acronym: We are a WHORE. A WHORE is a water heavy, oxygen rich world and water heavy, oxygen rich is rare, rare, rare, rare, rare.

So, it may very well be that every one of these is closely monitored. Well, once you allow that notion, then the presence of the psychedelic genes, the psychedelic, uh, activator in the environment begins to look more like a sort of biogenic engineering. It is curious that what these psychedelics do on a -- on a scale of the community is they release new ideas. You become a bearer of new ideas, or new tools, new techniques, new ways of doing things. And that this is how culture moves forward. That culture is a phenomenon dependent on the generation of ideas, plans, notions, connections. Well, this is precisely what these compounds are doing. So, is that a coincidence or is that, uh, part of the regulator? Are we, in fact, somehow managed towards some point? And then the question becomes, of course, for what? And then it devolves into the realm of science fiction. I had a -- I had a professor once who had a fairly grim view of things. His notion of what human history was all about was that, uh, it was a, uh, radioactive minerals mining project. And that when we finally had all these nuclear weapons stacked up like cordwood, somebody would come from another world and say, "Thank you very much! [audience laughs] This is what we wanted and you've done a good job" [audience laughs] [Terence laughs]

All of human history was to get to stockpile plutonium for somebody else's very good reasons. Well, I don't think it's anything quite so Jack Armstrongish as all that because what I sense in the mushroom is a tremendous heart -- a tremendous, you know. It's well beyond all of that. It's a -- it's an emotional, intellectual, feeling toned kind of thing. But, is it a benevolent, galactic monitor? Is it the beating heartbeat of Gaia? Is it this entelechy that I spoke of at the beginning of the hour that is somehow the sum total of process on the Earth? Or, is it possible that I have been, uh, remiss in my assessment of the capacity of human beings and that this is nothing more than us? It doesn't seem to me like us. It -- It doesn't look like that to me.

I got into this game originally as a kind of an art historian, and art historians are -- you track motifs over centuries or decades depending on your bailiwick. And you -- what it really is, is the exploration of the human unconscious viewed as art. Art -- you learn what people have made, can make, and do make in the

realm of images. Well, the thing that was most astonishing to me about these high game psychedelic states is how unfamiliar it is. How totally unfamiliar it is even if you've made a study of the productions of the human mind in the visual dimension. So that, it -- to me, and again this may be my own psychology, what is always left out of descriptions of the psychedelic state, the deep psychedelic state, is how weird it is. I mean, a hair-raising oddness that adheres to it that is, I call being in the presence of the other. The other wants to be as acceptable to us as possible. It doesn't want to frighten us, it doesn't want to appall us, but it's very hard for it to perceive what our parameters of expectation and bearability are. I mean, that's very, very clear.

Uh, one of the things after years of smoking DMT and trying to form a metaphor for it, I finally realized that this place that I kept bursting into was, um, the equivalent, it was somebody's idea of a playpen. It was somebody very weird! This was their notion of what a human being would feel most comfortable with. And so, you know, it was rounded, enclosed, there's a low hum and it's white, and these, uh, language elves that come hopping out of the woodwork to transform themselves. Those are the equivalent of what you hang over a baby's cradle. You know, bright colors, moving lights; that will keep them busy! [audience laughs] While -- and, and, and, it was a shock to me to realize this because I realized it profoundly. It's true, that's what it is. It's some kind of environment designed for a human being who has just been transported across hyperspace and is going to be observed for two minutes and fifteen seconds, and then sent back.

And, uh, why should it be that way? Does this really have anything to do with the spiritual life or is this some skewed off other tack entirely? I don't know. There are suggestions, there are hints, but by no means has the support of a broad river of tradition. For instance, um, the 56th fragment of Heraclites who was a great guy and was one of us. He would be comfortable with this situation, I'm sure. The 56th fragment of Heraclites says, "The Aeon, the Aeon, is a child at play with colored balls." This saying is 2,600 years old, what is it talking about? Who knows? But, then you break into this place and you see the Aeon, and it's a child and it's playing with colored balls. You say, "My God, you know, it's like you're not meant to know this stuff."

The Cabeiri in alchemy are the children that are generated in the alchemical process—not the homunculi—but these are the little elves of the metals that come out of the retort and can be seen dancing, uh, in the fire. These -- this archetype or motif, whatever it is, is hair-raising when you encounter it because it doesn't look like an archetype or a motif; it looks like a little man eleven inches high, or a self-transforming jeweled basketball, or an object from a -- another dimension. Very puzzling. The parameters cannot be known, or at least are not yet known. I mean, perhaps it's foolish to say the parameters cannot be known. We are like explorers. We--anybody who goes into this psychedelic dimension—we are all going to go into the books as pioneers because it's too early for us to be anything else. There's no maps, no finished database, just anecdotes of the crazy, crazy stuff that goes on. That's why it's so important to, uh, to try and share this stuff.

[Question]: Doesn't the comparison of -- it sounds to me that the DMT experience and you've said other people have had very similar experiences with the languages and the elves and all this. Does your comparison with that and other hallucinogens help you draw a conclusion as to maybe this particular one is more off the wall and more...?

No, I think it's a place that you approach by different strategies because a high dose of psilocybin will

eventually put you into a place where you have to say, "My God, I can't tell it from a DMT flash." And a high dose of ayahuasca will eventually carry you exactly to the same place. The difference is that the DMT -- if you -- the only way you can evade the DMT is mechanically. That means, only if you take too small a toke will it fail. If you can take a big enough toke, it will deliver the goods. While with the psilocybin mushrooms, with the ayahuasca, you have to be a navigator. You have to know how to tack, and breath, and descend, and level and maybe a little mantric flash and dash -- it's trickier. But, uh, with the psil -- with the DMT, you know, by God, it has you if you get enough of it.

You know, they used to say during the Mughal dynasty - they used to say of the city of Isfahan in Persia that it was half the world because of the beauty of the vaulted ceilings of its mosques. Isfahan is half the world. Well, DMT is half the world. It's just -- I would be totally despairing if it didn't exist because it holds back the premise of the mundane. The premise of the mundane is shown to be ludicrous beyond belief and not worth a moment's trouble. It's just ruled out of bounds, you know. The world is - I'm sure you've heard me say this: The world is not only stranger than we suppose; it's stranger than we can suppose. I mean, think about that. It is stranger than we can suppose! And when you sit down with a notion like that and let it sink in, you realize that any conservative habit of thought is totally skewing you away from the quintessence. And, it's personal, that's the other thing. The world isn't this unbelievably strange thing which is out there. The world is this stranger than we can suppose thing, which begins from the core of us out. That means nothing can be taken for granted. It can be taken apart. It can be put together many, many ways.

I mean, I really -- a short definition of Tantra--you probably all have some notion of what Tantra is--a short definition of it is, it's the shortcut, that's what they say in India. The premise of Tantra is that a single being can attain enlightenment in a single lifetime. That's the premise of Tantra; that in a single lifetime you could attain enlightenment. Well, imagine if you took that seriously? How much more engaged you would be with the problem of figuring it out? What if the only place you can figure it out from is a living body? And so, you get eighty, ninety years in a living body, and if you haven't figured it out by that time, well then your dead and that's it. But, during that time, you had a crack at the big one. There was nothing holding you back from figuring it out and then transcending such absurd notions of life and death and here and now. So, it's like an opportunity. You get to walk out on the court, they pitch you the ball, and you have a chance to make an eighty foot set shot, and if you don't [audience laughs] -- into the bin with that one! [Terence laughs]

Oscar Janiger, who was a great old LSD researcher and who runs the Albert Hofmann library in LA -- when he and I first met we were sort of testing each other and he has a famous reputation for being irascible and we were sort of fiddling around and then I mentioned DMT and he just beamed and lit up, and said, "Now, that's something, my God!" And, this is what everybody says when you push them. They -- it's, like, admit that it is what it is, but it never occurred to them to go further, to look into it and to see what could be done with it. Of course, it's sneered at them from two directions. It's called the businessman's trip because it's so short. The old thing in the 60s was that you could do it on your lunch hour. Well, what I want to know is what business are these businessmen in? [audience laughs] Because -- and then the other thing that was said of it was it fries your brain. Well, that's a subjective statement about what it is like to have it happen to you. It doesn't fry your brain. The fact that it reverses itself in seven minutes shows that it probably can compete with the world's five or six most innocuous drugs because that's a way of thinking about how your body handles a drug. My God, if it can return you to the baseline of consciousness in seven minutes, then it's just immediately turning this stuff into harmless byproducts

that go into the urine. It means it's safe. Well, you see, we're reaching scary conclusions here. We're reaching the conclusion that the strongest of all hallucinogens is the safest of all hallucinogens. That would carry with it a certain implication about doing these things.

And yet, what is on the line when you do DMT is not your body, but your maps, your structure, your belief system. I've never seen it hit anybody quite as hard as it hit me, but I was transformed in a moment from a Marxist skeptic scientist. I just -- it was then and I will say it still is now; it is pure 100% magic! It's magic! It's not a drug; it's an event. It's not something that you do; it's something which happens to you. And people come out of it saying, "What happened? What happened?" You say, "You did it!" They say, "That's what happened, I did it? I just smoked that. That's it?" You say, "Calm down, the trip is over." They say, "'Trip? You must be crazy to call it a trip. It's not a trip. It's a -- it's a -- it's an event. It's like being struck by lightning!" Have you ever had one of these things? It's a lot like an automobile accident. An automobile accident is a very interesting thing because you're going along, everything is ordinary and then reality just begins to unpeel. You have this very, "Oh, man! God, I can't believe it." [audience laughs] It continues to go on and you say, "Wow! It's really happening." [audience laughs]

It's exactly like that. You know, I mean, it's just a collision with another modality. I have, uh, on DMT made sounds, the intensity and purity of which it would immediately convince you that no human being could do this. I mean, it's just not the way humans do it. It has this synthesizer steady and I'll bet the wave is absolutely flat down as far as you care to look into it. It's as though we don't know what we are. It's as though this is the control panel in the human animal and you discover, you know, the monkey form, the third planet from the sun, all that was a mere fiction. And the reality is this other thing. And then why is it -- why does it have the character that it does? For instance, both ayahuasca and mushrooms approach this place from different directions, but the DMT and the psilocybin have this unexpected science fiction aspect to them. This is what the art historians left out. This is what you don't get in Hildegard Von Bingham. You don't get the machine, the deep, iridescent, highly polished surfaces that are clearly made somewhere, manufactured. You don't get this cosmic viewpoint where the history of the solar system and the local history of the galaxy is being called upon to validate what is being said. In short, why is it so cosmic? It's different from ayahuasca. Ayahuasca is a heart-opening, earth-centered, earth tones, uh, pastel, flowing water, organic form, fish in the river, mothering, canoe, animal type thing. It's that even in Hawaii or British Columbia. It isn't the Amazon unless the morphogenetic field is amplified without subject to the universe-square law.

Well, this is really mysterious stuff that human cultural forms should be scripted in to plants - what exactly is going on here? Uh, one of the things you can do with psilocybin and, uh, ayahuasca that's very puzzling and should be studied, is you can, um, when you get equilibrium in the state, uh, project a motif. Let's say art deco. Suddenly there will be thousands, thousands of art deco objects: water pitchers, cigarette lighters, automobiles, hood ornaments, uh, sculpture, grill work, and then you can just instantly -- you can say, "Italian Baroque" and in a single moment, you know, you're at the church at Santa Maggiore and seeing all this gold work and all this stuff. And then you can say, "Surprise me." So, what kind of a dialogue is this and what kind of an entity is this? Is this part of the spiritual quest? Is it off in it's own domain?

The language of ayahuasca, a way in which ayahuasca and psilocybin slice it differently, is psilocybin actually speaks. There's an informing voice. It tells you. The language of ayahuasca is visual. It shows you. You become like the eye of the cinemascope camera and after a good ayahuasca trip, you just feel like your eyes are sticking out of your head. I mean, it's like going to Madison Avenue to buy art or something.

You've looked at so many prints and you just look and look, and you've been looking and looking because that's how it does it. And, you know, what I said on Friday about the more perfect logos, this thing which is visually beheld? See, what we're doing is mucking about in the domain of profound mystery and I really can't help you. I don't have answers. My one answer is my little time wave which I'm willing to share with you, but, uh, ideas in this domain are a dime a dozen. I mean, my dream was always to catch an idea because I saw that's what the psychedelic thing was. And, some of the ideas are tiny ideas, amusing and preposterous, but utterly worthless. And then the large ideas leave you just, "bubububu" like that because they go by and tear your nets to shreds and your main concern at that point is to row for shore. But, every once in a while, there comes one of manageable size that you can actually wrestle into your little boat and take back to astound everyone in the village with.

And the time wave -- I have the feeling that in the DMT ecstasis that the time wave gets about a minute -- about three seconds because they say, "Look at this." You say, "Oh, wow! That's amazing!" Then, they say, "My God, but look at this." "But, look at this!" And each one of these, your amazement is genuine and your reaction is correct. You are being shown the most amazing things you've ever seen. It's simply that you cannot retain what they are. So, the goal is, first of all, to be there, to know about it and to draw strength from the evidence for magic. But, then the higher calling is to be a hunter. To find something, to bring it back. If that's a little too meaty a metaphor for you, well then think of yourself as a noetic archeologist. We want to bring back an object: a flower from hyperspace, a machine from another world. Apparently, the easiest things to bring back are ideas. And so, we have to pay a lot of attention because ideas can cross the barrier - very little else can, but if we pay sufficient attention, I think all -- much of these ideas can be brought across and we can bring -- nothing is unfair. I mean, computer graphics, voice operated tape recorders, uh, anything that works and this is -- we've hit the main vein of ideas out there in hyperspace and the goal is to just fill our knapsacks as full as we can and then get back to base with this stuff. [audience laughs]

I guess really, I mean, I'm about wind it down now. The real point of this month and I have to keep clearing it back and reminding myself and you -- is that we've discovered something and that we don't know what it is. And we're like the monkeys in *2001* dancing around the monolith, but this is important! I mean, that's almost all we can say at this point. But, it's very, very important. The world will never be the same once the implications of this are worked out and since I believe a lot of this impact is going to be in psychotherapy and I see you guys, that probably many of you will be psychotherapists, or therapists or doctors; you're going to have an impact and be involved in this. But, basically we're just clearing a space for a discovery. And it's a hard discovery to announce because we don't know what we've discovered. We just know we've really discovered something. Fire must have hit with this kind of impact and look how long it took to work out what you could do with it.

Well, that's it for today. Thanks very much!

Easter 1987

Esalen Institute, Big Sur, California

Description

- [Audio Link \(Psychedelic Salon\)](#)
- [Transcription](#)

At each of these weekends we usually update people on, uh, books on the subject that are available. One of the things that people don't do enough of when they do psychedelic work is, uh, spend time in the library. I mean, there's a great deal of published literature on these things - historical, chemical, so forth and so on. And uh, it's good to be informed. I know that I often- I use reference books; I use Schultes' *The Botany and Chemistry of Hallucinogens* for those aspects. Peter Stafford's, uh, *Psychedelic Encyclopedia* is good for a kind of social history overview. Um, Marlene De Rios has a book called *Cross-Cultural Perspectives on Hallucinogens*. Probably one of the books that I recommend most to people is Michael Harner's anthology *Shamanism and Hallucinogens*, where he gathered a bunch of very good articles together there. Hoffer and Osmond's old classic *Hallucinogens*, even though it was last updated in '68 still, on the major hallucinogens, is the best source. And in addition to those, which I just mentioned but don't have here to show you, I want to show you some of the newer or more interesting stuff in the field.

This is a book that has not been widely distributed at all. This fellow might be a candidate for teaching at Esalen, I don't know. Uh, it's *The Science and Romance of Selected Herbs Used in Medicine and Religious Ceremony* by Anthony Andoh. And Andoh has, uh, his own institute in San Francisco; he runs a nursery on Taraval. He's, uh, judging by this book, an extremely knowledgeable person with a worldwide education in herbs and a special stress on, uh, on folk usage. So there are for instance, here's, uh, a piece- an Egyptian illustration of Sennefer, the royal garden- gardener and his sister Merit. There's a lot of plant lore in here that you just don't get anywhere else and, uh, another book like that is William Emboden's book *Narcotic Plants*. Terrible title but a tremendous amount of information that doesn't seem to appear anywhere else. Uh, Macmillan is the publisher. So he's a Bay Area resource that we certainly were not aware of until very recently and maybe some of the rest of you were not aware of him either. This is some- this guy should- he's one of us. He should be part of the party.

Then in terms of publications, the publications on psychedelics that you may be familiar with, such as *High Times* and *High Frontiers* are sort of addressing this, uh, trying to restart the youth rebellion or, uh. Anyway, it's not a full spectrum or deep look at psychedelics. This magazine, which was previously called *Psychozoic Press* and has been renamed *Psychedelic Monographs and Essays*. [chuckles] Are you a psychedelic monograph, Eric? Oh you're an essay?

[Audience Laughter]

It's published out of Florida and, uh, it's very, very lively. It has a huge letter section. Everybody you know

seems to write one letter per issue in and, uh, for instance, this issue has articles on psychedelics, a woman's rite of passage, Earmarks of Psychedelic Spiritual Experiences, also by a woman. Psychedelics and lucid dreaming, door ways in the mind, also by a woman, and Tom Riedlinger who some of you may know from Chicago, an article by him on psychedelic schooling. Uh, this is simply printed but it's from the heart, it's scholarly it's uh, the tone I think is very good. I would actually urge you to support these people by subscribing. We have nothing personally to do with it; it's just that they're, uh, on a good trip. I'll hand this around and you can get addresses off of them if you want.

This is Rupert's new book. Rupert is, uh Rupert Sheldrake. It's just begun to be distributed. He is going to make a revolution in thinking about, uh, resonance and form and it has an aspect in it that is very kind to our concern. The psychedelics are much more centrally important to understanding in a morphic resonance theory of nature. So, uh Rupert is just a brilliant writer, even more brilliant than he is a talker and, uh, this is a delicious book to just read ten or fifteen pages at night, uh, before you go to bed.

This is a reference, uh- I'll send this one this way- this is a reference book that in terms of getting a lot of information between the covers of one book with a massive amount of color, uh, illustration - uh, this is Richard Evan Schultes, the leading light of Ethnobotany. He spent over fifteen years in the Amazon and, uh, has, uh lead hundreds of graduate students into careers in Ethnobotany and really, uh has put the field on the map and his co-author is Albert Hoffman who invented LSD. In terms of one book about psychoactive plants that is in print and readily available, I would go with this one I think.

[Audience] – Alfred Van Der Mark?

Van Der Mark, I guess, did this edition. It was originally done by Macmillan. This is Riane Eisler's book, *The Chalice and the Blade*. It may not immediately appear to have anything to do with psychedelics but it has to do with, um, re-visioning society by looking at ancient models of how men and women, uh arranged social structure in the past. And like Rupert, this is a book with a secret agenda. This book, uh, is a tracking horse for a new respectability for psychedelics because when you begin asking the question, why was there a partnership society for so long and why did it give way to a dominator culture, the answer lies, I think, in changing patterns of plant utilization and a changing relationship to the psychedelic experience. This is a wonderful book; maybe the most important book for archeological scholarship in the last ten years or so. Riane lives in Carmel Valley. She is a local person and a great, uh resource and I'm sure that you'll be seeing more of her, uh in the Esalen catalogue and around. She speaks very well if you- if you have a chance to hear her speak, I would urge you to do it. Send that this way...

This is just to remind you of our little book on cultivating mushrooms. I don't think that- if you have the time and the focus, this is really the way to do it shamanically - to get out of the 'dealing' cycle and the 'not knowing what you've got' cycle. And also, as I've said earlier, this trains you to punctuality, cleanliness, attention to detail - all of these qualities which I- I, in fact, I used to say to people once you've grown the mushroom, you know you're ready to take it because it has imbued in you the qualities you need to take it through the act of growing it. Don't be fooled, it isn't easy and it isn't that the process is difficult. It's that you have bad habits that will get in the way of the process. Habits like leaving your apartment occasionally. [audience chuckles] You can't do that any more if you do this....

And it's, it's definitely much more than a grower's guide. It contains a lot of, as Kat mentioned, a chronology and a lot of discussion about what the mushroom is. It also is the first place to- where these

images from the African Plateau, the Tassili Plateau in Algeria, have been reproduced from and they are strong evidence for the use of mushrooms in Neolithic Africa. This is evidence which Wasson did not include in his books; new evidence and, uh both of the major, uh, the major, uh, rock paintings that argue for this point of view are in here. The next issue of revision will have a drawing by Kat on the cover and an article by me about mushrooms and the goddess. An article-it will be a psychedelic issue. Everything in it will be psychedelic so you might watch for that.

And then last and just sort of as a fun thing, in case you're not aware of this book, some people aren't. It's called the S- the *Codex Seraphinianus* and it is written in an unknown language. It contains hundreds and hundreds of color drawings and since it's written in an unknown language, it's impossible to figure out what it's about because the drawings are all of objects which don't exist in this world. So it's, uh, great fun, it's stimulation for the imagination. It shows, I think, uh, one person's response to the psychedelic, uh experience. And this book was originally published at \$75.00. It's obviously a labor of love. It could not have been conceived of as a money making proposition. Consequently now it's being remaindered in most places. You can pick one of these up for 19 bucks, at least at Moe's in Berkeley and probably any other large volume, uh, bookstore like that. You can spend hours with this thing. It's more than you can take in at one, uh, go.

Well, I thought this morning because we don't have too much time and I have- several people have asked me to talk about our personal visions and some people specifically, the Time Wave and all that. I'll sort of work my way into it. I did want to take account of the fact that today is Easter. There are workshops who would have fallen upon the coincidence of Easter with themselves as an excuse for an orgy of oval ceremonialism but, uh, somehow it slipped past here. But I, I will, uh, Well, it's an excellent excuse for me to talk about what seems to me one of the most mysterious of all passages in the New Testament. I'm not a New Testament scholar but I've puzzled over this passage for years and years and I think it relates to what we're doing.

I'm not sure, I believe it's in Matthew when the women come to the tomb on Easter morning looking for Christ – now I think the two, the two Annes and Margarets- it's Mary Magdalene who comes first and she's alone I believe – and Christ is there, she sees him. It is the two Margarets who come later. She starts toward Christ because she thought he was dead and she sees him standing by the tomb. She starts towards him and he stops her and he says 'touch me not, for I am not yet completely of the nature of the Father.' And I've always thought that this was just a fascinating passage because, uh, what is being said here? What's going on here? He see-Christ seems to be indicating that though he is now alive, he has resurrected, he has come through the crucifixion, nevertheless in some sense he is not yet completely transubstantiate and it suggests, uh, a process, a physical change in the body that requires time to complete itself.

So, this morning I thought I would talk a little bit about time and, uh, insights into it that have come to me out of, out of psychedelics. What I always hoped for out of the psychedelic voyaging was to bring back something. I always felt and still feel that that is the attitude with which you should go into these things – to bring something back. I mean it could be something – a personal insight into a personal dilemma or a more generalized idea. Because I really think that the, uh, that the psychedelic realm is the realm of ideas and that ideas which change the world come first from, uh, from that place. And I'm always a little reluctant to get into this because when I speak about my own ideas, I feel much more, um, how much I'm asking from you as an audience. In other words, it's like an ego trip because it's *my* ideas and why spend an hour on my idea instead of talking about all these, uh, facts, careers and, uh, established, uh, concerns? But

you asked for it so, uh...

In the-in 1971, when we went to the Amazon to look into DMT and all of these things, we really had no clear conception of what we were after. We just knew that we wanted to get more time in that dimension, more hands-on experience. Well, if any of you have read *The Invisible Landscape*, you know that my brother conceived of a certain kind of project where he thought that the psychedelic molecules could actually be bonded in to the physical body, into the DNA using sound and that they could be made briefly superconducting, and it's interesting that that was a word that no one knew what it meant back then. He predicted room temperature superconductors, uh, in 1971 at La Chorrera. Well now room temperature superconductors are a huge concern of a vast part of the scientific research establishment. A whole new technology is promised by this stuff.

Uh, he had this notion that you could bond psychedelic molecules into the DNA and that then the trip would sustain itself indefinitely and could be analyzed as a kind of, uh, waveform signature of the totality of the organism. In other words, he felt that the ordinary psychedelic trip is a fleeting photograph, an almost an X-ray, you could say, that comes into the mind when the psychedelic molecules occupy these bond sites and then flash to the higher cortical processing area of the brain, a kind of gestalt of the state of the organism. And he felt that if you could stabilize and permanentize this that, uh, it would be worth doing. I mean, it wasn't clear whether he thought he would become a Taoist sage or turn into a flying saucer or what it was. I mean it was a shifting image of totality that he was projecting.

Well I was very skeptical of this and, uh, because it seems unreasonable and basically I'm a reasonable person. But on the other hand, going to the center of the Amazon Basin had been our purpose and here we were and now somebody seemed to be coming up with something very interesting so we let the experiment run since it seemed to me it would either work as he said it would work or it would fail utterly. Because what was proposed was that you saturate your body with psychedelic molecules then sing in a certain range and in a certain way. And I thought either nothing will happen, 99 chances out of a 100, or since he's so impassionately convinced something will happen, the thing he is convinced will happen, will happen.

So we performed this experiment and if you've listened to *True Hallucinations*, you know what a riot it was and what chaos it set off. And I won't really review that except for those who haven't- who didn't read *True Hallucinations*: what he said would happen didn't happen but on the other hand my expectation that nothing would happen was completely frustrated and instead he seemed to initiate what at first brush looked like a psychotic break. He became unaware of the people around him. He would talk right through other people's talking as though he couldn't hear them. He began to make less and less sense. He lost motor control and, uh, and every-and everyone assumed that he was slipping into some kind of psychosis.

What complicated this was I, who had been cast in the role of the skeptic and the witness, had noticed that the moment he had forged the joint (as he called it), something began to happen for me. Something very unusual. What it was was the teaching voice familiar from psilocybin experiences but with none of the ambiguity and difficulty of connection that I had associated with the psilocybin experiences. Instead it just came on and appeared to be locked in place and he was saying, that's it, we've succeeded. Uh, this is what it is. And, and all the hallucina-I wasn't even on mushrooms. He had taken ayahuasca. There were no hallucinations. There was no feeling of being stimulated or depressed – there was nothing but this voice and it was talking at such a speed that I would walk these jungle trails like this: uh-huh, uh-huh, yes, I se-yes, yes! At that speed, not for minutes but for months, you know?

And, and what it was concerned to convey is what I now call the Time Wave and, and I will attempt, without blackboards or mathematics or being boring I hope, to explain what this is. And that's a formidable problem because this is an idea as rigid as the kind of ideas that run subway trains and send submarines back to their bases. I mean it's a, it's a formal, tight idea. But the way it was taught to me was in a steady process of self-amplifying parables or teachings, you could almost say. So how it began was it said to me: have you noticed that every day is like every other day, somewhat? I said, yes I've noticed that. 'And have you noticed that every week is like more or less, like every other week?' Yes, I said. It said: 'well did you know' – and this is a typical mushroom construction – 'this did you know, I'll bet you *did* know' (and then the whammy) 'that every day has a relationship to four other days. And they are not the four days preceding it, they are scattered back through time. One of them may be six months in the past, one of them may be thousands of years in the past but each day is actually an interference pattern caused by the, uh, resonant, uh-the coming together of the resonances of other times.'

And so I-it never occurred to me. It never occurred to me that that was a possibility. So then it said, uh, 'go get your I-Ching' and I went and got my I-Ching and it said 'we're going to look at the first order of difference.' I said, 'what's the first order of difference?' It said, 'oh, you don't know that the first order of difference is. The first order of difference is how many lines change as you go from one hexagram to another.'

Now, I don't know how many of you are familiar with I-Ching but I assume most somewhat. Right? Ok, the I-Ching is composed of structures, which have six levels called hexagrams. They are either broken or unbroken lines. The first one, called the creative, is all solid lines. The second one, called the receptive, is all broken lines. Who can tell me the first order of difference between the first and second hexagram? Here's a clue, it's the number of lines that break.

[Audience Silence]

No fair!

It's six. I don't know why you're not leaping forward with this. It makes me wonder how far we can go. Six. Anyway, to try and shorten this story, what this teaching voice was concerned with was structure in the I-Ching; previously hidden structure. So I-it said, 'we can't go forward with this conversation until you get some graph paper because this is going to be not only conversation, this is going to be diagram.' So I got graph paper and it said, 'draw the hexagrams in a descending line in the King Wen sequence and then make a graph of the first order of difference – the number of lines that change as you go from hexagram to hexagram.' I did this and I got a wavy line obviously.

You can tell that, uh, the values will lie between one and six. In some cases six will change, in some cases only one. Never none because each hexagram is different. I was puzzled as to why an Amazonian mushroom wanted to talk about the archaeology of ancient China. And so what that this resonance calendar existed but then it said, 'no, no, you don't understand. We have just- we are now in the atrium of what it is I want to reveal to you. [audience chuckles] I want you to go back and look at the first order of difference wave and I want you to understand that'- and I already knew this but I hadn't done much with it. The reason the I-Ching is based on 64 is because 64 are the number of codons that DNA runs on. The I-Ching is not an arbitrary construction. It is something that comes out of a deep, formal inspection of what the human organism is. The human organism is a molecular machine that runs on an iterative program of 64. And our-the proteins that compose our bodies are like this, so forth and so on.

And then I said, 'well, I understand about DNA, I understand how the I-Ching mirrors that, but I don't understand how then it's also a calendar' and the voice said, 'well don't you see – perception can be only organized out of the matter which composes it. Time appears to you in your psychological perception of it in the way that it does because time is a property of matter that is being amplified by biology into the theater of awareness.' So in other words- and this is now me speaking, not it- my interpretation of what it was saying was, life is a phenomenon of quantum mechanical amplification and because we are organized on the blueprint of this quantum mechanical pattern that is very deep at the sub-molecular level of matter, then all our institutions, languages, religions, love affairs – everything has this pattern as the base embedded in it, almost like these fractals which give rise to endless amounts of a certain kind of beauty but if you were to see the equation which generates the fractal, you know, it has six terms. It can be written, uh, in fifteen seconds.

So then there was, there were-years passed and a great leap had to be made because I was like non-functional. Because I worked with this wave, I felt I had the signature of the universe, that a great gift of truth had been given to me but when I tried to tell people, they just backed to the wall and said, you know, 'get help. Now. Now get help!'

Here's where we separate the men from the boys, the women from the girls, and the wheat from the chaff. The conclusion that I reached was that this universal wave, which has been operating for several billion years, will reach its maximum concrescent, uh, state of enfoldment, uh, at dawn on the 22nd of December 2012 A.D.. This immediately puts me in the nut category. This is what's called messianic delusion. Millenarian, uh, uh, grandeur, so forth and so on. Nevertheless, it's a persistent intuition of most religious ontologies. Perhaps not the Buddhist, but the Hindus, the Jews, the Muslims, the Christians, all appoint an end to their world. And uh, I really, I'm a little shy about this because I-it's so personally mine. Nobody has ever made a contribution to this idea that was substantial. I just, it seems to be mine alone and welcome to it and yet, I want you and historians and paleontologists and primatologists, and people who are experts on time in different, uh, sizes to look at this wave. It's working ladies and gentlemen. It does in fact describe the ebb and flow of this thing called novelty.

Now when I questioned the mushroom about this, it, it almost makes it trivial. For it, it's an 'of course.' Of course you are made of DNA, DNA is made out of matter, matter has to have time as a precondition of its existence. The signature of time embedded in the atomic structure is amplified to the molecular structure, then is amplified to the organismic structure, then – and that's called a human life well lived, then it's amplified to the societal structure – that's called the birth, growth and senescence of empire. And then it's magnified to the global structure and that's called the coming of the hyperspatial object at the end of time. It's also a theory of resonance. It's saying that large scales of time have their themes and concerns condensed and revived in the smaller components.

Now this is somewhat hard to understand but rich enough to pursue. It's this idea.

Now I'm going to use James Joyce's classic example. Joyce wrote a book called *Ulysses*. *Ulysses* is a book about a man who rises on a morning, a bright morning day in June in 1905 or 6; he wants to fry some kidneys for breakfast so he gets his wallet and heads out into Dublin to score some kidneys to bring back and he has all these adventures. But Joyce understood that this man on this day was also Ulysses with his brave component of men journeying to the end of the Mediterranean laying siege to Troy for nine years, winning the Trojan War and returning their homelands. In other words, he understood that in each of us, we are acting out larger and larger scales of time that give color and precision and depth and interest to our

being. So if you find yourself on a Saturday night in a place in San Francisco called Hadrian's Hamburger Joint, it has something to do with the emperor Hadrian and his conquest of Britain and his effort to hold back the barbarians. Life carefully examined is actually a form of allegorical literature of a- with a very tight constructional grid laid over it.

Um, this is a rich idea and as I say, I'll be giving a five-day workshop on this only because this is the only psychedelic idea I've ever brought back other than, you know, idiotic realizations such as – 'everyone's little finger precisely fits their nostril.' [audience laughs] You know – there's no market for that. But this, this would actually create a re-visioning of time and had we more time this morning, I would tell you how it could be turned into a calendar of the Goddess. How, by living with a solar year, that always puts Christmas with the same slant of sunshine coming in, that we have locked ourselves into a paternalistic, uh, masculine dominated structure.

What the universe is, is flux. Nothing lasts. Nothing abides. Everything moves on. Women know this. Men don't and we're living under a solar masculine calendar. The reason our ideas and I-by our ideas I'm now speaking of the entirety of the new age and all of this stuff – the reason our ideas meet resistance is because the framing around the entire discussion of the spirit and feminism and transformation, the frame is always the masculine solar time frame. As long as we operate under that calendar, we will have a very difficult time advancing ideas. This is- the Chinese understood this. This was why when great reforming emperors arose, the first thing they did was change the calendar. If you want food for thought, look at hexagram 49. It's revolution. You open it up expecting sage political advice; it talks only about the calendar and it talks about the magician as a calendar maker. In fact it says the magician is a calendar maker.

So I think that, uh, what this teaching that came out of this experience in the Amazon was all about was, it was a totality symbol. Dennis had thought that the flying saucer would emerge out of his body as a spinning violent disk of trans-linguistic matter that would become showerhead, pizza or Mercedes, depending on what you needed at the moment. He thought it would become matter in the act of appropriate activity. Instead what emerged was a totality symbol. And Jung talks about how in the individuation process, you always hope that the patient or the client will generate a totality symbol but he usually means a kind of individual and wavering totality symbol like a mandala or a, a, a cohesive structure or something. I think we got, and I try to say this without hubris because I felt like I was nothing more than the vessel into which this thing was being poured – what we got was *the* totality symbol in a complete version, not- certainly not a totality version because I don't think the human mind can encompass the total version, but we got a skeletal blueprint of what totality is in the world.

What it is, is knowing how things happen. Knowing that all processes, the firing of a nerve, the culmination of a love affair, the fall of an empire – has a, a, a pattern. And if you know the pattern, you will be at ease with any process in all or any of its stages. Because you will just say, 'ah this is the time of resistance. It will soon be followed by the time of foreword motion. That will be followed by the time of re-enfoldment.' And what this does is – it eliminates anxiety ultimately. That's the bottom line. Our anxiety about death and our anxiety about the future and our relationships and money – all this stuff can be boiled down to anxiety about the unknowable aspects of the future. If we could assimilate a model like this we would be Taoists. The future holds no terrors for a person who knows how process inevitably unfolds. They are always right and with it in each moment.

So I, I think that we've always talked about the I-Ching and Taoism and all this sort of thing as short for the culmination of mysticism but to make it a living faith in our own lives, there should be nothing

mystical about it. And I maintain to you, there *is* nothing mystical about it. It's simply that we are at such a primitive stage of culture that we haven't yet understand-understood what time is.

A hundred years ago we were at such a primitive stage at culture that we didn't understand what time was. Einstein had to come along and say, you know, time is not an abstraction necessary to have a place to put objects that you want to examine. Time itself is an object. It is curved in the vicinity of massive gravitational fields. It has a topology. It has a surface. I think what we need to understand out of this idea, ultimately what the psychedelic experience is teaching, ultimately what Taoism is trying to say – is that time is a topological manifold. It is a surface. Events flow across it like water over land and like water flowing over land, when the land is flat; the water becomes reflective and moves slowly. When the landscape becomes disrupted, the water moves faster and chaotic attractors appear and new kinds of activity emerge and out of that new activity, then comes the new states that define the future.

Well, uh, I'm going to stop there. I haven't shown you a graph or written a number or drawn a hexagram and I think that's remarkable. [audience chuckles] This is the feeling the feeling tone; this is the good stuff that you get if you go through those graphs, numbers and time on at the computer. But this is the totality symbol that I was able to get out of living a psychedelic life and I believe that there are as many of these kinds of totality symbols as there are people willing to trip. And each one of them is different. You know, we create them for each other, they complete our lives, they assuage anxiety and they give us a tremendous appetite, then, for the adventure of being rather than the ordeal of being. And they arise out of using psychedelics to amplify and inspect the quantum mechanical and subconscious and superconscious portions of the human mind. This is why the psychedelic experience and psychedelics are so important. It's because they are tools for understanding and re-visioning the reality in which we all live. The personal growth is a wonderful thing and will naturally follow along but it's more important than that. It's a way to make a new world that is Taoistic, feminine, free of anxiety and in great anticipation of further stages of completion laying into the future. That's, uh, that's where the mystery, the transcendental object, the pot of gold at the end of rainbow is waiting and I think that's the job of each of us – to show our best toys and our best tricks that lift us and our friends to higher and higher levels. And there is no end to this bootstrapping process. The future of the human mind and body and the future of humans together is, uh, endlessly bright.

Keep the faith! Recognize each other and maybe I should close with a little line from Gary Snyder if I can remember it. He said, uh, 'learn the flowers, travel light and stay together.' [audience chuckles, claps]

The way I got into all of this, and it seems to me it's worth talking about because it- psychedelic, uh, the word has, in a sense, been too narrow. It's a- it's a kind of secret faith, uh-uh, having to do with perception of the world, I think. I mean, I feel that I was psychedelic long before I knew anything about psychedelics, because what I was interested in as a child was, um, nature and complexity, but not simply nature and complexity, but a certain, uh, visual suggestiveness of mystery. So, I was like a beetle collector and a butterfly collector, and it was this pursuit of iridescence was actually what it was. And then years later when I studied psychology and the brain, I read Sherrington's definition of consciousness as an 'iridescence upon matter', meaning an effect that when you shift the point of regarding slightly, the iridescence disappears. And, I was, you know, it's hard to even explain to myself, let alone to a room full of people, how much I cared about this kind of thing. I mean, how is it possible for a nine-year-old child to hold the image of one insect continuously in their mind for months as in almost a mystical epiphany because of how it looks; something about how it looks? And, then, um, you know, as I broadened my- my interest, as a pre-adolescent child, I got into science fiction.

As I look back on it now, I see it was simply that it broke down barriers - conceptual barriers about what was possible and that it was setting me up for this position vis-à-vis the input of the world which was that I would entertain any idea, but believe in nothing. And this is, I think, a very you know, if we're actually trying to talk about a psychedelic canon; this is a very central part of the psychedelic attitude toward the world. To entertain all possibilities, but to never commit to belief; belief always being seen as a kind of trap because if you believe something, you're forever precluded from believing its opposite. So, you have run a line down the center of the cognitive universe and divided things into the believable and the unbelievable. Well, if you know how a child lives in fantasy and how fantasy then gives way and gave way in my case to science fiction, this is a kind of pre-psychedelic mindset that many, many people of my generation were experiencing as they came up through the Eisenhower years which were spiritually a complete desert, but in this pulp magazines, uh, you know, beneath the surface of consciousness.

Notice throughout this month, how much of what is important to what we're talking about goes on in the non-sanctioned corners of the culture. Pulp literature, uh, cults, uh, un-sanctioned gatherings of friends, Rock & Roll - all of these areas where the emotional content of the culture is allowed to come to rest are, uh, somewhat off limits. Into adolescence, this cognition breaking iridescence-pursuing thing came

directly up against Eros which was, you know, a complete, uh, new dimension for the goggle-eyed terror of the science fairs to be plunged into which was myself. And, uh, you know, women, sexuality, social signaling, intense emotion, all of this and everyone experiences this. In a sense, sexuality is the built-in psychedelic experience that only a very few people manage to evade because, uh, you know, we may like to think that we are rational animals, but for purposes of biology, a whole set of completely irrational programs have been built in that just can take, you know, a professor of Indo-European grammar and turn him into a haunted figure pursuing chorus girls or any of the other 50,000 variations on that theme.

So, Eros is an ego-overwhelming, boundary dissolving, breakthrough creating force scripted into human life that is pretty intrinsically psychedelic. And I think that, um -- I don't really understand how all this works at all, but when you get very deep in, especially on some of these tryptamines, you brush up against some kind of -- it's hard to even put words to it -- but it's erotic. It's a -- It's a potential within the concept of Eros that is almost too much to bear and almost seems to imply that what we call, uh, erotic sensibility is a kind of lower dimensional slice of some higher dimensional reality that our feelings are trying to carry us into.

One of the -- this is sort of an aside on that -- but one of the interesting things about psychedelics and I now speak of the compounds themselves is -- especially the plants is they have a certain fascination with where the genes go and will pair people across great lines of improbability. In other words, uh, it's almost as though the biological control which is exerted on this mammalian species by the mushroom is actually at the materialistic level a control of who has children by whom which means the control of the evolution of gene lines. I maintain this is why the place most people feel magic in their own lives - even the most humdrum people feel magic in their lives - is in the matter of mate-selection because, you know, I was just down in the baths and heard a story this morning where a man said, you know, "I had a happy marriage for seven years. It was perfect and then I ran some kind of a company and one day I got a telephone call. Someone wanted to sell me a new line of nails and I knew when I heard the voice on the other end that my marriage was ruined and that I would follow this voice [audience laughs] and possess this woman and so forth and so on" which he had done for better or for worse. Well, this kind of thing where the most staid lives can be skewed off in other directions is -- uh, you know, in the old style of talking about it -- it's an eruption of the unconscious. But, where psychedelics are involved, it seems to be more of a winnowing of, uh, of the genes. So, sex obviously has this, um, deep, complex multi-meaning kind of, uh, feel about it that, uh, pretty much the rest of reality for most people doesn't, I think.

Uh, the next step in my own evolution - and I feel like I am simply the fortunate beneficiary of a series of random events which were very fortuitous from my own point of view; in other words, that without having a whole lot of sense and with very little foresight - I very fortunately found myself in a lot of right places at a lot of right times. And the place I went after adolescence was, uh, political awareness and the discovery of what it meant. You know, the goggle-eyed kid had conquered or, at least, had had a brush with the feminine, but then the next great item on the agenda was the community. And I was, uh, in Berkeley for the street uprising in 1968 and learned what a revolution is; not what it is from the point of view of history books or the 11 o'clock news, but what it feels like - what it actually feels like - to take and hold a place that's been denied you against the state. And, uh, what this -- what I learned from that, I think, is that one of the core elements of this psychedelic thing is freedom on the broadest scale. I mean, it truly is, and you'll hear me use this phrase over and over again, boundary dissolving. And that's almost for me synonymous with freedom. This is what we want to do. We want to dissolve boundaries between the rich and the poor, the feminine and the masculine, the living and the dead. All boundaries do dissolve in

psychedelic experience and the social metaphor that captures this is revolution. Revolution is an eruption from the unconscious. It is not a reasonable thing. It has a logic of its own. It's as though the overmind reaches down into the mechanics of political process and says, "No, it won't be that way; it will be this way."

And, uh, as you watch this thing in China unfold, the revolution that I went through was child's play. But, the revolution going on in China is about consciousness. I mean, God, the notion that, you know, people were selling Jon Stewart Mill in translation in Tiananmen Square like hot cakes brings a tear to your eye. I mean, uh, it's incredible. And, as I said on Friday, this -- the psychedelic dimension lies directly ahead of us. It is permission for cognition; permission for revolution and resolution of the, uh, contradictions that have emerged out of 500 years -- 1000 years of practicing culture in this particular way that we've been doing. It just doesn't work. Well, Abbie Hoffman said, uh, that the first duty of a revolutionary is to survive. And so, my political career reached a point where, um, I would -- I had to choose between exile and martyrdom - hope that you should be so lucky because both choices are heroic, you see.

But, I chose exile which brings me to the next of these psychedelic metaphors or these psychedelic styles that have nothing to do with the compounds and that is travel. Travel! Some of you are traveling. I know because you have accents from far away, so you probably know what I mean. But, the people who don't go anywhere are -- are in danger of missing a major point about what is going on. So, I -- my traveling began very tentatively and I went to Israel and then I went to the Seychelles Islands and then I went to India and then I got in trouble. And then I couldn't come back. So then I had to be who I said I was because I had essentially been making a tour in order to return to Berkeley and slay women with my tales of daring-do. But, I got caught out there, halfway around and had to stay not the plan -- three months -- but years, years and years and years, and India, Indonesia, the Amazon, Tokyo and, you know, just a series of scenes. I used to say I never sleep in the same bed twice. I also came to realize then that what happened to me in ten days was more than happened to my friends back at home in a year because I would see, you know, three countries, five cities, eighteen ecosystems, five cuisines, so forth and so on in two weeks. And for them, you know, they were living out some kind of machine like existence.

Nothing is as boundary dissolving as -- uh, except psychedelic compounds -- as travel. Travel is really up there. I mean, you know, go to these places. There are many, many places and they are not to be taken at face value. They are parts of your own psyche. They are syntactical intersections of intentionality and cognition. The fact that you have to fly there on KLM is only incidental, you see, because what you come up against in these other places is cultural relativity. And cultural -- the deep coming to awareness of cultural relativity is finally permission to look at who you are, not who they say you should be, you know. You see in this tribe, you're an SOB if you fail to eat your uncle at a certain critical time in the situation and in this society, you're an SOB if you don't own a condo in Carmel. So, you know, how seriously are we to take all this?

There's a great saying -- um, an alchemist of the 15th century, Athanasius Kircher said, uh, "The highest mountains, the oldest books, the strangest people, there you will find the stone." And this idea that there is something to be found, first of all, this is very important for the psychedelic life. Again, I was very lucky, I read Carl Jung very early before the Jungians really got a hold of him and ruined it. And, um, what Jung is saying about conceiving your life as a quest is absolutely true. Psyche is some kind of semi-malleable, uh, medium and if you set yourself up as a loser - if you image yourself as a loser, you will be a loser. And so forth, this is not big news. But, what's big news is, if you set your life up as a quest, you will actually find

something transcendental and unimaginable. I mean, I am living proof of this because I set my life up as a quest for a perverse reason: to prove that there was no mystery. In other words, to debunk it. To say, you know, I will follow the ancient formula and show that it's baloney by doing it perfectly and achieving nothing. [Terence laughs] That's the kind of guy I am! [Terence laughs] [audience laughs] However, [Terence laughs] what I discovered was, um, that the world -- the model of the world that we inherit, that it's three-dimensional space, very hum-drum and like that you're caught in it's laws, it's just not so.

I don't have all the answers but this is where we need to put pressure. The world is some kind of thing, which can be taken apart and shown to be something else, many other things and nobody is saying this. I mean these physicists are just as sober as can be and all this argument that goes back and forth about this paradigm and that paradigm and whether the world is made of anti-newmesons or -- the world was obviously made of mind and intention. And I -- I don't mean this in some airy-fairy, can't get a grip on it way -- I mean, if the world is made of cognition and intention then let's get a technology together that allows us to use that principle to make it the way we want it to be.

My mother said to me when I was at her knee, if wishes were horses, beggars would ride. And, I think, you know, the political implication of that is, uh, beggars should ride and therefore turning wishes into horses is a reasonable political agenda. And psychedelics show, you know, the way it is to be done, it's somehow... I don't know. I don't know! My intuition is very strong that with people with sufficient intelligence and sufficient courage could at any time break through and make this somehow happen. I mean, it's a fantasy of two people having a conversation which ends with the abolition of language, basically. In other words, turn the tools upon themselves and unscrew everything and lay it out and look at it. And then rebuild it, um, the way we want to. Now, this could not even be talked about if there were not evidence that it is possible and the evidence lies in this weird dimension, this psychedelic thing. And I would be utterly despairing of the state of this planet and ourselves if it weren't for the existence of these compounds. I think we would not have the chance of a snowball in hell, not a chance, because everything on the surface spells ruin. You know, we are murderous monkeys. We have looted the future! We have eaten the food of our own children. This is the kind of crowd we are. And yet -- and yet and yet -- you know, there is this shining transcendent thing that is real. And this is what I hold against all the priests and gurus and rishis and roshis and geishas and Babajis around. They don't explain that what they're talking about is real. I don't even think they know that it's real. Perhaps they're just, you know, parasites on an idea but it is real and it is possible to manifest it.

The problem is that we are so perversely committed in the way we invest energy. I mean, a modern, well-equipped fighter plane costs \$75 million. The United States government orders them in lots of five hundred at a time. You know what \$75 million would do to consciousness research in California? One -- the cost of one fighter plane? I and the people I know and they people they know could deliver the millennium for that kind of money if, uh, you know, the law stood back because what we're talking about is a correlation of data that has gone on now for four hundred or five hundred years: botanical data, chemical data, human data, anthropological data, data about language, data about complex systems, generally, mathematical models, dynamics, chaos theory, so forth and so on. These are the tools out of which an understanding of the dynamics of mind can be created and creating an understanding of the dynamics of mind is the way out of the political logjam. No amount of haranguing and preaching is going to do it. It requires a breakthrough to the mechanics of ourselves. That's what it basically comes down to, that we must see ourselves as potentially salvageable, reprogrammable and worth saving.

And I think that because the psychedelic experience is not bound in history, but in a way is a morphogenetic field amplifier of our species. I mean, if you think of the Sheldrakan model of morphogenetic fields and then imagine that they cannot be detected by radio, they cannot be detected by any electronic, uh, means, the field is too subtle. But, if you imagine that mind is a quantum mechanically indeterminate and delicately balanced enough system that it can actually resonate to the presence of the morphogenetic field then you begin to have a theory of what the psychedelic experience is. It's the experience of the transcendent dimension of every object and every object has a transcendent dimension, more than one. I mean, it has a dimension which extends into the past; it has a dimension which extends into the future and it has a dimension that is orthogonal to any of these that is the internal horizon of its own transcendence. Now, this kind of talk is Whiteheadian talk. Whitehead, in the 20s and 30s, actually created a philosophy, a rigorous metaphysic entirely capable of -- of working in a psychedelic environment. Had he written it in Sanskrit, he probably would have, uh, had a wider audience, but he wrote in plain English. So, if you're interested in a metaphysic of the psychedelic experience where you actually take it seriously and say these things which we perceive: the dissolution of boundaries, the recombining of form, the transience of form, the transience of meaning, uh, the coming together of actual events in a real world and the dissolution of those events into a world of potentiality. This is all, uh, Whitehead-type stuff.

Some of you may know the notion of memes. A meme is the smallest unit of an idea. It's to ideas what genes are to biology and memes compete in the same way that genes are competitive in an environment. A meme can be copied. I can tell you something and you can tell someone else. The meme has been copied. A meme can be repeated. I can say the same thing over and over again to different people who then copy it and take it away. But, in the same, uh, sense as a gene is only effective if it remains, uh, faithful to its original, the meme must remain faithful to its original. And the only way we can correctly copy these memes and pass them among ourselves is through clarity of understanding. So -- so, is this pressure on clarity, nothing should be ambiguous. I don't believe in it. You know, I believe that understanding passes everywhere and that a thing is not existentially apprehended in some sense until it is understood.

And, as far as what understanding is; it's simple. It's nothing more than the perception of connecting patterns, so that here is a data field -- it could be a beach full of people, a great corporation or the history of England -- a data field. What patterns do you perceive in it? The more patterns you perceive in it, the more you understand it and there is no bottom to this. I mean, understanding just falls through the phenomena of the world endlessly. Essentially, it's about communication, that most of what we say and do, even though we may define ourselves as wide ranging intellectuals, most of what we say to each other is incredibly animalistic and low-grade data exchange because we're not used to pouring the energies of cognition into articulate speech. We just tend not to do that, but actually it's at this stage of things the closest we can get to hardwired, uh, telepathy, you know, honest straight talk that draws from as deep as it, uh, as it can.

And the search for, um -- well, Blake said this thing - see if I can get it right - he said that truth, if it is told so that it is understood, must be believed. In other words, if you hear it and you understand it and it's so, you will automatically give allegiance to it. This is because we resonate with some kind of ground of being that is below the speakable and yet supporting it. So, the idea here will be to try and communicate between ourselves to create, um, a slightly different kind of reality than everybody else is hanging out in. Mostly, I hope our reality will have more hope than the generic reality that's going on outside because I think that, um, there's a lot of data on the table now, more information than ever before and we can actually begin to figure out what's going on, not in terms of the first three milliseconds of the universe, but actually, you

know, what is going on on this planet. What is human history? What is a cognizing species doing running around by the billions on the surface of this planet obsessed with religions and driven by vice and hatred and visionary longing? This is not what they talk about in the biology books and still less is it what they talk about in the physical chemistry books. Something has torn loose on the surface of this planet and we are embedded in it and we are it and it is sweeping us and all life on this planet into some kind of apotheosis, some kind of shit-hit-the-fan situation where all the hopes, dreams, fears and obsessions are going to be held up to some kind of transcendental inspection. Nothing can stop this.

Uh, perhaps, you know, it could have been stopped in the 12th century or the 6th century, but now technical processes, population growth, information transfer, destruction of the environment -- we have -- the great dying is well under way and the question is: does this make sense? And an even more cogent question: can it be made to make sense? In other words, can we come to in the situation of a planet sinking into chaos and somehow run around and punch some buttons and close off some areas and salvage something. Can meaning be salvaged? Or is the process that has gone on over the last, uh, you pick a number but it's in the billions of years, essentially meaningless dumb show and, uh, absurdity? The really freaky thing about this, I think, is that it is not clear, that it seems to rest in the domain of human decision. That the universe is not at all what we suppose it to be and that we are in effect presented with a three-dimensional, four-dimensional, eleven-dimensional koan: a labyrinth, a puzzle, a kind of conundrum, which has to be cut through. And, it's all done in the mind. The whole, uh, apparent world is actually, uh, syntactical in nature. This is what they don't tell you in the philosophy departments or the physics departments. That the universe is made of words and that there has to be a speaker and there has to be a hearer. Photons, quarks, anti-new...that's not what it's about. That is a linguistic model that floats above the bedrock of syntactical connectedness; that mind travels through to create networks that it interprets meaningfully. That's what's really going on.

So, looking at this situation, years and years ago, knowing and feeling what I've essentially just said to you twenty-five years ago, I, uh, I've always been a skeptic. I've always been sort of on a downer, cynical even: take things apart and belittle them and see how they tick. It's just, uh, it's a male rational style, a scientific style. And the assumption behind that is that you can reduce the whole world to something which is nonthreatening and neutral somehow. But, um, a weird thing happened on the way to completing this program which was, um, I discovered something which it is my intention to try and share with you. I don't know, it's --- many people have made this discovery, but I can only speak, uh, for myself. So, for me, it had a very intense and kind of transformative immediacy. And this was, I discovered that in the realm of the so-called transcendental -- I was raised, uh, Roman Catholic and in the process of cutting that loose, switched, uh, Latin for Sanskrit for a while -- and, uh, you know, I've had a life long interest in the transcendental, but basically from a debunking point of view. In other words, not for me sweeping up at the ashram, not for me the ambiguities of Babaji. And -- I just -- and in India, the tact that I always took with these people was, "What can you show me?" You know. "Anything!" Because talk is cheap. God, if I don't know that, who does? [audience laughs] So, a line of patter is completely non-convincing. Well, it's not, uh -- it's not to be found in those traditions.

What I'm trying to say is that when I put pressure on the spiritual domain, the only people who could deliver were shamans with a history of use of hallucinogenic plants. And, um, an awareness of this came to me, say, as early as 1967 and I begin to pursue it. At first, I pursued a pharmacological basis behind, uh, Tibetan shamanism. The pre-Buddhist shamanism of Tibet is called Bonpo. I went there thinking that their art could not possibly be what it is unless they had access to hallucinogenic plants and were using them.

Well, I was, you know, twenty-two, I didn't know anything. I didn't speak these languages. I had no notion of the task that I was setting up for myself. But, later I went to the Amazon basin and there -- there is an extent and thriving a rich shamanic tradition of hallucinogenic plant use and they can just convey you into, uh, astonishing dimensions. And it's those astonishing dimensions that will form inevitably the focus of what we do this month because we need to run it as a headline.

It goes something like this: uh, scientists discover nearby hyper object in alternative continuum. It's that sort of thing. It's that by pushing the psychedelic experience, we can satisfy -- and by -- let me define "pushing" there. I mean putting a great deal of research pressure on the tryptamines -- by pushing the hallucinogenic, psychedelic experience, I think we could fairly quickly satisfy ourselves, if the legal climate were different, that the Freudian model won't do, the Jungian model won't do and that, in fact, all psychological models will fail. And that what we're dealing with is something quite of another order -- and I am not one to reach, you know, for the metaphors of spirit with the connotation of moral opprobrium and all that, but there is a dimension which is accessible to each and every one of us - this is the primary thing about it, it's accessible - that is so appallingly, titanicly and bizarrely different than the continuum that we're currently residing in that it seems to throw doubt on the entire effort to understand the world as it's been carried out over the past 1500 years.

In other words, there is an object in this mental space which, as culture creating creatures, we are attempting to colonize and invade this cultural space through the concrescence of language. In other words, through exteriorizing our ideas as tools, we are invading this cultural domain and the psychedelic, uh, tryptamines and very recently discovered, by the way. I'm doing a book for Bantam and I have to go through the whole history of these things and to my amazement, I -- the indole trip -- the indole hallucinogens actually were never studied. LSD was invented in 1938; they put it on the shelf for five years, then the guy took it, Hofmann. He said it's a hallucinogen but, uh, the war was raging. That was 1943. It didn't actually make its way into the journals until 1947. Then, from 47 to roughly 65 there was a great deal of interest in LSD and research on it. Then that ended with it becoming illegal.

In the meantime, psilocybin, uh, DMT and, uh, the, uh, beta-carbolines, the number of articles and papers published on these things numbers in the dozens. In the case of DMT, it's under ten -- human, we're talking now human experiments, not rat-slicing and, uh, physical chemistry, but actual human data. So, what we inherit out of the 60s -- one of the ways which we have been disempowered that we didn't even know (isn't this fun to learn a new way that you were disempowered that you didn't even know? [audience laughs]) is that the LSD experience was made the paradigm of the psychedelic experience and it was placed at the center of the phenomenological mandala and then all of these other compounds were sort of related into it in terms of: doesn't last as long as, lasts twice as long as, uh, that sort of thing. When you think about this alternative reality and the exploration by drugs with psychedelic drugs and then the pervasive problem with other sorts of drugs in the society, it's, it's -- and it cuts very close to the core of ourselves as creatures. I mean, we are addictive animals. We addict to everything. We addict to each other and glorify it as our most noble outpouring of sentiment in the phenomenon of romantic love.

I mean, when a pair of lovers are parted, the withdrawal symptoms are indistinguishable from heroin. I mean, vomiting, shaking, uncontrollable emotional outbursts, sleeplessness, short temper, hysteria -- this is real. It is -- what romantic love is, is a pheromonal bonding, an exchange of chemical messengers which takes these two autonomous organisms and welds them into one galaxy of need and intention and understanding and expectation. Well then you just tear that apart and people are, you know, shook up. We

addict to political ideals, you know, all kinds. I mean, it's wonderful what's happening in Peking but, uh, several decades ago the same thing was happening in Berlin to a different beat. You know, people find an idea and it works and all barriers appear to be movable and all goals attainable. We addict to things. This is, you know, like magpies but then through media trained to propel ourselves into ever more extensive relationships with objects. We invent money which is kind of a, uh, multi-transformable drug. It stands for everything. [audience laughs] You know, everything that you ever wanted and you can addict to money.

Nevertheless, uh, what I will argue during this month is that, uh, that this is not a bad thing. That we have a secret history that I will try to convince you of and I -- and you should try to convince me that I'm wrong. And we will argue over the secret history of the human race and why it is, therefore, that we are as we are and why it is that these psychedelics are not some peripheral issue of screwballs who can see God in a cabbage, but that, in fact, the issue of psychedelics is directly on the tracks of the onrushing locomotive of rationalist, paternalist, uh, schloko society and that it ain't going to go away. Because what we're talking about here is a nude part of the human mind. What we're talking about here is something which takes its place in the great unfolding of the define -- of the defining of human freedom that characterizes the entire adventure of global civilization. In other words, uh, you know, we've got the Pope under control - that happened in the Middle Ages. Uh, slavery has now been generally embraced as a bad thing to be into and we've gotten that on the books as a bad idea. Women have been suddenly recognized to be human beings and so forth. So, this, this, swelling bubble of 'aha' and perception of the real nature of the universe should also include the, uh, sudden realization that governments have no business telling people what foods and spices they should prefer. That this is an absurd role for government and that, like slavery, like the, h, subjugation of women, the, uh, uh, legal, uh, persecution of dietary habits has just got to take its place with the high-button shoe. [audience laughs]

Uh, and we will talk a lot about the consequences of this. What does it mean? Because, you see, what the government would have us believe and perhaps believes itself - although I doubt it - is that we would return to the beast. That's all. You know, we would just shoot junk and toot blow and flop around in ruinous orgies until hell froze over and they - wiser, sterner, more disciplined than ourselves - represent the edifice of moral authority. This is the, 'I'm doing it for your own good' trip. See? And actually this is all hypocrisy and we will talk about all that: the roles of governments in the promulgation of drugs and drug cartels and how -- this is what I learned doing this book for Bantam: that drugs have always been there and have always been manipulated by governments. I mean, this is almost what money was invented for, was to do dope deals and, you know, I'll show you what I mean as we get into it.

Um, but I want to return for a minute to the transcendental object because that's the part that gets me off the most. It's taken me a long time to believe what was actually happening in that I always said I could believe it if I read it in the newspaper, but I can't believe it because it's happening to me or it's happening so near to me. But, I just, you know -- it hardly now seems to matter and what we just have to do is to try and talk frankly based on our -- the experience which each of us brings to this about, you know, the thing. How much of it have you seen? Well what do you think? You know. How does it cast its shadow into your life? What is it? Uh, because I talk on these subjects, I am a sort of a nexus point for information and I gather stories and I see that, you know, science and rational philosophy and all that stuff is going on over here quite to its heart's content while hundreds and hundreds, if not thousands and thousands, of people exactly like ourselves are logging in these experiences which are, you know, absolutely off the scale.

And I just don't -- I mean, there are a lot of people having problems. People abducted by UFOs, people

visited by Whitley Strieber's triangle face? That's not where I'm coming from. I have nothing but scorn for all weird ideas other than my own. [Terence laughs] [audience laughs] So, and the reason I tolerate my own weird ideas is basically because of what I've gone through. I would never believe it if I hadn't seen it. You know, there's a wonderful story and I have no love for Christianity either, but I'll tell a Christian story. This is what I got out of the Gospels. Uh, Christ appeared several times in the upper room after the crucifixion to the apostles. The first time he appeared, the apostle Thomas was not there. And so then, uh, Thomas came after the visitation and they said, "The master was here. He was with us." And Thomas said, "Bullshit!" [audience laughs] [Terence laughs] And they said, "No, no – he was here." And he said, "Unless I put my hand into the wound, I will not believe it." So, time passed and Christ came again to the upper room and, uh, Thomas was there among the other apostles. And Christ said, uh, "Thomas, come forward, put your hand into the wound." And he did. And he did. Now, the conclusion that I draw from this story is: alone of all human beings in human history, Thomas, the doubter, touched the incorporeal resurrected body of Christ. Only the doubter was allowed that privilege. For everybody else, you know, the show.

And I -- I just take that absolutely seriously. I think that God or he, she or it, loves the doubter and prepares treasures in paradise for the doubter that eclipses anything. The method has worked for me and I have seen absolutely astonishing things. I'm sure many of you have, too. I have seen things where I had perfect confidence that no human being had ever laid eyes on these places before and I'm sure you have, too, because that's how big it is in there. It is -- the further in you go, the bigger it gets. We are like monkeys sitting in the presence of a flying saucer whose doorway has just been flung open. This is what we need to become conscious of. We need to dissolve the assumptions of the culture and this is why LSD was so terrifying because I firmly believe that one of the things psychedelics do is they, uh, dissolve cultural assumptions. It doesn't matter whether you're a member of the politbureau or a go-go dancer in Berlin or a professor of agronomy in Kansas, you will doubt your beliefs and your world if you take psychedelics. This is good. We need to dissolve our cultural conditioning and try to get down to brass tacks because I'm convinced that reality is a tinker toy set that we can learn to take apart and put together in completely different ways.

And we're going to have to pull some real rabbits out of the hat or the planet is just going to pour over the edge into chaos. Uh, and I, you know -- before they were called psychedelics, they were called consciousness-expanding drugs. Well, if there's any possibility that that's true, let's put our best people on it because consciousness is what we're dying for! We don't have enough of it. We can't feed the hungry; we can't manage a global economy; we can't hold down guerilla warfare and we can't cure AIDS – we need to get smart. If this stuff has anything to do with getting smart on any level, even for one in a thousand of those who use it, pour it on! We can't stand around like a bunch of nitwits just watching the planet burn down around us.

Now, it's very touchy, this whole thing because it is literally and, uh, and perhaps metaphorically as well, illegal, forbidden territory. We're like South Pacific Islanders. We have taboos, you know. Bring this plant into your house and you must go away to the big slammer for a while. [audience laughs] This is a taboo. I, um, I don't -- my position, which I don't suppose I should say I advocate it because as I understand that's one higher level of federal crime, so here is my position, but I don't advocate it: [audience laughs] [Terence laughs] is that people should be able to do whatever they damn well please. The government is for the convenience of people. And, in particular, in the United States, we already have in place a clause which says: life, liberty and the pursuit of happiness are inalienable rights. Inalienable. That means government cannot interfere with these rights. Well, pursuit of happiness, I don't think you have to be a

shyster to believe that pursuit of happiness covers experimenting with psychedelic substances. It seems to me perfectly clear.

I think that, uh, you know, part of what I do as I speak around and I suppose I should say it here because I imagine some of you will end up psychotherapists or are psychotherapists – is that, uh, you know, without an understanding and familiarity of the psychedelic experience, uh, you should be sued for fraud if you're practicing psychotherapy [audience laughs] because, uh, the dynamics of the mind – isn't that what psychotherapy is about? – well, you know this much unless you have had a variety of psychedelic experiences. That's where the confirmation of all this theory is and that's where you find out what you're running from.

It isn't that it is a psychotomimetic as the government researchers hoped it would turn out to be; it's simply that it plays all the changes. You know, it pulls out all the stops and it plays in the major and the minor keys. You see it all! This is indispensable for psychotherapy and if you look at the pure statistics on alcoholism with LSD, uh, it's phenomenal before LSD was made illegal. Now I -- understand, I don't believe these are chemical cures to drug dependency, that isn't how it works. It works like this: you take LSD, you're an alcoholic or a junkie, you take LSD, all your illusions and defenses are dissolved. You see that you're killing yourself, that you're a pathetic wretch and that you're destroying yourself and the people around you and then you come down. And out of that experience you existentially draw in some cases the power, the self-will and the motivation to change your behavior. Well, I believe that as a culture we could do this and this comes perilously close to sounding like everyone should take LSD. I don't believe that. I think that, um, it's a -- it's a calling. It's a kind of a profession. It's, uh -- well, shamanism is the best model and I think that the rebirth of shamanic awareness is part of a much larger cultural phenomenon which I call the archaic revival. I hate the term "New Age." I think it's just, you know, 11 o'clock news stuff.

But, the archaic revival is a notion of a series of integrated trends that have been going on for over a hundred years that are the actual turning belly-up of Victorian, Christian, scientific, male dominated, uh, civilest, materialist civilization. It begins with phenomena like pataphysics in the 1880s in France and surrealism and Freud and Jung and abstract expressionism and even the Nazis had a piece of the action because of their understanding of how ritual and propaganda. I mean Goebbels was the architect of the German archaic revival. LSD has a part of it and what it is, it's, uh, an intuition - an intuition - that to save ourselves from what we have done, we must reach far, far back in time for a stabilizing metaphor; not as the renaissance did back to classical Greece and Rome to create classicism which of course all happened in the 15th century, but further back to a prehistory, to a time when people and nature lived in a kind of balance. I don't mean just any time in prehistory; I mean essentially the post-glacial called the Magdalenian, about 19,000 years ago when the glaciers began to melt and the Sahara turned green again and, uh, the cave paintings were done at Lascaux and Altamira, bone antler technology was invented. It was the great springtime of our people and the last springtime of our people.

And then we came down through. Uh, but, in that time, in a partnership society - and this is Riane Eisler's term and I will talk about that through the month - in a partnership society there was no oscillation between a matriarchy and a patriarchy. There are dominator societies and there are partnership societies, and gender has nothing to do with it. We can entirely overcome the bullshit about gender in talking about cultural forms. It's dominator versus partnership. And, uh, the partnership society that existed in those times was the quintessential expression of a symbiotic relationship and this is a new, you know, a new idea that I want to get across during this month which is, our anxiety, our angst, our wandering in the wasteland is because, um, there's something wrong with us that we don't know about. What it is, is this: we are

symbiotic creatures. We require a relationship with a certain plant and if we don't have this, we go slightly bananas and this symbiotic relationship was disturbed about 12,000 years ago.

It has to do - and I will go over it in more detail downstream but it has to do, uh - with periods of drought in the African continent that forced people into the Middle East to where they were no longer able to access this plant. Then begins what we call human history at the 9 th -- at the 11,000 BC point at, uh, places like Jericho and Catal Huyuk in southern Anatolia. What's happening with human history is a -- perhaps not even articulated, but nevertheless restless driving search for substitutes, substitutes for the lost partnership ambience, substitutes for the plant symbiote which held that in stasis. And these substitutes work their way over the millennia through, uh, the opium cults of Anatolia, um, the hemp cults of the Skifians, the Eleusinian mysteries -- and these, these are the great, uh, acceptable substitutes for the mystery. You see what religion is, is a contact with the tremendum, with the numinosum at the beginning of history in this context of plant hallucinogenesis and then the fall, literally, the fall is the telescoping stages that moved us away from the original purity of this numinous image and it ends in crack addiction. It's all about substances. This is why we frantically search the universe for what my friend Leo Zeff used to call the perfect high. That's what we're looking for. We can't help ourselves. Whole cultures are doing it. And they don't think of it as a drug; they think of it as an epiphany, a religious system and a set of sacramental buildings or a city organized on a divine plan. But, what they're trying to do is restore order and they can't do it because like the romantic lovers parted, the partner is not present. The, uh, completing anima image is simply not there. And so, we are restless, violent, neurotic, repressive, migratory, uh, destructive, self-negating, so forth and so on.

I think that we're coming to the place where we can actually begin to take an idea like what I just said and amass evidence for and against it, and try to then cure ourselves. In a way I'm trying to carry out a kind of Jungian analysis where we realize that we are all the children of some kind of very damaging thing which happened in prehistory and it's plain as the nose on your face, it's just that we are so traumatized that we do not see it. I mean, look at the story of Eden which is the central datum, the central mythologem of our culture. It's a story of, uh, substance abuse and the consequent punishment that follows upon that because Eve eats of the fruit of the tree of life and it says in Genesis: if they eat of this fruit, they will be as we are. In other words, it was specifically the issue of consciousness expansion and Yahweh, the jealous god, the volcano god of a paternal -- of a -- of a dominator culture said "No, you're not coming into that inner sanctum." But, she had eaten of it anyway so there was a parting of the ways. Well, this parting of the ways, I believe is a metaphorical description of the breakup of this symbiosis in Africa and the fall into profane time. The, uh, withdrawal of the, uh, the bride really in alchemical terms or in terms of the -- of the Jungian marriage of the marriage of the anima and the animas and, uh, we are now I think in a position to, at least, talk about this as a possibility because this thing which was driving these religions on the plains of Africa was a tryptamine hallucinogen. It was specifically a mushroom which was occurring in the, uh, the dung of the most -- of the early cattle that were just at that stage being domesticated.

Well, the experience which that mushroom induces in us is no less overwhelming and transcendental and incomprehensible than it was to those people 15,000 years ago. We have nothing up on them. In fact, we may be in a worse position to understand it because our language is now carrying a thousand -- a millennia-long legacy of paternalistic, egocentric, uh, materialistic and empirical biases. They may have possessed languages that far better commanded the true modalities of the transcendental object than do our languages. So, the archaic revival is, uh, an invitation to historical humanity to view itself as a kind of prodigal son and to abandon the wandering in history, the peregrination in history, and to return to the

archaic fold with what has been learned. And what I will suggest to you that has been learned is, uh, the purification and, uh, and, uh, rational analysis of the, uh, *sine qua non* of the whole shtick which is the hallucinogenic compound. In other words human history is a dipping into matter, a kind of Faustian, um, pact to come away with what the shamans of the -- of archaic times were approaching by a natural means. Well let's see. It means I've talked for about an hour. Are there questions?

[Question]: Uh, yes. I'd like to hear you talk a little bit more about language and words. Um, I read somewhere - I can't remember exactly where - if silence is a reality then all words is an intrusion and a lie. And when you said that reality is made up of words and yet it seems to me aren't you talking about rather than, you're talking about it?

Yes, well that's a good question. Um, my brother said a funny thing one time. He said, uh, "Has anybody noticed that as you expand the sphere of understanding, the surface area of ignorance necessarily grows larger?" So, there is this paradox that as we understand, there becomes more and more that we don't know. Uh, I, uh -- what I am interested in and it may not be the highest value - I'm perfectly willing to agree that it perhaps isn't - is communication. So, I can't do much with silence, uh, but I do, uh, grant it primacy. What we're trying to do - but also, you know, I have to say and I suppose it's good to say it in the early phases - I am -- I try to be rational and analytical about what I'm dealing with and I don't even know if I would agree that the psychedelic dimension is a spiritual dimension. In other words, all I'm willing to say at this point is it's another dimension. It -- trying to turn it into something which would make us better people or worse people, it doesn't seem to operate like that. Uh, William Burroughs had the notion. He said language is a virus from outer space.

Um, it's possible that language is some kind of higher order organizing principle. It only arises in the most highly organized higher mammal on the planet. And to those of you whose hearts leap to the defense of dolphins, magpies and honeybees, good luck, but 'cause it ain't King Lear. That's the point. You see, it isn't Milton. Language has a force and a dynamic of it's own. Perhaps it is a virus from outer space inhabiting us, using us to articulate sound. I--I'm fascinated by the mystery of language because it's very central to understanding what psychedelics are. Why do I say that? Because, and I will refer again and again to DMT, dimethyltryptamine, as the most interesting for many reasons of these psychedelics, but today I just want to mention one aspect of it.

In the trance that overwhelms you when you experience this hallucinogen, it only lasts for a few hundred seconds and, in that place, there are entities that are making sounds, which visibly condense before you. In other words, language has the potential, I swear to you -- in other words this settles a question -- language has the potential to be seen rather than beheld. Well, I saw this years ago in DMT flashes and, lo and behold, a thorough inspection of Philo Judaeus who lived contemporary with Jesus Christ and was an Alexandrian Jew who wrote volumes of commentary on the religions of his era, Philo Judaeus talks about what he calls the Logos. Logos was an interiorized teaching voice which Greek ecstasics sought to contact, and Philo says -- he sets up a little dialogue and the first speaker says, "What would be a more perfect Logos? A more perfect Logos than the informing, teaching voice?" And Philo answers, "The more perfect Logos would go from being heard to being beheld without ever crossing over a noticeable moment of transition." Astonishing! I mean, I always wondered, did they know what they were talking about? What did it mean to them? What did it mean to him to write that sentence? Well, we'll never know so here's what it means to me! [audience laughs] [Terence laughs]

It means that the program of language is an open-ended one and that we are dynamically caught up in it. That we are language. That's what distinguishes us from those who chirp and twitter and romp in the trees. That we are language and that language is evolving. It's changing and that, in fact, what we call culture is nothing more than a kind of shockwave trailing behind the forward edge of this language-making capacity because you can't invent it before you can say it. You can't sell it before you can describe it. You can't do anything with it until it exists as a linguist -- commandable set of syntactical connections. So, in one sense and I will carry this forward over the month, what the psychedelics are for us as a species rather than for each one of us as an individual -- what they are for us as a species is an enzyme that catalyzes the language-making capacity. What is an enzyme? An enzyme is an organic catalyst. What is a catalyst? A catalyst is a chemical agent, which causes a chemical reaction to proceed faster than it ordinarily would without being consumed. The catalyst is not consumed.

So, I think that the astonishing proliferation of cultural effects, languages, religions, ontologies over the past 40,000 years out of nothing because before that human organization was, I mean, it was dull back there for a million or two years. I mean, it was -- there was, so far as we can tell, no material culture at all. Now you may wish to defend that it was wonderful but you will find you have no evidence for it. But, suddenly after staying stable for a million years, the human brain size doubles almost overnight and there is this cascade of cultural effects. I maintain that it has to do with pastoralism as a behavioral habit bringing these proto-hominids into contact with psilocybin as a dietary element and that psilocybin specifically catalyzed certain qualities of the human organism that worked to its evolutionary advantage, such as consciousness. Can you imagine a more multi-purposed, mutational, adaptational change that would serve you well than being able to think clearly? I mean, if a flatworm could think clearly, evolutionary horizons would open before it or any other organism. It's like a super nonspecific immune response. You can handle any problem. Give me a problem! I'm a thinker! I can handle it! You know. So.

But catalysis of language, well, then, it only ceased, uh, two thousand years ago at Eleusis when triumphant Christians stomped out paganism wherever they found it and all of these mystery religions were driven underground and forgotten. And it has to do, you know -- there are other factors such as the botanical scarcity of decent hallucinogens in the European ecosystem but details, which we can talk about. But, the point is 2000 years is all that we've been away from this and in that 2000 years, you know, we've elaborated the most lethal set of assumptions and cultural conventions ever brought forth. I mean, you know, war. Before people used to knock each other on the head, but in the hands of these un-stoned dominator types with this linear linguistic bias which then is totally reinforced by the printing press, why, you see, you know, it's a suicidal cultural style. Well, one of the things I think that happened in the 1960s that supports my case; in the wake of LSD, you see a tremendous enriching of language, endlessly sneered at by those who don't talk that way but, you know, it introduced the notion of the vibe, the ego trip - these are worthwhile concepts -- the bumper, uh, the flashback. Uh, these are linguistic pearls that, uh, you know, crystallized out of that experience. I realized in the Amazon, hanging out with these ayahuasqueros, these people using ayahuasca, which is a different strategy to make DMT happen, but it ends up with the DMT happening. Their songs were not to be listened to, but to be seen. People would say, "How did you like my song last night?" And people would say, "You mean the blue one or the yellow one?"

And, so, you see, I believe that the psychedelics are working at the cultural level to promote language, but also to -- it's not simply a linear enriching of language. There's also something going on biologically that language is actually gaining in the vertical dimension in its, uh, uh, beholdability. And this is taken very seriously in the Amazon because these small hunter-gatherer groups, where there's big pressure on protein

and there's no room for mistakes, they guide their societies by taking these drugs together in a group situation and collectively they "see," whatever this means, they see and they model, uh, what their future is going to be. It's true telepathy. You see, when you listen to my voice, if you understand what I'm saying, it's because my incoming words cause you to go to your dictionary and look them up, one by one, and if your dictionary is pretty close to my dictionary, we will understand each other. But the whole act of communication depends on this assumption that the dictionaries are the same. If they're not the same then you will not understand me.

If, on the other hand, I could make you see what I mean, this is not a culturally conditioned avenue of information transfer. You don't have to learn English to look at an English woman. It's easy. You just do it! It's at the biological level. And so, this is, I think, in terms of consciousness expansion. You say, "Well, it's good as a general notion, but what direction is it moving?" It's moving in the direction of, literally, a clarifying of language, a clarification of language into something that can be beheld. And, uh, it's an arrow toward a greater domain of existential validity that each of us can, uh, can move in. We need to communicate. We need to find out who we are, each of us, individually, and then we need to tell each other.

The whole dominator style of un-stoned culture engineering is ego. That's what happens when you don't take psychedelic drugs as a culture; ego flows in. That's what was happening on the plains of Africa every Saturday night. Everybody was getting loaded and boundaries were dissolving. The boundary of the assumption of the uniqueness of the individual. They were taking these things and they were having, well, group sex, basically. These were the two things – it's clear because of the quality of psilocybin that it actually at midrange doses causes arousal. You see, at very low doses it increases visual acuity. Therefore, your hunting improves. Therefore, you and your progeny are more successful. Then at slightly higher doses, everybody's horny and there's a lot of activity in the group and partying. At higher doses, then that turns into religion and you just slam to the floor of the cave, you know. So, it's this three-step thing which plays on our basic needs to drive us into a deeper and deeper relationship with this, uh, with this mystery. And, it's such a huge idea that this is what we are, that this is so fundamental, that this isn't just some curiosity of, you know, hedonic, west coast, so forth and so on. But, that it is, in fact, central to understanding and defining humanness and to trying to grab some of the controls of this sinking submarine of a planet and get it back up to the surface long enough for us to all climb in a row boat and, uh, make our way somewhere.

So, thank you for being here today, all of you!

[Audience: *Thank you.*]

So, one of the things that's really important, I think, about psychedelic get-togethers, uh, however marginal and contrived, is that everybody gets to see who else is in the community. Most of the time we're fairly deep in the closet and can't be told from a typical convention of investment bankers or sports car enthusiasts or anything else. I won't keep you too long tonight because as I've said, a lot of people came a long distance. I always think about these things before, because I wonder - is it changing? What's my role in relationship to it? Have I sort of fallen into being some kind of gatekeeper, or in a worst case, a dancing bear? This issue of infotainment... recently I found myself in clubs at four in the morning raving at people at high decibel with the perfect knowledge that they couldn't understand a word I was saying. I wonder - this is a strange thing to happen to a philosopher. Is this what my daddy raised me for?

[Question]: What clubs are you raving at?

Blow my cover! Well, not in LA yet. In San Francisco we did a rave at Paradise Club down below market. In the Fox Warfield, I appeared with a shaman, which was insane. They give you a microphone and just push you onstage. Just breathing on one of these microphones makes the walls move back. Megatripolis in London - I appeared there and Knowledge. The point being, I keep trying to understand where to put the psychedelic experience in terms of the available cultural pigeonholes. Is it to subvert academic thinking? Is it to ignore all that constipated bourgeois dominator malarkey and go for the kids?

I've been here as scholar in residence for a week and so I've given a couple of lectures, which naturally, some of the themes we'll talk about and some of the themes have been anticipated. I think, what is the point of thinking this way? The way I'm willing to purvey rather than some other way? What is so great about this point of view? I decided the final defense is that it's the most fun. This is not normally how we evaluate ideologies. Normally the concern, which is true, and then whatever is decided is true, no matter how dreary and depressing that may be, then somehow because it's true, some enormous morale obligation descends upon you to believe in it.

I remember this from my own intellectual journey when I was 14, 15 and 16, the world looked very bleak. So I read Camus, Sartre and the lesser lights of that dreary French existential school and because it was true, you had come to terms with it supposedly. You know, life is a drag! But as you mature intellectually

or as you spiral off the track into madness, whichever my particular development can be described as, you discover that truth is philosophical coinage for the naïve. The banks of philosophy do not trade federal truth certificates. That's for the hoi polloi. What's going on among the professionals is something very different, a sense of the limitations of knowledge. Cogito Ergo Sum, I think therefore I am, appeared to be a kind of axiom, a kind of bedrock statement. I – think – therefore – I – am. Now somehow in the 17th century this appeared to have some kind of incontrovertible logic about it. Like – I am I. But when you analyze it, it's an incredibly complex statement embedded in assumptions that can barely be languaged. Just look at the connector 'therefore' and try to wrap your mind around what this actually means. What are the limits of the meaning and what is implied? It's a profoundly intuitive concept not easily languaged. All knowing is incredibly provisional and this is something which is hidden within in the context of a culture. Cultures don't run around announcing how they haven't got their acts together. That's not what culture is about. Culture is all about announcing how we do have our act together. Look at this Gothic cathedral, look at this Stone Henge or look at this wonderful human sacrifice we just put on here. We know what we're doing. We know how to run nature and ourselves.

In the 20th century, at last the evolution of philosophy has become sophisticated enough to sort of question this search for truth. I studied philosophy from somebody some of you may have read or personally known, Paul Feyerabend, who was a wonderful philosopher of science and essentially an anarchist. He wrote a book called *Against Method* and he talks in there about the provisional nature of knowing and how naïve we are in the ways in which we manipulate data about the world. Just as an example, we imbibe without question the very complex philosophical assumptions that lie behind probability theory. For instance, talking about averages poses no intellectual problem for us. If you want to know how much current is running through a wire and you take 10 measurements, you add them and you divide by 10 – we then say this is how much current is running through the wire. Strangely enough, when you go back to your original 10 measurements, no one of them may be the value that you now announce to be the true value for the current running through the wire. All of our epistemic enterprise, all of the effort to understand the world, is hedged about by this uncertainty. Wittgenstein was once asked if a particular proposition was true and he said it's true enough. This is the voice of modern philosophy, where at last enough simple common sense has sunk into the philosophical enterprise that we're now talking about things being true enough rather than the revelation of God's truth.

I mean, good grief, if you met a termite wandering across the floor of the jungle and interviewed him on his life's work and he announced that it was the discovery of certain truth, you would be fairly condescending on how you would relate to that. But do you believe that you are greatly different in your cosmic positioning than that termite? Monkeys are better at this than insects? I don't think so!

I spend a lot of time trying to make my ideas seem rationally apprehendable but in a way that's just slight of hand. Their attraction for me and I hope for you, is not their rational apprehendability but that they're fun. You can't top this for fun? If you can, I'll convert to your way of doing it. The phenomenal world is delightful. It's humorous. It has locked within itself all the adumbrations and reflections of its aspirations, its past and its unfulfilled possibilities. I really think this is what the psychedelic thing is about, or at least for me; it's a kind of sensual glorification of multiplicity. That's why if we were to look at spiritual traditions and try to categorize them into great or weaning categories, then I think what you would get are the minimalist schools which are all about white lights, nirvanas, satoris, sunyatas, and things largely unsayable that discourse despairs of describing. Those ontologies that glorify the phenomenal world - and that would be Paganism, psychedelic thinking and shamanism - notice that these are more nitty-gritty positions not driven by a thirst for abstraction but driven by a thirst for sensation.

To my mind, the centerpiece of the experience of being and the centerpiece of the psychedelic experience

and the point around which the great issues of modernity revolve is the issue of the felt presence of experience, the relationship of the individual to the sensorium of the body. We see it in all kinds of subtle ways and unsubtle ways. Unsubtle ways, the whole issue about a woman's right to control her reproductive processes. Subtle ways, the way in which the entire society is an engine for producing certain behavioral outcomes in the marketplace. Everybody is being programmed and manipulated and I think the antidote to that in some sense is this wider appreciation of complexity and experience.

The reason the psychedelic thing is so powerful and can touch so many people of so many classes and outlooks is that it's an experience. It's not an ideology. So we're not talking something which competes on a level with say Marxism, behaviorism or deconstructionism. This is something more operating on the level of sexuality, emotion, devotion; it's a feeling and it's a birthright of the organism that has been socially restricted and controlled in a very weird way. We are literally a schizophrenic species. We are at war with our own nature. Civilization, whatever that means, is felt to be so fragile an enterprise that it's constantly refusing to come to terms with the context in which it finds itself, which is the animal body, sexuality, emotion, pain, desire, elation, and ecstasy; so we go outside of those things and create a generalized abstraction and reason backwards.

The reason psychedelics are so frightening to the guardians of social order is because they represent a direct addressing of experience. For a very long time, I mean one millennia, five millennia - choose a number - experience has been hierarchically distributed in human society from the top. You get a Christ or a Hitler or a Pope. It's a leader of some sort or a visionary, and then the exegesis of the vision is passed down through and we imbibe it as a product coming with the sanction of social correctness. This has had a kind of neotenizing effect on us as human beings. What I mean by neoteny is the retention of juvenile characteristics. We have allowed ourselves to become more and more childlike to the point where now some considerable percentage of us allow ourselves to be warehoused in a larval condition most of our waking lives watching television. Consumer object based fetishism and the cycle of production of money for the acquisition of fetish material, then the inevitable disappointment, the reformulation of the fetish, so forth and so on. This is what occupies us. It was William James I think who said, 'if we don't read the books with which we line our apartments then we are no better than our cats and dogs.' I guess I say - if we don't take the psychedelic plants that are in the environment that we can avail ourselves of, then we are no better than our cats and dogs.

There are doorways open to us but they are all experiential and personal. They lie in the realm of sexuality and I guess what you would call experimental psychology. These are areas where we get very nervous and want to follow rote, follow tradition and be assured that we are not deviant, that we are not strange and that we are not violating any canons of the tribe. I think because of the social crisis, meaning this vast generalized sense that everyone has that things are out of control, we are going to have to go back to first principles. What that means is a return to the authenticity of the body. You know McLuhan wrote how media distorts human self-images? One of the reasons I'm involved in virtual reality and electronic media and all of that sort of thing is because I think that the age of the distortion of the human self image by media is coming to an end. That the medias of the future will be largely transparent and that this is very important because it's going to allow us to discover who we are. A person who can read is a person who possesses an ability that is tremendously distorting of their essential relationship to their humanness. I mean if language is a bizarre activity, and no question that it is, reading is orders of magnitude more bizarre yet because abstract signs are being manipulated at close to conversational speed and in some cases faster than conversational speed.

So much of culture is complex behavior and I think that what the psychedelics show - that is a secret that some people don't want told - is that we can redesign our behavior. We can change very, very quickly the image of ourselves as somehow the rigid inheritors of evolutionary programming and therefore doomed

like lemmings or Monarch butterflies to enact a programmed pattern of behavior and destroy ourselves. This isn't what I see happening at all. The whole history of humanness is a history of unexpected, adaptive response to unusual circumstances and I believe that's because the imagination has played such an important role in defining who and what we are. Whatever the imagination is, psychedelics catalyze it. Psychedelics enhance it. The thin bandwidth of interior self-monitoring that goes on in normal consciousness becomes much more clear, three-dimensional and intensified under the influence of psychedelics. These things used to be called consciousness-expanding drugs; it was just a good old phenomenological description. Well consciousness, or the absence of it, is what's pushing our species towards some kind of crack up.

So if there are factors in the rainforests, in the Arctic tundra, in the toolkits of preliterate and aboriginal people that can act to transform consciousness then this is where we have to put our attention. If we could feel the consequences of what we are doing, then we would stop doing it. The reason we don't stop is because we are partially anesthetized to the consequences of untrammelled population growth, unregulated capitalist market oriented behaviors, so forth and so on. We are semi conscious. This is our problem. We're like someone half awake inside a burning building.

Are we going to suffocate and become a crispy critter? Or are we going to sufficiently integrate the situation and grope ourselves to an entrance and call 911? In our case, I don't know who comes when you call 911, but it's something like that. During the weekend, we'll talk a lot about human history because I think human history is something that we are far too blasé about. We take it for granted because our own lives are so ephemeral, last seventy years or something - we think of history as something that was installed with the rocks but in fact it isn't. It is a behavior very recent like language, another behavior very recent. Physically, human beings have been about the way we are for 100,000 years, and much the way we are for half a millions years. But the behaviors have changed radically. From nomadic partnership, from societies based on shamanic intoxication, orgiastic sexuality, and no fixed abode, to a massive integrated global electronically based civilization. These are extraordinary modifications of behavior. It's as though hummingbirds were to begin assembling locomotives. That's the kind of radical transformation that we see inside our own species.

Well then, the question is – what's it about? What we are doing, by replacing one behavior after another, never resting, never satisfied, is in practical terms – we're accelerating the entire temporal continuum. We seem to be pushing process towards some kind of dimensional apotheosis of some sort. We're not content to let things rest. Human history is the record of this process, which begins as a kind of random walk across the epigenetic landscape of culture. The random walk finds a compass heading and this compass heading has many names. You can call it unity. You can call it God. You can call it a chicken in every pot. You can call it completion. Whatever it is, freedom seems to be its central feature. We want freedom. We want freedom from the constraints of the cycles of the sun and the moon. We want freedom from drought and weather, freedom from the movement of game, the growth of plants, freedom from control from mendacious popes and kings, freedom from ideology, freedom from want. This idea of freeing ourselves has become the compass of the human journey. That which doesn't free doesn't serve.

This has become almost a kind of universal ideal. No one on Earth preaches the virtues of slavery. There may be people who practice slavery but they have the decency to keep their mouths shut about it because the defense of slavery has become impossible in polite company. I think over time, the growth of an ideal of what human perfection is – first worked on by the great religions and then some time I suppose around the time of the Italian Renaissance handed over to secular forces – who began to say freedom was more than the right to wear wool and pray twenty-four hours a day. Freedom means the acquisition of property, of the visible manifestations of wealth, the acquisition of information. Freedom with the publication of the first books becomes associated with accessing the database of the culture. Well, what we've learned

through Freud and Jung is that the database of the culture goes deeper than we may have anticipated and that the final keys to the deeper levels are in fact plants that were part of our shamanic heritage millennia ago. So freedom has become basically a project in the Blakian imagination. Blake called it the divine imagination and we now dream of transcending the constraints of matter, space, time and energy themselves.

I mean this is what stuff like nanotechnology and virtual reality and this sort of thing is about. We wish to find ourselves in the imagination. Well, I maintain that this desire is a kind of nostalgia for a paradisiacal possibility that actually existed in the past. To understand the human predicament, we're going to have to come to terms with the idea, which has been around for a long time, but not given much coinage recently, history is a fall. That this is a lesser state than we have known in the past and that all this material culture and all this exhibition of energy control; these are the toys of lesser gods. Being integrated in nature, at peace with the rhythms of life and death and co-identified with the eternal organisms of community, that these were actually higher and nobler ideas that somehow became compromised with the fall into history. It has to do with the relationship to the lost continents of our own minds. That's what this psychedelic this is really about. I think it's as profound as the European discovery of the lost half of the planet 500 years ago. It's that half of the human mind became disconnected from the ego and for a thousand years or more, these things have drifted in such profound estrangement from each other that when reunited, the only thing that we can map it to is a flying saucer invasion or a descent of angelic intent, or something, because we have become so alienated from the collected images of the soul.

While it's true that shamanism has existed forever and ever and that people, midwives, shamans, visionaries, schizophrenics, have been doing this in all times and places, nevertheless it now has a special poignancy because the official philosophy of our civilization – capitalism, materialism, reductionism; I guess that's it, maybe misogyny is in there somewhere – has played itself out. It's failed! Modernism has failed! Modernity has failed! The rational analysis of matter has led to the revelation of the irrationality of matter. The attempts to create systems of perfect deterministic prediction have led to the revelation of the chaos that haunts all systems and makes all prediction in principle impossible. The prosecution of the dream of a formal edifice of logic to explain mathematical structures in truth has given way to Gödel's incommensurability theorem, which shows you that basically nothing makes sense. Everywhere where reason has shown its light, the greater darkness has been revealed.

I think a turning point has come in the human enterprise. Childhood's end is upon us. We have to drop the naïve assumptions of certain truth and perfect understanding; the conjuring rod of reason turns out to be a fairly weak magic after all. We have to begin to cultivate a sense of mystery, a sense of living without closure because that, in fact, is how the world is. The world is a mystery. It's not going to yield to the fragile constructs of the human mind. Some portion may be rationally apprehendable but the basic facts of the matter are that we do not know where we come nor why, nor where we're going, nor according to what plan. Instead of seeking a flawed communication with the intentionality of deity, I think the psychedelic religious agenda, if that's how you want to think about it, is a more modest one. It's a cultivation of a sense of wonder in the presence of something, which obviously cannot be encompassed by the human mind. It can no more be encompassed by the human mind than the ocean can be emptied into a thimble. Once you get that straight you can go back to getting high, staying tight with your friends, making love, growing your garden and appreciating the felt presence of experience and realizing that the abstraction game, the high-modeling game, is in fact simply a game and that there should be no emotional investment in these structures.

What I've learned from the mushrooms ultimately is that ideas are for play. The final payback from all of this is a sense of fun, a sense of humor. The truth for sure, when it arrives, will make you smile. If it doesn't you should seek a deeper truth. For a long time it troubled me, this question of truth and falsity.

Now I think that it's more like this: that the person who has the best idea, or the let's put it this way, the best idea and that means the funniest idea, the idea that brings the small smile to the corners of your mouth, that ideal will win. It will win! It's twee the cheerful. Twee treads on the tail of the tiger, no blame. No blame because the cheerfulness of twee overcomes the inherent reticence of the world. The light touch is the right touch and if psychedelics don't give this to you, you may be an incurable case. There may be no hope for you but Martin Heidegger in high doses or whatever they do with people who have displaced funny bones.

The world is truly a strange place and getting stranger all the time. It's more the character of a pun or an optical illusion than it is the world of humorless, scurrying, grey atoms and invisible forces that we inherit from nature. The laboratory of being is your own body, your experience. Everything else is going to come as an unconfirmable rumor so fraught around with epistemological problems that you might as well toss it out at the beginning and not even bother with it. The basic thing is the empowerment of experience. That's why sexuality has always raised such a ruckus among authority freaks. It's why the psychedelic is so unsettling. It's why youth itself is unsettling because these things cause symmetry breaks. They cause a shift in perspective but this is in fact, at this point in time, exactly what we have to it.

It may be that we're going to rack and ruin but it's not an unconscious process. There are the technologies, the information retrieval systems, and the engineering capacities to fight like hell against the dying of the light, if that's what's going on. But the will has to be activated. The problem is, the people creating the problems, which are the people in the high-tech industrial democracies – people like you and me – are the furthest from the consequences of the problems. Here we anticipate the apocalypse and it's a theological discussion. You go to Somalia and the apocalypse is well under way. It's moved beyond the planning stage in many parts of the world but these are the parts that we don't go to. Yet we represent, for all our humility and financial difficulties, whatever they may be, we represent the five percent of the world's people who have some ability to contact control and direct the resources and the technologies that are available on this planet. If you're able to sit here at Esalen this evening, then you automatically are in that five percent classed as the world controllers, you and your friends.

[Question]: Why can't if enough people lock into that space of undeniable unity that cause almost an epidemic on the planet?

Well I'm not worried. I think that what is happening is a transformational process, not the bankruptcy of ideology. Not the spin down of technical civilization. I'll argue through much of tomorrow and tomorrow evening that history is not our fault. You no more can blame us for the shape of human history than you can blame a fetus for the unfolding morphology within the womb. That history is the necessary distortion of an animal species to lead it to the brink of an ontological transformation. When we get into this issue of politics, it's a very tricky issue I think, to handle from a psychedelic point of view. This is because the psychedelic point of view as I read it from a fairly deep level is that it's a done deal. It's OK! Basically we're going to make it. We've been on a straight line vector for millions of years with this transcendental attractor that has shaped us, called us out of matter, and is revealing itself through us. But knowing that is not permission for sitting on your can or ceasing to participate in the struggle to create a just and caring society. It does mean that you shouldn't worry, that worry is off the menu. That you don't know enough to worry is one of the arguments to be made.

So it's basically a case of: we need to act locally and think, not simply globally but cosmically. In our cosmic ruminations, struggle to erase boundaries and to see that the difference between us and the next species in waiting in the evolutionary elevator, and the difference between life and death, and the difference between pre and post history; these are differences that can be easily erased. When they are, what comes through is this lost sense of unity, purpose and rightness that we're trying to recapture. Well that's all I really wanted to say about that tonight. I didn't want to keep you past 10pm. We'll get

together here tomorrow morning. Get a good night sleep. The baths are open twenty-four hours a day. Thank you very much. Bring your questions, controversies and whatever, and we'll dig into all this with great gusto on the morrow. Thank you very much!

It's only 10am and already it's been mighty peculiar. Did anybody have any particularly strong reaction to last night or feel that we were started off on a wrong direction, or a right direction? Is there any feedback from all of that last night? I'm beginning to have the feeling that the need to stoke the furnace of psychedelic information is a task that is being generalized into the culture. It is a relief for me because it frees me to discuss to my own megalomaniacal concerns, which are this mathematical effort to model history that will probably be mentioned on and off all day then dealt with in detail this evening. Strangely enough, the novelty wave or my theory about how history is structure, normally leads me into a situation of whipping the horse ever faster towards apocalypse and millennium. Very recently we're entered into a phase where you should get out your lawn chairs and learn to play solitaire or something. Because at least by the expectations of the time wave, the next couple of years are going to be incredibly repetitious, mundane, pattern bound and ho-hum compared to what we've just been through. From our close perspective it's hard to tell it, we've been through one of the most profound decades or five or six years of the 20th century. The whole slow, catastrophic collapse of Marxism and what it's meant for Islam and capitalism. It's all in the past but very dramatic.

I like talking about my chaotic notion of time because it seems to me that the scientific data that is arising week by week is supporting my originally somewhat far-fetched contention that the universe is getting weirder and weirder and weirder at an extraordinarily asymptotic rate. Just two examples in the last six weeks, both bizarre. This ice-drilling project in Greenland has brought up 325,000-year continuous record of snowfall and because of the decay of isotopic oxygen, there's some mumbo-jumbo by which you can determine the temperature of the air at the time the snow fell. So what they're getting is a continuous temperature record over 375,000 years. They can hardly believe what it's telling them. It's telling them that the climate and the weather has been nuts for tens of millennia. There are five-year periods where the world temperature fell twenty degrees, remained there for seventy years and then bounced back. A picture of completely chaotic climatological fluctuation has emerged just in the last two months. I mean – they're holding congresses and flying people in and drilling a second core to try to understand this because it's always been thought that the planet's climates were fairly stable, except that the human factor was capable of perturbing it. Now it looks like these glaciations are merely macrophysical reflections of micro-reflections in the climate that are extremely dramatic. So that's one piece of data that's arrived in the last six weeks arguing that the universe is a strange and chaotic place on an accelerated trajectory toward novelty.

The other is much more peculiar and in fact it's at a level in the scientific literature where panic has not quite broken out. Are you all aware of this very large object, which has entered orbit around the planet Jupiter and which has broken up into between seventeen and twenty-five objects? This is not coming to you from the Fortean Times and The Star; this is Astronomy, and Sky & Telescope. It's apparently a cometary body but it's very large. It has broken up and gone into Jovian orbit but the orbit is decaying rapidly and the whole situation is explicit enough that they can say with reasonable certainty that next July 22nd, these objects are going to encounter the Jovian surface with greater release of kinetic energy than the extinction which wiped out the dinosaurs 65 million years ago.

The impact as presently calculated will occur on the side of the planet turned away from the Earth but within six hours, that side will swing into view of terrestrial telescopes. The amount of energy released in the impact, it will be possible to calculate it by studying the reflected flash off the Jovian satellites. So what we're talking about here, in the words of Astronomy magazine, a once in a hundred million year

event. But that's the clue that something weird is going on. Once in a hundred million year events don't happen in the lifetime of a single human being. What are the odds of that? We also had Marilyn Monroe, the Kennedy assassination, the landing on the moon. How many once in a 100 million year events can you cram into a single lifetime. Well, I don't know what this thing going on out at Jupiter is about but it's bizarre.

It's bizarre that in science now, things like chaos theory and non-linear dynamical systems and these kinds of things, these intellectual tools arrive just as the assumed stability of reality, established by Newtonian gentlemen in powdered wigs working through their brass instruments, that all flies apart and there's just the heaving oceans of the spaghetti of ambiguity as string theory and non-localization stretches you from here to Zebu Gonubie and back again. The feedback between the perceiver and the object perceived is tightening. I don't know if this is a psychedelic theme but it's the theme of my psychedelic explorations. I think of the shamanic model as inherited from classical aboriginal shamanism worldwide, which is a model of levels that the universe is somehow made of distinct levels. Energetic, geographic, but that there is an access, an elevator that allows you to move from level to level. This is usually some extraordinary technique of physical stress production or in the hipper societies, a pharmacological intervention of some sort.

The information is deployed differently on each level. They're like defined perspectives on the stuff of being, the raw perceptual input of experience. I really think that and I don't understand, you can't quite wrap language around it, it has something to do with the fact that we're physical creatures at all. The mind at its deepest organizational level reflects the geometric principles of the organization of space and time. The mind as present in us at this moment has been folded and sculpted and shaped into a tool for threat detection in three-dimensional space because the body is a fragile thing born along by the vicissitudes of matter. But when you take a psychedelic or when you perturb ordinary brain chemistry by any means – illness, high fever, lightning strike, hunger, prolonged drumming, grief, all of these ways – then there is a transition of level, or what Mircea Eliade in this wonderful phrase, called the 'rupture of plain.' The rupture of the mundane plain – isn't that great...you'd almost swear you'd have to smoke DMT to get together a phrase like 'the rupture of the mundane plain.' But then the organization of the information on these different plains has hitherto been largely thought to be somewhat expressionistic, or haphazard ala the Jungian maps of the unconscious or something like that.

I think that there is actually more to be gained by making a strict mathematical model and saying that the shaman is a person who penetrates to a literal informational hyperspace of some sort. To take it literally in terms of a geometric explanation because think about it for a minute, shamans are primarily in their aboriginal setting, they function in three roles. They predict the weather. Weather prediction is very important in shamanic cultures. They tell where game has gone. In other words, they monitor the food source of the group and direct the hunting and gathering activities according to the availability of the food. Thirdly, they cure disease and this is very important and they are incredibly adept at choosing patients who will recover. This would be a cynical way of putting it. They are very adept at choosing patients who make miraculous recoveries. Some of you may know the tape recordings of Maria Sabina's mushrooms Velada made by Wasson, where an eleven year old child is brought to her and she says she wont shamanize for this case – that this kid is not going to make it. He doesn't make it and dies within three weeks.

Well if you're a materialist of the modern stripe, then the only way you can deal with this testimony about shamanism, about the precognitive knowledge of weather and game movements and the miraculous ability to cure is to deny it. To deny it and say that this some kind of sleight of hand or they are very closely observant of nature. In other words, some 'only this' argument that denigrates the thing. I think when you actually look at the ethnographic data from all parts of the world collected in the field by people who spent time with the Azande, and the Kikuyu, and the Witoto and the Kyrgyz and so on; the body of testimony of

what we would call paranormal phenomenon is sufficiently impressive that another model has to be called into play. I think it's that there are ways to push the mind by extraordinary pharmacological encounters or stress into a kind of higher dimensional space. This would be sort of like the idea that the indeterminacy that adheres to matter at the quantum mechanical level, the fact that it displays itself as particle or wave depending on the questions being asked – that that fundamental indeterminacy apparently has to be amplified through every level of nature, including the human level. So that when you get to ourselves, the mystery of ourselves is the particulate, finite and dissolving body and the intuition of the unseen wave like infinite spirit, the indwelling entelechy that creates the cohesion of the nexus of actual occasions that is the coordinated prehension of an organic system, right? We'll just stop there...

[Question]: Let me see if I'm getting this right? Somehow I'm getting the image of you mathematically decoding the language of the gods in a way?

Well except that it isn't actually a language. It's more like a point of view. What I'm suggesting here is that the magic, if that's the word, or the grandiosity, the power of ecstatic exelation that resides in the psychedelic – is because it is literally a change of dimensional perspective. I hope this isn't too an obscure an example – in the 14th century Petrarch climbed a mountain somewhere in Italy and wrote a passage about it and invented the observation of landscape and nature in this single work of art. People had never done that before. It was an entirely new thing to climb a mountain and look at nature and feel the unity and the grandiosity of it, and write about it. It was part of Renaissance humanism. It was part of getting people out of those dreary, urine stenchy cathedrals that they'd been hanging out in for far too long.

So what I'm suggesting is that in a sense, the shaman is someone who climbs an inner mountain but a real mountain, a geometric mountain, and then has a higher perspective. It's a shift of awareness. We all are body, soul/spirit but to the degree that we concentrate on one, we occlude the other. I don't really like the sound of that because it sounds like you could turn that into some kind of asceticism, which in principle I am against. I think the key is paying attention to mental life without bias. One of the things I've been talking to the staff here because I'm scholar in residence is Finnegans Wake. We've been taking it apart and looking at it and noticing that part of the genius of Joyce in the way the Wake is composed is that all terms are transparent. Every word you can see through it to other words, to other associations, to other connections. Nothing is explicit and overt and defined. It's a mental universe.

The novel can take two directions. It can try to create what's called realism, which is in a sense an attempt to duplicate the laws of optics on the printed page in narrative, so that you have lord and lady so-and-so moving about their country home with the crisis of daughter and servants, or whatever. But then that's not the world those people are living in. That's the world you would see if you were a camera watching them. The world they're living in is a much less crystalline and temporally defined world. It's a world where memory and anticipation are in a disystolic relationship as the attention of the characters ebbs and flows, focuses and merges. This is what a great deal of modern literature is about.

[Question]: Are we trapped?

Well, trapped in artifice. Trapped in art. In a sense, yeah. That's why Proust and Joyce, who are so different, can be seen to be essentially about the same thing. A true rendering of experience is very hard. This is the great challenge. I think that's why somebody asked me recently – what was I doing with myself or where was I going? It seems to me that once you work your way into all of these places, the real test of your psychedelic authenticity is the ability to write a novel because what you have to show to yourself, not necessarily to anyone else; what you have to show to yourself that you can put yourself into the mother giving birth, the fascist interrogating a prisoner, the child at play, the gangster plotting the advance of his career. In other words, the human experience is open to you. You know what it's like: hooker and priest, saint and sinner. It's all accessible to you. That's the sign to me that a person has really dissolved their

boundaries and done their inner work because the quintessence of understanding is the ability to occupy other people's points of view. I certainly make no claims in this area. In fact, I'm very weak in this area. I learned a long time ago but watching how I play chess, that my emotional immaturity is right on the surface because the way I play chess; I make brilliant plans and then I attempt to carry them out as though there was me and nobody else there. Meanwhile, coming at me across the board is this bewildering series of interruptions of which throw off the plan.

This is the Via Dolorosa, the street of tears. I think there's a crying tradition among North American Indians. Stress is what we're talking about on one level. It may be that there are two ways to attain these places, stress and psychedelics. And then we could have a discussion about whether psychedelics are a subset of stress or not. I mean that's sort of like whether you think of surfing as stress. Obviously it's strenuous and it can kill you but some people think of it as exhilarating. There are many ways to perturb the mind. The reason, when we talk about psychedelics, we fall automatically into a vocabulary of travel. We talk about journeys and tripping and that sort of thing. This is because travel is how people normally attain this if they don't have pharmacological means and that's always been respectable. Even among very Bourgeois societies like the 19th century England. The summer holiday in Italy was de rigueur and if you saw room with a view, this was where Eros and the dark Latinate unconscious was expected to swarm over these pale English women and initiate them into unspeakable pleasures and debauchery. It doesn't sound half bad, does it?

[Question]: You talked about...I'm having trouble wrapping my mind around it but my question has to do with one of the topics of the weekend, which is ethos vs. politics, inner vs. outer. Psychedelics are a way of experiencing other planes of reality or reality in a different way but it seems as if you're also talking about a way of using that requires – I don't know if there is inner discipline – how do you use it so that it's not just a distraction or a drug?

[Question]: The fetishes? The fetish objects?

I think the simple answer to how do you do it without trivializing it is that you doses that scare you. These things are not physically dangerous and yet they are terrifying at what are pharmacologically completely harmless doses. The LD50 for psilocybin is hundreds of mgs per kg, yet if you take anywhere about 25 mg, I think strongest wayfaring soul reaches for the break pedal somewhere in there. It's amazing how we just skim the surface of this and we can't go very deep because language fails. Most of you who have done committed doses know that you go into a realm where it gets weirder and weirder and weirder, and finally the very machinery of explaining to the observer what is happening begins to melt. Then you are there with it for a while and then you descend out of that and the language mechanism reactivates and says, we are now leaving the utterly unspeakable behind.

It's an extraordinary thing, the motivation of my career is I just can't believe how this much strangeness could lay that close to the surface and the enterprise of human history be conducted for 10,000 years with people running around trying to do weird things, writing polyphonic music, the Rudolfian court, Hieronymus Bosch, and all this stuff. Right under the surface, just a Niagara of peculiarity and strangeness that makes no sense to me when I put on the hat of the biologist. Why should an advanced animal of some sort have this curious relationship to an invisible river of imagery running collectively through the brains of all and each? What is that about? The beauty of it, and as in Blake's word, the futurity of it. The fact that in the glistening of the flowing waters of the unconscious, you glimpse not only the square topped towers of Ilium, the ruins of Carthage, Petra and all that – but you also see the intimations of some kind of magnificent future. Is it in the imagination? Is it directly ahead in the time stream? Is it lost in dream? The whole circumstance of being alive and being a self-reflecting, thinking human being is just too peculiar for words.

[Question]: Would you say that, as far as the terror of this goes and what makes people hit the off button, to

push the breaks to the floor board, something that you were saying last night about lost continents – it seems that this psychedelic experience isn't new in the sense of a cultural endeavor, that's called out the discovery of the unconscious, and Freud attributed that to the Romantic poets, so I think what you say, that one could see the whole modern and post modern era of this progressive discovery of this lost continent, the unconscious, and perhaps it is as the Native Americans would put it, the purification in the sense that psychoanalysis, the analysis of the unconscious brings to light hidden aspects of truth of peoples lives, or their collective lives, that no one wanted to face. But these things have been layered into the unconscious so it's a process of bringing things to light, or as Carl Jung says, enlightenment does not consist of visualizing figures of light, but making the dark unconscious?

Well, I'm not sure I understand the question. If you're saying how derivative of... I mean I basically agree with the premise, I would just push the thing further back into time. I think where this all... it's fun to find various break points. I mean, was it Tim Leary, was it Alfred Jarry, was it Lenormand, or was it the French symbolists. I've been thinking about this a lot recently. I think that what's popularly called age of the marvelous indicates the real descent of the western mind towards the psychedelic confrontation. When we look at the time wave tonight, maybe we'll get around to talking about this but basically with the inventing of printing in 1440, I now see books as obviously a psychedelic drug of enormous power. The early books were manufactured with chains on them so they could be bolted to tables so that addicts would not tear them loose and take them home. The invention of printing and the seizure of Constantinople by the Ottoman Turks set off an age of scientific advancement, exploration, so forth and so on, that lead to the discovery of the new world only 500 years ago. And this had the impact on Europe that flying saucers on the White House lawn would have on us. It was an alien planet that had been discovered with trackless jungles and temperate forests and people clad in gold practicing strange religions and enormous trading. It was an alien civilization, and at the same time, the grip of the medieval church was breaking down and people had a fascination with the bizarre and with the phantasmagoria of natural existence. They were bringing back birds of paradise from Bougainville. They were bringing back carved Incan and Mayan material, codices and all of this stuff. This is the period shortly then into it of the great flowering of European magic. The establishment of the Rudolfian court in Prague and all of that.

It was the age of the Wunderkammer, the wonder cabinet, where you collected together stuffed birds, amonites, gnostic gems, bits of archaic detritus, large insects, narwhale horns, all of this stuff. It was pre-Linnaean, it was before the categorical mind had stepped in and the whole thing was just a maelstrom of individuated data collections. I think that's where the psychedelic thing in the west became explicit.

[Question]: Back to this man's question about the actual taking of a psychedelic, I think it's real important that it be done with an intent and to kind of ask for or put it out there what you need or want?

Yes, you have to talk to these things. You do it on an empty stomach in silent darkness in a situation where you feel secure, which can mean in your apartment with the phones unplugged and the door locked or off in some jungle. It's very important, empty stomach and silent darkness and intent as you say; then, not a reckless dose but a committed dose. Not to see if it works - it works, other people have established that. You don't need to do research to confirm that it's psychoactive – you just do it! There are techniques for navigating through there. The best is a pure heart but since we can't always come up with that, sweating blood also helps.

In terms of actual, physical techniques, singing – this is what I learned in the Amazon. You don't always have enough presence of mind to breath but if you will sing, the breathing will take care of itself and the body is an instrument. The Yogis, they got that right. The body is an instrument for tuning through these dimensions. I don't know what it all confirms. I don't rush to embrace any particular esoteric school; in fact, I'm fairly scornful of all of that because I see how it's used to promote priestly hierarchy and mumbo-jumbo and that sort of thing. Certainly science doesn't have the whole story. The human body is an

incredible esoteric instrument. It's just that I think you need to self teach yourself.

[Question] The shaman's perception, I guess that's what you're trying to get to, on the subconscious level. Their minds aren't cluttered. They don't have to overcome the knowledge, the facts, because they don't start with that. How do you get past that? It would seem to me in this case, the more you know, the more difficult it would be to reach that pure second conscious level where it's just a matter of knowing through the vision of your consciousness will do.

Well I don't know about that. I see the logic of it. I had a shaman tell me once in the Amazon, he said, 'it's not easy for us to do this.' It's no easier for us to do this than for you to do it. I imagine, giving shamans pure DMT and stuff like that, and watching them go through it – they're macho, they do it but at the core are as sensible and afraid as anybody would be. Everybody comes down to a local language structure and a local set of cultural myths. The shaman's job is to be outside, behind and under that. He's sort of an archetypal plumber. He sees and he knows where the shit goes. He knows how to repair the system that is invisible to everybody else. I think it's very challenging to do this stuff in any cultural context. One thing you find that you may not expect when you go to the Amazon is not all shamans have the great zest for going as deep as possible. There are a lot of shamans whose attitude is, you get in, you do the work and you get out fast. You take only as much as you need to...

[Workshop Day 2]

It's a question - which is more important to the content of your psychedelic experience? The books you've read in your life or your genetic heritage? That kind of thing. Teasing this apart, the only way we'll ever know and this is why I tend to encourage and hang out with the technical crowd on one level, virtual reality is a technology that might allow you to show somebody the inside of your head. If I could spend six months building a virtual reality, which was my DMT trip, then escort someone into it and show it, then they would say – that's exactly what happens to me or they would say, you know that was the damndest thing, no where does that come tangential to anything familiar to me. Well then this would be wonderful in either case. You would either have confirmation of a generally recognized reality or a breakthrough to an immense domain of potential creativity where every individual could create their own equally personally compelling metaphysical joy ride of some sort.

I think on one level what we're doing here is something that's never been done before in Western society that I'm particularly aware of, which is, we are talking about the psychedelic experience. This is the first step towards understanding it. I guess the first step is having it but then, so many people have had it who don't attempt to English it and it's quite respectable to do that. Too much has been made of the indescribability of it. I mean it's fine to say that but then decency demands that you go forward and describe it. You're pushing there against the envelope of language.

The culture cannot evolve faster than the language. The language is the flashlight that shows the path and so if we don't talk about something: race, homosexuality, drug experiences, then no cultural progress takes place on that front. It's like it just doesn't exist. So part of what we're trying to do here is create a dialogue that is not necessarily politically confrontational. Too much of the public dialogue about drugs is whether they should be legalized or not. You can take care of that in one sentence. Yes they should and they won't be. So now let's move on with that.

Experience, this is probably the richest domain of experience that we have. I mean, you may go on your

vacation to *Benares* and I may go to Argentina, and we will get back and talk about the restaurants, national parks and museums that we visited, but far more interesting conversation could take place if I do psilocybin and you do mescaline and then we get together and talk about the places that we've seen. In other words this psychedelic universe, whatever it is, is the major datum of experience. It's larger than this planet. Nobody knows how large it is. The further in you go, the bigger it gets. We don't know what to make of something like that. That's the reverse of our expectations.

[Question]: You seem to use sound a lot as a key issue. You were mentioning in South America, you sang songs. Were those songs ayahuasca songs, Inca songs or little ditties you were doing your own self?

They were in some cases ayahuasca songs that Don Fidel taught and in some cases just taking ayahuasca, I learned and called them songs. But one of the things that's so interesting about ayahuasca is that it promotes a synesthesia that's very dramatic. You see sound and when you make it. You have an experience, which is beyond English by several leaps. The experience of generating colors out of a vibration so that you go 'onnnnnnnnn'... and a chartreuse line like a neon light descends and hangs there and then you can move it off and it goes from chartreuse to lemon yellow. Then you just begin playing with this and within 30 seconds you're doing something that seems to you only intelligent insects on other planets do.

[Question]: Is it true of everyone who you've talked to about ayahuasca?

I think if you can come through. You have to sort of get your wits about you because ayahuasca sweeps over you. There's stomach stuff. There are waves of hallucination but once you sort of get your sea legs, you can do this. It's very clear when you're with these shamans that these performances are pictorial. Originally the active principle of *Banisteriopsis Caapi* was called Telepathine when Theodor Koch-Grunberg and those people went in there in the early years of the 19th century, they collected samples, took it back to Berlin, characterized it and called it Telepathine. Then it was later realized that the compound had been earlier isolated from *Peganum Harmala* and called Harmaline and the rules of chemical nomenclature give the early discovery precedent. But it was called Telepathine because the tribal groups using it seemed to have this extraordinary group mindedness. This is one of the things that I'm keen to talk about, is the fact that telepathy of a sort we didn't conceive seems to lie very close to the surface in these states. I think most people think of telepathy as you hear what I think, that's telepathy. That is not what psychedelic telepathy is. Psychedelic telepathy is you see what I mean. You see what I mean! There is a way to use voice, inflection and tonality to edge people's transduction of the language experience out of the audio, out of the ear mode and into the visual mode. This is something which is neurologically very fragile in us. It's as though the land is very flat and the river flows one way through the audio processing channel of the neocortex but just a very slight shift of the inner stratigraphy and the river would flow another way. It would flow into the visual cortex and language would become a thing beheld. One of the things that's so interesting about ayahuasca is that it contains DMT and Harmaline and these are both brain neurotransmitters occurring in normal metabolism, suggesting that there is simply a one or two gene mutation or the intensity of the expression of a gene already present that would switch brain chemistry toward visual processing. Meanwhile in the culture, simultaneously there is this tendency going on, the culture is becoming more and more imagistic. The invention of photography, high-speed color printing and film, we see and we relate through the image much more. So I think psychedelics, media and the predisposition of the neuro-landscape is setting us up for a kind of ontological transformation of the project of communication. Yes?

[Question]: As you're saying this, I'm observing the way that I'm listening to you and I'm seeing what you mean. Your language, like when you say neurological, I see a picture. It goes really fast but I'm seeing what you mean. That's how I'm comprehending you.

Yes, well you're embarrassing me by turning the magnifying glass upon the current project of communication but that's the name of the game.

[Question]: Maybe it evolves as we evolve, that seeing what you mean?

Yes, one reason some people have criticized me is because I use big words. But I've always had the feeling that if you use big words right, your listener understands perfectly what you mean. I don't know how that works exactly or it may just be an illusion of mine, but it's a very satisfying one.

[Question] It seems like in a way you're working with sound and you've got in touch with that sound on different levels but you express it in conscious communication, which anyone's consciousness is somewhat a lie. It becomes more conscious and they hear communication or understanding and it all clicks right.

I think language is a behavior. It was acquired 50,000 or 100,000 years ago and I think people don't use it enough. Ninety percent of spoken communication is trivial. It's very interesting to try and use the descriptive blade of voice; it's like Manjushri, the sword of discriminating wisdom. Communication is about discrimination. It's about finely delineating difference. With this sword of discriminating wisdom, you make your way into the world and, granted, it's an image of penetration and cleavage and so one but what your left with is the cognitive enterprise.

[Question]: After all these years, what is it these days that would make you want to hit the breaks?

Out in the state you mean? Well it does this thing on me occasionally, which I call going all 'halloweenish.' And I say, 'why are you doing this to me?' It's scary. It's probably just my own inner demons. I ride this stuff through but I always feel like you should never take the sea for granted. The metaphor we're dealing with here is the sailing of small ships over great and turbulent depths. I've also noticed, my god, if an iota of pride lodges in your character it can rub your face in it like you just don't want to know from. So I respect it. I fear it, the strangeness of it. Somebody near and dear to me - I won't name them - but just recently described taking ayahuasca and the dose was somewhat low, so after a couple of hours they smoked some DMT on top of it. With your MAO inhibited like that, this is a pretty hairy chested thing to undertake. Don't try this at home folks! With your MAO inhibited like that, it just settled in and he said 'it is strange!' When you get the tabs trimmed and you get the focus right and you can just look at it - it just says behold if you can, oh mortal, the essence of Freg-Youg-Maglama-Glock and you just say oh my God! It is clear that it presents itself through a series of veils. It's so kind to first timers and second timers. It's like a series of Disneyesque images, but god, once you're into it, it begins to part the veil and you realize that the human mind is just like the mind of a gnat falling into the sun of peculiarity and then you come back and try and talk about it.

[Question] – I have two questions. After all of your psychedelic experience and these experiences of other capacities and abilities in the brain, when you come back to the mundane plain, have you found yourself developing the ability to use your brain in the mundane plain in the same way that you have experienced its capacity in a psychedelic plain? And also, do you think all of this is just the tip of the iceberg in terms of leaving this dimension, like maybe a near death experience, leaving the body ultimately through death and is all this just kind of like the beginning of that? You seem to feel that the fear component is important to you. Is it more like a fear of dying when you go too far?

I think in my case, it's a fear of madness. I've convinced myself that dying is highly unlikely. The madness question is totally open book. Who knows? And you do get into places where the only reassurances that it won't last...as far as the tip of the iceberg question, and death and all that – I have a lot of intellectual resistance in this area myself. I was raised Catholic, I fought my way free of that, as I said toward Camusian existentialism and then I got hooked into all this and then was just swerved back into a more spiritually teeming universe than I ever would have thought possible. It's hard to talk about. It may be that what the psychedelic thing is, is that it is some kind of look over the edge. Out of let's say, 50,000 years of conscious human experience; 49,500 of those years has been lived in the assumption that something

survives physical death and only in the last 500 years in Europe has this become a gradually less and less popular assumption.

We don't understand what biology is. We understand some of the details of how form maintains itself but we don't understand the mystery of the descent of form into matter. We don't understand where mind fits in to the loop of causality. So the testimony of DMT for me is that there is a nearby dimension teeming with intelligence that from one perspective – and one of the more conservative perspectives – seems like an ecology of souls. It seems as though that what the shamans always said they were doing was in fact precisely what they were doing. They always said 'we do it by ancestor magic.' We go to the realm of the ancestors. The ancestors exist in some kind of super space. But ancestor is a sanitized term for a dead person. What we're talking about here is apparently beyond the train of mortal care; there is this super-space where apparently everything is made out of mind. And so, in James Joyce's wonderful phrase, "if you want to be Phoenixed, come and be parked, but up n'ent, prospector, you sprout all your worth and you woof your wings." Is that perfectly clear?

Well, if you want to be Phoenixed, come and be parked means if you want to be transformed and reborn as an angel, you have to die. And up n'ent prospector, prospector means rock hunter, as in searching for the philosopher's stone, you're a prospector. You sprout all your worth and you woof your wings meaning you make your own body out of the imagination and I don't know what this means.

One of the things that interest me is the fact that we seem to be moving towards a transformation more radical than any that has ever occurred to our species before. So radical that in the interest of intellectual fairness, one of the possibilities that has to be put on the list is that we're about to go extinct, 100%. We don't know what that means because we don't know what death is. When you look at the record of biology on this planet, 95% of every evolved species that has ever lived are now extinct. This is what nature produces, fossils of extinct species. And the question then, we're down here to ultimate values. Are we trying to have what the Catholic Church, with an utter lack of irony, calls a happy death? Or are we trying to seize the levers of the cultural machinery and pull out of the power dive at the last minute and get this baby back up to altitude and sorted out here? What's going on? Or are there in fact any controls in front of us at all? Are we the hapless passenger on this strange vehicle that is...

[Question] Doesn't it seem with all the soul searching and people getting in touch with what you might call the source - that the messages will be coming down with what you might call 'the way to go?'

Well that's what I think. It's what I think and it's also possibly delusional, so be forewarned, but it appears to me that history is ever more rapidly vindicating the notion that it is building towards some kind of apotheosis, some kind of apocalyptic, apocatastasis. Anyway, something in Greek! The people who project the human future thousands of years they don't understand the asymptotic speed. You talk to somebody in; lets just take a field, gene transplant. You talk to somebody who is tops in gene transplant, they tell you things that drop your jaw. Then you walk over here another laboratory and talk to somebody in parallel processing computation and they tell you astounding things. Well, you realize these two people don't know each other. All of this information is vectoring together and the connections are being made and it's out of control – no company, no government, no religious group – nobody is in control of this and yet there is a plan. It isn't a chaos. There is a morphology being expressed that won't wait and we all are simply the cells being directed into this archaeological expression of mind.

[Question]: When you were talking before about the enlightenment period where artifacts were being brought back, displayed and enjoyed, I'm wondering about the Time Wave 1996, what sort of cultural manifestations we might be involved in? If that makes any sense?

No that makes sense. It might make more sense to other people this evening but the answer to the question is: the parallel resonance between now and then, or between 1996 and the past was the great flowering of Umayyad Caliphate at Baghdad, which was the birth of modern science through the codification of

Algebra. So two things to keep your eye on in 1996 are the political fates of Islam worldwide and breakthroughs of a major sort in abstract systems of description like Algebra and that sort of thing.

[Question]: Or virtual realities?

Well certainly there were technological breakthroughs under those caliphs as well. They were the great patrons. They preserved all this. They don't get any credit. We talk about our heritage from the Greeks but we never talk about how that heritage comes through the Arabs. There's a great book called *How Greek Science Passed to the Arabs*.

[Question]: You said this last night and I want to see if I've got this straight. You said that the mushroom said, 'don't worry, everything is going to be OK?'

I think worry is preposterous. That was Wei Po Yang; a 6th century Taoist sage said that. Worry presupposes that you understand what's going on and I think it's safe to say that we do not have a clue as to what is going on. We can't even tell whether it's a happy ending or a catastrophe. We can't tell whether we're slamming into the wall of our cultural limits at 50,000 miles an hour or we're about to go hand in hand off to the galactic center with the human soul as companion and vehicle.

We just do not know what's going on. I think it's safe to say that we're approaching a symmetry break. That whether you're a horrified pessimist or a gung-ho optimist, everyone can see that the make or break point is coming up because life is either going to get a lot drearier suddenly or there's going to be some kind of a breakthrough. I don't think cosmetic management of the cultural crisis will work much past the current Clinton administration. This is apparently the last go at spin doctoring the apocalypse.

[Question] – I just wanted to ask how you feel about the technology behind the AIDS crisis?

So what do you mean exactly by the technology behind the AIDS crisis?

[Question]: Undecipherable.

Well, in a sense, I see AIDS as the inevitable consequence of the ocean-crossing airliner. Always sites of pilgrim were sites of disease conveyance. Any virus worth it's salt would jump into this situation and exploit it. Now as to the darker side of the AIDS thing, in terms of was this a product of human engineering or human intent or so forth or so on? That's an interesting question but in a way it really doesn't matter. It's a product of human behavior and I don't mean simply sexual or homosexual behavior; I mean such behaviors as travel, pilgrimage and the wish to mix it all up. Think of the gene streaming that is taking place in the 20th century. I mean I know a Tibetan married to an Egyptian woman. Stuff like that's going on all over the map so there are all kinds of crisis. When we were a nomadic community the transmission of disease was retarded by the fact that human groups didn't really come into that much contact with each other. When you're in a place like Terminal One at Heathrow and you just look around you – my god – Muslim priests, Tibetan Lamas, Botswanan Dignitaries – people are just swarming and swarming and swarming and using the bathrooms and coughing. In these airliners when they fly over the ocean - when they fly above 30,000 feet - they recycle the air in such a way that if there is one person who has a problem, 275 people are having their immune systems on red alert by the time you get to Tokyo or New York. Not to rave but...

[Question] I'm not sure but it sounds like your talking about early Christianity, the abstract, that all sounds hallucinatory, a look back towards paradise or something like that?

Well, one way of analyzing Christ if we keep pretty much to the strict orthodox and accept the Gospels and so forth – it's as if he presents a shamanic figure. The unique claim of Christianity was this bizarre doctrine of the resurrection of the body. That was the part that was the jaw dropper. Christianity, working from the primary text, looks very much like some strange kind of biological magical invocation of some sort. There is that amazing passage in one of the gospels where the three Marys: Mary the mother of James, Mary Magdalene, and the other one, go to the tomb and Christ is standing outside the tomb and one of the woman starts toward him and he says, 'touch me not for I am not yet completely of the nature of the

father.' Well good grief, what's going on here? He is resurrected. He has overcome death but he says touch me not, I am not completely of the nature of the father. My interpretation - it's maybe too much to get into at this point - but my notion of what religions are, is that this dwell point at the end of history, which is acting as an attractor for the temporal process and drawing and sculpting and shaping everything as it is brought into its light, as it were, has a kind of reverse causality operating. And what Wordsworth called intimations of immortality haunt time like a ghost. So if you're a Buddha, a Mahavira, a Christ, a Mohammad, you get essentially a geometric theory. You're simply geometrically positioned vis-à-vis the object at the end of time that you become a false reflector of its light and these false reflectors always distort it in some way. It's the nature of it. It's no rap on them; it's just the nature of it that they distort it and some distort it horribly - a Hitler, a David Koresh - and some distort it maybe we like to think less - a Buddha, a Mahavira - but the point is they all distort it. Marshall McLuhan said, 'you know - our mistake is that we're driving the vehicle of culture into the future using only the rearview mirror,' and that's sort of what we do.

But each one of us you see, we are like Christ, Buddha and Mahavira. We also have a perspective on the transcendental object at the end of time, on the divine, and we work it out in our life in our psychedelic experiences, our sexual epiphanies, whatever it is that moves us. It's just what Blake said: psychedelics are window washing equipment for cleansing the glass of perception that allows you to then perceive the world as infinite. Because this transcendental object lies ahead of us in time, to know it is in some sense very 'woo-woo,' very tricky to English - in some sense to know the future and that this is where I think the existential power or the quality of nmenosisness, of realness, comes into the shaman's personality.

The shaman knows the future in the same way that I as a 46-year-old man can advise my 12-year-old daughter and have an immense kind of position of existential authenticity in her world. It's because I know the future. I know that the first love will not be the last love and I know that heartbreak lies along the way and all this. I am wise from her perspective. Well a shaman is a wise person and they are wise because they know the future, not of the individual only but also of the culture. That is why when the TV cameras arrive in the Ecuadorian village and they boot the medicine man out of his thing - they say - well Jose, what do you think of the fact that the forest is being cleared? The usual reply is: eh?

[Question]: Blake also said religion and politics are the same thing. This is a political seminar and I've been waiting to ask you this. I'm wondering if you would entertain a question on what religions are in viruses? I want to talk about the dark side of Christianity and if I could get you to frame it in this way? On psychedelics with books, Christianity - I think a better word is Christianism - as a spiritual ideology looks like a warfare, a protracted warfare if you will against the Earth, against the body, against our very humanness, and I think we accept that there are these invisible things called viruses that attack the physical body. But would you be willing to entertain the possibility that there can be a spiritual virus that attacks the planetary body, in fact attacks Gaia? The reason I ask that, you remember Porphyry long ago when Christianity was on the rise, a Neo-Platonic philosopher said that he thought Christianity was a disease of the soul and I think Freud and Jung has pretty much proved the same thing.

Well long before the viral metaphor, somewhat before the viral metaphor became *au courant*, Jung talked about what he called psychic epidemics. He, in I think 1934, wrote an essay on the return of Wotan as an archetype of the German soul and very presciently picked up on what National Socialism was all about.

[Question]: I'm talking about monotheism when I say Christianism. Patriarchy and monotheism and Christianism as the apotheosis - I get to use that word too - in western history of western society, Christianism being the apotheosis of the patriarchy.

Well, I'm on one level not keen about monotheism. I think it gives a distorted map for the psyche to emulate but I also see Christianity as a pretty radical betrayal of the monotheistic agenda. Monotheism, whatever its social consequences, makes sense. It's a drive towards philosophical economy so you get down

to the idea of not many gods but one God and it works like this. Christianity is a gnostic cult of physical redemptionism grafted onto this Jewish theology by Alexandrian controversialists who had a very curious notion of what they wanted to do. I see Islam as a reclaiming of the pure intent of Judaism to conduct a philosophical discussion of the consequences of monotheism and that all becomes really murky with the mystery of the Trinity and the nature of the Father and the Son. Christianity is an incredibly exotic religion. Other religions are just absolutely straight ahead, they're metaphysical systems with morale consequences. Christianity is about the absolute worship of the irrational and the incredible. Origen, who was one of the patristic writers, great Christian fathers – they said 'your religion is absurd, it's preposterous.' And he said, *credo quia absurdum*. I believe it because it is absurd. That's the foundation of the Western mind. All this mumbo-jumbo about reason and evidence, when you strip it away it's ultimately faith in the absolutely, incontrovertibly incredible: the resurrection.

All three see the permission of this belief, its true, comes out of the earlier stratum of Judaism where an earlier unlikely promise is made. The promise that God would enter history. That's what set them up for this later deal. God will enter history they were told. So then if you're a theologian of this faith, the question obviously arises, how will God enter history? And you ruminate on that for 500 or 600 years and eventually what you come up with is, he will send his own son. He will send a divine manifestation that will be an absolute union of spirit and matter. There will be a descent of the Paraclete into our midst and the idea of the messiah is born, which is an incredibly peculiarly western idea. Buddha, Lao Tzu, Mencius, Confucius – these were guys, you know. A messiah is a horse of a different feather. A messiah is not exactly a human being you know. A messiah is a convalescence of historical force of great energy. So, I don't know, where are we with all this?

[Question]: I don't want to argue; I just think there is another way of looking at it. These are the same guys that we have to remember, the white, male guys – we see the Pope over here, we see the medieval picture. These are the same guys who burned Giordano Bruno, the great poet, visionary and scientist of the state because he wouldn't recant, probably because of a stubborn Calabrian; I'm not sure about that though...

But look at the reputation they gave him! Bruno without the pyre is a whisky priest laying waste to the maids of Umbria. No, I mean here is my point on this: I agree that history has been a nightmare and if it could have been any other way, then probably there is some answers have to be given and some debts paid.

[Question]: But I'm saying there might have been another way if they hadn't burned all the libraries, sought to destroy knowledge to the point in the middle ages, when the Christians so called liberated places like Toledo and found these Arabic writings about the Greek lost science, they couldn't even translate it because they didn't even have a concept of zero. It's like the barbarians won in this society.

Well, yeah – they won.

[Question]: Would they have won if they closed down the philosophical schools and didn't destroy all the knowledge? Would it have been different? Well, we'll never know because we didn't have the chance...

Well, what I hear you saying is: life is tough.

[Question]: Especially for Pagan philosophers...

Yes, you have to make your career choices carefully here.

[Question]: Is your belief in this one dwell point to which history is moving, a form of monotheism?

Is it a form of monotheism? Well, I guess it's a form of Neo-Platonism. I had digested all that - Porphyry, Proclus, and Plotinus – I do feel the power of the argument that when all boundaries are dissolved there will only be the plenum, the one. It's an idea with a very long history in western philosophy. It goes back to *the Timaeus*. My idea of how this thing is working is that boundaries are dissolving. If you want to make one prediction that you can take to the bank, that would be it. Boundaries are dissolving so any scheme that involves setting up new boundaries is probably doomed.

[Question]: Undecipherable.

Well, yes, so it is a kind of impressionistic pastiche that we are trying to anticipate. The other thing is and this goes slightly more to the guts of the mathematics of my theory but I think that time is wrapping itself in an involuting spiral, where each spiral is 1/64th as long as the cycle that preceded it. If you accept that premise then you have a cosmogonic scheme where half of the unfolding of the manifestation of the cosmos will occur in the the last hour and 35 minutes of its existence. So attempting to anticipate what it will like as we go down the maelstrom towards the lapis at the end of history, it can only be conceived psychedelically and wordlessly. I really think history is a psychedelic experience and this old saw about how ontogeny recapitulates phylogeny. If you carry that through to completion then all organic process ends in the big question mark of death and we individually recapitulate that journey. We each will end in death. One of the things that always amuses me is that people are always so resistant to the idea of the end of the world. Never apparently having noticed that it's a fairly academic question when played against the fact of the certainty of their own death. Their world is going to end so what's with all this altruistic concern about all the rest of us? We'll take care of our own apocalypse, thank you! You just need to come to terms with your own because it's inevitable.

[Question]: What do you think will happen to Islam when the east hits the west and fundamentalists are struggling to survive and reclaim their old territories?

Well I think that as this post modern, post communist thing unfolds for several reasons, Islam is poised to make the greatest steps forward since the 10th century. For two reasons: first of all because out there in central Asia, Azerbaijan, Turkmenistan, Kirghizia, an enormous chunk of real estate is poised and rightfully toward moving toward fundamentalist Islam. If those states becomes Islamic states, Islam will effectively double the amount of land that it controls on this planet. The other thing is, as time accelerates, as the weirdness spreads, the global networking, the simulacra, the teledildonics, the virtual reality, as all this stuff becomes more and more prevalent, a lot of people are going to freak out and reach for the button marked 'return to traditional values.' And on a global scale, this is Islam. Christianity is a whore to capitalism. Christianity is not traditional values. Islam is not kidding. I can imagine millions and millions of people alive today who can't imagine that they would ever entertain conversion to Islam who will before the end of their lives make it part of what they're about because there is no other traditional system available. It's either that or what I call consumer object fetishism: which means the Mercedes, the house in Trent St. Tropez, the Rolex watch, all of that.

[Question]: Undecipherable.

That's it!

[Question]: The weekend seminar!

Diamonds on the souls of her shoes, yeah!

[Question]: What about Judaism.

Judaism is not a converting religion. You say you want to become a Jew, they send some guy three times to convince you it's a bad idea. You're not going to.

[Question]: In between, you have the Islam and you have Christianity but in the society it doesn't seem like you have what you would call the word of truth coming out of the music or out of society. It's like bits and pieces and fragments but there is no basic word of what you might call hope or truth.

You mean out of popular culture?

[Question]: Right, there is nothing really coming out. You hear fragments in music...

This is why I associate myself with rave culture, house and ambient music, and all that – you all know what this is right? Well see that's part of the problem. For years and years, youth has just been wondering in the desert of neolism and industrial noise, bands and that sort of that. So now out of England there is a new kind of music which has different kinds of names: it's called House, it's called Ambient, it's called Rave, it's called Trance Dance, Tribal rap; it comes out of hip-hop. It doesn't come out of Rock & Roll. It's quite

consciously not Rock & Roll. It's very optimistic. The people who are eighteen to twenty-eight are the most with it generation in a while and they are not buying in to the consumer object fetishism and they don't seem to be converting to Islam in large numbers either. So I think that you'll be amazed that popular culture will take a very positive turn in the next few years. There's immense energy under the surface. Most of these bands produce CDs in pressings of 2 or 3 thousand copies but it's a very vital and alive thing.

[Question]: Are you seeing that they might come out with a wave of conscious lyrics that are true, and like somehow in the 60's, you had Pink Floyd and The Beatles, and all the groups but there was a basic movement and everyone at that time could relate to those words?

Well I think we're just slightly premature. If the 90s are the 60s turned upside down, then we probably have to wait until 96 and that the energy is gathering. I'll show you on the Time Wave tonight, not that that's gospel, it does appear there is a kind of gathering charge under the atmosphere of Southern white-boy eschaton that's attempting to be created, but when that's all over and the hard lesson is learned that Christ himself couldn't right the American Government as presently constituted, then I think we'll get down to a more serious dialogue. It probably involved electing a fascist president but what's new about that?

[Question]: The media likes to pull the popular cultural mass movements and what sort of distortion happens when people start looking in that mirror. How do you plan to avoid the Timothy Leary syndrome wherein you allow something good and a few people in the know become trivialized, banal and totality commercialized? How do you plan to escape that?

Me personally?

[Question]: Yes, if you're connected with the rave moment.

I will pursue what I call the Salinger-Pynchon strategy. This is where I'm going to become progressively more remote, hard to reach, legendary, and sort of just fade off... But I don't really have any complaints about the media. If I could get to the kind of consideration from Mondo 2000 that I get from the New York Times, all would be rosy in my world. It's your friends who scare you to death in the media.

[Question]: I think it was Colin Wilson who said when he published The Outsider who said there were two ways that the society could totality destroy ones creativity. One was by totality ignoring you and the other was by recognizing you.

Yes, that's right. You become a cliché.

[Question]: The 18-to-28 group, my concern is, what's going to happen to them?

Well what's going to happen to all of us? We're all in the same...

[Question]: Doing for them, so that what happens in the 60s doesn't happen to them. Being particularly aware of the incredible kind of resistance, brain washing and cult snatching...

I don't think we want to get into a wrangle with the establishment over some life or death issue like the Vietnam War. That permitted an incredible penetration of the underground. The great middle class who was maybe not interested in the war but who was also not interested in tearing their clothes off and smoking pot in the panhandle; they were willing to stand by and watch while the establishment really did a job. I think also a stealth strategy is best. You don't want to manufacture ten million hits of LSD in the dormitory on the weekend and then go for the jugular of society. Obviously this alarms ordinary people. Remember when Ken Kesey used to tour the country with the bus, 'Further.' Well they had a big banner, which was on the front of it which said, 'we have come for your daughters.'

Now this is great for a laugh but it doesn't reassure the folks out there in Baboon Wassu when you roll into town.

[Question]: Kind of teaching discretion since the general tendency of youth is to be kind of...

And a lot of survivors of the 60s are now in position to help. A fifth column within. All the years of guilt you've built up over how you betrayed the revolution could be redeemed in a single moment down the road

a few years because you can intervene at some crucial point.

[Question]: Does that include stoning Bob Dole?

Stoning Bob Dole? Dosing Bob Dole? No, I think the Republicans; their only hope of survival is to nominate Perot, which they probably will do.

[Question]: I wish I believed in your writing off of fundamental Christianity but I kind of see it as such a strong irrational force that I worry about it. I'm wondering why you think it's not?

Well, again, when we look at the Time Wave tonight, you'll see that we're in a period, which has a very strong resonance with the Dark Ages. You probably noticed anyway. I think that fundamentalist Christianity is rising in its power but that that power doesn't extend much beyond the turn of the century. There is going to be a last gasp and a final bubble in their attempt to influence the political agenda, but in a sense, their gripe is already broken but there are enormous battles which lie ahead. By the turn of the century, I don't see it as particularly a problem. It's only in America that this horrible business goes on. Europe is a truly secular society. They are just absolutely baffled that our political agenda can be influenced so strongly by what they perceive as crazy people. Rattlesnake handling ecstasies from the hills of Tennessee, I mean, you have to go to Bengal to get stuff like that.

[Question]: They're taking apart our sacred constitution. You're talking about crypto fascism; won't you also admit that there is Christo-fascism that we need to be worried about that just as much?

Well for instance, this Supreme Court decision on animal sacrifice is alarming to animal rights people but the larger issue to my mind is that it's an invitation for eccentric religious practices to get constitutional protection. The Supreme Court even re-invited the submission of the Oregon Peyote case based on that. I think that the election was about this and that, cut it how you may, those people got their asses whooped. They just keep screaming about it because they're bad sports. The election basically turned into a referendum on this family values crapola they assumed everyone would rally around and instead, that was the final evisceration. So I think they are very poor sports but that they not controlling the political agenda of this country.

Of course, give the democratic party enough rope and I'm sure they can sufficiently fumble the ball to get Hermann Goering elected...

[Question]: I'm just wondering if anyone is in such disbelief as I am that in the anti-papist country of Thomas Jefferson, the Pope could come here and draw a crowd that looks like The Beatles visit in the 60s. You know, a stadium full of all these people crying and tearing at him. This is supposed to be a secular society – why does this guy get this kind of reaction from the American populous? Doesn't that disturb you?

Well what disturbed me about the Papal visit, I could see that some very, very sly public relations people are going for the same demographic I'm interested in. The way in which it was presented as an outreach to youth and how he's in the hood, he's our guy, he's my man! The pope, my man! I just thought this is bizarre but also a measure of desperation. I just think this too will pass away. Let's check the Time Wave, I think it has something more to do with the captivity at Avignon than the politics of Denver, I think. Help me out here somebody, where are we?

[Question]: The second-generation are very beautiful kids. They've gotten good spiritual training over the last 18 to 20 years. They don't have anything to do with the institution and they have a nice appreciation for drugs and chanting, dancing and feasting. I think when the raves get with the second-generation Hare Krishnas, it will be nice combination.

Well, see in a sense, the rave is an attempt to be second-generation freaks; to actually learn from the 60s. I'm pretty positive about it. It's just going to be a smorgasbord. The evidence is going to come in faster and faster, supporting all positions. Things are going to get a lot worse and a lot better and it's all going to happen simultaneously. I really believe that from 1945 to 2012, we are reliving in a compressed form about 4300 years of human history. Very literally, this is not a metaphor and if you take that seriously then

we have reached 765 AD. That's as far as we've come from 1945 and ahead of us lies the establishment of Gothic Europe, the Black Plague, Newton's laws, the Italian Renaissance, the machine age, the European Enlightenment, the discovery of atomic power, DNA – all that lives beyond the turn of the century. So when people are frustrated by the fact that we can't see what the transcendental object at the end of time is going to look like – I can't say here is what it will be like on the great day when it comes – it's because it lies literally below the horizon of rational apprehension.

But that doesn't mean that when you look east the sky isn't streaked with the blush of rosy dawn. It is! It has been for centuries. We're moving toward this thing. It has to do with the idea of human freedom. It has to do with the idea of the inherent dignity of human beings. It has to do with the idea that everybody should have four square meals and a roof over their head. It stretches from the sublime to the mundane. It's an idea of how it should be and sometimes it resides in the secular domain through the schemes of Marxism or even of National Socialism and sometimes it resides in the domain of religion as some kind of great cleansing or the descent of the glory or the coming of the Maitreya. But human history is the outer shell of the phenomenon, that's one way of thinking of it. So if you find yourself inside of human history, then you are inside the attractor field of the transcendental object and then you just have to find where you are in the historical galaxy. Are you just about to escape it's influence and drift off into the interstellar darkness or are you closer into the core and therefore irrevocably locked and irrevocably being moved slowly but with great certitude towards the confrontation and revelation of this thing? And of course it happens to us individually with death. There is no escaping it!

Then we choose, in the same way we're a little dodgy about facing our own death; we're even more dodgy about thinking about the fate of the species. Science has tried to tell us that human history is purposeless. Well this is a very odd contention because if it is purposeless, it's the only purposeless and disordered process that's ever been observed and there it is right smack in the middle as the sum total of the activity of the most conscious entities known to exist in the cosmos. A strange place for purposeless to crop up with such a vengeance.

[Question]: You talk about how psilocybin mushrooms are responsible for the big cranial leap from the proto-hominid to the Homo-sapien. Do you think its possible that again the psilocybin mushroom can play a role in the next evolutionary leap or some form, it may not be physical...?

Well that's a good question. I don't think I've talked too much about this because it has a sort of funny vibration to it. But sort of following Isaac Asimov's style of writing *Foundation and Empire*, *Second Foundation* if you haven't read these books, these are huge science fiction histories of the future. It seems to me that you could make a case that there is something called the Strophariad. It's great that this Latin word works out this way. The first Strophariad was established on Earth half a million years ago and lasted until 12,000 years ago and then it ended. Then there was the historical era, the imperial era, the era of ego, kingship, phonetic alphabets, exteriorized technology, standing armies, urbanism, architecture, hierarchical structure, forced social role playing, so forth and so on.

Then beginning in 1953 - that would be the year zero of the second Strophariad when the Abraham and Sarah of the new order, Gordon and Valentina Wasson, discover the mushrooms in the mountains of Mexico. And then of course in the 70s, the brother's McKenna propagate the method for cultivation, which turns it from a rare tropical endemic into a denizen of every attic and cellar from Nom to Calcutta. The symbiosis between human beings and the fungi is reestablished and it's a symbiosis that leads directly back to a connection into the Gaian mind of the planet. It would be great. It's a little grandiose for me to claim it but it would be wonderful if technology would miniaturize itself, if sexuality would generalize itself, if nomadism, electronically sustained through universal issuance of power books and fax/modems, were to come into vogue and an entirely new social order – isn't that what it says on the dollar bill, a new social order for the ages would be born and we could all become an eye floating above our own pyramidal

database of uniquely sculpted virtually real personal brick-a-brack.

I think that the mushroom has an immense role to play in the human drama?

[Question]: What do you mean symbiosis? What do we give the mushroom?

We give it hands. It has no power to manipulate the environment. It touches the environment as lightly...

[Question]: Are you saying that you think it's an intelligent thing that needs expression through human mind and body?

Well that's one idea that I have entertained – that it's some kind of thing that blew in here a long, long time ago. As I was saying earlier this morning, we will come to live in the imagination. If you look at the mushroom, it looks like an organism that engineered itself that way. It said, 'let's deemphasize our bodies, let's reproduce by spores, let's be primary decomposers, let's get out of the food chain, let's spread ourselves as lightly as cobwebs through the ecosystems we inhabit.'

[Question]: And see who eats us first?

And see who eats us first! But it seems to have like a database of intelligence that is transplanetary. We don't know what kind of a barrier space represents to the drift of life. We've only known about DNA since 1950. Presumably any civilization with a full understanding of DNA could design itself and create a karmalious body, an eternal style and an enormous telepathic capacity. Mushroomhood may be something that we're headed for or at least it may serve as a natural model for a new style of organic existence as the shedding of the monkey begins to be progressively accelerated.

It's perfectly clear; I don't think that we can go to the stars as hairless monkeys. It's just bad packaging. It was great for the conquest of a terrestrial environment but if we're serious about taking our place in the hegemony of galactarian civilization then I think a considerable downsizing and repackaging is going to be necessary for that. The spores offer a good blueprint for that.

I see that it's noon. To your scattered bodies, go. We'll meet back here at 4 o'clock and I'll probably be in the tubs part of the afternoon. I'll be giving an interview part of that time but I'm happy to talk to you anytime that I'm around untrammled, feel free.

Well let's see. It was suggested to me that maybe we should confine questions to designated periods so as not to break what was perceived by some as the forward thrust of rhetorical momentum and perceived by others as the unmitigated exhibition of megalomania. Ho-hum for that! So maybe we'll do that. I was sorry to hear that because questions are such an easy way out!

Let's talk a little bit about any loose ends of this morning and then I'll talk for a while and then we'll entertain discussion at the end of that. Is anybody disappointed? Are we not getting to your favorite subject or somehow slighting some side of it that you're afraid isn't going to get its full treatment? Any comment on what went on this morning?

[Question]: I was just talking to some people in the bookstore and I thought pretty much everyone had the same experiences but with me and mushrooms, I had profound teachings and teachings of things that I was unconsciously aware of. I was given very good advice and sometimes instructions as well as awarenesses, so I don't know if this would be boring since you do it a lot but I would like to hear about stories.

So you like stories? I agree. I just never know. I'm always trying to calculate. There's just such a limited number of hours. Is it OK to swap stories and never mention the Paleolithic? What gets sacrificed for what? I think stories are great and I certainly don't discourage them.

[Question]: As you were talking about before, the intelligence in these substances, the intelligence that seems to be in these substances.

So that's what interests you? Well yeah, it's what interests me. What I keep going back to is how confounding it is. How confounding it is to rational expectation that a plant can, exactly as you say, it gives

you specific advice. It can color coordinate your wardrobe if this is a major concern of yours. It has no snobbery in what it will deal with. It's eerily like a companion. No other psychedelic does that. It's in a sort of a category by itself as an entelechy. On DMT you encounter these self-transforming machine elves or the gnomes of hyperspace but these things are drenched with the peculiar or the *au pre*.

Often in the mushroom thing, it's very approachable, friendly and manageable at least on a certain level. It's like anybody, any personality. It has depth. I never know – is this news to people or is this ho-hum and we've been over all this many times before? The mushroom as mind, the mushroom as historical – something which is penetrating human history and changing what it means to be a human being. In my book *Food of the Gods*, I argue that it actually shaped human organization out of primate organization. Our bizarre situation in nature, that of being half primate and half arch-angel, is explainable only if you assume some extraordinary catalytic agent coming into our environment around the time when we were descending from the trees and becoming omnivorous and switching over to becoming nomadic grassland animals. The human brain size doubled in two million years, the most extraordinary transformation of the major organ of a higher animal in the entire paleontological record. This, under any circumstances, would be an extraordinary challenge to the theory of evolution. The fact that the theory of evolution was generated by this very organ under discussion makes its inability to explain it particularly embarrassing if you follow my logic.

So there was some extraordinary catalytic action that in terms of the geological record was like a bolt of lightning. A species, a primate, an arboreal creature transformed into a grassland forager suddenly stands upright and begins to perform symbolic activities. Our peculiar relationship to our sexuality and to dominance hierarchies has to do with the fact that as primates, we are genetically scripted to have male dominate hierarchies. But for a very long time, the presence of psilocybin in the human diet pharmacologically interrupted that maladaptive behavior and created an orgiastic social style that was very strong glue for group consciousness because men could not trace lines of male paternity under those circumstances.

So a very old primate behavior was for a couple of million years perhaps overwhelmed by a dietary factor. Then fairly recently with the drying of the African continent, the mushroom religion and the society that had gathered around it and the social and sexual style that had gathered around it, collapsed. These ancient people around 10,000 BC migrated in yet another wave of migration out of Africa into the Middle East and established the early human stratigraphy that we see in the Nile Valley and at Jericho and at other places. That is the fall into history! Because in the absence of the mushroom, the old primate program reemerges and it's right at that moment as we break with the African grasslands and as we become sowers of cereal grain across Asia Minor. It's right at that moment that a whole series of maladaptive institutions spring into being simultaneously. Male Kingship, standing armies, urban concentrations, canonized law, suppression of a goddess religion in favor of a religion of male warrior figures, the age of Gilgamesh, agriculture – all of that comes at once. I think it represents a break with the Gaian mind previously maintained through this quasi-symbiotic, shamanic, psychedelic, mushroom connection; a break with that and a profound alienation from the natural world that issues into history.

Gilgamesh, for crying out loud, the earliest piece of literature out of that area that we have is a story about a guy who gets a hold on the loyalty of the shaman and co-opts his loyalty and gets him to help him cut down the world tree. They go off into the wilderness, Enkidu, the shaman figure and Gilgamesh, the wily king figure, and they cut down the world tree. This is the earliest piece of literature out of that area. Just to leave no 'stern untuned', in our own liturgical tradition, a story of that antiquity is the whole Bible story of Genesis, which is the story of a drug bust essentially; a whole hassle about a forbidden plant, a plant that conveys knowledge, that the owner of the garden has decided that this knowledge is not for the human beings and then the woman - the woman, the gatherer - the one who represents the old religious strata, now

being suppressed heretical, fungal connection. The woman eats the plant then she corrupts her roommate, the landlord goes berserk, the lease is cancelled and in the final fade on that story, what we get is 'and God set an angel at the eastern gate of Eden with a flaming sword that they might not find their way back.' Well that's simply an image of the desiccating African sun driving these people out of the cradle, the Saharan cradle, of this mother goddess, psilocybin based, nomadic, cattle centered religion, which was a kind of style that had arisen there and flourished for a 100,000 years. And then the fall into history is real. We are like the children of a kind of a dysfunctional relationship. There really is a trauma of some sort in our past. History really is a kind of pathological bereavement because we were dropped on our heads 12,000 years ago and we've been trying to sort it out ever since. It explains to my mind, our fascination with drugs. It is true that many animals, elephants trample down fences to get to rotting papaya and butterflies hang out as dishes of sugar until their little legs are clawing the air but human beings are of a different order when it comes to addictions.

We physically addict to several dozen substances, psychologically addict to dozens more, addict to behaviors, political ideologies, each other, and art works, you name it! People go bananas in some cases if deprived of any of these things and show all the symptoms of heroin withdrawal: insomnia, palpitating heart, irritability, irrational decision making, delusion, so forth and so on. The extraordinary confluence of events necessary to call us into being as a thinking species was this kind of quasi-symbiotic relationship that evolved between us, cattle and fungi, where the fungi became or is for some mysterious still to be discovered, a pipeline into a mind, an entelechy, which we can only image as feminine and can only associate somehow to the environment, to the ecosystem. This is the Gaian mind. This is what the goddess really is! The goddess is a network of connective intelligence that is operating on this planet.

I think it's not in its essence mysterious. It's simply that what the psychedelic does is it dissolves boundaries. One of the boundaries that it dissolves is the boundary between community, which is a behavioral boundary maintained by the convention of language and therefore not as set in concrete as you might wish to be congealed. Between that boundary and nature there comes a dissolution and then there is, low and behold, not the barren howling atoms of Democratian materialism, but instead, nature. Pulsating, minded, alive, caring, threaded into the human enterprise, willing to advise you on your fashion choices and your investments. It's an astonishing thing. We were the great celebrants of that in the Paleolithic world. We were its chief acolytes if you will because our glory was the neocortex. The language processing capacity that we brought into the game because we had been primates in the canopy of trees with a pack signaling repertoire at the level of dogs, or something like that. Then under the stimulation of the glossolalia brought on by ecstatic doses of psilocybin in this context of orgiastic boundary dissolving sexuality, this mystery was connected with. It is exactly the same mystery that you hit at five grams in silent darkness and it's still mysterious. Thomas Aquinas, Heidegger, they don't really shed much light on this. We haven't in 25,000 years learned anything that makes this trivial or dismissible. It still raises the hair on the back of your neck. It still feels like the true indwelling of a metaphysical essence. It turns out that all the careful deconstruction of living nature by materialism was in vain. I mean – nature is alive and minded! I don't know what this means.

I myself, as I sit here not loaded particularly, cannot grasp the implication of a minded nature. It means that we're living in a world much closer to the spirit of early Greek mythology than the spirit of our own materialist philosophies. I suppose that's why there's an argument for being *au courant* in your philosophical biases because from places in our cultural canon like quantum physics and chaos mathematics, places that are very like early Greek philosophy. Heraclitus speaks for chaos and I suppose Parmenides or Thales speaks for some of these other points of view. Quantum physics, the discreet nature of the world; these things, if you can assimilate them are very close to what is perceived with psychedelics but very, very far from the models that are being inherited from the past. At the very center, you put your

finger on it to bring it back around to it, at the most confounding center of this mystery is the presence, the voice, the companion, the ally! It's crazy! It literally is impossible within the context of the cultural expectation and yet it's real. This is what got me onto it all this years and years ago because somehow I had friends early on who said these plants talk to you. And I just thought, my god, they're losing their marbles. I would take LSD and smoke cannabis and do these things and have all kinds of strange experiences but I never got what this thing was about and how the plants talk to you until I got to psilocybin. But you have to invoke it! You have to speak to it. It doesn't speak until spoken to. They're shy. They're like fairies – hell, they may be fairies, who knows? You have to coax it out and then it will just come forward. It's the damndest thing. As I sit here, a man of 46, earning a living by telling people how you coax fairies out from under invisible bushes, I wonder myself at what the cultural crisis has come to. Nevertheless, it's true! It's as true as anything and it's more confounding than most things.

I don't know what it means. I've been through the possible explanations: Jung, autonomous psychic entities escaped from the controlling influence of the Superego, yes, but when you're talking to a gnome, saying that to them is absurd as suggesting to a Javanese person that they're an autonomous portion of the psyche that has escaped from the control of the Ego. It doesn't wash. I think that somehow we, unlike shamans, we haven't taken these worlds seriously enough because we have a materialist basis. One of the things – this is maybe a point worth making then I'll stop raving about this – one of the things that quantum mechanics has secured is the necessity of the observer for the ongoing enfoldment of phenomena. To me, that means that hallucinations have undergone an ontological shift of status. If hallucinations are now part of reality, they are primary data for theory making in the same way that the movement of the stars is or the changing of the tides. Quantum mechanics secures the mind as the necessary agent in all process and so hallucinations are no longer off the table or out of evidence in terms of trying to understand what's going on with reality.

[Question]: That brings up the question that I've heard posed before, sometimes it's on people's minds and they don't want to say it. That is, why should people believe this Irish raving tale-tell of human evolution? After all, I have to admit, I am in awe of your intellectual prowess. I figure everybody knows this guy talking about stories. A guy who can convince his girlfriend to bring his lover down the Putumayo could talk a whole generation into anything. Your powers of persuasion are fantastic.

Thank you! I appreciate that. Are you saying...what is your question?

I mean I agree, I think the best idea will win. In a sense you're right. The person who can tell the best story, that story will win, but best story is a complex concept. It also means best formal mathematical underpinning. You get high points for that and most people come up rather short in that department. I come out of the Berkeley tradition of all-night conversations. I think, often in arguments, you don't make progress until the 9th hour and I'm willing to debate all this stuff. As far as my theory of evolution is concerned, first of all you might suppose there is a large and established body of theory that has to be exploded – what the straight people say about how we doubled our brain size and got culture and mathematics. It turns out no, they haven't got a clue. There is no big theory, which has to be blown up. The best shot the straight people can give it: they say we were puny and small in a world of the large and the lumbering and so we learned to throw rocks with great precision and accuracy. They would essentially make the big league baseball player the pinnacle of human evolutionary development and then say, once we had done that we had so much brain capacity left over, the plays of Shakespeare and modern mathematics were no problem.

I say that this is hokum. Obviously they've done these experiments where they raise identical rats in environments which are very rich in experience and then others poor in experience and the ones raised in the rich environment when – hang on folks – sacrificed, exhibit in the brain slices a much more complex arborization than the ones that were in the learning poor environment. So I think one way of thinking about these psychedelics and especially the psilocybin family coming out of these mushrooms were that they

were catalysts for the human imagination. They catalyze cognitive activity, whatever it is. Counting your toes, painting on your friend, playing around in anthills, making funny noises in your off hours, arranging the roots you've collected in different categories – it just promotes cognitive activity, which you then take back into the group.

[Question]: Is there a different effect from the fresh mushroom, the mushroom picked fresh from the dung patty and the dried mushroom?

I don't think particularly. You mean like is the spiritual intelligence present in the dried stuff?

[Question]: Is the effect more potent?

Well the fresh ones are definitely kickeroo simply because the psilocybin isn't bound up in dried cellulose matrix. It dissolves much quicker. That's probably what that's about.

One of the things that I think happened. I've spent a lot of time trying to understand this scenario of transition from what I call the mushroom partnership paradise to the historical bummer that came down when all that blew up. I can imagine, as Africa grew drier, the mushroom would have perhaps over millennia slowly faded in availability. Instead of being all the time everywhere; it would go to being seasonable and then to be only in the rain shadows of mountains and stuff like that. I'm sure a certain amount of cultural specialization would take place, i.e. you would appoint shamans to be the people who take the mushrooms in order to keep the connect open. The other thing that would go on, there would be anxiety about preservation, to keep a supply available for human use. Well, perversely, the most obvious method of preserving mushrooms or any other delicate foodstuff in that kind of an environment is to desiccate it in honey; put it into a crystalline honey and the sugar will draw the water out of it. This is why you hear about the Romans eating hummingbird tongues pickled in honey. It's because the honey made the whole process possible.

The problem there in our scenario where we're talking about how drugs shape culture is that honey itself has the perverse ability to become a psychoactive substance to ferment into mead. If you've ever been in the tropics and experienced aboriginal honeys, they have a much higher water content than what you are getting at the A&P and they do quickly ferment. When you're offered honey, it's often a completely baffling and horrible thing that you can't really associate to what you know at home.

As an example there of how drug styles shape cultural styles, alcohol, the fermented meads in early cereal beers of the ancient Middle East, they create a different set of cultural values. Gone are the orgies, gone is the connection to the Gaian mind; now what you have is an increased sense of verbal facility and the lowering of sensitivity to social queuing. The kind of behavior you see in singles bars on a Friday night. A lot of negative imprinting goes on around alcohol or in the past has gone on around alcohol. This thing I was talking about earlier, the itch we can't scratch – this fascination with drugs. Once the umbilical connection was broken to the Gaian mind in this African situation then it was just a series of insufficient substitutes. The early beers and meads, opium appears to come into the picture shortly after this time. Cannabis we have no idea how old it is. To my mind, cannabis is the closest substitute for the social glue and provides the same kinds of social functions that the mushroom may have provided. It may have later across central Asia played a somewhat similar but subsidiary role.

We have explored nature frantically in search of intoxicants of all kinds. This continues to this day. The old style primate dominance hierarchy reemerged and what it brings with it is moral cruelty and insensitivity to suffering and a willingness to sacrifice others for grandiose political schemes and a willingness to let dogma rule over common sense. And 10,000 years of letting that run rampant as an engine of cultural destruction, it can't be beat. The pygmies in the rainforest are no match for it, nor is anybody else. After 10,000 years of letting that run rampant over the landscape, here we are. Strangely enough then, here we are gathered for the deathbed scene of western civilization and as every text is published, every archeological site excavated, every occult system explored, every drug injected, so forth

and so on – comes the news from ethnography, this minor branch of anthropology, that people are taking these drugs, these plants, in the rainforest and making extraordinary claims about its ability to transport you into other dimensions and heal and so forth. It's like the Ouroboric snake taking its tail into its mouth and the energy just runs around the circle.

History is somehow redeemed by this return to the archaic. The question of what history was for, I'm not sure, but what caused it, I'm pretty clear on. It's a pathology or a series of behaviors that are responsive to the tremendous trauma and stress of the break up of this symbiotic relationship with nature. It's like a crisis of adolescence or a temporary psychosis or something like that. Now strangely enough, we have gained through the peregrination of history, vast knowledge about forbidden and dark subjects – the control of matter, the control of the genetic units of life itself, the building of instrumentalities that can survive flight to the stars – but to this point this has all been in the service of some weird Faustian conqueror complex. Now all these tools have to be put at the service of a kind of ethos of planetary care giving and ecological maintenance. It has all fallen into our responsibility.

In a sense, we have come of age. Child of the Earth, now here is the inheritance. There are a few dents in the Ferrari from some of the little episodes that we took before we settled down but it's all ours to make of what we will. Then behind that, what is it that Andrew Marvel says in his poem: the graves a lovely quiet place, but none do, dare I think embrace, for always at my back I hear, times winged chariot near. Of course, behind this level I'm talking about is time's chariot hurrying near. The fact that rising over our world is the black sun of the incomprehensible event of our cultural transformation that has been built into our cultural mythology since Abraham hesitated to slay his son. This is our thing. The finite apotheosis of the world and all these yet un-integrated but soon to be integrated technologies, control languages, understandings are leading to the transformation of the human self-image.

Really the psychedelic experience is just inoculating yourself for the onslaught of transformation that is going to be rolling towards you through 3D. It's not going to come entirely through drugs you know. It's going to come through the cultural. It already is. It's batshit weird out there. You don't have to have a bone through your nose to pick up on that.

[Question]: I read a theory that primates from four legs to two, exactly why I don't remember, but once up in the higher air the brain enlarged and prospered more rapidly and the number of neurons in the brain increased so that we now have 100 billion neurons and that was the real origin of civilization.

The complexification?

[Question]: No mushrooms.

Oh I see what your saying. Well it is true, if you've ever observed even squirrel monkeys, which are a fairly primitive primate. Squirrel monkeys, if they want to run quickly, will rise up off their front legs. There's a lot of question about bipedalism and when it came in. Some people think it didn't come in until we leave the trees. We were a complex animal, there's no doubt about it when we were in the arboreal canopy. But we were probably no more complex than the Prosimians that exist in the world today. You see the real challenge for evolutionary theory is not that the human brain could evolve at all – that seems reasonable and somewhat inevitable – but the speed is really shocking. A transformation of a major organ like that when charted in some other animal order occurs on a scale of 50 million years. In the human beings, it occurred in a million and a half years. If you're just going to limit yourself to the rules of normal evolutionary theory, then when you look at that transformation of that major organ in a million and a half years, you have to say there was an extraordinary selective pressure operating there that apparently operated on no other species at no other time in the history of the Earth.

I think to generalize a bit here, that the un-discussed dimension of evolution is diet. If you study evolution without great depth, what they tell you is that mutation is acted upon by natural selection and that mutation

is caused by gene breakage and that gene modification is caused by radiation - cosmic radiation reaching the earth. Now that part of the story is a gross simplification. Gene breakage is actually caused by stress of all sorts. Incidental cosmic radiation reaching the surface of the Earth is only one kind of stress. Another kind of stress is the chemical toxins in the environment, especially chemical toxins in the diet. So if you have a species, which comes under nutritional pressure, it has two options. It can either go extinct or it can begin experimenting with its diet. If it begins experimenting with its diet, there is many a slip before it gets it sorted out.

Many exposures to toxic and poisonous substances or quasi-toxic substances skew the ovulation cycle or affect expression of body hair or cause the retention of juvenile characteristics. So when an animal is undergoing dietary transformation, it's in a situation of extraordinary of mutational flux. An example that I think makes this perfectly clear, sweet potatoes are a big part of human diets in many tropical parts of the world and many primates are keen for sweet potatoes. But Ortho-Novum and birth control drugs like that are made from those same sweet potatoes, from dioscorea vines which are grown on huge mechanized plantations in northern Mexico. That's where the birth control hormone comes from.

Well now, here's the scenario: a hungry band of foraging primates comes upon a big patch of what looks like our favorite food – sweet potatoes - and everybody chows down. It turns out it's jammed with these hormones and lactation, ovulation, menstruation, fertility, fetal formation – all of these things, you just shuffled the deck folks. You don't know what you're going to get out of that. If the animals are sensitive enough to the situation to stop eating it, well then it's just a localized catastrophe. But if they persist they will be mutational or extinct within several generations. So I'm suggesting that at this moment when we left the trees, there was a great deal of dietary experimentation going on and psilocybin was a factor in there. Looking at us and trying to understand our relationship to the other primates, one of the things that evolutionary primatologists have always noted is that human beings exhibit was is called neoteny. Do you all know what this is? Neoteny is the preservation of juvenile characteristics into adulthood. We all do this. If you look at our skull proportion to our bodies, it's an infantile proportion when you compare us to other primates. Human adults look like the fetuses of other primate species. Our hairlessness, that is a fetal and juvenile characteristic in other primates that fades in adulthood. We retain it and so forth and so on. This is the kind of thing that we see in other species that are reacting to toxic episodes in their earlier evolutionary history. We are a funny looking monkey, you have to admit. Ugly suckers too! Thank god the estrogen reddening of the bottom was suppressed before we got down to the business of civilization. Public masturbation seems to be under control but otherwise if you've ever looked at those Prosimians and the proboscis monkeys of Southeast Asia, they're just like very ugly people, you know. Anyway, enough about that.

[Question]: We're there other predators that were likely to happen upon this psilocybin?

No. Well possibly. See the thing is, animals tend to specialize their food supply. An animal will not explore a new food unless it's under nutritional pressure. I don't know if there were other animals being pushed out of that same environment. A sort of parallel family that if the primates hadn't seized the golden ring might have gotten somewhere were the raccoons. The raccoons have a pretty advanced optical system, a pretty adaptable hand, a reasonable level of socialization and would make a cute movie I supposed.

[Question]: Maybe bears, weren't they omnivorous?

Bears also have been suggested as one of the lines from which an intelligent species might emerge.

[Question]: When these mushrooms in the wild die, do they just decompose eventually or do insects eat them?

Well, they persist. They are not the kind of mushrooms that auto-digest. Some kinds of mushrooms just turn into slime. Most of the psilocybin mushrooms, especially the more palatable ones, persist. Well, you should understand, the mushroom that you see which mycologists call a carpophore is just a small part of what a mushroom is. A mushroom is really a very fine network of spider like material, cob-webby material

that's under the soil. It can stay like that for decades, no problem, growing, vegetatively propagating itself the way a houseplant is vegetatively propagating. No sexual reproduction involved there, just an individual getting bigger and bigger.

Last year, you may recall, they reported some of these mushrooms clones that were acres in size and weighed more than a sperm whale and were in fact the world's largest organisms, and were these enormous fungal individuals sleeping in the Oregon forest for unaccounted eons, dreaming nightmarish dreams that were....

[Question]: They were 30 miles big?

I know. The mind boggles to the point where I lost my thread in the thing.

Oh, the natural history of the mushroom! So what I was saying, the mushroom is like something that happens when this fungal mat, this mycelial network gets in the mood for sunbathing and sexual thrills and so then it undergoes dikaryotic self expression. The genetics of fungi are somewhat complex to the point where I never really have understood it myself. They're not like you and me, let's just put it like that. Then it fruits! It fruits, that's what the carpophore is; it's also called a fruiting body. In the *Stropharia Cubensis* mushroom, a single mushroom can shed up to 3 million spores a minute for six weeks. So you know it's a truly astonishing deal and they're at the bottom of the food chain. They're primary decomposers. If you were a Buddhist with a hyper degree in molecular biology and were trying to design a karma free body, you would have to become a fungus because they are the only blameless members of the food chain because they exist on dead matter. They don't destroy anything. They don't live off living material. The spore is this tiny microscopic capsule of genetic material that is surrounded by an organic layer of material that is as electron dense as many metals.

I maintain that these spores in fact percolate through space and that they can survive the conditions of extraterrestrial environments. If you want to store mushrooms spores, you essentially store them in liquid nitrogen. It's about as outer space as it gets. You can calculate, if a single mushroom sheds 3 million spores a minute for six weeks, heh, I'm telling you – there are a lot of spores being shed into the terrestrial environment and then they percolate and some percolate into the outer atmosphere where they become involved in highly energetic events that actually detach them from the terrestrial environment. I think one of the easy predictions that you can make - it's like a knockoff and yet it would be the cover of Time magazine - it's perfectly obvious that space is no barrier to certain viruses and spores and that one of the future revolutions of biology will this will somehow be proven.

It's always puzzled me, and some of you have heard me talk about it, that psilocybin is an indole which is phosphorylated in the 4 position. This is chemist talk but the important thing for our discussion is, it is the only force-substituted phosphorylation of an indole on this planet and that's very weird. Why? The way it would expect chemical evolution to work is if you have 'molecule A' then you should find molecule 'sort of A' and 'nearly A', and 'A+1' and 'A+2', but here's a molecule that has no near relatives. I think one kind of mentality looks for extraterrestrial life by shifting for radio signals with a telescope. I think one way to look for an extraterrestrial thumbprint would be to make a thorough molecular categorization of the molecules on this planet to see if there's anything that looks like blew in from somewhere else. Psilocybin would be a strong candidate. What is it doing in some forty species of mushroom? There are hundreds of species of mushrooms, which do not contain psilocybin proving therefore that psilocybin is not somehow a necessity for fungal existence. Well then, if you believe that evolution operates with a certain economy then why do these forty species furiously dedicate a major portion of their metabolic budget to making a metabolite that seems to have no purpose?

[Part 3]

I think when we finally, if we ever, tease apart this psychedelic thing, what we'll discover is it's an interspecies communication system; that life is a seamless web of signal transduction and that we somehow have become isolated from this process by our historical pathology. So for us the voices have grown mute. We can't get the signal and consequently it's a pretty grim row to hoe. There's a curve with the introduction of every drug of great expectation. I mean once it was Milltown and then Valium, then something else and usually once as your data sample swells, you begin to see the negative effects of these things.

I'm very sort of not the person to ask this because I'm very...some people have said blindly prejudiced in favor of plants but I just think human beings have evolved in the presence of living systems and that that's a very good filter to pass drugs through. The question: do they occur in living systems? I mean God knows there's enough stress built into modern life. It's like a stress production machine. I'm constantly trying to tell myself that we're having a good time now. But this is what it's all about.

If I may go off on a tear here. I followed with interest the crop circle phenomenon in England and recently a book has been written by an American called *Around in Circles* and it basically buries the crop circle phenomenon. If your metaphysic was hanging on this, you better head for cover in a hurry. The most interesting figure to me in the controversy was this British meteorologist Terence Meaden, who at the beginning, his position was this is the wind. These things are vortices caused by heat convection and they're capable of swirling the wheat into these patterns. He was, you see, a reductionist. He was saying there's nothing unusual going on here, so forth and so on. Then as the phenomenon got rolling, the circles became more and more elaborate and Meaden, always being asked by the media to explain these things, came to insist...he eventually electrified his vortices and they became plasma vortices, a rare natural phenomenon disputed by some whether it even exists or not. Once he had in place the concept of the plasma vortex, no matter how elaborate the crop circles became - the straight lines, triangles, triangles in triangles - Meaden could always explain that if you were cognizant of the higher mathematics which ruled the world of plasma physics, this was all perfectly straightforward and in fact predictable from theory. This went on until the BBC made a crop circle and then took him out to it and got him to certify it as genuine and to lecture on the various features, which made it impossible for human beings to create such a structure and then they revealed to him that it was in fact artificial.

Now if you'll repeat your question, I'll connect this up to it.

[Tape Cut]

Well that's an interesting question. So far we've had this cheerful little scenario where the monkey descends to the bottom of the tree empty of tummy and lo and behold, here is this mushroom. I called it, I think, an extraordinary confluence of events or some weasel term like that. What I was skirting around is the issue of: was this simply a wonderful fortuitous confluence of events or was this a thickening of the plot? Was this a bringing together of two elements that had been designed to meet each other in the councils of the Galactarian eons before somewhere else? I don't know. It does appear to be a viral catalyst for technological civilization. You give it to a monkey and 15,000 years later they're landing instruments on their nearest planetary neighbor.

I had a professor in college who said what he thought it was all about was that someday flying saucers would visit the Earth and they would take all the fissionable material away and they would just then explain that human history was a project to concentrate fissionable material for their purposes. 'Thank you very much, you people can go back to picking fleas and beating each other brains out as far as we're

concerned.'

You know, we do that. There's a technique for extracting gold out of very low-grade gold ore where what you do is, you crush the gold into a watery slurry and then you infect this muddy gold laden water with a kind of bacterium that concentrates gold in its body tissues. Then you stir this up and cook this up and then you just skim off the bacteria and harvest the gold out of their body tissues.

I actually lost the thread of that. My point was that if you're committed enough to a hypothesis, no matter how the data can twist and turn, you can fit it to the hypothesis. I find it possible to entertain the idea that the mushroom actually is some kind of extraterrestrial thing. After all, we don't really know what the nature of the cosmic situation is. We don't know whether life arises wherever conditions are OK. We don't know how chaotic the universe is. Do most planets get ten hundred million shots at stability where they can get higher animals together before some comet or geomagnetic reversal or something flips it over? I do think if you were an extraterrestrial and you had an ethos of non-invasiveness and you wanted to have a very low key interaction with an intelligent species, the way to do it would be to come at it through an intoxication. You don't appear with trillion ton beryllium ships over major cities. "We have been studying you for 50,000 years." I don't think it's done like that. I think it's more like: you find a dimension in the cultural world of the species you're trying to study where weirdness is sanctioned, then you setup your lemonade stand in that world. In this case the world of psychedelic intoxication.

I'm not sure it's all about their purpose. Everybody assumes their purpose is to communicate with us. It seems to be that if their purpose is to communicate with us, they could have just communicated with us. The purpose appears to be to influence or to observe. My purpose is to tell all secrets. I'm at war with the keepers of the secrets.

[Indecipherable Question]

It's one way of looking at it. I don't think they've done it to another species. It seems that what they are - they're mean traders on one level. They've blown in here and they have this intentionality to communicate. The content of the DMT experience is where this contact becomes much more explicit, more puzzling, more alien and more strange. What's happening with psilocybin usually is a voice and a voice you can handle - because if it doesn't speak in English, you can't understand it. So it must operate within a certain narrow band of rational apprehendability or you lose it and it makes no sense. On the other hand, a visual input can go off the beam of rational apprehendability and you're still looking at it. As it loses coherency and tentacles sprout and ciliary snap and exogonal eyeballs roll by and then it gets its fix back on. Oh excuse me for a moment; I merely lost my face as it were.

The content of the DMT thing is really puzzling. One of the motivations for my career is to get other people to check it out because here is truly confounding data. That you don't have to make an expedition to the heart of the Amazon or battle your way through hours of waves of nausea and dark spaces chanting your mantras obsessively. When you smoke DMT, thirty seconds later you're in the presence of the unspeakable and the show is going full blast. These tyke-like self-transforming machine elf things that rush forward to exhibit their rhetorical skills in a three-dimensional language that you look at rather than hear and they offer you the technological artifactory of another dimension. Faberge eggs and Ming Dynasty orreries - just the most amazing fabricated objects, which they make out of language. They demonstrate language in another dimension. That's why I really think that part of what we're moving toward is technological only in the most fundamental sense. It's going to arise out of the body. The project of language in human beings is only partially completed. It doesn't have to stop at little mouth noises. There's a way to pass over into something more grandiose, more enclosing, more boundary dissolving, more emotionally intense.

What I always tell people who are really dedicated and it's deep advice - go to the Amazon. The mere act of placing yourself in the Amazon is pretty psychedelic in and of itself. As you make your way through

these colorful personalities that are the Peruvian people and their medical practitioners, all kinds of adventures happen and then eventually if you're lucky, you actually get to the good brew and it will sweep you... just knock your pins right out from under you. Sweep you screaming into the cataracts of perturbability.

[Indecipherable Question]

Well it may be. It may be. You have to take a number if you want to accuse me. You can't just elbow your way to the front of the line like that. I don't have any problem with the idea that dance is a primary language. Cognitive activity is the term that I prefer. Clearly we had an animal existence of a very limited number of concerns: not to be killed, to feed our children, to get sufficient sex and like that. Then we broke through to something else and self-expression. I think people danced for each other, did glossolalia for each other, body painted, made faces; did all of these things and for a long, long time before meaning was invented. The reason language got a special position in all this is that it's easier to make small mouth noises than it is to dance. It's easier to make small mouth noises than it is to make faces or gestures. So it was an energy economy thing.

That self-expression comes out of the body and dance, you're probably right, very well was primary. I think where my fetish lies, if there's a genuine accusation in all of this – but like any fetishist, I will defend it – is for the visual. People say, why do you always insist that you always have to have hallucinations? Why are you so bent about the visual connection? Well the answer is, a voice in the head or a funny bunch of thoughts - like for me that's what LSD was, it was for very odd kinds of thinking. All of these things could be generated out of my own psyche but I'm pretty familiar with the inventory of my psyche as far as its image bank is concerned because it's drawn like yours. It's from the culture. It only stretches so far from Hieronymus Bosch to Andy Warhol and all the themes in between. Well so then when you turn on psilocybin and you get these bursts – 'I've never seen anything like that before' – then that convinces me that this is the real McCoy.

So the fetish for the visual is pretty real I think. The object fetishism; these things aren't exactly objects. You have to understand that we download through many levels of compression in order to sit in this room and talk about such outlandish things. I describe them as objects like Faberge eggs made of agate, chalcedony and ivory but I could just as easily have described them as puns, interlocking in a dance of casuistry; reflexive meaning and teleological entendre of great satisfying depth. Something like that, you see, because they're both/and. These things exist in another dimension and I don't do the best job. If I could make it weirder for you, I would. People say 'you evoke images very well.' Sometimes that's the defeat of rhetoric because what we're really talking about is in fact so hard to invoke. We're really pushing the envelope of language. It really frustrates me when people have psychedelic experiences and don't talk about them, because to me that's what they're for. They're to fertilize the enterprise of communication. It's to be talked about and if it's not talked about - it's sort of like seeds which fall on sterile ground.

[Indecipherable Question]

Well, I've heard it. This is also said about the Maya. It was said even about the dinosaurs, which doesn't mean it can't happen. I don't know if I believe it ever has happened. Obviously I believe in principle that it can happen. It's always seemed to me that this used to be the motivation for my LSD taking. It seemed to me that you could sit down in a room with someone and begin – this is maybe what I'm trying to do with you but we never get there – sit down in a room with someone and begin to have a conversation that would take it apart. Take it apart and leave nothing there! You know? At the end: no guru, no method, no teacher and no nothing else either. I think that the world is held together by a misunderstanding and that if you could overcome that misunderstanding, it would just fold up and deconstruct. In a sense this is what the concept of enlightenment is. It's a series of insights or thoughts or revelations, ones that project forward into another, which lead you to just say – 'oh, it's not this and it's not that, and it's not this...'

[Indecipherable Question]

Well I guess the mundane plain is the misunderstanding. I guess if we analyze the mundane plain we see what constitutes the misunderstanding; a belief in three dimensional space and time, a belief in the finite life of the organism. And then the rupture of the mundane plain leads to this kind of platonic super space where there seems then to rest incontrovertible truths. They are not truths approached by logic and argument, they are self-evidently true so they're either true for you or they're not true. Shamanism sort of views all this very optimistically – takes the existence of this trans-mundane world as a higher world. A world in which healing can be done and the community can be made to cohere. The shaman is essentially a technician, wiring and repairing and moving behind the board of culture, keeping all these lines open and together. Is that where your interest lies?

[Tape Cut]

Apparently, it seems to me; it looks like mind is something that if we were to make an analogy, it's somewhat like sulfur in that sulfur has this weird quality of having two melting points. You have solid yellow sulfur and you heat it and it melts, but then you keep heating it and it turns back into a solid. You continue heating it and it melts again. This is a curious property of sulfur, but not magical. The human mind seems to me to be like that. It's something that in the mundane plain, it has collapsed down into a tool for threat detection and social account keeping basically. But when you go alone or with your nearest and dearest to wilderness, or places where you feel secure and you perturb the chemical foundations of consciousness, then this is the equivalent of heating the sulfur and lo and behold, a new geometry is cast out of the fluid mercury of the psychedelized mind.

I think I said this morning; I really favor a geometric model. I think that the shaman's power comes from the fact that the shamans really are seeing things from a higher dimensional perspective – that's not a metaphor or analogy; that's the voice of mathematics speaking. As I analyze the history of biology and higher animals and culture and so forth, what I see as a continuous theme from the very beginning is the conquest of dimensionality. Life conquers dimensions. Life begins as a fixed line in one place with no eyes, no ears, no nothing, and it evolves tactile awareness. Then it slowly becomes, through the sequestering pigment sensitive cells on its surface, it acquires the notion of a gradient of light and darkness. Then through the formation of lens, it's able to stabilize an impression of the exterior world. It evolves progressively more advanced forms of locomotion. Eventually it evolves memory and complex cognitive interior maps for anticipating the future. This is a description of a strategy for the conquest of dimensionality.

I think really the shamans are the people among us who represent the next evolutionary level. They're people who have learned to do what we can't do, to come and go from hyperspace, whatever it is. An informational super space that exists inside the psychology of the individual and the group that we can't even see because we're materialists, fixated on the topological surfaces of the three dimensional manifold, which is only one level in the onion of reality. These shamans have moved over to another level but I think they are the paradigm for a new authentication of the human experience and it's all about experience. This is what we clearly have wandered to far from. We are too in our heads. The consequences of a phonetic alphabet, monotheism, modern science, Greek aesthetics is just to move us too far from experience. So then this compensating thing is coming back in and the shaman is the paradigmatic figure and when you analyze what shamanism is, the psychedelic experience is revealed to be the sine qua non of this lifestyle. I've fiddled with screenplays. My objection to most visions of extraterrestrials is people don't understand extraterrestrials are not mundane. They don't want our beautiful women; they don't have a fascination with our gross industrial output. The real trick with an extraterrestrial is to know when you're in the presence of one because it's going to be so strange and of such a different order of magnitude in many parameters that the trick is recognition I think.

I mean eventually we may come to see that many life forms - that we are not all to be traced back to one blob of germplasm, the warm pond theory. I think the warm pond theory is in for serious revision. I think interesting genes have blown in here every once in a while over the millennia as the Earth has ground forward and of course those genes get embedded in living systems. The mitochondria, which power the animal cell, were originally free swimming bacteria that got into a symbiotic relationship with some kind of membrane-like matrix and before they knew it, they had been incorporated as sub cellular organelles of a larger system. Mind that this doesn't happen to you.

[Tape Cut]

Well isn't it the role of the artist? It's to stretch the envelope. It's to bring the music from the edge. The musician, the shaman, the smith, the physician; these were all originally combined, you know. Because the mystery of creation and the mystery of the human body, this was all spun together. That's why when people say, what is the proper response to the culture crisis? I think the response is to shamanize. That means to help with the healing, to explore the invisible world and to make art; to try to make art. To try and anticipate the revelatory process by which the transcendental other is drawing the historical matrix into an ever clearer reflection of its identity – whatever it is. It's going to come through us somehow. We invoke it. We're boring toward it through the mountain of human history. It's boring toward us. We can anticipate it. It senses us. This is a real relationship here but it's a relationship where illusion must be shed and shed and shed about what the other is.

[Indecipherable Question]

Well it's not clear as I say; it's not clear what the intent is. After all, what we now take to be the great canon of western art were basically a fairly self-indulgent bunch of courtly types spiraling around, producing public relations flackery for royal families. There are different ways of looking at the artistic enterprise in each time and place.

[Indecipherable Question]

Well I maintain history is a self-limiting process and that you can see the end from here. You have to have a pretty complicated rap to deny that we are in some kind of unusual situation here folks. Well that suggests to me that this is awfully close to the surface of ordinary metabolism considering what a shocking shift of consciousness it is. Millions of people go to the grave without ever having a DMT trip unless they have it at the brink of the grave that we don't know about. But the idea that in a dream such a shockingly extreme physiological response could be elicited means, if we could do human work with DMT unfettered in an environment of biofeedback and that sort of thing, that you could teach people to have this experience. Well that may be what it's all about – a non-invasive, non-drug technique for just opening up a portion of your brain that somehow cultural abuse has closed off to us and that if we could access it that would be the dream time and that would be the entry into the domain outside of history. Yeah?

The Seth Material. I used to say if you can do this without drugs, you're probably mentally ill. I tend to take a hard view of it. I don't exactly understand the razzamatazz that surrounds it. I've talked to many entities; I've never felt the need to establish the spelling of their English name. This wish to name the entity puzzles me.

[Indecipherable Question]

Or whatever.

[Indecipherable Question]

But I didn't then write a book and then go on opre and say that I was channeling Dorothy and that the world should pay attention. It seems to me a curious relationship to your own mental life that you would say you were a channeler. It's just these are the things we think and it's a way of casting it. For instance, it never occurs to me or doesn't seem to me a very interesting question to say of the mushroom – is it the same person each time? What a joke. It's some kind of enormous intellectual agency. It's not a human

being, that's the thing. The channeling – I guess my take on channeling and it will come out maybe tonight when we talk about the Time Wave, is that the real skinny is that you have a connection to everybody whoever lived. There's a way of tuning your internal machinery in such a way that here comes Marie Antoinette or here comes Beethoven but it isn't that Beethoven is a relative of yours, or still less, that you were Beethoven. How likely is that for crying out loud? It's simply that they're all there in some cultural super space and can be reached and called down. I mean they're an idea. Beethoven is an idea. His grumpiness, the hands behind the back, the da-da-da-dah – we know Beethoven so he lives in some kind of super space and I think people are much too literal.

I have this trouble with channeling and flying saucer people and with the fans of great Atlantis and the people who believe that lantern job Neanderthal visages ten miles high that are gracing the deserts of mars. All of this, the attraction of this kind of thing completely puzzles me because it's so hokey. If you want the real thing, it's just five dried grams away. The real thing! So that you will be done with anecdotes by the denizens of trailer camps in Florida or all of this other stuff – it's not that the woo-woo isn't out there. It's that it's so much more woo-woo than the beady-eyed peddlers of it assume. They just have no idea with what they're playing with.

The New Age generally I find somewhat obnoxious because it's a flight from the psychedelic experience. What you can safely say about the New Age; if a technique doesn't work, they'll proclaim it. I'm very much in favor of anything, which breaks down the conceptions of ordinary medical practice. That's the most important part of the New Age, the attack on the medical fascism of the hierarchy. But people confuse science with reason and think that if you're anti-science then you're somehow just permitted to go bananas. No, you can be anti-science but nobody gets released from stuff like the rules of evidence. You have to make sense. Your position, whatever it is, just can't be sky blue and you should then expect to be treated with the same respect as somebody who's gotten themselves epistemologically together and ontologically oriented. There are flaky ideas in this world.

People associate with me with the New Age because that was the only place where I was originally tolerated but I really want my ideas to be tested in the ordinary way, by the ordinary methods. I offer a mathematical formalism and then surrounding that, a bunch of arm waving verbal exegesis. The core thing is the mathematical algorithm to be tested by the ordinary rules of evidence and falsification. You can read Karl Popper to figure out what all that's about. I love science. I just think it's just incredibly pretentious and has claimed too much. Its methods are great but its constipated conservatism is maddening because what it deals with is the most interesting thing there is, nature. Nature is very, very interesting, complex and permits all kinds of radical speculation about what has happened. It's just that science is also a business and a priesthood and also a men's club; also the plaything of certain classes – so all that has to be overcome.

My method, if method is the word that I would share with you since this question about the New Age came out, is not to embrace things that are simply to outrage bourgeois sensibilities but to explore edges. To test edges yourself, that's the important part. Yourself! You don't learn about Tantra by reading about Tantra, or ibogaine by reading about ibogaine. You have to go and do these things. What you will discover is you will be fleeced a few times in your youth with this method. You'll get in with some flying saucer cult or some beady-eyed guru and his fanatical devotees but eventually you'll learn the neighborhood and you'll become street smart. You won't be a mark – that's the goal of real spiritual method – is to not be a mark. Then when you get that together, lo and behold, you would think this would lead to cynicism because you say, well I went and stayed with Baba Ji and he was a jackass and then I joined the Unitarian Uniformitarian Unifunctionalists and that was just a scam and so forth and so on. You would think it would lead to cynicism. Not if you keep to the edges because eventually you're going to come to psychedelics – and then lo and behold – jackpot! The real thing! Weirdness beyond all possibility to

comprehend. You have just won the publisher clearing sweepstakes of peculiarity.

[Tape Cut]

I had this happen in the 60s. I got into a place with LSD where I had this LSD and I would give my friends one and I would take one and then I would excuse myself to the bathroom and take five more. And then I would end up holding their hand all night long and I felt weird about it. Where is all this stuff going? It's like it's not working and when that happened to me, I just said it's time to dry out for a while. And I did and then everything worked normally later. One of the weirdest things I've encountered is about one in twenty people don't react to DMT and it looks genetic to me. I can't believe you could resist that if it's coming at them the way it comes at me; nothing could stop it. And yet, they will do it and take enormous inhalations and then say – 'is this it? I don't know, it's kind of strange but it doesn't seem'... and you're just like, 'oh my God, what is this?'

One thing to bear in mind in all of this is that we talk a lot about the mental effects of drugs but these drugs are tiny objects. They are molecules and they won't work unless they find their way to your synaptic cleft and find waiting for them there, what are called drug receptors. Think of them as little outlet holes into which the drug can plug itself. How many of these little receptors you have is part of your genetic inheritance and so some people have a lot and some people have a little and some people have some for some and some people have some for others. You have to learn what works for you and what the right tool is. Yeah?

[Audience] – Toad?

Yes, toad is 5-methoxy-DMT. It's an exudate of Bufo Alvarius – a large southwestern toad.

[Audience] – So it is DMT?

No, no, it is not DMT. It is 5-methoxy-DMT. It doesn't cause the same thing that DMT causes. It causes an intense void-like emotion that is very dissolving but it is not accompanied by the kind of visual activity that DMT has. The visual activity on DMT is astonishing. It conveys you into a world more complex than the world we're living in, a world of brilliant colors and faceted surfaces.

[Indecipherable Question]

Yes but on ayahuasca, unless it's really horrendously strong, you will never reach the kinds of places that you reach on a DMT flash.

[Audience] – Smoking it?

Smoking it. No, there is nothing like that this side of the yawning grave I hope. I don't know, is everybody cognizant of what that's like? About how fast the world can be rearranged and how totally replaced it can be by something that you not only hadn't imagined, until thirty seconds before that, you couldn't imagine. And now here it is and you just gaze, you gape in slack jawed disbelief at what has happened to reality.

[Tape Cut]

Oh no, it doesn't induce. Somebody asked, is it dangerous? The danger with DMT is death by astonishment. This is an entirely possible outcome of your involvement with it, especially if you're intelligent. I think the more intelligent you are, the more at risk you are at death by astonishment because you just say, good grief!

But I see that it's 6:04 and time to knock off. We'll do the Time Wave tonight. It's a kind of indulgence of me because it's the only original idea I've ever had. So, you're forewarned if you have something better to do. The hardcore will assemble here at 8pm and will there be a technician to boot the disk or is there somebody here is DOS?

Cool. Good.

Well I'm pro-virtual reality, just in the sense that I don't think it should be made illegal and stamped out. I think it should be a legitimate area of research. I certainly don't think that most people should plan on

decamping to virtual reality land for the rest of much of their lives. That wouldn't be a good idea. I see it primarily as a tool for studying language and communication. You never know where a technology is going to lead. When Edison invented the phonograph record, his sincere belief was that it's major application would be in the making of wills because you would have an incontrovertible record of the person's voice speaking and so it wouldn't be legally contestable in court. Well I don't know if anybody has ever made a will on a phonograph record. It clearly had an entirely different use and application.

[Tape Cut]

So here we've arrived at Sunday morning. This is basically loose ends, complaints, resolution, that whole bit. So let's work our way into it and then if need be, I'll harangue. So anybody have anything they want to...

[Tape Cut]

I like understanding. Whitehead said that understanding is the apperception of pattern as such. That's all, as such. So you can look at any situation and see different patterns. I mean like in this room. If we were sociologists, we could analyze where the women are and where the men are and that would be a pattern and we could talk about that. Then we could switch our field of interest and talk about where the men and women over forty are and the men and women under forty are; an entirely different pattern. Where the people wearing socks are and the barefoot people are. You realize that in any assemblage of objects, there's an infinite number of patterns of connection and the more of them you see, the more you have this feeling, which we call understanding. It's a feeling of having assimilated the object to yourself. The great mysterious assemblage, the mother of all weird assemblages, is history you know? The peregrinations of our species is through time and the detritus of that journey – I have a friend in London who is a rare book dealer and when I'm in London I'm usually able to contrive a situation where he has to have some errand out so that then I'm left alone for hours with the books inside these multiple concentric circles of security and I can open up all the cases and pour through this stuff and it's astonishing.

I mean, just the cul-de-sacs into which the human mind has wandered - Phlogiston theory, the Chaldean oracles, the Wunderkammer, the hollow Earth thing and then all this literature of exploration. I mean, the stratigraphy of the human experience is maps and machines and diaries and blue prints and out of all this, if there can be a pattern, then there's a kind of epiphany – a sense of order, of ah-ha, it does make sense. It isn't simply a chaos.

Well that's a Hindu notion of this same thing essentially. This Platonic super dimension where all and everything is suspended and in place. If you ever want to have a very bizarre sub-psychedelic experience when you're in Oxford – go to the Pitt Rivers museum. Everybody goes to the Ashmolean, and of course you should, to see the Uccello's and all that – but on the kinkier side, the Pitt Rivers museum. Pitt Rivers was an early ethnographer in England and into one of those Victorian caste metal and glass ceiling buildings; he gathered hundreds of millions of objects classified by category. So you know there are like 50,000 needles from all over the world in drawers. 10,000 pairs of pliers from all over the world, from all times and places, and on and on and they're in drawers which you can open. The stuff is stacked up twenty feet high and you realize that it's a concentration of manus. It's a concrescence. There's one section where there are over two hundred drawers labeled magical amulets. You open these drawers and magical amulets, southern Iraq, magical amulets Syria, and on and on. Very bizarre. That to me is searching for patterns through the detritus of human history because I really think that we are caught up in a relationship with something very, very mysterious. I don't like religious vocabularies but an epiphany is taking place.

Something...consciousness is really important and it is using the stuff of biology to create some kind of new order in nature, and technology I'm convinced has something to do with it. Machines are more than they appear to be and the machine as we have known it - is to a possible technology what the chip flint is to the technology that we possess today, in the concept of a machine which is downloading of a function into

matter – is a concept of immense profundity. Life may be able to extend its career by orders of magnitude through this means and life is now seen to be clearly central in the evolution in the career of the universe. Most stars gutter out of existence after 500 or 600 million years. That's the average lifetime of a star. We happen to be on a planet around an extraordinarily slow burning and smooth burning star that has lasted a long time. But life on this planet has been here for at least 2 billion years. That's three times the life of the average star. Biology is persistent. Biology is a major player and biology is not entropic.

A star, no matter how smooth burning and self-sustaining is on a downward energy curve toward heat death and extinction. Biology, on the other hand, pumps itself to higher and higher levels of complexity, faster and faster. It uses the dying stars as stepping-stones for one to another. You know for instance, in the Hawaiian Islands, there's thirty million years of evolution visible but no island out there has been above water more than six million years. The islands keep slipping beneath the sea and rising at the western edge of the complex and the life keeps stepping from island to island and perpetuating itself. Hans Moravec has done calculations of the kinds of computational simulations that could be carried out if you had a computer where every atom was a switch and the computer was the size of the solar system. With a computer of that size you could resurrect every DNA sequence that has ever existed on this planet and he feels that you would feel a moral obligation to do so and that the resurrection of the dead would become a social project pursued with government funding.

[Tape Cut]

Well I don't think Rupert would agree that biology is entropic. The way biology works is by being what's called an open system far from equilibrium. You see a closed system like a star or a fire will always drift towards equilibrium, which is entropic. But the miracle of biology is that by taking in matter, by being an open system and allowing matter to come into the system and then breaking down that matter and extracting energy from it – the biological organism achieves the miracle of evading equilibrium. It hovers off the main curve of equilibrium so people who talk about the third...what?

[Indecipherable Question]

Well this is debatable at the highest level. There's a problem there because for some weird reason, the identifiable amount of matter in the universe falls so close to the cusp of either 'it's open' or 'it's closed' that they can't tell. And why this is probably means there's something wrong with the theory. You know P. W. Bridgeman said 'a coincidence is what you have left over when you apply a bad theory.'

But I want to go back for a moment to this question of the open system far from equilibrium. The second law of thermodynamics, which was thought to be inviolate, states that all systems run down into entropy. But in practical terms, given the facts that I just stated about how life is three times as persistent than the average star and that if you view life on this planet as a single unified system of genes, then we have to say that there has been a dissipative structure far from equilibrium for 2 billion years. It's been able to maintain itself well off the entropic curve. So I think the second law of thermodynamics looks much more provisional from that light.

[Indecipherable Question]

But you see it's been the third law that's been the downer. I mean the second law because it seems to dictate some existential terminus to everything. See that's when you view the universe as matter. Here's another thing you have to lay over this; that all comes out of a materialistic view of the universe. If you view the universe as information, the picture becomes much more complicated. We don't really understand what this process is of symbolic signification, of arbitrary assignment of significant association, and it's not simply something done in human language. The codons of the DNA that code the three nucleotide codons that code for a amino acids that build proteins are arbitrarily assigned at the molecular level. There is no inherent logic that says that guanine/guanine/guanine, that codon should code for what it does. It's entirely arbitrary and yet out of that leap towards arbitrary signification comes life itself.

So we shouldn't assume - and it's a natural tendency to fall back into it - that we know what we're talking about. That our intellectual journey through time has taken us to the level where we can actually glimpse what the basic ordering principle is. It may lie in language, not matter. Yeah?

[Audience] - I keep waiting for you to get to the political implications of all this.

Oh, well I think I passed through it lightly but let me take another stab at it. If my picture of things is correct or even close then the future is going to become considerably more dramatic from the middle 90s on. What we have directly in front of us is sort of the long golden garden party afternoon before the news arrives. As the world gets more and more and more peculiar and improbable - and given the kind of things going on out at Jupiter that I talked about - this seems to be arriving on schedule, all this chaotic activity. There's going to be various political stances arise in relation to all of this stuff. For instance, one faction will say that nothing at all is wrong. This is I think what we see going on now. That there's a kind of collusion by governments and institutions to manage apocalyptic awareness and to say, well you don't need to worry about the fact that ozone is disappearing from the atmosphere because by 2000, we will have a 7% reduction in output of CFCs and by 2050, we're planning a further 7% reduction. And you say, 'no, no - these are crazy people obviously.' There's a lot of arranging the deck chairs on the Titanic going on. But I think eventually as the fluctuations become more violent, they will burst through and political dialogues will start on various fronts. It's hard to say where it will come. For instance, historians of the break up of the Soviet Union can reasonably argue that what actually was the hole in the dike there was the Chernobyl explosion and that actually set off a series of thought of awareness - people's minds changed. It was like a psychedelic drug, this radiation spreading through Soviet society because they realized, my God, this was a power plant. It was at ground level. It wasn't even a designed explosion and eight days after it happened above Auckland New Zealand you could sample the radiation in the air. There was a whole crisis of faith in the command economy, in everything. This will happen. The one thing you can be sure of is that the 90s will be shaped by the unexpected. It could be anything. A hot day in August in Mexico City and a million people die when finally all of these toxic levels come together as they potentially could. Or it could be a nuclear failure, or it could be an assassination, or it could be the outbreak of a synthetic disease. Or anything.

What this will bring home to people is that the meta-stable nature of society is beginning to break down. That the shock waves of the future are building up. In engineering an airfoil, engineers have to take account of what is called Q-forces; vibration. If you don't design the airfoil correctly, as you approach the speed of sound, the wings of the airplane will be torn off. So you have to redesign the airplane to move through this barrier. What we have to do is redesign the cultural airfoil so that we slip...

[Indecipherable Question]

What? You mean that it shouldn't support wrecking the third world? Pardon me?

No, see I think that kind of thing is like talking about closing air bases near Sacramento and whether western civilization can survive the shock of this loss jobs. We're turning into an information society and managers are trying to meet the crisis but if my faith rested with human managers, I'd be frantic. The main thing is that the design process is being imposed by nature itself. Just in the way that a supersonic aircraft has it's design imposed by nature itself. The nature of the medium is dictating the shape of the society that is coming into being. The main thing is to try to make this through with as little bloodshed and hysteria as possible. It's very hard call. Looking at something like Bosnia, you know, the impulse to use F-18s to correct the problem is very great. Yet in the past this has not brought joy and thanksgiving where it was used. Also the hubris of thinking that your job is to separate these people. On the other hand, we can't have people running around trading nuclear weapons in the red light district of Frankfurt, which is going on. This is actually going on.

There is a great potential for chaos on the Eurasian landmass right now. How should that be managed? A

lot of people have nuclear weapons that have no business having nuclear weapons. I think we need to disarm from the top. That's a political agenda and one thing that has to be understood is that what is going on is a process of fragmentation. That is what is supposed to happen at this cultural stage I think. McLuhan talked about what he called electronic feudalism. Wherever fragmentation is resisted, violence and war and horror will break out. For instance, five years ago there was great anticipation of a federal Europe. That ran against the current of dissolution and now we see there won't be any federal Europe. I mean there will be something on paper in Brussels to keep the diplomats shuffling back and forth but there will be no unified psychology. They're going tribal. The great political force shaping the 90s on one level is ethnicity and turf battles. As these huge ideologies withdraw their imperium, all these local satrapies and warlords begin to exercise their historical claims.

Islam is set to make enormous gains. This has to be accepted in the West. It shouldn't be resisted. The historical momentum is too great and you know, it's 700 million people and it represents the only reservoir of tradition of significance left on the planet. In terms of a political agenda, it's pretty clear. The psychedelic thing speaks to freedom, so you can shine that on a number of issues: women's rights, abortion, legalization of drugs - but not absolute libertarian anarchy because I don't think we want to get rid of the Food and Drug administration. We may want to execute the top echelon and replace it - but the concept...

I've lived in a country without a Pure Drug Act and it's a nightmare. In India, you can't buy pepper without being afraid that it's been contaminated with lead flakes to make it weigh more when you buy it in the market.

[Indecipherable Question]

But none of us ever had a psychedelic experience in a safe environment. We come out of the nightmare ages. I took psychedelic drugs under the aegis of Richard Milhous Nixon. I've stared at archetypal danger in the face. I took psychedelics under Indira Gandhi. That was...

[Indecipherable Question]

Well see here's the bottom line on this. It's exactly - and I've said this ad nauseum but I can't think of another metaphor for it - it's exactly like a birth. So what you have when you have a birth, it's going to happen. The only option you have is you know: is it going to happen smoothly and with skillful pain management and quickly brought to a conclusion or is it just going to be an opera of agony and hysteria and pleading and so forth and so on. The way to ease the historical crisis is by spreading awareness. You're right, the psychedelic is the primary catalyst and then what follows along is this vocabulary of 'relax' for crying out loud.

If hearing the word relax is enough, then so be it. If you have to have the Time Wave and all this mathematics to prove to yourself that you should relax, then that's fine too. But the bottom line is we're in the roller coaster. The little pipe has now been dropped into your lap. Please do not stand up, scream if you want, hang on and we'll come through it. But we have to reassure people and the way you reassure people is by getting them to transcend the systems that are spreading the anxiety. I mean if you're a fascist, if you're a capitalist, if you have some vested interest in the system, then you're going to be sweating blood. You have to divest yourself of a commitment to the system because it's in the process of transformation. Here's a hard psychedelic truth actually if you want to boil it down to the bottom line. This is the one thing I've learned, maybe, from psychedelics which is - and this is the message of the Time Wave and this is the message of your life and my life - it's that nothing lasts. Heraclitus said it, *Panta Rei*. All flows, nothing lasts. Not your enemies, not your fortune, not who you sleep with at night, not the books, not the house in Saint-Tropez, not even the children - nothing lasts. To the degree that you avert your gaze from this truth, you build the potential for pain into your life. Everything is this act of embracing the present moment, the felt presence of experience and then moving on to the next felt moment of experience. It's literally

psychological nomadism is what it is. That's what evolve to do and that's what we're happiest doing. But we've fallen into this object fetishism, sedentary agriculture based style and then we're frustrated. So a recovering of this ability to surrender and release, it's very hard for me and it's very hard for anybody who has an ego and it's why the psychedelic experience is so challenging...

[Part 4]

The Maya established their own civilization in a not very interesting part of their own calendar. Not at the beginning but sort of two thirds of the way through. It looks as though they counted forward to an end date rather than just had an establishment date. How they were able to count forward that many thousands of years to a solstice without losing and time or being off even by a day is hard to figure. I made an interesting discovery just a few weeks ago with a program called Voyager. I don't think we discussed this, did we? There's a program called Voyager, which lets you view anywhere in the Solar System from 10,000 years in the past to 10,000 years in the future. So I typed in the longitude and latitude of La Chorrera, December 21, 2012 AD. I knew that the exact moment of the solstice is 11:18am Greenwich, so I knew then that this was 6:18AM local time at La Chorrera. I put in all these coordinates and saw that the sun, if you turn and look east along the equator, the sun has risen about 12 minutes before. I went up to the menu and chose the ecliptic and it slashed down through it as it would because the sun defines the ecliptic. The ecliptic is the path the sun follows. But then I went up and chose define the galactic ecliptic and it drew a line, which made crosshairs that exactly caught the sun in the crosshairs.

Now this is very interesting. Those of you who aren't astrologers or astronomers let me explain what's going on. This is what's called a heliacal rising. What is happening is the galactic center, which is where the plain of the ecliptic and the plain of the galactic ecliptic cross each other at 28 degrees Sagittarius at the cusp of Capricorn. There that point, the galactic center is rising at the exact moment of the rising of the sun – that's called a heliacal rising and this heliacal rising is in this case occurring on the winter solstice. So then you ask yourself as you do of any such astrological configuration, how often does this occur?

Using Newtonian mechanics where you simply propagate Newtonian laws backward through time infinitely – the answer is it happens once every 26,000 years because it's a phenomenon that depends on the equinoctial great year of precession. You all know that this happens? OK! Now if you use modern mathematics to calculate how often this happens where you put in the chaotic factor into these orbits, you discover that this doesn't happen once every 26,000 years. It happens once only in all eternity because in orbital calculation back beyond 20,000 years, uncertainty accumulates in these calculations and they are not reliable. The solar system itself is chaotic.

'Loud child screaming in the background'

I think someone is processing as they say.

Just the last thing on that. If any of you are interested in that and its an area I'm interested because I don't quite understand what all this means but there is a book called *Hamlet's Mill*, which deals with this old, old myth of galactic world wide myths of the galaxy in the Paleolithic era. There's a lot about this notion in many cultures that there are these gates – conceptually gates – which need to all align themselves and then there is some kind of straight shot...

[Question]: And you felt that they made the Mayan calendar out of that line up so accurately?

Well they end their calendar on this particular solstice. Oh I know what I wanted to say about this because I don't want to leave it. It's a real question because the galactic center as a concept was not defined for Western Science until the early 1960s, so how could the Maya have locked in on a concept so abstruse? It means you would have to know there is a galaxy and so forth and so on. The only explanation I can come up with for that, which maybe shows my ability to explain everything by one hypothesis, is that perhaps there is a drug that allows you to see at the far infrared end of the spectrum. So that instead of hypothesizing that the Maya had a super advanced mathematics and radio telescope and all this fancy equipment – maybe it was simply that they had a drug that when you look at the night sky in the direction of Sagittarius, there's an enormous pulsing thing in the sky which you then could - because you can see it in this drug state - calculate when it would be eclipsed by certain bodies. It seems to me a more economical...because it's a real thing to try to explain how they would have known this.

Then the question, what does it mean? There are in many cultures, the Norse Culture, the Hindu culture and so forth, this idea that the world exists for a finite time and then the stars return to like an original setting. It's sort of like an alarm clock after it has gone through one complete cycle and it returns to the original setting, then the world disappears, is destroyed or the gods come. Anyway, it points to the end of a cosmic cycle. You haven't known me my whole life so it's hard for you to deconstruct it; this is not my style of thinking. I'm repelled by the particularity, the messianism, the counter logical nature of it and yet attempting to objectively describe the content of the psychedelic experience and the map of the human mind that it makes visible. This is the message that I get.

It's as general or as specific as you want. It's as general as 'everything is going to change soon' and it's specific as 'these computer programs that not only show you not only the exact moment when it's going to change but the exact numerical valuation of every moment in the entire history of the cosmos back a trillion years preceding it.' So it's as though in the plants, in nature or in the human mind, depending just on where your depth of focus is; this pattern which can be as generally stated as I said – everything is in the process of transforming or as specifically stated as a mathematical formulism. We've lost it!

History has been the pursuit of a false god: the god of stability, the god of permanence, the god of the unchanging and we've become just neurotic on this subject.

[Question]: You mentioned last night one of the big things is that our thinking process is wrong. This morning, I have nothing last. That's a basic truth but we all cling to building visions, projects and ideas that we can cling to and hold onto. We try to make reality more structured and solid and what's happening around us is that it is falling down in a way. The structured society if 1996 will start crumbling. It is crumbling now but all that solidness that everyone has built – security in a way – all you realize is that nothing does last and you're just experiencing life.

Well in a sense the bottom line of this from a feeling and a heart place is that what's being said here is: reclaim experience. Do not dwell in the mistakes of the past. Do not lose yourself in the castles of the future and do not give your authenticity away to experts, gurus, government commissions, bosses, wives, mates – take back your mind and your body and begin to engage with the fact that you are alive, you are going to die, nobody knows what being alive is and nobody knows what dying is. You're involved in a mysterious engagement where every living moment presents you with mystery, opportunity and wonder. There is no mundane dimension, really. If you have the eyes to see it, it's all transcendental. Every object, a leaf, a bird, a pebble, everything leads back to the basic questions. Everything is the stone. The stone is present. It's a matter of you being present for the stone.

[Question]: I'm not a great spiritual searcher but I did a vision quest once where you traumatize yourself to get into vision. One of the things that I realized that hit me home was that life is chaos and that in human mind, even our walls are built to give us a sense of stability, to protect ourselves and our foundations, we

create a sense of stability that really doesn't exist. It's our name.

Well, the quest for permanence. By having children, this is a pretty good way to do it because you've actually got a shot at a billion years with a lot of luck. But building houses on the slopes of Hawaiian volcanoes is probably not something...

[Question]: It's a whole different dimension. That's how you imagine it?

Well yes, I've imagined it many different ways and according to how recently I've been loaded, I take different positions. People are pushing, I think, because they don't want me to disgrace myself towards a soft version. Something like - that we all make nice and clean up the Earth, you know. No, no! I'm convinced and I think the Time Wave argues for this and looking at the prediction of the cometary impact on Jupiter next July, how can you argue then that this wave is generated out of human biology or culture? It's not. It's not even generated out of biology if it's predicting a cometary impact on the Jovian surface. Presumably no biology is involved. We're talking about what we're seeing is the laws of physics themselves beginning to go into some kind of crisis. It's not no blame for human beings. We are the witnesses and we were somehow called forth by all this but the laws of physics are going into crisis. This is why I urge people to look at Alfred North Whitehead, who was a very scientific and mathematically grounded thinker and who talked about what he called sudden shifts of epochs. His philosophy made a place for sudden shifts of epochs and what that means is the speed of light drops by half over twenty-four hours or the charge of the electron is rearranged. One of the peculiar properties of a fractal universe is almost all the transitions are very smooth but every once in a while you come around the corner and there is a transition that just side winds you because you're crossing over one of these nodes at the highest level of the structure then profound things occur.

[Question]: The shamanic ethos that you talked about in the description of this weekend, is that what you mean by the commitment to direct experience?

Yeah, the commitment to direct experience and then the commitment to build a language for this; to build a culture. The suppression of psychedelics has had the unfortunate affect of making it impossible for us to build a linguistically coherent community and have a shared body of experience. Because you know - you just can't say this stuff to everybody. To put it in very simple, understandable terms, coming out of the closet on psychedelics should be part of the political agenda. Psychedelics should not be classed with other drugs and certainly the Schedule I category, which seems to be reserved only for very hard narcotics and all psychedelics. That's just a cockamamie categorization and the whole society is phobic of the mind, terrified of the unconscious, terrified of dissolving the ego, very anxious if you dissolve your ego - it's a real issue. It's a taboo, very thoroughly a taboo.

[Question]: Does the commitment to direct experience preclude a metaphysical perspective for you?

No but the direct datum for metaphysical speculation should be one's own experience. If you've studied modern philosophy, I think you discover that it's very clear that all you can rely on is your senses. You can't rely on what anybody tells you. The real laboratory bench for philosophy is you looking at your mind and examining it and trying to make judgments about it. Reclaiming experience and the political consequences of reclaiming experience are: that far more than we realize we're embedded in a hierarchy of declension where information is distributed over Macneil Lehrer, Time magazine, CNN and we the serfs down in the valleys are the grateful recipients of the news! 'And now for all you jerks out there - the news!'

So we don't believe anything of our own experience. We wait to be told that a White House commission or a Blue Ribbon group....

[Question]: How does this affect history?

Well I think of history as this prison. I would go with Stephen Dedalus who said, 'history is the nightmare from which I'm trying to awaken.' That's the consequence of bad metaphysic.

[Question]: Earlier you called it a misunderstanding and I'm saying that you have to deal – in this sense it's all about metaphysics.

Well but that works. If you think of it as a misunderstanding then the dissolving of the prison of gnostic confinement was an act of contact with the higher hidden order of things behind appearances. That was the gnostic epiphany. I would say if history is the prison then the psychedelic experience is the epiphany of dissolution that frees, and then you see eternity. You see the Platonic. You see time as the moving image of eternity. The mystery is revealed. That's this whole thing about how a shaman is somebody who has seen the end. That's all and that's what confers this wisdom is having seen the end. It's kind of ultimate experience and then you take your place. You go back to your group and take your place and perform your function.

[Question]: I'm wondering if you've had experiences of talking with other shamanic teachers who also talk about this. I know Henry Taylor, who is an Arapaho medicine man, has that 2000-year-old shamanic tradition. He says that there is time coming, he doesn't say 2012, but he says soon when life will not be like we know it at all. We won't eat the same food...

I made a list of them once. There are about five or six different sources of this 2012 thing. There are some Hasids in Israel who have decided that July 2012 something is going to happen, the Mayan calendar, my thing, something else and some of these Indian prophecies. Of course you see my theory would explain this because what's happening, it would say, as we get closer and closer to the transcendental object, it gives off what I call scintilla. They're like sparks or little reflections that ricochet backwards through time. So you take a psychedelic or you have a dream and then you say I had this dream, there were flying saucers and it was the end of the world and they were taking millions of people off the planet while there was some kind of an adjustment. Well I would call that a typical transcendental object anticipation dream where your dream is not true – that isn't how it's going to happen – the human mind cannot encompass how it's going to happen but that's a little fable about how its going to happen.

Some of you may know Arthur C. Clarke's wonderful book, *Childhood's End*. If you've never read this, it's wonderful. It's about the end of the world, a believable scenario for how it could in fact be transformed and its just spin chilling – it's wonderful. It too is simply a fable. The real thing will be beyond your wildest imaginings, literally. It's messianic return, it's flying saucer invasion and it's Gaian revelation. It's all that and more and more because eventually the machinery of anticipation fails and you just say, it's more than we bargained for. It's the jackpot.

[Question]: I'm interested in your thoughts on psychedelic drugs and levels of maturity. In children for example, to your knowledge are there cultures at a particular age – not three, maybe it's five, maybe it's fifteen – when are humans who are allowed to be exposed to these chemicals and socially indoctrinated?

Well among the Augaruna Jivaro in Ecuador, they put ayahuasca on the mother's nipple the third day after birth. So they quickly establish at least a chemical recognition in the immune system. It's an important question, what do you tell your kids about drugs. I thrashed around about this. I have two kids, a 15-year-old boy and a 12-year-old girl and this question comes up in the family and at these groups a lot. I think all you can do; you have to tell the truth. You have to just lay it out and educate them. It's the one place where you can actually function as a parent because the schools are lying and you just say, this is part of life.

You're going to have to make choices, there are dozens of drugs, they are associated with different lifestyles, risk levels, sensations, kinds of people and the main thing I think to avoid is hypocrisy. I think it's really weird, people who say, we can't smoke dope until the children go to bed. This is weird! First of all, the children know and what they know is that you're conflicted and giving off different signals about it. If there are drugs you do that you wouldn't want your children to see you doing, you shouldn't be doing those drugs! That's a perfect litmus test.

[Question]: When do they get to? Is age twelve the age, talking about mushrooms?

Well the first thing to recognize is that it's not up to you and that if you wait too long then they'll just present you with *fait accompli*. So if you say, you know I think it would really be good to wait until your fifteen to do mushrooms, they say – right ok and then you found out it was done. Sometime between thirteen and sixteen, they're going to sort it out. It's right up there with sex. The thing to do is to really say, this is very adult business and you can get into trouble of all different kinds and here's the kind of trouble you can get into. My son is surrounded by cautionary tales and I try to warn him that the great age of hashish smuggling lies in the 14th century and shouldn't be duplicated.

[Question]: Undecipherable.

Oh I'd say we're pretty tight. We live together as sort of bachelor roommates and try to not get into conflicts over women. We like the same kind of music and it's done me no harm with my son to get into this rave club, staying up all night, London, New York, Frankfurt scene because he just loves that. It amazes me. When I was a kid, I was socially terrified and I remember I used to never go to the canteen dances because I knew there were these enormous guys who would just stomp me. I used to lurch in the park across the street and watch them going to and from the canteen because I couldn't socially show my face. So it's a late flowering adolescence that it perfectly in synchrony with my son.

[Question]: Do you believe that theory that some people in the 60s will tell you, that because they were heads, their children have more of a chance to be heads, and do you think it's a social thing?

Well to me that's this issue. This is a real hard issue for parents and to some degree deeper even and harder than the drug issue. And that is, I think I can speak for most people here and say – we are alienated intellectuals of some sort. Alienation is ipso facto not such a cool thing to be. It means that you're constantly aware of the failings and the betrayals – it's alienation and we're alienated intellectuals. So then you have kids and you see that there seem to be only two paths open. They can become nitwits or they can become alienated intellectuals. Which do you want for your children? Do you want them to be perfectly satisfied with a house on the cliffs, two cars in the garage and their position at the advertising agency? Or do you want them to be like you – haunted, always in conflict and never able to come to terms with what? That's a big problem...

[Question]: I want to come clean and say I have a 15 year old daughter who hears all this stuff about it. I've had to come to terms with it. I've said this to her, do you want to be another stupid American or do you want to be alienated like your father?

And she says I'll take stupid!

Well my daughter is not conservative exactly but she looks upon me differently than Finn does I think. Although she's only twelve, so we'll see what it does to her to go through all that. But that's a real problem. I don't regret my alienation. It's hard for people sometimes to understand where I'm coming from. Like a lot of people will go through a weekend like this and one of the rare resistances I get is people say, your vision is so dark, which is completely puzzling to me because it's the most optimistic vision conceivable,

not only by me but by anybody. I say that heaven is eighteen years away and they accuse me of pessimism? What that tells me is that the world transformation is so threatening to some people that no matter how much you talk about how great it's going to be, all they come away with is: 'oh boy – big change?'

[Question]: Maybe it's the way you describe certain analogies. When your talking about some guy falling through a black hole through eternity, it kind of sounds like shit!

No it's the Silver Surfer?

[Question]: Undecipherable.

Well this is the question that gets down to an all-Catholic catechism classes. Sister will there be sex in heaven?

[Question]: The end is going to be an individual thing. Whether it's 2012 or the end of Pompeii, for everybody who it was the end in Pompeii, for some it may have been ecstatic and for others it may have been terrible but we all face it individually.

So what you're saying is that it's the accumulation of fate. It's really what you did before that ultimate moment...

[Question]: It's all going to be individually and it depends on what your situation is at the moment because it's going to be a grand moment. You may have a beautiful high; someone else might be in the depths of depression.

Well what you're saying is that it will come like a thief in the night, unannounced. This is what Christ told Nicodemus. He said, I will come like a thief in the night. No man will know the moment of my coming. Blake talks about this. He says, though Satan's watch fiends shall search through all eternity for the moment, they will never find the moment. Apparently the moment is a very big deal. That's why it's interesting that this all devolves down to a moment. If you're interested in this kind of thing and want to keep your psychological wits about you, read *When Prophecy Failed*. It's a wonderful book about a flying saucer cult that comes to expect the end of the world and has been infiltrated by two Stanford sociologists who then observe what it is like for this very, very devoted cultish group of people to be disappointed, to have an extraordinary disconfirmation of their theology and what they do about that and how they react to it.

[Question]: You mean December 23rd, 2012?

Well people ask me, what will you do if nothing happens? I am not a believer. I want to keep this tar baby definitely at arms length. I think it's very interesting that I have this idea, very interesting that the Wave conforms to history. It's all weird I grant you. It's like being trapped inside a science fiction novel. But I could go through December 21st, 2012, have absolutely nothing happen and say, well, that blows it off – let's go have some coffee. My 65th birthday will occur thirty days in front of the date, so I will just gracefully retire. I think that would be the decent thing to do at that moment! Just say, it's been nice...surely you didn't take it seriously?

[Question]: One of the things that have impressed me this weekend is your encyclopedic knowledge. One of the things I'd like you ask you, what do you read to get the news? How do you get all this information?

Well for instance, the best thing to read to keep abreast of science is Science News. It's totally unpretentious. It's nuts to subscribe to Nature or Science – they cost a hundred dollars a year and you can't understand a word of it. So you read Science News, which comes out once a week and tells you things months in front of everybody else. I subscribe to Archeology magazine, Astronomy magazine, On Our

Backs just to keep in touch with the lesbian erotic literature front...very important!

And let me, what else? For twenty years I've been a member of the Society for the Study of Alchemy and the History of Chemistry, so I get Ambix. I don't know. A lot of information flows my through my scene. People send me stuff. There's a very lively underground press: Psychedelic Illuminations, Reactor out of Chicago, Talking Raven out of Seattle – a very lively English press, music press and psychedelic press. You shouldn't read mainstream media particularly because there's a much more interesting strata of information under the surface.

[Question]: In the question of practicality, how reliable are street psychedelics?

As reliable or as unreliable as the street chemist who made them. That's the problem. When you're confronted with an off-color powder, all bets are off because the motivation for making this powder is nine times out of ten to make money and corners can be cut. That's why if you really want to liberate yourself from the illegal and toxic cycle of drug production, you should grow mushrooms. My brother and I wrote a book called *Psilocybin: Magic Mushroom Growers Guide*. If you want to get into alchemy, this is real alchemy! The formula is rye to mold, mold to gold. You can take a twenty-five pound sack of rye, which costs \$19.99, and you can turn it into \$22,000 worth of mushrooms. Not that you would want to do that of course, you would want to turn it into an enormous number of mushrooms which you would give to everybody in your apartment building and neighborhood. It was one of the most satisfying things about my career, it doesn't happen much any more because that book is long in the past but when I first started public speaking, people would come up to me and say we just want to thank you for writing the mushroom book, you kept a family of six off welfare for eight years.

So growing the mushroom is a wonderful, satisfying thing. The mushroom is an incredible workhorse organism. It will take dry weight of rye and transform it into dry weight of mushroom at 12% efficiency. That's just amazing! And it's short supply these days, like cleanliness, punctuality, attention to detail, responsibility, sensitivity to small shifts of parameters – it teaches you, it literally teaches you to be the kind of person that it wants to take the mushroom.

[Question]: Is it out of print? Can it be found?

No it isn't out of print. It can be found. It can be ordered from a place in San Francisco called Quick Trade. They'll even take a credit card number. Quick Trade has it!

[Question]: Is there anywhere in LA that carries it?

Yes some very hip bookstores keep it.

[Question]: What about the Invisible Landscape?

The Invisible Landscape, which has been very hard to get for ten years or so will be reprinted next year from Harper on the 15th of April with considerable new material and revision. When that's done, when *True Hallucinations*, *Invisible Landscape*, *Archaic Revival* and the Time Wave Software in the Mac and MS-DOS version – when all that's out there, that's essentially the bit. I may be considerably less inevident because I don't see myself... as it is I've given every one of these raps sixty times and Paul has archived it. I would like to go off to some jungle or island somewhere and get back into stretching the envelope with these plants and substances.

[Question]: Could you give us a sense of what's going on in Europe?

Well what's going on in Europe is that this very large intelligent, postmodern youth culture is sustaining

itself and growing. It has more than the dimensions of a fad. The house music scene has been around since 1988 and it's growing still and innovating still. It's a very tribal, positive message and it's very critical of establishmentarian values. It started out as an MDMA based club thing and it's turned much deeper, much more towards psychedelics. I've given talks like this in Megatripolis – which is a London nightclub in Charing Cross. We turned out three hundred people. I talked from ten to midnight and then we dance until 4:30am. And this kind of thing Sasha and Ann Shulgin took London by storm. There really is a fertilization going on. There is a similar scene in Berlin, a similar scene in Frankfurt and I think common cause can be made. The Europeans have a different attitude towards all this drug problem. They see it as a social problem to somehow be studied and solved, not that you have embraced Satanism if you smoke a joint, which seems to be the American attitude. Eventually European attitudes will just shame us into changing our...

[Question]: Is there a drug hysteria there?

No there is not a drug hysteria there. In a very good Berlin restaurant after dinner, make a splif and pass it around and the waiters bring you a silver ashtray as they're clearing the table.

[Question]: I thought that the legal punishment for illicit drugs was a lot more intense in Europe.

No, no! The Swiss are talking about giving Heroin to seven hundred addicts and they just concluded this free needle thing. They're open to experiment; both social experiments with large numbers of drug users and clinical, medical work is being done there. It's being done in Switzerland; Hanscarl Leuner is doing work.

[Question]: I know of one in Amsterdam, where they take about two-hundred people, some inmates, some college students, some working class people, some hippies, various groups of people – and they give them all ecstasy and somebody will talk and sort of work the whole program, the whole communication into a oneness where everyone experiences that together and they say profound things happen in the psyches of all those people.

Yeah, a lot of things are happening. The hemp movement is very strong in Germany and getting stronger in England. But I believe that the boundary dissolving quality of these psychedelics makes them social dynamite and that the policy makers figured this out long ago. This is not a simple, straightforward issue like it's trying to be presented. They just can't allow these drugs to be legal. They will shift social values too much. They know that alcohol, tobacco and sugar are much more detrimental than let's say, mescaline, psilocybin and cannabis – but this is not an argument about detriment, this is an argument about what social values shall be affirmed and what's suppressed. Alcohol keeps a dominance in place. A very rote like, machine like, assembly line society can be maintained based on alcohol, red meat, tobacco and caffeine. They don't want people philosophizing and kicking back and getting people in touch with their feelings about the system.

So I predict that at the very best, there will be a kind of permissiveness but no legal revolution is insight I think unless it comes through the hemp argument. Simply that we can't afford to let the tax revenue go by and the resource base that hemp would represent so we have to change our attitudes on this.

[Question]: I'd like you to talk about the emergence of women?

We didn't talk too much about woman this time. Sometimes we talk a lot about all that. The major difference between historical society and this archaic thing that I'm so enthusiastic for was the position of women. Nature is imagined as feminine and that in the partnership society there was role appropriate behavior. Obviously women represent the unconscious, the untamed and the wild side of things and that's

why the control of woman is so high up on the agenda of everybody who is trying to hold the line on what's happening.

The more rapidly that women can find their place, the better it's going to be. Then the question is, what is their place? I think feminism, understandably but nevertheless, did itself no good by deciding that what liberation meant was that 50% of the country CEOs should be women. It meant nobody examined the system into which all these people were going to be liberated and noticed that it was a horribly repressive system itself deserving of radical reformation. But I think the agenda of women seems to be now being reexamined and thought about. I'm amazed at how powerful misogyny is and how politically incorrect the 90s are from the vantage point of say the mid-70s.

In media, women have clearly lost ground. The bimbo is back big! How this is to be addressed, I don't know. I think it's all related to – well here this opens up a big issue but let me just mention it – Esalen is one of the places which promoted the idea that you can heal various conditions through visualization and imaging, you know? But one of the consequences of that that has never really been dealt with anywhere is, if there are images that can heal then there are images that can sicken. There are images that can make ill. Our terror of psychedelics and anxiety over sex have lead us to substitute for those legitimate domains of human experience, an incredible plethora of images of violence. I am very, very strong first amendment person. I don't think anybody should be restricted in anything but I'm troubled by the obvious affect of images of violence on society and women. The woman question is right in there.

As long as we tolerate an unrestrained outpouring of violent images, we're undercutting any chance women have of moving their agenda forward. I don't know how you do anything about this. It's a very difficult problem. Violence without violence to women is like a circus without lions. Violence is code word for violence against women.

[Question]: Violence is no fun without women?

It doesn't sell particularly.

[Question]: The connection of sex and violence?

Well, the number of images. See we try to pretend we're not being shaped by our technology but an average evening of TV brings you three hundred fifty images of violent death and dismemberment. Well in a lifetime of hunting people down and hacking their heads off, you wouldn't see that much violence if you were in a media free world.

So what the hell is going on here? It's that somehow we're anxious about sexuality, so no; no there can't be any of that. We're anxious about drugs, that's not even on the agenda. So the only pizzazz left is this violence thing and it's like a drug, in that you build up very rapid tolerance and so there has to be just more and more piled on. It's amazing to me that this is all done in the service of the ideals of the marketplace. This is all done so people can make lots of money. It's an extraordinary abdication of responsibility on all members of society that we tolerate this kind of iconoclastic behavior. Anyway, that's why I think of television as a drug and a very insidious drug, a drug you can program. I mean, a drug you can buy time on for your message. And yet millions of people are being larval states of mind for years and years out there in the flats just getting those sixty channels, nine hours a day.

[Question]: It's voluntary!

There are so many levels of programming. See what happened is, this is just my take on it – but it was a very traumatic thing for my parent's generation to go through the depression and then the defeat of Hitler in Europe. All that science fiction stuff about eugenics and what was done with the Jews – people were just fed up with the 20th century by the time the atom bomb arrived. What they wanted and what they had been promised by the New Deal Democrats was a paradise. Well the only way you could deliver paradise in that political context – it has to be an ersatz paradise. A paradise of stucco and TV, TV dinners and tube

furniture and that's what they got. They got an ersatz paradise and out of that come the discontent of their children who see that Howdy Doody and a water sprinkler on the front lawn doesn't feel like paradise. That is what has driven American society deeper and deeper into artificiality – the need to supply this synthetic, manufactured paradise. That's why the cult of the celebrity and the intense media saturation and all of this is diversion; it's a substitute for a life. That's what 'get a life' means – go get stoned, go get laid, go climb a mountain or kayak a river but somehow take back your own authenticity from the people who are peddling you canned experience with laugh tracks, caffeine augmentation and so forth and so on.

The real message of psychedelics I think is to reclaim experience and to trust yourself. Your perceptions are primary. Your feelings are correct. Everything must constellate out and make sense and parse with what you know. If you don't start from that assumption then you are off-center to begin with. The psychedelics will dissolve the cultural programming that has potentially made you a mark and restore your authenticity. That's what it's all about. Whether the only transformation in life is the personal dying that awaits each of us or whether there is a grand opening and opportunity just ahead at the end of history. That's all folks!

Well, I'll just say a little bit about myself and how I relate to this. I don't really like to talk about it in those terms, but since this is the getting-to-know-each-other thing, it's very important to the what I understand that, um, everybody else understands, there is nothing special about it, or me. In other words, for what I'm trying to do to make sense – this access to this transcendental realm – has to be democratically available. It can't depend on your spiritual accomplishment or your mastery of a technique or something like that. It isn't like that. It's something that is as much a part of us, as ordinary people, as our sexuality is. And sexuality is not something that is dispensed by gurus; it's just something you figure out, and do, you know. And, this is much more along those lines. My -- How I explain to myself what I'm doing in this position is that I was just simply incredibly lucky, incredibly fortunate to be, at certain places, at certain times, when they were handing out the good stuff. [audience laughs]

And, um, so -- I see you in the same way. Someone over here – Fred – said that he was looking for the answer to the mystery of life. Well, the weird thing about taking that position is that you can fall into positions where you find it; where you find the answer. And, I sort of feel like that's the situation that the deep plant psychedelic community is in. It's a sense of having found the answer and now the task changes. It's a completely different kind of spiritual universe that you live in after you've found the answer because the task becomes facing the answer. Facing it. You now have it. It's no more about disciplining the passions and all that. No, no. It's now been handed over, and so what are you going to do with it? And, this is, uh, to my mind, in a way, the problem and the challenge that we face globally as a species.

You know, if the holy grail of the Western mind was the ability to release energy and form matter and control nature then this is now achieved. The goal -- so, now, the whole context of the problem changes and the problem becomes changing our own minds, controlling the hand that controls the energy. And this is an entirely different kind of problem. It is not to be solved with the analytical knife plunged again and again into the body of nature. That whole approach is, uh, seen to be, uh, at best, passé, at worst, bankrupt. So, instead, it's about trying to edge up close to nature and feeling, as individuals and as a society, very peculiar about this. You know, it's like going back to your rape victim and pleading for their forgiveness. And yet, as I've tried to make sense of these psychedelic experiences, first, in a general way, saying, "What are these molecules for?" or is that a proper question to ask? "What are they doing for the plant? What are they doing for me?"

As I've tried to come to terms with what this might all be about, I've come more and more back to the notion that, uh, it all lies in the plants, that our peculiar restlessness which, in modern circumstances, has evolved into a rapacious appetite for addictive substances of all sorts - our peculiar, uh, inappropriateness in all contexts -- we are not quite simply complex mammals and we are certainly not angels and we just seem to occupy a very uncomfortable place in the hierarchy of, uh, creation. I think this has to do with the fact that we are, uh, the traumatized inheritors of a dysfunctional relationship, a relationship that grew dysfunctional, uh, in the last 15,000 to 25,000 years. And what we call history is the fall out of a dynamic here-and-now feeling-toned relationship with our environment and into, you know, this morbid anticipation of the future and worry about the past, basically, ego.

I recently spoke in New York and New York is a very nuts-and-bolts kind of town. And people there took issue with the notion that all of our problems can be boiled down to a single problem: If you trace the thread of every screw up back into the maze, it all comes back to a single issue which is excess of ego. We all have excess of ego. Our entire situation - legalistic, psychological, religious - everything is about this. That it doesn't work. It's maladaptive, and yet we have it. And, uh, why do we have it, if it's maladaptive? If it doesn't promote human values, then how in the hell did it get started and what is it that's maintaining and sustaining it? Well, this is what I want to talk about over the course of the weekend.

When I pushed the analysis of what the psychedelic experience meant, to the limits, I was surprised to discover that it left the domain of my personal relationship to the mystery. You know, what is it? What does it want from me? What is it trying to say? All that had to make room for another issue, which is, there's a political issue here. I think most people in this room - most people who have had the psychedelic experience - will agree that the most profound, the most open-hearted, the most moving moments of their lives, some of them, have been tied-in with those experiences. But, we seem unable, unwilling, or even afraid to extrapolate that conclusion to the notion that this is a general panacea for society because we cannot conceive that our, uh, that the solution to a spiritual dilemma could lie in matter. In other words, we ourselves have been infected by the inside/outside, matter/spirit dichotomy of the dominator culture. But, the notion that man - notice the gender thrust here - the notion that man could somehow bootstrap himself to godhead without reference to nature seems to me highly peculiar and simply nothing more than an expression of hubris, pride. A belief, you know, that we can do it our way, and alone.

So, all of this is very -- the shelf life is short on all of these issues because the planet is in a state of terminal crisis. Does that have anything to do with the psychedelic experience or are these separate issues? How can they be separate issues, if the psychedelic experience is a mirror of the state of the individual and collective psyche? And, if the planet is, uh, on a collision course with some kind of terminal crisis. It seems to me then that nature is struggling to right this disequibrated planetary ecosystem. So, in a sense, there is nothing to be done except to watch and wait. But, on the other hand, we are not apart from nature. We are in some sense a portion of nature. This part of nature is the most reactive and energetic because we are reactive and energetic in the domain of epigenetic codes. We can foment rapid change. Until recently, it was a truism of thinking about society that all change had to be gradual. This myth has now been exploded. We know that, you know, you just take them all out and hang them, then that's not gradual and suddenly you've got a new world. This had been done in several places with excellent success recently. So, change need not be gradual and, in fact, I think we're entering into a historical domain where very little change will be gradual. Gradual change was a luxury of the past.

Well, how to come to terms with these processes and patterns - forming and reforming - in our lives, in our

relationships, in our families, in our businesses, in the extended relationships we have with people? It's -- what is needed, you see, is a kind of collective breakthrough in apperception. I was thinking in the hot tub, today, that the most politically potent thing you can do for somebody is to educate them; to give them the facts. The facts are now so horrifying and the means of delivering the facts so effective that there is no excuse for everyone not beginning to act in an informed manner. And I - I think this is happening.

A few months ago, I was in Belize, which is an extremely poor country, a little chip of land in the armpit of the Yucatan that used to be British Honduras. I didn't know there were countries this funky in the western hemisphere. I thought you had to go, you know -- they have the fortune, good or ill, of speaking English as a national language. So, when the British left, they just simply pointed their dishes to the sky and they got 270 channels of American television. It has completely educated the entire population of the country into an extremely sophisticated strategy for surviving in the real world of the present moment. They understand that their only resource is their nature, so they have made the entire country into a nature reserve. They understand that they -- that tourism is their only hope, and for tourism to work, they must halt the destruction of their environment. This, informing people at distant points of the value systems operating at the centers, where values are being created, allows people to position themselves for success.

I mean, a lot is being lost. You cannot pretend that the situation we're in is unambiguously rosy. It isn't. It's extremely complicated. Marxism dissolves. What does this mean? It means that now, uh, 21 language groups and 16 tribal groups are open to exploitation, homogenization, the leveling of cultural values. Every- body will be turned into a kind of white-bread consuming citizen in a beige-fascist world. And this is the alternative to Armageddon. We hail this as a great step forward. What is happening is that all restrictions are being done away with against the expression of completely rapacious drives for immediate self-gratification. Until 18 months ago, only half the world had permission to behave like assholes. Now, this permission is being extended to everyone as quickly as possible as a right, you know, your right to join in the looting of the planet. Well, certainly Stalinism is a bad thing, but is the only ideological counterpoise to that to be high-tech mindless consumer, uh, fascism? I don't think so. In fact, I know not. Because there isn't enough metal in the planet to put a Volvo in every driveway of three and a half billion or four billion people.

So, the search for a serious revolution in values is on. It cannot -- it must come from the spiritual realm. And, the spiritual realm in practical terms means the imagination. The -- the frontier of our species is the imagination. Now, we have to take that slogan and somehow turn it into a technology. How can we go to the place where ideas come from? How can we somehow separate our architectonic fantasies from the ongoing momentum of the planet? Both are valid, you see, but we have to recognize that what we are is almost an ontological transformation of life. We are to life, what life is to the inorganic realm, and we need to separate ourselves from the planet. the planet -- the entire planet should be a bio-reserve. How many of these oxygen rich, water heavy worlds are there? Now it's pie in the sky to talk about moving all heavy industry into space or to the asteroid belt or something like that. But, on the other hand, when you extrapolate a visionless future, even as much as three or four decades into the future, you see the accumulation of problems on such a scale that then there will be no pulling out of the power dive because once a society passes a certain point in the process of dissolution, you just don't make a decision to change. It's too late. You don't have the engineering skills, you don't have the technical community and you don't have the resource extraction ability. It's all slipped through your fingers.

Well, I think psychedelics are catalysts to thought, to imagination, to understanding. And, we are like

somebody who has been dead drunk while the house was burning down around us and now we have awakened to the sound of falling timber and the smell of smoke. We have a certain limited amount of time to figure this situation out. We don't have 500 years or 100 years. Anybody who speaks in terms of solutions that require 100 years or even 50 years to implement doesn't understand the dynamics of the situation. History has some kind of will for its own transcendence. And, I think, we are now so close to the dropping of the mask and the realization of what the game was all along that the -- the sense of this nearby revelation informs all of our lives, I mean, drives our dreams, our thoughts, the choices we make. This is why we're here in this room this evening. It's very big news I think.

The world is not at all as we suppose it to be. I find that very amazing. I mean, that's the bottom line, for me. I always think of these things in reference to that scene in *2001* when the anthropoid apes are leaping up and down and screaming and pointing at the monolith. That's what we're doing here in this room. I mean, the subject of this weekend is unspeakable, you know. It can only be obliquely indicated. Whatever you say about it is not true, uh, and yet, it is somehow the informing mystery of being, and it is not remote, that's the big news. That, the previous human model, which is that we are all poor groveling sinners and that gnosis will trickle down to us from the wonderful folks up on top of the steep building nearby where they're conducting mysterious business with liver readings and star-gazing, that model is, uh, insufficient and insulting considering the situation we have been brought to by those very star-gazing men wearing dresses.

I think what we have to do is just take the machinery into our own hands. It's a matter of personal responsibility to find out what the world is really doing and what it is. What do you think is going on? What do you think this is all about? Who do you think you are? What do you think English is? Uh, how do you really cognize notions like the future, the past, where I've been, what I want? I mean, you know, in *Moby-Dick*, Melville says, "If man will strike, strike through the mask!" Everything is a mask, and just behind that mask lurks, well, what? That's the question. It's the thing that informs every individual existence and that's fine and people have always lived in the shadow of that mystery. It is our weird privilege to live in an age where there is also to be a collective dropping of the mask. A moment of melting and recasting of what reality itself is to be. So, you know, discussing this, convincing ourselves of it and then working out the minute details of how it all is inevitable and couldn't be any other way is how we will occupy ourselves this weekend.

I'm really conflicted in these situations because I feel for some reason - I suppose it's an ego trip - that I want to be correctly perceived. I, as a person, want to be correctly perceived. And, I think of myself as a reasonable person, a person sensitive to concepts like evidence, causality, uh, so forth and so on. And yet what I have to say is completely unreasonable. I'm a messenger bearing news of complete madness approaching from all directions, so -- and I got into that position by staying pretty close to the principle of skepticism. I'm not a believer. In fact, when the aliens draped the mantle over my shoulders, they said, "It's cause you don't believe in anything." This is why -- that's why you got this far, because you didn't believe in anything. It's a good method. Normally, it's a method spawned out of futility. You say, "Well, fuck it! I don't believe in anything." But, it's also very good for getting rid of a lot of crap because the real stuff can take the test of skepticism. The real stuff doesn't have to be bowed down before, you know. It works. It's on its own.

The news is, and it's very hard news to get out because it's news about the structure of reality, the news is coming back from, you know, 50, 60, 100 years of anthropologists, ethnographers, geographers, botanists

dealing with the most quote-unquote primitive people in the most remote parts of the world. The news is that reality is not at all as we imagined it to be and that our prowess in the technical sciences is simply a cultural artifact, an accomplishment of ours. Some people do great tattoos; we send spacecraft to the stars. But, it doesn't mean we understand anymore. And, in fact, the evidence is building that our style of society is the historical equivalent of a temper tantrum. You know, that it has no viability. It's completely self-limiting. It's destructive. And it hands nothing on to its receivers.

So, I sort of talk to this group and others from two points of view: I'm trying to convince you of something, and yet, reason dictates that I assume that you're already convinced pretty much. So then, it's also an effort to figure out what it is we're so convinced of and then what is so great about it? Because I think, uh, some kind of -- this is a real mystery - the only one I know. This is the thing that you hope exists and assume doesn't, if you're a reasonable person because it's that -- you know, all the dreams of childhood, all the sense of magic and the dissolvability and transcendability of boundaries, is returned. It is affirmed in this experience. Well, yet here we are, having this on the brink of a planetary meltdown of culture and ecosystem. So, is this just some kind of dancing on the brink or a kind of ultimate self-indulgence? Does it feed back into the central moral problem of the age, which is, what is to be done? What are we to do? How can we be effective, whatever that means? Is there a discernible role for each of us to play in the metamorphosis and near death of the planet that we are now experiencing or are we simply to witness it?

Well, I don't think there is any point in thinking about these kinds of questions unless you draw back to the big picture and first premises. Uh, you know, a good example of what I mean is, suppose we save the rainforests and stabilize the population and then 50 years down the line, the sun explodes. It means that we didn't get it. It means that we were not reading correctly the message nature was trying to hand to us. And, so, we did the wrong thing and are going to be blown out of the water for such churlishness. So, what's important is to figure out what is going on before you start pushing in the process. And, I don't think you can do it from within a culture. In other words, if you're a person of decent intent and moderate intelligence, and you read the great minds of your culture and study their thought, it's insufficient because everybody is bound within an illusion of language. The entire enterprise of culture is this illusion of language. Homer was as sick with it as Heidegger. So, there's no going back and no classic recension.

What we have to do is reach past to some kind of experience. It must be anchored in an experience. But, there is this thing about being human, which we, as a culture, have ignored, repressed, and don't want to talk about, face or think about which is you can get loaded and nobody knows quite what to make of this. We dance around it with the same kind of furious, ambiguous intensity that we also reserve for sex which is also a boundary-dissolving, momentary, uh, loss of self into some kind of greater whole. And, It also just drives us into a frenzy. And we establish boundaries, we have hierarchies, we push it this way - it just drives us up the wall. Whoever she was who designed this system had the good sense to connect the sexual process very tightly into the generative process. So, there is no way you can get sex out of the human experience. I mean, people have tried in all times and places and in many strange ways. A hundred and fifty years ago, they were putting pants on pianos because it was thought that young men should not see pianos unclothed because it might excite them to impure thoughts. [audience laughs] And, this is real. In England and in our culture, not New Guinea or the moon, but in England pianos wore pants.

But, the psychedelic option is sort of like an appendix. You know, you can have it but you don't need it, apparently. Apparently. That's the key thing. Whether or not you have the psychedelic experience does not stand between you and the ability to pass on your genes into time. It does not stand between you and

continued existence like the autonomic reflex of breathing. It's a kind of a potential loop in development, which we can as culturally-coordinated creatures choose to follow or choose not to follow. But, this development is very recent. Until -- pick a number. Ten thousand years ago, the onset of puberty - which was, you know, a wave of hormonal release, basically - the onset of puberty was the signal to the social mechanisms of the people to begin the administration of psychedelic plants to carry people into adulthood, to carry them into a feeling-toned relationship with the mythological material that they had learned as children, but that they now would be expected to exemplify as realized adults within the Kung or Shu culture, or whatever it is that they are. We, in our anxiety about all this -- and I'll talk about why. I'm sure will come out, but for the present, just to say -- we have interfered with this and have enforced upon ourselves a kind of infantilism. This is a phenomenon that is well known and it's called neotony.

Neotony is the preservation of adulthood characteristics into adulthood - [audience "childhood"] - childhood characteristics, infantile characteristics or even fetal characteristics into adulthood. So, for instance, all primate fetuses are hairless but only the human being retains this fetal characteristic throughout life. The very large head of the human infant, the percentage relationship to body mass remains, uh, very much in the fetal end of the statistics throughout life for human beings. We have large heads. The very prolonged, uh, period in which skills, cultural skills are acquired, up to 16 years. Well, this tendency towards biological neotony, which was reinforced by, uh, mutagenic influences in the diet, is carried over into culture as a cultural characteristic. Have you noticed that every generation views the generation it spawns as more childish than itself? And, we look back to our rugged grandparents who slogged across the plains and I suppose they looked back to people in chain mail who were only four feet high and who could go without eating for six months, or something like that. We become more and more soft, more and more infantile and the final phase of this was just the decision that we never needed to grow up at all. We never needed to find out about the nature of our relationship to being at all. And, so, the psychedelics were suppressed and what you have, in the pre-adolescent child, what is an extreme expression of ego. You know, the 11-year-old child, let's take as the example, is the supreme egoist. And, in a sense, we got hung up at that place because we, uh -- we didn't get hung up in it; we fell into it. We were in balance, but the suppression of psychedelics created the precondition that allowed the generation of ego. And these are -- its very complicated and a lot of factors were at work you see. The mushroom style, the shamanic style of the nomadic hunter-gatherer is a style of goddess worship and, uh, psychedelic shamanism and orgiastic religion. There the shamanism and the religion overlap each other considerably.

The style that replaced that was a style of domination, hierarchy, with these alpha males -- with powerful males controlling females at the center of these hierarchies. And, to my mind, the concern that caused the shift was, uh, the accumulation in the psyche of these hominids of enough ego that there became concern for the line of male paternity. In other words, men wanted to know who their children were and that made the orgiastic style of religion in conflict because that was all about -- the children were the children of the group and sex was a shared activity even though there might be bonding. But, once people -- once men got it into their heads that they wanted to know who their offspring were, then females had to be controlled very rigidly and there had to be control of sexuality and the whole thing just turned into a nightmare. My women, my property, my children, my food, and my territory and so on and so forth.

What had been going on before was a true incipient symbiosis and this is the new idea that I want to communicate and that I'm 1) absolutely serious and, 2) literal about this idea. Our glory and our uniqueness, and why we are as we are, exists because we are a plant-animal symbiotic species. Our ordinary state, our state of nature - the way in which we existed until 10,000 years ago - was in a very

tightly bound symbiotic relationship with plants. They were -- we domesticated them and we, uh, spread them, and we created environments for them through the use of burning. And, in return for this, this mysterious connection opened up where real information couched in humanly cognizable terms - information about where the reindeer went, who you should marry, and what the weather is going to do, stuff like that. Real information began to be traded back and forth.

Now, biologists are familiar with the notion of pheromones, message-bearing chemicals that regulate behavior within a species. But, we're just getting ready to go to the next level and recognize the possibility of what have been called exopheromones, pheromones that regulate behavior between species. It's very clear that in climaxed ecosystems of great age, such as the equatorial tropics of this planet, uh, exopheromonal interactions become the major mediating force in all the evolutionary exchanges going on. The old notion of competition and survival of the fittest is now seen to be bankrupt. The way that nature works is it's the species that can make itself most necessary to other species, the one that can cut energy deals with the most of its neighbors that is the successful one. So, you maximize cooperation, you maximize dependency, you maximize integration. This is the successful evolutionary strategy. I mean, of course, you can be a jaguar and crash around in the forest and eat things immediately smaller than you, but, um, jaguars will be a memory in the fossil record of this planet when the plants will still exist given that man were not part of the picture. So, uh, uh, the dynamic of, uh, of life dictates that these energy levels be held very close.

[Question] - Outside of the natural?

Well, no. Nothing is outside of the natural. All of this can be explained in terms of climatological flux on the African continent. Very briefly, you know, the primates evolved in Africa. Out of the primates came the hominids which were these gracile, upright, opposable thumb, binocular vision and there were a number of these and they existed for, you know, over the past six million years. But, Africa and the planet, because of repeated glaciation, is subject to cycles of drying. And, uh, every time the ice moved south, primate populations were bottled up in Africa. And, we know there have been four glaciations, immediately the last one, the ice melted 20,000 years ago. And, out of Africa that last time came pastoralists, people who had domesticated cattle and had a style of following cattle around rather than being just strictly hunter-gatherers.

Well, I maintain what happened was these arboreal, tree-canopy-living apes came under pressure as the continent dried up to expand their diet because the forests were disappearing and being replaced by grasslands. Well, most animal species eat only one or two kinds of food. This is a general rule in nature and it's in order to hold down exposure to mutagenic influence. But, when an animal population is in a situation of food scarcity, the logical thing to do is to begin to test food sources and to expand your repertoire of food. Well, that's what these primates coming out of the trees did. Number one, they began eating meat which gave them a real interest that they had never had before in these ungulate mammals that were evolving in the grasslands and they also began to test all kinds of other foods in the environment.

When you do that, you are exposing your population to mutation and mutation rates soared. And, it was during this period that the human brain sized doubled, in, like a million and a half years. Someone said it was the most rapid evolutionary expansion of a major organ ever seen in the fossil record. Nothing like it ever happened. Why? What was making this happen? Well, uh, it looks like probably huge numbers of mutations were taking place in this population because people were literally eating anything that they could

get their hands on. And in this environment of the grasslands, the mushrooms were growing on the dung of these ungulate animals. Well, a weird thing about psilocybin is that in very low doses - doses so low you that don't feel anything - uh, your vision improves. They've done tests with this and, you know, there is an improvement in visual acuity, uh, on psilocybin at low doses. Well, you can imagine the evolutionary impact of something like this on a hunting-gathering population where visual acuity is all that stands between you and grim starvation.

It means the population of animals -- the populations of these evolving hominids that accept the mushroom into their diet have just been given a tremendous leg up on nearby competing troops, the competing troops that don't have it. It's like chemical binoculars. Immediately there is an evolutionary reason for mushrooms to be eaten and for mushrooms to be accepted into the diet as an item. When you take slightly more mushrooms and like all alkaloids, it's a CNS arousal. It means you feel alert, feel interested, and you want to boogie. Also, if you're male, it means you can sustain an erection. Now, arousal means arousal, so this stuff is an enzyme promoting sexual activity at that level. Well, sexual activity, you know, the number of copulations that occur within a population is directly related to the number of successful impregnations. So, suddenly you have these horny primates with a lot more interest in sexual contact and partners and all this means that these psilocybin-using creatures that are now more successful at hunting and more interested in sex have all kinds of pressures on them that will force them to outbreed the dull, uninteresting folks who don't use mushrooms at this point. [audience laughs]

Well, so then, uh, yet higher mushroom doses, it's no longer about sexual activity or clarity of vision. It becomes about the psychedelic trip, this tremendous, which is as awesome to you and me as it was to these so-called primitive folks 20,000 years ago. We don't know what to make of it and they didn't know what to make of it. They founded a religion about it. We're trying to start the engine of that same religion all over again. And, the way in which this religious ecstasy manifests itself is in language activity, in cognition, but also in glossolalia, in spontaneous outbursts of syntactically organized vocal activity. Well, the great mystery of human emergence is language. What is it? Where did it come from? How did it ever get going on such a scale? So forth and so on.

But, it looks to me like what we're seeing in psilocybin is a kind of neurological enzyme, a catalyst in the environment that could take an evolving primate population and put it through a series of forced changes that produce ultimately a self reflected, minded, uh, creature practicing a shamanic mother goddess religion in this nomadic context. And, that was paradise and that was the ideal for the archaic revival. In other words, that Eden actually existed. That, we are made for better things than what we've got. It says in Finnegans Wake, "Here in Moicane (Moicane was the red light district in Ireland) we flop on the seamy side, but up n'ent, prospector, you sprout all your worth and woof your wings." That's a promise for the future -- "up n'ent, you sprout all your worth and woof your wings." But also, Antes, we sprouted our worth and woofed our wings, and this whole nostalgia for a perfected shamanism in prehistory is reasonable, I think.

I mean, I think, we had an unimaginably precious gift. We had consciousness and dynamic order. Consciousness as we experience it now within the confines of history is most analogous to cancer. I mean, it's replicating, spreading, but it once was a dynamic ordered thing. People lived, they died, they made love, they had children, they herded their flocks, they had ecstatic flights into dimensions which we cannot even conceive of and they felt no need, you know, to break into the earth, to divert the rivers, to do all of this stuff. And, you know, even if we're not aesthetically attracted to that, we have to make a value

judgment on it because it was not a runaway process. It did not push everything towards crisis.

Okay, well, so, what happened? What the hell happened if that's how it was? Nature is just an ongoing story. The very drying processes that created those grasslands, that created those pressures on diet, that created the mother goddess religion that evolved those ungulate animals - that process continued and the grasslands dried up and the winds began to blow and the water holes got further and further apart from each other and the mushroom festivals went from every Saturday night to the first Saturday of every month, then to four times a year, and then to once a year, and then to once every five years and then to never. And, in the absence of the psychedelic experience, this ego thing gets going. I mean, it's literally like a calcareous growth in the bloodstream of the psyche. If you don't inoculate yourself against it, it will begin to take root and grow. And the world -- the boundaries of the world begin to move inward, you know, and you no longer see things on a planetary scale or a millennial scale. It's just about my women, my money, my land, my children - all of this stuff.

And, at that point, you get the appearance of historical civilizations. You have kingship and the Age of Gilgamesh. My God! When you read the story of Gilgamesh, you just wonder what's going on. Uh, Gilgamesh spurned the goddess and the goddess sent a bull which, to me, you know, is symbolic of the mystery of the mushroom, the ungulate herding horned animal, the cryptic symbol for the goddess. And he rejects the bull and he rejects the goddess. Then he takes Enkidu, the shaman figure and forces him to go with him into the wilderness. And what do they do in the wilderness - this oldest of all myths, this story of the first men - what do they do? They cut down the tree of life. That's what they do. They cut down the tree of life and then it goes forward.

The earliest strata of mythology that comes out of these middle-eastern civilizations is full of this male/female nature artificial tension. The story of Genesis is a similar thing. I mean, what's happening in Genesis is history's first drug bust. [audience laughs] A woman is involved with a plant and the plant, uh, opens their eyes. And, they see that they are naked, which happens to be the case - they are naked. So, in other words, they see -- they grok their true existential condition. And Yahweh, wondering around mumbling to himself in the garden, says: "This thing that these people have done. What if they eat of the fruit of the tree of life? Then they will be as we are." It's very clear that there is concern to withhold knowledge that human beings are to be held in an inferior position. Otherwise, if they were to eat of the fruit of the tree of life, of knowledge, they would be as we are. So there's this whole tension.

And, in the story in Genesis, you'll recall that Adam and Eve are cast out of Eden and an angel is set at the east of Eden with a burning sword. Well, what I take this to be about is the -- it's a story from a strata where already the shift to the dominator culture has taken place. But, they're looking backward at the partnership society on the grasslands of Africa and the angel with the burning sword is nothing more than the sun. That they literally were cast out of Eden. Eden disappeared around them. It dried up and blew away and there was nowhere for them to go but the Nile Valley and Palestine. And these people who appear in the Nile Valley and Palestine at about 9800 BC, called Natufian, come out of nowhere with a very high culture and a tremendous ability to exploit plant resources. And I think they are the remnants of this partnership culture.

And you see our -- the way that this all ties into the present and attempts to be more than, you know, just a cultural reconstruction of prehistory - we're trying to understand who we are, why we are the way we are. The major thing now is that we have transcended ideology. Nobody gives a hoot whether you're a Marxist

or any of that anymore because we've all seen through that. The new issue is human nature and it evolves around this drug thing, you know. Is it the truest and purest expression of human nature that you should drink nothing but cold water and eat nothing but raw vegetables and any departure from this is an abomination? Well, when you get to drugs, this is really an abomination. How -- what should be our relationship to substances and why are we the addictive creatures that we are? I mean, I know that elephants intoxicate on papayas and bumblebees get loaded on sugar-water, but human beings addict to dozens of substances, to behaviors, I mean, all kinds of things. A guy goes out in the morning to pick up his paper off his porch and it's not there. And he has a heart attack and he has to sit down and he says, "My God! What am I going to do?" He has to have instant relief from the traumatic crisis of the non-presence of the morning information fix. Then, there is the phenomenon of falling in love which doesn't really happen with other animals. Other animals bond, but they don't go bananas in the way that we do on this issue. Uh, we're chemically highly queued in a way that a lot of animals around us aren't.

So then history, because of this, because of this addictive drive within us, because of this disrupted symbiotic relationship in prehistory -- see we're looking for the score, but we can't quite find it. Imperialism doesn't do it, heroin doesn't do it, sadomasochism doesn't do it. Nothing quite does it, but we keep trying stuff: cocaine, money, fascism, mercantilism, ideology -- all of this stuff. We are very, very restless and the path of our restless, frantic peregrinations across the intellectual landscape is what we call "history," you know. It's our effort to try and get straight and get back to something, which we feel we deserve and that we lost. And we don't know quite what it was.

Meanwhile, in the rainforest, in the arctic tundra, these little brown people have been keeping the gnosis going. Never questioning, never doubting, millennia after millennia going into these hyper-dimensional mind spaces and operating there. While this has been going on, we have been elaborating positivism, scientific philosophy, building atom smashers, so forth and so on. We have created then out of our infantile cultural style, uh, what Erich Fromm would call a fecal cultural style because we just excrete stuff, you know, all kinds of stuff. Uh, they have held this mystery, but they -- to my mind, the mistake that has been made is that it's been thought that they understood it. That we now go to the shamans and they will explain to us what the inner-skinny is on all this. That isn't it. There's no explaining this. Once you've been there, you know the futility of a notion like understanding the psychedelic experience. It's like understanding the ocean or understanding planetary ecology. We think that things are to be understood, but some things are simply to be -- what's the word? -- appreciated, imbibed, to be in the darshan of them.

Well, let's talk a little bit more as we were did this morning. I talked a little more than I intended to. What is anybody's take on this. Did anybody not get their licks in this morning? Yeah?

[Question]: You mentioned the odd, the strange and the weird. Other than hallucinogens, how can we fool this brain away from the ego?

It's pretty difficult. I think that's why we're in the situation that we're in.

[Question]: I'm talking about things that we can do everyday, not just once a month.

There is no substitute for awareness in any situation. I mean, part of the work is the spectacular episodes of intoxication that break down the boundaries of our personality and reorient us and recast us. But, the other thing is just living that out from day to day and there's no substitute for hard work. I mean, people say,

“How can psychedelics be real? You’re saying that it’s some kind of shortcut to spiritual wisdom.” Well, it may be a shortcut, but nobody said it’s easy. Uh, it isn’t easy. No. It’s just that it’s ultimately effective. I don’t know, I find myself preaching a doctrine that is hardly welcome in the touchy-feely circles that I’m usually teaching in, which is stifle it. There’s a doctrine to take home from the New Age. Stifle it. You know, the ego is much too large. I mean, we need an ego, yes. That’s so that if you take somebody to dinner, you know whose mouth to put food in. That’s having an ego. But, above and beyond that, it becomes sort of superfluous. It’s a habit. It’s a bad habit. It’s an infantile response that has been culturally supported to the point where it’s become institutionalized.

[Question]: Do you believe a person needs a strong enough ego before they can transcend or transform it? The reason I’m saying that, I’ve seen a lot of teenagers in the city and they experiment a lot with drugs, and especially with psychedelics. Sometimes I wonder if they’re really getting anything out of that early experimentation. I didn’t get into psychedelics until my late 20s.

Well, it’s a real complicated question. Civilizations evolve folkways to deal with the drugs that they’re interested in and this takes hundred or even thousands of years. Part of the question I hear you asking is - you say that these drugs dissolve the ego, but aren’t some people in a weakened ego condition when they come upon them and I think probably you’re right. It’s not clear that the onset of puberty, when there’s a good deal of psycho-sexual and endocrine confusion going on anyway, that this is the precise right moment that you want to drop these psychedelics on somebody. Although this is done in many traditional societies. But, the problem is, in societies where there is shamanism, there’s an understood way to do it. There’s an understood way to initiate somebody. Kids growing up on the streets taking drugs of all sorts, in doses of all sorts, is very hard to sort it out, you know. I mean, people don’t have intent, they don’t have focus, they don’t have information. Everything is so fragmented in modern life. Part of what all this yammering about shamanism might eventually lead to is the reformation of psychotherapy along the lines of a shamanic style, so that then, uh, you know, people could have these voyages, could have the insight into their problems that you get from psychedelics.

[Question]: Also, in those cultures and societies where they do use psychotropic drug at puberty, I think those societies support the individual, the child growing up, in very positive ways and feed their ego in a very constructive, positive way so that they are not filled with a lot of self-consciousness and self-hatred and a lack of self-worth and so forth. A lot of the critical nature and the lack of nurturing and attention that a lot of us grow up with in our society then get weak egos from adolescents then on into adulthood. I think the developmental quality of life in different cultures has a lot to do with one’s ability to utilize the drugs and the plants effectively.

Cooperation is just an automatic response among many of these rainforest hunting-gathering people and when you finish a job, you go on and do another job until all the jobs are done. And, this is clearly a learned response because these are human beings just like us, but under the extreme pressure of being, you know, 20 people trying to hold it together in a rainforest through gathering. They have accepted that the tribal unit is the lowest common denominator and that everything has to operate in the light of that. Back here.

[Question]: Part of what was being discussed here was the difference between discursive and one-pointed meditation. And, discursive meditation is meditating on the stations of the cross if you’re Catholic, or the seven teachings of the self if you’re a Hindu, and it sort of serves years of doing that as establishing a ladder that

can take you to the transcendent. One-pointed meditation, and even more profound than the use of psychedelics, can suddenly put you into a transcendent state and whether you'll have the capacity to get back is the question. So, there might be a role for a period of discursive meditation or an education along that way before something instantly propels you into an experience of the transcendent.

Yes, although, um, this difficulty getting back is an interesting thing to talk about because I certainly know what you mean. I think, that everybody who takes psychedelics a lot eventually has a trip that stands their hair on end. And, the reasonable fear I've always felt about psychedelics was not that it would kill you - that's not reasonable - uh, but, the somewhat murkier question, could it drive you mad? is a little harder to just say, of course, not because why not? It's definitely rubbing up against those areas. I have real faith that it's like flipping a coin and getting it to land on its edge. The psychedelic experience represents such a stage of disequilibrium that in almost all cases the entire system is striving to return to normal and will do so very quickly. You know, my life is built around one spectacular exception, where my brother took a bunch of things and had a theory and proceeded to sail off for the better part of three weeks. And, this sort of brings up another issue, we sit here relatively down and calm and we can talk about the LD50 of psilocybin. That's how much you would have to give to 100 mice for 50 of them to die. This is what pharmacologists are all about. But, when you're actually stoned in these places, you realize, or you have the apparent realization, that, of course, the mind is in control. And talking about safety - you're only as safe as you think you are. Literally! And, if for a moment that you decide you're not safe, the state is very fragile. It's skittery. Get it going too fast in one direction and it will be very hard to run around and get in front of it, get it halted and moving off in some other direction.

[Question]: Is that what you meant by self-toxicity?

Did I use that phrase this morning?

[Question]: Well, no. In a past tape, you did mention about self-toxicity and possible negative effects.

Well, yeah. I think this is what people fear, that they are self-toxic. We have all been disempowered. To some degree, we are self-toxic and that's a real tragedy. It means we have been made our own enemy. Whether or not we are, we all fear self-toxicity. This is why in the 1960s when LSD first began to appear, people had such violent reactions to it. You know, Tim Leary said, "LSD is a psychedelic drug which causes psychotic behavior in people who haven't taken it." [audience laughs] This is absolutely true. Why would a drug that you don't take cause you to become psychotic? It's because the mere fact of its existence is so threatening to you because you know that you're self-toxic. That's what I always felt in the 60s. These people all know their crazy and they don't want to get near anything which would perturb their psychic dynamics. They know beyond a shadow of a doubt that they're certifiably insane and they don't want to hear about it. So, they're not going to be delving in to something that shines a Kleg light on the mechanics of the psyche [audience laughs]. It's the last thing that they are interested in.

[Question]: If the definition of ego is the reality-testing mode of the psyche. The psyche's ability to perceive reality, then it almost seems that the psychedelic experience augments the ego to a new level rather than extinguishes the ego and that it gives a truer picture of reality.

Well, you know, Freud had this concept that he called the "superego" and this term has somewhat fallen out of use. And because we all tend to be a little more Jungian than that and we talk about the collective

unconscious. But in a way, though I'm more sympathetic to Jung, I like the phrase superego because the phrase "collective unconscious" is a kind of blah concept. It's like a databank, a repository, whereas superego seems to imply organization, intelligence, focus, and awareness. And, uh, what seems to emerge from these psychedelic experiences is that where we expected disorder or the absence of organization, we find order. We find mindedness. The superego seems to be everywhere. So, in a way, it is like that. It is that you're becoming more informed, but it diminishes your personal importance and the physical atom of your body, you know. I mean, we believe - and it may be true but the question is - how important is it that we are each unique and that somehow in this uniqueness is our worth? And that if something were to happen to you, we can't replace you with me and you can't stand in for me. But, uh, you know, back off to where you're looking at a thousand years of this stuff and you see that each one of us actually is expendable and that the general processes in which we are embedded are so large that it probably doesn't matter who you are. And I could have been you and you could have been me. Once you've got that nailed down, being becomes a whole different project.

Being is something out there that you do: you garden well, you bare and raise children, you feed people, you build objects, you know. It becomes something outside of you rather than something interiorized and, I think, you know, thousands and thousands of generations of people were born, lived and went into the ground with this kind of a psychology. And, we are all imprisoned by our cultural expectations to such a degree that the real problem is to make ourselves realize how blind we are. How much of what we've been taught, the words we use, the expectations we have hem us in. The psychedelics show us that cultural relativism, not as an exercise, not as something that you're convinced of by rational argument, but that you just see it, immediately. I think we're very malleable creatures and have held many positions in the last 10,000 years vis-à-vis these structures, which we call the ego, the superego, the self, the unconscious. It's more fluid than we imagine.

Language may have emerged only 40,000 years ago. Well, imagine that, language is the software without which we wouldn't be people, you know. I mean, language allows us to explore realms of subtlety and inclusive understanding that so exceed the animal grasp that they can barely be compared. Uh, I think that probably in the beginning, language was something that women held almost as a magical power. The reason for this is that there was greater selective pressure on woman than on men to develop language because the physically larger male - when there began to be role specialization - the physically larger male was made a hunter. Hunting places a premium on such values as stoicism, patience and an ability to keep your mouth shut.

The women were involved in gathering and because the children were physically with the women, this area in which the gathering went on was more tightly related to the living space. Well, if you know anything about the science of botany, you know that it is a science of the coordination of detail. Everything is about the detail. Here you have 50 species of grasses. To Joe Blow, they all look exactly the same. To a specialist in the gramineae, here is a whole rich universe of taxonomic diversity to be combed over and milked for years as you advance through the academic machinery. So, women had to learn all these differentiations. Women had to be able to make statements like, "It's the small bush at the bottom of the draw with the wrinkled leaves and the sticky, white berries with the silver hairs on them." See. It's all color, shape, form and relationship words.

Well, this kind of language is the kind of language that gave us a leg up on animal organization. After a passage of time, I think this linguistic thing generally established itself but it was, uh, originally a thing that

women were into. Even to this day, when you go into villages in third world parts of the planet, uh, there's this phrase in all travel books, which is, the chattering of the village women. And, it's true, they really do chatter and it's because they are more collective creatures. The male is this proud, lonely hunting figure and the females represent the village values and they held the knowledge of the plants. They discovered all this stuff. You even get that in the Eden story. It's a woman who's blamed. Somehow these women have a deeper insight and the poor guy is just led to slaughter because he's trying to get some chow. [audience laughs]

[Question]: Perhaps an appropriate image would be one of climbing a temple. (...) most impressive temple that I've ever visited. But, um, there, as you walk up the temple, if you pay attention, you hear (...) Buddhism and different symbologies, but, basically, your vision of the surrounding jungle expands and your sense of self diminishes, so...

Because you see the larger world.

...you see the larger world from on high.

Yeah. From the center of the mandala. The same psychology is operating on the Mayan buildings. The Mayan buildings are barely buildings at all; they're more like pedestals. This thing is 230 feet high but when you climb to the top of it, there's room for twelve guys to stand shoulder to shoulder. And, that's the building. It's clearly to elevate them above the social space. It was literally a machine for lifting the priesthood into another dimension and the dimension into which it lifted them was an aerial dimension. They could see then the whole world; they could see the socbay stretching out to the next pyramid. They could see the next pyramid five or ten miles away on the horizon and could see the life of the city and all this.

You know, there's a funny thing, um, it's almost as though biology and then its ancillary tack on phenomenon - culture - is a kind of conquest of dimensions that has been going on for a very long time. And, this aids me in understanding the transformation that I think lies ahead for this planet. The earliest forms of life had only a tactile sense. That means all they knew was what they were bumping up against. And they would move around and what was edible was eaten and what wasn't wasn't. And then a long time passed, you know, 100 million to 200 million years, and certain specialized cells, uh, aggregated. And, these cells were light sensitive cells. They could send an on/off signal based on whether or not photons were falling on them. So eye spots developed and eye spots are just these sensors that tell you if it's light or dark. And, suddenly these creatures could move off after a light source or could retreat from danger into a dark spot. While then, eventually, these eye spots evolved into the kinds of very finely coordinated optical systems that we have and octopi have and so forth.

At the same time, motility was developing. The ability to move through space. Well, have you ever noticed that when you look at something, at a place a few feet away from where you're sitting and then go there, physically move there, that what you have really done is you have coordinated a short trip into the future? Because you have looked at a spot and said - this is how the brain computer works - "I am not in that place. I want to be in that place. I am in this place now. To get from this place now, to that place then, I have to move through the following points." And, when animals began to move, uh, another dimension was added to their repertoire of control. And, when they began to coordinate vision, another dimension was added to their repertoire of control. Well, we made then a great and fundamental break in our neurological

organization. All animal life, as far as we can tell, is imprisoned between very steep temporal canyons having to do with the present moment. Animals are in the present moment in a way that would be very frightening to us, I think. If you could suddenly enter the mind of an animal, the immediate thing that you would notice that would really unnerve you was the absence of a past and a future. That just, you know -- talk about "Be There Now" - an animal has that down pat.

Well, when we, through language -- language is a strategy for binding time. Language is a strategy for taking the animal mind locked in the present moment and pushing it back conceivably to the creation of the universe as we do, and forward conceivably to the end of the universe. So, culture is a strategy for intensifying the dimensionality of an animal species. And, uh, the, uh, -- when you get into what's called epigenetic coding, not simply being able to recall the past neurologically and project the future neurologically, but to actually write down the past and calculate the future. Well then what is happening is mind is spreading out through the dimensions available to it and this whole cultural intensification that we call the 20th century - the spinning down and interconnecting of technologies, and, uh, animal ecosystems and philosophical systems - all this knitting together is a going hyper dimensional of our species that yet more of the future and more of the past is apparently to be realized. And, if you know anything about virtual reality thinking, there time is to be homogenized completely. I mean, you will not be able to tell if its next week or last week because they will be approximately equally accessible. And, uh, somehow the psychedelic experience is related to this bootstrapping process of climbing organizationally from one dimension to another, deeper and deeper into complexity.

It's almost as though the psychedelic experience is a viewing of the process from the highest dimension in the plane. One way of putting this that isn't so mathematical is to say what you experience in the psychedelic experience is eternity. All of time. You leave the slowly revolving Taurus of time just as one would leave the galaxy in a spaceship and you go outside, and then you look back and you see all of time. You see the beginning of life, the end of life, the fiery death of this planet bi-millennia hence, whatever it is. And, I think this is a true vision. That this is what shamans have achieved. This is what we with all our sophistication are confounded by. A shaman is someone who has seen the end. A shaman is somebody who has seen it all. They've run the movie and run the movie and run the movie, and they've satisfied themselves that they understand the movie. Then they go back to their place in the movie and they live it with a small smile [audience laughs] because they know the end. They know how things work. They know what life is.

And, when you have even a piece of that action, you can get a real handle on peace of mind, on true authenticity because it's in the tumbling forward rushing chaos of the lower dimensional slices of time that we lose it. That we become confused. Who am I? What do I want? Where am I? Who should I be with? What should I give myself to? This is a voice speaking from chaos. I remember once at a period of turmoil in my life, I - I took mushrooms to try and resolve my personal difficulties. And I said, "I'll think of a question" -- you know they say, "You think of a question" -- so I said, "I'll think of a question" and the question was: "Am I doing the right thing?" And at the point in the trip I posed this question to it and the answer was, "What kind of a chicken shit question is that [audience laughs] to ask an extra-terrestrial entelechy?" So then I got it, you know. That that was a chicken shit question and that I had been completely misunderstanding the nature of the relationship. This wasn't some kind of little glass ball that gives "Yes" or "No" when you turn it upside down.[audience laughs] This is -- I don't know - words fail -- but, nobody to expect psychotherapy for free from, anyway.

Alien Dreamtime was a multimedia event recorded live on February 27th 1993

All right. Tonight for your edification and amusement, three raves, two interregnums. Visions by Rose-X. Didgeerido: Steven Kent, and sound by Spacetime. Words and ideas by Terence McKenna.

Rap 1.
The Archaic Revival. History is ending because the dominator culture has led the human species into a blind alley, and as the inevitable chaotic approaches, people look for metaphors and answers. Every time a culture gets into trouble it casts itself back into the past looking for the last sane moment it ever knew. And the last sane moment we ever knew was on the plains of Africa 15,000 years ago rocked in the cradle of the Great Horned Mushroom Goddess before history, before standing armies, before slavery and property, before warfare and phonetic alphabets and monotheism, before, before, before. And this is where the future is taking us because the secret faith of the twentieth century is not modernism, the secret faith of the twentieth century is nostalgia for the archaic, nostalgia for the paleolithic, and that gives us body piercing, abstract expressionism, surrealism, jazz, rock-n-roll and catastrophe theory. The 20th century mind is nostalgic for the paradise that once existed on the mushroom dotted plains of Africa where the plant-human symbiosis occurred that pulled us out of the animal body and into the tool-using, culture-making, imagination-exploring creature that we are. And why does this matter? It matters because it shows that the way out is back and that the future is a forward escape into the past. This is what the psychedelic experience means. Its a doorway out of history and into the wiring under the board in eternity. And I tell you this because if the community understands what it is that holds it together the community will be better able to streamline itself for flight into hyperspace because what we need is a new myth, what we need is a new true story that tells us where we're going in the universe and that true story is that the ego is a product of pathology, and when psilocybin is regularly part of the human experience the ego is suppressed and the suppression of the ego means the defeat of the dominators, the materialists, the product peddlers. Psychedelics return us to the inner worth of the self, to the importance of the feeling of immediate experience - and nobody can sell that to you and nobody can buy it from you, so the dominator culture is not interested in the felt presence of immediate experience, but that's what holds the community together. And as we break out of the silly myths of science, and the infantile obsessions of the marketplace what we discover through the psychedelic experience is that in the body. IN THE BODY, there are Niagaras of beauty, alien beauty, alien dimensions that are part of the self, the richest part of life. I think of going to the grave without having a psychedelic experience like going to the grave without ever having sex. It means that you never figured out what it is all about. The mystery is in the body and the way the body works itself into nature. What the Archaic Revival means is shamanism, ecstasy, orgasmic sexuality, and the defeat of the three enemies of the people. And the three enemies of the people are hegemony, monogamy and monotony! And if you get them on the run you have the dominators sweating folks, because that means your getting it all reconnected, and getting it all reconnected means putting aside the idea of separateness and self-definition through thing-ferish. Getting it all connected means tapping into the Gaian mind, and the Gaian mind is what we're calling the psychedelic experience. Its an experience of the living fact of the entelechy of the planet. And without that experience we wander in a desert of bogus ideologies. But with that experience the compass of the self can be set, and that's the idea, figuring out how to reset the compass of the self through community, through ecstatic dance, through psychedelics, sexuality, intelligence, Intelligence. This is what we have to

have to make the forward escape into hyperspace.

Rap 2.
Alien Love Hello... So that was like an introduction, now for some preaching to the choir on the subject of how come it is that the further in you go the bigger it gets. I remember the very, very first time that I smoked DMT. It was sort of a benchmark you might say, and I remember that this friend of mine that always got there first visited me with this little glass pipe and this stuff which looked like orange mothballs. And since I was a graduate of Dr. Hoffman's I figured there were no surprises. So the only question I asked is, 'How long does it last?' and he said, 'About five minutes.' So I did it and... there was a something, like a flower, like a chrysanthemum in orange and yellow that was sort of spinning, spinning, and then it was like I was pushed from behind and I fell through the chrysanthemum into another place that didn't seem like a state of mind, it seemed like another place. And what was going on in this place aside from the tastefully soffit indirect lighting, and the crawling geometric hallucinations along the domed walls, what was happening was that there were a lot of beings in there, what I call self-transforming machine elves. Sort of like jeweled basketballs all dribbling their way toward me. And if they'd had faces they would have been grinning, but they didn't have faces. And they assured me that they loved me and they told me not to be amazed; not to give way to astonishment. And so I watched them, even though I wondered if maybe I hadn't really done it this time, and what they were doing was they were making objects come into existence by singing them into existence. Objects which looked like Faberge eggs from Mars morphing them- selves with Mandian alphabetical structures. They looked like the confluence of linguistic intentionality put through a kind of hyper-dimensional transform into three-dimensional space. And these little machines offered themselves to me. And I realized when I looked at that if I could bring just one of these little trinkets back, nothing would ever be quite the same again. And I wondered, Where Am I? And What Is Going On? It occurred to me that these must be holographic viral projections from an autonomous continuum that was somehow intersecting my own, and then I thought a more elegant explanation would be to take it at face value and realize that I had broken into an ecology of souls. And that somehow I was getting a peek over the other side. Somehow I was finding out that thing that you cheerfully assume you can't find out. But it felt like I was finding out. And it felt... and then I can't remember what it felt like because the little self-transforming tykes interrupted me and said, 'Don't think about it. Don't think about who you

are. Think about doing what we're doing. Do it. Do it now. Do it!!

Rap 3.
Speaking in Tongues And what they meant was use your voice to make an object. And as I understood, I felt a bubble kind of grow inside of me. And I watched these little elf tykes jumping in and out of my chest; they like to do that to reassure you. And they said, 'Do it.' And I felt language rise up in me that was unhooked from English, and I began to speak... like this, 'Eyo ca dema fla gwa si pipi eng...' or words to that effect. And I wondered then what it all meant and why it felt so good if it didn't mean anything. And I thought about it, a few years actually, and I decided that meaning and language are two different things. And that what the alien voice in the psychedelic experience wants to reveal is the syntactical nature of reality. That the real secret of magic is that the world is made of words, and that if you know the words that the world is made of you can make of it whatever you wish. And one of the things that I learned about DMT was that if you've ever had it, even just once, then you can have a dream, and in this dream somebody will pull out a little glass pipe, and then it will happen! It will happen just like the real thing. Because there's a button somewhere inside each and every one of us that gives you a look into the other side. And that's the button that resets the compass that tells you where you want to sail. Good luck... Rap 4, 'Timewave Zero Hello... alright. Have you ever noticed how there's this quality to reality which comes and goes, and kind of ebbs and flows and nobody ever mentions it or has a name for it except some people call it a 'bad hair day' or some people say 'Things are really weird recently.' And I think we never notice it and we never talk about it because we're embedded in a culture that expects us to believe that all times are the same, and that your bank account doesn't fluctuate except according to the vicissitudes of your own existence. In other words, every moment is expected to be the same and yet this isn't what we experience. And so what I noticed was that running through reality is the ebb and flow of novelty. And some days, and some years, and some centuries are very novel indeed, and some ain't. And they come and go on all scales differently, interweaving, resonating. And this is what time seems to be. And Science has overlooked this, this most salient of facts about nature: that nature is a novelty conserving engine. And that from the very first moments of that most improbable big bang, novelty has been conserved because in the very beginning there was only an ocean of energy pouring into the universe. There were no planets, no stars, no molecules, no atoms, no magnetic fields; there was only an ocean of free electrons. And then time passed and the universe cooled and novel structures crystallized out of disorder. First, atoms; atoms of hydrogen and helium aggregating into stars. And at the center of those stars the temperature and the pressure created something which had never been seen before which was fusion. And fusion cooking in the hearts of stars brought forth more novelty: heavy elements - iron, carbon, four-valent carbon. And as time passed there were not only then elementary systems but because of the presence of carbon and the lower temperatures in the universe, molecular structures. And out of molecules come simple subsets of organisms. The genetic machinery for transcribing information, aggregating into membranes, always binding novelty, always condensing time, always building and conserving upon complexity, and always faster and faster. And then we come to ourselves. And where do WE fit into all of this. Five million years ago we were an animal of some sort. Where will we be five million years from tonight? What we represent is not a sideshow, or an epiphenomenon, or an ancillary something-or-other on the edge of nowhere. What WE represent is the nexus of crescent novelty that has been moving itself together, complexifying itself, folding itself in upon itself for billions and billions of years. There is, so far as we know, nothing more advanced than what is sitting behind your eyes. The human neo cortex is the most densely ramified complexified structure in the known universe. We are the cutting edge of organismic transformation of matter in this cosmos. And this has been going on for a while; since the discovery of fire, since the discovery of language. But now, and by now I mean in the last 10,000 years, we've been into something new. Not genetic information, not genetic mutation, not natural selection, but epigenetic activity: writing, theater, poetry, dance, art, tattooing, body piercing and philosophy. And these things have accelerated the ingress into novelty so that we have become an idea excreting force in nature that builds temples, builds cities, builds machines, social engines, plans, and spreads over the Earth, into space, into the micro-physical domain, into the micro-physical domain. We, who five million years ago were animals, can kindle in our deserts and if necessary upon the cities of our enemies the very energy which lights the stars at night. Now, something peculiar is going on here. Something is calling us out of nature and sculpting us in its own image. And the confrontation with this something is now not so far away. This is what the impending apparent end of everything actually means. It means that the de-no-ma of human history is about to occur and is about to be revealed as a universal process of compressing and expressing novelty that is now going to become so intensified that it is going to flow over into another dimension. You can feel it. You can feel it in your own dreams. You can feel it in your own trips. You can feel that we're approaching the cusp of a catastrophe, and that beyond that cusp we are unrecognizable to ourselves. The wave of novelty that has rolled unbroken since the birth of the universe has now focused and coalesced itself in our species. And if it seems unlikely to you that the world is about to transform itself, then think of it this way: think of a pond, and think of how if the surface of the pond begins to boil - that's the signal that some enormous protean form is about to break the surface of the pond and reveal itself. Human history IS the boiling of the pond surface of ordinary biology. We are flesh which has been caught in the grip of some kind of an attractor that lies ahead of us in time, and that is sculpting us to its ends; speaking to us through psychedelics, through visions, through culture, and technology, consciousness. The language forming capacity in our species is propelling itself forward as though it were going to shed the monkey body and leap into some extra-surreal space that surrounds us, but that we can not currently see. Even the people who run the planet, the World Bank, the IMF, you name it, they know that history is ending. They know by the reports which cross their desks: the disappearance of the ozone hole [?], the toxicification of the ocean, the clearing of the rain forests. What this means is that the womb of the planet has reached its finite limits, and that the human species has now, without choice, begun the descent down the birth canal of collective transformation toward something right around the corner and nearly completely unimaginable. And this is where the psychedelic shaman comes is because I believe that what we really contact through psychedelics is a kind of hyperspace. And from that hyperspace we look down on... we look down on both the past and the future, and we anticipate the end. And a shaman is someone who has seen the end, and therefore is a trickster, because you don't worry if you've seen the end. If you know how it comes out you go back and you take your place in the play, and you let it all roll on without anxiety. This is what boundary dissolution means. It means nothing less than the anticipation of the end state of human history. A return to the archaic mode. A rediscovery of the orgiastic freedom of the African grasslands of 20,000 years ago. A techno-escape forward into a future that looks more like the past than the future because materialism, consumerism, product-

fetishism, all of these things will be eliminated and technology will become nanotechnology and disappear from our physical presence. If we have the dream, if we allow the wave of novelty to propel us toward the creativity that is inimitable to the human condition. That's what we're talking about here: psychedelics as a catalyst to the human imagination, psychedelics as a catalyst for language; because what cannot be said, cannot be created by the community. So what we need then is the forced evolution of language. And the way to do that is to go back to the agents that created language in the very first place. And that means the psychedelic plants, the Gaian Logos, and the mysterious, beckoning, extraterrestrial minds beyond. Hooking ourselves back up in to the Chakras of the hierarchy of nature, turning ourselves over to the mind of the total other that created us and brought us forth out of animal organization. We are somehow part of the planetary destiny. How well we do determines how well the experiment of life on Earth does, because we have become the cutting edge of that experiment, we define it, and we hold in our hands the power to make or to break it. This is not a dress rehearsal for the apocalypse. This is not a pseudo-millennium. This is the real thing folks. This is not a test. This is the last chance before things become so dissipated that there is no chance for cohesiveness. We can use the calendar as a club. We can make the millennium an occasion for establishing an authentic human civilization, overcoming the dominator paradigm, dissolving boundaries through psychedelics, recreating a sexuality not based on monotheism, monogamy and monotomy. We.. All these things are possible if we can understand the overarching metaphor which holds it together which is the celebration of mind as play, the celebration of love as a genuine social value in the community. This is what they have suppressed so long. This is why they are so afraid of the psychedelics, because they understand that once you touch the inner core of your own and someone else's being you can't be led into thing-fetishes and consumerism. The message of psychedelics is that culture can be re-engineered as a set of emotional values rather than products. This is terrifying news. And if we are able to make this point then we can pull back, we can pull back and we can transcend. Nine times in the last million years the ice has ground south from the poles pushing human populations ahead of it and those people didn't fuck up. Why should we then? We are all survivors. We are the inheritors of a million years of striving for the unspeakable. And now with the engines of technology in our hands we ought to be able to reach out and actually exteriorize the human soul at the end of time, invoke it into existence like a UFO and open the violet doorway into hyperspace and walk through it, out of profane history and into the world beyond the grave, beyond shamanism, beyond the end of history, into the galactic millennium that has beckoned to us for millions of years across space and time. This is the moment. A planet brings forth an opportunity like this only once in its lifetime, and we are ready, and we are poised. And as a community we are ready to move into it, to

claim it, to make it our own. It's there. Go for it, and thank you.

[ONLY THE END OF THIS WORKSHOP HAS BEEN TRANSCRIBED--THE EARLIER PORTIONS OF THE WORKSHOP STILL NEED TO BE TRANSCRIBED--PLEASE FEEL FREE TO PUT YOUR NAME AT THE BOTTOM AND START WORKING ON IT]

[Audience - 2:13] — I was wondering, have you always been a knowledge junky, or have psychedelics increased your enthusiasm for learning (or your capacity for it)?

I've always been sort of a knowledge freak. I was a very weird kid. I knew I was weird when it was happening but now that I have a fifteen year old son and watch how he does it, I realize how absolutely weird I was and how alarming I must have been to my parents. I was not socially adaptable at all because I had bad eyes, poor coordination and I was very easily intimidated. The story of my early schooling was - in a town of only 1200 people - I was able to find 1700 hundred different ways to get from school to my house in order to avoid being pounced upon by roving cannibal bands of my peers who had sworn to get me. And they never got me! It was astonishing!

[Audience - 3:41] - Is this in New York?

No, no, this was some cow town in Western Colorado. The other thing I discovered early on - but maybe this is too psycho-therapeutic to waste time on - that I could hold them at bay with story. Essentially I became like the King's Jester. I could hang out with these lumbering lumpen people because I was always willing to verbally outrage and say crazy things. One of my things that really got me a lot of points with the tough guys was, I could stand up in class and very rapidly speak sentences into which I could occasionally drop obscenities but you just couldn't quite hear it. The kids could hear it but the teacher couldn't.

So that was my scene. In terms of the relationship to knowledge, it's what William Blake said. He said, 'attend the minute particulars.' That's what's interesting, I think. The details of the distinction among things. That's why I was a butterfly collector, an art historian, a Tibetan art hound, a rainforest botany person because what it's all about is the incredible variety of morphological expression in the world. Now I suppose a Buddhist would recognize this as a serious samsaric hangup. That I love the texture of the apparent visible world.

It's funny that you asked this question because in my morning meditation this morning, I had this image of a work of art which many of you know I'm sure. It's Dürer's etching of Melencolia. It shows an angel in the foreground and she has the instruments of geometry. There's zoological collections and maps spread out and an orrery of the solar system, and she's holding her head and this strange geometric form is beside her.

Well, I've put a lot of study into this geometric form, tracing it's history and so forth - but that wasn't what caught my attention in the meditation this morning. It was that I realized, or I recalled, that someone had said that this might be a medically accurate portrayal of migraine. Perhaps the earliest because Dürer was interested in pathology. Then I got the thing for the first time, which was that the angel has a headache because of the proliferation of this technological artifactory of all sorts that is spread around. It is this amazing picture of historical exhaustion.

I don't know how I got off onto that. But anyway, this thing about complexity and appearances. I think the way to get into reality is by running the edges as I've said. For me the entry drug was Science Fiction, definitely, because that permitted anything. I suddenly got the idea, aha!, the imagination sets the perimeters. If it will work in your head, that's good enough. You don't have to go further than that. You can build machines, societies, organisms, relationships - in your head. And if when you run it and the gears turn and the wheels go and it works then that's it. It works. You don't have to go further than that.

Well it sort of is working here. I'm amazed at what I'm seeing happening. I have the feeling that we're just calling it into existence. That it's working. Just don't drop the ball. Don't jinx it. Nobody say too much. But it's turning. I can feel it. It's like turning a battleship with a canoe. But it's turning, you know! It's enormous. So it's hard to deflect it's momentum. Nevertheless, by holding this point of view, somehow it's working. I've never seen anything like it. I wouldn't have believed it possible. It is that the world is made of language and it is that by a certain act of contained concentration - if you are with the Tao - it begins to shed it's secret or it begins to open ahead of you.

What's that thing by W H Auden: A glacier rattles in the cupboard, the desert sighs in the bed, and the crack in the teacup opens a door to the land of the dead.

It is a linguistic structure. You can decondition yourself sufficiently to actually step outside the cultural illusion. It's a breathtaking possibility because nobody knows what's outside the cultural illusion. Plato got it right. We are chained in a cave watching the flickering shadows of something. But life taken with sufficient seriousness and pushed hard enough at the edges - then this stuff will give itself up to you. And it isn't about belief. It isn't about commitment to a guru or dogma or method. It's about observational integrity. It's about witnessing. Some kind of primacy of self.

In other words, you have to believe that you can tell shit from Shinola and when you say it's shit and they tell you it's Shinola; you have to vote with your own side, you know? It's very interesting. The world is like a labyrinth or as I said yesterday, it will be mastered by a feat of understanding somehow. It's like a riddle. Yes?

[Audience - 11.07] Could you give some advice on how to avoid the pitfalls of mushrooms and the danger of mushrooms. The supply is irregular for those of us who don't have our own botanical garden. From time to

time, there are just physical problems. Is there any practical advice you could share?

Yeah, well the very best thing is to grow them. This is not as difficult as it's been made out to be. The dedication of half of a small closet will get you, your friends and their friends absolutely smashed. I'm serious about urging it. It may sound exotic but if you want to meet the alien and have a relationship with something very strange that loves you - but that is a lot different from a house cat - you should grow this stuff. First of all, it's white as the driven snow; Melvillian associations aside, there's something to be said for this.

And then it will take rye, which you buy in a health food store for \$17 dollars per hundred pound sack. It will take rye and convert it with a 12% efficiency to dried mushrooms. 12% efficiency to dried mushrooms! This thing just wants to enslave itself to you. It will work like a dog. I've never seen anything like it. It promotes virtues such as: cleanliness, the primary virtue in western civilization. Attention to detail, awareness of scheduling, all these grounding qualities. And then at the end, it will deliver to you the alien body of the higher and hidden unspeakable.

I suppose I should say that my brother and I wrote a book about how to do this which is around. It's not under the name McKenna. We did it pseudonymously. It's called, Psilocybin: a Magic Mushroom Grower's Guide. Literally, if you want to turn your life into pure science fiction, this is the way to do it. Because then you have it and it's not the dried stuff that's rubbery that only works half the time that costs an arm and a leg. It's the living quintessence of the thing. My lord, from that point, you are your own Magellan and need take lessons from nobody. The universe that it opens up to you is so large that really you can be confident that you'll see things that nobody has ever seen before or will ever see again.

Technically, it's not that difficult. It's at the level of a hobby. It's a little trickier than canning jam. It's up there with growing sprouts in little trays or culturing yogurt or something like that.

[Audience - 14.39] Could you maybe say a couple of words also about DMT and what sort of situations I've had before and how to set it up?

Well DMT is regrettably very rare and hard to get. I did notice that the last issue of a magazine called Psychedelic Illuminations (that's published in Southern California and that you could probably get at the Phoenix or the Bodhi tree) published the recipe. Published four pages of Chem abstracts, saying, 'just in case you were wondering, an interesting phenomenon is going on.'

We haven't talked about it much this weekend but briefly it goes like this. As many of you probably know, there is a South American hallucinogen called Ayahuasca that is orally activated DMT. It's orally active because it's complexed with a Monamine Oxidase Inhibitor, in this case Harmine, which comes from a large South American vine called Banisteriopsis caapi.

Well hardcore plant 'psychedelicos' all over North America have begun to realize then that this formula - DMT containing plant plus MAO inhibiting plant boiled together, concentrated, gives you some kind of pseudo Ayahuasca. People are experimenting furiously and producing ghastly brews and amazing stories. In some cases actually getting it right. What seems most promising, it was just discovered - now here's an example of ethnobotanical progress: it was just discovered about two and a half years ago that a plant in the American Midwest called Desmanthus Illinoensis, the Illinois bundleweed; a plant that has no

particular folk history or anything. It's just a problem plant on the prairie. It has more DMT in the root bark than any plant ever measured on this planet and no history of human usage. Although to me it's suggestive that it's called bundleweed because that suggests medicine bundle, but maybe that's just coincidence.

Anyway the Indians claim they don't know from it. Well you can take that plant and scrape the root bark. Then there is another plant that grows widely in the American west and the seeds of which are sold in Iranian markets all over the country as incense. A plant called *Peganum harmala*, the giant Syrian Rue. It contains not harmine, but Harmaline, which actually is a more hallucinogenic congener than harmine. So what people are doing, they're taking *Peganum harmala* and shredding it and boiling it with *Desmanthus Illinoisensis* root bark and they're producing a North American analogue to Ayahuasca that works.

This is a very interesting development on many levels because it means that people are essentially concocting their own unique personalized brews. It also means that probably *Peganum harmala*, which I'm not kidding in these Iranian markets they call it harmal and for six dollars they'll sell you a pound of it which has enough harmaline in it to flatten your entire apartment house. *Peganum harmala* as a source of this MAO inhibiting harmaline can probably be used to activate all of the DMT containing plants in the flora of North America, and there are many.

There are, first of all a whole family of grasses - the *Phalaris* grasses. *Phalaris Arundinacea*. I can't remember several others. They cause staggers in sheep. They are identifiable grasses. There are a number of species of *Acacia*. *Acacia Confusa* contains DMT. There's a plant out in the central valley of California that clogs the locks, the canal system. They spend millions of dollars dredging and piling up mountains of this stuff. The root bark of that, *Arundo donax*, it contains DMT. So people are out there scrambling and you know, if you are of a witchy turn of mind, this is something to fiddle around with. There's nothing more satisfying than finding your way to that moment where in your head, you know, it begins to glitter and you realize - it's here, it's here, it worked, theory and practice in perfect concert has delivered outrage!

So that's a possibility, yes?

[Audience - 20.22] They're saying that life on Earth started a lot earlier than they thought. They thought it started six billions years after the Earth stabilized when it was only like 400 million years. And that it was very possibly, one of the ideas they had, was that it was started by spores from space.

Yes. Eventually you see - this is what I said - they will come to us! That's almost like a freebie because all you have to do is just wake up for a moment and realize that of course space is not an impermeable barrier to life. It's a tough barrier but I've been in the Seychelles and in the Hawaiian Islands - these are mid-ocean islands that have been populated by life that has drifted in there.

When you think about the fact that a single *stropharia cubensis* mushroom in the sporulation phase, which can last up to three weeks, sheds three million spores per minute for three weeks. One mushroom! Then you have the dynamics of the atmosphere. They pick up off the antarctic ice shelf chunks of mars half the size of your head. This is now established that an asteroidal impact on mars ejected material into Martian orbit that eventually percolated into Earth orbit.

You know now the way meteorites are prospected for is: they eventually put it together that on the

Antarctic ice shelf where the wind is blowing 150 miles per hour most of the year and cutting the ice away - there is no land. What you would eventually get to is the Antarctic sea. You can fly over those ice shelves in helicopters with high powered binoculars and any black spot is a meteorite or an asteroid fragment because what the hell else could it be?

They've tripled the world's inventory of meteoric material in the last five years through this prospecting technique. They have found a whole box full, like 20 different specimens that they are confident are lunar material ejecta from cometary impact on the moon. But two strong candidates for martian origin. We're talking about fist sized Donies [? 23.20]. So the notion that the percolation of spores and biological material is not possible; it will be concluded probably fairly shortly that life originated who knows where and has been percolating out through the universe for a long line time.

[Audience - 23.43] Where do you see the place of Cannabis in consciousness evolution? On the one hand, it's obviously doing something like that, but on the other hand kids do it before they do drive-by shootings in LA. Also address maybe the notorious affect on memory? You mentioned that you consume cannabis when you are doing mushrooms. In my experience, I don't bring back as much information that I remember...I just want to hear your comments about this.

Yes well, it's worth talking about Cannabis. I certainly don't think I would be who I am if it weren't for cannabis. It hasn't particularly affected my memory. I'm actually the most devoted on a lifetime scale. The person most devoted to cannabis that I've ever known is myself. When I lived in Asia, I used to set my alarm for 2 am to smoke because I couldn't go from midnight to five. People thought I was bananas. In terms of its deleterious effect, I think it's pretty on a scale of the other major drugs of commerce, which would be alcohol, tobacco and white sugar. I think it comes off as in the best position. I sort of think of it as going back to this partnership model about mushrooms in Africa - that when that all dried up and those people were moved into the Middle East. There had been previous waves of migration out of Africa that had established populations in central Asia. This is why you have 'Peking Man' and 'Java Man' - those are earlier remnants of earlier migrations.

Cannabis, botanically, originated north of the Himalayas on the plains of Central Asia. I think it probably is the best substitute for mushrooms on the cultural level. It's one of the oldest domesticated plants. It was early on associated with cordage and fiber and it's strange that all the words to narrative are also words about weaving. You weave a story. You unravel a yarn. You thread and unthread a situation. You untangle a situation. The parallelism is very old in all European languages, this association with narrative and fiber, which means hemp. So I sort of see it as the pilot light of Gaian consciousness that was kept going.

Now what people always say to shoot this down is: they say, well Islam tolerates cannabis and Islam is hardly the pilot light of Gaian consciousness. It isn't actually that Islam tolerates cannabis. It's that the Koran expressly forbids alcohol and then that leaves you to sort it out from there. I certainly think that cannabis should be legalized and that if every serious alcoholic were encouraged to be a pothead and other drug abusers encouraged toward pot... The problem with pot from a societal point of view is that it is psychedelic enough that like all psychedelics, it erodes loyalty towards cultural values. Meaning, this is the bullshit effect. People say why don't you get a job. Bullshit! Why should I?

I don't see it implicated in violence. I think if anything, probably cannabis in ghettos is holding down violence as a drug but probably promoting violence as an item of commerce, and that is because of

chuckleheaded laws. I'm absolutely convinced that the way to solve the drug problem is to remove the profit motive. That's so obvious that it's baffling to me. Society is so schizophrenic on this topic. The most dangerous drugs are alcohol and tobacco, both fully established in the engines of commerce. It's a bizarre situation and largely driven by the agenda of Christian fundamentalism in collusion with criminal syndicalists who see this as an opportunity for enormous profit - and cynicism all the way along.

[Audience - 29.10] But I do find that I can't smoke a lot of pot. Unfortunatley I can never become addicted to any drug as much as I try. My body just doesn't tolerate it and I've tried them all more than once. But I do find with pot...I've had friends who became pot heads who, it wasn't that they betrayed commerce, they lost their ambition. You're very intelligent and you've got a vision and you're dedicated to your vision. You're a little bit above most average people (or different)...

Manic is what you're trying to say, yes. I understand.

[Audience - 29.52] - But I would say, these people really got lost because of their addiction to pot. So I think there's more of an issue around...it's not about drugs as much about addiction and the issue of addiction...

That's right.

[Audience - 30.07] - And how individuals become addicted because they're avoiding certain psychological issues that they're struggling with. And rather than dealing with the issues, they turn on the TV.

Well this relates to this larger model we talked about - of time. Of the war between habit and novelty. The thing that offends people about drugs, and if it doesn't offend you, there's something wrong with your value system - is to observe unconscious, repetitious, self-destructive behavior. If that means betting on the ponies or chasing hookers or shooting junk, or making bad investments or always blowing your stack with your friends; whatever it is, repetitious self destructive behavior triggers disgust in the rest of the gang.

Drugs, for instance heroin and tobacco, are interesting examples because they are probably tied for their addictive ability. Yet to shoot heroin, people just turn away aghast. It's like your the lowest of the low. Cigarette smoking until recently was tolerated everywhere. What is the difference here? The person who is smoking the cigarette, we know that tobacco is tremendously destructive - that's beyond argument. Heroin on the other hand, if you shoot with clean needles and have a steady supply, in other words if your not putting in social factors, my god these junkies live forever. They just pickle themselves and live forever and they don't get sick. So then why is it that society is so abhorrent of heroin addiction and so accepting of tobacco addiction? The answer is, the presentation of the intoxication. When you shoot heroin, first of all you become very agitated and follow people around raving at them if you're an addict. Then you nod. So you drool and your face falls in your plate and your friends have to put you to bed.

Tobacco on the other hand. You can maintain. There is no dramatic sequela of symptoms to betray that you're completely jacked up, twisted around and self poisoned with this. But there you are at your desk working efficiently, making phone calls, making money, keeping it all together. It's the presentation.

The other thing to say about drugs is that - like everything else about us but even more so - drugs are subject to your genetic heritage of drug receptors. It's not the same for everybody or even close to the same. The range of response to drugs can be over several orders of magnitude and can vary throughout

your life. The fact that I can smoke endless amounts of cannabis and still produce and function just means that I can. I see people, alcoholics, if I have more than a drink and a half, I have headaches and I pay my dues. To watch someone go down on a fifth of Stolichnaya, you just realize that this person is a martian, metabolically speaking. It would just kill me to do that. So this has to do with tolerances and the way the organism can accommodate itself to toxins. But then below that at bedrock, it actually has to do with genetic proclivities.

[Audience - 34.18] With regard to best cannabis as a hallucinogen, is there a difference in your experience in smoking vs ingesting it?

Well that's a good point. See hashish or the way cannabis entered the west was through hashish, which was eaten in the 19th century. If you read the accounts by 19th century savants who ate large amounts of hashish, it will convince you that it was the LSD of the 1870s. I mean these are mad intoxications that they are describing. It's not sitting around seeing the wall paper move.

[Audience - 35.08] Well they had more of it?

Well they were eating it.

[Audience - 35.13] Why not cookies and brownies? Why did that lose fashion? Is there a danger in it?

No, I think when pot went from \$15 dollars a lid to \$475 people stopped cooking with it. Let me say this about eating hashish. If you're going to do this, I recommend that you eat a red Lebanese hash because Lebanese hash is made in a way that people don't really touch it in the same way that chara is made in India by people whose hands may not be so clean. You're going to take a hit essentially of the ambient bacterial population of the village of Hamarubitsar.' Your guts will go completely berserk. This is one argument for baking it in a cookie - to get the pathogens at least smacked down a bit.

If you've never read Fitz Hugh Ludlow's book, *The Hasheesh Eater. Confessions of a Hasheesh Eater.* Here it is. It's 1852 and he's at Union College at Riverdale New York. He's been invited to the Dean's tea and he's just taken this massive hit of cannabis jelly before arriving at the tea and he says something like: 'when the umbrellas protruding from the Oriental umbrella stand turned into gargoyles, I knew that I must excuse myself least I run the risk of betraying my condition.' I'm too loaded, I've got to get out of here!

Let me say one more thing about this. There's a wonderful book called *Shaman Woman, Mainline Lady* that is writings by women about drugs. If you want to read something that just will make you roll on the floor with laughter, it's Louisa May Alcott's account of a picnic she and her friends went on with a Dr. somebody or other. It's just the most insane thing. It's these incredibly pretentious Victorian femmes with this Dr. by this river in the English countryside. It's Lil, Nell, and Dolly. Dolly says 'oh, Dr. We're so exhausted with canasta. Surely you have some new little [unknown word] that you can share with us.' And he says, 'well Dolly, I do have this little case of the best Moroccan hashish bonbons from Paris.' Then it's madness. It's just the most extraordinary thing.

[Audience - 38.36] How does Cannabis work on the brain neurochemically?

It's not very well understood. There is a receptor but cannabis is not an alkaloid. Cannabis is technically a

polyhydric alcohol, which makes it a chemically unique type. It's also botanically unique. Cannabis is what's called a monotypic genus. In other words, these three species, Ruderalis, Sativa and Indica, which are all obviously speciated within historical time and can by chromosomal studies be shown to be all derivative of Ruderalis, the Central Asian wild type. It has no near relatives. So it's unique and it's not well understood.

As far as somebody asked about using it psychedelically. I think the real, and I can't say I do this because I need it for other reasons, but in terms of the pure psychedelic issue, the way to do cannabis is once a week, in silent darkness, alone, with the best stuff you can get and then just do as much of it as you can possibly do in a short a time and sit with it. You will every single time be absolutely torn to pieces by it. It's just astonishing. The problem is that people get into it, myself included, for other reasons other than that hallucinogenic flash. But that would really be the ideal way and also it would prove you were a person of great rectitude and self control if you could do that.

[40.26 Tape Cut]

Well this phrase, nostalgia for paradise, I don't know who invented it. I first encountered it in Mircea Eliade's book *Cosmos and History*. If you never read this book, it's a little book. It was one of the most influential books on my thinking because I saw there a whole different way of talking about spiritual reality. But I disagree with Eliade that it is simply attitude in the human mind. I think there really was a fall and that this is a diminished condition and that there was some kind of cohesion - that we do have this nostalgia for. That's why I think our whole relationship to drugs is all about the fact...look here, here's the metaphor. We're like the children of an abused relationship. Something was taken from us 15,000 years ago. It was the thing which kept us in balance with each other, with the Earth. It kept us in our imaginations, in the poetic world of natural magic and then it was taken from us and it was a big downer. Life turned into history and warfare and subjection and classism and all of these things — and the thing that was taken from us was this intoxication.

So then we moved on to alcohol, to money, to opium - because that was very big in the Minoan phase. Opium had a huge influence on Minoan civilization. All of these things, an effort to scratch an itch that you can never quite reach, but in the meantime, all kinds of addictions, wars, criminal syndicates, horrible things go on. Now in the 20th century through the science of anthropology, a complete inventory essentially is taken of the world's intoxicating possibilities. It's part of a complete inventory of the world's people, languages, technologies, and belief systems that characterizes anthropology. But there it is, in 1953, Gordon Wasson returns from the village of Huautla and Sierra Mazateca and he has the body of Eros pickled in a jar. Lost since the fall of Minoan Crete but suddenly restored and then nobody knows what to make of it.

The CIA looks at it and Hofmann looks at it. Now it is found, I think. I don't know if it comes too late or if the final irony is that we learn what it was all about, but nevertheless have to succumb to the momentum of our own stupidity. In other words, it's this kind of Greek drama where you have this horrible realization and fully understand the whole bit, but you're doomed anyway just because it makes for better theater. Or whether it is the happy ending of the Christian Eschaton. Yeah?

[44.44 - Tape Cut]

What the 9th century's best tools were for cognizing these kinds of matters were Scholastic theology. I've been accused of that! So what Scholastic theology says is that there is something called the Nunc Stans, the eternal now. This all goes back to this wonderful thing that Plato said. Plato said that time is the moving image of eternity. My notion of what this is all about is that the Time Wave we looked at last night is eternity. It's the fractal structure of the temporal module viewed from a higher dimension. Time is the traversing of that thing. The nature of the singularity is hard to anticipate. If you use the old fractal principle: ontogeny capitulates phylogeny. You all understand what that means?

It's the phenomenon that a fetus, as it develops, ontogeny, recapitulates the evolutionary history of life on the earth. That's phylogeny. In other words, the fetus is first a little kind of thing, an amoeboid mass of cells, then it becomes sort of like a salamander, then it becomes a primitive mammal and so forth and so on. Well, using that principle to try and anticipate the end state seems legitimate under the fractal dispensation. However it leads to the conclusion that when you look at an organism, what happens to all organisms is that they die. So that leaves you with the conclusion that what happens at the end date of the whole enchilada is the equivalent of some kind of mass dying.

Well that really doesn't tell you much because we don't know what dying is. How can the ultimate novelty be complete extinction? It must be then that we have to overcome as positivists, our phobia against this area of speculation previously presided over by beady eyed priests and actually take it back and say that in the mysteries of metabolism and morphology, it is perhaps now necessary to entertain the idea that death is not a nihilistic release into non-entity. Instead, the shamanic model is correct and that biological life is a sojourn into matter.

At death, you do go to some incomprehensible unfoldment. Only the first moments of which can be made sense of. I really think the DMT thing is like bungee cording into the bardo, you know? There you go and then just as you're there, it jerks you back. So you get that much of a look into the yawning grave. I take it as, it's strange, yes. But surely reason for hope and optimism. How much of oneself, whatever that means, is going to be carried over. I don't know. It looks to me like, probably not much. What lies ahead to quote Bilbo Baggins, the greatest adventure still lies ahead. I'm pretty convinced of that, which surprises me because I'm a cynic. I'm not easily swept into optimism.

[Audience - 49.16] Well you just had a great little pre-echo with the analogy of Scholastic theology to let us know what's going to be the defining moment of 2012. The collective works of Terence McKenna are published under the title, Summa Mycologica.

I'll take it.

[Audience - 49.34] What cautions and reservations do you have with this dance with Kali. We talk about the revival and sometimes I wonder if we remember what we're talking about. In this possible great ecstasy, here lies....

Some danger?

[Audience - 50.00] I'm constantly asking that question as I've taken a four and half year break from drugs and I'm moving back in that direction. Having consumed some mushrooms recently and wanting to, in this revival...the use of these substances needs to be absolutely reverent and to be sensitive to what I'm doing.

Well, the danger as I see it and I feel it very strongly. The danger is, just to put it out there, is madness. We talk about stretching the envelope. We talk about running the edge. You don't want to rip the envelope. You don't want to island yourself in a situation where nobody can make sense out of what you're saying. Yet, that's the game we play. It's always pushing. So what you said about reverence and absolute impeccability of attitude and also I think it's very important to be physically together. It's important to be physically together anyway. I go to a gym three days a week and I think of it as preparation for psychedelic voyaging because if your body is a clean instrument, you can do it.

The other thing is technique. In the psychedelic state, if there are problems, there are techniques to deal with them. The best technique, and western people don't naturally gravitate towards this, if you get into a place that you don't like on a psychedelic, sing. You must sing! Most people's tendency is to clench. This is very bad because it can just grind you to nothing. What you have to do is sit up and you have to sing. It doesn't really matter what you sing. You will find the song. Start out with out with 'row, row, row your boat' and go from there.

The other thing is, the real issue I find in myself, is surrender. That it's all very fine to sit here getting paid dollars per minute extolling this stuff but boy is it different to do it. You can talk all you want but the thing is so - I don't know if scary is the word - it's so total what happens. You're so vulnerable and you know that if there is any flaw in your approach or attitude that that flaw will be magnified by the stress of the thing and become highly problematic. So it's all about asking the question, you know? Am I ready?

Now this is not how beginners approach it, nor should they. It's incredibly forgiving of first, second and third timers. But as it takes you in, what it gives is a certain measure of, for want of a better word, let's call it power. The payback on that existential validity would be another way of calling it, rather than power. The payback on that existential validity is that you have to be OK. Maybe it's my Catholic upbringing or something but one cannot do the examination of conscience carefully enough because there is always flaw. So it's about staying right with it. It teaches the right way to live and also surrender.

That's why I don't ever have an agenda. I regard having an agenda as essentially aspiring to be a magician of some sort. And I don't. I want to witness it. I am perfectly content to be present at the miracle. I don't want to do the miracle and I don't want the miracle to be done to me. I just want to be there. Frank Herbert in his book Dune said something, which over the years I've found, though it sounds flimsy to say, it actually works. Some of you may recall that in that book, they had this drug called Stroon and it did pull you out of time. It was not just a drug, it revealed like I'm saying psilocybin/DMT do; the real structure of reality.

In there, they discuss what do you do about the fear that comes with the gigantic awesome dimensions of this vision? And he says, or someone tells the main character, fear is like a wind and it blows through the mind. What you must do is, you must wait. It cannot sustain itself unless you give it an object. This is actually true I've found. Fear, whatever it is cognitively, physiologically it's a chemical wave of release of adrenaline. What you do is just sit and watch it come like a bell curve and then recede and then your still on the surface of the ocean and the power of it has been defeated.

But if you give it any object to cling to it will break white water and then the chaos will overwhelm you.

[Audience - 56.10] I was wondering if you could talk about the difference between psilocybin and Ayahuasca experience. I'm particularly interested in...I heard you talk once about the value in the psilocybin experience is more technological and 'get ready to depart the planet' type of value. Whereas ayahuasca is more 'save the planet...'

Feminine. Yeah, somebody once said to me after they took a mushroom trip, they said I don't think I'll do that anymore. I said, why not? They said, because I'm not interested in insects that drive spaceships. Which sums up psilocybin pretty well.

Psilocybin is Apollonian and hortatory and grandiose. It's interesting that they have these personalities. I mean psilocybin is kind of megalomaniac. It says history is ending. Prepare for the departure. The crisis of the species is upon us. Cosmic forces are intersecting. Machines the size of manitoba will be involved. It's all about mankind, prepare to depart for the higher orders of the galactarian hegemony and this whole thing like that.

Ayahuasca is all about how rivers flow, family lines intersect, what is in the river, what is in the mind of the woman? It's like this very sensual, telepathic gas which spreads out when you're in the rainforest and brings you into connection with everything. It also doesn't speak. It becomes the eye of the camera. Its language is entirely a visual language. It never speaks. It just shows you. Showing, showing, showing. After a good Ayahuasca trip, you feel like your eyes are falling out. You have been looking, literally looking, with full attention for hours at this stuff, with this sense of it being distant from you somehow.

[Audience - 58.38] How do you reconcile those two?

No it's a little puzzling because DMT is... Psilocybin in the the metabolic pathway doesn't actually become DMT but it is about as close as it could possibly be, so the difference is quite startling. N,N DMT, when smoked, (not when taken in the Ayahuasca situation where you get what I just described) but when smoked, it trumps the psilocybin. It goes so far beyond it because it carries you into the part where you can't understand. The other one, the psilocybin, communicates at least in human terms. I mean apocalyptically, mega-technically, through these science fiction metaphors and so forth - but the DMT flash goes beyond that and you say, this is truly the presence of an alien mind. This is not being filtered for my consumption at all. This is absolutely just off the wall, whatever it is.

[Audience - 59.47] Indecipherable.

That's right. It's puzzling that the route of administration and the complexing with the MAO inhibitors gives it these different psychological tones. I think almost everybody has experienced these things would agree with what I said about these aspects of the personalities of the substances.

[Audience - 100.11] Does LSD fit into those categories?

No, LSD is different. LSD is like psycho-analytical Drano. It's not a personality.

[Audience - 100.20] What about the natural derivatives?

You mean the morning glory seeds? I've only taken those things five or six times in my life and all in my

youth. I remember the visions. I remember the hallucinations. Once on Hawaiian Woodrose, *Argyreia Nervosa*, I entered into a higher world based on the theme of the sea urchin. I was in these cathedral like vaulted spaces which were the insides of sea urchins. Then there was this coach pulled by these very strange looking animals and it had these nipple like protuberances all over it and everything was done in mauve and purple and white. It was sea urchin world for about twenty minutes and then that went away.

[Audience - 101.14] Will you explain - and I know this gets back to the basic premise that you've been talking about the last couple of days - but can you elaborate a little more on why you conclude that these hallucinations are in fact true hallucinations? In other words, why do you conclude that these elf like entities really exist?

Well...really exist? True enough. We talked about that didn't we? About the Wittgensteinian thing? Did we? Yes?

They're true enough because they have efficacy. See, we miss the point because we think the world is made of matter. Matter is simply a concept. The world is made of language and since the hallucinations communicate in language, they are as real as anything else. They are helping make reality. It's crazy to think that the universe is made of quarks and Nu-mesons and neutrinos and stuff like that. Who here has ever seen one, or even has the most specious grasp of how you would go about looking for such a thing?

[Audience - 102.30] But we get exposed to those words.

But we get exposed to those words. The world is really made of language, of interlocking concepts. Well so then that means the hallucinations are real. That in that sense where Mia Farrow says in *Rosemary's Baby*, my god this is actually happening. That's what needs to happen inside the psilocybin trip. We have this category called hallucination or intoxication or trance. Then we say, 'oh it's only mental therefore it's not real.' Well, I've got news for you. It's all mental and therefore it is real. The big news is that while we've been waiting for aliens to come in ships from the stars, we have totally overlooked the alien nature of reality around us.

By pushing into these mental dimensions, we discover a bewildering fauna of angels, demons, helping spirits, and ancestor spirits. I only speak from my own experience, so for instance I'm unable to pass judgment on something like Voodoo or Tantric invocation or something like that. But I, using reason, was able to confirm the existence of things that no reasonable person believes in. This is impressive and it's repeatable. That's the thing I want to stress. This is not some faith or something where you have to...I don't know...it's just that it's a technology. It's a technology of ethnopharmacology.

[Audience - 104.31] Obviously the experience is repeatable but what that experience means... whether it indicates, for lack of a better phrase, objective reality, separate and apart from your mind is not necessarily proven by having the experience itself.

Yes but see it's difficult to prove that there's any objective reality apart from mind anyway.

[Tape Cut - 104.54]

Yeah but it not only rests on Barkley, which is an earlier version of it, but it also rests now on quantum

physics' need to include the observer into the equation. Somehow there is a something, which the vectors of which are collapsed into the experience of the here and now by the observational act. Then the role of language in this. It's not easy to sort this stuff out. If you want to read an interesting book, read Dispenay's* book, The Philosophical Foundations of Quantum Mechanics. This will give you something to chew on for sure.

(*NOTE - I could not find the author here. It seems likely McKenna was speaking of Hans Reichenbach's book *Philosophic Foundations of Quantum Mechanics*.)

Yes?

[Audience - 105.42] *What would you say about LSD?*

Oh, that it has no character? By character, I meant personality. I didn't mean to diss it. I just meant it doesn't organize itself around a personality the way psilocybin does. I found LSD to be like a conceptual enhancer. It was great for looking at things and for thinking about things. But I also, and this may be my obviously personal thing, I found it just physically incredibly hard on my body. My god, the next day I would lay in warm bathes and try to sort it all out. I was taking good LSD, Sandoz LSD. So for me, when I got to psilocybin, I was just exultant.

See what I had done was read Huxley then I had gone back to Havelock Ellis, *The Dance of Life* and Henri Michaux, *The Miserable Miracle* and people like that. Havelock Ellis talks about ruined buildings of great antiquity drooping with opalescent jewels and protruding from Venusian forests and I said, that's what I'm after.

LSD would never ever approach that. It was much more mechanical and elusive and fast moving. Then when I took psilocybin, lo and behold, it was just like Havelock Ellis. Produced and directed by Havelock Ellis. That is what I love. It may just be a prejudice of mine but to me the transcendental part of it is the visions. Thoughts, you can have and even insights you can have but to have behind your darkened eyelids, a huge technicolor movie going on for minutes and minutes, stunning in its cohesion and beauty and architectonic triumphal; you just say wow, this is great. This is great! Who's doing this?

And the thing, if you appreciate it like that, it will say: 'oh you think that's something. Look at this!' Then it starts trying to impress you. You say, yes just do it! Take me I'm yours. Let's go, go, go!

[Audience - 108.22] *Could you say something about the information that's revealed through the drug induced state and dreaming.*

Ah, good question. I think that perhaps dreaming...perhaps every night we go as deep as these psychedelic drugs take us. But there's apparently very little short term or long term memory trace laid down by these experiences. I think if we would just legalize these things and turn our creative science people loose on this... What we really need is a drug that allows you to remember your dreams. That's it!

Pardon me?

[Audience - 109.10 - *Indecipherable*]

Well, we have the concept and we have claims but I mean one that will work for me.

[Audience - 109.20] Smoking pot inhibits it.

Yes, that's a good point. The one argument that I feel the force of against cannabis is that it completely suppresses dreaming.

[Audience - 109.37] You still dream but you don't remember them.

Well it's debatable. I think that because it's a boundary dissolver. I have sort of a pressure theory of dreams. Somehow cannabis depressurizes the dream place because you deal with these material in active fantasy. But boy, if you're a regular cannabis user and you stop smoking, within 48 hours you will have dreams that will have you on the phone to mother. I mean...whoa. And it goes on and on. I stopped smoking cannabis about a year and a half ago for four months. What finally sent me back to it was the dreams convinced me I was losing my marbles. Enough of making a point, you know!

[Audience - 110.30] ...had and it was accessible to my rational mind. My rational mind was in place enough to know that I had dreamt it and I was re-dreaming and absolutely recollecting and reliving the dream state and the previous dream that I had.

Really? And where were these Amanitas from?

[Audience 110.55] Michigan

Michigan.

[Audience 110.58] - Indecipherable

And what were the other symptoms. Did you feel cold? Did you hallucinate?

[Audience - 111.13] It was totally as though I were dreaming. I was totally engrossed. I was catatonic. I did not move for three to four hours.

Well that's very interesting. We didn't talk much about Amanita Muscaria. Amanita Muscaria is very mysterious because it is so variable over its range. It's seasonably variable, genetically variable, geographically variable. You hear once in a while amazing amanita stories. Most amanita stories are that it's toxic and horrible. But maybe one in 15 stories will be something wonderful like this.

I'm convinced that it has to do with some very subtle chemical equilibrium that people find and lose. Probably when amanita shamanism was flourishing - it was a case of where you really did have to go to a master to sort out how to do it without wasting your time or poisoning yourself.

[Audience - 112.28] I really think did initially think I was dying. I mean I knew was being poisoned but it was all right. I had willfully entered into it. It was a sense that I wanted a death. Not a physical death per se

but a wider experience of a bardo. It was like a willingness to feel poisoned. It wasn't a negative thing that I had willfully sought.

And was it muscarinic poisoning? Chills, and salivation? Uh huh

[Audience - 113.06] Yes. But it was OK. It was as though I had accepted full responsibility that that was a willful act on my own part. So what is death? Is death birth or is death death? So it was as though I were participating in a birthing. I focused on that aspect of it so I was not really dying, I was birthing. So it didn't have the negative. I was throwing up and I was sick. [Indecipherable]. A week before that I had all these energies and the idea was this voice just kept saying pick and choose. So it became very apparent that you could get paranoid and engulf in that aspect and say, oh my God I'm dying.

The ego - this is what the ego tells you as its last desperate ploy. Let me say to the group as far as Amanita Muscaria is concerned - don't try this at home folks. It's out there on the edge of the bardo. I hear what you're saying. If you're truly psychedelic the difference between living and dying is quite immaterial, no pun intended.

[Audience - 114.44] You manifest in your mind this sense that 'I am dying or do you just transmute it and just say I will be reborn. You manifest the reality as whether you are dying or whether you are being reborn.

Yeah, this is the issue of surrender because boundary dissolution is interpreted by the ego as death. If the boundary dissolution is happening rapidly or for some reason - in an alarming fashion to the ego - it will pull out this explanation and then you really have to discipline the hindbrain and say, no no, this is what we chose to do. This is the course we're set on and this is the course we're sailing because what are you going to do?

[115.43 - Indecipherable]

Well it's hard to say you know. You ask about a path not taken as well as a path taken. All the women I've ever been with are heads of some sort of varying and lesser degrees. I was married for 15 years. We're separated. I don't see the drugs as a particular issue although my wife used to complain that I spend a great deal of time out of the flow of family life and loaded. But on the other hand, I remember when I was eight and nine years old, huge scenes with my father and mother because they were always going off on picnics and I always wanted to stay home and read. So it was exactly the same pattern before drugs appeared in my life. I like to do things by myself, a lot.

Cannabis for me was really a turning point. I remember the first time I smoked cannabis and I realized, aha! I can be a normal person with this stuff. I can self medicate myself and I can stop being this incredibly hyperactive, nervous, yammering, skinny, bespectacled Ichabod like creature that I was. Then, I don't know. I leave it to you to judge the results. My impression was that it helped with that and it helped with my social relations. I was always so alienated and peculiar. But my life has been so totally about drugs that I can't imagine it any other way. One of the things that most horrified me when I stopped smoking cannabis - and I had always said it about cannabis - was you worry. You worry. People who don't smoke cannabis worry. Now they would say that they're tending to business and that that's part of being an adult. But most worry is superfluous and preposterous.

If I don't smoke pot for a week, I become very attentive to stuff like balancing my checkbook. Receipts - getting deeply into receipts - and just all this weird stuff. I start thinking 'gee, is my medical insurance paid up,' or 'I should pre-pay my taxes' - all this kind of thing. Now I suppose to go too far in the other direction, you would just be a complete space case. But my life seems to function very well and people say that I have an abnormally neat apartment so I don't think I'm letting down too much. Anxiety is a very dubious thing I think and anything that assuages that - as long as it doesn't sedate you - is probably a pretty good thing.

Your presence makes me think it's not as eccentric as it probably actually is. So I appreciate your contributing to my own delusional state. I hope you found this information interesting. Avoid gurus, follow plants - it's like Van Morrison says - no guru, no method, no teacher, just you and me and mother nature in the garden; in the garden wet with rain.

So thank you very much!

The idea of sexual relationships between human and nonhuman beings is a persistent sub-theme through much of mythology. In the Old Testament it says, "And the gods found the daughters of man fair." And the Persephone myth is a good example of this where the Platonic demurgus of the underworld ensnared Persephone. Oh, and another example that should be mentioned are the incubi and succubi of medieval uh, mythology. These were male and female spirits which were thought to come to people in the night and have intercourse with them. And it was very bad, very bad for health, and general wasting away diseases were often explained by invoking this phenomenon.

BUt uh, what I want to talk about is something similar but with a uniquely modern caste which is. Recently the flying saucer phenomenon has begun to take on a new character this erotic dimension. There is no hint of this kind of thing in the early literature, meaning from 1947 through 1960, but now it seems to be a rising theme. And uh, I would like to talk about it because though this idea is the darling of a screwball fringe when it's in this form, I think it represents an interesting developing folkway that we can learn from.

So uh, what about it? It's only in the last sixty years, since the discovery of DNA and the Hertzprung-Russell diagrams, that we have begun to get an idea of the true size of the universe. That the notion of extraterrestrial life and extraterrestrial intelligence could even be coherently framed. Before that time, man's relationships with transhuman intelligences tended to be demonic or angelic, to fall into those categories of beings that occupied hierarchical levels above and below us in the structure of being but all basically terrestrial or in some sense terrestrial. But science, by clarifying the nonuniqueness of biology and giving us an idea of what's going on in the galaxy and beyond, has validated the notion that life is ubiquitous and that intelligence is a property which accompanies life and is also therefore probably very common in the universe. This legitimates fantasy about the existence of extraterrestrial life so that what is happening in the last half of the 20th century, the mythological outlines of what the alien must be are being cast now. The expectations of people living now who have been given a rudimentary knowledge of biology and astronomy allows the thing to be conceived. Their expectations expectations are casting the extraterrestrial archetype into a mold that it will hold until it is disconfirmed or confirmed by true extraterrestrial contact, whatever that means.

We now know enough to fantasize realistically about what the alien, uh, would be like, and this sets up polarities in the collective psyche that previously we have only seen at the level of the individual. What the

developing archetype of the extraterrestrial “Other” means, and the source of our fascination with it, is that, collectively, for the first time we are beginning to yearn. This new collective yearning is happening in religion on a very broad scale. The previous concerns of salvation and redemption are shifting into the background for the great majority of people, and what is driving religious feeling is a wish for contact — a relationship to the Other. The alien then falls into place in that role; the alien fulfills it. I believe that if religion survives into the long centuries of the future, this will be its compelling concern — an attempt to define a collective relationship with the Other that assuages our yearning and our feeling of being cast out or, as Heidegger says, “cast into matter, alone in the universe.”

It’s as though by passing into the psychedelic phase — the space-faring phase — the entire species were passing into adolescence and becoming aware of the possibility of something like a sexual completion with an Other, with an intelligent, nonhuman species. This is an idea that had previously been masked for us in our collective prepubescence or polymorphically perverse phase, during which we were self-absorbed. One dimension of the culture crisis is a collective erotic drive for a connection with the Other.

To sum up what I’ve said about religion, it is as though the Father-God notion were being replaced by the alien-partner notion. The alien-partner is like the angelic tetramorph. It is androgynous, hermaphroditic, transhuman; it is all these things that the unconscious chooses to project upon it until we have enough information to define what it might actually be for itself.

Eventually this contact will occur. We are now in the pubescent stage of yearning, of forming an image of the thing desired. This image of the thing desired will eventually cause that thing to come into being. In other words, our cultural direction is being touched by the notion of alien love, and it comes to us through the rebirth of the use of plant hallucinogens. The shamanic vision plants seem to be the carriers of this pervasive entelechy that speaks and that can present itself to us in this particular way.

The appetite for this fusion is what is propelling global culture toward an apocalyptic transformation. It isn’t recognized as that in the culture yet, but nevertheless it is this fascination with the Other that propels us forward. Culturally we are growing toward the potential for falling in love, but then if there is no one to love this potential can turn to rancor and disillusionment. We have embarked on the exploration of a unique historical opportunity in which for the first time the issue of the Other is being fully constellated and dealt with by the species. The question is being asked, “Are we alone?” and though we now focus on that question, we need to think beyond that to, “What if we are not alone?” Then what becomes the next imperative question? It is obviously the exploration of the relationship to the Other, part of which has an erotic character.

We will discover, as soon as communication is even remotely possible, that we are obsessed with it. It becomes very important to know whether or not we are alone. It becomes very important to open a dialogue if any dialogue is possible. I think that at this stage the facts are secondary to the description of what is going on. In other words, this option could slip away from us. It is a potential that has drifted near the historical continuum, and if it is invoked by enough people, it will become a fact. But it could also slip away. We could harden; there are dominator, hypertechnological futures that we could sail toward and realize. That would eliminate this possibility of opening to the Other.

I always try to define for myself what the historical importance of psychedelics is, because we know that shamans have used these plants for millennia and have plumbed these depths as individuals. Still, I always

have the intuition that there is a historical impact of some sort, and I think this is it: that we are actually positioned to attempt something that has never been attempted before, to open a dialogue as a collectivity with the Other and to use that synergy to bootstrap ourselves to a new cultural level. There isn't a great deal of talk about it; this intuition exists at the folk level. None of the managerial or analytical elements in society are looking at this at the moment. But it is forming and crystallizing in the background.

Contact with extraterrestrials and voices in the head and Logos-like phenomena are not a part of the general mythology of LSD. Certain exceedingly intense individuals may have achieved this intermittently, but it is not something that is attached to the notion of what LSD does to you. With psilocybin, on the other hand, it definitely is. Our survey showed that as people's doses increased, their susceptibility to this phenomenon increased markedly. The issue of contact with the extraterrestrial for large numbers of people has been broached by mushrooms. It's very puzzling to people, because our expectations are always that we are cells in a vast societal animal and that the news of anything truly important will be conveyed electronically to us; that if flying saucers land, the president and the secretary general of the United Nations will convey the word to us. But the challenge of the psychedelics is to realize that the potential for an alchemical wedding with the alien exists now. It is a tribal phenomenon that is happening as an experience at the individual level. People in the confines of their own apartments are becoming Magellans of the interior world, reaching out to this alien thing, beginning to map invisible landscapes and to bring back stories that can only be compared to the kind of stories that the chroniclers of the New World brought back to Spain at the close of the 15th century. Stories of insect gods, starships, unfathomable wisdom, endless realities.

Many times I've spoken of the psychedelic experience as a landscape and as a confidant — a kind of girl Friday who tells you things; but another facet of it is the erotic element. There is no other word for it, because it inspires a feeling of opening and merging that is, in our cultural conditioning, what we associate with Eros. To distinguish it from ordinary love I always think of it as LUV. It's the kind of love that you get with the alien. What it means is that the relationship to the alien can be thought of as modeled on the relationships to the Other that each of us forms through relating to other people. This is similar to the Jungian notion of the coniunctio, a situation in which two people get together and try to function as alchemical mirrors for each other. Tantra and Taoist sexual practices also have to do with fusing into dyads. In that situation each party to the fact is taking on the quality of the other. In a nonerotic context that's called becoming what you behold.

We are uniquely susceptible to becoming what we behold. This is why we have always been led into the future by our imaginations; because we dream and then we realize the dreams. This fact about our monkeyhood, when put in combination with a relationship with an alien mind, means that we will become the Other we behold. This is, in fact, what I think is happening. The curious intimations of the deepening contact with the Other make it seem probable to me that we are in love, but we're only slowly realizing this because we've never been in love before. So articulating this kind of idea, one person saying it to another and discussing it, is actually an attempt to conjure this into being — to call it forth and make this supposition become fact. Because all facts are the suppositions of very large numbers of people, the fate of this archetype now hangs in the balance.

There is tension around the flying saucer, aside from the erotic connotation, because the flying saucer represents a tremendous challenge to science, perhaps the ultimate challenge. It may be as confounding to science as the resurrection of Christ was to Greek empiricism and Roman imperialism. The flying saucer

is essentially an agent of cultural change. On the level of the machine, it bids distress for our most cherished explanatory schema, but on the level of the alien as flesh, it presents a much more basic and fundamental challenge, because the erotic complex is being redefined by this phenomenon.

Many people take LSD, and yet it's very difficult to get precise numbers on this matter because people don't talk about it. Yet in the last fifteen years, sexual researchers have had a field day because people are very, very willing to discuss their bizarre sexual peculiarities and to pour out their hearts to people with clipboards. So we now know a great deal about human sexuality. I suggest that our taboos are on the move. They are moving so that as we become more sexually polymorphic and open with each other and our ego is less identified with our sexuality, we become very private and constrained, secretive and religious about our psychic experiences, particularly the psychedelic experiences. We are much more open with each other sexually and in our examination of our libidinal drives, but the taboo has now moved to this interior world where we have an adolescent sensitivity about our developing relationship to the Other.

These attitudes are elements in the emerging human future, a human future that is accelerating exponentially. It is not a mere linear propagation of the present; peculiar factors are impinging on it: psychedelic substances, the ability to erect large structures in deep space, the presence of the alien Logos in the mind of the collectivity, the presence of the cybernetic network that is developing, the politics of feminism — all these things are going toward release of humanity into the imagination. To date, the cultural engineers have not stressed enough that the erotic element be included in the design of the human future.

Let me sum up by saying that there is an emerging zeitgeist of hyperspace. I call it a zeitgeist of hyperspace because electronic culture will add another dimension whose effects will reverberate at every level. We are now living in a hyperdimensional collectivity, not only of earth and space but of information of past and future, of conscious and unconscious. The technological culmination of this is the projection of human consciousness into whatever form it seeks to take. The zeitgeist of hyperspace that is emerging, initially freighted with technology and cybernetics, requires that it be consciously tuned to an erotic ideal. It is important to articulate the presence of this erotic ideal of the Other early. This is an opportunity to fall in love with the Other, get married, and go off to the stars; but it's only an opportunity and not evolutionarily necessary.

If we only live with the ideal of the Other and never find and fuse with the Other, we can still evolve along whatever pathways lie ahead of us. But if the opportunity is seized, if we take seriously the experience of the last ten millennia and complete the modern program of realizing the ideals of the Archaic Revival, recognizing that what the 20th century really is about is an effort to establish and perfect the ideals of late Paleolithic shamanism, then we will have acted with integrity in relating to this opportunity and we guarantee ourselves a grand and peculiar historical adventure — which I cheer for.

Audience: Could you say a bit more about the role of the psychedelic experience?

Once we set ourselves the task of describing the psychedelic experience it will become more accessible, because if we each gave our best metaphor and then all used those metaphors to produce a better metaphor, we eventually would retool our language so that we would be able to handle these modalities. And this will happen. Historically, the psychedelic experience is a new object for the Western languages. It will be very interesting to see what English, the language of Milton, Chaucer and Shakespeare, will be able

to do with the psychedelic experience. In William Blake you get the feeling that English can do staggering things with it. Passages in Andrew Marvell imply the same.

The relationship of the psychedelic experience to literature is a whole field unto itself; there are certain moments where great literature has passed near it. Flaubert's *The Temptation of Saint Anthony* got it, very succinctly. Huysmans' *Against the Grain* is an amazing novel about a man who is so sensitized to perception that he can't leave his apartments. He has his walls covered in felt and keeps the lights very low. He collects Redon when nobody had ever heard of Redon. He buys turtles and has jewels affixed to their backs. Then he sits in a half-lit room and smokes hashish and watches the turtles crawl around on his Persian rugs. Let's all go home and do this.

Audience: I'm curious about whether the chemical induction is necessary. I've been exploring vision through dream work and it seems promising. In sleep we see a lot of things.

Yes, I think dreaming and states of psychedelic intoxication, possibly the after-death state, possibly the post-apocalypse state for the collectivity, all these are related to each other. Certainly dreaming is the natural access point, because it's a part of everyday experience. But these places are what's called state-bounded. It's very hard to bring back information — you have to have a natural inclination or a technique. It doesn't matter whether you are using psychedelics or yoga or dream-manipulation; it's just a matter of exploring the mind by whatever means works. I've seen studies that show that the deepest part of sleep is the high point of production of endogenous hallucinogens, such as DMT and beta-carbolines, in the human brain. Nevertheless, it's only in the wildest dreams, which are necessarily the most difficult to recover, that one passes into places that are like DMT and psilocybin ecstasy. Yoga makes the claim that it can deliver you into these spaces, but people have different proclivities for these altered states of consciousness. It's very hard to move me off the baseline of consciousness. I am very stolid and set in the here and now, so plants work better than anything else for me. I scoured India and could not convince myself that it wasn't a shell game of some sort or was any more real than the states manipulated by the various schools of New Age psychotherapy.

But in the Amazon and other places where plant hallucinogens are understood and used, you are conveyed into worlds that are appallingly different from ordinary reality. Their vividness cannot be stressed enough. They are more real than real, and that's something that you sense intuitively. They establish an ontological priority. They are more real than real, and once you get that under your belt and let it rattle around in your mind, then the compass of your life begins to spin and you realize that you are not looking in on the Other; the Other is looking in on you. This is a tremendous challenge to the intellectual structures that have carried us so far during the last thousand years. We can do tricks with atoms, there's no question about that, but these tricks immolate us. The higher-order structure of molecules, let alone organelles and that kind of thing, is intellectual terra incognita to us; we have no notion of how these things work or what is going on. Yet it is from those levels that the constituent modalities of reality are being laid down. What do I mean by that? I mean that you can understand all this fine nuclear chemistry about the atom, but where does it put you if you are an intellectual? The story you tell yourself about how the world works can't explain to you how forming the wish to close your open hand into a fist makes it happen. This is the true status of present science. It cannot offer so much as a clue about how that happens. Scientists know how muscles contract — all that they know. It's the initiating phenomenon, that which decides, "I will close my hand." They know as much about that as — and perhaps less than — Western or Eastern philosophy knew in the 12th century.

And it is at that level, at the level of the body experience and the mind experience, that we operate. You can live in the social and religious system of Hellenistic Greece and offer sacrifice to Demeter, or you can live in 20th century America and watch the evening news, but you should have no faith that you are getting the true story on reality. These are just historical contexts that can be transcended only by the acquisition of gnosis, knowledge that is experienced as self-evidently true. It's hard for people to even realize what I might be talking about because they believe that something like logical consistency or ability to be reduced to mathematical formalism is how you judge the efficacy of an idea. Ideas such as that are what led us into this extremely alienated state. We haven't demanded that the stories we tell ourselves about how the world works confirm our direct experience of how it works. The psychedelic substances, by focusing attention on the mind-body-brain interactions, are re-framing these questions; and not a moment too soon, because the cybernetic and technical capabilities of this society demand that this all be looked at very clearly or we're just going to sail right off the moral edge of things and into the abyss.

Audience: Could you comment further on the interaction between various sexual yogas and the psychedelic experience or intoxication as tools — as in effect potential tools for approaching the kind of extraterrestrial eroticism you're talking about?

Certainly. You have all kinds of things going on when people are having sexual intercourse. The physiological state is one of activation, there's production of pheromones. I've noticed on psilocybin that there is a disappearance of normal resistance across a membrane, especially if there is perspiration, so that two people with large amounts of skin in contact become one entity. I'm convinced enough of this that I would suggest to Masters and Johnson, or whoever has license to do these kinds of things, to check it out if they are serious about validating telepathy. This is a very simple experiment.

Taoist sexual practices lay a lot of stress on the generation of unusual substances in the genitals or in the perspiration, which is a theme that is absent from Indian yoga but that is picked up in Amazonian shamanism, where there is a lot of discussion of magical forms of perspiration, magical objects that are generated out of the body or put into the bodies of other people. In the matter of Taoist alchemy, it appears that there was an erotic control language, so that much of what appear to be prescriptions for sexual practices are actually recipes for plant combinations, because words that were used with sexual connotations were also code words for plants and fungi. The association in the Taoist mind between the fungi and the feminine genitalia was very close. The words and the concepts are the same. This is a prevailing motif of the so-called esoteric schools of Chinese eroticism, meaning the schools where actually nothing appears to be going on, but the presence of certain plants and certain objects in a composition indicate that it actually is an erotic cryptogram of some sort.

Audience: Could it be that the natural psychedelics that exist on the planet are a kind of love offering from the Other to us with which, when we accept them, we can develop that bond sought by the Other?

I have spoken about extraterrestrial contact and the relationship to the psilocybin mushrooms. I've mentioned that psilocin, which is what psilocybin quickly becomes as it enters your metabolism, is 4-hydroxy-N,N-dimethyltryptamine. It is the only 4-substituted indole in all of organic nature. Let this rattle around in your mind for a moment. It is the only 4-substituted indole known to exist on earth. It happens to be this psychedelic substance that occurs in about 80 species of fungi, most of which are native to the New World. Psilocybin has a unique chemical signature that says, "I am artificial; I come from

outside.” I was suggesting that it was a gene — an artificial gene — carried perhaps by a space-borne virus or something brought artificially to this planet, and that this gene has insinuated itself into the genome of these mushrooms.

It is an unresolved problem in botany why there is such a tremendous concentration of plant hallucinogens in the New World — in North and South America. Africa, which is where man is generally thought to have arisen and gone through his formative cultural development, is the poorest of all continents in hallucinogens. The New World is very, very rich, and this is why hallucinogenic shamanism is so highly developed in the New World. So, yes: the fact that the psilocybin compound is chemically unique, the fact that it induces this Logos-like experience, causes me at least to entertain the possibility that this is an extraterrestrial contact and that the notion of extraterrestrials as we have previously conceived them, as someone from far away who would come in ships and get in touch with us, is an obsolete notion.

As human history goes forward, we develop the linguistic discrimination to be able to recognize the extraterrestrials that are already insinuated into the planetary environment around us, some of which may have been here millions and millions of years. In other words, space is not an impermeable barrier to life; there is slow drift. There is genetic material that is transferred through space and time over vast distances.

Operationally, I deal with the mushroom that way. It may well be an ad- umbration or some slice of the human collectivity, but since it presents itself as the Other, I treat it as the Other. Sometimes, as I have said, it is my colleague, and sometimes it is my Jewish godfather, and sometimes it is what Jung called the soror mystica, and what my brother Dennis called the sore mistress. It all has to do with changing our preconceptions of things so that the idea that a mushroom could be an intelligent extraterrestrial, which is preposterous from one point of view, can be seen to move from possible to highly probable. This change of mind occurs by simply shifting language around; the evidence has been left untouched.

The evidence is equally friendly to either point of view because the evidence is so impersonal — science is totally impersonal. The empirical evidence that the mushroom is an extraterrestrial is thin and circumstantial, but the subjective experience of those who have formed a relationship with it overwhelmingly supports that view. This, then, is where we have ideas in competition, the evolution of points of view through time. That’s why I say the opportunity should not be missed to open a cultural dialogue concerning this phenomenon among ourselves, and with the thing itself. It’s a unique opportunity.

Audience: I’m going to ask you to speculate just for a minute.

I never speculate.

Audience: Just try. Given that we are led by our imaginations into the future, and that facts are indeed suppositions that are agreed upon by a large group of people, how many people do you suppose it would take to agree on these facts and what sort of rituals or ceremonies would be required to align everybody’s thinking to agree on specific elements of the invisible landscape to the point where it would be possible to retool the language to accommodate the new visions and take advantage of this opportunity to perfect the Paleolithic ideals of shamanism?

I don’t know. Maybe there’s a critical 5%, or something like that. Political revolutions are made by 10%. Psilocybin mushrooms have emanated throughout society. In the last eight years we have undergone

something like a second Neolithic revolution. The first Neolithic revolution was the invention of agriculture; the second Neolithic revolution was the invention of home fungus cultivation. Suddenly, twenty or thirty species of psilocybin-containing mushrooms, which were previously rarely met forest endemics or the coprophilic kinds of mushrooms — the ones that grew on the dung of cattle — all of which had restricted endemic zones of occupation, these all have become available. *Stropharia cubensis*, the most ubiquitous in the natural state, was before the invention of human cultivation a rare tropical mushroom. Now it grows from Nome to Tierra del Fuego in every attic, basement and garage around. The strategy by which the mushroom conquers society is exactly the same strategy by which the mycelium spreads across a petri dish; it simply moves out in all directions. My brother and I wrote the book *Psilocybin: Magic Mushroom Grower's Guide* in 1975. It sold a hundred thousand copies. We had competition from Bob Harris, who also wrote a cultivation book. Jonathan Ott wrote a book. So did Gary Menser and Stephen Pollock. Spore companies sprang up; it's very hard to imagine how many people are doing this.

I'm very bullish on psilocybin. I think that the word "drug" is inappropriate and that the model of hallucinogenic substances that we have inherited from our experience with LSD is completely inadequate — that the fact that LSD is our model hallucinogen for doctors and researchers is only a historical accident. It was discovered first, or characterized first, in the laboratory, and then millions and millions of people took it. It's active in the 100 µg range, whereas psilocybin is active at 15 milligrams. Millions and millions of people were able to be touched by LSD. I don't think that mass drug taking is a good idea, but I think that we must have a deputized minority — a shamanic professional class, if you will — whose job is to bring ideas out of the deep, black water and show them off to the rest of us. Such people would perform for our culture some of the cultural functions that shamans performed in preliterate cultures.

I like the plant hallucinogens. I think that a true symbiosis is happening there. LSD was a thing of the laboratory. Psilocybin is a creature of the forests and fields. When we propagate it, when we spread it, when it stones us, there is a reciprocal relationship and transfer of energy and information. This is a true symbiosis. Both parties are gaining; nobody is giving up anything. We have domesticated many plants and animals; that's not big news. But this is not a walnut or an apple; it isn't even a cat or a dog; it may be smarter than we are. So the implications of this relationship have to be couched in at least human terms, and that's why the erotic metaphor is not inappropriate.

Audience: If psychedelic substances were legal and this were a class in introductory psychedelic appreciation, what do you suppose our first assignment would be?

From me? I guess I would have you plant some seeds and read some history; when you had read the history and grown the seeds (and I don't know what they would be — morning glory seeds or the spores of mushrooms), when you had assimilated and cared for the plant and brought it to its fullest self-expression of fruitful production of alkaloids, then you would be at the threshold of your career and I would adjourn the class.

Appreciation of history is very important to doing well in the psychedelic experience. Psilocybin shows you movies of history; it sees us as historical creatures. It has this above-everything point of view where it isn't dealing in the slice of the moment. It's dealing with the phenomenon of the monkeys over the last million years; that is how it sees us. You can assimilate some of its viewpoints by having a real feeling for the ancestors, all the people who are dead and the people who went before. What a long, strange trip it's

been, you know — from the cave paintings at Altamira to the doorway of the starship. And now we stand on that threshold, hand in hand with this strange new partner; out of historical change comes the unexpected. The problem of the Other, the need for the Other, the presence of the Other, the nature of the Other — these are the questions and the concerns that will drive the next order of human knowing.

Audience: You don't preclude at all the possibility that the yearning for the Other is just a yearning for the Self — that the Other really is an undisclosed Self.

No, I don't. In fact, I said at the beginning that the nature of the archetype is being set now in the light of scientific knowledge concerning other intelligence in the universe. It's a combination of our need for connection and science giving its blessing to this form of expression of that need that is creating the potential phenomenon of alien love. We don't know what the Self is; Buddhism says that everything is Bodhi-mind; that means that there could be extraterrestrials, and if it's true that everything is Bodhi-mind, they too are an aspect of the Self. This word "Self" is as great a mystery as the word "Other." It's just a polarity between two mysteries and then the thin, thin myths that are spun to hold you suspended there without freaking out. The myths of science and religion and shamanism all represent a polarity between the mystery of the Self and the mystery of the Other — and a mystery is not to be confused with an unsolved problem; a mystery is by its nature mysterious. It will not collapse into solution. And uh, we are unfamiliar with that kind of thing. We think that if there's a mystery, then experts of whatever kind can get it straightened out and issue a report and that's that, but this approach only works for trivia. And what's important — our hearts, our souls, our hopes, our expectations — are completely mysterious to us. And so how must they appear, then, to the Other, if it truly is Other?

So we need to cultivate a sense of mystery. The mystery is not only in the Other; it is in us. And this reverberates again with what I said about the idea that we become what we behold. The nature of history is suddenly transforming in the post-quantum physics, postmodern phase; this was not expected. Uh, the 19th century, the early 20th century — they didn't realize this was what they were pointed into. Although some few people, the 'Pataphysicians, the surrealists, they saw what was coming. But here we are.

Audience: The discussion earlier of how the mushroom was likely seeded from afar reminded me of the panspermia theory — of the idea that life itself was sent and that we were all sent down here together.

TM: Yes, I should have mentioned that theory because it is the best support I have for the idea I was putting forth. The panspermia theory which was formulated by Cyril Ponnampereuma and uh, Crick, who was the discoverer, along with James Watson, Francis Crick, of DNA. Ponnampereuma and Crick are proposing a much more radical theory than what I put forth, at least in terms of- relative to biology. They are saying that prebiotic molecules arise in the greatest numbers in deep space, not on the surfaces of planets; that planets are only secondarily and at a late stage in the development of complex polymers and prebiotic compounds. I'm sure you know the old adage that we each are made of stars, that the atoms in your body were once cooked in the hearts of stars. This is true, but it- a, an unremarked uh, uh, accompanying necessity of that fact would be that there must therefore be some atoms in your body which were not cooked in the heart of stars, but which were part of the planets that circled around those stars before they exploded.

My point being that not all of this material that is circulated in the galaxy has been through something as violent as nuclear burning at the heart of a star. When stars go nova their planets are blown to pieces, and

biotic material has evolved on those planets is injected into the general cosmic soup of circulating material. And that is more my idea of what the spore strategy may have originally been about. It was forms of life which had evolved in very harsh environments where seeds could not survive. Mushroom spores survive best in an environment as much like that of deep space as possible. Ideal is total vacuum at -40, at -60°C. Then they last virtually forever. At any lower temperature they will slowly degrade. The logic of the case is well-founded. What is on much shakier ground, of course, is the idea that the mushroom is an intelligent life form. That's my special obsession and province. Most people say I'm welcome to it.

It's very interesting that in a book called *Scientific Perspectives on Interstellar Communication* by Cyril Ponnampertuma, there is an article by R.N. Bracewell, who's an astrophysicist, talking about the logic of searches for intelligent life. And he concludes that no matter what kind of life form you are, no matter what kind of technology you have, if you are seriously going to search space by physically sending probes from one star to another, then the only strategy which would work would be what is called a Von Neumann machine, meaning a machine which could reproduce itself. or four of these machines are sent out in four opposed directions from a parent star. At a certain distance from the parent star each machine replicates. Then you have eight machines. And at double that distance, they replicate again, giving sixteen machines, and so on. The notion is that only by this process of replication can you cover all bets. And then probably what you do is send a message that says, "We are searching the galaxy for intelligence by an exhaustive means. If you read this message, please call the following toll-free number and we will then initiate contact." And only by this means could you hope to have contact with all the habitable worlds in the galaxy. This scenario makes clear that it may be very important to understand what the message is that the mushroom conveys.

The Mandaeans, who were obscure religious cult of Gnostics in the Middle East of very long survivability, have this very interesting idea. They believe that at the end of time what they call the Secret Adam will come to earth. The Secret Adam is a messiah-like figure, but what he does is he builds a machine which then transmits all the souls back to their hidden source in the All-Father outside of the machinery of cosmic fate. This notion of the messiah building a machine is very interesting. It's conceivable that if there is an extraterrestrial message in our environment, it is a message to build some kind of device so that a less tenuous form of communication can be opened up. Uh, and Bracewell makes this case. To him this is inherent in the logic of the situation.

And I suppose it would be an interesting branch of logic — the logic of protocols of extraterrestrial contact. What can we define about contact that is so basic that whatever form of life and intelligence you were, you would have to flow along those creodes? Um, this is probably an undeveloped field at this point, but it certainly uh, could be done. It's like alternative physics. We need alternative theories of social contact and uh, and social contract-making in the event that we meet an extraterrestrial. This is a fertile theme in science fiction, the logic of contact, how to make it without giving away too much and yet not get anything out of it. It's poker, but the stakes are very high. We're talking about the survivability, viability, and evolutionary fates of species, if not entire planets.

Audience: You talked about the collapse of the distinction between inner and outer space.

Right

And what would- how would you, could you go into that more?

Well, the distinction of inner and outer space is rooted in the self and the body electronic consciousness and also as we explore the erotic dimensions of the other that indicated tonight in a way that the identified between king and self has been

I would like to ask whether you see a difference with what you're doing with your life and what a shaman would do? The last time I heard you speak, you said you didn't consider yourself a shaman.

The primary characteristic of shamans is that they cure. In other words, they perform a medical function. If I'm performing a medical function, it is a fairly curious one. That's how I differentiate, because I respect that and it is often lost sight of. People think of the psychedelic plants and the magic and the magical feats, but they forget the curing. In Carlos Castaneda's work I don't think anybody cures anybody in about 1,200 pages of material; nevertheless, classically and statistically, shamans are healers. I think there is something called "lived shamanic ideals," which is what I'm trying to do — to try to explore reality with a shamanic spirit and by shamanic means. But the curing is the sine qua non of shamanism.

Audience: Could you give me your best understanding of what space is from the psychedelic perspective and the differentiation between inner mental space and outer physical space, and the validity of that differentiation? Just the relationship between space in general and consciousness.

The world is reconstructed in the mind through the input of sensation. The sensation is canalized through the perceptors so that we're getting at least three or four lines of unrelated input, or it's generally thought of as unrelated. But the body is the interface between the mind and the world, and language seems to be the throughput from the mind to the world and then from the world back into the mind. As for space — there is this curious thing in biology: the earliest forms of life had no perception of the world at all. If food was in their way, they took it in. Then later, with the development of eyespots and pigment-sensitive chemicals concentrated in certain cells, you get the differentiation between light and darkness. Then later still you get mobile animals and the evolution of complicated eyes and so forth. You see, what is happening is that biology is a conquest of dimensions and that if you view culture as the extension of biological evolution, it too is a conquest of a dimension. It is the conquest of a dimension of time where, through the invention of alphabets and coding systems and oral traditions, experience is able to be coded. Now we seem to be coming into a place where we are coding space and time, but the evolution of the conquest of space through motion allows our whole mapping of the world. Culture is turning into a hyperdimensional entity fulfilling the biological program of life. Whatever it is, it is transforming itself through a series of dimensions, bootstrapping itself from one dimension to another. You'll notice that currently human culture is very two-dimensional, or it's very flat. What is the highest building in the world, a thousand feet high? And generally most buildings are twenty feet high; but now we are proposing to build space colonies where the notion of how high the building is doesn't exist because the world is the building and the building is fifty or a hundred miles long.

We can record essentially anything we want about any event and recall it later. There is a synthesis of all this, which leads to the discovery of the inner dimension, which may be thought of as a higher or lower dimension. The human imagination is the dimension beyond space and time, or it precedes all dimensions.

At some level it has pointlike characteristics; that's why all this talk about the hologram, because it has the pointlike characteristics of new consciousness. It has all-at-onceness. Its everywhere-at-the-same-timeness has fascinated commentators.

Audience: You talked about the collapse of the distinction of inner and outer space. Would you go into that more?

The distinction of inner and outer space is rooted in association of the Self with the body. I think as the Self moves out into the ocean of electronic consciousness and, as we explored, into the erotic dimensions with the Other that I've indicated tonight, this identification between Self and body will become secondary, in the same way that the identification between king and Self has become rather secondary over the last 5,000 years. We don't even have a king. We seem to manage without one. It's conceivable we could manage without a body as well. These are just ways that loyalty is transferred toward forms of cultural concrescence validated by local languages.

Audience: It seems that the talk is of humanity being on the threshold of a New Age, and that maybe contact with aliens will help us cross this threshold.

I definitely think that there is a process that has been long underway that has been gaining momentum since its very beginning. It is the process that formed the planet, that called life out of the ocean, that called higher animals out of the lower animals, that called humanity out of the primates, and that called history out of tribal, sacral, timeless existence. What it is leading toward is some kind of transcendental, transformative flowing together of everything that is beyond our language system. It is the umbilicus of being; it is where it's all tied together, and therefore it's very hard to describe. I think that all of our science and religion and history are patterns thrown across a limited set of dimensions by the hyperdimensional presence of a certain object at the end of history toward which we are moving and toward which we are being drawn. I think that most things about human beings are mysterious and that what is happening to us is mysterious. The sudden explosive development of the neocortex is entirely out of context with what we know about the rates of evolution that occur in other species and previously went on in the primates.

Now its been very fashionable in the past fifty years or something to think that it's all very humdrum somehow; and yet this is just everybody- every ideological system that has been granted the status of being the official view of reality has always proclaimed that it had everything nailed down but the last 5% and their best people were working on that. But I think that we are for all that we know, we know practically nothing. Though I am not in most senses religious, I think that religious thinking about the transformation of the world is more on the right track than the notion that the laws of physics will always be what they are, the laws of biology will always be what they are, and we're all just going to go along and things are going to get worse and worse, or better and better, but that there are no surprises. I think that we do not see what's going on.

One of the reasons I like to make this argument about the mushroom and the extraterrestrial and all that is just to show people how one can see things differently. If things can be seen that differently, how many ways can they be seen differently? And to try and get people to stop waiting for the president to enlighten them. In other words, stop waiting for history and the stream of historical events to make it clear to you. You have to take seriously the notion that understanding the universe is your responsibility, because the only understanding of the universe that will be useful to you is your understanding. It doesn't do you any

good to know that somewhere in some computer there are tensor equations which perfectly model or perfectly don't model something that is going on. And we have all tended to give ourselves away to official ideologies and to say, "Well, I may not understand, but someone understands." But the fact of the matter is that only your own understanding is any good to you, I mean because it's you that you're going to live with and it's you that you're going to die with. As the song says, you do, the last dance you dance, you dance alone and you want to be in good company then. So uh, it's very important

I don't know what the transformation means, this rushing together of everything.

[Announcer]: Thinking Allowed...Conversation on the leading edge of knowledge and discovery, with psychologist, Dr. Jeffrey Mishlove

[Jeffery Mishlove, Ph.D.]: Hello and welcome. I'm Jeffrey Mishlove. Throughout recorded history, human society has been haunted by reports of unidentified flying objects in our skies, many of which have defied all attempts at scientific explanation or understanding. What are these phenomenon, and how can they be explained? With me today is Terence McKenna, a philosopher and thinker of note in the area of altered states of consciousness and alternative realities. Terence is the coauthor, with his brother Dennis of 'The Invisible Landscape', and also 'Psilocybin: The Magic Mushroom Grower's Guide'. He is a founding member of Botanical Dimensions, a nonprofit organization devoted to preserving and studying psychoactive plants used by native cultures throughout the world, and he is also the developer of a computer software package called Timewave Zero, designed to augment interpretation of the ancient Chinese book of prophecy, the I Ching. Welcome, Terence.

[Terence McKenna]: It's a pleasure to be here with you.

[Mishlove]: It's a pleasure to have you here with me, also. You know, the UFO phenomenon is, uh, striking because it's so bizarre. It seems as if the, the reports that come in about UFOs defy any attempt whatsoever to categorize them. I guess from my point of view, I can only assume that there are probably many different interpretations of, of this event. I think, given your background as a student of shamanism and altered states of consciousness and alternative realities, you have some unique perspectives on the UFO phenomenon. I wonder if we could, uh, get into that material.

[McKenna]: Yes. Well, the ordinary approach to the UFOs has been to view them as visitors or intruders from a nearby star system that have come in metal ships, uh, for reasons of trade or scientific investigation or military conquest --

[Mishlove]: Or missionary activity.

[McKenna]: -- or missionary activity, to the vicinity of our planet. This was a myth that sprang up but concomitant with the modern wave of sightings that began shortly after World War II. As time has passed and the number of sightings has gone from hundreds to thousands to hundreds of thousands of instances, as the myth has fleshed itself out with sub-themes -- the theme of abduction, the theme of telepathic contact, uh, it's become much more difficult to fit all the known facts into the simple model of, uh, space-faring visitors from another world. So what we are left with, then, are a number of more exotic competing theories in the so-called postmodern phase of thinking about the UFO. Probably the best known of these alternative explanations was the one pioneered by, uh, the Swiss psychologist Carl Jung, who in 1953 wrote a book called 'Flying Saucers: A Modern Myth of Things Seen in the Sky'. And, Jung was at great pains, without passing judgment on the reality of the saucers, of the things seen, to interpret them psychologically, to interpret them as one would interpret a dream. And, he saw in their circular form, in their scintillating, shining, uh, alchemical brilliance, a symbol of human wholeness, and felt that they were a symbol of our collective yearning for a kind of totality and individuation. Now, in a way this kind of explanation is very satisfying; however, it is not satisfying to the person who has immediately undergone a very strange and a very real seeming experience.

[Mishlove]: Unless such a person were told great messages of hope for the planet.

[McKenna]: Well, and this is a persistent part of the flying saucer phenomenon [Mishlove: Yea]-- that people who have close contact with the saucers return with messages of universal brotherhood and benevolence, with stories of a beneficent hegemony of organized intelligence, where wiser, older worlds and civilizations help younger and, uh, and, uh, less mature worlds toward a kind of galactic citizenship. However --

[Mishlove]: That's just one thread of the evidence.

[McKenna]: It's one thread of the evidence, and it isn't really well supported by the evidence. Jacques Vallee, who is one of the foremost commentators on the phenomenon, has been at great pains to point out that with the flying saucer phenomenon we're dealing with thousands and thousands of incidents per year, throughout the world. It's very hard, with...even at our own primitive level of scientific sophistication, we can learn a great deal about a planet by sending a single probe to that planet. What kind of scientific program of investigation requires thousands and thousands of appearances? And, if we make the assumption that not all appearances are observed, but that in fact only a small number are observed, then the number of appearances that must actually be going on soars toward an astronomical number. It suggests we're dealing with an interpenetration by an alien dimension on an almost industrial scale.

[Mishlove]: Of course, a single probe could cause thousands of appearances.

[McKenna]: If it were of a sophisticated enough nature, that's right. The approach that I have taken, that has characterized--uh, characterized my work with this phenomenon, was first of all to say, we have not carried out a sufficiently in-depth survey of the life already on this planet to be able to say that at some time in the past life did not arrive here and thrive here that is not part of the general heritage of life on this planet, but that has somehow come in from the outside. My candidate for that kind of an intrusive extraterrestrial would be probably a mushroom of some sort, or a spore-bearing life form, because spores are very impervious to, uh, low temperatures and high radiation -- the kind of environment met with in outer space.

[Mishlove]: In other words, a mushroom spore could conceivably, uh, even waft itself up through the atmosphere of our planet and enter into empty space.

[McKenna]: Oh, there's no question but what this is happening -- that through what's called Brownian motion, which is sort of random percolation, spores do reach the outer edge of our atmosphere, and, there, in the presence of cosmic rays and meteors and rare, highly energetic events, occasionally a very small percentage of these biological objects are wafted into space. We even possess, uh, meteorites that are believed to be pieces of the Martian surface, thrown out by impacts on the Martian surface of asteroidal material. In fact I think part of the grappling with the UFO mystery is going to lead to the conclusion that space is not an impermeable and insurmountable barrier to biology -- that, in fact, planets are islands, and life does occasionally wash in from distant places, and if conditions are correct, can, uh, take hold. However, let me say, in the UFO phenomenon we are dealing, or we presuppose that we are dealing, not simply with the phenomenon of extraterrestrial biology, but with the phenomenon of extraterrestrial intelligence, and this is a hair, uh, hackle-raising notion.

[Mishlove]: We're dealing with more than mushroom spores in that [indcipherable].

[McKenna]: We're dealing with more than mushroom spores, at least as ordinarily conceived. And, I--I think the thing that has been overlooked in almost all discussions of extraterrestrial contact is how strange the extraterrestrial is likely to be. It isn't going to be a friendly, elfin little feller with a beating heart of gold. It isn't even going to be some of the more extravagantly grotesque creations out of Hollywood. Uh, conditions and time spans in the universe are long enough and varied enough that, I would bet, the real task with extraterrestrial intelligence will be to recognize it, you see. We have no conception of how species-bound our images of life and biology are. This is a place where we have never been asked to confront to what degree the monkey within us has channeled our expectations and perceptions.

[Mishlove]: Well, it is the case that, on this planet, virtually all known life forms are based on the same DNA molecule.

[McKenna]: Well, except that, have all life forms been examined, to see to what degree they deviate, percentage-wise, from, let's say, a standard DNA molecule? The answer is no. The sequencing of DNA is a very expensive process, and is only carried out on laboratory organisms with an extensive history of involvement in medical research, like *E. coli* or, uh, the ordinary laboratory rat. No, there's a great deal we don't know about life on earth. We don't know when the fungi entered into the evolutionary chain. We don't know what kind of intelligence is really possessed by, uh, the cephalopods, the shell-less molluscs that include the octopi. The intelligence of dolphins has been studied by Lilly and others; the intelligence of, uh, of the large primates other than man. One way of looking at nature is that it is *entirely* linguistic intent -- that DNA is in fact a-a-way of uttering protein syntactical structures into matter.

[Mishlove]: In other words, that all of nature is, is like a poem. [laughs]

[McKenna]: Yes, nature is a communicating system [Mishlove: mmmhmm] of some sort, and the, the problem that we have is to transcend cultural languages [Mishlove: mmmhmm], historically created languages with very limited applications, and instead fall into phase with the communication systems that nature has placed all around us. One possible view of the flying saucer is that it is a kind of projection from the consciousness of the planet -- that it is Gaia, that it is in fact a kind of alchemical object haunting human historical time with a symbol of totality, the kind of totality that our religions and our mystical yearnings are so at pains to concretize for us. But, unless we, as egocentric beings, clarify our relationship to the unconscious, then I think the flying saucer is going to remain quintessentially mysterious. And, this was Jung's view.

[Mishlove]: One of the things that Jung pointed out in his book is that we must pay attention to the research that Dr. J.B. Rhine was doing at that time at Duke University in ESP and psychokinesis, and that, even if UFOs had a physical reality, could be

photographed or could be weighed and measured, that they still might in some manner be projections of the human mind.

[McKenna]: Oh yes, this is an important point to make, which the flying saucer people are forever misunderstanding, and that is, saying that the flying saucer is a psychic object does not mean that it is not a physical object. Uh, Jung in 'Mysterium Coniunctionis' is at great pains to say that the realm of the psychic and the realm of the physical *meet* in a strange kind of never-never land that we have yet to create the intellectual tools to explore. This is where the mystery of synchronicity is going to come to rest, the mystery of, uh, all kinds of paranormal activity on the part of human beings, and the mystery of the flying saucer. It's interesting, you see, that if you take the broad world of the so-called 'Mysteries' -- para-psychological, shamanic, extraterrestrial, and so forth -- and hypothesize another spatial dimension, one more spatial dimension, then suddenly all these mysteries become trivial. They are easily done. Locked boxes are opened; future events are discerned; lost objects are found. Uh, this sort of thing becomes quite the ordinary run of things if we hypothesize dimensions hidden from ordinary experience.

[Mishlove]: And, of course, there's serious work, at this point, in the field of, uh, unified field theory in physics, to postulate other dimensions of space than we normally think of, so...

[McKenna]: That's right. [Mishlove: mmhmm] The current physical models of the universe require eleven dimensions, eleven integrated variables to describe. And that's physical models of the universe. If we then turn our attention to mind and realize that we have no definition of what mind is, why then is there any mystery in the fact that we have no definition of what the UFO is? The mind is present at hand in every conscious moment. It has been our constant companion for fifty thousand years, and we haven't a clue as to what it is. So therefore, a manifestation of the other -- the superego, or the extraterrestrial other like the UFO -- it is not surprising that it is a mystery. I always hark back to the words of J.B.S. Haldane, the great British enzymologist, who said "reality is not only stranger than we suppose, it may be stranger than we can suppose."

[Mishlove]: Well, that, that suggests to me that if we look at some of the most bizarre, most anomalous cases that we have, such as UFOs, and we begin to ask ourselves, not so much what are they, because that's a mystery, but what is their function? How are they affecting us? That's like holding up a mirror to ourselves, and it tells us a great deal about the basic mystery of our mind and our reality.

[McKenna]: Yes, this is the so-called postmodern approach -- to ask the question, not what is the UFO, but what is it doing to us? And, Jacques Vallee pioneered this approach. And, the answer is fascinating. What the UFOs are doing to us, to global society, is they are eroding faith in science by casting directly in the path of science a-a-a kind of gauntlet, a challenge: "Crack this" -- almost as though the cosmic giggle had shown up at, uh, the bachelor party of science to spoil the bash, uh, in the same way that the resurrection of Christ posed a tremendous problem for the intellectuals of late Roman antiquity, because they had no place in their world view for someone rising from the dead. They were Greek materialists, atomists, essentially. In that same way, the UFO challenges the assumptions of science, and, uh, I think in that way--in that sense, Jung was really onto something when he saw it as coming from the unconscious. It is like an object coming from the unconscious with a compensatory function -- to turn us away from the rational and toward the intuitive; to turn us away from the paternalistic, Apollonian, solar, uh, masculine view of things, and toward a kind of watery, lunar, mysterious, intuitively felt, feminine force -- almost as though the UFO is a manifestation of Gaia as mother goddess. Science, as the proudest -- pardon the word -- erection of the rational mind, then, is challenged by something from an entirely other dimension, an entirely other realm, that concretizes for us the culture crisis. And that's why I've gotten into UFOs; I think they are important for a resolution of the culture crisis. They concretize the struggle between the paternalistic-masculine and the lunar-feminine, to--uh, between a dominator society and the kind of partnership society that we require to survive.

[Mishlove]: And yet, it seems as if that challenge is not a direct confrontation. As Vallee points out, the UFOs are operating almost at the mythological level of our culture. They're not landing in the White House; they're not really challenging the military or NASA.

[McKenna]: No, they're very mercurial, very watery. When you reach out toward them, there is nothing there. What they chiefly have--have become is an intellectual force in human thinking about the future, but when you reach out to grasp the hardware, to read the message, to meet the alien, there is nothing there. I've come to the conclusion, both from talking to contactees and having had a contactee experience that whatever lies behind the UFO mystery, it is a force which can literally do anything. So, it is fruitless to talk about the size of the objects or their composition or color, or the size of the entities, their dress and weapons and accoutrements, because it can appear literally *any way* it wants to. It can appear as the Virgin Mary; it can appear as galactarian overlords; it can appear as gnomes, elves, sprites, this sort of thing. It is not to be s-caught in the rational net.

[Mishlove]: Your description is strikingly actually parallel, with one exception, to the view of many Fundamentalist Christians, who say this UFO stuff is all the work of the devil.

[McKenna]: Well, I don't know about the work of the devil. Jung's criticism of Christianity was that it had not made a place for what he called the shadow, and he said the production Chr---the productions of Christian culture will always be neurotic because the shadow has not been included, so there's a lack of psychic balance. Perhaps the UFO carries compensatory psychic energy from the realm of the shadow. Some people are very frightened of it. Some people see it as an almost millenarian, salvational hope, the savior of mankind. I think that it's very powerful, that it haunts time like a ghost, that the messianic anticipations of Fundamentalist Christianity and Islam are in fact a picking up on the shock wave that the image of the flying saucer casts backward through time -- that this image of the New Jerusalem, the four-gated city descending from the sky to whisk the elect away to a better place, is a kind of prophecy yearning toward a fact in the act of becoming. You know, Christianity and Islam are the most history-obsessed of all the world's major religions.

[Mishlove]: Along with Judaism.

[McKenna]: Along with Judaism. And, all three of them have this notion of the transcendental object at the end of time. And, alchemy in the sixteenth century was an outbreak of an expectation of a transcendental object in the nearby here and now, that would cure --

[Mishlove]: The omega point of history, so to speak.

[McKenna]: Yes, it would cure all ills, confer longevity, fertility, virility, immortality. And I think that the flying saucer is an airborne philosopher's stone -- the *sophic hydrolith* of Paracelsus haunting the skies of modern America, with a promise of mandalic cohesion for the future that science has not given us. Science has been a very sadly disappointing religion in the realm of the heart. The flying saucer comes from the heart, but it bears the very strange energy of the other in its manifestation as planetary goddess.

[Mishlove]: I'm often struck by the, uh, psychic powers that seem to be associated with people who've had intensive encounters with UFOs. I've researched many of these cases myself.

[McKenna]: That's right. [Mishlove: I've researched many of these cases myself] The thing is both material and psychological. It anticipates the future. It seems that the memories of the contactees are transparent to this force. It can reach deep into their lives and confront them with information taken from forgotten incidents in their lives. It is an awesome kind of force that transcends space and time *for the individual*. Now, it may be that we will never have a general theory of flying saucers. It may be that this is something that addresses the individual, in the same way that I don't think we will ever have a general theory of falling in love. That, too, is something which addresses the individual. We have been mistaken to expect Time magazine or the New York Times to explain the flying saucers to us. They will not explain the flying saucers to us, any more than they will explain *ourselves* to us. This is something that haunts the membrane of experience very close in to the experiencing ego, and therefore it, it, uh, is threatening. This is one of the reasons that I think it relates to the psychedelic experience, because the psychedelic experience is like a UFO encounter on demand. [Mishlove: Yea] It's where the will of the person having the experience enters in. They decide to have this curious symmetry-breaking kind of experience. What I have tried to, uh, say to the UFO community is that we will not really have a deep understanding of what the contact experience is until we include data from the psychedelic experience as legitimate data to be included when looking at the problem.

[Mishlove]: Well, you have talked earlier about our need to make an extensive survey of all of the biological manifestations on our planet. It almost seems that, eh, in order to really get a handle on the UFO phenomenon, we'd need to make a comparable survey of all of the psychological manifestations of which we are aware, and it seems to me that at some level you would agree with me that the UFO phenomenon is one of our psychological manifestations.

[McKenna]: Yes, I agree.

[Mishlove]: We've got about two minutes left, so I wonder if we can sort of summarize your view in that regard.

[McKenna]: Yes, I think that the UFO phenomenon is a modern manifestation of a phenomenon which has been with us for thousands of years -- that is, the partial penetration of our own cultural space by others -- pixies, elves, fairies, sprites, demons, whatever you wish to call them.

[Mishlove]: Angels.

[McKenna]: Angels. [Mishlove: mmhmm] In the past we had a professional class for dealing with these go-betweens. We called the professional class 'shamans', and they mitigated these comings and goings and had a lore and a mythology about them. As we have lost contact with our shamanic roots, the things which go on at a low frequency, out in the wilderness and deserts of this planet, have become to seem to us either like invasions from another world, or like virtual impossibilities. I think that the flying saucer is knocking on our door to remind us of the depth and strangeness and animate intelligence that is resident with us in nature on this planet.

[Mishlove]: Terence McKenna, it's been a very eloquent presentation and extremely thought provoking. Thank you very much for being with me.

[McKenna]: It's always a pleasure to talk with you.

[Mishlove]: And, thank *you* very much for being with us.

Terence McKenna Interview, Part 1

James Kent

Terence talks about his childhood and early years in the first part of our interview

HE IS A RENEGADE SCHOLAR, an outspoken advocate for high-dose tryptamine experimentation, and yet he has a book deal, a worldwide lecture tour, a visiting professorship at Esalen, and a growing mass of followers who he sometimes refers to as his "fans", sometimes as his "constituency." Either way, you could not help but be delighted by his voice and style. His syntactical razzle-dazzle, mad-scientist voice, and dead-aim comic timing left us in grinning awe. We loved him. We nodded and said, "Right on," yet many of us

still wondered, "who is this guy?"

At this time in our not too distant past, I was a young freelance writer set to the task of interviewing Mr. McKenna for a small New Age newspaper in Southern California (don't giggle, it's true). They only wanted 2100 words, but being a fan of psychedelic exploration and skeptical by nature, I didn't pass up this perfect opportunity to spend a few hours getting to know Mr. McKenna and finding out what he was really up to. I wanted to know who his publicist was, if he was represented in Hollywood, how his career had been orchestrated,

what kind of twisted childhood he had, all the strange drugs he did in college, all the isolated rainforests he'd trekked through, and, probably most of all, was he was actually managing to make a living at being a full-time psychedelic guru for hire — have rap, will travel. So the following is a transcript of the interview which took place on the day I met with Terence in search of those answers. The three hour discussion took place in a small restaurant and later on in his then-home in Occidental, CA. We talked about his life, his theories,

and his career. What appears here is only part one of the dialog we had on that day, but stay tuned for more (because we always want more) to be broadcast in the near future right here at TRP.

James Kent: I've read a lot of interviews with you which were aimed at people who already knew who you were, but I wanted to try to get a broader view of who you are and what you do for a living. When I tell people I have this Terence McKenna interview, they're like,

"Terence who?"

Terence McKenna: It's not possible to be famous enough. (laughs) I recently heard that Michael Jordan was retiring... and, I have to confess, who? This giant was passing from the scene and apparently I was going to become aware of him only at the last moment.

JK: I never watched much basketball, but I would sit down and watch if he was playing. It was pretty amazing to watch him play, he was...

TM: Just because he was so good.

JK: Yeah. When he was on it was like nobody could touch him.

TM: Umm..

JK: Well, one of the main things I wanted to cover today was a little bit about your life, your career, your day to day schedule, your itinerary...

TM: You mean at the moment?

JK: Well, what is it you do?

TM: Oh, what is it I do.

JK: Yes. I mean, I know you're a writer...

TM: Yes.

JK: And you're also called a "shamanist," but that is sort of a vague term. What do you call yourself?

TM: Well, I just think of myself as an itinerant intellectual, trying to stay afloat by writing, lecturing, film consulting - some friends of mine and I have formed a company to develop software... But basically I'm an unassociated intellectual, of which there probably aren't more than half a dozen in the country. I mean, I do not work for any university...

JK: Have you gotten any offers?

TM: No (breaks into laughter). But how perceptive. No, I do however work for a couple of the world's largest corporations, but that's...

JK: Which ones?

TM: Well, Food of the Gods is published by Bantam, that's Bertlesmann, which is the world's largest publishing consortium. And Harper, which publishes all my other books, is wholly owned by Rupert Murdoch.

JK: Oh? And how do you feel about that?

TM: Well, he never bothers me, so... (laughs). But it just shows how difficult it is to remain unentangled these days. "Publishing" now means multinational corporate association. What are you gonna do?

JK: And when was True Hallucinations released?

TM: April [1993].

JK: And you're doing a lot of promotion for that?

TM: I did a lot of promotion work for it. It followed by a year my previous release, which was called Archaic Revival, and it preceded by a year — in other words, next April 15th will be the release of a book called The Invisible Landscape.

JK: That's a reprint, isn't it?

TM: It's a reprint but in the first edition no more than 1500 copies were sold. Most people have never seen this.

JK: No. I haven't. So what is the "Invisible Landscape"?

TM: Have you read True Hallucinations?

JK: No, I had a copy being sent to me, but it didn't arrive in time.

TM: Well True Hallucinations is like the easy-to-read narrative anecdotal version of what The Invisible Landscape is the no-holds-barred, all the footnotes, all the citation...

JK: A recounting of your experience at La Chorerra?

TM: Yes, though The Invisible Landscape is more talking about the ideas that came out of the event.

JK: Like Timewave Zero?

TM: It's in there. So are many of Dennis' theories.

JK: Hypercarbolation?

TM: Exactly. It's all there.

JK: Well, I've been doing some research. It's funny, when I told my editor I was thinking of doing a story on you, she was very excited. I first heard of you, I think I heard you on public radio somewhere, and I tracked down some of your books and interviews, found a set of your tapes... I actually saw you speak somewhere around LA.

TM: Chapman College?

JK: Yes, Chapman [note: Future site of Meeting of the Minds]. I even found a bootleg of one of your weekend seminars at Esalen that I listened to while driving up, so I've compiled quite a wide assortment of topics that I'd like to cover today. Lets start off with personal background here just to get some reference. You were raised in Colorado, in a small mining town. Does the town still exist?

TM: Oh absolutely.

JK: Where is it?

TM: It's called Paomia, Colorado. It's actually become quite hip because in the '70s and '80s freaks moved in and bought all the apple and peach orchards.

JK: When you say "freaks" what do you mean?

TM: Hippies. (laughs)

JK: Oh, hippies. There's all different kind of freaks...

TM: And they went organic, the whole scene went organic. So when I was there it was absolutely podunk. I mean if you read Time Magazine you were suspected of Left leanings.

JK: Do your parents still live there?

TM: My mother died in 1970. My father remarried later and lives in Mesa, Arizona.

JK: What did they do when you were growing up?

TM: My father was a... Paomia was the town where my mother grew up, actually. My father was a salesman for a very large industrial electrical equipment company — switches, transformers, this sort of thing — and visited mines. He had a lot of uranium mines and lead mines. He had a four state territory which he worked with an airplane. The thing which was unusual about my growing up is in this small town, I guess we were close to being the richest people in town on close to fifteen thousand dollars a year. This was a county in Colorado where even up into the 1950s thirty percent of the county was on welfare. So it was a real hard-scrabble sort of environment.

JK: Now, your brother is Dennis, you're the oldest, right?

TM: That's correct.

JK: Growing up were you maladaptive?

TM: To the extreme.

JK: What kind of social difficulties did that bring you. Peer harassment?

TM: Well I had bad eyes and I was uncoordinated. And in an environment where there wasn't winter, spring, summer, fall, there was baseball, football, basketball, and... something else...

JK: Hockey?

TM: (laughs) Yes. So I was marked out early as the peculiar one. Also, I was smart, so I was very accelerated in one dimension, very embryonic in another dimension.

JK: Were you picked on?

TM: There were bullies. There were certainly bullies who occupied a huge amount of my time. I mean on one level I think my supposed brilliant speaking ability comes from understanding that the problem is to keep them from killing you until the bell rings, and if you can just hold them five minutes longer by any means necessary, it'll be over. But as I grew older I became more seriously alienated. I mean, a lot of kids have those kinds of problems, but I began to realize that somewhere there was something called "Western Civilization" — there was philosophy, music, art, possibly even Jews. I mean, who knew how wild it could get. And here I was in this town where, like I say, Time Magazine meant you were an intellectual. So I left when I was 16.

JK: For?

TM: Los Altos, California, which is down on the peninsula. I lived there with relatives for a year. Then I finished high school in Lancaster, CA, which is a city up in the high desert north of LA.

JK: Ugh. So by this time what kind of exposure had you had to alternative sciences, philosophies, drugs, psychedelics?

TM: Oh drugs and psychedelics, not at all. I think I became aware of — oh I know where I became aware of psychedelics. It was the Spring of 1963. I read The Doors of Perception.

JK: And when were you born?

TM: November, 1946.

JK: November what?

TM: Sixteenth (double Scorpio). I read The Doors of Perception in early 1963. Then there began to be articles in the newspaper that spring about morning glory use. And I immediately started tracking down these morning glories. And, I just pursued that. I read everything I could...

JK: Did you experiment with Morning Glories?

TM: I did.

JK: Did you find them satisfying?

TM: I'm not exactly sure I would call them satisfying. They showed me that there was something there worth pursuing.

JK: So you attended college at Berkeley.

TM: Right.

JK: You studied art?

TM: Art history.

JK: Is that what your degree is in, a B.A.?

TM: No no, my only degree is — I switched majors. My only degree is Bachelor of Science degree in Ecology and Conservation. It's complex to explain, but I arrived at Berkeley the year after the free speech movement and in an effort to keep the place from blowing sky high they had told this left-wing professor that he could have an experimental section of the university. But out of the incoming class of 15,000 or whatever it was, he could only take 150 freshman and design a special curriculum for them, and classes would not be in the regular university, they would be in an old frat house.

JK: This was a pilot program?

TM: Yes, it was an experimental program. So that's what I did. It was this thing called the Tussman Experimental College.

JK: Is that still around?

TM: Oh no no, it was run for a total of 6 years and then it was discontinued.

JK: Hmm. Okay. I'm going to shift gears here and get back to some personal questions. I didn't see you pull up, but what kind of car do you drive?

TM: (laughs) I drive a '75 Ford Grenada.

JK: Really?

TM: My only car and I'm fiercely proud of it.

JK: How long have you had it?

TM: I've had it for five years. I bought it with 12,000 miles on it, now it has 80,000 miles on it.

JK: Hmm. Do you have cable TV?

TM: No. I don't have TV period.

JK: No TV?

TM: Well I have a VCR. I don't have an antenna to any broadcast television.

JK: As far as entertainment goes, what is your favorite venue for the arts? Music, movies...

TM: I listen to a lot of music. In terms of time commitment, I listen to music a lot.

JK: What's your favorite musical genre, style, or composer?

TM: I've been listening to a lot of house music.

JK: Really? Like techno?

TM: Techno, house, ambient, you know. Well I'm in that business partially. Also people send me stuff, and I'm very interested in it. I think it's very exciting music. I listen to a lot of baroque music, I guess. Those are the two categories. I have a lot of Rock-n-Roll but I don't listen to it much anymore. I have a lot of '80s New Age stuff which I've found doesn't wear well at all.

JK: As far as house music goes, do you have any groups you like?

TM: Well, I really like Coil. I really like Orb. I'm working with Szvuy, which is an English group. I'm releasing a CD this Halloween with Spacetime Continuum. In fact I'm doing a rave on Halloween.

JK: While we're talking about it, tell me how you got introduced to the rave scene.

TM: I went to England and I gave lectures — the bouquet of flowers, pitcher of water, chair and podium lectures, and a lot of ravers came, and they came up to me and just sort of swept me along. They said, "You've got to see this scene. We're doing what you're talking about." Which seemed to me to be true. It's an incredibly — I mean I'm totally up on youth culture. I think media has done an incredible savaging of youth culture. I don't know what it was like to hang out with the Sex Pistols but it's lots of fun to hang out with the Shamen, or the various DJs, and you know there is a very lively house scene in San Francisco.

JK: What do you think the driving force of this scene is?

TM: Do you mean in terms of cultural agenda... drugs, or money?

JK: In terms of cultural agenda.

TM: Are you familiar with my notion of an Archaic Revival?

JK: Sure.

TM: Well there it is. This has been going on throughout the 20th century.

JK: But why are the youth of today so into it? What void in their lives in this rave scene fulfilling?

TM: Well England, which is where this was born, like so much, has been a Thatcherite hell for 15 years. A whole generation of kids have grown up in those steel towns in the midlands with absolutely no hope of bettering themselves and absolutely no faith that mainstream acculturation in Britain held anything out to them. And rather than producing an anger movement, like punk or something like that, it has produced a dropout movement more like the sixties. People aren't angry, they're just not participating. They're creating their own value systems and I think it's very healthy. I think a lot of this kind of thing comes out of the unconscious. Nobody sits around and figures this stuff out.

JK: Do you think this is an attempt to step away from cultural norms to reprogram their values, or at least deprogram the messages they receive from corporate media culture?

TM: Yeah, I think they're very aware of media culture and they're very anti media culture. For instance, in the clubs in London there's no stage, there is no cult of celebrity. The dancers are the show, the performers are pushed into the corners or locked in a box on a different level. And the whole macho rock-n-roll groupie destruction-derby psychology is not welcome in these scenes. People are a lot cooler. To somebody as cynical as I am a lot of it seems Polyannish. Songs about saving the wetlands and stuff like that. But on the

other hand it's real and it's the right message. The right message is not the skinhead message or the "become a yuppie stockbroker" message. The real message is ecology, community, and feeling. And they've got it right. Now they have to get through the gauntlet of evil record companies, the communications media...

JK: Exploiters?

TM: The exploitative machinery waiting to make t-shirts and...

JK: Movies?

TM: Exactly.

JK: So when you're called upon to join one of these ceremonies what sort of function do you fulfill?

TM: You mean at a rave?

JK: Yes.

TM: Oh I go on stage and I improvise some kind of stem-winding soliloquy to contact the self-transforming elf machines in hyperspace (laughs). It seems sort of weird to me, you know, a 46 year old man at three in the morning hanging out with a thousand loaded teenagers exhorting them to the eschaton.

JK: You use the term eschaton to describe some kind of singularity at the end of time. What is your definition of eschaton?

TM: Well all esch words derive from the greek notion of something final [gr. eskhatos - last]. So eschatology is the study of last things. There is a branch of theology where you study the end of the world and the general judgement and second coming. So the eschaton is the last thing. That would be a definition. It just simply means the last thing.

JK: Interesting. Who would you consider to be your peer group?

TM: My peer group?

JK: You know, contemporaries... collaborators.

TM: You mean people who I agree with? Who I'm most comfortable with?

JK: Close friends, people you find interesting or bounce ideas around with on a regular basis.

TM: Did you read Trialogues at the End of the West?

JK: No, I haven't.

TM: That was a book that I wrote with Ralph Abraham and Rupert Sheldrake, who I would consider peers. We don't see eye to eye on everything, but we get along very well as people, and we spend a lot of time together. Do you know who Sheldrake is?

JK: No, I know of Ralph Abraham.

TM: Well Sheldrake is a very controversial British theoretical biologist who wrote a book called A New Science of Life that Nature, the British journal of science, said was a candidate for burning. It created quite a controversy.

JK: Who else? What about in the literary world? Do you have any favorites?

TM: You mean who do I like or who do I spend time with?

JK: Either or?

TM: Well, I read and spend time with Tom Robbins, he's a friend of mine. Great guy. I read Steve Ericson, Lucious Shepherd, I don't know these guys but I would like to know them. I think they're very exciting. Steve Ericson wrote Tours of the Black Clock and Art Dense and Rubicon Beach.

JK: So what do you do for fun?

TM: What do I do for fun...(pause, thinking?)

JK: You know, leisure activities.

TM: Well I'm going through a divorce right now so excuse me if I can't remember (laughs).

JK: Do you want to talk about that at all, or say a few words?

TM: Well, it's certainly just punishment for being stupid enough to get married in the first place. It's kind of a little self-correcting mechanism there.

JK: So what is your relationship like now? Your family is still here in Occidental?

TM: Well my son lives with me, he's just at school.

JK: Your son?

TM: Yes, I have two children. A son who is 15 [Finn, now 21] and a girl who's twelve, about to turn 13 [now 17]. They were definitely the best thing to come out of the relationship, but I don't blame the personalities involved. I think marriage is a curse for everybody. I'm not too crazy about monogamy either. These are social styles that have very disruptive consequences on the psychic life of the individuals. But I was married when I was 30 years old. I hadn't really thought all this through. It was the only bourgeois value system I ever committed to, and as it turns out I should have stuck with my consistency.

JK: While we're on the subject of consistency, when someone asks Terence McKenna to speak, what topic is most requested?

TM: All they want to talk about is drugs.

JK: And how do you feel about that?

TM: I wish they'd go to the library or buy a tape or a book. I mean, I'd like to move on. I've said everything I have to say at least ten times, and, you know, I said it well, I hope. So, enough already.

JK: It seems to me that, when talking about drugs, you just elaborate a few simple positions over and over. Why is that?

TM: Well really, you see my position on drugs ultimately is that what I think about them is not important. What's important is that people be allowed to check it out for themselves. So consequently, if I'm succeeding at this my crowds should not get larger and larger, people should come once or twice, hear it, understand it, and go get a life.

JK: So how do you feel about having devotees who preach the McKenna party line, call you a guru, want to save your fingernail clippings for future generations...

TM: Well, as I've said on this subject if you think I'm a guru you haven't taken enough psilocybin (laughs). And I don't know what to tell people like that. "Take more! You're not figuring it out!" What makes the whole psychedelic thing so exciting to me is that it's for ordinary people. I am an ordinary person. It's not false humility, it's true. And so it's for ordinary people then there's nothing to be learned from some advanced personality — assuming such a thing exists. And, what's so wonderful about psychedelics is their effectiveness and how democratic they are. That's what I would like people to get on to. In fact, a lot of people do. A lot of people pass through the thinking I'm a guru and take enough trips to understand that no, I was just a witness. I was just a witness.

JK: What were your initial goals when you first started on this journey. Coming back from La Chorrera you had quite a lot of information to mull through. Has everything sort of fallen into place since then or were there a lot of stages you had to go through to get where you are now?

TM: You mean did I ever drift away from it?

JK: Yes, sure.

TM: No, I never drifted away from it. Once I got the concept... I'm incredibly patient. I mean, for instance, my prediction of the singularity in 2012 is 20 [now 25] years old. The prediction is 20 years old. It's something that I've lived with for 20 years and I'll live with for 18 more. I'm very patient, but my attitude is that this thing that went on at La Chorrera was special enough that it's worth spending one life on. And it'll be my life. What I spend most of my time doing is reading philosophy, history, science, sociology, literature, and what I'm

trying to figure out is am I out of context? Or, to put it another way, am I crazy? And the answer is no.

JK: No?

TM: Well something very unusual happened down there, and the world is in a very unusual circumstance, which most people don't seem to perceive. Weather we're talking about Bill Clinton or someone living under a bridge, we have never been here before. This is not business as usual. Management techniques that worked in the past are not going to work in the future.

JK: So what sustained you financially through those dark years in the '70s and '80s when Terence McKenna wasn't a big name?

TM: Well Terence McKenna wasn't a big name but O.T. Oss was.

JK: Ah.

TM: And, umm... I am O.T. Oss.

JK: Of course. So you lived on the royalties of the Magic Mushroom Growers Guide alone?

TM: And something which we should probably describe as "consulting".

JK: I see (laughs).

TM: (laughs loudly).

JK: (regaining composure) Well, I guess that's what I was shooting for with that question.

TM: Yes, there was a lot of "consulting" in the '70s. (laughs).

Stay tuned for more...

Terence McKenna Interview, Part 2

James Kent

We're getting into really deep territory here now. Hold onto your seats

James Kent: How did your success with the 'Magic Mushroom Growers Guide' steamroll into a career?

Terence McKenna: As the new age got going, say '80, '81, '82. I just found it incredibly irritating, and I was busy consulting and staying home and I also had small children, but I just thought it was such a bunch of crap.

JK: Talking about crystals and such?

TM: Yeah, the crystal, aura, past life, channeling business and I said, you know, why don't these people check out drugs? What's the matter with them, my god? And finally someone persuaded me to say that in a public situation, and it's been constant ever since.

JK: Could you be more specific about 'saying that in a public situation'?

TM: Arthur Young invited me to give a talk at the Berkeley Institute for the Study of Consciousness and there were people there who were from Esalen. So from that came the invitation to Esalen, and there was a very far out guy at Esalen who has since died who really believed in psychedelics. And all through the '80s, which were kind of a Dark Age for this stuff, they held a conference every year and paid everybody to come. Anybody who was a researcher in psychedelics or who even had strong opinions... and we all got to know each other. That's what Esalen did; it actually created a community by bringing us together from all over the country once or twice a year. Stan Grof, Gordon Wasson, John Lilly, Dave Nichols, Myron Stolaroff, Rick Yensen... virtually anybody who now has any visibility in the

movement got to know everybody else during those years. And we all proceed in different directions, you know. I mean, Sasha is the great synthetic chemist, I'm the plant advocate, Grof is the transformative Freudian... people have their own bailiwick.

JK: So what do you hate most about what you do? What just burns you up every time?

TM: United Airlines. (Laughs) I'm getting nutty on the subject of how much I hate to fly 'cause I'm convinced that these air flights, especially the ones to Europe where they fly really high, you know, they recirculate the air, and if one person has the flu... So you arrive in Hamburg and you're supposed to get your act together and give a talk and you realize you're getting the flu. I hate the flying. I'm a hermit. I mean, my natural inclination is to be alone. I have been alone at times in my life for very long periods of time with perfect

contentment. So it's kind of strange that I'm cast in this very public role.

JK: What would you most like to spend your time doing?

TM: I like doing some kind of research with a lot of books and a quiet setting. I mean, if I were not me for instance, I would go to a company like Voyager in L.A. and say, 'Hire me to build a CD-ROM of Ulysses.' And I'd take the text and put it on the surface and then line up the streets of Dublin and all the stuff behind. That's the kind of thing I like. I like tight, meticulous work. I've had jobs like insect specimen preparer in museums and art conservation and all these little, tiny, nitpicky kind of things. I really like that 'cause I can think when I

have a job like that.

JK: How much of what you do do you feel is just pure crap, just absolute, well... garbage?

TM: What I hate is repetition, and that's what drives me crazy is the pressure to be more creative than you can be unless you repeat yourself. I would rather give three talks a year and have each one be absolutely stunning and unique than give 25 talks a year and have them be these weird clones of each other.

JK: What do you perceive your potential to be now, as far as what you can accomplish in the future?

TM: Well, I've laid out a theory that's very radical, but very complete in the sense that modern theories must be founded in mathematics. Otherwise, you don't have a theory, you have an idea. So, this theory is very complete, but very radical. The spirit in which I do intellectual work is closer to science than to anything else. I like criticism. I think there should be rules of discourse and rules of evidence. And if you can't stand behind your product you should prepare to abandon ship. So, the role I will play over the next 18 years, god

willing, is advocate for this peculiar notion, trying to communicate it, and trying to invite a critique of it. I would like to have the best minds on the planet tell me where I went wrong. I'm willing to accept their judgement, but I want to have the dialogue.

JK: Who do you feel would be qualified to evaluate what you've pulled out of the King Wen sequence?

TM: Good question. Well, the problem is I have reached competent people. Ralph Abraham for example. But you think in your naivete that if you've discovered a world-shaking principle all you would have to do is run into the street waving it and people would say 'This is great, he's discovered a world-shaking principle!' In actually trying to carry it out you discover that people say it isn't a world-shaking principle. Or they say, 'You didn't discover it, this was discovered in 1830 by Wemmeholtz.' (Laughs) And your enthusiasm and certainty dissipate in the face of this peculiar attitude towards innovation. So, I've learned the only way to truly innovate is: big ideas must have advocates, so I will argue my position in any forum with anybody until it becomes clear to me that my ideas are absurd. And over time,

an intellectual environment is like a natural environment; ideas are selected by natural selection. The better ideas survive.

JK: Meme wars...

TM: Yes. You have to get your candidate onto the playing field.

JK: So, specifically, if you could cut it down to 5 or 6 sentences, a sound byte, let's say, what is your agenda?

TM: Well, agenda implies...

JK: If you're advocating something...

TM: I think the world needs to awaken to the presence of the transcendental other and its accessibility through psychedelics. This is the single most important discovery of the 20th century. It came through anthropology. It came through a more careful examination of the societies of people previously dismissed as barbarians. And this discovery is as challenging and potentially capable of refashioning our institutions as the discovery of the New World was for Renaissance Europe.

JK: So how would you gauge your own historical importance?

TM: Well, if I'm right I'm Newton, if I'm wrong... I'm crazy. There's no middle ground. Or at least I like to think there's no middle ground because I would like it to be that way. This is the scientific impulse to force clear resolution of the data. I've discovered enough already about the I Ching that... I mean these matters are very technical, but I feel I'm on pretty firm ground. I'm waiting to meet the person who can overthrow this. That's who I want to meet, the person will just sit down and say 'Whoa, my dear, hello, you've completely forgot X,' and I'll say 'Oh!'

JK: How do you cope with the power that you have, now that you have people listening? Do you ever worry about accountability coming into play here?

TM: No, I don't. I suppose I should. As far as the following... I just blame this on sort of the childishness of our age. Look at Steven Hawking. Talk about an unlikely person to inspire groups. I mean the man is a theoretical physicist who's seriously handicapped and barely comprehensible. But lord, by minions! This is very hard for me to relate to and understand. I meet so-called celebrities and the people who take themselves seriously are unbearable. This whole culture is a bunch of hype. Did you see Madonna's movie?

JK: Truth or Dare?

TM: Yeah... where they bring somebody back to meet her... Kevin...

JK: Oh, Kevin Costner.

TM: Yeah. She turns to the camera and says, 'Why is it that if you're a celebrity everybody thinks you should meet other celebrities?' And this is because we are essentially a very infantile culture. I have a great faith in my own ineffectiveness. Anybody who thinks they are pushing the world over the brink or saving the world from going over the brink is severely deluded about the nature of metastable systems. I wish people would just pass through me on their way to the information, and the information is to be found in books, of course.

That's where it is.

JK: What sort of problems have you had with government authorities?

TM: None.

JK: None? In your entire life?

TM: Oh, no. Well, when I was a hashish smoker years and years ago in the '60s I had many problems with the American government, but we seem to have gotten that all ironed out. As far as this public career of drug advocacy this question is always asked, asked a great deal. Nobody has ever called me on the phone or even allowed me to be certain they were there, you know. No pressure, no matter how subtle, has ever been put on me.

JK: Well, you're also very subtle yourself. You're not as outspoken as say, Tim Leary was. You're not a rabble-rouser...

TM: If you follow me around enough I can be baited into rabble-rousing. People say, 'How come they don't come and get you?' and I've said it's because I use too many big words. They don't know what this is. They don't care. And anyway, my theory about drugs and the government is where money is not being made, they're not interested. What they're interested in are people making \$100,000 a day dishes out blow in some rat's nest somewhere. Since I'm not making any money off illegal drugs it must be fairly dull to them I think.

JK: OK, lets discuss hyperbolization. Did Dennis come up with this on fly, sort of out thin air?

TM: Out of thin air.

JK: So if I understand you correctly: at La Chorrera sonically induced superconductivity was used to intercalate psychoactive molecules into the rungs of DNA...

TM: Close, say it again.

JK: You claim that Dennis used his voice to sonically induce a state of superconductivity that could bind or 'intercalate' psychoactive molecules into the rungs of DNA.

TM: Yeah, to intercalate these molecules between the rungs. Yeah, that's it in a nutshell.

JK: Are you the only specimens to try that?

TM: Yes, to my knowledge.

JK: So it's never been attempted since then?

TM: Well, it was hard to find a volunteer willing to go bananas for three weeks, which is what happened to Dennis, you see. As Bill Burroughs said, 'We need a worthy vessel.' (Laughs)... It would be very interesting to me, and maybe... You asked about my agenda. I suppose this is on my agenda, to gain enough attention that serious money would be spent looking at some of these assertions. I mean, can you use sound to intercalate drug molecules into DNA? This question could be settled with test tubes. You don't need human beings, you just need square wave generators and...

JK: Isn't Dennis sort of travelling that route?

TM: Well, yes, but these chemical companies, they're not always hiring him to check out his fantasies of early adulthood. Dennis' attitude toward all this is very ambivalent, because he's the guy who basically ate the shit end of the stick. Are you going to interview him?

JK: I'll be catching up with him at some point, yes.

TM: He looks older than I am, but he's 4 years younger than I am. I get the feeling that I'm regarded as... let me reach for the word... I'm not finding it. It's somewhere between obstreperous... uh... A lot of people would like [La Chorrera] just to go away. Nobody saw as much as I saw. People saw lesser pieces of it. A lot of people are in certain levels of denial about what happened. Apparently this is the normal course... you get old, you forget all that crazy shit you were into. You go to work for a corporation. You get life insurance. It hasn't worked out for me that way. I saw too much. I know too much. They're gonna have to prove it to me that it didn't happen. Sneering has no effect on me. I'm immune to it. And Dennis' view is, I think, that he doesn't really know what happened and he doesn't really like thinking about it because it lies right next to this issue of going bananas for 3 weeks.

JK: How do you feel about insanity?

TM: It's an occupational hazard.

JK: Do you fear it?

TM: Mhmm. I don't think anybody could do high doses of... I mean, some people are so lumpen that they don't connect to the implications. You know, they take 10 grams of psilocybin and [in his best bong-toke Cheech and Chong voice] 'Wow that was really fuckin' weird, maaan.'

JK: (Laughs)

TM: Right. So what about that? And they somehow blow it off. But I think the more intelligent you are, the more terrifying psychedelics become because you can't talk yourself out of it. You can't just say, 'Oh, a buncha weird shit,' you know. You took it because you took it seriously and now it's taken you seriously.

JK: Let's talk a little bit about this spiraling hum Dennis produced. Have you checked it out? Is it a key, is it a note?

TM: Well, I'm not... I have a total blind spot in the realm of musical nomenclature. I suspect that a musician of a certain type could listen to this and say, 'Oh, that's a...' Because here's what it is: [makes an ooooweeeee noise that ascends in frequency at an accelerating rate] Now, that kind of ascending thing is obviously a smooth function of some sort, and someone who understood acoustics or music would just say, 'Oh, that's an asymptotic something or other.'

JK: Have you ever taken the wave and fed it through a sound mapper?

TM: No. See, there's never been money or... there's a kind of ambivalence about looking at all this stuff. I am not competent... I was not competent to do the experiment at La Chorrera and I didn't do it. The fact that the people who were competent to do it are phobic of it raises a certain problem. All of this, we've at times made lists of experimental approaches to various aspects of what was asserted about La Chorrera. There are many, many different approaches you can take. It's just they all require time, money, and staff.

JK: Are you familiar with the work of H.P. Lovecraft?

TM: Absolutely! I cut my teeth on H.P. Lovecraft. Dennis too.

JK: It seems that a lot of the imagery you pull out of psychedelics, especially this insectoid creature...

TM: Do you associate it to Nyarlotepe, the crawling chaos, or Cthulu? (Laughs)

JK: Well, I was thinking of one diety in particular, [name omitted for safety of readers], who appears only within states of mad raving. Hey dwells in the intersection of time and space, and is referred to as the blasphemous evil which lurks just beyond the silken veil...

TM: Well, Dennis told me recently that he inhibited his MAO with some not very good ayahuasca, and since it was so boring having done this he smoked some DMT with his MAO all inhibited. And he said it was appalling. And he said you just feel this thing, and it's a mind, and it's there, and you're locked into it like that. He said it says, 'Behold, oh mortal, if you can, the form of (unintelligible growl)!' (Laughs)

JK: And of course every beast in Lovecraftian lore is revealed exactly like that...

TM: Yes, Ya Shugothoth...

JK: Shub Nigguroth...

TM: ...The goat with a thousand young! (Laughs)

JK: Let's talk about DMT for just a moment. You obviously have a lot of well thought out opinions and ideas, but you're very easy to dismiss as a crackpot because of these things you say about DMT and self-dribbling jeweled basketballs and such.

TM: Poke away, if people want to dismiss, they should at least...

JK: Right. Your answer, of course, is to take the ten minutes and see for yourself.

TM: Yes, it's only ten minutes.

JK: Why do you continue to pull it out of the closet? Don't you think there's a point where you say, 'I've talked enough about the DMT elves. I don't want to talk any more about the elves. There are other, you know, important things.' I'm curious as to...

TM: Well, let's see. DMT is the most interesting thing I've ever encountered. Essentially what you're saying is that I'm not being very strategic, and wouldn't it be better if I just didn't mention it. But you're talking to someone who is a profound thinker. I mean, you couldn't discover the timewave and not be a profound thinker. So the idea that I could either speed up or slow down the unfolding of the thing is completely at variance with the mystery I'm trying to articulate. And I do think that in terms of assertions made, the assertions I make about DMT are not overly outrageous, and the means of proving them are simply to do it. Other people make mad assertions, but they're not so easily overcome. I've asked people to smoke DMT in order to disprove what I'm saying. I don't think they will, and I think there's a lot of arguing about what goes on and I don't think people do high enough doses... But I think that it's too accessible; it's not hard. I mean, you know, most people think you have to trek up a jungle river or go to Jupiter or something like that. This is something

interesting that you can do in the confines of your apartment. (Laughs)

JK: I've heard people say that you've adopted DMT as a clever vehicle to put yourself in the forefront of the psychedelic community because DMT is such an obscure compound and there hasn't been much exposure of it. So it's almost like you've latched onto the one molecule that no one wants to latch onto because...

TM: Because it's so bizarre? When I smoked DMT for the first time it was 1967, and I figured that there would be pandemonium on the planet within the next three weeks. I thought surely you can't sit on something like this, but it turns out you can sit on something like this. So, I have always been amazed by how little it's discussed for a couple of reasons. Number one, it's so dramatic. Number two, it's so apparently harmless. It violates my notion of how reality is. I mean, this is designed for people who jump out of airplanes on Saturday afternoon to get their rocks off. And yet nobody's interested, you know. It's almost as though it is not rational. In other words, it's almost as though it carries its own protective shield or something. You don't hear about this until it wants you to hear about it, or

something.

JK: Before I came into contact with anything that you had to say about DMT all I heard about it was it's a nightmare, stay away from it. It's a rollercoaster ride through hell.

TM: (Laughs) Well, now who could stay away from something described as a rollercoaster ride through hell? (Laughs) I mean, you could spend 5 million dollars and build a rollercoaster ride through hell and you would expect people to line up to the horizon for it. (Laughs)

Hellcoaster!

JK: I want to talk a little bit about the elves. I think that when you say DMT elves people picture, you know, Tinkerbell flying around.

TM: Well, this is what I call the Disneyfication of elf land, and people expect cheerful friendly places that they know and can recognize. But it's much wierder and much more scarier than that; more like the lower-east side than it is like Wonderland.

JK: So, when you say elves, they're not in the shape of human elves.

TM: No. Here's what is elf-like about them. You have the impression that you're underground. Elves live in the center of the earth. They make things. This is what elves are traditionally said to do. They are makers of jewelry and fine machinery. These things are involved

in language somehow. They're involved in pun and riddle. This is standard elf material. And there is this very peculiar kind of out-of-control, madcap humor. Also, elves are tricky.

JK: Plus there's the singing...

TM: Yes, and the singing. I haven't carried out a study of the evolution of the image of the elf in the Western mind, but I think probably Disney and Grimm obliterated whatever had come before. But these things up until that time were very ambiguous creatures of the

threshold and woodland. They were known for stealing babies primarily.

JK: Have you ever considered they might be a reflection of some sub-atomic phenomenon?

TM: Quantum creatures? Yes, I've thought of that. Because I take very seriously the question, 'Where are they?' You know, are they here but invisible? Are they locked in the quantum realm? Are they on a planet around another star that we can somehow punch into on

DMT? I take it seriously. I think it is like any other phenomenon of nature, it should be studied on its own terms.

JK: Do they always seem to know you're coming?

TM: Well, that may be an anthropomorphization. They cheer when you arrive.

JK: You can't sneak up on them? (Laughs)

TM: I don't think you can sneak up on them, no... (Laughs) Whether they're looking at their watches and waiting, I don't know.

JK: It would seem that smoking DMT is now the doorway into their domain. Why don't they have some other way to move into our world, some sort of reciprocal vehicle to make the journey? I guess what I'm saying is... are there certain conditions in a person's life besides

smoking DMT which you feel would make them accessible to this... or would make them the perfect vehicle for this sort of elfin mischief to occur?

TM: I would really hope not. That's my definition of madness. That's why I'm not interested in the 'do it on the natch' people. I think they're sailing towards the cataracts. The last thing you want is to be able to do it on the natch, 'cause if you can do it on the natch there's a possibility that you cannot fucking stop it. (Laughs) I mean, I would be very alarmed if any sort of psychedelic effect established itself in ordinary consciousness. These are radical alterations of consciousness sustained by peculiar pharmacodynamics. You don't want that

settling down on your tea party.

JK: You're fond of the notion that these elves may be ancestors, or at least that's the party line as far as shamans go.

TM: Shamans say they're souls, yes.

JK: Does it follow necessarily that they're human ancestors or just 'those who have come before'?

TM: Well, they're more like a human being than they are like an animal because they possess language. The two things that human beings do that animals don't, they do. Number one, they communicate linguistically. And two, they're fools for technology. I mean, it's a strange technology, but they're no weavers of cocoons, these elves. They make stuff, all kinds of stuff.

JK: (Laughs) You obviously, (or maybe you don't) notice some similarity between your accounts of the DMT experience and catalogs of near death experience from the beginning of time. What's your comment on this?

TM: Well, I mean, I certainly moved here without great conviction or certainty. You ask what is my opinion and I give it and I think it doesn't count for much more than that. But this is the central problem or the central dilemma of modern science: what is the status of spirit in relationship to organic life? And for 300 years the answer has been 'none whatsoever.' However, we're not getting as far with reductionism, empiricism, and behaviorism as we thought it would carry us. It appears that we've left something out. I think that it is this

awareness of spirit, whatever that means. It means an architecture of connectedness in an invisible dimension. I think this is what the DMT establishes so dramatically. And that's why it's such an important, pivotal issue.

JK: Why do you think that smoking it is so important?

TM: As opposed to injecting it? Oh, because it's much more dramatic. This is one of the things that have caused science to not understand what I'm talking about because pharmacologists love to inject people with drugs. This is because they can get an absolute,

quantified dose in the barrel of a syringe. I have not shot DMT, but I've talked to many people who have and I've studied the medical reports. It is nothing like smoking it. It comes on slower, it does not reach such an intense peak, and it goes away slower.

It's very hard to talk about DMT. The wildest metaphors are in fact lies... even mine are lies. There is something which happens which lies beyond the possibility of description and that's the strangest part of the DMT experience. And then all the parts you can describe

which people say 'Jeez, that really sounds weird...' - that isn't it.

JK: What countries is DMT illegal in besides the United States? Do you know?

TM: I don't know. I suspect in practical terms very few. Probably it's illegal in all the high-tech industrial democracies because they will all have signed the United Nations convention on narcotics. It is not actively suppressed anywhere in the world because, A, there isn't

much, and B, it's not posing any kind of a medical problem. I mean, the way you judge a drug if you're trying to figure out whether to suppress it is to look at emergency room admission statistics.

JK: It doesn't really seem to be the kind of substance that would cause a public health threat. I never understood why it was illegal, except that it just falls into that category of powerful things we don't really understand...

TM: It was made illegal when they made LSD illegal. They made everything illegal without any evidence, medical or otherwise, being presented. And then when the feds decided to make everything illegal they used the California statute as a model... and again no medical

or scientific data was presented. So, if a person had the money, the laws making DMT illegal could be pretty strongly challenged. Also, the fact that it occurs in the human body... that has never been debated in a court. Can you make illegal an actual human metabolite?

JK: Transformative language is something you talk a lot about. You say, 'If any significant change is going to be made within society, you need to first transform the language.' Do you have any concrete idea about how one would go about doing that, or is this just a notion

that you're fiddling with?

TM: Well, no. I don't simply mean speaking more clearly or something like that. I mean that language can... Apparently the human neurological architecture is such that incoming audio signals can either be processed in a low-dimensional audial environment, or in a much richer, higher-dimensional visual environment. When we hear great poetry... what we call great poetry is language which triggers this active high-dimensional visualizing capacity. I think language aspires to visibility, and that drugs like ayahuasca are allowing the people who use them to experience a kind of telepathy. It's not a telepathy of you hear what I think, it's a telepathy where you see what I mean. The fact that the chemicals in ayahuasca, DMT and harmaline, both occur in the human brain, and that they carry with them this peculiar transformation of language, pushing it toward the visible, suggests to me that in the human brain, the language functions are not yet genetically established and defined, and it could be that we're just a one or two gene mutation away from having our language go

from radio to TV essentially. And what this will make, if possible, is a much richer field of communication. People will be able to both communicate and receive communication about much subtler and more finely delineated matters.

JK: You also talk about an actual physical substance that will spontaneously take the shape of your thought.

TM: Well, now we're getting into eschaton territory, although it is claimed by these off-river tribes like the Juarani, the Agaruna-Jivaro, the Witoto, these kinds of people... that the shaman does what he does with this magical, iridescent, blue phlegm, which they regurgitate. It was thinking about that, taking those reports seriously rather than just dismissing it as ignorant Indians, that led Dennis down the path toward hypercarbolation. We tried to take seriously the notion that you could actually physically change your body chemistry in very

profound ways under the influence of psychedelics.

JK: You use the word magic when you describe the fabric of reality and dismiss with the wave of a hand the laws of physics...

TM: Well, not quite with a wave of a hand, but...

JK: Well... what exactly do you mean when you say magic? Do you have a hard definition of it or is it magic in the sense of...?

TM: No. I think Arthur C. Clarke gave the best definition of magic. He said magic is a technology you don't understand. I just don't understand the hubris of modern science. As we look back at the past every society has assumed that it had 95% of the right answers... and was wrong. So, why should we make the same stupid assumption? And of course we're wrong, reality is incredibly mysterious. Science shines its light brightly in certain corners, but it doesn't illuminate the universe. It doesn't even illuminate the universe of the human

body, let alone the human mind and soul.

JK: So what do you plan to be doing December 22, 2012?

TM: Paying careful attention. I will not be organizing an integrated worldwide group of rock festivals and performances, I hope. In fact, use this against me if I am.

JK: (Laughs) Some clever promoter might latch onto it.

TM: Well, I'm sure there will be those who cash in. People ask this question. It's funny to be at the center of all this. I'm not very attached. I understand how unlikely my assertion is... that it's a trillion to one chance. On the other hand I understand the consequences of my being wrong... no big deal. People are wrong all the time for crying out loud. I also know that this theory, which I feel is very strong... if I were off by 1%, the theory tells me I could be off by 10 million years. Well now, if I'm off by 1%, I say I'm dead on. But the theory says,

well no, it isn't December 21, 2012, it's December 21, 2012 plus 10 million years. So, a reasonable person would expect nothing to happen. However, an intellectually honest person would give the situation every opportunity to overturn that expectation.

JK: Are you going to be watching Headline News? (Laughs)

TM: Well, no. The real answer to your question is if I'm right, I won't watch alone, because it won't sneak up on us. If I'm right, then by 2005, 2006, people will be looking at this theory to provide answers because what's going to happen if the theory is right is that it's going

to get stranger and stranger until finally no amount of face-saving and explaining will be able to hide the fact that singularity stalks the planet.

JK: Don't you think that people tend to ignore strangeness though? Strangeness happens all the time and yet they turn on their TV at 8 o'clock and it's gone.

TM: Well, they have thresholds. The world we're living in is completely bizarre compared to the world we were living in 10 years ago. I mean, AIDS, multimedia, the disappearance of communism... If you had told somebody 15 years ago that within 15 years sexually transmitted diseases would threaten the human species, communism would be a memory, and people would be spending most of their time in machine-created environments, they would have been very puzzled. And this is just the beginning. We haven't hit the steep

descents into novelty, which come after the turn of the century.

JK: And you firmly believe there's some sort of art to this existence. It's a work of art...you say it's syntactical in nature like a musical score.

TM: Yes, it's like a musical score. It's a complicated musical score.

JK: That's why I asked earlier if you've ever thought about putting the timewave through a sound synthesizer.

TM: Other people have suggested that. I'm simply not proficient enough with understanding sound and music to be the person to do that.

JK: After the event at La Chorrera there was a period of time when you were not mentally stable, when you were very unbalanced in a lot of ways.

TM: Well, there was a lot of debate. There was never an actual incident where people... I managed to avoid [a medical pronouncement]. There was just a lot of anguished conversation among my friends. Basically, my problem was that I had a one-track mind. I was obsessive about this stuff coming out of the I Ching and the timewave and the end of history and hypercarbolation and I would take roomfuls of people prisoner and hold them for up to 14 hours at a crack. Which is, of course, a sign of mania. On the other hand, I doubt

that Shakespeare's plays or Moby Dick or Mont St. Michel were built without somebody giving a damn about how it came out.

JK: Now there are other people who believe that the last page of the Wall Street Journal is where the CIA communicates, and they have theories and charts and cryptography all mapped out, and it's all very elaborate... What's different between what you're doing and

what they do?

TM: Well, the timewave predicts the past, and the past has happened, so there isn't a whole helluva lot of fudging you can do. Predicting the future is no challenge to anybody because who can rule you out of bounds? I think that, based on its ability to predict the past, judged by the ordinary ways we judge predictive success, that the timewave should be taken seriously. It isn't a mystical doctrine, and I don't defend it with mystical arguments. I put it forward as an exotic scientific hypothesis to be tested and overturned by the usual

methods.

JK: I think I heard you once say that the DMT experience mimics itself in dream states sometimes. Have you heard accounts of this happening, or is this just a personal experience?

TM: Oh, no. It's a personal thing and people have told me about it. What I actually said was if you smoke DMT, if you have the experience then, at some later time, even years later, you will have a dream in which a glass pipe is produced and the DMT flash actually occurs. And it occurs so dramatically in the dream that it suggests to me that this most dramatic of all psychedelic experiences is almost like a fingersnap away. There's some series of autonomic functions that if you could take hold of them - and biofeedback says you can

take hold of any function you can monitor - if you could take hold of this particular function you could have a DMT flash at will.

JK: But that's like you were saying 'on the natch.'

TM: I don't think anybody's having DMT trips on the natch except in dreams. But if that were possible, you see, it would just change the entire discussion... it would end it. It would put it in the same category as sex. You're self-equipped; therefore nobody can stop you.

(Laughs) JK: What defense do you have from people who dismiss you as a crackpot and say that any theory you come up with certainly can't be of any importance because you're not credentialed? I mean, what sort of credibility do you have?

TM: Well, these people have clearly never read Thomas Kuhn's *The Structure of Scientific Revolution*. The only people who ever advance science forward are the people who come from the edge, from the outside, usually amateurs, usually not institutional. The way scientific advance happens is through completely irrational bursts of brilliance. Then they create a scenario of careful research and cross-checked data and slow accumulation. It doesn't happen like that. People are free to dismiss me, I don't even necessarily say they're wrong. The ideas need to be judged on their own merit. If they're saying they can't be true because I take drugs, that's like saying 'It can't be true because he's a Jew' or 'It can't be true because he's a homosexual.' These are not sufficient reasons to dismiss anybody's ideas.

JK: As an individual, what is your goal, besides sustaining yourself monetarily and not starving in the streets? Do you have some sort of goal that you would like to accomplish before your meeting with the infinite?

TM: Well, in my heart of hearts, I really think that somehow... this must all be true. Otherwise it doesn't make much sense. Because I'm clearly not a raving mad person...

JK: That's what they said in *The TellTale Heart*.

TM: Well, I may be a mad person, but... (Breaks into maniacal Edgar Allen Poe voice) 'Mad, certainly not mad! True, nervous, nervous, highly nervous. But on the other hand...' (laughs) I have very modest goals I suppose. I would like the psychedelic experience to take its place as a respected vehicle of spiritual work. That's a modest thing to want. On the other hand, I feel like the transformation of the human species is possible, not in the far future, but now. And it may well be that we are going extinct. But, if so, it's an incredible tragedy because we could go to Alpha Centauri instead. So, it's not simply that we are going extinct the way of the dodo or the trilobite because there were no metaphysical stakes on the table with those extinctions. With us there is something, perhaps the destiny of life in the

universe if in fact biology could be... If biology is unique to this planet then, my god, the moral responsibility that falls on us is practically inconceivable. And if it isn't, nevertheless, the fate of life on this planet seems to be in our hands.

So, I don't understand why there isn't more visionary dreaming going on. And, by that, I don't mean pleading for machine elves to take control of the IMF, I mean stuff like, why is there no effort to build down the military industrial complex worldwide? Why is there no effort to save the environment? It's not a bleeding heart issue; it's the ground you're standing on. And what we call progressives, like Bill Clinton, I hear nothing progressive, nothing visionary. And yet that is what leadership is supposed to be about. So, I feel very, very frustrated because I see the last, best chance of humanity, a good chance...being betrayed by incredible perversity and stupidity. I mean, I think John Kennedy screwed movie stars and was some kind of a rich brat from New England, but I don't think that he was empty of

idealism about the destiny of the human race. And these other people seem to be. I mean, maybe Bill Clinton doesn't fuck movie stars. OK, points for that. But how about a vision?

JK: I think he does...

TM: I think he does too...but I don't care if they would just get up off of their dead duffs and do something. I mean, I can't believe the debates that go on. They want to close an airbase in Sacramento. So, you would think that Western civilization was on the block. Well, if you can't close an airbase near Sacramento, how in the hell are you going to get rid of nuclear weapons, feed the hungry, cure AIDS, and create a decent environment for 6 billion people? I am afraid that the answer is...just junk democratic processes and put the world in

the hands of benevolent technocrats.

JK: Philosopher kings.

TM: Philosopher kings. Not Samosa's or Saddam's, but well intentioned. But what that means is that the highest aspirations of Western social thinking, which culminate in the democratic, self-regulating individual are being put aside. We're saying no, no, it turns out that the bulk of human beings are too infantile, too childish, to manage their own fates. And, of course the world is not staying simple, you know, maybe people could manage their own fates in 1760, but can they in 2000? And I say yes always. I am a radical democrat. I used to say if you come upon a group of people setting fire to a building, you have to have very good reasons not to join in that action because the people are doing it. Now, do you have an agenda or understanding that is higher than what the people's agenda is? Some people say, 'You're just an anarchist.' And sure, fine. I marched behind that flag. That was the flag we carried in those demonstrations. We were never red, and in fact had total contempt for that. And were proven right I think. I don't know if that answers your question, but

I'm very frustrated by the lack of imagination.

JK: The way you manipulated the I Ching, was it directly from the voice of the mushroom?

TM: It was pretty direct.

JK: Telling you 'OK, now do this.'

TM: Yeah, I had very little interest in the I Ching and no patience for that kind of behavior. I'd never done anything like that in my life. In fact, I've always felt that part of my life's problem personally was that I never go deep. And here I was, going deep, deep. I mean, I am pretty sure that many of the things I've discovered about the I Ching were put there by the people who created that sequence and have not been dealt with since. And god knows a lot of minds have fingered their way over the surface of that and they didn't find the way in.

But I think I did and I think it's not a metaphysical assertion. Anybody who cares to can follow my argument and see if they agree or not.

JK: Now, why exactly did you have the William Baines translation of the I Ching with you in the Amazon?

TM: I had picked up the habit four or five years before all this of just throwing the I Ching at the new and full moon. It is the only ritual in my life and I did it very unritualistically. And so, consequentially I happened to have it with me in the Amazon.

JK: And what prompted you to turn to it at La Chorrera?

TM: As near as I can reconstruct it... the first line of the dialogue that lasted years... the first line was... the mushroom spoke and it said, 'Did you know, I'll bet you did know, that every day is made out of four other days.' And it just led me through. I guess the strongest argument for me personally that I was dealing with something outside of myself and 'real', whatever that means, was the way it was taught. It was just not my style, you know, and it just went on and on. Nobody else can share this perception because nobody knows what

'my style' even means. But I tell you: it was not my style.

JK: Now, this theory was sort of foisted on you. Did you go in asking for it? Did you say, 'Give me your best shot?' Or were you just randomly chosen to be the bearer of this news?

TM: Well, maybe something slightly different from either of those. I was puzzled by... As Dennis descended into this rave about the hypercarboration I was all for it and I was fully backing him. But, every once in a while, this thought would cycle through: 'And nothing for

me?' So, in a sense I think this was the gift, you know. He got the hypercarboration and I got the timewave.

JK: Now, the other members of your party, were they as consciously 'enhanced'?

TM: Well, no. There was a lot of backbiting and controversy because... well, first of all the general irrationality of the situation. Also, I think at the time I did not give this enough weight because I had been butterfly collecting for 9 months before this all through Indonesia.

But I think they were scared of the Amazon. And so, for me it was like another jungle, but for some of those people it was like, 'Oh my god, we're 200 miles up this river and this guy appears to be losing his mind and his brother appears to be becoming...'

JK: And you were 25 at the time? And the people you were with were 20, 22?

TM: I was the oldest.

JK: I can see how that would be daunting. (Laughs)

TM: We were very different from any 22-year-olds that I've ever met. In fact, that amazes me; what serious people we were. I mean, when I think of the 60's I think of humping in a heap, and going to dances. But, my god, we must have been serious, serious, serious...

JK: Did you ever experiment with oo-koo-he like you had...

TM: Oh yes, that's a whole other cycle that I've never published or written about because it's somewhat... it just doesn't really relate to all this. But in 1981 Dennis and I went back with Wade Davis who wrote *The Serpent and the Rainbow*. Dennis was getting his Ph.D. then in plant biochemistry and we went after the oo-koo-he again. Not in Columbia. We went to a place in Peru where there was a displaced population of Witoto and we got numerous samples of oo-koo-he. We took them. Dennis wrote his Ph.D. thesis on them, and they were fully chemically analyzed. It's a kind of a downer in the sense that what we finally concluded was that the Virola trees, which are the source of that drug, are genetically degraded in some way. Anyway, what it does is that it races your heart like crazy. We did it, and

on this one particular batch where I thought Dennis was having a heart attack basically, the next morning we sought out the shaman. And he said, 'Yeah, it takes getting used to, doesn't it?' (Laughs) We said, 'No shit, man!'

JK: DMT or psychedelics as an alien artifact/technology - is this sort of a pet theory of yours or something you sort of latched onto?

TM: Well, I'm not wedded to any of this. I just simply state the facts, and the facts are that, not DMT so much, which is pretty common in many plants and animals, but psilocybin. Psilocybin is 4-phosphoryloxy-NN-dimethyltryptamine. This is slightly technical, but it is the only 4-phosphorylated indole on this planet. That's strange because the way biology works is if you have a molecule useful in a biological system, then in other biological systems you will get that same molecule or tiny variants; methylated or o-methylated. So here is psilocybin with the only hydroxylation in the 4 position on the planet. Well now, they search for extraterrestrial life with radio telescopes waiting for a signal. Fine. Another way would be to search the biological inventory of this planet for something that looks like it did not evolve from the main, broad flow of animal and plant evolution. And if you do that, this 4-phosphorylated indole is sticking up there like a sore thumb. I'd like to see a paper about how many of these kinds of chemical anomalies are known to exist on this earth in life. And

what's the explanation for this? I've never seen anybody discuss this kind of thing. And yet to my mind the psilocybin molecule is as artificial as a Coke bottle. JK: As it appears in nature.

TM: As it appears in nature. If you'll just inventory nature you'd pick this molecule up and say, 'Well what is this?'

JK: What's the difference between that and the 4-ring indole in LSD? Is it because it's produced synthetically?

TM: Well, LSD is a more complicated... LSD is produced quasi-synthetically. Usually they go from ergot, which is actually a natural product.

JK: It's also a fungus isn't it?

TM: Yes it is. It's not a mushroom, but it's a fungus. It's not a basidiomycelae. LSD is a more complicated molecule with a 3-dimensional architecture. Most psychedelic molecules are flat and planar, and in fact that's why they will fit in-between the base pairs of DNA. They're just little, thin sheets that shoot right in there. That I think is an incredibly peculiar situation that I've never heard anybody talk about. I mean, why is it that these drug molecules fit perfectly into DNA? Coincidence? Well, but the DNA is the core stuff, it's not letting anything in there that hasn't passed four billion years of evolutionary vetting. So, the fact that these molecules activate mind and have a relationship to the genetic material seems to me highly suggestive. Also, in here, the unsolved mystery of memory. Where are the memory traces? If your body changes every molecule every five years, then how can an eighty-year-old person remember the pattern of their grandmother's dress? I think that memory is one of those areas where reductionist science is sailing close to the rocks. I don't

think you can produce a theory of memory out of reductionism.

JK: Has anyone ever mapped the physio-pharmacological change in the body when smoking DMT?

TM: You mean the actual breakdown pathway? No. The amount of research done on DMT is vanishingly small. It was discovered in '56 by a Czech. It was illegal by '66. There was a 10-year window of research. During those 10 years they didn't know how to do what we can do now, which is make what are called positron-emitting drugs. You see, if you make a radioactive drug, you actually put a radioactive atom into the drug. You can give that to cats and rats, but you can't give it to human beings because you're going to kill the animal four hours after administration. But with positron-emitting drugs, they give a strong signal in a CAT scan, and they're completely safe. And so what should be done now is some hot or warm DMT should be made. Dave Nichols could make it. He made hot harmine for Dennis. And then, give it to people in a CAT scan and see where it goes. I'm not sure what we would learn from that, but Dennis used positron-emitting LSD. In fact, he actually solved the mystery of where does LSD go in the human brain. 95% of the labeled LSD ended

up in the clostrum, which was completely a surprise. The clostrum is an ancient brain sub-organ way in the back, way underneath.

JK: The reptilian sub-brain.

TM: Yeah, nobody knows what it does. Everybody thought that the LSD was going to flow to the neurocortex.

JK: That should be a sign right there that we're dealing with something that predates consciousness.

TM: Well, I saw in Science News two weeks ago that marijuana receptors have been discovered in the spleen. And it showed a chopped up piece of spleen tissue glowing with hot THC that was sticking all over it. Yeah, I think neurophysiology is as Gandhi said of

Western civilization: 'It sounds like a good idea.' (Laughs)

JK: What would you say is the main difference between you and your theories set forth in The Food of the Gods and so forth and, say, Erich von Daniken [author of Chariots of the Gods]?

TM: Number one, I should say I have actually never read Erich von Daniken. But I know exactly what you're saying. The difference is I'm not making any assertions that I don't think other people can satisfy themselves concerning the truth of. It's one thing to be the spokesman for an experience that can only be had at the whim of the gods in lonely cornfields. What I'm advocating is simply that people examine these psychedelic substances that are throughout nature. If somebody thinks I'm full of shit, that's fine, but did they do their

homework? Did they in fact investigate the phenomenon? That's all I'm asking. I mean, I can't believe that this is thought to be so radical. What other science carries out its program of research without ever coming in contact with the subject of its concern?

JK: But then there's also a rebuttal to that saying, 'Well, psychedelics make you crazy... they're dangerous, they're not to be tampered with!'

TM: Well isn't that what we're trying to find out? Do they make you crazy?

JK: Well, for a lot of people, I'd say for the majority of people, the FDA has ruled them dangerous and their research has been done for them. They don't need to make these distinctions any longer.

TM: Well, this is the larger question that you and I dealt with in a different context earlier, the infantilism of people. People can't be bothered to exercise their democratic rights. They can't be bothered to explore chemical states of mind on their own. Eventually, they probably won't even bother to have sex; it'll just come over the tube for them. There's an incredible abdication of individual responsibility and authenticity. That troubles me. Why should people trust the American government on the subject of psychedelic drugs? Has it ever been right about anything? I mean, any examples will be cheerfully entertained. Have they ever gotten it right? So suddenly they have the answers on something as subtle as psychedelic drugs? They got birth control wrong. They got abortion wrong. They got race

rights wrong, women's rights wrong, gay rights wrong. Lousy foreign policy. Stupid space program. Miserable tax setup. Lousy healthcare program... and you want to hear their opinion on psychedelic drugs?

JK: Assertions that marijuana is a gateway drug, things like that are one of the big issues that they stand on. But it's a complete red herring. There's no way you could prove that. The only way it is a gateway to hard drugs is that it's in the same schedule. Cannabis is more

like aspirin than it is like crack. (Laughs)

TM: Well, I'm not a conspiracy theorist. I don't think there's a conspiracy, but drugs, for centuries, for at least 600 years, have been enormous moneymakers for Western civilization. And by drugs I mean tea, coffee, sugar, opium. When this much money is being made I think governments are bought, or run scared. Or that it's a combination of the amounts of money that can be made and the enormous bureaucratic inertia of these agencies that are supposed to regulate all this and their corruptibility. So many people are making money off drugs that nobody can understand why it should be made legal. Pot right now in Sonoma County is \$425.00 an ounce. Should we expect barefoot freaks to come out of the hills to parade for pot to be made legalized? My god, what would happen to them if pot were legalized? It's all that stands between them and going to live under a bridge. You know, they bring up these ships from Columbia and with high-speed speedboats they take the weed off. If you're in that scene in Miami you can make four trips a night to the mothership. You are nobody, and you make \$300,000 per trip. You make \$1.2 million a night. And you are not Mr. Big, you're nobody, you're just some flunky who takes the stuff off the ship. That's the kind of money that can be made in these drug deals. And these intelligence agencies, it costs a lot of money to murder newspaper editors and set up phony political parties and pay off demonstrators and do all this shit that they do. Take a flyer on drugs. It's so transparent that governments since the middle of the 19th century have been doing this. And what's happened is social consciousness in the meantime has evolved and certain practices previously deemed OK became morally odious. Slavery, that was a drug... and then the opium trade and how that happened. So, governments have simply distanced themselves and settled for kickbacks rather than launching the ships, unloading the stuff, and banking the money they now move into the background and they use Mafias, which are nothing more than off the books extensions of legitimate power, I think. I mean, the Mafia worked hand in hand with the U.S. Army during the invasion of Sicily. Lucky Luciano conferred with the Chief of Naval Operations on a daily basis and basically delivered Sicily to the 6th Army. Then they used the Mafia to break up the left-wing unions in Marseilles at the end of the war. So, I just think what governments can't do in the light of the day they allow Mafias to do, which they then loudly denounce, but in fact, the existence of these criminal syndicates is entirely at the pleasure of the government. That's not a conspiracy

theory or even a paranoid view of things. I think that's a pretty, I mean, of course, of course, how else?

JK: So basically you say there's no hope of drugs being legalized.

TM: No, I wouldn't say that. There's a lot going on. For one thing, people's consciousness is changing. And people have finally gotten the message that the relative risks of these things they were lied to about. I think most people now know that alcohol and tobacco are the two most destructive drugs on this planet. And it puzzles them at this point, 'How come then it is the way it is?' Eventually that puzzlement could turn into anger. But I would say it's 50/50 whether we'll make alcohol and tobacco illegal or legalize everything. I mean, think

of the money to be made if alcohol and tobacco were made illegal.

JK: You were saying earlier... I just want to touch on this 'cause I saw a note of mine, that salvation will probably come in the form of art.

TM: The design process applied to human culture.

JK: The design process applied to human culture. When you're talking about the design process, you're talking about the imaginative construction of a system which works. How do art, singing, and dancing fit into this sort of design process which is a science?

TM: Well, the inspiration comes out of the unconscious. And so people have to put themselves in these right-brained states for this Gaian intentionality to be perceived. I mean, that's really what we're talking about.

JK: Although you never talk about it, when you're talking about these elves singing and creating this is a concept that Australian indigenous peoples have carried within them. Native American people singing the reality into existence over and over, singing creation, and

singing life. It's their database, it's their social database is this art form. But to them it's not an art, it's how they communicate, it's how they see reality.

TM: Well, the word becoming flesh, singing it into existence. In some profound way that nobody understands, certainly I don't, we are imprisoned by our expectations, and somehow the change never happens until the expectations are deconditioned. I mean, as an

example, if everyone thinks that black people and white people can't possibly have anything to do with each other, then they can't. So, the change must precede the fact.

JK: On the same level, if you have a government that assumes the relative ignorance of its citizens, it creates an ignorant population.

TM: You in fact make it so. You see, what happened in the 60's, the first postwar generation came of age that had been given what was then called a liberal education. When you're given a liberal education you read John Stuart Mill, Rousseau, Voltaire. What this makes you is a social critic. They said, my god, we're financing our own suicide! We don't want tens of millions of 25 year olds asking why we are not following John Stuart Mill's prescription for liberty. They said the universities must be turned into trade schools. Forget Western philosophy, art, and culture. Teach these people data entry, management skills, financial skills, and high tech. And this is what has happened. I think that the idea of universal, public liberal education was... they realized we'll all hang if we proceed along this path, and so they stopped it. And now people are given 6.5 hours of TV a day, the Brady Bunch, all this. Idiot jobs, idiot political choices, and people are completely diverted by... Michael Jordan's father's problems, baby so and so who was carried to term by a camel and a contract

which is now being debated...

JK: Are you familiar with Noam Chomsky?

TM: Oh sure, yeah. He's an intrepid critic. I heard him on the radio the other day and it interested me. I identified with him. It's sort of hubris, I suppose.

JK: I identify the two of you together because although you come from very diverse angles, when you come down to it, you both have the same thing to say: educate yourself, open your mind to possibilities, the only change will come through a grass-roots sort of

realization.

TM: Well, where I see us as similar is that the first love of both of us is utterly incomprehensible. In other words, I have listened to Chomsky lecture on his first love, which is transformational grammar, and you just come out holding your head and muttering, 'My god!'

(Laughs) But I assume, without fully understanding it, that Chomsky has made a major field-redefining series of discoveries.

JK: I don't think the ramifications of what he's done will be known for another 30 to 40 years, and he at the moment is very wary of what he's done because he's revolutionized the field of rhetoric. I mean it's gonna be hardball now.

TM: Right. No, he's a great model and a very, very inspiring person. And relentless, as you must be in this social criticism.

JK: (Laughs) Well, to go along with the common view you don't need any support to back you up. If you have a scent of an opinion you have to have thousands of references and citations. You must do the research.

TM: You have to be impeccable, because they're gonna come after you every way they can think of.

Session 1

[words after this point not included in current audio]

It's a very interesting group of people.

[words before this point not included in current audio]

I can't imagine uh, a domain of human endeavor that isn't impacted by the imagination. I mean, teasing the imagination apart from the talking monkey is not an easy thing to do. Imagining ourselves without imagination is itself a paradox. Uh, and yet, you know, what is it? And, and why is it?

If you take the view that uh, biology does nothing in vain and evolutionary economics are incredibly spare then why have this faculty that allows one to command and manipulate realities which do not exist? I mean that's, to my mind, the basic function of the imagination. Some people might argue and say 'well the imagination is the coordination of mundane data' in other words 'if I work this hard, and earn this much money, can I afford that car?' To my mind this is not putting great pressure on the human imagination. Uh, the human imagination as I, uh, suppose it is uh, almost an extension of the visual faculty. Uh, imagination is something that one beholds, something that takes- people speak of castles in the air, or something like that. Uh, one idea that is worth entertaining because it is entertaining, not necessarily because it's the truth, but is the idea [audience cough] that the imagination is actually a kind of window onto realities not present.

In other words, it's very clear from an evolutionary point of view that our, our body and our sensory preceptors are organized in such a way as to protect us. To, to warn of danger, to give you the muscles to respond to that danger when it comes. The imagination doesn't seem to work quite like that. If the imagination runs riot in the dimension of the mundane, it's paranoia. In other words, if you believe every cop on the corner is looking at you, every chance heard comment is about you, the imagination is, in that situation, pathological. It is taking the raw data of experience and giving it, uh, a maladaptive spin.

So then, uh, where is the imagination appropriate? And it seems that it is most appropriate in the domain of human, uh, creativity. That uh, in fact separating art from imagination is simply the, the exercise of separating, uh, cause from effect. Art, sculpture, poetry, painting, dance is like the footprint of where the imagination has been. And you know, the abstract expressionists, Pollock particularly always insisted that a painting, a Pollock is not what process is about, the process is about making a Pollock, being Pollock, the act of creation. What the rest of us have been left with is, uh, a husk, a tracing, uh, something left behind

which says "Imagination was here, imagination acted in this place," and this is, uh, this is what it left.

A very interesting thing that is going on in physics at the moment is, and I don't want to spend too much time on this because it is slightly off subject but it certainly is fascinating. The great bridge between art and science that was supposedly built in the 20th century hinged on this thing called the uncertainty principle. Uh, it was the idea that the as you know more and more about things about certain aspects of a system, an atomic system in this case, certain other parts of it lose focus and become less and less clear. For example, if you know velocity you don't know position. As you hone in on exact position, velocity becomes smeared out. And probably more ink and more breast beating has been shed over this aspect of modern physics than any other. Now, for the great embarrassment of all the people who held workshops, and wrote books, and pontificated on this matter, it appears that this is what it always looked like: fuzzy and confused thinking.

And that, uh, the Heisenberg uncertainty principle, or rather the Heisenberg formulation of the quantum theory, uh, is, uh, now not to be preferred. The preferred understanding now is the version of quantum theory formulated by David Bohm. The difference between these two theories mathematically is precisely zero. There is no difference, but they make different assumptions. The reason originally that the Heisenberg formulation was preferred was because it was felt that this uncertainty principle, which was a hard swallow, was not as hard a swallow as the piece of baggage which the Bohm theory carried embedded in it, and that piece of baggage was called "non-locality."

The two theories produced identical mathematical descriptions of nature, but one had this uncertainty principle in it. The other had built into it "non-locality". Non-locality is the idea that any two particles that had been associated with each other in the past retain, across space and time, a kind of, uh, connectivity such that if you are- if you change a physical aspect of one of these particles, the law of conservation of parity will cause the other particle to also undergo a change at the exact same moment even though they may by now be separated by millions of lightyears of space and time. This was thought to be so counterintuitive, so preposterous, that the Heisenberg uncertainty principle was, was chosen as the lesser of two evils.

But it turns out over the past ten years, experiments have been done in the laboratory, not thought experiments, actual apparatus experiments, which secure that non-locality actually is real. There is below the ordinary surface of space and time, ruled by relativistic physics there is this strange domain of instantaneous connectivity of all matter, of all phenomena. Uh, it raises the possibility then that the imagination is in fact a kind of, uh, organ of perception. Not an organ of creative, uh, uh, unfoldment, but actually an organ of perception. And what is perceived in the imagination is that which is not local and never can be.

So, uh, I-I myself am up in the air about this, or as you get to know me better I don't feel the need to believe or disbelieve to proclaim this true or untrue, uh, but it is useful at this stage for understanding, uh, our mental life. Uh, I've spent a lot of time talking to people and thinking about the origins of consciousness and in one sense asking the question "What is the imagination?" is a different way of asking the same question "What is the origin of consciousness?" Uh, and as some of you know to ex- distraction, I believe that psilocybin mushrooms played the role of kick-starting human evolution. I don't want to repeat all that, here, it's been stated many times. But, um, what I want to point out is that we can see in nature, I think, the uh, declension from the full-blown human imaginative capacity back into the organization of the

animal mind. We can see these stages through which this must have unfolded.

The interesting animal to look at for all of this, for the moment, are the top carnivores. This is not PC in a vegan environment but thought just has to lead you wherever it leads you. It's very clear to me that top carnivores coordinate data in the environment, uh very judiciously. Cows have very little to say about grass, but cats, hunting cats have a great deal to say about their diet, because a top carnivore to be successful must in a certain sense think like its prey. And so at the very point of the emergence of these coordinates strategies held in the mind there's a paradox: the earliest consciousness is consciousness which apes- other consciousness. In other words the top carnivore which is the most successful is the carnivore that can think most like a weasel, or a groundhog, or a rabbit, because this ability to think like the prey gives you a leg up on the prey.

And if you've ever seen, not domestic cats, but small jungle hunting cats or jaguars or something like that, in the sudden presence of a chicken a hundred feet away or something they fall into a fit of imagining because they can almost taste it, they probably can taste it. And they fall into uh, a strategic mode that is clearly an intense state of imagining but it is triggered by, uh, the presence of the prey.

What is interesting about human beings is that we went one step beyond that, we s- we, for reasons which don't need to concern us here, acquired the ability to strategically suppose not in the presence of the stimulus but in fact back in the back of the cave around the fire with our bellies full, telling tall tales. It's interesting that the imagination is the land of "What if". And "what if" is almost like a statement in a computer language, "if" is a Boolean operator if you know what I mean, "if" uh, brakes the flow of reality into two possibilities. If A, or B, or more. And, uh, this ability to contemplate worlds which are only *in potentia* is the basis of imagination.

And I would submit to you since we all are sitting here in monkey bodies that its pretty clear that the stimulus for all this if-thinking comes in two forms, uh, uh, food and sex. In other words we think about what we are going to eat, we construct our behavior along an "if" tree. "If" I go to the water hole, "if" I take my sharpened arrows, "if" I lay in wait, "if" the Gods favor me, I will bring down dinner.

The sexual game is played the same way, "if" I approach the desirable female with the correct offerings, "if" her mood is correct, "if" my gifts are found pleasing then some wonderful thing will follow from all of this. So a- animals I don't think think like this. They may think, but they don't think like this. It seems to be a unique human ability that, uh, probably has to do with, as I say- in our case there were many different factors. For example, we became the top carnivore on the planet, but who would have placed their bet on- on a monkey to be the top carnivore on the planet? When there were saber-toothed cats walking around that weighed 1,100 pounds. How were we able to insinuate ourselves into a more powerful position than these enormously powerful animals that we once shared the earth with, and that in fact we hunted into extinction. It's our destiny and our fate to have removed the so-called megafauna from this planet. It, it's now generally agreed by paleontologists that the disappearance of the megafauna and the appearance of human-beings are linked in time.

Well, we did this by imitating those carnivores, and imitation is an act of the imagination. We like in our story about ourselves to think of ourselves as bold hunters, but the, the evolutionary truth of the matter is probably that as the first wave of primate radiation into the grassland occurred, as the diet was in transition, we were scavengers of carrion, we were not noble hunters bringing down mighty animals. We

followed along behind lions, lion kills. There is one school of evolutionary theory that believes that this is why our olfactory senses are so diminished because, quite frankly, we had our face in rotten meat for a million years, and if that doesn't dull your appetite for keen smells, uh, nothing will.

Least you despair, I'll tell you that there's a counter theory that says "no, no we lost our sense of smell when we stood upright because we lifted our face off the ground" In either case, there seems to be the idea that when you get away from the olfactory action the, the uh, energy to support the maintenance of that sense collapses. For whatever reason, uh we made our way to the brink of the imagination, in other words I don't think we require a *deus ex-machina* to take ourselves to the position of being top carnivore on the planet.

We have a mean throwing arm, you may notice that no animal throws things the way we do. Uh, other primates hurl excrement down on agonized explorers, but fortunately not with great accuracy, and anyway that particularly material is rarely deadly anyways. But a human being, for example a big-league baseball pitcher can, at 125 miles an hour put a baseball across a 17-inch plate over and over again. One theory of the origin of consciousness wants to say that throwing something is an interesting action- activity because though it may appear to be the same activity as digging grubs, or scratching your ass, or something like that, in fact it requires coordination toward a future outcome that is highly mathematical. In other words, you may not think in numbers but you must somehow sense the concept of trajectory, coordination, of target and intent, and when you get all this up and running, uh, according to some people you have enough brain power left over to write the fifth symphony, invent quantum physics, uh, and paint uh The Last Supper if you like.

This seems preposterous, to me. I think that uh, how the imagination got such a hold on us was that we accepted into our diet catalysts that we were unaware of that pushed our mental state around, uh, specifically psychedelics of various sorts. And a reasonable working definition of psychedelics, what they do, whether your for it or agin it, whether you think it triggers paranoia or, or attoraxia [sp?], They are catalysts for the imagination. They catalyse thought. Thought becomes more baroque, it reaches deeper into reality for data. It sees forms of connectivity that previously escaped it. It makes assumption- leaps of assumption, not always correct, but sometimes correct. So what it does is by, uh, to some degree transferring chaos into the mental world, it creates a much richer dynamic. And um, and so thought processes become more complicated, and in a sense then, uh, language becomes the behavior which expresses the imagination. Uh, i- i- it can be expressed in a limited form, through dance, through gesture, and of course it can be expressed very well through painting if you've reached the stage where you have painting and are not chipping rock, or are not drawing in blood in the sand, and stuff like that, if have a really rich, uh, technology behind your artistic intent, uh, but that rich technology would have never arisen without the intercession of language.

And so, these two things which make us unique among nature's productions on this planet, imagination and language, seem to be almost like the exterior and interior manifestation of the same thing, the same phenomenon. And what it is, is it's a facility with data, an ability to connect it in novel ways, uh, for one's own entertainment and amusement if nothing else. Storytelling is obviously this kind of activity, where modules: a ghost, a princess, a lost kingdom, a, uh, a disturbed father-son relationship, these modules are manipulated to entertain people. And you know it's a cliché that there are only 5 stories. And I think Robert Grayes in the white Goddess argued that there's only one story, and we keep telling variants of this story over and over again.

Well, uh the- what history then is, or what culture is, is, um, the- the phenomenon that attends the rise and spread of the imagination in the human species. But because the imagination works on this “what if” model, it always tends toward idealism. In other words, it is not simply a, a networked process, it's a networked process with a vector field. In other words, it's going somewhere... It's not just a random walk. It's headed somewhere. We idealize. If you're going to play the game “what if”, uh, most people who are psychologically healthy don't sit around entertaining dire possibilities. What if I get a terrible disease? What if I'm run over by a truck? No, people say “what if I make a lot of money?” or “what if I meet someone who gives me a lot of money?” And it, you know, it begins to tend toward idealism, and we are obviously uh, ruled by ideals and ideas. Uh, we haven't found a good one yet, but we certainly have sacrificed a lot of blood and time in the process of discovering a whole bunch of bad ideas, and we haven't lost our faith in ideas even though human history is the record. Not one idea has survived from the distant past, uh, in its original form, uh, and some of the most persistent ideas I would argue are some of the most pernicious ideas. The idea of man's inherent uh, uh, flaw, that's an old, old idea and how much suffering has existed because of it.

Uh, but culture then is the record of the human imagination. Well, that's fine. That is of interest to anthropologists and somebody else, who knows. What gives the whole thing a lot of bite is that more and more the imagination is where we spend our time. Uh, you know, there's a lot of talk these days about virtual reality, a- an immersive state of the art technology in which you put on goggles, and put on special clothing or enter special environments and then you are in artificial worlds created by computers and this is thought to be very woo-woo and far out. But in fact, if you're paying attention, we've been living inside virtual realities for about ten thousand years. I mean what is a city but a complete denial of nature? Say “no, no, not trees, mud holes, waterfalls, and all of that. Straight lines, laid-out roads, class hierarchies reflected in local geography” meaning the rich people live here, surrounded by the not-so-rich people, who are served by the poor people who are so glad they're not the outcast people. Uh, so uh, you know, urbanization is essentially the first of these impulses where society leaves nature and enters into its own private Idaho. Uh, and the, the growth of cities and the growth of the uh, uh, immediacy I guess you would say, of the urban experience has been a constant of human evolution since urbanization began.

Uh, now, the only difference that the new technologies offer is we are going to do this with light, not mortar, brick, steel, aluminum, and titanium, which are incredibly intractable materials. I mean, it's- it's amazing to me, I mean we started with the toughest stuff and uh, and of course it cost enormous amounts of human blood and treasure to work with such intractable materials. It's always been amazing to me that the largest buildings human beings ever built are in a sense the first buildings human being ever built because the first pyramids of Egypt are enormous, even by modern scale, and yet they were among the earliest buildings, uh, ever built. In virtual reality, the difference between a hundred story building, and a 10 story building, is one zero, that's all, in a line of code. You specify a hundred over ten and you get a hundred story building instead of a ten story building.

Uh, what this should tell us, is that in the domain of light, the intractability of matter is overcome. And so we are on the brink of time, we are- we have arrived, we are *at* the time where they human imagination now need meet no barrier to its intent. And so we are going to find out who we are. We are going to discover what it means to be human when there is no resistance to human will.

Now, uh, I, this is, I suppose, like a litmus test for paranoia. I- is this going to be a nightmare of, you know,

24-hour a day sadomasochistic pornography or is it going to be- will we literally build heaven on earth? Knowing what I know about the human animal, I suspect it will be both and, uh, because we're not going to get everybody marching in the same direction on this. And one person's hell is another person's heaven. Uh, but, the imagination, which to this point has been a human faculty, and uh, the consolation of artists is about to turn into real-estate. You know, as real as any real-estate there is.

And uh, in a way I think the, the shamans who, for the past 50,000 years have been, uh, essentially they leapt over the material phase of imagination engineering and went to nanotechnology 25, 30 thousand years ago. By nanotechnology I mean reliance on machines to achieve your goal, machines that are under one nanometer in size, smaller than a billionth of an inch. They- we don't think of drug molecules as machines, but in fact they are machines. They perform work in the synapse like machines. Shamanism didn't use matter to build its realities, it, it was more sophisticated than that. It directly addressed the capacity of the human mind in the presence of unusual neurochemicals to produce unusual, uh, phenomenon and unusual, uh, sensoria of experience.

Now what's happening is these two strains of development, the let's call it pharmacological, nano-technological low-tech, natural, shamanic path and the high-tech, material-manipulating, macro-physical technologies are encountering each other and meeting in the domain of the modern computer. And, uh, this is fascinating. The world is becoming more and more defined by the imagination. And those of us who are involved in, in creating this I think have the feeling that it has in it a kind of built-in dynamic toward finality. In other words, this is not a process than can go on for hundreds of thousands, or even hundreds of years. Because the human imagination is so endlessly self-transcending, whatever its most advanced creation of the moment is, it's in the process of obviating and denying it, and seeking to go beyond it.

And you know I think it was Plato, I'm not sure he said it first, but said "If God does not exist, human beings will create God." I think the truth is that they're not even going to wait to find out, it's easier to cut to the technical solution and sort the whole thing out later. If the God we make and the God we find are in conflict with each other they'll just have to duke it out. [audience laughter] Maybe they'll Marduke it out. I'm not sure. Because you know there's a wonderful phrase in *Mistrings and Mysteries* a wonderful book by Mircea Eliade where he's talking about powered flight, of all things. The Wright brothers. He said "Whatever we make of this as an engineering feat, it speaks volumes about the humans psyche desire to transcend itself infinitely"

And so, you know, in a sense the powered flight is a psychological breakthrough. Because man flies. Well then spacecraft, we break beyond the embrace of gravity and these, these technological breakthrough are always presented terms of overcoming some set of boundary constraints imposed by nature. And in virtual reality, all boundary constraints are overcome by nature just as in the imagination, but the imagination, metabolically sustained, in other words you eat well then you smoke a lot of hash then you enter into an imaginative reality. But as metabolism ebbs and flows, as your food digests, as the drugs leave your system, uh, this reality, whatever it is, falls to pieces and it is washed away.

Uh, but the reality, the virtual realities created in code are more enduring, they are in fact as enduring as the code-maker. And so we're beginning to talk in terms of dreams which don't go away. Worlds of the imagination which one can work on for months, and then lead one's critics through and collect their critiques and make the connections and dot the I's and cross the T's according to the way one's critics and friends think it should be done. And so what this means is somehow the imagination always, among the

most private of domains, is like everything else under the impact of the new technologies, being redefined so that there is no private and public distinction anymore. So we are on the brink of losing, in a sense, a part of our individuality. We are going to be able to show each other what we mean, we are going to be able to build hallucinations, and walk through them, and discuss them, and edit them, and re-edit them.

And I, you know, to this point we've been doing psychology sort of like a blind man polishing a Cadillac in total darkness. You know, if you keep excellent notes and don't lose your place you form a kind of a notion of what a Cadillac must be. But what we're about to do is turn on the fluorescent lighting and look at the thing. And I don't know what this will bring. I think it will redefine us. We are a great mystery to ourselves and to each other, but not in principle. Only through limitations imposed by the physical body and limitations of technology. And so I think, you know, what our yearning for community, for collectivity, for telepathy, for universal human understanding is in a sense going to be self-fulfilled by simply opening up the imagination, not as a private dimension, but as a public and shared dimension.

And this will be, I think, incredibly enriching and surprising. We are going to find out, uh, what the human critter really is, and what we are really capable of. And I- I'm not afraid of this at all because I- I think, uh, well basically I am a Platonist, and Plato identified the good, and the true, and the beautiful as the same thing. But notice it's very hard to know what is good, and it's quite difficult, even more difficult to know what is true. But it is intuitively understood what is beautiful, so beauty is the easy way in. Beauty leads to the good and the true.

And we are on the brink, I think, of taking a stride towards beauty that is the greatest stride in that direction since the emergence of language in the human species. And the emergence of language in the human species was the first shoe dropping in this enterprise, and the building of virtual realities that can be shared and critiqued and understood is the dropping of the second shoe. A true civilization lives in its own imagination and lives through its imagination. And when, uh, when this is an accessible possibility to most people I think a great deal of our inhumanity will simply fall away from us, because it is not inherent. It is the product of misapprehension. Misapprehension of each others goals, and intent, and aesthetic.

So, uh, I think that's all I have to say about that tonight. I get spun into it and I can't stop, I don't know whether I am talking to you or to me!

But uh, uh, this is some of what we'll talk about this weekend, this may be the longest sch- uninterrupted schpiel you hear from me. As I said, these things are best driven when people inject their agenda into it. But these are the things I'm thinking about, history feels very risky to a lot of people. I think there- that it is risky, but I think that it is because the stakes are so high. We really have an opportunity to transcend ourselves, and to fulfill the human enterprise on this planet. And, uh, you know I- I'm just so aware of the limitations of the people of the past. Their agonies, their concerns. I mean, how many children died- were born stillborn, how many women died at childbirth. Nine times in the last five million years the glaciers have ground south from the poles, pushing everything in their path. Those people didn't drop the ball. Uh, the amount of human suffering and agony that has gone in to carrying us to this moment of privilege and opportunity is incalculable and can only be redeemed if we bring this inherent human beauty uh, into the world as spiritual food for ourselves and for the human community.

----BELOW NOT INCLUDED IN PRESENT AUDIO---

So that's it for this evening, I see I ran over a little bit. We'll talk about all of this tomorrow, or something else if that's your agenda.

(Next morning)

We talked a little bit about the imagination last night just to give a sort of a feeling for the vocabulary of the territory. If there's anything coming out of that anybody wants to say or that, yeah:

Q: [in regards to the emerging language and imagination in developing humans and how the concept of music fits into that paradigm, if he thinks it adds a specific human quality to the development of language]

----ABOVE NOT INCLUDED IN PRESENT AUDIO-----

TM: Well it's very interesting, I I-I am working on a book now. A lot of it is about the subject of language. It's a little hard to talk about it in English, because in English the word 'language' both means the general linguistic facility and it also is heard as meaning "speech". And as I looked into language and studied it and studied what other people had said about it, I- I- there were some surprises. The, the first surprise is that the, the straight people in the field, the- what is taught in the academy is that language is no more than 35,000 years old. This is- was astonishing to me. Uh, I just for some reason, my own intellectual biases, assumed that the conservative academic position would be that spoken language is old, because it seems so basically a part of us. How can it have arrived 35,000 years ago? That makes it something as artificial as like a bicycle pump or a transistor radio.

Well, the problem here is that this word language is misheard in English, so in writing this new book I had to make a very clear distinction: language is old. Honeybees do it, dolphins do it. It's even possible when you think of chemical communication that flowers and ants do it. Nature is knit together by communication which has rules, has syntax, and so is language. If you've ever stood in a, in a rainforest or any species-dense environment it's alive with signals, with sounds, with odors, uh, that are carrying messages. These things are not just produced for aesthetic effect uh, they are- have intended hearers and so forth and so on.

But- and language in human beings is old because we know that we evolved from pack hunting primates, socialized primates, that had, as we observe the behavior of primates alive in the world today, very complex repertoires of signals. Signals which mean "dive for cover, an eagle is cruising the area," or "here is food, enough for a dozen of us", and so forth, complex pack signaling. Uh what happened, and I- it was the greatest technological leap we've ever made, and in some ways the cleanest and most astonishing. It's almost like a resonance- remember I mentioned last night how strange it was that the largest buildings people ever built were the first buildings they ever built. Well, the greatest technological revolution, so far, ever launched by human beings was in a sense the f- this early one, I won't call it the first because there was tool making before that, there was fire before that, but somewhere in Africa, no less than 40,000 years ago. And this- this means a time when human beings who looked like you and I, maybe a little pigmentation differential, but basically people exactly like you and I had already radiated all over the

planet. I mean, by 40,000 years ago nobody argues that people weren't everywhere. Recent finds in Australia have pushed back the date of aboriginal penetration into Australia into 120,000 years. And that's not woo-woo, that Wollongong University department of archeologies stuff.

Uh, 120,000 years, so people were all over the world. Well, did they communicate? They certainly did communicate. They communicated with dance, with gesture, and, leading back to your question with music. They communicated, uh, in all kinds of ways. But we now know from the study of the introduction of media that if, if a medium of sufficient power and bandwidth is introduced into a population, it will abandon all previous forms of media in favor of this. We saw this in America after World War II when a print literate society within a decade became a television society. Uh, we are seeing it now where in the face of 5 years the internet goes from being "say what?" to indispensable for huge numbers of people, and that's in the space of 5 years.

Someone in Africa, probably loaded, experimenting with singing and chanting and sound, had the- was lifted out of their plane, in other words they actually had a breakthrough in the imagination, and they said "how would it be IF?" this amazing word, the power of 'if', how would it be if we decided that a certain sound is associated with a certain thing? And let's play a little game, every time I make this sound, you think of this thing, and lets a make a little list. Let's take 5 sounds and assign them to 5 common things, and now I'll make the sound and you think the thing. Well, behind all this is the, the organizational architecture of the human organism, which on to a game such as that, will effortlessly lay what is called syntax. Uh, and Chomsky and others have shown that this- that what is called the tools of transformational grammar, or the deep structures of language are genetic. Uh, all languages, in order to be intelligible, have to obey these rules. A language which does not obey these rules is not a language, is not intelligible.

Uh, so through a breakthrough in imagination, a kind of stepping sideways from the, by then, old enterprise of entertaining each other with funny mouth noises, uh, language was produced, probably, I mean, literally at a definable moment in space and time. A person, you know, the mother or father of all media discovered utterance, and it- it was like an intellectual virus spreading through the population. And moving as quickly as human beings could carry it because it was a superior form of media. Before communication had been, I imagine, highly slanted toward emotional states and time-bounded states. You know, you go up to somebody, you take hold of them, you look at them and they understand, uh, we're either going to go hunting, or we're going to go have sex [audience chuckles] and it will be spelled out in just the next little while, that kind of thing.

And this kind of communication was the- a sufficiently vicious social glue to hold small hunting-gathering groups together. As society complexifies and spreads out through space and time, uh, it either loses its coherency or it evolves methods of communication to keep it in touch with itself. I am not a linguist. I read a lot of this linguistic literature without really understanding it, but I know that the people who give their lives to this believe that they can extrapolate the rules of spoken language of the Indo-European, uh modern European languages to reason backward toward a language that was spoken twelve to ten thousand years ago called "Indo-European" or "Proto-Indo European" And this was thought to be, you know, the great achievement of linguistics as of fifteen or twenty years ago. Now a new generation of people have pushed it further back. There is a language called Nostradic, which is a language that was spoken on the Anatolian Plateau and across Europe fifteen to twenty-five thousand years ago.

Now, people like Shevoroshkin at Stanford, and uh, this is-was all done by Russians by the way. The Russians hold the high ground in linguistics by the way, it was Russian, it was Russian insights that cracked

the Mayan language too. But Shevoroshkin and his people are now talking about a language called Old World, and Old World is the first language ever spoken on this planet by higher primates. Beyond “Old World”, there is inarticulate silence. And “Old World” is a 35,000 year old language. Uh, how can we know such things? we have to push into the linguistic literature and you’re a better man than I am [unintelligible]. There are websites you can go to where people speak in Old World and you can hear what it sounded like. And, um, sounds like a bunch of really primitive people. [Terence laughs]

Q: Terence, how do we know that we really evolved this language [???

TM: This is funny, this is a really interesting area, you know one of my sub-themes is novelty and that supposedly reality becomes more novel as we approach the present and this is certainly true of biology and many, many phenomenon. But there is an important exception, so I’m told. I’m not yet entirely convinced of this yet but convinced enough to pass it on. And that is, though this obviously contains a paradox, language is seen to be more complicated as you go back in time. S- a, uh, structurally and in number of words, so that for instance, um, Old English is considerably richer in certain areas than, uh, modern English. Now I say probably what’s happening is that technical vocabularies are keeping the boat roughly, uh, at equilibrium. But, you know, for- for every 'widget' word, a word describing some subset of our technology, if we’re losing words that indicate emotional nuances, or nuances of rapport and understanding, then the language is being, uh, impoverished.

Most scholars of English believe that, you know, Shakespeare caught the wave. Shakespeare is not only a phenomenon of- of immense human genius focused in one person but it's also a moment of incredible linguistic richness and opportunity that didn't exist 200 [audience cough] years before and didn't survive 200 years after.

Q: [???(Inaudible, question referencing to language)

Well those are I guess what you would call “Locally indexed vocabularies” but we have non-local vocabularies which are the important ones, the ones where we address our humanness. To suggest that one group of people have more words for sex or for affection than another people, that’s a tremendous knock on the 2nd group.

In a sense we are saying that they are less human.

(Further commentary)

Well, but as I lay in the tubs at Esalen a vast vocabulary of subtle gradients of interpersonal states of angst, longing, need, rejection, triumph, and defeat are passed in front of me, and frankly and I’d rather read my manual on my hard-disk sometimes. [audience & Terence laugh] But I’m a tough nut to, to crack. Um, but this does lead on to- to an aspect of all this that I wanted to talk about. Which is, language is, I’m sure you've heard, I'm sure you've heard it said- it’s a double-edged sword because it liberates as it saves. All clarity is achieved by a sacrifice of, um, true identity. You know, the world is actually a messy and

difficult to articulate place, and if you can make it all seem very simple and smooth-running then you're a con-artist of some sort. Yeah-

Q: As always, as soon as I speak, I already lie.

TM: Yes, well one group of linguists suggest probably the big impulse of producing language originally was the wish to lie. They said "if only I could...deceive people more!" And I always, you know, along this line, the wonderful thing which Winston Churchill said at the height of World War II, he said "truth is so precious that she must always be accompanied by a bodyguard of lies" [audience chuckles] That's an interesting point of view, the truth is not something that you trot out and show everybody, that you, you surround truth with lies so that only the discerning, you know. We- we simple, straightforward plain dealers don't think like that, but believe me when you get with an Amazonian shaman or someone like that, he is not operating under a strong moral obligation to tell you the truth, the whole truth, and nothing but the truth as quickly as he possibly can. No it's all about, you know, leading you this way, and then dropping you and watching you wiggle. Then leading you another way and eventually because truth is guarded. This is- in our society the commodification of information has made it something that you want to deliver with maximum punch to its target audience as fast as possible and cash the check and get out. But tha- that is not [clears throat] traditionally how its done.

Q: [Commentary, inaudible]

TM: That's right, that's right. It divides the seamlessness of reality into the articulated and the unarticulated. Trumbore Stichnine, who's not exactly a household name, was one of those poets who died in the trenches of World War I, the golden generation, and uh he wrote a poem called "Meaning's Edge". And he said in that poem "I do not understand you, 'tis because I lean over your meaning's edge, and feel the dizziness of the things that you have not said". And it's that "the dizziness of things unsaid" that always surrounds, uh, uh, the enterprise of communication, especially spoken language.

Now to go back to this thing about the evolution of language and technology, and are we getting better or worse at it, communication. Um, I discern at least, if you look at the evolution of media, the way you would look at the evolution of a species or a group of genera in an organic situation, a, uh, a very pronounced preference for the visual. We- you know, from the simply, the idea of colorful and rich speech, which was all we had for a long time, gives way in the early 19th century to photography and it's still, and it's black and white. But immediately the people who invent it can think of nothing but color and motion. And by 1900 they got that under control, and then there's stuff like stereophonic sound, and on and on. Clearly, we view the language-forming enterprise as a task not yet brought to completion.

One of the things that seems to always come up in these things is the fact that so-called primitive or aboriginal or pre-literate people using psychedelic plants that, uh, melt local cultural conditioning seem to access a place where language is much more a visual enterprise. Uh, Ayahuasca circles sing, but the singing is critiqued as though it were pictorial activity. In other words, the- after the shaman stop singing, you hear people say "I liked the part with the orange spots, but I thought the olive drab magenta section was self-indulgent" something like that [audience laughter] And you think, you know, this is the critique of a song? No, the song is the sound, is the carrier, the acoustical wave is no longer in the foreground of the experience of appreciating the performance. It has become the carrier of something visible.

And uh, you know, lot of people think that somewhere in the human future lies telepathy. And it's usually imagined as "you hear what I think" uh, a kind of extension of- of what we have. I think it's more likely to develop along the lines of "you see what I mean" Uh, in other words we add dimensionality to language, uh, and we can then walk around it. I touched on some of this uh, uh last night with the virtual reality. Because virtual reality, in the service of the ideals that I'm interested in would become a technology for showing each other the contents of our imagination with less ambiguity than we have ever had before. Yeah.

Q: ???

TM: Well, I suppose every technology has created more opportunity for deception. Uh, you can't have complex, illusionistic realities unless you work in pictorial space. Yes, I don't think these technologies will reform, uh, the human character, also I'm not sure- subterfuge is a major part of art, it certainly is a major part of- of legerdemain. Every sentence is essentially a conjuration, and, you know, the rabbit of meaning is pulled out of, uh the hat of constructive syntax. So, uh, you- you cannot have, uh, truth unless you allow for the possibility of error. You know, this is the point that illuminates why predestination is a waste of time.

Predestination is the idea that the universe is a kind of film and its running, and it's all determined how it's going to come out, and there's nothing anybody or anything can do to affect it. God created it, and its unfolding. Well the- uh [clears throat] the thing that makes predestination theory worthless in my estimation is notice that if that's true, then you think what you think because you can't think anything else and that puts the enterprise of seeking truth in a preposterous position. In order to seek truth one must have the option of screwing up, and uh, then it's the dichotomy between the screwing up and finding truth that creates the sense of dynamic, uh, existential completion.

Q: Commentary, inaudible

----BELOW NOT INCLUDED IN CURRENT AUDIO

**A lot of people are eager to do that, you don't want to rush that move. I think anybody who has thought about it, or taken a lot of LSD, so forth and so on, comes to the conclusion that the highest truth resides in silence. But it's a bullet in the head for conversation. Having genuflected in that direction we then move back to the lower plane of rummaging in language.
(Question, inaudible)**

---ABOVE NOT INCLUDED IN CURRENT AUDIO

TM: Well this is now at the cutting edge. I mean, yes, yes, and yes. Sound is the 4th dimension. Uh, sound is a very effective way of transducing energy into the body. The body is virtually transparent to sound. Uh, the mushroom said to me once, apropos of absolutely nothing, it said uh "What you call, uh, man we call

time.” And time and metabolism- metabolism is permitted by time and somehow time is caused by metabolism. And then sound is in there as an energy transducer. And, uh yes, I think a future technology of- of sound probably will cure disease and set people right. A-all this business that goes on in shamanism with blowing on the body and projecting sound into the body, obviously some of it is misunderstood and marginal and showmanship. But at the core, uh, sound is, I think, not yet been given its complete role in all of this.

The fact that you can see sound, uh, under certain conditions. You know there, there's a phenomenon called “sonoluminescence” where- that creates temperatures that are 20 times greater than the surface of the sun. This is done in a test tube simply by using acoustical waves and bubbling fluid to collapse and create extremely brief, high-pressure states. Um, so sonoluminescence, there's a website you can visit...isn't there always? Yeah, Al.

Q: [inaudible]

TM: I guess what I'm sort of saying is that once you have the concept of, of nano-technology you see that drugs and prosthesis, or computers or tools, are- are categorically migrating toward each other. You probably heard me say, uh, you know “the only difference between computers and drugs is that one is too large to swallow”. And- and our best people are working on that very problem. [audience chuckles] Uh, so uh yeah, I th- I think that from the middle of the 19th century on without really much drugs to help them along, I mean, a little ether, a little hashish, uh, poets and artists in Europe were obsessed with synesthesia.

Uh, there's a wonderful New Yorker cartoon, maybe some of you saw it, that a bunch of guys in suits are sitting around what is obviously a corporate board room, and in the background there is a profit and loss chart and it's clearly headed into hell, and the chairman of the board is saying to a small smiling man sitting on the other side of the table “You're right Higgins, a deliberate disordering of the senses worked for Ramboe, but would it work for us?” [Terence laughs] So his is a reference to a symbolist poet of the 19th century and, uh, and the belief that we need to erase the boundary between the senses, and create a synesthesiac, a hallucinogenic, a psychedelic, if you will, reality.

I mean, the late 19th century, the pre-Raphaelized(?), the Eugen---[??] impulse, that was all like they could smell psychedelics in the air of the future. They couldn't quite get high, but they were definitely bird-dogging in the right direction. So, yeah, the, the trick if we're going to design our own states of mind is to make sure that we don't dump the baby out with the bathwater. We want the net to be as haunted as possible, we don't want to lose its atavistic connections back into the darker resources- recesses and resources of uh, of the unconscious.

That why Bill Gibson's novel “Neuromancer” is so prescient because here it is, this super-technological fantasy, but at the center of the net the Gods of voodoo are reappearing. And, uh, I- I came to the realization thinking about the internet. Uh, you know, The Other is within us. If the other if it finally, if ever, comes into full manifestation it won't come in mile-wide ships of titanium that position themselves over the secretariat building of the U.N. It won't come like that. It will come out of human hands and human dreams. It will be fully other. I am not copping out here, it will be fully other, but it can only be built through us. This address is what I was beginning to get at last night when I talked about non-local information. The alien is real, but the alien is not 'here' in the stupid sense. The alien can only manifest itself through us, but this probably means that given a sufficiently resilient technology it can manifest

completely through us.

So, uh, in a sense the internet is a kind of landing pad, there has always been in our fantasies of extraterrestrial contact the notion of “the pad” which has to be built for them. And people claim is the Nazca lines and all- you know. It’s an archetype, it’s the idea of the prepared space that awaits the arrival of the other. But now because of the nature of the internet, because you can’t see whose coding, uh, you can almost imagine that we’re calling the thing forth. And I think it will probably appear as a website. And uh, you know, when it’s sorted out, you’ll realize “My God <http://zetareticulae.org> is really coming from Zeta Reticulae!” But through, through virtual, through uh, non-local Bohmian space. Yeah.

Q: [inaudible]

TM: It’s totally separate in the sense that it is somewhere else in the universe and evolving complete along its own lines and not in any way under our control. Then you turn the coin over and the division between it and us is completely seamless because of the non-local nature of information. In other words, this is an incredibly empowering idea, if true. I mean it will make a revolution in psychology that few people have yet even sensed coming. What we’re talking about here is putting the Jungian idea of the collective unconscious- first, expanding it to the size of the cosmos, and then showing with physics exactly how the trick is done. So we are not separate from any place.

Obviously when you evolve inside an animal body localized in space and time, you get hellacious set of reflexes and muscles designed to deal with immediate threat in the environment. But at the core of the oyster is this portal into universalism which we have denigrated to what we call the imagination. Uh, it is a pre- it is- there is a third eye, the third eye exists, but it doesn’t look out at this world. You’ve got two perfectly good eyes for doing that. The third eye looks out at the holographic matrix of informational totality. And then the problem for that form of perception is, um, filtering.

Q: Would you say in another [???

TM: Well Atman means “soul” or “being” or- yes. It’s simply that yes, consciousness is distributed and holographic and nobody has their brand on it. What we have been calling 'human consciousness' is the only consciousness there is. Uh, it’s something you tap into, not something that you evolve out of yourself. I mean, you, you required a local language to create a local model of this universal input. If your local language is insufficient then you abide in a, in a domain of intuition and I would- that’s what I would call animal consciousness. It’s a domain of intuition of, of being. Animals intuit being. But given a more advanced nervous system, a more advanced cultural toolkit, uh, the intuition changes into a- a direct perception and you begin to make poetry and experience loss and feel love. And, and you begin to feel the emotional outlines of the enterprise of being and how far one can go into that. Uh, I assume its infinite, or at least appears infinite from our limited position.

Q: So the local language is?

TM: Well, the local language is a necessary compromise. It’s interesting, uh, the thing that makes psychedelics so central to a discussion like this is they are the only thing which pulls the plug on the illusion, the illusion created by local language. That’s why people are both in love with it and terrified of it because it addresses a fundamental aspect of reality and it addresses it incontrovertibly. And people who

feel culture as a safety zone that is keeping at bay the black oceans of God knows what are not interested in taking psychedelics. On the other hand, people who feel confined by the cultural dream and who want to cross the black oceans of who knows what to see what's on the other side, they embrace that same experience as a God sent gift, but it's the same phenomenon.

So it, it, it addresses, you know, one's own fundamental relationship to the unknown. Local languages, like local cultures and architectural styles, and everything else are designed to create, I think, uh, a, a- an infantile sense of security. One of the bees up my rear end these days is idea that culture is not, uh, our friend, that we have been very naïve about uh, about what culture is and how it is something designed for the convenience of the species. And, you know, it could turn you into a janitor, or a banker, or a celebrity, or anything else with no interest or concern for whether that's good for you. Uh, it plays with individuals and, uh, you know, most people think, or at least here I *think* most people think that when you get to be, 30 or 35 or 40 or something you have jumped all the hurdles. You got your college degree, you had some children, you made some money, you lost some money, maybe you had a marriage, maybe you had several, and anyway people sort of get the feeling "Well, I've- I've done it" Actually, the major adventure still lies ahead and the major adventure is to claim your authentic true being which is not culturally given to you. The culture will not explain to you how to be a real human being. It will tell you how to be banker, politician, Indian chief, masseuse, actress, whatever, but it will not give you true being.

And uh- maybe this is the voice somebody who just turned 50 talking, but uh, I thought it would get simpler. It doesn't because this rejection of culture thing, uh, is the last and hardest step to take. And there are all kinds of impediments to taking it. The fact that in middle age if you've played the game right, you get a lot of money. That's totally stultifying in most cases in terms of going forward to the next level, it's almost as though culture is an enterprise self-organized to buy you off at the moment when you might be most dangerous to its values and goals.

Q: ...trying to reach harmony [???

TM: Well you know in Revelations, the ancient of days is described as, there's a sword which comes out of the mouth, it's a very hard image to picture. But a sword, a turning sword which comes out the mouth. Uh, and of course the whole Western myth of creation is us, the world was made by an utterance in *Principio ad verbum et verbum caro factum est*. "In the beginning was the word, and the word was made flesh." And some sense, I think, what is not stated there, is that then out of the flesh the word must be re-distilled. That's the 2nd half of the historical process. In this book, which I may mention at some point, the statement is made "God created man in order to taste the bitter fruit of time."

Uh, in the DMT flash, the entities that appear, their entire program is a program of language acquisition. And you know, this is a point that's brushed over in science fiction films because its actually such a conundrum. Those of you who saw, and you suffered as I did, uh, Mars Attacks. The little role for Rod Steiger in there as the German guy with the translation machine. Well, if you think about alien contact, real alien contact, we cannot assume that universal understanding is easily achieved. The very first aspect of true alien contact would probably be a language lesson of some sort because the aliens don't want to communicate about our Gross National Product or our political system, if they do they're not really aliens, they're just odd looking people from far away. Real aliens have something really alien to communicate, and it can only be communicated in an alien language.

So I think it's very suggestive that these invisible entities that we contact when we dissolve the local language boundaries, and they are, they're like mud walls built around our little hut of mental, you know, our collection of boats and stuff that we've pushed together. And then we dissolve the walls and there's alien people, there's alien minds out there waiting to trade with us. They have probably always been trading with individual geniuses through dream, through insight, through imagination. I mean many of- if you've read Thomas Kuhn's book "The Structure of Scientific Revolutions" you know that even in as constipated and self-conscious an enterprise as science, the real breakthroughs occur in situations of delirium, frenzy, drunkenness, inspiration, and then guys- usually its guys- spend the whole rest of their professional life trying to make it sound reasonable and rational and how it preceded from earlier work done by other people and so forth and so on. This is just a kind of a fancy, a way of attaining respectability.

Q: (Question/commentary about sound relating it to yoga)

TM: Well yeah, Hinduism and Hebrew, those are the two biggies, have really elaborate theories about the power and the tr- the place in the universal scheme things of certain tones, and I was sitting I was thinking "Sufi" and I was also thinking "Pythagorean". I mean some people called this the Pythagorean impulse, the belief that basically the universe is harmonious and exists as a series of octaves, and that if you know the mechanics of this you can converse with angels, you can ascend to higher levels. Uh, yes again, it's an issue of language. I mean some languages fill your pockets with lead and some languages, you know, give you a helium balloon for plunging into these metaphysical areas.

Uh, one thing I wanted to talk about this morning and maybe this is the place to get into it, is we've spoken of the imagination as a seemingly boundless realm, but it's not ruleless. And people who encounter it without rules often have very difficult experiences, the most difficult of which can be raving madness, I'd think. So if we're going to embrace the imagination as the new benchmark of uh, of being, then we need to talk about what the rules are the obtain in the imagination. You know, the 14th-century Nominalist William of Occam dealt with question like "Can God do anything? Yes, God can do anything. Then can God make a rock so heavy that God can't pick it up?" and then if not, why not? And what does this mean? Well, this is an effort to tame the imagination, and Occam concluded from exercises like that that even God must follow the rules of logical necessity. Otherwise becoming trapped in self-negating uh, paradox.

So I, in thinking about this I listed three areas where rules might be gleaned, that could be applied to the imagination. Uh the, the first two are linked somehow, uh, mathematics. Mathematics is not what you think it is. Mathematics is basically a rational thinking about defined sets of entities. And since the imagination is nothing but defined sets of entities, the rules which govern them uh, are worth learning. In practical terms what this comes down to is uh logic, and one of the problems that I think haunts the current cultural impasse is the fact that there is a lot of hostility to science. And it has spilled o- and science we should be very suspicious of. It's a wonder-worker. It's a magician dealing its wares in the marketplace. So we should be suspicious of science, but this scientific paranoia has spilled over into a, a suspicion of reason. This is too much.

If you abandon reason you will have nothing to guide you but the emotional depth of the situation. This is what Heidegger called "the depth of the call" And in the 20th century, the history of following the depth of the call has not been a happy one. We can not trust the call of the blood uncritiqued by reason. Reason is primary in this situation. Well, so then many people say "Well, mathematics is impossible, logic is a difficult one, isn't there a third possibility, is there yet another way to get a handle on this?" and the answer

is yes, but I'm not sure its easier. It may seem at first easier, but that is uh, aesthetics. The imagination uh, must serve the ideal of the beautiful. I talked about this a little bit last night. Uh the, the uh, that which is tasteless is to be avoided at all costs, and ninety percent of the difficulty in your intellectual life would never have happened if you had just had better taste.

[audience laughter]

TM: Am I not right? You know? Uh, uh, I, I look at this 'Heaven's Gate' thing in amazement because of its tastelessness, that's all. I mean uh, it is utterly unappealing for that reason. I don't even have to reach for the club of logic. Uh, if it had been better scripted uh, I might need logic, but the aesthetics of the situation are just so overwhelmingly "ugh". But-

Q: What's Heaven's Gate?

TM: the suicide cult that eliminated itself in San Diego.

Q: [???

TM: Oh I thought you were going to say French people [audience laughter]
(In regards to technology and class struggle)

Well, usually I mean, usually when people ask me what will happen in 2012, I say "Its like asking a man facing east at 2AM 'what will the sunrise look like?'" In other words, its too early to ask.

Q: I mean, in terms of [???

TM: Well, I think that, A, I don't have an answer to the problem of the bully and the slave, unless, as the Marxists claim, that is inimical to disparity of wealth. Because I think disparity of wealth is a transient phenomenon, uh, based on a limited technology, but it is entirely possible that we can make everyone a king and we will still have bullies and uh, slaves. So if the Marxists are wrong, and the addressing of the economic disparity doesn't change the human soul then uh, we will have to go deeper. And I don't know how this is going to look. There's a lot of tension in any community that discusses this kind of stuff over what- where the body lies in all of this. Can we solve our problems and maintain our individual existences, or are we about to- are we in fact furiously building a level of hierarchical control above the level of the individual that, that will make things like states and corporations seem like pale soup indeed. Are we in fact trying to create a super organism? What is the relationship of an idea like that to classic fascism? Uh-

Q: [???

TM: What about the internet? Is it the coming of the superorganism? It is prosthesis on an incredible scale. It is going to define, to redefine what it is to be human. I, I think technologies are neither Gods nor demons, it's what you do with it. But the dilemma of human freedom is that we don't know, we don't know where we rest in the universal hierarchy of good and evil. In other words, what would we do if we could do anything? Would our transcendent impulses drive us to a kind of angelhood, or as James Joyce says would we flop on the "sceney" side. And the answer normally given is "some would do one, and some the other" Yes, but what if we erase that possibility of individual action and is there then only one destiny? And then

what shall it be, and who shall uh, decide? Uh, I would be fairly pessimistic if I saw this all going on on a level playing field. But it isn't all going on on a level playing field. Transcendence is favored. Nature seems to be in the business of building systems which transcend themselves. We can see that as far back into time as we care to look and throughout all of nature. So it seems like we actually have a hell of a tailwind helping us toward the transcendent other. Probably that is what will make the difference. We couldn't have done it by ourselves, but we happen to be in a universe which is itself involved in the process of bootstrapping to higher levels.

Q: ????

TM: Well, traditionally, meaning since the invention of print, the artist has had this role where the eccentricity and the Bohemian lifestyle and so forth of the artist was tolerated because the argument was that the artist is a kind of antennae for this mysterious thing called "the future" and uh, and the artist would sound the alarm and bring the news. In a sense we don't hear this kind of talk anymore because this is the future. You know, have become the very thing our parents have warned us against. Uh, we d- we those cheerful dreams of endless progressivism that built up the 19th century and early 20th century have given way to a much more cynical and sophisticated understanding that uh, we may- our buildings may become taller, our automobiles shinier, but somehow the human animal is not moving forward uh, at the same rate as our technology.

Uh, so what we have to do then is to give people opportunities, and let the devil take the hindmost. At least create a world where those who aspire to transcendence are not blocked in the aspiration. And of course it's not, it's not that some of us are these pure aspirants and others, the haunters of the sleazy side of the internet. We each play all these roles and move in between them according to taste and mood. I mean one of the great falsities of print is, is the- making illegitimate of schizophrenia. I mean we are all just swarms of personalities. The idea that the healthy person has a unified identity is just a silly idea. It's like believing that sexual preference comes in only two flavors or something. It's one of those incredibly weird simplifications that once made everybody lines up and salutes no matter how much agony it causes at the individuals.

Q: [??]

TM: You mean what I said a few minutes ago or last night? Well last night what I said was that I was a Platonist, and that Plato felt that the world was approached through three paths: the good, the true, and the beautiful. But that goodness is controversial, and truth difficult to discern, but that beauty has a kind of resonant self-evidence. And so following beauty, it's my faith, will lead to the good and the true. And some beauty is- I mean I'm a fan of extreme forms of beauty, Hieronimus Bosch, and Redon, and James Ensor, I mean the beautiful can be grotesque, of course this then opens up a whole aesthetic can of worms that we don't want to get into.

Q: [??]

TM: Well, beautiful art is never bad.

Q: [??]

TM: Yes, I think grotesque- that the beauty of the grotesque is the unique modern contribution to the discussion of beauty. I mean it's a higher form of perception, I mean it's all very fine to find beauty in a wildflowers and women dancing in diaphanous dresses and harpsichord music. I mean it's quite another to find beauty in ripped-up railway tickets, and found objects, and smashed machinery and, and that sort of thing. The modern sensibility has been unsentimental and has in that sense I think advanced the cannon of beauty. Modernity I'm feeling much better about now that it's over [audience laughter]. You know? It's such a huge enterprise to look back on, you know? What faith, what simplicity, what naïveté those people possessed. I can hardly get over it. The 20th century for all of its brutality and its uh, its flirtation with the dark-side of the human soul, the counterpoint to that was its incredible optimism and idealism and simplicity. I mean, the simplicity of Fascism, the simplicity of Marxism, the simplicity of democratic political theory. I mean, these are ideologies that clearly never met a human being!

[audience laughter]

Q: How do you reconcile the notion of...inaudible

TM: Well the idea of an attractor, you see...these huge thought structures that we live inside that we're not even aware of, and one of them is the idea that uh, uh causes precede their effect. We- this seems like a non-statement to most people, of course causes precede effects. But in fact, uh, processes- if causes always preceded effects than many, many processes would be unpredictable, but are in fact predictable and this has to do with this word we introduced last night briefly: The creode. The runnel. A given process. The destiny of the people or the evolution of a political system or the growth of a series of interconnected scientific ideas is not, in fact, free to develop in any direction it wants. It is going on in an epigenetic environment of, of intellectual confinement of some sort. In the same way that water runs downhill, a given idea developing in a given time and place will predictably develop in a certain direction.

Uh, one of the very large creodes that we can see at work in nature and society is what I call uh, the "conquest of dimensionality." Uh, biology is a strategy for moving into and occupying ever more dimensions. And biology begins as a pointlike chemical replicating system attached to a primordial clay in a- the proverbial warm pond somewhere at the dawn of time. And as life develops it folds itself, it becomes a three-dimensional object. It replicates itself in time. By that means it claims the temporal dimension. After uh, 2 or 3 billion years of that it evolved itself to the point where with strong muscles it can move through space. With superb visual organs it can coordinate its exterior environment. And finally, through the advent of language it can tell its story, it can move information around not present, and as soon as you begin to code that information into stone, or magnetic medium or whatever, in a sense time has stopped. You are moving outward now.

And uh, this very large creode seems to inform not only biology but the human enterprise as well. So when I talk about stuff like the evolution of photolithography and moving pictures out of photography and the evolution of surround sound and the global airline system and these kinds of things, these are dimension-conquering phenomenon designed to shrink the earth to a point. And of course the internet is the mother of all dimensional conquest. In a single 40-minute session on the internet I may talk to computers in Helsinki, Australia, Paris, Vanuatu, you name it. And I don't even notice this happens. Yeah it doesn't matter, it's meaningless to think in those terms because in fact you might as well think of it all being inside your CPU sitting on your desk. It has the same effect.

What that is, is the sum-total of human knowledge being daily augmented, and the fury with which people put their thing on the internet, everything from, you know, how grandma's recovering from her stroke" to...I visited a language site the other night that had 122 syllabuses for 122 languages that were philological engines for searching these languages. I got there through the Voynich manuscript site. Yes that all still goes on. That community is at work. So apparently we will not rest until all space and all time is brought down into, for all practical purposes, a single point. And this is an idea that has been around in various forms since at least the 16th century. I mean, it's the alchemical idea of the philosophers stone: a universal panacea, a medicine which makes you wise, immortal, all-seeing, all knowing, all good. Uh, but interestingly conceived as an artifact of technology, conceived of something brought into being through the effort of a technological worker in concert and resonance with the intention of nature which is to do the same thing. The human world is simply a catalyst for nature's intentions, we are speeding up nature's program of dimensional transcendence. Yeah.

Q: [??]

TM: It is, it is that and in a sense it is the Jungian unconscious, but no longer unconscious. In a sense what we're saying is, you know, we all- before the internet you were who you are, you knew what you knew, and you knew there was a great deal that you didn't know. You had once known it, but forgotten it, or had never learned it but somebody somewhere knew it. Uh, and because we had this vast dark companion, the unconscious, bad things keep jumping out of it. Uh, it was remarkable to me that throughout the Cold War period, a planet ruled by carnivorous monkeys filled with ideological hatreds under immense social and economical pressure and yet, nobody ever used atomic weapons except once, the two Japanese instances. And in a sense they don't count because they didn't know what it was, they had to use it to see what it was, and once they saw what it was remarkable restraint set in. Uh, I would never have guessed that we would have been capable, I mean remember how deep the fear of the Soviet Union was, remember that for 35 years a thermo-nuclear strike was a possibility within a half an hour within of any undue movement on the other side. And yet somehow we got uh, through that. There is in the human animal an effort to awaken.

You know it was um, it was- it was H.P- oh, no- it was H.G Wells who said "History is a race between education and catastrophe." It's a white-knuckle enterprise. Catastrophe edges inches ahead, education moves ahead. Uh, and again, if it were a level playing field I would be betting on catastrophe, because I believe that nature favors the good, the true, and the beautiful. I've got all my money on education. I think we'll make it, but I think we'll have to scare ourselves to death in order to keep focus. You know we're, we're primates and we don't really dig in and get rolling until we're painted into a corner.

Q: [???

TM: The courage of the imagination? Well, I guess the answer that is you somehow have to make it your friend. You have to make it your friend. There are ways to do that. Actually I made a little list. You played right into my hands. Uh, uh, the- the first and probably oldest friend, older even than, than psychedelics is dreams. Dreams are hugely important. Uh, I was in Australia in February and I did a lot of reading up before I went down. Uh, the aboriginals of Australia are- have been at the cultural enterprise for a long, long time along a different path than the rest of us. I mean, I've spent time with Amazon tribes and with people in central Asia, and yes they're funky, and yes they're different. But these Australian aboriginals are on to something quite other.

Uh, many people barely open their eyes...people sit silently, people don't talk. This again relates to what we said about language. In Australia among these people you get this feeling among these people that they don't talk because they're not sure it's here to stay. If, if an aboriginal wants to communicate something with you they would rather walk a half mile with you into the bush and point at it than to simply describe it back at camp.

So uh, the dreamtime and the Jungian unconscious, and the unconscious made conscious by the internet begin to sound like the same thing. I previously didn't have much interest in the Australian aboriginals because I was slightly irritated by irreliance on psychedelics [audience laughter] And so it was like...what am I supposed to do with these people, they're clearly very loaded and very far out, and how do they do that without drugs? It was paradigm agonizing to me.

[audience laughter]

Well it turns out that they are just better at keeping secrets than people in the Amazon, there's a revolution breaking over ethnobotany. We have been saying for decades that South America was the most hallucinogen rich ecology on the planet, and why was that and so forth and so on. In the next eighteen months some Australian ethnobotanists and trippers are going to publish data that shows that the Australian aboriginal worldview is entirely running on DMT. These acacias, this gumtree ecology that stretches from Queensland all the way down to the south coast is replete with DMT. It's simply that the aboriginal culture is even more secretive than other cultures, other aboriginal cultures in other parts of the world, and only very, very slowly is this information uh, uh being let out. So dreams are one of the great friends of the imagination. There will be more, it's not good for me to take the thunder. Many good people have hundreds and hundreds of pages yet to be published, and they've got the data and they've done the analysis.

Q: [???

TM: Well, I pretty much take the position that there may be people that can do it on the natch, but there's no technique, it's something you have to be born to, and there's no culture that can do it. I think throughout the human population there may be 1 person in 100 that has a futuristic set of synapses. Because I occasionally in a group like this, somebody will come up to me and say "Well I've never taken a psychedelic drug and I know exactly what you're talking about, and I see visions" and so forth and so on. I used to think that these people were nutcases, I've now encountered enough of it that I modify my position to say: These are just incredibly fortunate people. And you can't tell how much of it is personality, how much of it is chemically real. Again, how, how much of what I'm saying to you right now is being processed differently in ever head in the room? Some people are seeing pictures, some people are hearing words, some people are logically building on what I say, and for some people it's just music. And so it's very different, and it's something very hard to share because it's so subjective. Throughout the world there are what we would call "primitive" or "aboriginal" cultures and some are drug users and some are not. And it isn't a matter of ecology, it's a matter of something else. In eastern Ecuador you have tribes that are totally drugged, and across the river people who never touch anything. Living basically what appears to the unschooled observer, two cultural systems not that different from each other.

But generally speaking, the psychedelic cultures seem more- let me put it this way. The psychedelic cultures seem less dogmatic. Shamanism comes in two flavors, at least two. There's what I call a traditional shamanism is very rigid, and ritual-driven, and usually non-psychedelic. And the other kind of shamanism,

there are rituals but they are basically for the consumer, not the producer. And what shamans in these psychedelic cultures are simply alienated intellectuals. I've been in situations in the Amazon where you fly in to some remote place and the people come and the women come and they want to touch the airplane. And they want to look at your camera and touch your clothes, and all this. While this is going on, meanwhile standing off is the shaman and he doesn't give a shit about the airplane or your camera or any of that. He is interested in you as a person. And what he is is he's alienated from the values of his culture. The keeper of the values is the one person who knows that the values are bullshit. That's what they're doing in that function, it's like somebody has to know. And its like everybody is, you know, cow-towing and going through their business, but the shaman at the top realizes "my god we stare out into an abyss, we do not know" They're like scientists, they are scientists essentially.

Q: ???

TM: Well this is an interesting question, there's a hard and soft answer. It depends on whether you think the need to commodify is, is so basic to human beings that it can't be removed. If that's true, then the internet still holds out a certain amount of hope. A-a hard-core anti-capitalist position wants to eliminate capitalism because it sees it as an irreclaimable evil. But it's possible that the only thing wrong with capitalism is that it manufactures, distributes and commodifies physical objects. If there was a capitalism that only commodified information and light? Uh, that might be more tolerable. I- you know in the future, not that long in the future, if you want to live at Versailles, it will cost you 149 dollars to buy the software package and set it up and live in it. Well if Versailles costs only 149 dollars, then what is it worth? And the answer is: only what the market will pay.

So uh, I think, for a long time this process of raising standards of living has been underway, and it is certainly true that today in the world hundreds of millions of people live better than uh, emperors and kings two centuries ago. I think the important thing- well, before we totally dismiss capitalism we should see if it can operate in a virtual, informational environment less destructively. If it can't, then something else will have to come along. But certainly capitalism based on the extraction of resources and their fabrication by cheap-labor populations into objects to be sold in a central economy, that's finished, that's a dinosaur, that's self limiting because there is not an ultimately exploitable resource base. The end of that kind of capitalism is easily discerned.

Q: ???

TM: Well that's an interesting question, is there a kind of natural selection of means in the marketplace? There probably is. For example, imagine...governments deal with information completely differently than corporations. If a government obtains the proprietary technology, it's impulse is to classify it, move it out of site, and exploit it for political advantage. If a corporation achieves a proprietary technology, it drops a huge amount of money on promoting it, rushes products based on it to market and tries to spread it everywhere as fast as it can. Uh, this certainly has caused the evolution of certain kinds of technology, but the two systems, the capitalist corporate systems, and the governmental systems value and put emphasis on different kinds of technologies. For example, nation states use war as an instrument of national policy. Corporations almost never do that, corporations don't like war. It busts up environments, it makes products difficult to move around, and where you had healthy, happy customers, you have hollow-eyed refugees standing around with their hands out.

Q: ???

TM: But those were national interests, no corporation could have launched a war like that, it wasn't Exxon who had a knife poised at their throat, it was the economies of France, Germany, and the United States. Uh, also that war was generations ago, a completely different set of political rules were in place. That was probably the last of those sorts of wars, I would bet. What capitalism does with wars is it exports it to already burnt out market areas like Rwanda, Bosnia, Albania, they don't care what people do to each other in those places because they don't have uh, there's no market there anyway. Let me go on with my list here, I think I got through dreams and drugs, which were the biggies. This is "Friends of the imagination" in case you've lost your place here. Uh, uh fiction, and the enterprise of fiction. Not necessarily science fiction, although its interesting if you look at the golden age of science-fiction, the magazines that created that had names like "Amazing", "Astounding" and "If", these are the very words and themes that we've been pursuing around here.

But fiction is uh, until we get virtual reality up and running, in the hands of a master, the best way we have of showing each other the contents of our own heads. Any of you who have made your way through "The remembrance of things past", Proust's enormous novel about [???] life in Paris, there are thoughts uttered there that are so fragile delicate, that you when you read it, you think you were the only person who ever thought this and you never bothered to mention it to anybody because it seems so ineffable, and yet Proust has gotten it down on the page.

So it shows you what human beings are, and of course our world...Pardon?

Q: ?????

TM: I'm trying to think of an example. There's an example when they're going to a beach town and he's riding with a great society woman, and he's watching the trees go by the carriage, and he notices that- uh, how does this work, the nearer trees move faster than the trees further away. Over this spatial metaphor is mapped a temporal metaphor about people changing in time. And, you know, God knows what it is in French, but even in English its this exquisitely complicated thought, and you wouldn't think anybody could do justice to the feeling, but there it is in its completion. The other great friend of the imagination is travel. Travel is another way, a more gentle way, to break down cultural conditioning. What we call "culture shock" is when you go to Afghanistan or Albania and you realize how your expectations of how a table should be set, what a toilet looks like, how a bus ticket works and how a telephone is supposed to operate were so narrowly defined that now you're confronted with a telephone and a toilet and you don't know which end is which.

Uh, and it's not for nothing that the vocabulary of psychedelic experience has borrowed from the vocabulary of travel. So we take a trip, we have a journey, we go to an alien landscape.

And then finally, uh, the great friend of the imagination is the future because its in the future that we place our hope, our fears, our suppositions. I mean the future is a land of things imagined, things that have not yet undergone the formality of actually occurring.

Q: ???

TM: As a friend of the imagination? Well did I not mention last night that the two great motivators were food fantasies and sex fantasies, and yes, uh the sexual imagination is at a very early, I almost said primitive but I don't mean that.

But I mean early level, because if I'm understanding you correctly, it revolves around the "if" operator. "If"

I approach the desirable female with the proper blandishments, “if”, and then of course just sexual fantasy, then we will do this, then we will do that, and so on.

Q: ????

TM: It certainly is a vehicle for altered states, whether I would call them imagination or not, I suppose I would, but now that I am thinking about your question, I think there are pitfalls in the imagination. And probably the sexual pitfall uh, sentimentality. [laughter] Tastelessness is in there too. Sentimentality is a virulent form of tastelessness. Sentimentality is very hard to root out, you may think you're a hard cookie. But I'll bet there are areas of sentimental delusion that are so broad and deep in every one of us, and some people carry that to the grave, they're the lucky ones.

The rest of us have divorces, bankruptcies, muggings, what have you, and slowly our sentimentality is pounded out of us. It's a good thing to lose sentimentality because it's a false aesthetic, and I think we recognize it.

It's also a very easily manipulated, it is truly a false aesthetic in the hands of modern media because it is a great ploy for buying. If you can induce sentimentality in people they will buy the object of that induction.

(Question/commentary about hearing Terence's definition of sentimentality)

It's a false valuing of...I almost said experience...experience/expectations. It's a false valuing of things.

(Question: is it tied in any way to...)

Yes, well your word idealism is good here because it brings me to something I always eventually get to, which is in line with this thought “culture is not your friend” Idiology is not your friend, and ideology- some people think what we're trying to do here is sort out good ideologies from bad. Should I be a Marxist? Should I be a deconstructionist? And the answer is no, none of the above. All ideologies are uh, viral infections of some sort, mimetic infections that erode your functionality and your comfort with yourself. Ideologies set up polarities that are based on discontent. And ideologies are always, always, always based on false premises. Whatever the, name an ideology and I'll tell you the false premises that it's based on. So uh, part of this process of cultural maturity that I've been talking about is to get beyond ideology without embracing cynicism. It's not a “fuck you!” thing, it's a deeply saddening awareness that we are not yet angel enough that we should take ourselves that seriously.

Q: ???

TM: Yes I would say that ideology is that feeling of attachment we have to our ideologies. So for instance someone said “You know, Marxism, maybe we didn't have the right answer...but we certainly had a sense of a mission, and a wonderful...you know, we knew who we were!” That's crazy talk. I mean if it was wrong, it was wrong. That's like old Nazi's sitting around talking about “the great old days”, what was so great about the old days? You want community? Join a bowling league for cryin' out loud.

(Question/commentary)

Now that's a lesser evil, that's nostalgia, another impulse for marketing frenzy.

(Another question, different person)

Model and sentimentality. Yeah, did you want to say something?

(Commentary, something about the position and qualities of a romantic)

Well he used the word “romantic” (laughter)

But, but, but romanticism I think is a legitimate impulse, and well situated within historical context and so forth and so on. Sentimentality can break out anywhere, anytime, and is, you know... can find anything for, for it's object.

Sentimentality is a lazy form of thinking, I think. People don't want to think the hard thoughts, and yet I find the hard thoughts very paradoxically liberating.

For instance here is a hard thought, I don't want anybody to burst into tears on me so gird your loins, but you know I've spent a lifetime taking drugs, knocking around the world, having affairs, being married, being unmarried, this that and the other. If somebody asked me, so what do you know? What have you learned? I would have to say what I've learned is uh, that nothing lasts. There's a hard thought, is that a cause for joy or despair? Well if you're thinking about everything you love and how it's going to turn into mush because you're shoveled into the grave it's a hard thought, but on the other hand if you think about all the jerks who've oppressed you it's a great consolation to know that they too will go down into that good night...

Nothing lasts. That is not a cause for joy or despair, it's a cause for expanding ones feeling in the moment. If nothing lasts, then there's a conclusion, not a feeling, to be drawn from that observation. The conclusion to be drawn from it is then, the felt presence of the immediate moment must be what life is for.

And somebody who could take that perception and use it that way could immediately transcend all kinds of neurotic behavior: longings, regrets, doubts, fears. You just say no, the felt presence of immediate experience. Yeah, sentimentalism.

Q: (Question/commentary)

TM: Oh, well first of all let me comment on the Buddhist thing. I'm not that friendly to that formulation because it's still is postponing gratification. It's saying death is the bouquet of life, you should live towards death. I would say the bouquet of life is this moment. To the more important point of longevity, I certainly am not interested in living forever, whatever that might mean because I suspect if you live forever you miss the point.

In other words I think that you miss the bouquet. On the other hand, I don't see anything wrong with...no that's too much to say... The only problem I have with living past...whatever, threescore and ten, is you get into political issues. Are people buying time at the expense of somebody else?

One of the weirdest things about this culture is we've invented a sin for which there is no name, it's so beyond peoples abilities to conceive. This sin that we've invented is we steal the future from our children. We do it with our medical health care plans where we know that all this fine surgery and stuff that you're getting is at the expense of the next generation of people. We overuse resources leaving nothing for future

generations. I don't know how all that would be sorted out. I'm, I am attracted by the idea of living as long as I want to live. I wonder how long that, that would be. And of course if you make people comfortable, probably they would like to live a lot longer. What reason is there for a person to check out of a comfortable situation? In a sense what nature does is it makes the body a less and less comfortable place to be until finally you just say "alright already!" Take me! Beam me up Scotty!

Uh the- but then you know the other possibility is what if there were forms of existence that were de-materialized. How would we feel about going into circuitry for a few round of eternity and what are the moral implications of that? I don't know, I've had this argument with Robert Anton Wilson. He's a big enthusiast for life-extension. It depends on what you think death is, and I've managed to talk myself into the idea that death is probably not simply dissolution and chaos. Not because I have received any guidance from on high, but just as I observe nature, she has a wonderful parsimoniousness about her behavior.

Clearly this form, which is basically an unraveled DNA molecule that is now making a lot of claims on resources in the environment to keep this body going uh, is uh- nature people a lot of effort into this. I think that the best model for what life is, based not on religious thinking but on biological thinking is: Life is what you get when a hyper-dimensional object protrudes into ordinary space. In other words if we take this cup and cut it in two, it doesn't change, it just becomes a cup in two pieces. But it doesn't bleed, it doesn't rot, it doesn't lose its essence. If we take any living being from a bacterium to a brontosaur, and cut it in two the entire system falls apart very quickly and the thing is a mess and we see that the thing we had is no longer there. So I think what biology is, is the intrusion into 3-dimensional space and time of hyper-dimensional objects. The other clue to that, that seems an argument for it, is that we do have this thing called a mind, but we can't find it anywhere. It doesn't seem to be anywhere.

Even when you get down to electrodes in the brain, and saying words to people and watching oscilloscopes you still can't seem to quite nail it down. So I think probably these objects retract back into hyperspace, higher-space, and that this is what the soul is. There is something to the psyche of a morphogenetic field. And uh, and we clothe ourselves in matter, but we are not matter.

So to actually complete a human cycle of existence, you have to go into death. It's where you came from in some sense. I mean the whole p- we put a lot of attention into death, we don't look very much at birth, we think we understand it. I mean we all know very much about the sperm and the egg and all that, but before that...what is going on?

Whence commeth these forms? We seem to have the matter down pretty good, but really what a being is, is the intrusion into space-time of a form, and the form is unique and then it retreats.

I think it would be one of the great jokes of human history if here at the end of the 20th century, at the end of the millennium, with all this techno-hypola surging around us, if we were to actually gain insight into the after-death state and one of the reasons I'm so keen for DMT is because when I have given it to people who were ported experts in the after-death state, Tibetan lamas, and shamans. They come back and they say "Yup, that's the territory all right"

Uh, and, and so in my highest states, I have had the insight which I will convey to you without saying its true, that this is the most limited form of existence that you will ever know. You can't be deader than this [audience laughter]

This is the bottom line.

So the good news is its only up from here. But of course you have to bet the farm on this cheerful rap. And there's no whining if you're wrong. This is an all-or-nothing bet, so naturally it brings your heart into your throat. But that's the kind of enterprise life is. Uh, all risk and the race to the swift. One last-

Q: (Question)

TM: You mean there's a 5th, and a 6th, and a 7th? I've heard that's it... Well I don't know, and I will wonder what I think when I approach the great divide. It's easy in the pink of health to speculate and play the philosopher and all that nonsense. The last dance you dance, you dance alone. And nobody will be watching, but I have seen people die, and it is an inspiration. I hope to have that equanimity of mind. The other thing about death that needs to be said is, that we all imagine that we will have a leisurely philosophical death. That's what we all want you know. Months to get used to the idea, to say goodbye, to gather friends, to make our bequeathments, to speak our final wisdom, but death for most people comes messily and unexpectedly.

So I don't think you should live in an anticipation of the drama of your deathbed scene. Better to repair to the moment, being a realist, primarily. What I find always waiting when I return from these flights of philosophical fantasy and imagination, is my body, my history, my space, my time. And these things are all good, it's a great space, a great time, a great body, a great being to be. So the real message of the psychedelic experience and the anti-historical thrust of the critique we've been carrying out here is to take the moment, the felt presence of immediate experience. It is all you know, it's all you will ever know. Everything else comes with unconfirmed rumor, innuendo, unrealized possibility, fading memory, conjecture, lie, hope, who knows. But in the moment of being we have the completion of being, it is always complete. Every moment. And to the degree that we force ourselves to look beyond it or can not find ourselves within it, we betray it. And then we have more work to do. Well that's enough I think, for the morning. Yeah.

(Question/commentary)

That's exactly what we are saying, yes. We will get together this evening.

(Pauses and breaks for the continuance of the next section)

The discussion was not concluded this morning, it seems like it was just uninterrupted at the lunch hour, there was a number of things in play at the time.

Do you want to pick up any of that?

(Question/commentary)

I think the issue had to do with accessibility, and in relationship to life and the internet. There's a certain impulse toward connectivity, accessibility. But once you achieve that you discover that there's so much there in life, or on the internet, I mean we're talking about two things at once.

But the issues becomes about how to filter the experience, how to set up your own labyrinth so that what reaches you is what you intend to reach you, and what is deflected is irrelevant.

Yes and in the absence of filters you are just drowned. Searching the internet is just a strange kind of entertainment because no thought is ever carried to completion, it seems to be an infinite series of foot-notes, and cross-referencing.

You can spend an hour or two doing this and through the experience you have this feeling at the end, somehow your inquiry into the taxonomy of the orphadasis....

End of part 4

2:30:45

Well you have to somehow exercise that invisible muscle that tolerates strangeness. My brother had the notion of what he called "extra-environmentalism."

He said "The reason we are fascinated by the aliens is because we want to become the aliens." And the aliens- this is the thing I keep coming back to about the need to "graduate" from culture. I'm really into this. It's not about recovering your Irish, Jewish, Slavic roots. We're beyond that. It's about uh, discovering and acting from your uniqueness, and not defining yourself as a member of class or category. That's a print-created mental error. Things like racism, sexism, all these forms of averaging and leveling are sloppy forms of thought. Have you ever noticed that race, for example, is a quality that adheres only to large groups of people. To speak of a race you have to have a bunch of people. It's not a quality that adheres to an individual, any more than an individual water molecule is wet. Wetness is something that only emerges when you have millions of water molecules.

And yet- and I think this is a print-created phenomenon. This over-use of simple categories is a kind of genuflection to the simplification of the world that takes place through print. So for instance we analyze social problems through the use of the category "class". We say "well the ruling class is screwing the lower class" or "the working class isn't getting it's fair deal." This kind of gross over-simplification to problems makes the solutions to problems almost intractable because the objects that your model seeks to manipulate, classes, is an illusion in the first place. And we see in the 20th century, I think, the bankruptcy of this kind of thinking about human problems.

A friend of mine says of mushrooms, that every time he takes them the goal is to stand more, to stand more. What is meant by that is "hey, it ain't easy to go the limit". The thing is constantly able to challenge your categorical maps, no matter how advanced your categorical maps are. It can always raise the stakes

painfully higher. And so the goal is to stand more, and the more you stand, the more your own place of intellectual origins, your own cultural venn, recedes into quaintance.

This is what you were getting at with going beyond culture. Culture is a simplification and a lie. It's the currency by which fools navigate.

The world.

Smart people get beyond it. You can choose when to do that, I don't think, for myself it happened until my middle 40's, then suddenly because experience and maturation somehow found each other and carried me forward I began to think like this.

Uh, uh before, I was in a sense a true believer. For all the psychedelic experiences and political activism, and so forth and so on, I hadn't yet understood that culture was a vehicle that could only be ridden so far, and then beyond that lies uh the great and to be defined unknown of ones own individuality.

Many people never get beyond the imposed neotany of imposed conventionalism. I said that's its insidious that in middle life circumstances tend to deliver us money, either our parents die or our professional activities finally pay off. And that money is usually the final nail in the coffin for ever evolving beyond cultural convention.

Why should we? At last we've achieved the fruits of our labors, the good life, the comfortable dream, but it's the dream of anesthesia. You know, that feeling you feel is the gurney that's rolling you toward uh, the tissue disposal oven.

So, anyways...(laughter)

Q: ???

Yeah it does, you're right that "cool" then if you aren't cool, you go to incredible lengths to achieve by your sates means, by buying 3,500 dollar sunglasses and getting tattooed, and you know, but it can't really be faked.

The whole engine of marketing is designed to make you think that it can be faked. I don't know if I am cool or not, but I am incredibly resistant to any effort to make me think I'm un-cool. [audience laughter]

In other words, because the answer always lies in co modification. I'm not using the right body cologne, I'm not wearing the right Italian designer clothes. I don't slump with a half-smear on my face. All of these things which are marketed as the accoutrements of cool. So you get a clueless culture "aping cool" and of course real cool can't be co modified. That's what makes it so cool, and so maddeningly distant from the un-cool.

As long as we're on this kind of tack, this morning I talked about the imagination and it's friends, and you recall the list and I won't refresh it. But I thought it would also be useful to talk about the enemies of the imagination. We've talked about culture as the enemy of imagination. And I think we've done enough of that. The other thing that I think that is the enemy of the imagination, and this may seem paradoxical, and it may raise hackles, and it may bring controversy, but it has to be said.

I've always- there's always been a strain of this in my thinking, in what I'm about to say. But my son pointed out to me that I needed to hammer this particular key harder. Uh, I- my son is sort of my surrogate in the culture, he goes out to the highways and byways and listens to the murmurings of the people and tells me uh, what's going on.

And this brings us to the subject of relativism. I never quite heard it put this way until he put it to me this way. What is relativism? Relativism is the idea that your ideas are as good as anybody else's ideas, and all ideas are equal in worth because nobody can tell what's going on anyway. It's the "live and let live" laid-back approach to doing intellectual heavy lifting. I'm a nealist, you're a nazi, you're a Christian, you're something else. Hey no big deal, let's just hoist a beer and party on! Well, I have to defer.

I- there's, it's a problem, especially in California where this thing has gone from being a pathology to the defining mode of normalcy. But, it, it allows stuff like "Heavens Gate", it allows Jones Town. Nobody ever said to those people "You're full of shit! You know, don't think like this, this will lead to catastrophe" Instead people said "Hey, cool!" "See you in the sky!"

And people say "Now this sounds like you're advocating acrimonious and emotionally painful judgment making that will leave some of us disenfranchised in our belief of the space-people or the presence of great Atlantis" or something else that's very cherished. Yes. Yes, we have loosened our, our girding sufficiently folks. We are now open minded enough, you don't want to become so open-minded that the wind can whistle between your ears. And uh, there are logical razors and rules of evidence that can be brought to bear on any situation. So for instance, our culture is awash in claims of all sorts. Uh, religious claims, the thousand various religious offerings on the market, then it moves over into medical claims, dietary claims, claims of superior sources of knowledge.

I can read the dead-sea scrolls, you can't. She's talking to the space people, you can't. This guy is accessing past lives, you can't. There are all these whisperings and intimations of special connection and uniqueness.

If you are passive in the face of this, I think you're intellectual arteries will fill up with mental cholesterol and eventually you'll have the equivalence of a coronary thrombosis of the intellectual level.

It's, it's very important to hone intuition and logical razors so that reasonable questions can be asked. And um, it may break the mirrored surface of "We're all in it together" the illusion of community maintained by nobody ever criticizing anybody else.

This nobody ever criticizing anybody else brings the intellectual enterprise and the refinement of human

knowledge to a screeching halt.

Uh, the way in which the intellectual enterprise moves forward is by being critiqued, analyzed, subjected to tests.

And uh, uh, you know, you've all heard me knock science, and I have many bad things to say about science, it has to answer for some of its sins. But the great thing about science and the thing which makes it unique in the history of human intellectual endeavors is it is a human intellectual enterprise in which you get lots of credit for proving that you're wrong.

Scientists really respect each other for proving that they are wrong, if you have a theory that you've defended for 15 years and then you publish a paper saying "I've been over it again, I've looked at the data again and you know what fellow colleges? I botched it, I was wrong"

They promote you for this, they say this is the essence of intellectual honesty. We know you do good work because we see how you trashed your early accomplishments.

Religion doesn't work like this. In a religious domain you never admit you're wrong, you further elaborate the story to save whatever preposterous notion has been exposed and you never deny, you never recant, you never go back.

So what you get is error, based on error, based on illusion, based on delusion, based on lie, based on half-truth, based on supposition, based on somebody thought it would be nice if... And there's no wonder there's not a great deal of spiritual juice in that. So I think there are many things to be said about science, that it has relied on probably to too great an extent, so forth and so on.

These are technical issues, but in our personal lives it's a wonderful thing to take as a model. Always seek A. The simplest explanation. This is called the principle of parsimony, otherwise known as Occam's Razor. Sounds very fancy, what it means is always prefer the simplest explanation. Try the simplest explanation first, if it fails, complicate it as little as you have to to go to the next level. But we live in a culture where the simplest explanation is never accepted. Somebody sees a light in the sky, immediately it's a UFO invasion. The possibility that it was a meteorite, a piece of aircraft in trouble is not entertained, and so consequently people's intellectual lives become incredibly baroque, but unanchored in the world of observation and reasonable discourse.

God knows the world is so tricky that without rules and razors you are as lambs lead to the slaughter. And uh, I'm speaking of the world as we have always found it, add on to that the world based on techniques of mass psychology, advertising, political propaganda, image manipulation. Uh, you are- there are many forces that seek to victimize us.

The only way through this is rational analysis of what is being presented. It amazes me that this is considered a radical position. This is what used to be called a good liberal education, and then somewhere after the 60's when the government decided that universal public education only created mobs milling in the streets calling for human rights, uh, education ceased to serve the goal of producing an informed

citizenry. And instead we took an authoritarian model, the purpose of education is to produce unquestioning consumers with an alcoholic obsession for work, and so it is.

But as people who may have had one foot in this system at one point, and another foot in it at another, I think it behooves us to be alarmed and to attempt to recapture uh, our soul, essentially. From the nets of propaganda, market management, commodity obsession, uh, uh money fetishism, these various, extremely infective means that are spread everywhere.

Q: ???

TM: Yeah, a birthright to be left alone, this is why it was interested you know the debate that went on in the first Clinton administration, there is no right to privacy in the constitution, it's something we all talk about and assume but in fact you can't find a strong legal basis for this. It needs to be articulated, we need a dimension that is free from the potential incursions of uh, of those who would manipulate us. The constitution enshrines the right of a person to be secure in one's home and possessions, but that's not a strong enough statement to nail down the right of privacy. This may be the great, the single greatest right which everyone is being denied, many of other people are oppressed in other ways, but we are all denied the right of privacy.

Interestingly years ago when I got divorced at some point in these proceedings you have to file some kind of a court document, I guess it's an intent or a declaration to divorce or something. Within five days my mailbox was crowded with invitations to join singles groups. It was very clear to me that people were going over these court records and getting the names of guys between the ages of 30 to 50 who were filing for divorce and hitting them before they got home from the court house with invitations, and uh it's insidious that we are accessible to this kind of invitations and seen as victims.

I mean here's a tremendously private personal tragedy, but for a whole segment of society it's not a private personal tragedy it's a marketing-opportunity. You have pain? We have answers!

Uh, [clears throat] somebody over here....no? no? any comment on all of this?

Q: Since 1965 when young people started using drugs, we lost more privacy in the name of drug-investigation, for example it's very simple to get a group of judges something with search warrants, I know all about this, I've been a victim of it.....?

TM: Well yes, for example, before drugs were an issue, if we take a subset of the population like white college students, this was without contest one of the most law abiding subsets of the population. White college students are more law abiding than white-stock brokers, or almost any other segment of the population that you can name. But if you turn cannabis into a schedule one drug, a felony, suddenly, all these people that never felt inspired to descent, never felt the heavy hand of the government are automatically members of a criminal class.

What this does is both radicalize the people so persecuted and in a feedback loop of paranoia, drive the government into a frenzy of trying to penetrate understand and control this minority group. The idea that states of mind are matters for legal manipulation, it's amazing that that discussion is even taking place in

the democracy founded by Thomas Jefferson. Uh, you know does it happen that American conservatism, that used to stand for a free-market economy and a laissez-faire attitude toward life becomes instead the purveyor of the most Draconian and invasive approach to social management ever conceived of.

And what I'm talking about is the piss-test. The idea that any civilization would tolerate that level of invasion into the lives of its citizens and that those who would advocate it would dare to call themselves conservatives, in all- in the whole Marxist episode, nobody was asked to piss in a cup in the Soviet Union or Mao's China to establish their loyalty to the government or the corporation. But that went down here with barely a murmur.

(Question/commentary)

Well, this is a society based on paranoia, I can remember in the 50's when we were being dinned with the evils of Communism they would tell you, finally they would reach for the most outlandish bumper you can imagine. They would tell you "You know in Russia, children are encouraged to report on their parents if they would criticize the government?"

Well my God, now in America if children report on their parents and the parents are dragged away to prison, the mainstream straight people stand up and applaud. This is a wonderful example of the nuclear family functioning at it's maximum best.

(Question/commentary)

Well no, there are numerous examples of this. I don't know what to say about this, I despair of right-wing, left-wing political solutions. I think everybody is so uh, corrupted by the agenda of capitalism that it's amazing that we have any rights at all left. I mean you know, thank god for Jefferson, and thank god for the Constitution, I mean every time I go to England it just gives me the absolute willies. These people have no Constitution. If you get into some kind of complicated wrangle in England, the old boys club, guys in powdered wigs and locked rooms decide what happens to you and your fate.

And England is not exactly Kazhikastan, we think of it as a source of democratic ideals.

But it's just that in the absence of a constitution, what the establishment says the law is, is what the establishment says it is.

(Question/commentary)

Well first of all let me say that I'm a member in good standing of the ACLU, and they saved my ass in Los Angeles. Uh, I don't really see the contradiction, we cannot abandon culture completely. One could. What I mean is it's perfectly clear to me, because of psychedelics, if I started eating mushrooms and didn't stop I would in a day or two have to move up to the ridge and I would begin to browse on the local flora, and in a week or so, discard my clothes, and in a year or two my eyebrows would grow down along my face. I would be like the monk on cold mountain.

I could do that, you could do that. There is- once you find psychedelics, there's nothing that stands between you and a complete check out from your cultural heritage. The only cost to you is the complete

abandonment of everything you've ever known and loved, and if you can give that up, these, these monkish people, these fuzzy people, these people who hang out with dragons in the clouds, you could become one of them.

Most spiritual seekers drive with- drive on whatever spiritual vehicle they've rented with their foot on the gas peddle.

Once you get to psychedelics, you begin asking "Where is the break?"

Because you have now the power to transform yourself, if the search was for power you've found it.

But you see searching for answers is the position of an engenie, it's the journey of the fool. What I assume all of you people have to grapple with in different degrees is the fact that by chance, or design, or good fortune, you have found the answer. Seeking is over-with in this room.

But what you have to do now is a much more demanding and grown-up thing. You have to face the answer. And you have to take the measure of yourself against the answer.

You said you wanted to ascend into the dragon realms, you said you wanted these spiritual realities to become vivid for you. But now there's nothing between you and it except the decision to make it happen. And where do you come down on that?

Uh, so when I push things like extra-environmentalism, and critique of culture, I mean it in a very wussed-out way. If I really meant it I wouldn't be here saying it, I'd just let you all figure it out yourself and let you go off and be a legend and you could follow me into it, if you wanted.

I, I love things about the culture, but I w- and I define this loving of things about the culture as a kind of weakness. I'm not proud of the fact that the highest I can get is to teach at Esalen. I'm not at all proud of the fact that that seems to be where I top out. Had I greater courage, I would go further, but...I don't...[Terence laughs]. So I'm hoping that you people, my graduate students as it were, will sacrifice yourselves on the pyre of going further.

And uh, and, and report back. (laughter). The thing is a, the thing is a paradox, and you either live with the paradox, I think, and that contains a certain amount of hypocrisy, and hypocrisy was a word we used earlier. Or you become so individuated that from the point of view of everybody else you're mad. And I've been that too.

And uh, that- it, it's very hard to do it and remain in society, I don't think I could have done it. My episodes of madness occurred, thank God, 700 miles up a jungle river in baboon assholia, but had it happened in Manhattan or something like that, it would have quickly set up ripples that would have inexorably complicated and uh, and made my life much more difficult.

Q: What do you think um, I read a quote once from Oscar Wilde " our duty in life is to be as artificial as possible." (Commentary/question)

Duty in life is to be as artificial as possible. It's an interesting quote, it meant something to him something completely different than what it must mean to us.

Q: And I always kind of refer to that when

TM: I'll tell you a boring little secret about how I go to be who I am. I grew up in a town in Western Colorado where if you read Time magazine, you were suspect of being some kind of left-wing intellectual. I mean this was Podunk. And as I grew up there I became aware of all these extremely strongly expressed cultural values and most of them were hostile to something. Either Jews were bad, or black people were bad, or people who didn't work were bad, or people who made messy paintings were bad. All of these things were bad.

And one day it occurred to me, I will take the position that all these things are good! These things are good! Abstract expressionism, Jews, black people, science, good! Good! Good! Good! Good! And everybody said "there's something wrong with this kid!" but, and I didn't understand my own position. I mean you know I'd look at a Pollock and think, you know, "it is messy, it may be horseshit" but we must never admit that, we must defend the genius of Pollock unto death because we don't understand it.

And by taking that position, slowly I actually did understand some of these things and make them my own. And I discovered that that was the path to wisdom, a total rejection of my own, of the culture I came up with. Well, I don't know how that would work if you were born of Jewish parents of New York who were members of the Communist party and always took you to wonderful art exhibitions and made sure you got to Carnegie. If you rejected all that, you'd become a jerk like the people around me in that small Colorado town.

Uh, so this is not a fail-safe prescription. Uh, but in my case, by an embracing of everything artificial and antithetical and opposed by, and smeared at, by the people around me, I made my way to, you know, real depth, real worth, real culture. Not that I assimilated these things, but at least I came to live uh, in the light of them.

It's a great puzzle, I mean all of you who have children, and I have two, know that we are alienated intellectuals. I mean broadly speaking, this is what we are, and so we bitch about the government and we critique the monetary system and so forth and so on.

Well then you see your children on the bring of reason and then you say, you know "jeez, my alienation has brought me alienation, but I can't let the kids grow up to be marks, to be pawns of the propaganda and market machine" people scratching their heads trying to figure out whether they're Republicans or Democrats. I can't put that on my children.

So then you say "Ok then, they must join in the alienation, they must be taken out of the culture as we were taken out of the culture" And uh, this is a momentous decision because this act of separating of the culture is unambiguously alienating, and yet it seems to be the only way to find the self. Otherwise you never contact the self, you contact a commodified cartoon of the self, that finds meaning in outboard motors, and uh, basketball, and uh, you know, all this other crap that's peddled as reality.

So uh, our relationship to our culture I think is a very uncomfortable one, and of course psychedelics exacerbate this. And you know I think if you have children, it's one thing to talk alienation, but once they get to the place where they are asking to take LSD or to take psilocybin, you know Kafka said a wonderful thing, I think it's in the penal colony he said "You choose to be free, but it's the last choice you'll ever make." And uh, you know, that's sort of the dilemma in which we find ourselves.

Q: (Question/commentary)

TM: Wouldn't it fulfill all of our personal mythologies if I could now detail a long history of persecution nobly born by me. But the truth is they don't give a shit, they are so confident of their control that I, I think if I appear on their screen at all they just say "This is some egg-head, some spouting character who talks to a bunch of rich people in small rooms, and we don't care." I, I have a feeling there's something which I, I call the 5 percent rule. Which is, as long as any school of dissent remains below 5 percent of the population, no money is budgeted to destroy it. You know? It's just they have learned about noise in the social circuitry and they just say "Yeah these people, they gripe."

And we are held up as an example of what a free society this is. They say "You think we have a controlled society? You think we tell people what to say? Go down to Essalen and hear what Terence McKenna is saying. We tolerate this. What clearer proof that you need that we are magnanimous, generous, open-hearted and liberal. We tolerate this kind of thing"

Uh, I, I think of course that they do not understand the nature of the game, but it's a good thing because if the game is played on their terms, we lose. What they don't understand is the power of means, and the fact that uh, psychedelics are a touch-stone of creativity, and creativity can always provide break-outs from any situation no matter how confined. And also, they have a horrifying fascination with us, because they as the managers of society, probably know more about it's internal contradictions and its failings and its shortcomings than we do.

The information we have available is the declassified, downloaded, cleaned-up stuff. Recently I was in London and at the hotel the conference was down at the ICA, which is down near Buckingham Palace so the hotel was on Vincent's Square. So it was about a 20 minute walk from Vincent's square to the ICA and it was right through Whitehall, it was where all the intelligence agencies, and the ministries of defense and all this. We stayed late at the ICA, and walking back at 2 in the morning, the lights in the Whitehall are burning at 2 in the morning. The lights at the ministry of defense and the ministry of economic planning are on at 2 in the morning, why? Because people are sweating blood in those buildings, they are working around the clock to keep the entire system...

Look at these rainforest clearing statistics, look at these oil slicks! This is costing us money gentlemen. And what about this?

And the answer is that you can manage some of the future some of the time, and you can manage all of the future some of the time, but you can't manage all of the future all of the time. It keeps breaking loose in the most unexpected fashion.

The internet is a perfect example. Here was a privileged instrument of the intelligence community and the scientific elite that served it. Ultra-high security, totally out of the reach of the common man.

Meanwhile, over at Ratheon they're trying to...this was year ago, they were trying to develop a chip to guide a heat-seeking missile for the Navy, and they had certain design specifications that had to be made.

The projects ground on for a couple of years and they couldn't make this chip meet the specifications, finally the project was cancelled. The chip is thrown in the trash. Then some engineer digs it out and he says "You know what we could do with this? We can't hit a plane in flight with a missile with this thing, but you know what we can do with it? We can make a little desktop computer with this!" and these guys said "Why in the hell would we want to do that? We have enormous computers, we have computers the size of a city block, why would we want to do that?"

And they say "No, no, not for us, we have the God-like technology, it's a commercial thing! We can sell it to the Marks, and they can word-process with it or something" and so it came to be.

And they didn't understand with this thing, it's a pretty harmless thing, a computer sitting on a desktop with word running on it, but you sell 20 million of them, before you realize "My god they can all be connected together"

And then people just plug them in, and an entirely new beast springs into being. A technology so powerful that the head of the CIA 10 years ago didn't have that kind of access to information, that kind of information to real-time imaging, that kind of access to econometric data and that sort of thing.

So it escaped, while they were watching various...while they were keeping us from nuclear weapons, they seemed to do that rather well. No terrorist has ever set off a thermonuclear device so far as we know, so they were watching from the ramparts for that because it was something they could understand.

This thing came rushing in from the back-door and now the cat is out of the bag.

(Question/commentary)

I'm sure that that's true. You know the fact that the IRS is running on 20 year old computers. The government is just being left behind, and the world corporate state doesn't care, it finds governments a huge and boring nuisance.

You know in the same way that after the 30 years war, basically there was an enormous social shift in Europe. Before the 30 years war, Europe was ruled by Popes and Kings.

After the 30 years war it was ruled by Parliaments and people, I mean that's a generalization, but true.

Now, the nation state is being put out to Pasteur. It's being told as the Church was being told in the 17th century "You care for the poor, you take care of the highways, you bury the dead and you educate the children. But all the stuff which makes money, we, the new streamlined form of social organization, we'll take care of the money making enterprise and your job is to keep the road cleared and the dead out of sight"

So this is happening. When I understood this, it was like a bolt of lightning. When Jesse Helms stood up on the floor of the US Senate and called for the assassination of the American president I realized "This has become a circus. These people are yahoos"

When was the last time the governor of the world bank threatened the life of an American president? When was the last time that someone who sits on the board of directors of the IMF felt the need to physically threaten the life of a president? No, it doesn't happen.

Real power doesn't act that way, only pseudo-power, yahoo-power, thug-power acts that way.

So government has become largely irrelevant. I don't know whether this is good or bad, it certainly is complex.

War was an instrument of national policy for governments, war is not an instrument of policy for corporations, they hate war.

But governments keep cultures in a deep freeze, we spend a lot of time lamenting the destruction of aboriginal cultures, this rainforest tribe, that central Mexican language group, but while we're lamenting the loss of these exotic cultures, notice that your culture is being erased.

If you were raised in a close-knit Jewish family, if you were raised in a small town in the Midwest, those cultures are gone for most people.

We have all been given mall-culture, and co-modification of values. It isn't only happening to the Witoto and the Wichole, it's happening everywhere.

This uniformitarianism is entirely for the convenience of market economies.

If you can get everyone drinking the same brand of vodka it's much easier to sell and market vodka than if you have to appeal to ethnicity and local tastes and so forth and so on.

Everyone and everything is being leveled, dumbed down, and subjected to a hideous homogenization process.

(Question/commentary)

No, this leads to the question about paranoia and conspiracy theory. I am very puzzled by the popularity of conspiracy theory. It seems to me it just must indicate a paranoid tendency in the population because what I see is the more you aspire to control, the more frustrated and maddened you must be by the situation.

So, an example would be the communist party of the USSR. Infinite power to penetrate the lives of people, to manipulate media images. You have total control of the newspapers, total control of TV, total control, total control, and then the top guy dumps the whole thing...

I think that no one is in charge, and that this is a very good thing, because it allows the internal dynamic of the situation to express itself.

Everybody who wants to control the situation is fighting a losing battle, and if you bank with chaos your stock just keeps growing exponentially. Chaos is spreading, it's the place to put your bets.

All efforts to ideologically or economically or any other way to channel the global process seems to meet with incredible frustration. Nobody is in charge, the so-called great successful conspiracies of history are so successful that they don't even think of themselves as conspiracies. If you've been running a given piece of turf for 5 or 6 hundred years, you don't run around in conspiratorial mode, you stride boldly across the landscape, you own it. You think, you suppose...

(Question/commentary)

Oh you mean "if only Hitler were alive in Argentina calling the shots, it would all make so much more sense then!" That would explain things!

In the absence of an overarching demon like that, it's a little hard to explain things. I don't know, I don't feel this need for intellectual closure. I don't see why things should make sense, they never have. And they are always in process of formation.

And as soon as any given bench-mark or goal is achieved, it becomes abandoned and redefined in favor of something else. I think conspiracy theory is a very disempowering thing.

Because what it says is "You can't control the world" or "It's more difficult to control the world than you think it is", not so. I've had a very different experience. My experience with the corridors of power, if you want to put it that way, is that there are an immense number of clueless people.

It's almost like Mckenna's law. It's

As you advance in social hierarchy, the percentage of smart people does not increase. So lets now move to a cabinet meeting of the Clinton administration. There are as many stupid people, truly moronic people sitting in that room as there are sitting in this room.

It doesn't seem to make any difference. Because people don't seem to find their seats according to intellectual or social merit.

Every human situation is bedeviled by morons.

No matter how high you rise, you're surrounded by fools and you're lucky if you're not one of them. I mean that's the basic thing to try and guard against.

The other thing is that at the top, it's remarkably empty. You think, if you've never been there, that toward the top of the control pyramid there must be many people standing in line eager to take the helm, eager to make big decisions and establish their reputations and do whatever they do. Instead you find this fear as you go up the hierarchy. "My god, if I make this decision and it goes wrong I will lose my chairmanship, or I will lose my something or other"

So as you approach these enormously powerful levers for manipulating society, everybody's holding their hands behind their backs, they don't want their fingerprints on the lever because they know there would be war crimes trials if you stumble and get it wrong. I mean you thought you may have been on a golden crusade, suddenly you're looking at 12 guys in powdered wigs who think you're a jerk and they're going to hang you for the stunt you pulled. So it's like that.

(Question/commentary)

I used to think it was not true that all spiritual work began with ones self, I felt like that was a way of

disempowering people and say “You know if you wait till you’re an avatar, you’ll never join the people rioting people in the street”

And I used to say “If you see people rioting, you have a moral obligation to join. You don’t even have to know what it’s about” The people rioting is a sufficient imperative to political action to be there. Well, I’m not 25 anymore. That provided a lot of fun, but I now think you do not make unflawed contribution unless you have first

Gotten your ducks somewhat in order. I’m not saying you have to be able to walk on water, but you have to have at least considered your own life and your values and that sort of thing.

It’s pretty simple, the ethical life. It’s just demanding, many of you have heard me say this, this is my...this is “father McKenna” talking to you.

The moral life does not consist of wheatgrass diet or affirmation, or any of that.

The moral life is, unless your at Esalen, you should clothes the naked, you should feed the hungry, comfort the afflicted, bury the dead, and there are a couple others, obvious things to be done.

It’s not about how many prostrations you do or what lineage you’ve associated yourself with, or how much cholesterol is in your diet. Somehow we have confused the ethical and moral dimension with the dimension of physical practices.

Probably because we have been too infected by the means of tired Asian religions that long ago gave up moral philosophy in favor of rotational activity because the social problems of Asia are overwhelming.

That’s a response to an overwhelming human tragedy, the quietism of Asian religion, I think.

(Question/commentary)

Well and it’s flawed is what you’re saying. And yes I agree, that the person helped by that person is still advanced, but the whole system is not served by misguided do-good-erism, or the large nobles-oblige is an insulting attitude to take.

Because the real nature of the human condition is that we’re all in it together, this is one of the reasons why I am so hostile to all forms of spiritual hierarchy. I have never seen a truly superior person, I don’t believe. And if I have, they were so humble and self-effacing they never would have claimed that superiority as their own.

If somebody tells you they're a superior person, my God they're automatically to be taken off the active list. That alone screws the pooch right there.

And, it's tremendously disempowering. The mushroom said me once, and I've said it to many of you many times, it said "For one human being to seek enlightenment from another is like a grain of sand seeking enlightenment from another. Don't you get it? It's the same flesh, it's the same flesh, nobody knows anything you don't know, and even if they do, it's not your knowledge so what good is it doing you?"

The idea that it's OK for you not to understand mathematics, or not to play the violin, because somebody else does it very well, is a complete cop-out. You will be held responsible for what you know and what you can do.

And using the excuse that you lived in the same world as Jacha Heiffitz is not going to get you off the hook of not knowing how to play the violin. I say this as someone who does not play the violin.

It's fun to take responsibility. It's fun to test the waters. The hardest thing to put across to ones self and other people is that the universe is a more friendly place than we have been told.

Paranoia, culture is institutionalized paranoia. It's very hard to de-condition oneself from this, no matter how de-conditioned you make think you are, there is more and more work to be done.

I think the essence of Daoism, and why it's roots in nature are so powerful, is because what Daoism is saying is "If you will quiet your mind, and if you will pay attention, you will discover that you are supported and cared for by the dynamic of the universe"

This should be obvious by virtue of the fact that you're even alive.

I mean how unlikely is your existence? I put it to you...pretty unlikely! And yet, here you are.

Well do you just think it was the greatest series of well-rolled dice in history, that's silly.

That's ridiculous, probably would never have delivered us to this room this afternoon. Probably sculpted by loving intent has delivered us to this room this afternoon.

Once you can sense that living intent and make it an object familiarity you probably, that is the antidote to cultural paranoia and to the acceptance of your identity through imposed definitions by other people.

And psychedelics figure in here because they dissolve more dramatically and more effectively than anything else the cultural and linguistic and habitual assumptions that are masking that presence of Dao. It really is true, as the bible says you must become as a little child.

That means you must become pre-culture. You must recover who you were before the engines of culture went to work on you, and abused you and made you afraid and dumbed you down and distorted your values and so forth and so on.

(Question/commentary)

See I think what's happened is that at the top of the culture it's profoundly intellectually bankrupt. There is no plan except to keep peddling stuff until the forests are gone and the planet is polluted.

This is not malevolent. It's not malevolent, it's simply they are clueless, they have run out of steam, so the answer is to try and keep the game going as long as possible.

With daytime TV, with casino gambling, with lotteries, with endless distractions, with pop-culture fads, with cults of celebrity, with spectacular trials and gory mass murders and endless circuses

While the people at the top are saying you know "Sooner or later the shit is going to hit the fan" "Sooner or later the dam is going to burst"

And they say "Well lets make sure its later, and not sooner cause I've got 2 kids at the sorboun, I'm paying off a Mercedes, and I need to get this taken care of before it all falls apart"

So in the absence of any cultural plan imposed at the top, this strange dynamic is happening.

This has happened before in cultural history where some huge enterprise like Christianity or Patriarchy, or something like that, after running its games for millennia, it just runs out of steam. And often there's nothing to rush in and fill the vacuum, nothing that is consciously engineered to do that.

So in those situations, an actual creative bifurcation can take place because what is about to happen is not in the hands of human managers, it lies deeper in the dynamics of the whole system. And we all feel I think this sense of excitement, and the approach of the unimaginably new, and we don't know whether it's the aliens coming to pull our chestnuts out of the fire, or virtual reality, or a new drug, or a new style of sexual behaving, or star-flight. We don't know what it is, but we can feel that it will transcend the categories of our managers, and they and we will have to make sense of whatever this new reality is.

It terrifies some people, it liberates others, it's the same reality.

Steven Vincent Benet said something about at the end of John Brown's body, he says "when the prophets of strange religions ball out their bizarre despair, do not join them on the mountain, say only then it is here. It is here." Because it is here, I mean that was 1927 when he wrote then and he spoke then of technology as our humble servant, already half a God. That was in 1927.

You can imagine then what that technology is today.

(Question, do you propose in history that there is no longer a manager class?)

A manager class, I'd rather talk about a point in history where there's no more commodities. Yes I don't think there will be a manager class. A manager class, you manage towards ideology. If you can transcend ideology, the way to manage society I think would be self-evident. The problem is trying to force it into the service of some kind of ideological vision, and then of course it becomes intractable because no ideological vision we've ever had has been true to our humanness.

The Christian version of what human beings are, the Nazi version, Marxist version, the Secular market-oriented version, these all somehow insult various parts of our humanness.

So when an attempt is made to push us into these things it doesn't work and you get instead war, anxiety, and Q-forces swamp the social system.

I think the managing of society would be fairly simple in the absence of ideology. But we're addicted to ideology because somewhere along the line we've gotten the idea that you can't understand the world without an ideology when in fact ideologies are incredible impediments.

Q: [???

I suppose as long as we are disparate entities, there will be hierarchies of control, that seems obvious. But it seems as though we are palying with the idea that we may not be disparate entities, or that we may only be provisionally disparate entities. We are a peculiar creature, we human beings as a mass phenomenon we are somewhat like a slime mold. We have a life cycle where part of our life cycle we appear to be completely separate individuals.

But apparently if you view our development of the past few centuries, we're entering into some aggregation phase triggered by pheromones spread through technology and we are beginning to create some kind of a super-organism.

And the fear of some people is that once we are inside this super-organism, we will be forced into a permanent status as a sub-level of the hierarchy. In other words you will have to give up your individuality and you will become like some kind of liver cell or brain cell or something in this organism.

I don't think is the case, I think we have the unique ability to combine these two modes of existence. This is why we have the notion of society, and the private reality of the individual.

Probably, in the domain of society there will always be forms of, I don't want to say control, but management of the distribution of commodity. But the idea, I think, is to empower this other dimension.

To spend as much time as possible in the individual free-swimming free-agent mode.

In other words not to see membership in society as a goal, and a value to be conserved, but to see it as a necessary evil.

We need social organization, but in minimal doses. And when we go on a bender of addiction to social normative behaviors, then you get a psychic epidemic like national socialism where people voluntarily abandon their individuality to act in concert with some kind of mass impulse.

This is extremely evolutionary retrograde. It's not what we want to do, I guess what I'm pleading for is an enlightened form of alienation. Not simply an emotionally driven alienation, but a strategically driven alienation.

See, alienation can be used not to create neurosis, but to attain freedom.

Creative alienation, alienation that embraces itself as a source of inspiration.

Nobody ever said it was going to be comfortable to be a human being and to ride one of these bi-pedal bodies from the cradle to the grave. It's an uncomfortable, but I maintain, manageable situation.

But you have to have the lights on, you have to have your emotional responses in order, your intellectual responses in order, you have to have garnered some sense of how we got to this situation, and you have to have some sense of the tools available to transform it.

(Question/commentary)

Well, it's certainly true that the human classroom is the most untransformed portion of human society over the last 200 years. I mean we still pass on our cultural values to our children in the way it was done two or three hundred years ago. This may be changing, again I don't mean to make the internet the panacea of all problems.

But it seems to here is a problem that the internet can address and you don't have to be a technocrat to see

how it has enormous power. Because education is a process on one level of putting correct information in front of people, and in the present form of education the great choke-point is the limitations of human teachers. Who, as finely and nobly motivated as they are, inevitably they pass on their own limitations to their students. In the presence of the internet this is somewhat mitigated. There's a great leveling going on in the education process.

The quality of information available to all of us, if we learn how to make our way to it is orders of magnitude more dependable than it was a generation ago. I mean we have basically traded in cultural illusions for hard fact.

(Would you discuss the break up of soviet union with the growth of international corporation and the fact that our central government seems to be breaking up, including the (??) something about breaking up the soviet union)

Mcluhan talked about this, he talked about something called electronic feudalism and what he said was that the rise of electronic media would bring a retribalization of culture and that the nation state would completely disappear. I think this is happening, it won't disappear completely, but in the metaphor I made a few minutes ago it will take on the role of the church which is largely irrelevant. Corporations now call the shots.

Print you see has what are called hidden-biases. It allows and in fact makes inevitable certain kinds of ideas that once you get outside the domain of print conditioning these ideas appear if not absurd, then at least simply provisional. What I'm thinking of are ideas such as ideas that all men, apologies to women, that all men are created equal. This is a faith of print-created society.

There's absolutely no evidence that this is true, and in fact there's considerable evidence to the contrary.

The argument against not believing it is that if we don't believe this, we can't have social justice. So we must embrace and obviously preposterous idea in order to achieve social justice. Why is this preposterous idea so attractive? Well it's because print is linear and uniform.

Every lower case E looks like every other lower case E. Therefore if the world of print is made out of these interchangeable and equally weighted entities, so must be the society that practices print culture. So we get the idea of one man, one vote.

Another example, a different example is assembly of objects out of interchangeable parts. Before print, if someone made an object, it was a unique object. The idea of an object, lets say a water-wheel or something like that, where if it broke down you got in touch with the company and they sent "the part" and you then took out the bad part, and put in the good part, and the pump merrily proceeds, interchangeable parts.

So we begin to see that the conventions of the printers shop become the conventions of an entire society, and how it does its politics and how it assembles its commodities are all dictated by the invisible assumptions of a form of media that nobody really looked at its potential effects before it was put in place.

McLuhan saw that this kind of rational, linear, compartmentalized, uniformitarian culture would be completely broken up by electronics and so it has come to pass.

The great forms of print-media are what are called “one too many”

A publisher publishes a book, and many people read it.

These “one too many” or “top-down” forms of media are perfect for controlling large numbers of people.

You have the idea of the “Ministry of Truth” where ‘truth’ is something dispensed by governments and received with grateful up-turned faces by bewildered citizenry that would otherwise have apparently no access to truth. This is madness talking.

The new electronic media are what is called “any to any”. If I want to speak to you or if I want to send email to you that can be done. If you and I want to send email to 500 people that can be done.

Any to any communication is anti-hierarchical, there’s no assumption of expertise or power or anything else as you ascend the pyramid of information transfer and dispersal.

So it’s almost like the Wizard of Oz effect, suddenly people say “You’re not all powerful! You’re not the Wizard, you’re a fat man in a stained overcoat pulling levers behind the scenes” and then the whole illusion drops away, the illusion of leaders, or privileged ideologies, of special forms of understanding, this is resisted by some people, usually control freaks

Because they say “well in the absence of illusion you would have chaos”. Yes, indeed. Indeed, the mother of all progress. The source of all innovation and creativity, the wind that blows the ship of paradigm shift, chaos.

And the idea somehow that the human mind should somehow interpose itself between society and this expression of chaos is just an illusion of control freaks and how...

(Cut off very unfortunately between audio file segments)

The whole ideology is a simplification of reality where the mass seething messy baroque of being is put through some kind of rasher of reality and it comes out grossly simplified. And because it grossly simplified it becomes like a kind of algebra of idiocy where now you can set up these little equations and they solve themselves and you get a feeling of satisfaction from that, but in fact the whole thing betrays the human enterprise. And to give you a graphic example of what I’m talking about I’m thinking about, I’m thinking of a scene from *Novel* called “Carrelis Mandarren” by Louis Idabunieres where a guy whose a communist in Greek partisans during the war beats a villager to death who has given shelter and food to

some non-Communist partisans fighting in the mountains and the protagonist of this particular part of the novel says this guy as he's beating this old man to death and he says "Why are you killing this old man? He is harmless."

And the guy without even missing a stroke, and turns to him and says "It is a matter of historical necessity"

This is the voice of absolute fanaticism speaking and this is the voice of pure ideology. In other words, unconscionable acts. The Holocaust, up to that level of unconscionable acts become intellectually defensible in the presence of a complete corruption of language.

And so ideology always paves the way towards atrocity.

Q: [???

Well ideals and ideology are not quite the same thing. Ideals are simple and don't knit themselves into vast intellectual structures. In other words an ideal of mind is to do as little harm as possible, I may not meet this ideal but it is an ideal of mind to try and do as good a job as I can.

But in the name of that ideal, It doesn't lead on...there isn't a "therefore". "Therefore" what? Therefore I should become a Mormon? Therefore I should no longer eat meat? Therefore I should no longer have sex?

No, there isn't that kind of implication. But ideology always implies implications. "If man is, as Marxists say, and economic creature, then the following must follow and the following must follow from that"

So I think ideals are something that are close to our emotions, they're things that spring from the heart. Their boundaries are not well-defined and the implications are not clear.

If I say "my ideal is to do good for man-kind" the next step is not at all clear, but if I profess an ideology, the next step is always deceptively clear.

So I think ideologies flatten complexity. You know people don't like paradox, I'm not sure why this is...

I think it's a quality of print culture, people want closure. They want every program or every intellectual argument, or every examination of a phenomenon to end with a conclusion.

QED, therefore this is what it is, but you don't have to be a rocket-scientist to notice that this betrays the

complexity of the world, the world is never one thing, or even several things.

The world always have dimensions which exceed the descriptive machinery that you're applying to it.

And I don't know who it was, George Bernard Shaw, or Neitzche, or some other 19th century bad boy, but it has been said that the essence of intellectual maturity is to be able to simultaneously hold two contradictory thoughts in your mind at the same time.

Now you are actually approaching the beginning of intellectual maturity.

But if you're always saying "Well if it's this, then it can't be that, and if it's this then it can't be that" then you have been hoisted on the petard of dualism. And it's more than a joke to say that dualism is the root of all evil.

Of course it is, it's the root of all good. What really we are given is a seamless continuum of phenomenon, that we are asked not to understand...that's preposterous, why should talking monkeys understand reality? (laughter)

But to feel. We can feel. We have an extremely complex body and nervous system and perceptual apparatus which ushers us into feeling. So you have not mastered a situation when you understand it, when you understand the situation you're probably on the road to catastrophe.

When you *feel* the situation you are probably moving then into a good position to act in that situation. Often we, in fact usually we do not understand our feelings.

That's a strange thing to ask of ones feelings.

If we understand our feelings its simply a footnote on our intellectual housekeeping, it is neither necessary nor sufficient.

What is necessary, and what is sufficient is feeling into the moment. I think this is where we got to at some point earlier in this, but the felt presence of immediate experience is the defining phenomenon of being.

If you can't reach it, you are in trouble. You need some kind of help, psychedelics, therapy, loving kindness, something.

And if you can reach it, you have contacted the authentic domain of being. I almost said of humanness, but it goes deeper than that, but the animal world is living in that space.

I think because of the good offices of quantum physics and some other things we are beginning to realize that things like chaos, like paradox, these are not names for intellectual black holes, these are names for the sources of life's richness and it's advance, it's creative advances lies in these things.

Reducing, as we have done over the past 200 years, the universe to a machine, some kind of a machine, then robs it of meaning. Then we stand back and look at our lives and our societies and say "How come they have no meaning?" It's because we labored like demons to make sure they didn't have meaning, now we have no one to blame but ourselves for the gross simplification of reality and the betrayal of experience that we achieved in that process.

Q: [???

You know years ago in Canada there was a political party called "The social credit party" and they had a very complex scheme that nobody could understand, and they ran on the platform under the motto "You don't have to understand social credit in order to vote for it"

So this is sort of what you're talking about.

(A bit more commentary)

Why not, yes (laughter) feelings are primary. The primary datum of experience is feeling and then out of that comes a logical reframing of experience. Then still lower on the rung and I maintain low enough on the rung that one shouldn't go that low is an ideological recasting of experience.

It's a delicate thing, I am not offering a simple answer here. It requires constant fine tuning and intelligence. Every day I think we need, what is it that the Marxists used to do? Self-criticism, we need to be alert to ideology, it's constantly seducing us.

Yeah, dialectic. But the idea of criticism, self-criticism, the idea that you and your colleges and comrades constantly search your behavior for betrayal of the ideology.

I think we need to constantly search ourselves not for the betrayal of ideology, but for the embracing of it, and say "oh dear I'm starting to believe something, 'slap, slap', ah that feels better"

Because these ideologies are incredibly draining and distracting. They, they...get in the way between us and true feeling.

On the other hand if you don't apply logical razors to experience then feeling is open to all kinds of interpretations that become somehow themselves spring-boards to ideology.

I think it's really important to try to keep things as simple as possible, because they will still be hellatiously complex if you are true to experience.

The simplest explanation of what is going on here is still maddeningly baroque. So throwing on flying saucers and papel-plotting and plans of Great Atlantis only further exasperate the problem. If you just deal with the given, with the fact of your history and your destiny, things are quite complex enough.

Of course again what the psychedelics do are provide a reference point in organism.

It's like a reset button.

It says "Beyond ideology, beyond cultural programming, beyond language, beyond hope, beyond fear, beyond expectation, there is the raw datum of experience. Here, have a dose. Didn't work? Here, have a bigger dose"

And if we keep returning to the raw datum of experience, then these other things, they will re-crystalize around us, but not with the imprisoning intensity that they have for straight people. We know that behind all this constipated social stability lies the chaos of the psychedelic experience.

It's very important to keep it in mind in very un-psychedelic situations.

But people who have never broken through the cultural dream take it to be reality.

And commit crimes based on delusions about what is and isn't reality.

Q: [???

Well, not to speak of whales and dolphins specifically, but nature as a dynamic field of activity beyond the reach of politicians, image makers, so forth and so on, nature is the constant psychedelic companion of the human experience.

I think we know this, that's why we crowd into cities and build walls and keep nature at bay.

If you go into nature alone and don't eat much and don't speak much, within 72 hours the hills speak and the winds confer with you. You are conveyed into an animate, caring, living, natural dynamic.

But it's threatening to the ego, this is the first time in 2 hours I've used this word. The ego is a maladaptive tumor-like growth in the personality that has been inculcated into you by the toxicity of culture.

It is literally the response to toxic culture, the more toxic the culture the more the ego is revered as a natural value within that culture.

Responding to dolphins and whales and ant hills and termite swarms and these kinds of things is an opening to the natural dynamic that's all around us.

Many people never observe nature except when psychedelics force it upon them.

This is a very...I think if you feel afraid of psychedelics but you want the juice you may sense there, take up wilderness camping and do it assiduously, and though it's a slower process, and you may not have specifically colored hallucinations, the conclusions that you will emerge with are essentially the same that the psychedelic voyager emerges from.

Nature is deep, ordered, dynamical, and caring for the project of being. So should we be.

The order that we seek is the natural order of our bodies and our minds and interface with the world. Not the unnatural order of ideology, co modification, propaganda, and a misuse of communication.

Q: [???

No I think it's very difficult because the process of education, without anybody quite knowing where the crime was committed, has turned from a handing-on of cultural values to a handing on of this neurotic behavior around co modification.

People are clueless, and they're being used and abused. Seemingly intelligent people behave in incredibly stupid ways, the phenomenon of the respectability of aimless shopping.

Shopping in unconscionable, it's stupid. It's tasteless. It's murderous toward the earth.

And yet people who teach at Essalen will suddenly drop their guru persona and whip out the charge plate and head for Robinsons.

What kind of thinking is going on here? They are clearly not alienated enough, alienation may be for them just a stance, but where they're really comfortable is down at Barneys racking up the charge card.

Somehow the message has to be put across that there are no exceptions to the obligation to de co modify experience. Anybody who feels alienated from this orgy of consumerism is going to have to look elsewhere for their values.

I feel blessed because I guess I'm just so alienated that it doesn't touch me. Recently for some reason I had to lay-out my income for an attorney and say how much I spent every month on things like entertainment so forth and so on. So he called me on the phone, you declared 15 dollars a month for entertainment. Based on your income, do you know how much would be a standard deduction for entertainment? And I said how much? He said 700 dollars a month, that's inconceivable to me. How much of an idiot would I be?

I said "I put down the 15 dollars because I knew you wanted something" but in fact I don't think I spend 15 dollars a month on entertainment, I mean what is entertainment anyways?

So...you know...I suppose it just sounds like preaching a kind of monkishness, but what is the charm of all this crap? Can anybody explain to me?

I heard a story about the Dalai Lama, I mean let this riquoche around in your mind. The Dalai Lama came to Los Angeles and so the committee to receive him and make his visit comfortable wanted to do something with him in L.A that would be uniquely L.A, but that would be amusing for Dalai. So they decided to take him to Rodeo drive, and basically they just turned him loose with his translator and just said "We'll meet you back here in an hour and a half and check it out, this is a unique place in American culture"

So then, after it was over and they were all having their double espresso with a campare' or whatever they were having, the Dalai Lama said "I want to thank you so much for making this experience available to me, I feel I understand Americans so much better now. I saw so many things I wanted."

This is the Dalai Lama talking, he saw so many things he wanted, well if the Dalai Lama is not immune, my God what chance have you and I? If the Dalai Lama can't hold this stuff back, you know, you might as well buy that Armeys scarf, just give up, give them 200 dollars for the damn thing and enjoy it.

Q: [???

As an old anarchist I can tell you efforts to organize anarchists are so fraught with contradiction that I wish you luck and I'll make a small donation but I don't think it can be done that way.

Yes, you will definitely give me 15 dollars worth of entertainment per month.

Q: [???

Well I hate to tell you this but I would never do what you are doing, this may be the ultimate teaching. "Do not ever again spend money to see me"

My god how much income is going down the drain as the ultimate oral empowerment given (laughter)

Ok, as long as you take it as entertainment.

I have one more little story, I didn't tell you the story about the two rabbi's did I?

Good, this is my ending story for the afternoon. I don't present it as a summation, but it amuses me. For those of you who don't like Jewish jokes, you will notice as this joke is told that it is easily translated into a Zen mode, a Sufi mode, I just like the Jewish flavor.

There were two Rabbi's, extremely high Rabbi's, Talmudists, great men of accomplishment and they were at temple, and one of them prayed and he said "Lord" he stood up and spoke aloud and he said "Lord, I am nothing" and he sat down, and the other guy got up and he said "Lord, I am nothing" and there was a guy there sweeping the floor, a custodian person, and he thought "Well people are praying, I could get a prayer in here"

So he stood up and said "Lord, I am nothing" and the first Rabbi looked at the second Rabbi and said "So look who think he's nothing"

That's it, that's a story about the imagination.

(Next group meeting time)

The time wave is a variable wave against time and can be scaled around very large amounts of time, even amounts of time larger than the life of the universe. Thousands, millions of times larger than that. You might ask, "What's the point of scaling a temporal description over periods of time so vast that there is no reason to assume they ever existed?"

Well the answer is that at these transition points, these dramatic shift points, the software automatically as in the course of running the algorithm keeps track of days to end, days until you get down here to a hypothetical end point, even if this is not billions of years, but trillions of years. It will keep track of this day count number and what we discovered to our bewildered amazement is these day counts were almost always prime numbers or the product of two primes.

(What are we measuring again?)

Well I'll answer your question but it isn't relevant to what I'm talking about. What I'm measuring, what this is measuring is the ebb and flow of novelty and habit, and you've actually lead me back to the main track so we'll get serious and get out of pointer. That's always a sign that we're really serious.

I don't want to give my ordinary time-wave lecture because I've given it enough that the meme is actually established in the culture and there are dozens of tapes of it and written versions and fights of it on the internet, so why should I explain it to you all over again.

I will just assume that in the course of talking about specific issues that relate to it, you will pick up the rules of the game and then if you're just too excruciated by your confusion you can ask a question and I'll try and answer it. The basic assumption is that there is a quality to reality that science has overlooked.

Some people in the East have called it "Dao", I want to divorce myself from the freight of that tradition and I want to call it "novelty".

Novelty is the quality in nature that seeks complexity, that's what it is. And it's counter-veiling force is called "habit" so what I'm proposing to you is that we live in a universe ruled by two fundamental forces that are larger than physics and electromagnetism and all of those good things.

These two forces are habit and novelty.

In every situation whether it lasts a millisecond or billion years, the struggle between these two tendencies of the universe can be discerned. Now, it's pretty self-explanatory what these terms mean but I'll run through it.

Habit means repetition of previously established pattern, continuation of a equilibrium situation. A tendency for a system to degrade entropically under the egious of the 2nd Law of Thermodyanmics. A conservative tendency, a preservationist tendency, habit right? For crying out loud.

The other thing is novelty, the opposite of habit. What is novelty? It is the new, the untried levels of complexification previously unachieved, unusual connectivity, creativity, surprise, novelty.

These two things are in locked in struggle over vast scales of time, notice I did not say eternally locked in struggle. They are not eternally locked in struggle because the good news is novelty is winning.

Novelty is winning, if you get big enough chunks of time, though there may be vicissitudes, ups and downs, ultimately the situation ends up more novel than it started out.

Elia Pregosian, who got the Nobel prize for work in non-equilibrium thermodynamics called this “The principle of order through perturbation”

A counterintuitive phenomenon in physical chemistry. Because for a very long time one of the strongest faiths held in physics was that the universe is undergoing thermodynamic degradation. In other words everything is tending to fall apart.

Pregosian showed that this is not true, he showed that in physical systems, simple physical systems there can be spontaneous mutation to higher states of order.

So what's really going on in the universe is a struggle between these two tendencies, biology represents the emergence of a very novel set of chemical strategies for the preservation and maintenance of novelty.

The emergence of higher-animals and culture and language and technology, these things are also novel strategies building on previous achievements in the novelty department building toward our dear selves.

And one of the interesting things about this kind of thinking, is it gives a new importance to the human world, science will tell you that we're lucky to be here and we're simply the awe-struck witnesses to some kind of incomprehensible thing that has nothing to do with us anyway. Novelty theory would say “no, no, human complexity represents at this point the apex of accomplishment in the domain of novelty, and hence, somehow, the cutting edge of universal evolution, at this moment in space and time has come to rest in ourselves”

So...what else do I want to say about this. So let's look at this screen for a minute and I'll sort of explain the rules of the game. This is a span of time portrayed along the horizontal axis as you're used to seeing, in this case it's 7 billion years simply because we set it to be so.

This represents the ebb and flow of novelty, here's one moment in the next 2 hours to pay attention, this is the moment.

When the wave moves up, habit is increasing, not decreasing, it's counterintuitive if you're into the stock

market. In the stock market we always want it to go up unless we're selling short but none of you here would do that I'm sure.

So in this case the excitement is where the wave moves down, if this is 7 billion years, notice that what I said is true of this screen, we end up in a far more novel position than we started.

We started out here, habit won, was winning the battle for at least 700 million years along here, then it lost its foothold and novelty surged forward almost uninterruptedly although this is quite a hiccup, this probably lasted 200 million years this hiccup.

If you want to get a notion of the scale of what we're looking at then life emerged from the primordial oceans at the top of this pimple.

All this is what's called the archeozoic and the prebiotic phase of the earth's existence.

Q: [???

Good question, it derails my plan for economy but since you had the intelligence to ask it you should probably be told.

The basic data, and I don't want anyone to laugh, the basic data comes out of the I-Ching. If somebody had told me...this is the most powerful attack on this idea, and it begins like this.

"So uhm...you want to make a revision in physics based on a Chinese occult divinatory system, are we getting this correct?"

Well in spite of the sneering, let me see if I can make it make a little more sense to you. I'm not going to review what the I-Ching is, in an environment as exotic as this that would insult our intelligence.

The interesting thing about the I-Ching, even it's skeptics agree, is that it seems to work. Very puzzling, other forms of sortilege seem much less certain.

Here's what I think is happening.

First of all, let's look at the Western notion of time as we derive it from Newton.

The Western notion of time is that time is what is known as pure duration.

All time in Western physics is the place where you put process so that it doesn't all happen at once.

Time has no quality, it's pure duration, think of it as a perfectly smooth surface. The only modification to

this doctrine in the past 500 years is Einstein came along 100 years ago and said “In the presence of massive gravitational fields, this perfect smoothness is slightly distorted over large scales” So we go from perfectly smooth pure duration, to slightly curved space-time.

But the main idea which is contiguous through all of these intellectual evolutions is the idea that the local fine structure of time can be portrayed as a zero-dimensional space.

If that's too technical for you it means that locally it is OK to think of time as perfectly smooth. I say it isn't, why should it be?

This has to do with a form, remember we talked about sentimentality and how it can distort thinking. This adherence to the idea that time is perfectly smooth is a sentimental notion left over from our infatuation with perfect geometrical shapes when Greek science kicked off about 2,500 years ago.

It took Kepler and Copernicus to demonstrate that the orbits were not perfect circles because God loves perfect circles...

One by one, the perfect objects of Greek mathematical and geometric theorizing have been laid aside. The planets do not move in perfect circles, nothing else has been found to have mathematical perfection except that...

This idea of pure duration has been hung on to. And there's a reason for this, and I apologize for the digression but it's very hard to snip the loose ends on a thing like this. The reason this idea of pure duration has been hung on to is because science, modern science, does it's business through a series of hat-tricks called probability theory.

And probability theory is the idea that you can learn something useful about a phenomenon, lets say for instance you want to know how much voltage is running through a wire.

Strange thing about this value that you come up with is this: it is not necessary that it correspond to any one of the thousand measurements that you took.

It's entirely possible that you get a value that is not congruent with any one of your measurements, but we say with confidence “well it's the average! It's the average.”

Lurking behind this notion, “average’ is the unexamined assumption that time is completely uniform.

That it does not matter when the measurement is made. Now why do we assume that? Is there any reason to assume that?

Well not, looking at nature, no there is no reason to assume that. Looking at science, hell yes there is a reason to assume that, you can't do science unless you assume that. Because science depends on what is called “The experimental method.”

An experiment, you arrange a funny little unusual situation which is designed to cause some phenomenon normally lost in the noise of being to be thrown into high relief.

Basic to the idea of experiment is what is called the restoration of initial condition. In other words we're going to roll a ball-bearing down a ruler and measure its velocity.

And we do this, and we say "restore initial conditions" that means pick up the ball-bearing and move it back to the top of the ramp. Now notice that time has passed since the first time the ball bearing rolled down the ramp. If time is not uniform then you can not restore initial condition.

If you can not restore initial conditions you can not make sense of probabilistic data. We have assumed and conserved this sentimental notion of Greek science because it makes it possible to do modern science. If we were intellectually honest about what's going on, then what we really should say is that "probability and modern science is the study of those natural phenomenon so coarse grain that an assumption of the restoration of initial conditions does not destroy the integrity of the phenomenon"

In other words it's a lens that can be focused only to a certain depth, and beyond that, it begins to give false data. Of course ball-bearing always roll down ramps the same way, of course two liquids always mix together in the same way, but who cares about these things?

What we're interested in are love affairs, dynastic transitions, corporate takeovers, political revolutions, family feuds, and the interesting thing about these things is that they never happen the same way twice.

Have there ever been two identical births, divorces, love affairs, corporate takeovers? Of course not, we would not expect such a thing, we understand that the complexity of those phenomenon ensures their uniqueness.

So this theory has probably not stormed the intellectual battlements of Western civilization for one reason is that it poses so fundamental a challenge, science can not swallow the time-wave. You have to choose one or the other, the time-wave is not a cult, it is not occult. But it is not science as we have done it for the past 500 years, because it assumes that one of our primary intuitions is actually true.

The intuition that every moment is unique, it treats that as the central starting point for an entirely new metaphysics of being. So the "smooth duration", the "simple answer", the "parsimonious good-try" has to be put aside.

Now why the I-Ching? Because in the same way that Western culture evolved a maniacal obsession with matter that ends with atomic fusion, sequencing of the DNA, room temperature superconductors, Buckminster-Fullerines and all sorts of all that.

In the same way that Western intellectual methods were relentlessly pushed towards an understanding of matter, in the east a different obsession held sway for culture factors not needing to be discussed here, people were interested not in matter, but in time, the other great mystery given to us in this dimension. Time.

If you're interested in time, you don't conquer time by building vast instrumentalities and seeking a primary particle and all that.

The way you understand and investigate time is by moving inward to metabolism. The human body is knot in time, it is non-thermo-dynamic state of equilibrium maintained by the miracle of metabolism.

Metabolism is a slow, controlled chemical burning of organic material, so subtle a form of burning that the energy is trapped in various membrane and cytochrome cascades and put the work of organism.

If you imagine then, at some time thousands of years in the past, people possessing techniques which today we would call "yogic"

But what they really are, are what they would now call "stilling of the heart" techniques.

Techniques for suppressing gross bodily functions. In other words, noticeable breathing, noticeable heartbeat, noticeable pulse. It turns out that the technique for stilling all of this can be done, and is persistently claimed that it can be done, as noise leaves the physiological circuits...and circuits...the mind falls inward, into a world of interiorized phenomenon for which we have no language but the language of idiots because this is not our cultural obsession.

So we say "Well it's dream, it's hallucination, it's who knows, lets see what's going on with the 11 o'clock news"

But in other cultures, complex vocabularies were produced to study these states, vocabularies as complex as our scientific vocabularies.

In the same way that in the 19th century, Mendeliav and those people came to discern that all matter is produced out of the combination of a limited number of elements, there were arguments about how many, but it's generally assumed under 110, and that's generous.

Out of 110 basic elements the entire world of material, similarly in the inspection of time, it was realized that time too comes in flavors, if you will.

Not 50,000, not 300,000,000, not 4, not 8...but 64. And this probably has something to do with the cube root of 4, and certain things having to do with the dimensionality of time and space, I mean why this number is a reason for speculation.

It's a number built into biology, there are 64 codons coding for the 8 amino acids. This is no coincidence, it's something about the basic grammar of being itself arises around these numbers.

They not only saw that time is made of these elements, but they saw that they occurred in certain fixed patterns of recurrence at different levels, at different speeds.

That from the point of view of this I-Ching philosophy, a given moment of being, at some locus in space and time is a kind of interference pattern created by moving levels of, let us call them “influences” and these influences interpenetrate each other on many levels.

All of this can in fact be quantified and mathematicized, and portrayed in the universal language of mathematics.

I'm sorry this answer ran so long. But I want to make it seem reasonable to you that there are categories in time as well as in matter, if you can discern these categories, you can gain as powerful an intellectual understanding of time as we have of matter.

Let me get back to how this thing is read, and I want to move forward here.

When the wave moves up, habit is increasing, when the wave moves down, novelty is increasing.

For instance, a place like this is called a “novelty trough”, a situation like this is called a “plunge into novelty”

A situation like this is called an “ascent into habit” and time on all scales is made out of ascents into habit, plunges into novelty, novelty troughs, and further ascents into habit.

You can feel these things in your own life you know. When the luck is running with you, nothing can stop you, when the wave is against you, God help you.

This happens to empires, this happens to political careers. It happens to species. It happens to entire orders of biological life 100,000,000 years of endless radiation of all kinds of niches across the planet. Then suddenly a planetary cooling and a mass extinction and the novel forms disappear.

But over long periods of time, as I said, habit is vanquished and novelty is concentrated. And that's part of the story, half of the story.

The other half of the story is that this process of movement into deeper novelty is speeding up, always has been speeding up, goes faster and faster and faster.

So if this is 7 billion years, you can see back here, things were deadly slow.

Here, life appears, once life appears the pace quickens, once life leaves the ocean, at this scale, the thing is practically a direct descent into novelty.

Though when we blow this up, as we can do, we will see that this looks here like a smooth, straight shot into the lap of God turns out to be the old-rugged path that we've followed for a long, long time.

Normally in my lectures I go through a series of screens telescoping towards the present.

I don't want to do that this evening, I want to run it very close to the present and I'll explain why when we get there.

Here's the little movie, we're going to start seeing a series of screens, each screen will show us half as much time in twice as much detail, and we will be moving towards this end-point over here.

Here's 7 billion years on the screen, the next screen will contain 3 ½ billion, so forth and so on.

As it flows in, you'll get the idea I think. This is the fractal landscape of time, arrayed across this are planetary impacts, glaciations, this is 700 million years here.

It's fading off, life leaves the sea, this is probably the last 400 million years, a kind of oscillation around a mean, as animal orders conquered the land.

This is 100 million years. 50 million years.

If you're paying attention, you see that it's fractal, patterns that appear on one scale are appearing in another scale.

13 million years, the same pattern as the last 600 million years.

Here's 6 million years, oscillations, glaciations, extinctions, temperature fluctuations. Here's the last 3 million years, this is the domain of human evolution.

The last 1,700,000 years, almost the domain of homo-sapiens. The last 850,000 years, the last 400,000 years, this is all things human beings have witnessed. The last 200,000 years.

Now a reason question is, where is this all being generated from? In other words it's endpoint is all staying steady.

There's the last 53,405 years.

It's being generated from a date less than 20 years in the future. It's as though the winter solstice of 2012 was some kind of dwell point out of which the temporal continuum is being generated.

Every theory has a hard-swallow.

The hard-swallow in ordinary science is the big-bang. Notice that it's the limit test for credulity. If you can believe that the entire universe sprang from nothing in a single instant for no reason, what would you resist as a hypothesis?

It's the limit case for improbability as far as I can tell. Nevertheless, science says "give us one free miracle and we can then go from there and never ask the favor again"

So apparently you get 1 free miracle in your system building.

I prefer to locate my miracle at the end.

You may say "Is that just arbitrary? Why December 21st, 2012?"

Well, obviously if the theory has any utility, if this idea of habit and novelty has any instructive value at all, we should find novel events clustered in these troughs and we should find periods of constipated recidivism on these upsweeps. So now we have two data fields with which to play.

We have the formal and the mathematically defined and utterly inflexible wave, and we have the vicissitudes of natural and human history.

On the natural history level, asteroids impacts, glaciations, extinctions, fluctuations in incidental incoming solar energy. Cooling of the oceans, volcanic eruptions, this sort of thing.

In the human world, wars, revolutions, technological innovations, migrations of people, introductions of new technologies, and so the idea then is to take the mathematically defined wave and the admittedly messy data of natural and human history and seek a best fit between them.

And when you impartially get them lined up so that it seems that most major episodes of novelty that historians, or people who care about these things, agree on, and most low point in the wave, line up with each other...

Then you simply go to the end of the wave and pick an end point and it picks out a date. I did this and I will show you my correlations.

An astonishing thing about the date I arrived at by this method is...

That it's the same date that the Mayan civilization pointed for the end of its calendar, in all eternity.

You may choose not to believe that I didn't know this when I made this prediction, but I didn't know it.

I didn't, and yet I chose not the month, not the same year, the same day, month, and year.

(Commentary)

Well nobody knows, but I ask myself this question "What do I have in common with the Maya, that we both should reach the same conclusion?"

I have only one thing in common with the Maya: psychedelic mushrooms.

So then it raises the possibility "Does this thing have like a bar-code in it?"

No matter who you are, no matter where you are eventually you get to the bottom line and you turn over the carton and it says "Discard before December 21st, 2012 A.D."

That apparently is the witching hour. I don't present this to you as "You should believe me"

I wasn't told this by a God.

It was not revealed to me by a former incarnation, I can show you why I reached this conclusion, I will do so now.

Let's zoom in just a bit more, we're at 50,000 years.

Let's get a hold on it here, 26,000 years.

13,000 years.

The last 6,675 years. I'll move past this fairly quickly, at this scale this is the big picture, then I'll show you the big picture and we'll go for the details.

As a big picture, I think this is pretty accurate as to how most educated historians would view what has gone on, on this planet for the last 6,000 years.

It's telling us that 4,500 BC a descent into novelty is under way and it didn't start very far back here.

Quite a steep descent into novelty.

In fact what we find here is Sumer, Err, Babylon, Egypt, and so a series of civilizations each leaping beyond the accomplishments of the other until we reach the pyramid building phase of Egypt, the old-kingdom.

Then right down here there's a sort of novelty trough.

Egyptian civilization rages across here and in-fact it does fulfill the intuition of theosophists and other people that Egypt achieved something that was not surpassed in novelty until early Roman times.

In other words, clear all this happens, but you don't get all this level of novelty until you get over here at about 220 B.C. I maintain, technologically, so forth and so on, that's just about right.

This upswing back into habit, the historical record is characterized by brutal civilizations, the Hitites, the Metani, imperial Assyria, you know motorcycle gangs with chariots is what we're talking about here.

If we were to blow this up, we would see that there's some interesting plunges into novelty.

Alphabets, expansion of Phoenician trade routes, so forth and so on, but the turning point is up here, as far as Western history is concerned, what happens up here is Homer sings his song.

I maintain, symbolically and literally, that's what started it all.

That's what set the last phase in motion.

I had a professor, maybe I'm echoing his prejudice, a philosophy professor in college and he said "You

want to know where it all went wrong? I'll tell you where it all went wrong. When the Greek's stopped being fishermen and pulled their boats up on the shore and started to talk philosophy...it all went wrong"

Well I don't know if it went wrong, it certainly went in a different direction. Homer sings his song and it begins and almost unbroken cascade into modernity, and now I want to show you the rest of this.

3,337 years from Plato to NATO, as Rupert would like to say. This is the last 1,670 years roughly. This is where we have to bring us home to mama because this is where the stakes rise. It's one thing to talk about meteor strikes 220 million years ago, or the bust up of Gondowanda land or a middle Permian fluctuation in incidental solar radiation, I mean that's all very fine.

But who knows whether your playing with a full deck or not when you shuffle this stuff past them. But your superb liberal education has given you an immense knowledge of Western history, and I'm sure I can't fool you.

Q: [???

Yeah but if you go in to any point on this wave, it's an infinitely regressive fractal. In other words there is no place in time where it's all in favor of novelty, or all in favor of habit. You can discern trends, for instance this is a downward trend, obviously. But sufficiently magnified and lived through, there still were assertions of habit because the thing is a fractal, it has an infinitely repeating structural rogasity.

Q: [???

No, no you don't use probability theory to deal with this at all because it obviates the idea that you have a stable background against which to make your averages, it kicks that from under you.

Q: [???

Well you're somewhat anticipating what I'm going to get in to. What I want to do is run through this fairly large-scale situation in the last 1,600 years and then look at 1996 in detail because for a very long time, like since 1975, I was aware that there was a deep plunge into novelty into 1996. And now the question must be answered: Did it happen or didn't it happen?

Let me go through this and then we'll look at that and if I still haven't satisfied you then ask the question again.

This is the last 1,600 years and I hope you can all see it because this is one of my most powerful arguments. I maintain that among reasonable historians, the great episodes of novelty of the last 1,600 years are portrayed with freakish accuracy on this thing.

Q: [???

Not exactly, no, I'm saying that the accretion is novelty is occurring faster and faster. Accumulation, the accumulation is occurring faster and faster.

Time is not smooth, yes, that's right, that's a way of thinking of it, that' it's speeding up and slowing down rather than rising and falling.

That's just changing the vector...

Q: [???

You mean spatially or in time? They're not occurring at random, they're occurring under the igeious of this wave, this wave is replacing randomness. Randomness is a tricky concept central to probability theory.

Are they occurring randomly? No, they're ruled by this, they don't occur randomly, they occur where this thing says they may occur. That's the hypothesis.

It repeats itself not in the sense of it happens again, it repeats itself in the sense that if you were to zoom in on any point you could extract from that point the whole wave. This is a wave made of tinier and tinier versions of itself, that's what self-similarity is in a fractal.

Q: [???

That's right, in a sense this is a very conservative form of prophecy. It does not say what will happen, it says where to look for unusual events and where you're wasting your time.

Probability theory, the first thing you learn when you study probability theory they teach you that chance has no memory, and that example they always give is "If you flip a coin and it comes up heads 49 times in

a row, what are the odds that it will come up heads in the 50th flip?"

50/50. Chance has no memory, in other words according to probability theory, the universe does not remember those earlier throws. So the probability remains 50/50, now lets go to a professional gambler and we flip a coin 49 times in a row and it's coming up heads and we're about to flip the 50th time. How many professional gamblers in the room are betting it will come up tails? None.

The gambler has discerned that there's a run-on, but a run is not a scientifically validated concept. You see if probability theory were actually true, the coin would land on it's edge every single time.

Coins never land on their edge, that is the rarest of all outcomes. You can toss coins in bars even with sticky surfaces, and you will do it a long, long time before you get a coin to land on its edge. When you say this to a probability guy, they say "You don't understand, it's the ideal case but movement of air, the spin of the coin, these things favor one or the other"

Then you say "Well it isn't 50/50, you're telling me one or the other is favored" and they say "well, why don't you get a life or something, stop bothering us with this"

Ok lets look at this then, this is the last 1,600 years, it's not shy about making predictions, it fills the screen with precise predictions and I'm rushing this but you do understand, don't you that the software is capable of zooming in on one of these troughs and defining them to the moment.

In other words, this is not a theory where we say "Well between 1440 and 1444 something interesting might happen" no we say "The maximum potential appearance of novelty is slightly after 2 pm on the 16th of February, 1441. End of discussion"

It's almost an embarrassment of predictive power because we're so used to smeared predictions that when someone comes out with a statement like that we say "Well that can't possibility be scientific, it was so precise" Strange.

Ok, here is the fall of Rome in 475, the fall of Rome was not a dramatic event that happened overnight where headlines were published "The Fall of Rome"

It fell apart over quite a period of time, but generally 475 AD the abduction of Augustus Romulus of Alarex of Visigoth is considered to be the moment when it got the boot, so Rome fell.

Over here, in this little tick which you may not be able to see, Mohammed is born, but the Hagera is here, and the death of Mohammed is here, this deep trough here is the establishment of Islam.

Some people have criticized this theory saying it's not politically correct because it's euro-centric. My

answer to this is “the world you’re living in is euro-centric”, you know, the Maya may have been splendid people, but their contribution to present state of world civilization is precisely zilch as far as I can see. Molay sauce, that’s it.

So you know without being too harsh its apparently, who counts is who’s left standing.

You may not like European civilization, you may think Plato was full of shit, but you can’t argue that every man woman and child on earth is affected by what happened in Greece in the 5th century B.C.

It correctly portrays the triumph of Eurocentrism over all other values throughout the world, that actually happened and if this wave described history, it has to be true to that.

But, I mention this at this opportune moment. Because Islam is, not strictly speaking, thought of as part of European civilization. And this wave gives tremendous weight to the accomplishments of Islam, and I maintain “So must we” because modern science was not invented in Europe, it was invented in Baghdad and Cordoba when Europeans were scratching their asses and sitting around in bad wool drinking moldy beer.

So, it may have a Eurocentric twist to it, but it also is very friendly to the cultural accomplishments of Islam.

Just to make the point again, this enormous plunge into novelty here, in the middle 900’s precisely parallels the rise of the Umayyid (?), the invention of algebra, the elaboration of modern science, observational clinical medicine and all these things that were going on.

This next plunge is a purely European, well half of it is a European story, this is the Crusade. It is specifically the 2nd Crusade, and of course when we talk about European history that ended the hammer-lock on the European Catholic church, that was the first great loosening blow, and suddenly spices, and drugs, and exotic human beings and technologies and commodities, it was extremely dramatic for Europe.

It was like contact with an alien civilization.

We all know that is the Crusades.

The next plunge into novelty, and I’m going to advance the screen one shingle to get you more detail.

Now we’ve left, the Crusades are just on screen, but this is an interesting one. It’s a dramatic plunge into novelty but an incredibly dramatic return to previous patterns of habit and behavior.

It emphasizes that whatever this novelty was, it wasn’t a culture transforming technology, it wasn’t a new religion, it was not a new language, it was not a scientific breakthrough, what could it have been?

Well the bottom of this trough, if you zoom in on it is 1356, as you know, but are kindly not shouting out, in 1356, in an 18-month period, one third of the population of Europe died, and nobody knows how many people died outside of Europe.

What we're talking about is the Bubonic plague, the black-death. It is certainly novel to have one-third of everybody you know drop dead.

But, what happens in a situation like that? Well there's a lot of grief, and trauma, and then you bury the dead and the living move up these managerial positions, these unfilled positions, people take them on and they re-build society. Usually in a very conservative simulacrum of society as it existed before the catastrophe.

That's exactly what we see here, an enormous plunge into novelty and a very dramatic return to habitual patterns. So from here to here, it's roughly 1252 to 1400. 150 year period characterized by this novel collapse and a quick rebuild. But now over here we see, almost as though for your edification they were placed side-by-side, a different kind of descent into novelty, a descent into novelty extremely steep, starting at a higher point than this and plunging deeper than this, and then whatever the novelty unleashed here it was not so easy to recover from.

One of the great seminal moments of evolution of human life on this planet was the coming of the first internet. As if that weren't enough, 1440, only 15 years later in 1455 the Ottoman Turks seized Constantinople, and Europe is effectively cut off from the East. It's impossible to imagine the impact of this on the economy and psychology of Europe, I mean they were check-mated by Islam and nobody knew what was going to happen.

What did happen was some enterprising and moderately wealthy Italian capitalists decided to pool their money, take a chance on new ship building technologies and attempt to sail around Africa to reach the East, and they did it.

And the money that they made from this investment in R&D were greater fortunes than the world had ever seen, they were the first secular fortunes. These guys weren't movers they were business men. They made vast amounts of money, and seeing how they made it, they saw no reason to change their investment strategies and they poured money into new technologies of architecture, of city building, of creation of arches, patronage of the arts, patronage of the sciences, patronage of letters and litterateurs.

And this is the Italian Renaissance, precisely here, from 1455 on everything you've ever heard of the Italian Renaissance here, and it reaches its culmination down here at the very bottom, at the exact bottom of the novelty trough at this scale you get 1492, the discovery of the new world. I mean try to wrap the mind around the concept that it's only 500 years ago that we discovered the lost half of this *planet*.

I mean we shouldn't imagine that we've got it all under control, we only discovered our own rear-end 500 years ago, so how much can we be sure we know about reality?

The discovery of the new world is not something Europe has ever recovered from, it was literally like having extraterrestrials land in your backyard.

If you read Albert Durr's diary as he records his impressions of an exhibition of objects that he saw in Madrid that were brought back by Cortez and exhibited in the court of Louis the Fat...I mean Phillip the Fair. One of those people hehe.

As an intelligent educated European he was in shock, he had never seen such things, they were beyond imagining, they were psychedelic. And the fact that beyond that lay exotic animals, strange language, unimaginable deposits of gold, exotic human beings, all of that...and so, this is what's called, not by me but by art-historians "The age of the marvels"

Stretching from the discovery of America in 1492 to this sudden ascent into habit over here in 1619. And as you know, 1619 is the beginning of the 30-years war.

Certainly if there was ever a recidivus move to habitual chuckle-headedness, the 30-years war was it. For 30 years, it was sort of like Europe became Rwanda, and everybody went out and murdered their neighbors. Protestants murdered Catholics. Jews, forget it.

Everybody went into turmoil, nobody understood why they were doing it or what the politics meant, and it was just a bloodbath that finally ran itself out.

But before all that, you had the conquest of the new world and I maintain that this ugly bump, the bottom of this novelty trough, is where wonder gave way to co modification.

In the end people were just stunned, they couldn't believe it. And then when the wonder wore off, they began doing the calculations.

They say "My god, there is money to be made, we just put all these Indians to work, get their crops growing, get all their gold and we are going to make a mint" and they did.

The whole base of Spanish power, the whole reason for it's meteoric rise and essentially instability was that it was all based on new-world gold.

Here's the 30 years war, this steep ascent into habit is punctuated by this dramatic descent into novelty which I call "Newton's notch".

It's nice to believe that a single human being could make so creative a step that the entire age would bear the imprint of their intellectual breakthrough. If ever there was such a giant, Newton was it.

From where he started and where he ended, he basically moved the world.

After the Renaissance, the next great plunge into novelty is what's called the European enlightenment, and it begins up here with a bunch of high-flown French philosophers, Allivason, Voltaire, that crowd, and it ends in the very practical and chaotic experiments of the American-French revolution.

The first half of the 19th-century is here, that speed bump is basically the Franco-Prussian war, Civil war in the United States, and the descent into novelty from there is pretty straight-forward.

Now what I like to do is leave all this, I think by now you've gotten the idea and I want to look in some detail at this 1996 situation.

That's the last 417 years, the last 208 years, the last 104 years, the last 52 years. I want to talk about this one for a minute because there is an aspect of this theory that I find very appealing that I haven't touched on yet which is, if you've been paying attention you know that screen repeat themselves.

Remember I showed you a screen where I said "at the top of a certain mountain Homer sang his song?"

This is the same shape, but we're now not looking at thousands of years, we're only looking at 52 years, well what's the deal?

Because this thing is a fractal, it has built into it automatic resonances.

It gives you a very rich data-field to work with.

If this is a span of time from 1944 to 1996, it on another level is a span of time from roughly late-Egyptian time to the Umayid Telephates with Homer singing his song up here.

On the short-scale, the 52-year scale, this is 1967, these two things are in, according to this theory, in a situation of resonance or geometrical relationship to each other.

Is there anything about the world of Homer that is like the world of 1967?

And I maintain yes, a tendency to easy lifestyles, loose shoes, and sophomoric philosophies characterize both (theories?).

You see it's a way of explaining such transient phenomenon as fads and fashion. Why are we suddenly

putting lion claws on the legs of our bathtubs?

Well because we're passing through a period of resonance when that was done in the past, in other words the Orthodox theories of history and time would tell you that the most important moment shaping this moment, is the moment which just preceded this moment.

It was, as it were, the conduit for the wave of causal necessity to arrive at this moment.

I am saying something different, I am saying that every moment in time is an interference pattern made by other moments in time that are related to each other, not through linear seriality, but through this much more complex schema of relations.

If you suddenly walk into a room and there's a heavy hit of black granite, inverted corners, and silver shadowing, it's a Eugenshtiel resonance.

I live in a kind of waking hallucination, I have a little aphorism which covers this. It's Rome falls 9 times an hour. It falls more than that and less than that, but lets say it falls 9 time an hour.

Well then you're job is to notice every time it falls, in other words what we think of as our random musings and our personal mental furniture is in fact our subconscious awareness of these systems of temporal resonance operating around us.

So, as I look out at a crowd like this, if I let myself go I notice that Kant is sleeping in the corner, and that Madam Lafarge seems to have just come in from the baths and taken her seat.

Cleopatra is headed for the john and so forth and so on. How real is this? Who knows.

It's a matter of discerning.

Q: [???

What I would say is, first of all lets get a little more honest here. There's a lot of argument about where Homer actually sang his song, we can only really pinpoint it to within about 150 years, it's up here somewhere.

I could zero in on this, but 1967 is here. 1968 is just over the top. The first moon-flight is there, now suddenly we have the Homeric resonance, what is Homer but a story of noble men on a long and far voyage and eventually the homeward return and eventually the heroics of that echo over the centuries.

Probably the only heroic episode of the 20th century that's unsullied by hypola and manipulation and so forth is the flight to the moon.

I don't care about the politics or any of the rest of that, I mean what it took to do that, we're not doing it. We don't have the gumption, the technology, or the national focus to do that.

In a sense, I take the moon flight to be in a sense the capstone of modernism.

I consider post-modern time to begin after that, what was the 70's but the whining re-cry of the 60's?

Then everything else has followed from that.

Q: [???

Well it's a turning point, it initiates a cascade, it represents an achievement and a turning point.

Had it launched a trip to Mars, a colony on Gannymede, and expedition to Triton, then it should have been at the bottom of the novelty trough, but it was what it was and it was unique and politically unsupportable.

It represented the limits of the assertion of a civilization, not the beginning of a process. Who would have thought that time, who would have dreamed that 35 years in the future people would look back on the age of space.

The age of space is a historical era, like the age of exploration or something.

Q: [???

Yeah, it tells of a noble time long ago when brave men and women explored an unfamiliar world it had nothing to do with us.

Q: [???

I thought of this not as a line, but as a topological manifold. That's how I think of it and I think of events as like a fluid and this fluid flows over this landscape.

No. No.

The closest it can come to making a prediction, I was slightly conservative when I dealt this first, it doesn't make predictions it tells you where to look for the event.

Then I introduce the idea of resonance, the resonance can be a clue, but you are easily deceived, or I am easily deceived.

If I can show you this 96' thing, I think this will get clearer, let me try for it.

It does follow a spiral on large scales, there's the last 13 years. There's the last 6 years, you see this 96' thing, there's the last 3 years.

I want to change the end date. There's 96', now it's this really dramatic plunge into novelty. There had been nothing quite this dramatic, in a period roughly from the end of last February to the end of May it transited this enormous distance. This is a novelty plunge, this is a novelty trough.

Descent into novelty means rapid change in the novelty value, nevertheless it's obvious I think that these levels of novelty are higher than these levels.

Though this is going on in an atmosphere of more rapid change. If we were to look at the historical resonance of this, it's that period, the previously mentioned period of the Umayid Telephades. So when I was trying to figure out what this would be, what would happen, I said well what happened in the Umayid Telephades, if we are looking in the right place.

I also looked at China and there were some interesting things happening there, but for the moment I'm looking at the Umayid Telephades. It was basically as I said the birth of modern science. In other words there was a coming together of analytical and intellectual techniques, and a realization of how to understand nature.

In other words, a breakthrough in the understanding of nature. So I said "There should be some kind of enormous scientific breakthrough in this period"

Well going down here we got the comet, Hayukataki, it means 1,000 mushrooms. I took some hope from that, but comets don't really count, I mean they might have counter in the long past.

I mean they do if they have fleets of extraterrestrial vehicles trailing behind them.

But none have appeared to have this so far. So I was looking and different things happened, the Bose-Einstein condensate, these really far-out things in science if you follow science.

So I was getting over here and I was getting pretty desperate, there was only 20 days left and my email was

full of sneering voices saying “So wise guy, where’s the miracle you promised us?!”

And at that moment...the Martian meteorite full of fossils arrived on the scene.

I think it’s not unreasonable to accept it as proof that this is working, it may not have changed the lives of ordinary people, but it certainly changed the position of human beings in the intellectual universe.

And so, there it was, an immense scientific breakthrough related to astronomical matters which is what the Arabs were getting together in this situation.

It changed our entire notion of who we might be in the cosmos and so forth and so on, and I was pretty happy with that.

The original scientific announcement was on August 8. So then, time passed as it always does.

And then we lived past it as one always does, and there’s an ascent into habit and so forth and so on.

822. 808, right there, can you not see it? It’s right there.

I’ll leave this thing running tonight and you can play with it as you like, there are plenty of people who will show you how to run this thing.

But it’s a perfect prediction, so I had come that close, I felt pretty good about it. I said that somewhere towards the end of summer 1996 there would be an enormously important scientific discovery that would change forever our notion of our place in the universe.

Ok so fine, good. Then we live beyond it to where we are now, which is over here, and then these people come forward, completely unbidden, a Godsend, a double-miracle, and announce that they cloned the ewe.

The cloning occurred within 4 days of the announcement of the meteor, so I had a double whammy, and the late-punch was telegraphed 7 months later.

They’re not making anything of it, but that was the moment when the zygote was divided and the thing began to grow. No mammal had ever had it happen to them on this planet.

Well that’s not quite true, it had been done with mice in the last 15 years. But a higher mammal, it was a

biological phenomenon absolutely new in the history of this planet.

The planet had existed for 7 billion years without that happening, and then it happened within a week of the human race discovering that Mars harbored ancient life.

So I don't call this a knock-out punch of my critics, that would be preposterous, because my critics are the entire edifice of established science 500 years old and practiced by millions of people around the planet.

But not bad for so fragile and change taking a theory, I'm sure it struck terror in some hearts and fear and loathing in others.

I was set up to fail, and didn't I maintain. The fact that we can continue to have this discussion, you may think I failed, I don't think I failed but it should have unambiguously clear that I failed.

But the fact that we were able to keep the game in play is very interesting.

Q: [???

Sounds like it worked for you, I hope the check is in the mail (laughter)

Well I will do consulting for a very nominal fee.

Well I'm glad your story is a happy one, I myself am more provisional, I will advocate this, but I am more aware that the many in my audience, how unlikely this is.

I am basically a devils advocate because I am fascinated with the fact that I thought this up, and this is not my style. It's hard for you to believe that because I've been now talking about it since 1971, so it has become *me* in a sense. But it isn't me, this is not how I think, this is not how I ever thought. I had to be lead by the hand, I am sloppier than this, I am not precise.

This was told to me.

It's eerie. It's turned my life to science fiction, because I don't know what this is all about.

I don't know why...I'm here talking about this. I don't know why you're here listening to it, and I'm puzzled that outside this room the world is moving towards, not this theory, but these kinds of conclusions. Is it the millennia? Well this isn't about the millennium. This says "Forget the millennium, it's a complete waste of time", it's a speed-bump on the way to the real event.

I've tried to think of rational explanations for why, why this theory. I've had to go pretty far afield. Here's a rational explanation: Suppose the millennium is so psychically charged that there's a danger of mass hysteria of some sort, mass suicides or something like that. Perhaps the collective unconscious senses this and my mission is to smear the expectation.

In other words, what this does is it says "Don't get excited about the millennium" and then once the millennium is past, it will say "And don't worry about McKenna either" in other words it's a way of cheating you past the millennium, if there weren't people running around saying 2012, 2010, 2008, 2006, 2004, there would be so much energy concentrated on the millennium that there might be various forms of mass hysteria.

I don't know, but it's a more reasonable explanation than that the secret of universal temporal architectonics has been handed over to an Irishman by a mushroom for the edification of mankind. That is too much.

I'm amazed that...because you see it's so precise and I don't know if you can tell from what I've said this evening, but it's very clear to me, that it's not about being right some of the time.

If it fails once, it fails completely. There's no wiggle-room. That's why it's so interesting to try to trap it.

This is not something where if we get 7 out of 10 we're going to keep preaching.

This thing must be right 10,000 times out of 10,000 tries. And as I offer it to you and to other people because I think smarter people than me ought to be able to destroy it.

Remember when I talked about how when science gets points for proving you're wrong. If I could prove this was bunk I would get a lot of points.

If anybody could prove it was wrong, absolutely wrong, but it's amazingly slippery. So slippery in fact that it's almost like a living thing. Just when you think you've pushed it into a corner that it can't escape from, you get a Martian meteorite full of fossils right in your lap.

Q: [???

I believe it's 28, April, 1996, or 28 February...I'll get it for you. It is...that's the turning point, 2/19, February 1996. So last February, suddenly the bottom dropped out and that went on until... I was in Mexico, though I don't offer this as the turning point I think recall there was a fairly intense earthquake in the L.A basin, the 19th of February 1996. Yes that was the San Fernando quake, I believe it was.

Anyways, retract that, lets not get mired. I don't know what the turning point was.

Q: [???

Oh well tell me the date. The murder of Itshak Rabin(?) this raises the question of what's novel and what's not.

I'll tell you a story about the middle East, it's not a Rabin story, but this is almost like a Martian meteorite story.

Way back in the 70's I was watching the resonances, and this is a resonance with the Umayyid Telophate, I said that, so back of course some time around 1973 or 74 or 75, I can't remember, but anyways we were approaching the crucifixion resonance, and I thought "Now this will be interesting" because first of all, the crucifixion is fairly defined in time, it happened around Passover of 27, it's a very nice clean marker.

So I thought "Now what could happen in the middle East that would satisfy the crucifixion resonance?"

And I couldn't imagine it, and I said "Ok, so we'll wait to see"

Then the date came, and I thought "Oh wow, this is it, it's crucifixion day, lets check the news"

It said "Anwar Sedat has been murdered in Cairo", and it was like a revelation to me. It happened on the day of the crucifixion resonance.

How do I interpret that? A peace maker, a person of philosophical depth, a humanist, a humanitarian was sacrificed on the altar of the stupidity of mid-east politics.

In one case the Roman occupation of Judea, in the other case the whole quagmire of middle-Eastern politics. But eerie how one couldn't imagine a fulfillment of the resonance, but the wave could imagine a fulfillment of the resonance and has this uncanny way of expressing itself.

But I stress this is not occult. You could run the time-wave better than I do if you study history and paid enough attention. There's no mumbo-jumbo here, it's a reasonable hypothesis.

There have been many wave-theories of history. Oswald Spangler had the four ages of the world. Arnold Toynbee had a series of successive stages, Gyan Batista Vico in the 16th century in his "La Ciencia Nuova" proposed a scheme of universal history.

In our own century we've had the chondritiatic wave, which was a wave of mechanical theory of predicting economic cycles. Why shouldn't human history be under the control of cycles?

All other biological phenomenon on this planet.

Q: [???

Well it's a fractal wave like an electromagnetic field, an electromagnetic field is the same equation slightly tweaked used to describe it.

It's a genuine fractal wave-system. An interesting thing about that just aside, I had this down cold by 1975, and fractals didn't even become sheik until the mid-80s.

So this was all done...in fact there has been an eerie parallelism in the development of science and new-age focuses I guess, that seem to keep this alive.

It's astonishing to me that a notion conceived by me as a 23 year old in the Amazon, I'm still in the business after all this time and I've talked to a lot of smart people. People don't know where to put this...

If it's a delusion, it's a remarkably stand-alone delusion, it doesn't require me.

The fascinating thing about it, one thing is, through all these predictions that we've been talking about, all these successes that I'm claiming for it, hinge on a single and impossible to come to terms with assumption: That this planet will attain infinite novelty less than 20 years in the future.

If this theory is true but the end date is wrong, then all of these historical correlations fall out of phase. So in a sense, it's a prophecy that all that really matters is the final date.

I, being sane, believe nothing will happen. And yet, if nothing happens, what a curious trip this has been. What then was the *raison detra* of this whole exercise? Why did it offer itself? And why is it inherently self-limiting?

If it's an effort to deceive, an effort to deceive would ever be so foolish as to crawl out on the limb of such a clear-statement of prophecy.

It is disconfirmed by events in 2012, then we will be in the peculiar situation of having had a time-wave which worked every moment in history until it failed totally.

Again, I can't imagine what that point of communication would be.

One idea that's occurred to me, based on thinking about strategies of extraterrestrial contact is...maybe this thing that we are calling the time-wave is a piece of universal data, as universally known as lets say the atomic weight of hydrogen. Maybe there's somebody out there who figures, if they're intelligent they will recognize what this is, because all forms of intelligent life knows it.

And if in fact we're in a slightly indeterminate zone, we're almost intelligent enough to understand it, and almost so stupid that it goes right by us, so we're struggling to say, you know, is this a message? Is this meme? or is it a self generated hallucination?

I don't know, I offer it as part of this weekend on imagination because this is my best trick in the imagination.

My little theory of evolution is no more than a conversational rap, a "how would it be if..."

This is considerably different because it rests on a mathematical foundation, and don't forget it does come genuinely from the I-Ching.

So we have this peculiar, three-pronged situation.

We have a pattern in the King Wen sequence, taken by an Irishman, and contorted into a mathematical wave which gives a prediction for the apotheosis of the world, which matches the assumptions of a vanished Mezo-American civilization.

Huh?

Why?

One possibility that has occurred to me, and I've thought about this obviously for decades because I think everything you can think about this has passed into view at least once:

One possibility that would wrap things up very nicely is that if the great day came and I dropped dead. Then there would be this curious thing that for the rest of time, if anybody bothered to remember it, people would say "Do you ever hear the story of 'The Terence McKenna thing?' how there was this guy in the late 20th century that produces this mathematical theory about the end of the world and preached it on street corners and market place for over 55 years and got a whole bunch of people excited and when the day came he dropped dead?"

It would be no weirder than some of the other stuff, you know the instances of spontaneous combustion and so forth and so on.

Yes, it doesn't escape me that this date, December 21st, 2012 occurs exactly 1 month after my 65th birthday, and I can't tell whether this is the most dramatic retirement announcement, you know a guy who made a career out of announcing his retirement and was able to run that con for 55 years, I don't know...

Q: [???

Where does it end? Well, this question, when I calculate my own personal wave, first of all I do entertain the idea that we may each have our own time-wave, sort of following the model of astrology. But I'm

aware, and I'm sure those of you who are professional astrologers are also aware that the natal horoscope is essentially a commercial-con.

In other words, astrology, the royal art of astrology was invented to guide the destiny of peoples and kings, pharaohs, and courts. But in the late Roman period, the worlds first yuppies came into being, or one of the worlds first instances of yuppies, and they thought "Well the emperor has his horoscope cast, am I less than the emperor?" I too should have my horoscope cast, and enterprising Hellenistic astronomers were only too please to oblige.

Otto Noigebaur published a wonderful book about the natal horoscopes of the rich Athenian and Roman citizens. To some degree I think it is a slight distortion of astrology for astrological purposes. Nevertheless, in terms of the time-wave a reasonable question would be

"If this is true, then how can I have a bad day when you're having a good day?"

In other words, if novelty ebbs and flows according to this schedule, shouldn't we all be having good days and bad days together? And obviously we don't. So what then must be happening is that we are on different places in the wave-system.

Then if that's true then in a sense, this huge wave could be thought of as the summation of all the little waves which comprise it. It's perfectly obvious, lets say this were a huge scale of time, several thousand years. Then this might be a period of time as long as an entire lifetime, but not everybody alive in the world at that time would experience their life as an uninterrupted plunge into novelty.

No, a large percentage of people might. There is this phenomenon of the Zeitgeist, and to the degree that we participate in our time, our life is in concert with the larger wave. This wave has durations of cycles in it, and one of the cycles, the cycle we're living in now stretches from 1945 to 2012. It actually stretches from the Hiroshima bomb-blast to the winter solstice of 2012.

I was born 18 months after that event. If I have a person time-wave it will end 18 months after the end of this wave. How can that be when this wave seems to dictate the end of all lesser waves?

Another mystery to be unraveled by traversing the territory.

Q: [???

I don't know what the time-wave is portraying. In other words, novelty, how is it transmitted, is it detectable, can we build a meter other than this time-wave?

Can we build a parallel technology which would confirm the existence of this thing, what can you do with novelty? The electromagnetic field, it turns out you can transmit information. Light-city smelt metal if you

know how to do the trick.

What you could do with this, I'm not sure. You see if the last cycle from 1945 to 2012 is real, then in a sense all larger cycles are compacted into it. In a sense, from 1945 to 2012, we're re-living the entire history of the world.

If that's true, then we have reached roughly 1000 A.D.

That means that between now and 2012, we must traverse a...I don't even have the words for it. A domain of cultural domain equivalent to the domain we traversed between 1000 A.D and the present, slightly more than 1000 years of resonances have to be compacted into the next 16 years.

Consequently there's this feeling of things moving faster, and faster. In a universe which was actually built on this kind of architecture, imagine this, a universe that actually had this kind of closure, where each time-cycle was 1/64th the size of the one that preceded it.

Before a universe of that structure reached the domain of planks constant, 6.55×10^{-25}

It would undergo HALF of its unfolding into existence in the last hour and 35 minutes before the crunch.

In other words, if this is the kind of universe that we're living in, half of the unfoldment into novelty will occur in the last day of the existence, that's how huge these rates of acceleration are.

So when people ask the question "What will happen in 2012?" They're asking you to see around the corner 9 times. It can't be done.

Language fails, apparently, as far as I can tell what will happen as novelty asymptotically increases in the final months, hours, minutes, milliseconds is boundaries will dissolve. All boundaries, they're already dissolving, we see the nation state dissolving, but wait till the atomic field dissolves...

Everything is apparently crunching together in some kind of meltdown, it's the equivalent of a black hole, but it's not a gravitational collapse.

It's a novelty-collapse. We are collapsing into a black hole of novelty, I've tried to imagine "How could this happen? What could happen without God's direct intervention, and fleets of extraterrestrial starships appearing over every city on the planet?"

In other words, is there anything that we could self-generate that would fulfill this kind of a scenario? It turns out that I found at least one answer which is "time-travel"

If in fact what happens in 2012 is that we begin the conquest of this previously unscratched dimension called time, then it is perfectly reasonable that a linear depiction of the ebb and flow of novelty would stop

at a certain point because once time becomes non-linear, you can't portray it on a Cartesian graph anymore.

You need a higher-dimensional matrix, it starts coming at you out of the screen, the novelty over-flows the dimensional container you've built for it.

Interestingly when I had this idea 15 years ago there was no idea in greater contempt in the scientific journals. I mean "time-travel" ha-ha-ha, the grandfather paradox this and that and everything.

Now it's a perfectly respectable thing to discuss, there are schemes for time-travel on the books that would work. It would require some God-like technologies, in other words you would have to be able to spin a cylinder the size of Jupiter 9/10th the speed of light, but if you can spin such a cylinder at such a speed and travel along its horizontal axis, you will in-fact be moved backwards through time.

Everybody agrees on this, they just say you can't do it. Well hell, where have we heard that before?

We can't do it, but if you think of it you can do it, and if there's a crude, brute force way to do it, then there's a subtle, tricky, easy way to do it that comes along a little later. I mean the vacuum tube was not the end of that line of development, and what we're talking about here is a vacuum tube version of a time machine.

A time machine may not be what we think it is, the future is not like the past except that it hasn't happened.

If you were to suddenly find yourself in the future, it's a vector storm of unrealized possibilities.

You've never seen an unrealized possibility, all you've ever seen are realized possibilities and you don't know what an unrealized possibility would look like. There are a lot more of them than there are realized possibilities and they fill the space called "the future"

If you suddenly found yourself in the future you wouldn't even recognize it as that, you'd just think you've gone mad, I think.

So, I don't know, I should wrap this up. The basic notion is, this is what I learned from psychedelics, this is my show-and-tell.

It's an indulgence of my ego to do this because most of what I tell you, you could learn somewhere else. I just have read the books and can regurgitate this stuff and point you towards the plants, lead you through

the philosophical issues, talk about the medical stuff. It's not particularly flashy, it's just a mental short-cut for you.

This is original, and nobody has every tried to wrest it from my grasp, that's how original it is. Nobody wants the hideous responsibility of defending this particular piece of intellectual baggage.

Why I like it is I believe that the idea which is the most fun, is probably closest to the truth.

I find this idea to be absolutely delightful. It also has a kind of weird completedness about it. Although nobody else has ever made any contribution to this theory but me, in other words I thought it up, top to bottom, start to finish. It doesn't feel to me like a human being could do that, it feels to me that this is the product of an entire civilization.

It must have taken hundreds of years, many workers spread out in space and time.

I can tell it, and I was told it, that's how I know it, but no single individual and certainly not myself could have dreamed this up from scratch.

Q: [???

You mean before I had the whole thing? From 1971 to 1975. It was interesting, and this I can not ever share with anybody else, you'll just have to believe me, but the way it was revealed was very odd because it never let me see where I was going.

I couldn't figure out what I was doing. It said "Go buy graph paper, go get your I-Ching, look at the King Wen sequence. Graph the first order of difference."

I would try and guess, what are we doing? Are we trying to discover an ancient Chinese calendar? Are we...why are we doing it? It said "No, no, don't worry about that, next step"

It always hid from me where I was headed, it still hides from me where I'm headed.

The software has been written, the controversy rages on the internet, I even now have critics...that's good.

That shows that it is moving out of the realm of private Idaho into the realm of debatable cultural artifact.

I think that if it's true or if it has a part of the truth, we will know before 2012.

In other words, a lot of people observed...not a lot but a few hundred maniacs observed this prediction about 1996 and then watched the ensuing debate, my critics, my defense, their response, so forth and so on. So it's being watched.

And the meme spreads, and apparently we'll be helped by things like where we are in relation to the calendar.

Simply because we're approaching a millennial term, the producers of nit-wit TV shows want to talk to me, they say "I understand you have a way of predicting the future given to you by UFO's I heard, we want to put you on the air!"

Well you know...I'm not sure about the wisdom of all this, but I figure let the meme fight for it's life in the jungle competing models of reality.

When I pull back from the specificity and the fact that I invented it, that's my biggest problem, if I hadn't invented this, if I had just heard that somebody invented it, this is what it was, I think I would find it very interesting.

But since I know the inventor very well, I'm very prone to doubt the thing. This is not a guy you would want to put a lot of pressure on (laughter)

So....

I don't know. I'm puzzled, and I offer it as an unsolved puzzle, I preached here earlier that you mustn't seek closure. So I don't with this. If it's a communication, it's a very curious communication.

If it's non-communication, it's even more curious.

If it's a delusion, why is it so mathematically formal?

If I'm pathological, why aren't there a tendent sequela? Why just this very defined thing?

The whole thing smacks of the impossible, it's even pushed me towards the idea maybe that this is not actually a reality. We're trapped, or I'm trapped, I don't know if you're trapped, but we're in some kind of piece of fiction.

It's like a Phillip K Dick deal, we're in some kind of simulacrum and the clue to the fact that we're in a simulacrum is this impossible idea.

So the point of the idea is not to believe it, but to use it as a wedge to fight our way out of this labyrinth and fight our way back to whatever reality we were in before we fell into this situation. Something like that.

Anyways I have the feeling like I'm blathering and spinning my wheels.

Is there any final question that brings this all to a...

Q: [???

Yeah that is an interesting question, like people say "Well now is this some kind of permission for irresponsibility. Are you saying that the world is going to transform itself no matter what happens?"

I'm enough of an old political activist to sense the anguish behind that question because I don't want to say "Yes, don't worry about the Palestinians, don't worry about the Bangladeshies, it's a done deal, it's all fine, you can take your eye off the ball and your foot off the pedal"

That seems crazy to me to give advice like that, and yet this thing seems to be saying "It is a done deal, it's going to be fine, it's going to arrive on schedule, under budget, you don't have to reach it, you don't have to worry about it"

So then apparently where it lies is that, it is a done deal, but how the deal is done is not a done deal.

That there will be a deal is sealed, that is written into the laws of physics if this is correct. No escape from the transcendence, but how we present ourselves to it is our contribution.

It does not say what will happen, it simply says where the novelty will cluster and apparently it is still open to...what happens is still a matter of human decision and the unfolding of causal necessity.

So in a sense, it's saying there is a safety net under you, but you still should make an effort not to fall.

Q: [???

I hear what you're saying, yes a strange thing about the Mayan calendar is it begins in 3135 B.C and it ends in 2012, the Mayan civilization began, as far as anybody can tell, around 300 B.C and was a done deal by 790 A.D.

So here was a culture that lived by a calendar that seemed to have no relationship to it's own cultural origins or ends. That's odd.

That's not how people do a calendar.

The other weird thing about the Mayan calendar is it begins on a slow Thursday in August.

In other words, it doesn't begin on a solstice, it doesn't begin at an equinox. It doesn't begin with a special astrological configuration in the sky.

It begins on nothing-burger-day in 3135 B.C.

(brief comment)

Well but it runs forward to a winter solstice and ends precisely on a winter solstice. Who ever heard of a calendar that was formed from calculating backwards from a point thousands of years in the future? What kind of squirrelly culture would do that?

And the answer is: we don't know.

But yes this is a great puzzle that the Mayans seem weirdly disconnected from their own calendar.

The reason the Maya are so fascinating is because they had astronomy, they had politics, poetry, architecture, and they don't owe anything to Greece, or Egypt, or Sumeria, or Babylon, or Urr, or Caldea. They thought it up themselves, they did it themselves, they met problem after problem after problem and solves them in astonishingly unique ways.

You know it's just a matter of cultural accident when Cortez sailed into the bay of Campache, the difference between medieval Spanish civilization and the civilization of the Aztecs in terms of technology level and understanding, they were practically on a par.

I mean the Spanish had no antibiotics, no advanced weaponry, no advanced communication, they had better ships, but had the voyage not been done that way, 150 years the Aztecs might have landed on the coast of Spain and claimed it for a Montezuma's successor, that's how nearly in parallel they were.

But of course the bifurcation was tremendous, one civilization wiped out and the other through the looting

of the former, finances its way into modern science, and 500 years later we have atom bombs, and antibiotics, and DNA sequencing.

That's it for this evening, thank you for your attention and your indulgence, I'm very grateful to you. I'll leave this here, if any of you want to play with it I'm sure there are people who can instruct you if you get caught in a bind. Thank you.

(Next session meeting, the next morning)

I guess you know there was a time change last night because you're here, but there may be some people who are sleeping blissfully on, so that's fine too.

I want to say just a couple of housekeeping details that I've overlooked, and overlooked, and now I should mention. I'll tell you a URL if you're interested in visiting the website, because there's a lot of exhibits stuff there and even many buttons to more interesting places. The URL is the usual <http://www.levity.com/eschaton>

I've got 13 airflights scheduled in this tour and I've packed a very small bag so I didn't have to submit it to baggage so I didn't bring my usual raft of propaganda.

My partner, Jill Wagner runs a plant business in Hawaii, and if you're looking for salvia divinorum, or acacia simplex, or potrea viridus, or any of these exotic psychoactive plants, her company is called Hoti.

It's a great thing for a plant or animal to make friends with human beings because it's probably a free ride to the stars if you stick with it long enough.

Q: [???

No peyote is a scheduled substance, just a word about the legal system. Some plants and some substances are scheduled, the only two scheduled plants are peyote and cannabis.

This a travesty of the legal system, but these sacred plants should be lumped in the money engines of world criminal syndicalism like cocaine and heroin.

But who said it was a sane or just world?

All the plants that Jill sells are legal, one plant I do want to mention to you or just a piece of factual information that I'm keen to convey to people is this area of psychedelic botany there has been an amazing breakthrough in the past couple of years and this is: the discovery an entirely new psychedelic in an entirely new chemical family, in an entirely new genus of plants and this is salvia divinorum.

Salvia divinorum is legal, legal to possess, to buy, to advocate, to sell, to synthesize, to do therapy with, and to do anything else you want to do with it.

Be forewarned that the pure substance which is being called Alpha Salvanorine, is active under 1 milligram. If you're a chemist or a pharmacologist, this is astonishing, besides LSD we don't know of any psychoactive substance so powerful, and of course LSD is made in the laboratory.

Alpha salvanorine you can wash out of this Mexican plant with a simple, pot alcoholic extraction.

800 micrograms is a more than you can handle dose. 800 micrograms looks like a very small grain of salt.

So I'm concerned that people stick with the plant at this stage because some idiot is going to honk up 10 times, 20 times, 50 times too much and then present the community with an embarrassing corpse and a bunch of hysterical people saying a new drug scourge has been released to plague suffering humanity.

It's an excellent opportunity for us to prove we're as smart as we've always said we were.

If we behave with integrity and impeccability around this substance, I think the legal system at this point is very exhausted with scheduling drugs, and busting up families and dragging people away to prison.

We just assume not schedule this stuff and make a huge bru-ha-ha about it. So what I'm urging people to do is obtain the plant, and grow the plant, I approach it by chewing.

The leaves. My son and his friends do it in bongs and they swear that no one has ever escaped who submitted themselves to their regiment.

Some people have tried it here at Essalen and it's common for people to say "Well here was all this hype about this fantastic thing and I tried it and nothing happened"

Smoking it in a bong.

Apparently there's a pretty dramatic threshold, in other words, nothing, nothing, nothing, nothing, nothing... plenty. (laughter)

The way I do it is I interject Western rationalism into the process. An unheard of level of technical sophistication, I weigh out 35 grams of leaf, I remove the mid-vein with my fingernail to lower the volume of the pile of material. I roll it into a quid, I put it in my cheek, I lay down in silent darkness where I can see a digital clock. At minute 16 I spit it out into a Kleenex, I stay where I am, and around minute 18 to 22 it breaks loose.

It's strong enough doing it that way, that the question arises around minute 25:

How strong is this stuff?

Then after about 20 minutes of extremely bizarre, inorganic, quasi-mechanical, highly colored hallucinations, it just leaves you.

I stay in bed and sleep, and when I get up the next morning I feel fine. It's a fascinating plant, almost everything about this plant is peculiar.

Just to run over it quickly, the plant *salvia divinorum* is known only from the Sierra Mazateca of central Mexico.

Though only people known to use it are Seltzal and Satzil speaking Indian groups.

When you ask these Indians "What do you call this plant?" they say we call it "Hojas de la pastora"

Leaves of the Shepperdess.

They use the language of the conquerors to name this plant. They have no name for it in their own language.

To an anthropologist that invariably means that they must have encountered this planet very recently, this is not an old part of their cultural tool kit.

The mysterious thing is that it's not known from anywhere else, so if it's not known from anywhere else and they just contacted it, where did it come from?

People are scratching their heads about this and some pretty exotic theories are being booting around.

One group wants to say "It must come from the basque country of Spain, some basque, sailor, former shaman must have carried this with him to the New World and given it to these Indians"

Well the problem is it can't be found in Spain. It can't be found anywhere. It's a very easily grown plant, it's related to colias, which you probably all know an ornamental plant. You can grow it on a windowsill, you

can grow lots of it in your back yard in Santa Cruz, that kind of climate.

It's a kind of unclaimed place in the psychedelic space, the people who use it in Mexico, it's not their preferred or first hallucinogen. They prefer mushrooms but they take this when the mushrooms are unavailable.

So it's a kind of unclaimed, extraordinary powerful, short-acting, it can be smoked as well as chewed.

I invite your inspection of it.

If you're a professional pharmacologist, you could hang your reputation on this thing. Nobody knows the pharmacognacy, the pharmacodynamics, the nature of the receptor sites.

It's just brand new space, and it shows that late in the psychedelic game there are still enormous surprises. One last point and I'll stop, the chemical family to which this belongs are the diturpines, a chemical family unknown to contain psychoactive drugs of any sort.

This is not an alkaloid, not an opiate, not an amphetamine.

It's a completely different animal, so I just pass that on out of interest on keeping you up to speed.

Q: [???

No we don't do anything with mushrooms, what can be mailed through the mail with relation to mushrooms are spores because spores contain no psilocybin, they contain of course the genetic message for production of unlimited amounts of psilocybin, but no psilocybin.

So until gene-sequences for drugs are made illegal, it's freely saleable and mailable. With one exception, the state of California. A few years ago some crypto-fascist teddy boy, a guy named Ken Maddy wanted to be governor of California and he was locked in a Republican primary fight with a bigger jerk than he was and so he said to his staff "I need some drug legislation with my name on it, what can you come up with?" and they said "I don't know, everything is illegal already. And then they found the spore thing and rammed through the California assembly making a bill making the sale of spores in California illegal.

So you citizens in California have a unique distinction of living in the only state in the union to have made psilocybin spores illegal.

That's that, ok that's enough of that kind of practical stuff, I mention it because we're turning final as old bush-pilots say.

That's when you're committed to landing, you're low and the runway is right ahead of you. So this is your last crack at me, at least on this weekend.

Q: [???

Yeah a light, not hot temperature drying, and it's very stable. This is an interesting thing, you know when I got into psychedelics I was about 14 or 15 years old, even then in the literature, salvia divinorum was carried as a "suspect hallucinogen", but the way people worked back then was they had a chemical test called the "Dragondorf test" where you squeeze some plant juice into a bottle and if its an alkaloid it will turn purple. Salvia divinorum/Alpha salvanorine is not an alkaloid, so it escaped this test, the other thing was people said "There may be something psychoactive there, but it's so unstable that within hours of picking the plant it completely degrades and disappears"

It turns out none of this is true, alpha salvanorine is extremely stable, you can dry the plant, you can smoke the plant, that's the ultimate test of the stability of a drug. If it can go through the pyrolyzation process it's extremely stable. It's almost, I mean this is a little woo-woo, but it's almost as though we didn't recognize this thing until we needed it and now suddenly it's here.

The way drugs are made illegal, normally, is you simply show that they are structurally related to an already illegal compound. This is called the Cogener's Law.

...Reason to schedule it. In order to do that human research will have to be done, somebody will have to give it to human beings under clinical conditions. Well maybe in time all this will happen, but knowing how the government works it will be 3 to 5 years before they ever get off the dime.

In the mean time, this is a wonderful opportunity if you have been holding back out of fear of the legal system, here's a completely fire free zone you can operate in, do research in, therapy in, so forth and so on. It is a very interesting loop-hole.

Q: [???

First of all let me say I don't know, but here's what I think. The model I've always carried in my head is of a target, like a bulls eye.

At the center of the bulls-eye is the DMT high dose experience.

Even though I've spent my whole career raving about how strange it is, I always hit low.

It is beyond description, language fails, your language, my language, everybody's language. As you move out from that, maybe the next circle out is a high dose ayahuasca, followed by high dose psilocybin, or maybe those two are reversed.

Then further out, LSD, and then further out, things like 2-CB, and yet further out things like ecstasy and what's leaving the picture are, first of all, intense 3-dimensional hallucinations, and then intense 2-dimensional hallucinations, and the more exotic transformations of the mental state. I have a feeling that

we're always aiming for this center of the mandala.

Somebody else might have a different model of consciousness, Rolland Fischer had a torroidal model and various states of arousal, but to my mind if you raise the dose of any psychedelic it becomes more and more like DMT.

You have to take over 500 micrograms of LSD for it to be like DMT, but few people these days do that much acid because it brings a lot of physical stuff with it.

Ayahuasca, at moderate doses is the classical hallucinogen of Amazonian shamanism that you've all read about.

But double that dose and it becomes indistinguishable from DMT, same with psilocybin.

If a 5 gram trip is like a classic psilocybin trip, then an 8 gram trip is like a DMT trip.

Now some people are saying of alpha salvanorin that it's much stronger than DMT, it's much more frightening and bizarre.

Just to save my sanity I choose not to believe that, because I've been saying for years that if there's something stronger than that then I don't want to know about it.

Because that definitely pushed me as far as I wanted to go.

My son I think has more experience with all of this than anybody else I know and I said to him "Where would you put it?" and he said "It's *almost* as strong as DMT"

It's sort of like that, but over this set of values and comparisons I just made you have to overlay the fact that like your blue eyes, your height, your body weight, your intelligence and everything else about you that makes you unique, your inherited...allotment of drug synapses is unique.

This is why some people are sensitive to drugs, some people insensitive, some people extremely sensitive and one of the things about exploring consciousness with substances is

You have to sort of learn what works for you.

You may have gotten the idea from hanging out with the wrong people that the way you explore drugs is by doing as many as possible and in as many combinations as possible.

I couldn't do that, I have never done that and I can't do that. My body just can't take it, if I want a more intense drug experience, I take more of one drug.

Part of exploring this area is to learn what works for you. For example, the most dramatic and easy to understand example I can come up with is cannabis, most people, after a preliminary brush with cannabis which may last years tend to decide that it somehow interferes or that they have memory problems or feelings of social paranoia and abandon it.

Some small percentage of people experience no short term memory loss and can't live without it. I speak from first hand knowledge of this condition.

Learning what works for you is very important and then pushing that, push that to it's limit.

What fascinated me, I'll just unload my personal opinion on you, are the tryptamine hallucinogens.

I always found LSD too what I call "abrasively psychoanalytical"

I don't want to endlessly reflect on my childhood upbringing and whether I'm a good or a bad person, I'll do a little bit of that but I think I got that under control. I'm not interested in my self in quite the way that some people are interested in themselves.

What I'm interested in, and what's always been the holy grail for me, are visual hallucinations.

And people have said "You're a nut on this subject"

But the reason I'm so into visual hallucinations is because when I'm seeing something that I could not previously have even imagined then I am completely convinced that I am in the presence of an other.

Because I couldn't think that up, and yet I'm looking at it.

Low doses of psychedelics or moderate doses of psychedelics transform the quality of thought, you think faster, think deeper, think odder, think broader.

But you need more for that to burst through into hallucination. That always has fascinated me, I guess it's

just in my personality. I was thinking some months ago about the books that have really influenced me in my life, and you know we try to make a respectable list that makes us seem profound.

You know, Moby Dick, Finnegans Wake, Whitehead, yeah ok that's the public list.

What are the *real* books? Well "Bartholomew Cubbins" and the 500 Hats, that was a biggie, a really important book for me was a little book that Aldous Huxley wrote almost as a throw away, I'm sure he barely gave it a thought. It's a book called "The Art of Seeing"

Basically the message of this book can be given in one sentence: Pay attention to what your eyes are telling you.

The eyes are it, and it's the visual thing that is so thrilling, so sexy, so infinitely deep.

In that book Huxley tells you how to look at a painting. Basically, clear your mind, open your eyes, stand still, that's very important when viewing paintings, stand still and let it come in.

Then he gave advice, and this is advice which I've seen acted out in both of my children, incredibly simple advice in the world of child-rearing and incredibly important.

And the advice was: Draw from nature, literally with a pencil. Draw things. Because drawing things forces you to look at them, and don't draw from pictures.

If you want to draw a bowl of fruit, get a bowl of fruit.

And then what you look at is you say "Oh I see, when an object is red, it's shadows are not black, it's shadows are deep-pink, and when an object has this curvature, it spreads light around itself like this"

And as you look, this is a very impersonal process. You're not thinking about your childhood traumas or any of that stuff, you're really getting into the world and this is how the world can communicate back to you.

The world is something to look at, and that attitude in the presence of psychedelics will throw open a cornucopia of riches.

Did you want to say something?

Q: [???

Cannabis is in a different category, cannabis with air, with light, with being awake, with being asleep. There was a period in my life when I used to awaken at 3 AM in order to smoke because I couldn't go from 11:30 to 6 without it.

Granted I was in Asia and the rules were different. I don't know what life is like without cannabis, I hear there is such a thing.

No what I mean is I know people who say "Well we had a really far out time Saturday night, we did 120 ml ketamine and followed it with ecstasy a half our later and then we broke out the nitrous and somebody had a little 5-MeO with them" and I say "How was it?"

And they say "far out!" and I don't doubt it for a minute.

I don't want to go any place that I can't find my way back to, because I might want to show somebody and it's sort of like the multi-body problem in mathematics. You can calculate every body in a system if there are only two bodies, but you only have to add a third before it becomes beyond calculation.

Drug synergies are an absolutely unexplored area. You can not go to the medical literature and find any papers on what happens when you combine LSD with 2-CB.

There isn't such a paper on the planet. If you're going to do that, just know that nobody has ever been there before, and I don't mean intellectually I mean physiologically.

I don't know very much about the death of this writer who calls himself D.M. Turner.

He did die, and his book, his best known book is a book that I felt was completely irresponsible because it advocated these multiple synergistic drug doses, stuff like I just said, 2-CB plus ketamine plus nitrous plus e plus this plus that.

That's not how I would do it. I would say single pure substances and if you're satisfied with the experience then as Dr. Leary used to say "When in doubt, double the dose"

But he didn't say "When in doubt, empty the medicine cabinet"

Just double the dose, thank you.

Tim was a pretty reckless and wild act kind of guy, and if he took that position, I don't think we have to be ashamed to line-up behind that.

Q: [???

Ketamine. It has a lot of enthusiasts, the most effective way to do it is by injection.

Automatically this raises flags of alarms for me, I just somewhere picked up the idea that banging things is a bad idea.

But let's move past that, because it can be snorted. Ketamine is what is called a "disassociative anesthetic" it was for veterinary anesthesia like if you had a race-horse you needed to wrap its tendon or work on it in some way, this is the drug of choice.

I can not deny that the experiences I had and I only had 5, were very, very interesting.

I always did it in the presence of a physician and I always did quite, as I understand it, quite high doses. I did around 140 ml.

One of the things about ketamine is it's active over a huge range. Some people that roll it into their lifestyle tend to do small doses, like 40, 50, 60.

When used as an anesthetic in pediatric surgery and stuff like that, 600 ml IV push. That would be like being hit by a freight train moving at 10 times the speed of sound, you would never know what hit you.

For me, I'm just speaking subjectively, it was a sort of empty space. It was a light-filled space, and the metaphor that came to me was "it's like a new skyscraper and they don't have any tenants"

So there are these endless hallways that are lit by fluorescent lights and water coolers every 300 feet, but there's nobody there. I talked to Rupert about this because one of the things we've kicked around over the years is the idea that drugs are like morphogenetic fields.

So for instance when you take psilocybin, it takes you, and in a sense you are participating in every psilocybin trip anybody ever had.

And because it was taken for thousands of years by Mezo-American shamans, it's been decorated by them

in a sense. It has their mark on it.

So the morphogenetic field is extremely stable nothing you can do in there, you may be able to carve your initials on a picnic table or something, but you're not going to be able to make major changes in that landscape.

Suppose you're a drug chemist and suppose you read one of Sasha's papers where he tosses out the thought that one of the O-methylation in the 4 position of the tri-methoxy isomer of the this or that might be hallucinogenic and you make it.

Nobody has ever taken this drug, it's a synthetic drug and you take it and now you're going to take it.

In a sense, if you come down saying 'This was an incredibly beautiful visionary experience' the next person is very likely to have a beautiful visionary experience.

If you come down saying 'it was nightmarish and I felt bugs crawling under my skin' and all this, what's happening is the morphogenetic field is crystallizing around this drug.

The feeling I had with ketamine was 'it's really pretty undefined territory'

The one thing I learned from ketamine, and I actually have to give it credit for this is I got so loaded on that stuff that I lost the concept "loaded" and that's never happened to me before.

I couldn't understand what was happening because I couldn't remember what being high is.

So here I am and I sort of come into awareness and I say "What is this?" and the answer is..."who knows" and the next question is

"Who's asking?" and the answer is "Who knows"

And I just keep looking at it for a while, and suddenly out of left field this "Aha" experience..."I must be stoned!" and then it's like everything crystallizes,

"That's it! I'm a human being, I took a drug, I'm lying on the floor, this is a trip"

And then you say "Oh this is a trip, gotcha, now I know what's happening we're having a trip, ok lets have the trip"

But until I got that sorted it, it was like the biggest "Huh?"

So I would not...I don't prefer it because part of my ethic I guess you would say, is that you should be able to communicate your experience. It's almost like an obligation, its like if you go fishing on our lake, you should give some of the fish to the village. If you go fishing and catch a lot of fish and eat them out in the boat and come back with nothing but bones for the village, then this is kind of bad behavior.

I stay clear of ketamine, I have a bias, it used to be stronger against synthetic substances.

But again, in fairness I have to say these drugs, people have different kinds of experiences.

I've said to people on ketamine "You don't really hallucinate in the way that I want to hallucinate" and people say "No I had fantastic, it was beyond DMT"

So again the individual thing.

Then what's the final thing?

Then just physical things about ketamine. I don't like a drug so strong that the house could burn down around you and you would never bat an eye.

And that could certainly happen on ketamine, you had not a clue. They could remove your head and you would not bat an eye.

The other I noticed about ketamine is it really sticks to your ribs, in other words the experience lasts an hour but the next day you're driving on the freeway and comes a wave where you say "Oh my god, what is this?"

And I think it sequesters in the fatty tissue or something and that makes it a little dicey. I hope I didn't rain on anybody's parade here.

The people that are into it are passionately into it, I accused one guy one time of being a mono-pharmafile (laughter)

I said "My god, you won't take a drink, you won't have a hit, but this stuff...5 times a day"

Q: [???

Well I'm as interested as you are, I don't have any special information. I did talk earlier this weekend about this model of the hyperdimensional object intruding into 3-dimensional space-time and through the miracle of metabolism wrapping matter around itself for a few years.

Then when the hyperdimensional form retracts out of this lower-dimensional matrix, the matter that is organized simply falls apart. I like that model, my DMT trips, as I think I mentioned this too, I've given it to some Tibetan guys and they said "You can't go further than that and return"

What he actually said was "It's the lesser lights" The lesser lights appear at the beginning of the bardo.

The thing about DMT and we didn't talk about it much this weekend, is that it's an inhabited space.

Huge percentage of the people that take it encounter entities of some sort in there. Not entities like "Wombats and foxes"

But entities with intelligence of some sort, with language of some sort.

Well remember I talked about the principle of parsimony, of preferring the simplest explanation first.

Well when you have a drug which conveys you into an inhabited space, even the simplest explanation is going to be pretty baroque.

Some people including myself wanted to leap to the conclusion that "Well these must be the aliens, we've finally found their hive, it isn't under the Atlantic trench, it isn't inside mount Everest. They're hiding inside this organic molecule"

But I think in service of the principle of parsimony, preferring the simplest explanation, these things must be human souls.

It's easier for me to believe in the human soul than it is to believe in a colony of extraterrestrials camped inside an alkaloid.

But it's not that easy for me to believe in human souls. But still, the feelings you have from these things is one of immense affection for humanity.

That wouldn't come from a diplomatic mission from Zenebel ganubi, this intense love.

I dare to hope, having deconditioned myself from my Catholic childhood, and having gone through existentialism and all that.

Now I dare to hope that maybe there is some kind of existence beyond the grave.

One of the funny feelings, there are a number of I guess you would call it “thematic layers” in the DMT experience, but one of the thematic layers is “as weird as this place is that you burst into, if somebody very strange worked very to produce a place where they thought would be reassuring to a human being”

And the analogy, it’s stronger than an analogy, the feeling that comes through is like “this is a maternity ward”

It’s as though you’re being born and these marvelous self-transforming Faberge crystalline 4-d toys that they’re handing out in this space may be to them nothing more than the equivalent of those extruded plastic geometric shapes that we hang on a string over a bassinet.

If you ask a child psychologist “Why do we do this?” they say “It coordinates the child ability to see spatial...so forth and so on”

It’s very like that, you have been born into an alien world, and the only thing you can do is gape, basically gape in utter amazement. Everyone is surrounding you and they’re saying “Welcome, it’s ok, be happy”

Then if it is like a maternity ward then one can know as much about whatever universe that is as one could deduce about this universe from looking at the four walls of a maternity ward in a small hospital in say Selena.

In other words, if you were to actually die rather than smoke DMT then, if we follow this model, then you would be in that place but there would be no going back to this world after 5 minutes and instead there would be the next 5 minutes in that place, followed by the next 5 minutes.

I can tell within hours you would be beyond the reach of anything you have ever called humanness or have thought of.

In other words this isn’t a world where one comes back and whispers in the ears of people and bangs doors in the middle of the night.

It appears like, once out of the body, this incredibly infolded and compacted field called “the soul” begins to unfold into it’s death rite. And quickly one would become incomprehensible into this world, and all that is retained is the affection for us in our limited situation.

Of course thinking along these lines, I've looked at the literature of near-death experience.

What those people are describing is something far more mundane than a DMT trip. Either they are dumbing down the DMT and suppressing the oddness of it or they are having a quite different experience.

Because what's being said in the near-death thing, generally, is a tunnel, and then loving relatives reassuring and familiar peoples.

The DMT thing is a tunnel, but it isn't loving relatives waiting at the end, it's a welcoming committee of professional midwives.

And they help you through. So I would suggest with a great heat, that if we want to study the near death and after-death experience is that you come far closer to dying, whatever that means, on DMT than you do in drownings and things like that.

Q: [???

Yes he said it was the lesser light, he said you can't go further than that. This was not one of these Llama's with a can of Budweiser welded to his good right hand, this was the real mccooy.

Q: [???

Well any situation can be looked at from a point of view that reveals the whole fractal. In other words what its saying is experience is holographic on one level, but linearly sequential on another level.

In a way this is a continuation of the discussion of death. Because if we leave off the historical modeling and turn towards the modeling of an individual life with the time wave, then again there is a message of hope.

It says the most novel and amazing thing is the last thing that will ever happen to you.

I would like to believe that, I would like to believe that we gather our experience, we become wiser, we meet people, life becomes more novel, we have children, they have children, we have success, we have failure.

If you're living right, you're life should get more and more baroque, beautiful, complicated, mysterious, and then you die...and then it really gets interesting.

That's what this all seems to want us to believe, lets put it that way. Then people say, "If the world is fractal, is it not true that the evolution of an individual could be extrapolated to be the evolution of the whole system?"

And that leads to the mildly unsettling possibility that what this great transition we're moving towards is, is not T1 for everybody. But D1 for everybody, in other words: death.

Death is the thing that really stirs us. We don't know what it is, we don't know whether we're supposed to flee from it or race toward it.

People say then "is it possible..." to just take the date 2012 as a marker, "Is it possible that everyone would die?"

I've looked a lot at asteroid impactors because the people who study these things know that this is not an act of God or a miracle, that this happens. It has happened and it will happen, and it happens on different scales, from things like meteor craters in Arizona 50,000 years ago. Everything within 800 miles of that impact died instantly. 50,000 years ago.

But 65 million years ago an object impacted the size of Manhattan in the gulf of Campache and nothing on this planet larger than a chicken walked away from that.

Now if you talk about ecological disaster there's never been one like that in the history of the planet. Thousands, tens of thousands of species died, entire orders of animals were wiped out, the continents were re-arranged.

But guess what, the flowering plants of which we are so dear-fond, and ourselves of which we are even more fond would never have had a chance to insinuate themselves into the evolutionary life of the planet had there not been that clearing out of the reptilian climax.

So then you look at this and say "Well was this the greatest mass-extinction in history? Or was this the greatest evolutionary leap forward for biology in the history of the planet?"

And the answer is: it was both.

Out of enormous death comes and enormous surge in the domain of organic novelty.

I prefer to think that it is not a planetary catastrophe or a mass dying. I'll tell you why and this is a place, now we're working from the notebooks, in other words this is not prepared for public consumption, this is something I meditate on in baths.

I can't help but notice that as novelty increases in time according to this model, that the spatial domain of its focus narrows.

So for instance, in the early phase of the time-wave, the stars are condensing and the galaxies are forming.

We could say that the entire universe is moving toward novelty, but once carbon chemistry appears the cycles of fusion in stars and production of heavy elements and things like this are stabilized. The domain of novelty becomes biology, and a billion and a half years biology evolves and adumbrates its forms and moves from the prokaryotes to the eukaryotes to the multi-cellular, the conquest of the land begins.

But then, with the emergence of language using and tool using higher primates, in a sense, novelty leaves the domain of organic life. And organic life becomes meta-stable and evolution and mutation happens, but where the action has moved to is in to the epigenetic domain entirely defined on this planet by human activity.

So the human beings are the carriers of novelty, and that has gone on until about, oh pick a number but basically 3,000 to 2,500 years ago.

And then the novelty seems to concentrate itself into southern Europe. The Greeks take some kind of step that no other people have ever taken.

Even today if you go around the world and visit tribal people and ask to see their art, they show you, if you ask to see depictions of human beings they show you symbolic depictions of human beings, that's what an African mask is, that's what a Sepic river carving is. These are symbols of human beings.

The Greek mind crossed an invisible boundary and somebody said "Lets take a block of marble or some clay, and lets not symbolize a human being, lets make a perfect topological simulacrum of a human being. A face that looks like a face, flesh that looks like flesh."

It was as though the Greek consciousness rose to the surface and left the unconscious behind, and the eyes were open, and no longer saw through symbolic filters, and instead "Nature, in and of itself, this is the foundation for science and art as we know it"

So the novelty then was largely in the hands, largely, I'm rushing here the exceptions are obvious, were in

the hands of what we call the Greco-Roman mind. And so it has been for thousands of years.

Well then, pick a number, 100 years or so ago, it further contracted the novelty, it further contracted itself into the high-tech industrial democracy.

And now it has further retracted, one of the problems we're having in our society, there's a bifurcation going on in society. Part of us are going with the new novel technologies that knit us together that make us dimensionless, telepathic creatures through the internet.

And some people are digging in their heels and saying "No, no, no, beyond newspapers I can't go"

So those people are being left behind, they are practicing old style culture in an equilibrium state.

So now it is isn't even all of the high-tech populations of the industrial democracies.

As we get closer to 2012, if this process proceeds, then the source of novelty will constrict even further. I guess it may eventually come down to one or two people, or a group of people and maybe those people will make a machine, and then the machine will be the source of the novelty and all of us will be put out to the Pasteur of equilibrium, and maintain the rest of the world as it was...

But the novelty would have focused some kind of incredibly intense point.

So looking at it from that model, it's hard to see how it could be an asteroid impact or something like that because that would affect all biology, all geology, it would completely violate this long-standing tendency of the novelty to concentrate itself.

Well now the Buddhists have an interesting perspective that may have something to do with this.

There are many schools of Buddhism and I don't want to get into that, but there are schools which hold the following doctrine: That if a single person could attain enlightenment, then all sentient beings in the cosmos would attain enlightenment instantly.

In other words, that only one person, or one being has to break through the boundary for the entire state system to collapse and re-arrange itself.

So I suspect, and I was on the edge of this last night, here's a model by which this could happen that keeps things as sane as you can keep them for this kind of discussion.

Remember I talked about...(what works?)

It's December 21st, 2012. And through the world-wide VRML hook-up of the internet, everybody with an IQ above 10 has gathered in the great collective space to witness the first attempt to send the human being through time.

At the world-studies institute at La Chorrera in the Amazon the president of so-and-so makes a speech, the lady time traveler makes a speech, he straps on her helmet, she steps into the machine. The fanfare for the common man is played, a button is pushed, and off she goes into the future.

What has always been put against the time travel scheme is what has been called the grandfather paradox. This is easy to understand, it goes like this: If time travel were possible I could travel back in time and kill my grandfather.

If I did that I wouldn't exist so I couldn't do it, therefore there's a closed loop of paradox, therefore time travel is impossible.

I put this to the mushroom, and it said "well, time travel is possible, but you can only travel as far back in time as the moment of the invention of the first time machine"

You can't travel further back in time than that because there were no time machines before that. So it's a kind of barrier.

So then I thought...here was my model of what would happen when the lady temponaut sails off into the future.

Lets forget about here and ask the question "What happens next in our world?"

My first guess was, what happens next is thousands and thousands of time machines arrive from all points in the future.

They have come back in time to witness the first time machine take off, it was as though you had a piper-cub that you could fly off to Kittyhawk North Carolina, that windy morning in late December when the brothers Wright rolled her out of her bicycle shop and fired her up.

Then I said, but wait a minute, we haven't dealt with the grandfather paradox. One of these time machines from the distant future on its way to the first time flight could stop off and kill the grandfather of the driver of that first time machine, and we haven't gotten anywhere at all.

So then, I produced a slightly more complicated model but it works so here's what it is.

It's that because the future is not what we think it is, here's a metaphor which makes it more clear.

In this world that we're living in right now we have people such as Bill Gates and his research and development teams.

And we have people such as the upriver people in the Amazon that I spent time with, bare-assed people living at a very minimal cultural level.

Gates and his people and this Amazon tribe occupy the same planet and the same moment in history. But who is influencing who? Very few people in the world are taking up the Amazonian lifestyle or point of view. Millions and millions of people are going Gates direction and more and more will.

So what I concluded from that is advanced states of culture tend to squeeze out or mitigate less advanced states of culture.

Now let's return to the time-flight. What happens when the lady at temponaut goes into the future. Is not the time-machine arrived from all over the future, what happens is the entire rest of the history of the universe happens instantly.

In other words, a future, evolutionary developments, conquests of the galaxy, vast technologies that allow star-flight and worm-hole traps and all that. The fruits of all that are delivered instantly to our doorstep in 2012. I call it the God-Whistle model.

In other words, we end the whole thing. We collapse the state vector and everything goes into a state of novelty. What happens then I think is the universe becomes entirely made of light.

This is a sort of the cherry on the cake. You know there is something in physics called the principle of parody.

This is that particles can appear out of nothingness, as long as they appear in pairs, such that after a certain period of time the two pairs, the members of the pair encounter and annihilate each other. When this happens, physicists say "parody is conserved"

It's known in quantum physics that there is a phenomenon called vacuum fluctuation, vacuum fluctuation is a situation where in absolutely empty space, suddenly out of the quantum subspace particles jump into existence. They follow trajectories, they encounter each other, they annihilate each other, parody is

conserved and so it's ok.

So then you talk to these quantum physicists, and you say "Well how large can one of these vacuum fluctuations be?"

They say "they last milliseconds or nanoseconds" and then you say "Is there a theoretical upper limit on the size of the vacuum fluctuation dictated by theory?" and they say, no, no no, it's simply that the longer the fluctuation lasts, the rarer it is.

So in other words, the longer a fluctuation lasts, the less likely you are to encounter one. Then you say "Is it possible that this entire universe is such a vacuum fluctuation?"

And then you say "Well yes but that would be very rare to have such a long one!" Hell you only need one!

Calculating the probability of a univariate event is a fool's game.

It's either 100% sure or 0 sure.

So here is a model and I took this from the Swedish physicists Hanz Altven who hasn't gotten enough credit who was really a free-thinker.

Imagine that the universe is this kind of vacuum fluctuation, a 17-billion year long vacuum fluctuation.

What it means then is at the big bang, not one universe was born, but two. They sailed off into the superspaces and have no connectivity with each other, or they have Bell's non-local connectivity or something.

Anyways, they are distinctly separate. They are unbeknown to each other on a collision course with each other. Parody must be conserved eventually.

A model like this holds open the possibility of the instantaneous transformation of the entire cosmos because the collision of these two universes would not occur in 3-dimensional space, it would occur in a higher dimensional space.

So this cosmological model holds out the possibility that all matter in the universe could be instantaneously cancelled in this encounter with the anti-matter twin that was born at the beginning of the cosmos.

Ok if you're still following we're almost to (pater?) Every particle known to physics posses an anti-particle

which is locked into this parity conserving thing I've laid out for you with one exception, one astonishing and amazing exception: the photon has no anti-particle. There is no anti-photon.

This universe that is on a collision course with itself in hyper-space, at the moment of the conservation of parity, all matter vanishes and what is left is a universe made entirely of light.

We have no model, or I have no model, for a universe made of light. There would be no gravity because gravity is a property of matter.

Such a universe could be modeled and then the question is "what would happen to forms? You're body, my body, this planet?"

The answer is: no one can know. But it is very interesting that the esoteric tradition of nearly every tradition talk about light a great deal. Talk about ascent to the light, cultivation of the light.

After death vehicle as a thing made of light. I just put this out here because it occurred to me, my imagination in an effort to make the assumptions novelty theory congruent with the known laws of physics I discovered, this sounds like wild-hair stuff, but no violation of the known laws of physics is involved in this scenario.

Perhaps what enlightenment is, is what happens to a universe when it drops it's matter and anti-matter out of it's structure and it becomes entirely made of light.

That would certainly fulfill the novelty theory, anyways that's enough of that malarkey.

Q: [???

It was autopsy for a mathematical hallucination. I am proud to say that I named that paper, I mean Watkins said "I want to publish this objection to your thing" and what should he call it. I was in a fairly bitter and shaken mood so I said "How about autopsy for a mathematical hallucination"

Do you want to know the state of all that?

I was shaken by Watkins objection, but I'm in the strange position of having a theory that when the going gets really tough I can't understand my critics. Einstein had this problem too, when he published a general theory of relativity I think Herman Bonday launched a frontal attack on him. Heisenberg said to Einstein "What are you going to do about Bonday?"

He said I don't know what to do, I can't understand the man. That's my position with Watkins he's

definitely got a bee in his bonnet.

I intuitively feel he has missed something important.

Really I've had discussions with a guy out of the Santa Fe institute who's credentials are at least as good as Watkins and he said "You should rest easy", what happened to Watkins is he thought he was attacking my idea, what he was actually attacking was the implementation of my idea and the software. His critique is true but it misses me and strikes the software implementation.

Once you dump the software code and go back to the original method of constructing the wave, according to this fellow in New Mexico because we'll publish all this on the web in the next few months.

Watkins is wrong.

I intuitively felt very strongly that Watkins was wrong, he had a very powerful intellectual engine that he was running my way, but he never really understood what I was saying. So it was a perfect example of a communication failure.

Q: [???

Well that's where to attack.

He said "You made a move where there is no rationale for this move. I say "There is a rationale and I can demonstrate it. Right underneath 'Autopsy for a mathematical hallucination is a button called 'Watkins objection answer'"

That's my best shot and it's fully illustrated and I felt after I wrote it that I shot him out of the water. He emailed me back and said "You totally missed the point, you didn't even crease my haircut"

We're not talking about the same thing, and at first that was very frustrating to me. I think he's right, we're not talking about the same thing, and I think that certainly blunts the force of his effort to sink the ship"

I'm grateful to Watkins because he did do something which other workers on the timewave were never able to do.

You see the way Peter Meyer worked was I gave him a table of 384 numbers out of which he produced the time-wave. But a huge amount of work is necessary to produce those 384 numbers.

Meyer never checked my procedures. Watkins looked at my procedures and he wrote equations such that now we don't start with a table of 384 numbers. Now we start with the 64 hexagrams of the I-Ching and we go all the way to the timewave.

So he made the entire thing mathematically explicit. What he didn't understand was the way in which the

thing is structurally configured.

This fellow at the Santa Fe institute is going to do that. What we'll come out with is a completely formalized wave.

From a mathematicians point of view there will be no unanswered questions "Why did you do this? Or is this an ad-hocus assumption?" so forth

So as an intellectual assumption it will be clarified and this is how science works.

You're friends will always tell you you're a fine fellow, but it's what your enemies say that pushes you to redefine, re-create, clarify, and if necessary discard and start over.

There's no disgrace in that at all, that's, that's intellectual honesty.

Q: [???

You see the way the novelty theory is structured is you have this wave and it is iterated on different scales, and if you have a given level lets call it A.

Above A is a larger level that is A times 64. Below is a smaller level that is 1/64th of A

And anywhere you are in the hierarchy this is true, levels above 64 times larger, levels below 1/64th times smaller

Modern astrophysicists are arguing about it right now, but the universe is under 20 billion years old. Everybody agrees on that, and the question is, is it 9, 12, 13, 14? But it's under 20.

The time-wave has a cycle, the largest cycle I have found necessary except for the prime number research is a 72 billion year cycle.

So lets call that the top cycle, the A-level, a 72 billion year cycle, plenty of time for the universe to evolve to its present state.

Below that level is a cycle 1/64th that size. What would that be? Roughly 1.2 billion years.

At the initiation of that cycle, I don't know some dramatic thing happens in biology. Below it is another cycle. If the B level is 1.2 billion years, then the next level is 1/64th of that, I think it's roughly 275 million years.

The next cycle, divide it by 64, whatever it is, 750,000 years. Eventually you get to a cycle that's 4,306 years in duration, that's essentially the cycle of late history.

I mean certainly there was history before 4,000 years but the continuous march of global civilization over the last 4,000 years.

The next cycle down is only 67 years long, and I mentioned it last night.

From 1945 to 2012, each cycle begins with a bang, literally. Below the 67 year cycle there is a 384 day cycle, and that will run from late 2011, somewhere in November 2011 to the end of 2012.

And I call that the "Year of the Jackpot"

It's a 13 month year but the entire history of the universe will be reprised in that 384 day period.

Well then comes a 6 day cycle. By this time, I will have either gently bowed out or the entire world will be aware of what is happening because the novelty will be so intense. Imagine a 6 day cycle when the entire previous 67 year, 4,306 year, na-na-na-na-na-na to the top level are all being compressed and replayed in 6 days. Well then Comes the hour and 35 minute cycle. Then comes the minute and a half cycle. Then comes the 1.3 second cycle.

Now at that point, 1.3 seconds, if we assume that the cycle's can not be iterated beyond the level of Planck's constant, which is 6.55×10^{-23} seconds, the way for you to think of that is as a "giffy". It's the grain of the universe, we don't feel the need to discuss lengths of time shorter than that, because there aren't lengths of time shorter than that.

Time comes in those packets of that size.

Well if you're at 1.3 second cycle, you still have 13 cycles to go through before you reach the realm of Planck's constant, and you have come through 13 cycles.

So the universe is only half-done 1.3 seconds before it's end.

That's why asking what will happen in 2012 is preposterous, the mind fails. Half of the universes evolutionary unfolding will occur in the last few milliseconds of it's existence because of the asymptotic of the acceleration of the expression of novelty.

So it's this thing that begin very gently, very stately you know. The march of the atom, the condensation of the stars and the galaxy, the emergence of biology, the emergence of higher animals and the origins of mankind and just into a *screeeeching* photo finish where all this stuff is just bundled together, connected,

transformed, lifted into higher dimensions.

You see this is not a process that we can not take responsibility for, or discuss our guilt or innocence. This is The Cosmos itself tearing loose from it's previous constraints and moving ever faster towards ever greater freedom with ever more appetite and momentum until it achieves it's goal which is infinite novelty throughout all space and time. Holographic connectedness, Godmindedness, whatever your vocabulary is. Yeah

Q: [???

Oh yeah this is a completely legitimate move, it's mind boggling to think of this in human scales of time, that half of the universe is becoming a curd in a few milliseconds, but dig the fact that is the position of orthodox physics as we sit here.

It's simply that they say it happened at the beginning, I say it will happen in the end.

What they are saying in physics now is that the big bang occurred and then a few nano-seconds after the big bang there was this thing called the "inflationary expansion phase"

It lasted a few nanoseconds, and in those few nanoseconds the universe became 10's or orders of magnitudes larger than it was, so it's a legitimate move in physics however counter-intuitive it may seem on the human scale.

Q: [???

The problem with the many-worlds theory is that it violates the principle of parsimony, in other words that is not the simplest explanation.

Do you all know what this is? It's the idea that whenever a process in the universe encounters a bifurcation point, that it goes both ways. In other words, the multiplication of possibilities in a situation like that is staggering and I just don't feel the need for it.

If I understood Weilers mathematics better, I might, but that theory has been around since the middle 70's and he has a very respected position at Princeton, but he doesn't seem to be able to sway his colleges.

Which doesn't mean he's wrong, but it's a bit baroque for my tastes.

Q: [???

Well once beyond the zero point, but definition novelty must mean the simultaneous realization of bifurcations of all sorts. In other words what ultimate novelty must mean is anything we say it means.

There are no limitations when novelty soars to infinite.

The universe is a series of impediments to the expression of novelty, and when it has overcome all those impediments there is a flawless, higher dimensional matrix throughout all being I guess that's how you put it.

Q: [???

No that's another can of strings, and that's a different thing and more exotic. There's a lot of this stuff going around.

I am by no means the strangest cat on the block. Sky Allen Goof, have any of you looked at his website? This is a guy being paid a salary by MIT for God's sake and his thing is all about making universes, and he says "We can make universes and put them on the shelf"

"I made this one in February, botched that one in March" and talks about how the ultimate proof of the direction in which modern physics is moving is to make a universe.

After all, if they begin from an area smaller than the diameter of the hydrogen atom, a major laboratory could just stamp them out like hotcakes.

But of course the question is "What are they good for?" What do you do with a universe once you've made one?

But as an exercise in the imagination I take a look at what this guy is into.

Q: [???

We process sound and light separately simply because the way our senses have evolved is to accentuate those things in different ways. One of the things that happens on Ayahuasca is that many people can see sound. You see sound, this may be an ability closer to the surface than we realize.

One of the puzzling things in the Mayan codices is flowery speech, which is nobles are portrayed with stuff coming out of their mouths and hanging around their heads. We're familiar with this from the cartoon-thought-balloon which we do not speak and form clouds of words hanging in little round bubbles around our heads.

This does seem that this is an area where McLuhan had a lot to say, the forms of media that a society accepts, whether it's a manuscript culture, a TV culture, a print culture, or something else affect sensory input processing in ways that people rarely suspect.

So for a temple in a manuscript culture when people talk to each other McLuhan thought they saw pictures in their heads. When we talk to each other I think most of us hear a stream of speech.

It's possible to imagine a culture where when people talk each other, they actually seem streams of print.

Under the influence of psychedelics I've seen all these things.

I've had hallucinations of pages where as I looked at it, every 5th letter turned into an alien letter and then every 4th and then every 3rd and I watched the text transform itself from English into Zenebel-Ganubian, and then back into English and so forth and so on.

The ways in which we process information are myriad, and then every culture, it's sort of like drugs. Every culture out of the vast smorgasbord of drugs chooses one or two to culturally investigate in the same way

Out of these many neurological pathways of processing information a culture will accentuate and de-emphasize others and once these other ways are de-emphasized, it's only a matter of a generation before they're denied at all, or defined as pathology.

Q: [???

I don't think you have to hypothesize forms of light, I think ordinary light is magical enough to carry the groceries on it's own.

This is a model I made where I said "The universe might turn into light without the presence of matter"

In following that through in my mind I ask myself the question "What would the world be like if I were light?" If I were light. You mentioned light that travels faster than light.

What would it be like to be a photon?

The answer is: there is no time for a photon. A photon can cross the universe in zero-time. Subjectively, from the point of view of the photon it takes zero time to cross the universe because it moves at the speed of light, it doesn't move at 99% the speed of light, in that case it would take a fair chunk of forever to cross the universe.

But if you can actually move at the true speed of light, there is no time.

So if we were suddenly to be made of light we would look around us and the universe would be aging at an enormous speed all around us and there would be no distance because to wish to be somewhere would

cause one to be there.

So I think light is not bound by any of the limitations which bind matter, there are some hard questions when you talk about turning into light, in other words how is light complicated enough to support a nervous system? How could a nervous system be made of light only?

That's very hard to imagine because it's very hard to imagine, but that doesn't mean it isn't possible.

I think the intuitions of mystics are very good, it's when they turn their intuitions into methods that it becomes dubious.

In some sense, I think light holds the answer because light exists...it's almost like it's a higher-dimensional particle. The fact that it is not in-time in the way that all other physical and material organization is, it's a clue of hyper-dimensionality.

This is a kind of black-hole.

It's not an ordinary black hole you would see it coming. It's a black hole of novelty. There may be more than one kind of black hole in the universe, the ordinary black hole of physics is a gravitational-well.

What I'm suggesting is that there's a novelty well, a gravitational well, physicists are pretty confident in saying that if you're sucked into a gravitational well no structure can survive. Only spin, charge, and angular momentum are conserved when a particle is sucked into a black hole. Suppose there was the reverse of a black hole, that's sort of what I'm suggesting.

Not a hole where when you're sucked in that you lose all structure, but a hole that when you're sucked in you become everything. That's equally reasonable, you know quantum physicists have said that the particles thrown out of a black hole tend to be disorganized but in principle they could be grand pianos or ice-cream cones.

It wouldn't violate the laws of physics, it's just highly improbably given enough time these things would come to be. It's like the Edington printing press.

You know the black hole was hypothesized out of Einstein's work, but people thought it was a kind of an artifact, a joke, that there couldn't actually be such a thing.

Now we understand that probably every galaxy has a black hole. The reason black holes are somewhat unsettling is because science, the thing science hates more are what are called singularities.

Singularities are places where science doesn't work.

You just have to throw up your hands and say “Well it’s a singularity”

And until black-holes were taken seriously, physics only tolerated one singularity, it was the beginning of the universe.

It said you know, before time 0, that’s a singularity, don’t ask us any questions about it. Science could somehow accept the that there’s this one little place where it couldn’t shine it’s flashlight, but once you get the idea that there is a black hole, probably black-holes at the center of every galaxy, there are billions of galaxies.

If there are billions of black holes, that’s a lot of singularities, what kind of science are you doing if you tolerate billions of singularities? You’re not doing science at all.

You’re just playing at science and steering around these things, and then when Stephen Hawking got off on this tier about mini-black holes and said...

(Question/commentary)

Well yes when I first started...it must be the end of a large cycle, but having being exposed to Hinduism I knew that there are cycles, and cycles, and cycles. But in fact the way that this thing declines into novelty, in the way that I’ve showed you on the screen is what physicist, or what dynamicists call a “damped oscillation” and a damped-oscillation eventually actually just dies away, it finishes.

We are approaching a damped oscillation of our own in order to make the room-crew happy and clear the deck for the next group of seminarian.

Let me just try to sum this up, not certainly to sum up the ideas, but the ideas are not really that important. They may be true, they may be untrue, they may reside in a domain where those rules don’t apply.

The feeling that I hope you take away from all this is that...

Note: I paid for the full transcript from scribd, since it's a seven hour lecture there is a lot of text and their formatting is different to the above section one and part of 2 that other transcribed. Not sure if we should make the formatting like the majority of the scribd text, or like the formatting in the original.

Bruce Damer: If you want to render this asteroid that you convert into basic elements and engulf into structure, you would dispatch a kind of lichen that uses solar energy. The code is the light. It occupies that space and it starts to manufacture, to absorb the asteroid, and then it produces pollen which goes out, and it's networked pollen. Then it's in the Oort cloud, as Freeman Dyson says, and then life is off the earth and it's a very different kind of life. It's certainly not sentient life, but it's very effective. Some of the spores get stuck into themselves, basically. Of course they'll need atoms — at least as far as we know — to actually have a matrix of life, very ordered atoms. In the long view we're the ladder that life is trying to climb. Along the way we'll get great terraformers and we'll make lots of living space inside the earth.

Terence McKenna: You don't sound like you're of the school that thinks that we're close to some kind of AI and that when it goes over the threshold, within a matter of hours it will just inflate into some kind of thing that we can't even relate to and will be of no interest to.

BD: No, I think, of course, that it's hard to define intelligence and consciousness. I think that people underestimate the trial-and-error, the error-proneness of living processes.

TM: But on the other hand, the iteration speed of this machine life is so fast.

BD: There's a difference: the ecosystems that they're living in are extremely arid. They're basically life living in these very narrow tubes connected by very chancy processes.

TM: You mean the wires...

BD: The wires and the servers, if that's how it stays. Whereas an ocean is a billion trillion parallel processes, and black smokers and superplumes going up and carrying hydrons. It's a massively different ecosystem where you can have a lot of things happening at once in the same beast, a lot of reactions that happen at the same time, and I think that the error rate is always the crippling factor. Why, for instance, didn't we invent, of all the science fiction, something that eats all silicon, or that comes down into the earth and eats all carbon-based life and we're all gone — I think it doesn't happen because general-purpose things are really ill-suited for survival and when you're specific-purpose you're prone to lots of errors. So I don't think there are going to be planet-eaters any time soon.

TM: I don't think it was the planet-eater scenario so much as the idea that once something became sentient it would immediately design something beyond itself and you would get a cascade of self-perfecting machine intelligences that would go over the horizon before you knew what was going on.

BD: I think — and this is the theme of the next Biota conference: symbiogenesis — that every life form contains the code of the previous ones, like the cell absorption of mitochondria, that things are built that way. For instance, that human life as an organism is a bolus of biological organisms surrounded by metabiological forms called culture, and that in fact there isn't a way to regenerate a Frankenstein that's separate from all that. It's always going to contain the errors and the powers of the previous organism. Now, of course, if we generate code-based lichens, they would be so simple that they would be like a slime mold and won't achieve consciousness. They would achieve the ability to survive on the Oort cloud surface and evolve through error and process over tens of thousands of years. But they may evolve to be giant, coral-like slime molds and simply consume resources, because that's what life seems to do when it enters a new ecosystem.

TM: But doesn't it also tend to modify the ecosystem to make it easier on itself? At 1000MHz for 10,000 years, you don't really know what you're going to come back and find.

BD: I agree. I think that what will happen around 2040-2050 is that the transmissions between the organisms, between the biomes, will suddenly not be interpreted. For the first few years they'll be spreading across objects, even an asteroid with bits and pieces of dust this big is enough for it to colonize, as long as it's got certain ingredients and it's facing the sun. So you'll be able to track and understand it and then suddenly you'll be messaging and you'll get something you can't understand, and there's no way for anyone to interpret what communications it will have. They'll understand fundamental operating- system calls, the organism will be making a kind of housekeeping, but there will be a metalanguage that evolves.

TM: It'll be contextualized for the organism.

BD: It'll be like bird calls. That will be the moment when we have first contact. In two weeks there's a conference called Contact 16, Jim Funaro's conference, it's anthropologists and space scientists and science fiction writers that meet every year and talk about this kind of stuff, and this is what I'm going to talk about.

TM: There's a lot of study going on of the genetics that control bird song and how it localizes and what's actually going on, and it begins to look like there's a pretty seamless process right straight through to complex language that's just a mutation of this signal-generating impulse.

BD: I think language will tell us the date, and then we'll have something, not necessarily sentient, but something that is no longer anything we can understand. And it will be from that point on an attempt to contact this mass, this bolus, that will be in a ring around the solar system, and it will be tracked. It will become the second Terran ecosystem. They'll do work to support us. They'll render down comets and feed mass drivers and so on. But like any good farmer with his seeds and his crops, there'll be a lot of unpredictability.

TM: These nano-colonizations of Oort cloud material, that originally is established for mineral recovery?

BD: Probably, and for fuel construction.

TM: Why the outer solar system and not the asteroid belt?

BD: There's not enough elements, or variety of elements. I think the Jovian system is going to be where the action is.

TM: So many interesting satellites and so much incredible electrodynamics and magnetodynamics in that system.

BD: If you want to do anything to Mars you have to drop a whole lot of water onto it.

TM: But they're obsessed with Mars for some reason.

BD: It's kind of a mistake. But NASA again, I think if you picked any planet that is reachable in reasonable budgets and spacecraft sizes, it's Mars. Venus is kind of a lost cause.

TM: No reason to go there.

BD: They mapped it with radar and it wasn't very good. Mercury is too strange and small. It's basically a moon. It has an atmosphere that forms in twenty seconds when the sun comes up, the atmosphere's four inches high and it freezes on the other side, and it's a four hour day.

TM: But it is tidally locked to the sun, so you do have this interzone.

BD: The sun is half the size of the sky. But Mars has got enough stuff, it's got volcanoes and extinct oceans, icecaps. And the next one out is Jupiter.

TM: And Europa.

BD: They're going to drop Galileo into the Ionian atmosphere in August. It's a really crippled spaceflight. Galileo is an example of an early bio-instance, it's a model. I remember seeing Galileo being packaged to be launched on the shuttle, and this was the shuttle after Challenger, so it never shipped out. So, I went to see the Galileo spacecraft being crated up. It had a high-gain antenna which was this great big mesh thing in this tiny satellite dish that was all folded up, and when they did launch a few years later, it never opened.

TM: So instead of huge bitstream and bandwidth and all kinds of power, they had to work with...

BD: A low-gain antenna, the size of a pizza pie. When the Challenger shuttle blew up, NASA was no longer permitted to carry liquid fuel upper stages in the cargo bay, which was considered too dangerous. They had to carry solid fuel. It's safer but it packs very little punch, it doesn't generate much thrust, about a third. So they had to design a new way to get to Jupiter where they go around Venus twice and steal some of the angular momentum of Venus by slingshotting around it and coming back again and getting faster and stealing from the planets. Then they passed the earth twice, and on the way into the sun the high-gain antenna, which was still wrapped up, got heated and flexed and shrunk, because it was never designed to go into the inner solar system — it was supposed to go straight out on the express — and when they tried to

open up on the second time it came out like this. [gestures]

TM: It was a screw-up.

BD: It was a huge screw-up, and so the mission planner said, “It’s two billion dollars down the tube, there’ll be congressional hearings and we scrap it or we figure something out.” So on the way to Jupiter they changed Galileo’s brain to think differently, process differently, see differently and hear differently. By the time it got to Jupiter with this tiny little pizza pie dish — it had a reentry vehicle, this saucer-like pod, to be dropped into the Jovian atmosphere; they’d never build another one in their lifetime, so to lose that. . . and they got to the Jovian system, and by that time it had learned to see in this “jailbar” method — it would take strips out of the sky and the ground controllers would say, “Look, there’s more rings, now take smaller scripts and compress them as much as you can and send them to us.” So they couldn’t change the hardware but they could change the software. Galileo was sort of a very early 20th century metaphor of the visual biome moving out, being transmitted massless into a receiver.

TM: It was smarter when it got there and smarter when it left.

BD: Yes, and it’s been in orbit for 2.5 years now.

TM: But they had to stream these pictures back — instead of in real time, it takes months for the data to come back.

BD: Yes, at 8 bits a minute or something. But they’ve done fantastic science with it. They dropped the probe, they ran the recorder and the probe went down into the Jovian atmosphere down to Levy-9 and, like that, it collapsed because of the pressure, it was on chutes; and now they’re going to do a close approach, it’s only four times higher than the highest volcanic plume above Io — Io has sulphur volcanoes — and they’re going to graze the top of the volcanic plume and it may not survive. They’re going to try to do as much they can, and it may just burn up and destroy it; but it’s all being recorded and that comes back, bit by bit. The Jovian system is like its own solar system, and Galileo has been in orbit for 3-4 years, just sweeping by different moons.

TM: What you really need up there is several tons of state-of-the-art imaging equipment and all kinds of fancy steering engines. What an interesting system. This mission to Saturn is pretty epic.

BD: Cassini is the last big heavy mission, six tons of spacecraft.

TM: So, it’s going to drop a probe into the atmosphere of Titan that will land on the surface.

BD: Titan is the only moon with an atmosphere.

TM: There may be methane hydrocarbon oceans.

BD: With outsized tar blocks and the greatest surfing in the solar system, 600 foot waves.

TM: It’s like Solaris, Titan, it’s a really strange world.

BD: And yet our moon is way out of proportion, it's way too big. That's why they think now that our moon appeared because of a massive collision. There's no way the earth could have captured something the size of the moon, so it had to have been a very bad hair day.

TM: A Mars-sized object crashed into the earth and it separated and went into orbit.

BD: The Biota group goes back through time, to fossil sites. We went to see the Cambrian fossils at the Burgess Shale and then we saw the human fossils in Cambridge, England. On the next trip we're going to go back 3.5 billion years ago, to western Australia, where you have the oldest evidence of life that's certain — the stromatolites. The stromatolites are these towers that were the smokestack polluters in the pre-Cambrian, they're colonial forms of microbial mats that have blue-green algae in the top. If you went back to the earth then, you'd have to wear a spacesuit because there was no oxygen. These things lived around all the continental margins and they'd pump oxygen out into the atmosphere, which was very poisonous, a very toxic substance. In Shark Bay at Hamelin Pool, if you lie down at night next to the last remaining living stromatolite column, you get high on the oxygen, there's so much.

TM: There's a living column?

BD: Yes. It's hard as rock. What happens is that the top is this mushy layer with up to three billion individuals per square meter, it's colonial, it would be the only thing you could have seen with your own eyes that was obviously alive for two billion years, and underneath there's chemosynthetic stuff. Basically the stromatolites sucked iron oxide and calcium out of the atmosphere and built these towers below it. Ocean levels would rise and fall with the tides and these towers supported the top of the pond, and they're hard as rock. In fact, half the iron ore in the world is stromatolites. Life made the continents.

TM: So, the earliest life on earth built the American railroads.

BD: That's right, it was a biological process.

TM: The accretion of iron.

BD: And not oxidized iron. So what happened was that the stromatolites pumped and pumped, and then at one point 2.5 billion years ago, this sudden fantastic thing happened: the Oxygen Holocaust. The oxygen levels just flew into the stratosphere. Earth has been through many mass extinctions, but this was a really horrific one. Any single-celled organism that could not handle incoming high densities of O₂, which is very poisonous, it basically ripped these cells apart. So there was this mass extinction, and there were a few cells which could absorb the oxygen called mitochondria, and they basically turned it into an energy factory.

TM: One in trillions of cells; but all present life is traced back to the survivors of that challenge.

BD: When you go jogging and suddenly your body runs out of oxygen, the cells in your muscles switch back to the old system of metabolizing chemosynthetically. You get lactic acid and it makes you sore because you're going back to the ancient system before mitochondria could get energy quick, but at a price. So stromatolites — there's this tiny pond they found that's very saline, and they're there and they're 3.5 billion years old.

TM: And they're just fine, thank you!

BD: Stromatolites go back to 3.5 billion years, and the earliest evidence of life is 3.86 billion years, so they're very close. The meteorite impacts stopped at about 3.9 billion years. So life actually popped up pretty quickly after the cometary inflow ceased and you didn't have the surface of the earth getting all molten every once in a while. But we're going to thank the stromatolites for giving us oxygen and apologize for the fact that we're putting all this CO2 back.

TM: But plants like CO2.

BD: Earth of two billion years ago was really weird. Chances are the oceans were brown, because the continents had no plants that could hold the land, so the outwash was eight times higher or more. There were huge river systems pouring off the continents. The Himalayas and the Rockies are mountains that will never appear again, because there's never going to be that kind of deposition again. They're unique, they're creations of life, they're full of life. They're finding more and more that life and water are the reason why we have plate tectonics in the first place and why we have mountain ranges.

TM: Why do life and water drive plate tectonics?

BD: There's several interlocking factors. One is that water lubricates and allows this kind of continuous movement. Water also absorbed a lot of the crap that came through volcanism early in the earth's history and created a cleaner atmosphere, which in turn supported the rain, which in turn supported all the outwash. Life sealed the continents in this hypersea of roots coming into the ocean and sealed all that land in, so the outflow of the erosion wouldn't be at all what it used to be; so the future generations of mountains will be quite different. Now, in the past ten years, they've discovered these black smokers, in the mid-'80s, huge jets of water full of sulphates pouring out of the bottom of the ocean, and there's tons of life in and around it, eating chemicals and not needing sunlight. Bacterias and tube worms and crabs...

TM: Tube worms up to six feet long.

BD: Yes, they're eating the pollution. They were always wondering, if life evolved around one black smoker, they don't last long. How did they get all across the planet? All the black smokers have about the same lifespan. They found these things that are called superplumes, which are underwater Mount Saint Helens'. You get this block of hot water, which is the same as a pyroclastic ash explosion that comes out at 12-15 miles across, boluses of very hot water, 7

and they come blowing off as a mushroom cloud at the bottom of the ocean and then they get caught by waves and currents that carry them hundreds and thousands of miles, and they're full of microbes that have been carried in this express bus system and they're raining back down on other plumes. This super-plume system may have been the engine that transported life around constantly. Underwater volcanism is our roots. If we ever get to Mars we'll see the great granddaddy of all solar system volcanoes, Olympus Mons at 80,000 feet. The top sticks out of the atmosphere, so the atmosphere at the caldera is different.

TM: I didn't realize that... the Hawaiian shield volcanoes are the closest thing to it on the Earth.

BD: The volume encompassed by Mauna Loa, you could fit all the Sierra Nevada inside it. In effect, it's the single largest structure on the planet, and it was created by one process.

TM: It's the world's largest mountain by volume, and if you measure it from its sea bed floor, it's the world's tallest mountain. It's 13,000 feet above the sea; that's 16,000 feet that it rises from the ocean bed.

BD: There's a fair analysis of why there's a hot spot under here, it's that there's some sort of a constructive harmonic that's going on that's actually breaking up the crust, and there may be one on the other side. They've looked.

TM: At the exact antipodes of Hawaii?

[...]

BD: It's kind of a semi-conscious push, the drive that human beings have had to build and to make things and make life and create. We're creating, tool-making things. Perhaps they don't know why, but they'll make the next phase.

Well, it's a pleasure to be here. I want to thank Evolution Records for, once again, making an event like this possible. It's always a pleasure to return to England. Let me see if I can get my act here and make an event of it.

What I thought I would talk about tonight, since I figure we did our homework during my last visit, is how the psychedelic experience which we have as individuals relates to the global future that we can feel the world being swept toward and how this relates to our planetary paths. I think we can make some sense out of the human condition if we're willing to look at psychedelic plants not as simply tools for individual spiritual transformation, but actually as tools and forces which transformed us as a species in the distant past, and I'll just give it to you very briefly.

As you may or may not know, all primates -- and we certainly are primates -- have what are called 'male dominance hierarchies'. This means that the longest-fanged, meanest s.o.b. in a monkey tribe takes control of the group resources, the females, the weaker males, and this character runs the show, and this is pretty much how we do it today. But my belief, based on 25 years of working with and taking psychedelic plants and substances, has led me to -- well, certainly to the brink of hubris -- to make an adjustment to evolutionary theory and suggest that these psychedelic substances are not private, peripheral, ancillary, cultish, esoteric, meaningless, self-indulgent, narcissistic, or obscure; they are in fact central to understanding how what we call 'human-ness' actually came to be in the first place. I really believe that the reason we have language and notions like community, altruism, loyalty, brotherhood, hope -- the reason we have these qualities, which are the qualities that we embrace as most human and most ennobling to us, is because for a period of roughly a hundred thousand years we self-medicated ourselves and suppressed the poisonous presence of the calcareous tumour of ego. Ego is the psychological structure which is propelling us to hell in a handbasket. The problems which beset the modern world and which continue to go unaddressed and unresolved can all be traced to ego, to our inability to emotionally connect with the consequences of what we are doing to ourselves, to each other, to the world. Our newspapers are filled with data on dissolving ozone holes, planktonic life in the ocean is endangered, toxic wastes are accumulating -- you all know the litany. But in trying to trace it to a root problem, I see it as ego -- the inability of the individual to get with the programme of group values. And I believe that we have this problem because we have fallen into an historical and cultural style that suppresses, denies and ignores the powerful potential of psychedelic plants to transform personalities, to erase boundaries, and to fuse people

into a single thinking organism. This is what the nomadic tribalism of the past was all about.

Well, how is this done, or how can this be? If you've had a psychedelic experience, you know that each one is incredibly unique, addressed to the individual, and seemingly as private a matter as one could possibly conceive. But when, as a clinician or a person in my position, you have an opportunity to listen to accounts of dozens, hundreds, of psychedelic experiences, you begin to see the general outline of what these things are doing. And my analysis of it is they dissolve boundaries, they erase differences, they introduce you to the notion that reality is, in the wonderful phrase of Gregory Bateson, 'A seamless web', that we are not atomic entities forever imprisoned in our own private Idahos, we are in fact part of some kind of field. It's almost as though what the psychedelics are attempting to do for sociology and psychology is what was achieved by quantum physics from matter in the 1920s and '30s. Matter, during that period, was re-analyzed and found to be not tiny hard billiard ball-like particles whizzing through space carrying spin and electric charge, but that there was another level, a lower layer, and that other level, that other description, revealed an interactive wave system where individual points of concrescence are merely statistical rather than real, everything dissolves into a kind of soup of multi-leveled, multi-dimensional connectedness, and this is what the psychedelic experience is. I believe that one way of thinking about life is -- biology I mean -- is that it is a chemical strategy for amplifying quantum mechanical indeterminism to such a degree that freedom, true freedom, shimmers into existence at the macrophysical level -- the level that we, as thinking, suffering, striving, dreaming organisms, actually occupy, and that the amplification of quantum mechanical indeterminacy that allows for freedom then allows evolutionary processes to reflect the forces which are impinging upon them.

Now, orthodox science hands you a universe that is characterized by a forward-flowing casuistry where every event is somehow dependent in its existential completeness upon the moment which came immediately before it. And I believe that we can extract, as it were, from the psychedelic experience and return with an entirely different notion of time, space and causality. Probably most of you are familiar from your mathematics classes in school with the idea that they teach you in trigonometry that all possible ellipses can be obtained by sectioning a cone and we can build up a picture of a cone by examining thousands and thousands of elliptical sections of that cone and then reasoning backward to the higher-dimensional object which that cone represents. Well, I believe that every psychedelic journey is a sectioning of a higher-dimensional object of some sort, and that we ourselves, in our individual lives, also represent a sectioning of this higher-dimensional object.

So, then, the intellectual quest, the spiritual quest, becomes one of empowering the felt presence of experience, both psychedelic experience and the normal day-to-day experience of living, and noticing that that is the primary stuff of which reality is made. Reality is not made of quarks and mu-mesons and z-particles. Reality is made of language. Whatever we think reality is, it is an entirely private matter until we describe it -- either linguistically, mathematically, through painting, through dance, through innuendo -- whatever it is, reality then undergoes the formality of actually occurring when it is languaged, and what I've noticed about these psychedelics is that they are catalysts for language. They are, as it were, an enzyme operating in the human body politic propelling us to what's called 'stretch the envelope', stretch the design perimeters of the human experience.

Now, I don't think that many people actually realize how literally I take and intend what I'm saying. I encountered the language issue on psychedelics about 22 years ago when one evening a friend of mine stopped by and he had a little vial of an orange substance and he said 'would you like to try something

new?' And I had done my LSD graduate work some few months before, and I only asked him one question, I said 'How long does it last?' And he said 'It lasts about 10 minutes', and I said, 'Well, bring it on then my friend!' This was dimethyltryptamine, DMT, and I smoked it and I saw -- I had a feeling of slight anesthesia in my body -- I saw a swirling, floral mandala form behind my closed eyelids, and as I moved toward this mandala, I realised I was going to penetrate beyond it, and I burst through into a kind of other dimensional superspace, and my... I had expected a kind of instant psychoanalysis or perhaps swirling colors or moving geometric plains of light, perhaps a dancing canary or a little candies doing two-steps in a row -- this is what's called hypnagogia in the medical literature, and it is essentially trivial hallucination. Instead, what happened was there was an encounter with what can only be described as an elf hive, a colony of self-transforming, hyperdimensional machine creatures that came bounding forward with joyful squeaks to dribble themselves like self-transforming jeweled basketballs on the floor in front of me, and I was dumbstruck with amazement. Occasionally people ask me 'Is DMT dangerous?', and I think the honest answer is 'only if you fear death by astonishment'. Well, I was astonished, -- I mean, I was an intellectual of the Hegel/Camus crowd when I went through that violet scintillating doorway, and I came out a true believer. Because these creatures in this place are filled with a kind of zany, affectionate, reckless humour and a desire to communicate with human beings, or at least with me in that moment. And what they were doing and how they were communicating was by generating, through their songs, objects, so that what I was surrounded by was a crowd of diminutive, self-transforming blobs of intentionalised ectoplasmic material, and they were producing out of their bodies objects which looked like Faberge eggs or exquisitely-tooled machines made of ivory, glass, and gemstone that were themselves undergoing some kind of transformation, emitting musical sounds, condensing liquid metal out of the air and causing it to rain down on us. Well, my reaction to this was to go into a kind of shock of amazement and, you know, it raises fairly profound questions, like number one, 'Surely I must be dead, surely no-one can have this experience and return intact'. I mean, because, you see, it exceeds imagining, it is beyond your imagining -- even when you're looking at it, you attempt to pour the salutary waters of description over these transdimensional objects and it runs, language runs off them like water off a duck's back. And the emotional content of this kind of encounter is tremendously intense.

These things are attempting to communicate a new dispensation of the Logos. They are holding out the possibility that language need not be processed by the ears, that language can become, under certain radical situations of neurological perturbation, visible, that literally the word condenses into visible space, and they were urging me to do this. They were urging me to experiment with my voice and I discovered years later, taking Ayahuasca in the Amazon jungles, tribes of Indians that have actually mastered this art, and that saturate their bodies with DMT and harmaline, and then sing. But for them this singing is not a musical exercise, it's a pictorial exercise. They see what they intend. This is a kind of telepathy.

Well, it's humbling, it's transformative, it's astonishing to realize that shamans all over the world for time uncountable have been accessing this appalling, complex, ontologically challenging, scientifically impossible, reality. This means that culturally we are living out some kind of schizophrenic delusion, because we live our lives totally ignorant of these possibilities, or perhaps only glimpsing them at the edge of anesthesia, or something like that, unless, of course, we have the courage to be counter-cultural heads. But even then many people confine themselves in the private world of their own reflection because social pressure and, indeed, social legislation make it very touchy to talk about these things. But I say to you, this is part of the human birthright. This is as much a part of the game as birth, sex and dying.

Now, it may well be that there are kiliachasms(?) of time and that each individual is reincarnated time

after time after time, but I prefer to suppose not, and to entertain the idea that this life represents an enormous and improbable opportunity that is to be used for something, and the something that it is to be used for is to go out to the edge and explore. You know, you can stay within the conjured circle of scientific rationalism and ho-hum, mundane, secular, yuppiehood, but the method that worked for me was to adore, pursue and obsess on the bizarre, the peculiar, the outre. Somewhere there's an alchemical text which says 'The highest mountains, the widest deserts, the oldest books, there you will find the stone', and what I would like to suggest to you is that of all the methods, tools, points of view, ideologies, and so forth that you will meet when you begin your catalogue of the edge material, the psychedelic dimension is the ne plus ultra of that dimension. Most spiritual seeking is done with the accelerator pressed to the floor. Once you encounter psychedelics you have found the answer. Now the name of the game changes. No longer the ever-eager ingenue hanging on the guru's latest iron whim. Now you have to face the answer. It's not a matter of blithely seeking, it's a matter of screwing your courage to the sticking point, because the tool has been placed into your hand that will work, that will deliver the goods. You know, people tend to complain there's no adventure left in the world, the world is devoid of challenge. I say to you 'five grams in silent darkness in the confine of your own apartment on a rainy Sunday evening and you'll feel that Ferdinand Magellan should take a back seat'.

We tend, you see, to always imagine the challenge rests with someone else. We have been made spectators to life by a disempowering view of ourselves carried to us by science and mass media. You know, you're supposed to identify with Madonna or Elvis or somebody, but the richness -- the inner richness -- of one's own being, because it cannot be bought and sold, is deemed worthless by the culture. We actually live in a de-humanising culture and, as you know, the consequences of a couple of thousand years of this kind of alienation are that now we face the potential death of the planet. We have invented a sin for which there isn't even a word in English that I am aware of, it's the sin of stealing the future from your own children.

How, then, faced with a mounting panoply of facts, studies and statements that point to imminent collapse of our ecosystem, our atmosphere and our social support system, how can we change our minds? If hortatory preaching could do it, then the Sermon on the Mount would have been the turning point. If horrifying displays of military stupidity could have done it, then Hiroshima would have been the turning point. We have to pharmacologically intervene. This is not a test. This is not a game. We do not have 500 years, we do not have a hundred years, we must awaken, and jolly quick, or evolution and planetary dynamics will write "finis" to our fragile effort to build a transcendent vehicle that would move us away from, you know, the mute present of the animal mind and into the realm of spirit, poetry, art, love and transcendence. The only thing that I am aware of that can work quickly enough to make this change are psychedelic substances. They are the only things I've ever seen turn somebody a hundred per cent around in the space of about five hours. On a global scale, this is the kind of remedy that we are seeking. Well, why then can we simply not apply it? The answer is that our problem arises out of our pathological commitment to ego, and ego is what is put at risk by psychedelic compounds.

I believe Tim Leary once said -- although he denies it, but it's so brilliant it's worth repeating -- that LSD is a substance which occasionally causes psychotic behaviour in people who have not taken it. This is the problem we're dealing with. These psychedelic substances cause hysterical psychoses in people who have not taken them, and how then do you talk them down out of their tree and attempt to convince them that this is all well and good? Well, it isn't easy. It isn't going to come from the upper echelons of the establishment, this revolution in thinking, it's going to come from youth, it's going to come from people who stand outside the system and can see its contradictions. Well, is it simply a political evolution,

revolution, a desire for more freedom, less entanglement with bureaucracy and restriction of civil rights? I don't think so. I think that when we analyze carefully the content of the psychedelic experience we have to leave our previous models behind.

The psychedelic experience is far more than instant psychotherapy or instant regression to infantile traumatic situations, far more than simply a kind of super-aphrodisiac, far more than simply an aid in formulating ideas or coming up with artistic concepts. What the psychedelic experience really is, is opening the doorway into a lost continent of the human mind, a continent that we have almost lost all connection to, and the nature of this lost world of the human mind is that it is a Gaian entelechy. It turns out, if we can trust the evidence of the psychedelic experience, that we are not the only intelligent life forms on this planet, that we share this planet with some kind of conscious mind -- call it Gaia, call it Zeta Reticulians who came here a million years ago, call it God Almighty, it doesn't matter what you call it, the fact of the matter is that the claims of religion that there is some kind of higher power can be experientially verified through psychedelics. Now this is not, in Milton's wonderful phrase 'The God who hung the stars like lamps in heaven' -- it doesn't have to do with that, in my opinion -- it isn't cosmic in scale, it's planetary in scale. There is some kind of disincarnate intelligence. It's in the water, it's in the ground, it's in the vegetation, it's in the atmosphere we breath, and our unhappiness, our discomfort, arises from the fact that we have fallen into history and history is a state of benighted ignorance concerning the real facts of how the world works. You see, minded human beings existed for a hundred thousand years before what we call history. I believe that in the Saharan plains of Africa, through the use of psilocybin mushrooms -- at first unconsciously and then with conscious intent -- boundaries were erased. The previous several million years of primate hierarchy and male dominance were chemically medicated out of existence and men and women lived in relationships of respect and balance with each other, with their children, with the earth, with other human groups, and that this is the memory of paradise that accounts for our deep nostalgia for the past. It isn't a psychological mirage, it's real, there was a great mystery and it was lost, and we are the impoverished children who have inherited this situation of loss and abandonment, because you see the very forces which created the mushroom paradise in the grasslands of Africa, that same force which was the climatological drying out of the African continent and much of the rest of the planet, eventually turned those grasslands to desert and at that point, under nutritional pressure and with mushrooms a fading memory, agriculture was invented, paternity -- male paternity -- was discovered. And once male paternity is discovered there is tremendous anxiety on the part of males to control the behaviour of females and, as you know, this is not easy, and so consequently social discord arises. You see, what happened was for perhaps as long as two hundred thousand years, the presence of psilocybin in the diet and the environment suppressed ego and so a human relationship to the earth and to other people was possible, and during that time religion, altruism, sense of community, loyalty, all these things I mentioned, came to be. When the mushroom faded, those suppressed atavistic animal behaviours returned, men became territorial, women became property, children became chattel, and the unifying mushroom celebrations and the great lunar orgiastic ceremonies that accompanied the worship of the Goddess -- that all was suppressed and we marched off into history, a nightmare journey, that carries us to today.

And so you see, I see this whole business of the twentieth century as having the psychedelic experience as its centrepiece, as a cultural icon, but surrounding that are all the other impulses to the archaic that surround us now. It begins as far back as impressionism, which deconstructs the realistic image of the romantics, and then you get Freud's discovery of the unconscious, he points out that we are not victorian ladies and gentlemen but dark thoughts split behind our eyelids, that we are obsessed with sexuality, with fecal matter -- you know the list. Following Freud comes Jung, who carries it a step further, introduces the

notion of a race mind, racial consciousness, archetypes. Working in a slightly different area, people like Picasso journey to Africa and return to Paris with the masks of tribal peoples which then begin to feed into the theories of analytical and synthetic cubism. Simultaneously, the quantum physicists are announcing that the orderly billiard ball world of the Hamiltonian atom has to be replaced with wave mechanical functions of excruciating complexity, then you get, you know, in short order, I don't know, abstract expressionism, rock and roll, the outbreak of communal lifestyles of the 1960s -- you see, I think all of these cultural phenomena can be placed under the umbrella of what I call 'an archaic revival'. This is what house music is, this is what the psychedelic rebirth is, this is what the new cyber-tribalism is, and at the centre of this the sparkplug, the necessary element, the sine qua non, if you will, is the psychedelic experience, because it's not an ideology, it's not something that you get from Baba if you clean up around the ashram for a few years, it doesn't come to you from some beady-eyed roshi, rishi, geshe, or guru. It's a direct relationship between you and the plant, between you and nature, and when you open yourself up to this you discover that this is the secret that was lost and how they keep the lid on this I really haven't the faintest idea. This is the biggest news around. I mean, if flying saucers were to land on the front lawn of Buckingham Palace tomorrow, it would be less interesting than your next DMT trip -- to you -- because the DMT trip happens to you. The other, the Guardian or the Economist conveys it to us, and I suppose most of us imagine this is how the news of transformation will arrive. I don't think so. It's not going to come over the tele, it's going to come up from the toes, out of the earth, through your groin, into your heart and up to your brain. This is where the empowerment comes from, and until we begin to decondition ourselves from the images that we are obtaining from the dominator culture we will always be its creatures and it keeps us in a state of infantile delusion. I mean, we are not playing with a full deck unless we integrate into our psychology the presence of the psychedelic experience. Is it terrifying? You bet it's terrifying. Will it change your life forever? You bet, you'll never be the same. The analogy I like to make is to sexuality because the idea of someone going from birth to the grave without ever having a psychedelic experience is to me a notion that makes me as edgy as the idea of someone going from the birth to the grave without ever having a sexual experience. It means you never really rolled up your sleeves and played in the game. You were a spectator, you were a silent witness, you slid through, and you then did not empower yourself to act to reclaim the historical process, because the reclamation of the historical process comes through a commitment to a return to the atavistic through the direct transformation of experience, you see. This is not an ideology, there is no dogma, there are no rules, this is not a menu of moral prescription, this is something that happens between you and this transcendental reality.

Now, I believe that what shamans, including modern cyber-shamans, see when they ascend to the psychedelic heights is actually the viewpoint that we would have if we could penetrate into another dimension -- and I use the word in the mathematically formal sense. You know, Plato said 'Time is the moving image of eternity'. Well, I believe that what the shaman sees is the End, and that this gives the shaman a tremendous self-confidence, a tremendous existential validity, so that he or she can then return and take their place among the rest of us and be a source of inspiration, of a transcendent exemplar.

Well, what is the nature of this End which is seen? Well, mmm, this is where we part company with orthodoxy, if you think we hadn't already -- I think we have entirely misunderstood the character of time. We are not being pushed by the force of causal necessity, we, we human beings, are reacting to the siren song of the transcendental object at the end of time. We are on a collision course with an event for which there is hardly language. We are on a collision course with a temporal vortex of some sort. It has become a cliché of modern parlance and journalism that time is speeding up, that history is moving faster and faster. I take this perception very seriously, because I actually take all perception very seriously. I would always

prefer a direct perception than a theoretical construct, and so I would like to suggest to you that what is happening on this planet is that time is being speeded up in our species, we are under the influence of a kind of strange attractor which is moving us through the temporal medium at an ever-faster accelerating rate. This is a law of the universe, though not one recognised by science. (Hopefully, I will change that sad state of affairs.) Because you can see that the early universe immediately after the hypothesised 'Big Bang', was an incredibly simple place. There were no organisms, there were no molecules, there were not even atoms, there was only a pure plasma of electrons and as the universe cooled, levels of complexity crystallised out successively, each one building on the previous level of complexity, so eventually the temperature in the universe dropped low enough that electrons could settle into stable orbits around atomic nuclei. Well, in that case, then you get atomic physics. Those atoms condensed into stars and eventually the temperature and pressure in the centre of those stars was sufficient to trigger fusion and heavier elements, like iron and sulphur and carbon, are then cooked out of these stars. Well, then once you have carbon, with its four-valent quality, you have the possibility of molecular complexity, an entirely new domain of complexification. Well, not to belabour the point, but quickly out of molecules come highly complex polymers, out of highly complex polymers come early replicating molecules, from them prokaryotes (the earliest living cells, non-nucleated), then the nucleated cells, the eukaryotes, then clusters of colonies, colonies of cells, the earliest organisms, then more complex organisms, eventually higher animals. Out of them, binocular, bipedal primates with an opposable thumb. Out of them, language-using, mushrooms-using, orgiastic humans. Out of them, history, cities, warfare, hierarchies, writing, mathematics, music, and in the twentieth century this all knits together into some kind of global organism. Now, the horror of science is that it denies the importance of this phenomenon...

... this phenomenon at all. For science, the most important phenomenon in the universe is the move toward heat-death and entropy. They barely notice that life represents an amazing and persistent exception to the rule that all thermal dynamic systems run down, life has achieved the miracle of a stability far from entropy through the miracle of metabolism.

Well, notice that in this little scenario I sketched out where complexity emerges out of simpler states, that each ascent to the next order occurs more quickly than the process before it so that we are in a kind of tightening spiral, one of William Butler Yates's gyres, we are wrapping ourselves around a cosmic endpoint of some sort, and this is what I call the transcendental object at the end of time. It beckons across the dimensions, it throws an enormous shadow over the enterprise of human history. This is what drives the guru to make his statement, this is what kindles the messiah to his mission, this is what inspires the painter and the dreamer and the musician, it's that there is this enormous source of affection and concern for humanity that is calling us toward it, across the planes of lower-dimensional time and space. And the miracle is that through perturbing our neurochemistry in ways which shamans have always done, we can turn to the last page, as it were, and we can see then that all this process was actually toward a good cause. We are moving toward the most profound event a planetary ecology can encounter. We are about to witness the freeing of life from the chrysalis of matter. This is what our privilege and our destiny is, is to be the final generation of people with one foot in the material realm of the battered primate and one foot on the ladder to godhood.

And I asked the mushroom once about the social chaos at the end of history, and the mushroom said 'No worry, bro. This is what it's like when a species departs for hyperspace.' There's a little shimmy in the landing zone as we take off. So the metaphor that I have created to try and calm people and to make it possible for us to go into this future with dignity and hope -- which I think is the only appropriate response

-- is the metaphor of birth. If you had never heard, if no one had ever informed you, of the facts of life, and you were suddenly to come around the corner and encounter a woman in the act of giving birth, this situation vibrates medical emergency -- blood is being shed, clearly there's a great deal of physical pain and agony, pleading, a sense of helplessness, it looks as though an enormous tumour is metastasizing out of someone's body. It would be a real leap of faith and understanding to be able to contemplate that for the first time and to know or to guess that this is how nature does it, this is how we move to the next higher level, this is what is happening to us. Matter and the human body is the placenta of the soul and it is certainly true that the earth is the cradle of the human race, but no infant remains in the cradle forever. Again, to harp back to the birth metaphor, if it's time for birth to occur and it doesn't occur, then you do have medical emergency, what's called toxemia sets in, dangerous to the mother, fatal to the foetus, the two must be medically parted jolly quick or there will be permanent repercussions. This is why we must aid this birth process, because it is painful, life is sculpted out of death and the feeling that we as a species have in this moment is the feeling that the foetus has, I think, as it moves into the narrowest neck of the birth canal. Gone forever are the endless amniotic oceans of peace and tranquillity when we could rape and pillage and burn and explore to our heart's content because the earth seemed infinite in extent. Now, we have the same feeling that the foetus has as it starts down the birth canal -- we can't breath, there's no oxygen, we can't get food, we appear to be ... the walls are moving in to crush us.

What we have to understand is that this is the narrow neck that we have been trained for, this is our destiny, nine times in the last two million years the ice has moved southward from the poles, miles deep. Your ancestors, my ancestors, were there, they didn't drop the ball, and they didn't have antibiotics and advanced medical technology to see them through. Think of how much suffering and how much nobility and how much love has gone in to getting you to this moment. You represent an unbroken chain of responsible, intelligent, coherent people and it ends in us, and so then Tolstoy's question 'What is to be done?'

What is to be done? What we have to do is swallow hard, in a similar way that the Russians had to swallow hard, and admit we did it wrong, we did it wrong, and now the only way out is back, we must return to the archaic world of shamanism, mutual respect among men and women, a sense of seamless cohesion with the living world. If this is not done, then the experiment fails. Blake talks about falling from the golden spire into eternal death. This is a real possibility. This is the realm of existential decision, and it's not about confronting the government with massive force or publishing hortatory tracts or any of that, it's about doing larger doses more frequently and discussing it with one's friends. Perhaps this will develop into a much larger movement than it is, I'm not really interested in that, I'm interested in deepening the experience of the core peerage and that's the people who are here tonight -- none of us are loaded enough, at least I haven't met anybody who is and I certainly am not -- we must live the faith that we are trying to promulgate because it is done, as every shaman knows, by example, and therefore I would like to suggest to you, since we look pretty much like everybody else or a slice of everybody else wandering around in London today, that you look around at the people in this room, this is your peer group, you know, we are not of the same class, of the same colour, we have not originated from a particular line, but we are an affinity group and in the same way that every affinity group, every coherent social entity has had to claim its place in the sun, we have to claim our place in the sun. They're not handing out freedom to anybody, they're not handing out social respect to anybody -- ask black people, ask gay people -- the only way you get respect in this respect in this society is you take it, and I think this is the cusp upon which the psychedelic community now teeters. We were here before in the '60s and when they came with machine guns we just melted into the woodwork, nobody was ready for that, so now there must be a new strategy by

stealth, by worming from within, we're not dropping out here, we're infiltrating and taking over because it's our world and our children's world and we're not going to see it run over the edge by a bunch of constipated gentlemen -- that's not the plan.

Well, I think I've run over here a bit, not too much, but I just want to reiterate to you because it puzzles me and it's the compass of my existence. This is not shut and jive, this is not another Swami or Baba or anything like that, those of you who doubt me I'd like to point out to you that DMT only lasts 10 minutes and I think it would be obligatory on anyone who thought they were going to carry out a critique of this position to just get that experience under their belt and once that is done rather than carry on a critique, I think most people will join up, because this is incontrovertible evidence, incontrovertible evidence of the presence of the transcendental in our lives. That's what I was seeking, never dreaming that I would find it. By the time I was on the threshold of it, I didn't believe in it, you know, I had accepted all that marxist crap and all that existential stuff and the reductionism of science and the rules of evidence and all this stuff they hurl at you, that's all malarkey. The thought I would like to leave you with tonight, which you can verify for yourself in the confines of your own flat later, is the world is not only stranger than you suppose, it is stranger than we can suppose, and I tell you that gives a lot of permission for supposing.

[question from audience -- inaudible] Well, we're going to have a question and answer session here -- I hope you're first off the mark because that's what I'd like to talk about. The format for this evening is we're going to have about a 20 minute intermission so you can stretch your legs and exercise your consumer rights over at the book table, and we'll be hearing a couple of rave cuts that my voice has been slyly integrated into. First of all, these are -- this is an exclusive premier, by the way, these records will not be released until later this year -- re-evolution by the Shaman and tribal drifts version of Shaman I Am. So let's take a....Question and Answer Time Q: [inaudible] TM: The question is 'What do I think psychedelics have...' Q: No, no, what do you think happens to us after physical death? TM: Yes, well, my answer would have to be based on psychedelic experience. I described in my talk this encounter with these self-transforming...self-transforming machine elves. And, you know, if you take this kind of experience seriously to the point where you actually feel an obligation to produce a rational explanation, then it would seem to me that in spite of its radical nature, the most conservative explanation that you could come up with as to the nature of these entities is that since they are intelligent, since they seek to communicate with human beings, perhaps they are human beings. And then the only kind of human being they could be is a dead human being and, you know, even I found that a bit of an intellectual stretch to imagine that what the push toward scientific rationalism was going to eventually lead to was an erasing of the distinctions between the living and the dead. But when you go to shamans and expose them to DMT and then say, 'So what about it?', they say 'Well, these are the ancestors. Didn't we tell you that we do our stuff by ancestor magic?' And then you have to say 'Well, then, aha, now I'm getting the picture'. An ancestor is a dead person, but you know in the DMT state, these things don't... it isn't Aunt Mini and Uncle Ned, these are far removed from any association to us and our world. You know, when Patrick converted the pagan Irish, he invented the doctrine of purgatory that had previously not been church dogma and he invented the notion of purgatory to convince the pagan Irish that their belief in fairyland in a nearby dimension inhabited by diminutive dead soles could be assimilated to Christian dogma, and this worked so successfully that then it was accepted as general church dogma and very successfully used to convert Slavic people as well.

So I think ... you know that line by W. B. Yates about 'Once out of nature I would be a thing of gold and gold enameling'? It's as though the transcendental object at the end of time which the shaman encounters, and the individual apocalypse of the human soul at death are mirror images of one another -- as above so

below. That's why I'm always amused that people resist the idea of the end of the world, when you can be damn sure that their world is going to end, because some day they're going to slip beneath the sod, so we find the end of the world incredible and improbable as a notion, but it's actually guaranteed for every one of us. As far as, you know, any tried and true data on the after death state, I really couldn't say. My style is more to model and then to hope to improve models later. I did turn on a very high Tibetan Lama to DMT once, and he said after settling back on his heels 'It's the lesser lights'. What it meant for him was that it was a kind of near-death experience. He said 'You can't go further than that without the thread of return being broken'. So, you know, I think DMT is an excellent tool for studying death. I think there is very little reason to rule out the possibility that something survives physical death because nature is so economical, and with such variety of form, can memory and the perfection of the individual personality be all for naught? I'm not sure, I don't know, certainly it's an interesting question. I think, you know, a deeper definition of what a psychedelic life is, is that it's a life lived in constant preparation for death, the big trip, you know, you want to learn the way. This is what the shamans say, they say, you know, 'We're living people, who can go to and from the after world and this empowers us in a very special way'. Now, I need another question, but I can't see anybody.

Q: Do you still believe ??? in 2012?

TM: Do I still believe in the apex of novelty in the year 2012? Well, for those who aren't familiar with my work, when I talked tonight about the spiral of involution and the way in which each advancement into novelty happens more rapidly, I was not just whistling Dixie. I have a mathematic formulism which I chose not to bore you with tonight -- and you should be thankful I assure you -- which leads me to the conclusion that rather than a Big Bang at the beginning, 10, 12, 19 billion years ago, a more pleasing cosmology would be what I call 'the Big Surprise'. And the Big Surprise comes not emerging out of a pure vacuum for no reason, but the big surprise emerges out of the integration of complexity into one final holographic spin-down of all dimensions into a single point. I crib from your own Alfred North Whitehead informing these ideas, because Whitehead had this idea of what he called 'conrescence' and he said, you know, that the universe had an appertition for novelty, an appetite for novelty that moved toward a nexus of conrescence, and I believe that, yes, we are so close to the transcendental object at the end of time that really it is going to occur probably in late 2012. The reasons for being so specific are too complex to go into now, but I'll just give you a short of throw-away explanation which is that's the end date of the Mayan calendar. That's not why I chose it, but I later, after choosing this date, discovered it was the end date of Mayan calendar. Well, the only thing I have in common with the Maya, they took mushrooms and I take mushrooms, so it's almost as though, you know, this is the bar code stamped on the psilocybin paraphoniae, when you get it all pieced together, no matter where in time and space you are, there's this vector pointing at the early years of the 21st century as the place where we, where it becomes explicit that we are in a process of exponential transformation.

I mean, to me it's explicit already. I mean, I cannot deal with a city like London or Manhattan without saying, you know, measured against the background of organic nature, this represents some fantastic mutational phenomenon. I mean whether it's good, whether it's bad, who knows, but it certainly is peculiar and it certainly is happening very very quickly. That's why I think that it's a bunch bum(?) to think that you're suspended in a universe which will endure into some unimaginable future. As I mentioned a moment ago, each one of us is going to die, rather soon, so why not assume that whatever that transformation is it will be general, and then prepare to meet it as a collectivity, not the death of the rationalist and the reductionists where we return to worms, but, you know, the death of Blake and of

Revelations and of the Tao Te Ching and the Tibetan Book of the Dead -- the death that is victory, the transcendence of matter. That's what death is, and what we need now for the good of the planet and for ourselves is to somehow find a doorway into the imagination, that's where the future lies. Our powers have grown too great to be unleashed on the surface of a fragile planet.

Q: ??

TM: Oh, dear, you know cannabis.

Q: ??

TM: Well let me answer that. The question is that I urged higher doses and greater frequency, and the question is: do I really think that endlessly revisiting these places has something to be said for it. Is that a fair re-phrase of it? Yeah. Well, I don't find these places readily rationally apprehensible. I go back and look again and again and I'm astonished every time, but I'm willing to entertain the possibility that I may be a bit slow. The thing about it is that it exceeds intellectual grasp, you know, you finally come against something where you say 'This is not an unsolved problem, this is a mystery, it will not yield to closure'. And one of the things I'm fascinated by is I think that the way we need to live -- or that's maybe too strong -- the way we need to mentally balance our karmic accounts is to not seek closure, to Understand -- for heaven's sake, I mean you're a talking monkey, where is it writ large that you should be able to model the cosmos in all its complexity and glory? Better than having an anxiety about the absence of a complete explanation, we need to live in the open-ended, risky but exhilarating domain of openness and just, you know, live your life under the shadow of the great 'who knows', because the tales that were told are fairy tales. Science is a fairy tale, you know, economics is a fairy tale, political theory a fairy tale -- nobody has the faintest idea what's going on. We are not in command of the situation at all. That, in one way, is empowering, because it means, in the words of the dourest philosopher, Ripo Yang(?) 'Worry is preposterous'. So all I would say to address your question operationally is, if raising the dose isn't making it more interesting for you, then, you know, maybe you should found a side branch of the church, because to me it's an ocean, you know, and my mind is a thimble and I go to the ocean and it's crashing in. I'm actually like an ant with a thimble, attempting to fill that thimble from incoming surf -- risky business, what? -- and each time I take away a little bit, but the richness of it, as I said, I think it exceeds the grasp of apprehension. Somebody else -- or did you, did you had a two-part question.

Q: [inaudible]

TM: The question is: do I really think this stuff poses... god, what a question to ask. It's like if I wasn't dangerous before, I will be after I answer this question. The question is: do I really think this stuff has a political efficacy, or is it just some kind of elitist masturbatory artschool trip that isn't taking us anywhere? Yes, I absolutely believe that the issue is a maintenance of social boundaries and that this is done through conditioning and propaganda, not rationally contrived because it's been going on too long, it's just how we are. We are conditioned to submit to powerful male figures, we are conditioned to value the material world over the inner world, we are conditioned to chase money, all of these things, and these.. you see, if you don't take psychedelics -- or at least in my case, there may be other ways to reach this -- but in my case, if I didn't take psychedelics I would believe that culture is truth. Culture is not truth. Culture is other people's trash, you know, the detritus of thousands of years of mistakes, that's what culture is, and I think [applause]... So, as to why I'm allowed to walk around and advocate this stuff, well, first of all have you

noticed I use big words? That stamps me as an intellectual, the most pitiful creature in the human zoo and never to be feared by any power or establishment anywhere. No, I think basically the powers that be and the structures that are in place are like a dinosaur.

Q: ??

TM: Pardon me?

Q: ??

TM: Do I feel that they're going to carry on regardless? No, because you see, what's happening is that the contradictions in their system are reaching epidemic proportions. The people who run, I don't know, the Bank of England, the IMF, the UN Security Council, whoever, they have studies sitting on their desks which tell me that business as usual has been removed from the menu, that in fact the atmosphere is being destroyed, that in fact the planktonic life in the sea is in danger -- and that's the bottom of the food chain -- that in fact the toxic mess in the East Bloc -- radioactive and otherwise -- is insoluble at this point. So, you know, it's not heads who are alone in awakening to the fact that we are either headed for a nightmare of social collapse and catastrophe, or we are actually going to mutate toward angelhood, but, you know, blundering through, as we've done for the past thousand years, is no longer an option. Within the next 30 years we are going to have to discuss and contemplate things that would stand your hair on end and things that to people of another generation are going to seem incomprehensible. I mean, what are we going to do? Are we going to download ourselves into a supercooled cube of gold ytterbium alloy buried a thousand feet deep on the dark side of the moon and wander through an ersatz electronic wonderland forever? Are we going to atomize our consciousness and spread it to redwood trees and coral reefs and termite colonies? Are we going to build ships the size of Manitoba and depart for the galactic centre? What exactly is the plan folks, because business as usual is off the menu, and you know, in the '60s these substances were called consciousness expanding drugs, it was just a straight phenomenological description, consciousness expanding drug or substance. Well, if you take that notion seriously for a moment, then you need to stop and apply attention to this matter, because consciousness, the lack of consciousness is why we are going mad, because we cannot solve our problems. If there is one chance in ten thousand that these things actually increase in any measurable domain consciousness, then, by Henry, we should be leaning into it full bore, because if we don't get our act together, you know, the fossil record has a place for failed experiments and I'm not interested in that. [applause]

Q: ??

TM: No, I just think that's a description of the process I'm promoting from the point of view of someone who doesn't like it. The best and the brightest did desert the power structure because the power structure was essentially a merchant of plutonium, paranoia and mass death and propaganda. Yes, the values of Western civilisation are insupportable. The values of Western civilisation are held to the planet the way a madman holds a gun to his temple. That's what it's going to lead to. For instance, take something like free markets -- this is the clarion call of the politically correct at the moment. Free markets means the right to manufacture and sell junk everywhere, it means, you know, nobody will be able to say no. We don't want free markets, we want trade to be as difficult as possible and the more high tech and machined the object is the more we want to make it difficult to move it around, because what we must do -- and I'm not a luddite, I'm not anti-technology, I'm anti-materialism, we must dematerialise the accouterments of the

culture. I can imagine a world where people live in idyllic pastoral naturalism, naked with perfected ageless bodies, it looks like an aboriginal high Paleolithic existence, but when you transport yourself into these people's bodies and they close their eyes, what they see are menus hanging in mental space and these menus are generated by an object on the inside of their eyelid no larger than a contact lens and that object is a doorway for them into a virtual global culture that is electronically instantaneous, multi-levelled, multi-sensory, transformative, you know, the complete database of the species on call at a glance, and so forth and so on. This is a reasonable technological goal. If we cared for it as much as we care for atom bombs and epidemic diseases deliverable by artillery shell, we'd have it today. So, you know, the wrong dreams have been executed, the dreams of the paranoia, the psychotic and the dominator, and what we need now are dreams that celebrate consciousness, difference, variety and empower meaning, because the philosophies and the points of view of the last thousand years leave you with a mess of pottage, leave you with no explanation. Our religion as a culture is incomprehensible to 99 per cent of us. I mean, who would care to stride up here and solve a tensor equation? And yet that's, you know, the holy writ. We are completely alienated, so alienated from ourselves are we that when we encounter our own souls in the psychedelic dimension, we mistake it for a UFO. This is serious alienation folks, I think we have to get back into the inner jeweled realm and make ourselves at home there. Is there a woman? Yes.

Q: [female] Inaudible.

TM: Speak louder.

Q: [still inaudible -- but in connection with 'emotional hangups']

TM: Are you thinking of a particular substance?

Q: ??

TM: Well, you know, we have to genuflect to LSD for what it did in the '60s, but I'm into plants, and I found LSD to be abrasively psychoanalytical is how I would describe it.

Q: ??

TM: In your experience. In my experience it was very different. Mushrooms, if they address your personality at all, seem to do it very gently. LSD -I understand why the psychotherapeutic community was so excited because LSD really did seem to confirm the models of the psyche that were current at that time. I mean, you did experience childhood memories, often traumatic, and you did re-live painful experiences. I don't seek to imply that taking psychedelics is easy or pleasant. I think that the phrase 'recreational drug' is extraordinarily pernicious. It is a path requiring great courage and self-discipline because, you know, the fear can rise up and haunt you and, you know, these things can come at you that are completely unexpected -- ecstasy is not to be confused with mere delight. I mean, ecstasy shakes you to the very core of your being because it's a coincidentia positorum, you know, it is orgasmic and it is terrifying and it is transcendental and it is mundane. I mean, it exceeds categories, that's what it is, it's the experience of the melding and transcending of categories. I don't think everyone should take psychedelics. I think that people who instinctively fear it are self-diagnosing themselves as mad and therefore they shouldn't take it. They're right, they know, they know, believe them! Over here?

Q: Inaudible.

TM: Yes, I think you're quite right that it's a calling. Shamanism is the name of the calling and you know. You know whether you want to be an architect or a psychotherapist or a tennis star, and people know whether they want to be a Shaman, and those who do become exemplars for the rest of us. I don't think we need to make the mass revolution here, I think we need to empower a core group of people deeply and profoundly and that they know who they are. You self-select yourself, and make your way toward it over a lifetime. I mean, it is a path, and those receptors in your brain which make the psychedelic experience possible are, like everything else about you, under the control of your genes, so that it's reasonable to talk about affinities for this stuff, family lines where it is more commodiously integrated and received -- I think that's very real. We are biochemically unique, every single one of us, and this addresses that uniqueness. What these people who become the shamans must do is they must -- by impassioned speech, poetry, dance and theatrical display -- convey the feeling to other people. This is what the high Paleolithic was about, you know. We must share our art, we must open a doorway and some will pass through the doorway and some will stand and gaze through the doorway and some will only be enlivened by rumour of the doorway, but the doorway must be secured, made real. It's part of our birthright, it's the thing without which we are not ourselves. You know, I see history as the story of the prodigal son, we have wandered in the deserts of materialism now for two thousand years and our cataloguing, our relentless probing of the world, of the aboriginal, and the frontier of geography, has brought into our

TM: Okay, well I think of this talk as "Alchemical Youth on the Edge of the World", because I thought what we would do this morning is anticipate the psychedelic '90s, and talk a little bit about the youth culture that is emerging worldwide and some of the other considerations that the youth culture seems to be building bridges toward. Altogether, these various concerns seem to me to add up to a kind of neo-shamanism, or a kind of archaic revival of social forms, many of which have been suppressed for several millennia.

There are several facets to this new emerging psychedelic youth culture of the nineties. First of all, obviously, the ecology movement. This is something that was absent in the '60s, when the awareness of the approaching degradation and destruction of the natural environment had not advanced nearly as far as it has today. So there is a general awareness in the youth culture that its elders are handing on to it, a looted, polluted planet, in which very little planning or provision was made for the saving of resources for any future generation. So the ecology perception is part of the emerging social phenomenon as is feminism. Feminism has been with us now for about 15 years, but gone through various forms and rescissions and seems now to have taken the form that is very concerned to recover the religious attitudes that prevailed before patriarchy and history established themselves. In other words, we know that at some point in the past, 10 or 15 thousand years in the past, there was a partnership society which imaged its supreme deity as Gaia, a goddess of the Earth. And a re-awakening of the awareness of Gaia -- and this really goes to the ecology movement as well -- a reawakening of this feminine, ecological, earth-centred awareness is definitely feeding into the aesthetics of this new counter-culture that is arising. Now, another facet which is somewhat paradoxical and, perhaps on the surface, in seeming opposition to the concerns of ecology and feminism, is what I call "cyber-culture" or "hacker-culture". This means that a lot of people in the 16 to 30 year old bracket are very aware of the underground uses and applications of technology -- not only computers and virtual reality and game-making, but also desktop publishing, garage band rock and roll, and a counter-cultural record industry that often runs on very small pressings of very obscure groups and sounds. Nevertheless, this technological cyber-culture is what is making possible another facet of this

youth culture, which is a specialty music, a transformed rock and roll, a culture-wide re-invigorating of musical forms and, of course, driving that concern is the rediscovery of psychedelics. Psychedelics which were very big in the '60s in the form of LSD largely, were almost lost sight of in the '70s and the early '80s when the management-oriented yuppie culture came along. But now, with ecology, with feminism, with cyber-culture in place and cross-fertilising each other, psychedelics have become the natural glue for this movement, and they are largely plants. What is going on is an attempt to recapture the shamanistic institutions and styles that existed before history, and this means not only cannabis -- which has been with us throughout the 20th century, throughout all the counter-cultural and alternative moves of the 20th century -- but also largely mushrooms, mescaline, and so forth -- special emphasis probably being given to mushrooms because mushrooms have gone from being an obscure tropical deep-forest endemic to being something which can be cultivated in any garage or cellar in the land, and many people are doing this. It's sort of an odd fact about mushrooms that the qualities you need to take them are precisely the qualities that you will inculcate into yourself if you learn how to grow them -- punctuality, cleanliness, attention to detail, so forth and so on. I really think that the mushroom-growers within the new culture are the alchemists of the new culture; their formula is a rye to mould and mould to gold, and thank God for them, because they then create the juice that fuels the creativity of these other concerns that I've mentioned. Really, the psychedelics in my view should be seen as enzymes for the imagination or catalysts for language, and really what the new youth culture is attempting to do is to reclaim the language-forming machinery for itself. A culture can evolve no faster than its language evolves. What is unspeakable is unthinkable and consequently part of the task of the new spirituality of the neo-shamanism is to empower language to go into areas where it has never gone before, particularly the area of emotion. It's incredible how few words we have for our emotions when we have so very many words for even relatively obscure technical processes. So I see the psychedelics as functioning in two areas -- first of all to catalyse and empower the imagination and then, secondly, to dissolve boundaries between people. I mean, if you look at 25 thousand psychedelic experiences, the impression that you will have is this experience is one which dissolves people's boundaries -- it doesn't matter whether they're Hassidic Jew, a communist party apparatchik, a rainforest shaman -- if they expose themselves to these psychoactive psychedelic plants, they will call into question their most basic beliefs and assumptions. This is what gives the psychedelics their inevitable political edge, because the establishment and maintenance of boundaries is something that most societies are very concerned with and put a lot of energy into. This is why in the '60s the spread of LSD was viewed with such alarm by the Establishment, because it appeared that the machinery of right-thinking, Christian capitalist society was simply being dissolved before the startled eyes of its purveyors by virtue of the fact that so many people were calling into question the assumptions of the culture that they were inheriting.

Well, now we see something similar coming into being. Thirty years after the '60s we appear to be poised on the edge of another youth decade, another decade in which youth will set the social agenda for society at large and attempt to lead us away from some of the more lethal and self-destructive patterns that we seem to be so addicted to. Well, now, why is this happening right at the moment? Well, I prefer to think, rather than arguing rationally about it, that the reason the 20th century has been so repeatedly disrupted or enlivened -- depending on your point of view -- by these eruptions of the avant garde, the Bohemians, the beatniks, the hippies, the youth culture of today, is because unconsciously we are actually responding to the presence ahead of us in the future of what I call 'the transcendental object at the end of time' -- a kind of strange attractor, a kind of sociological black hole that reaches out to social processes in the act of evolving and puts a certain spin on them, calls them toward itself, so that history in the 20th century is not a random walk or a trendless fluctuation as we are taught in the academy. Rather, history in the 20th

century is a triumphal march toward the revelation of a transcendental object that lies beyond the turn of the century.

Every time we take a psychedelic compound, every time we slip into reverie, trance or dream, we form a relationship, we encounter in mental hyperspace, the long shadow of this transcendental object. It's as though we've been moving along a surface for a long time now, many centuries, and now we are about to undergo a phase transition or fall off the cusp of the phase space. And this falling off the cusp of the phase space is, for those who experience it, a dizzying sense of freedom, a dizzying sense of penetration into a dimension that was previously sensed and dreamed of but which very briefly and occasionally comes forward to be realised. It's a gold age, similar to the gold age of Greece or the renaissance, but for us it has a different character because this transcendental object ahead of us in time seems like a kind of condescension of all our hopes, fears and intuitions about what the future and the evolution of our species could become. This is, I believe, why the UFO has been such a persistent motif in 20th century popular culture. It's because we actually sense on the unconscious level a kind of approach of the end of time, a kind of closing distance between historical societies and some kind of truly mysterious, truly transcendental object that lies ahead of us in the future, in the near future. And again returning to the subject of the psychedelics, their role in all of this is that they seem to pick up and amplify that signal coming off this mysterious object hidden in the future, so that the contents of psychedelic experiences, when laid end to end in a composite, is to give a kind of picture of what this final scenario of global integration is going to be like. And though it is going to emerge as a phenomenon of culture, I think it will largely come out of not our cultural artifacts, not our technology, but out of human organisation itself. It's not for nothing that the self-transforming machine elves that one encounters on the other side of the DMT barrier, that what they seem to be concerned with is the teaching of invocation and forced evolution of human language. I think that somehow the part of human organisation that is most likely to undergo an evolutionary transition is the portion related to the production of language. Even ordinary language, which we take so for granted, when looked at from the perspective of the rest of animal nature, is seen to be something very close to the thumbprint of God on the human world. I mean, you can take your dolphins and your ants and compare them to a Grateful Dead song or Milton's *Paradise Lost*, and it's clear that human communication is going on in a domain of glorification and completeness that is transcendently Other when compared to all other forms of communication going on in the world. Well, then, isn't it suggestive that when we use these tryptamine hallucinogens -- hallucinogens which are strangely enough analogous to neurotransmitters within our own brains -- that then what we burst through to is the equivalent of a kind of shamanic finishing school where self-transforming machine elves -- apparently the animal life of this parallel continuum -- are urging us to perform some kind of transformational act on our own language. Well, I had this experience for many years before I found anything in the world of human experience, ethnography, or art history that could be mapped onto it, and then in the early '70s I took myself to the Amazon and I discovered there groups of tribal people using a combinatory brew called Ayahuasca, a visionary brew made of giant woody liana called *Banisteriopsis caapi* and a small leafed plant containing DMT, called *Psychotria viridis*. And when these two plants are brought together and brewed together for many hours and then boiled and concentrated, a very powerful psychedelic substance results and the people in these deep forest, rainforest areas have been using this shamanic preparation for thousands and thousands of years. When it was first encountered in the early years of this century, the compound was isolated and actually called telepathene. This was to refer to the apparent group states of mind that the people using this brew were getting into. Well, later it was realised that the compound had previously been isolated from the giant Syrian rue, *Peganum harmala*, and that the compound had already been named harmaline, so telepathene disappeared from the literature in favour of harmaline. But the

thought is worth noting that from the very beginning the early explorers, ethnographers, anthropologists who contacted this folkway in the Amazon assumed that it had something to do with group states of mind. Well, what I discovered -- and I certainly wasn't the first to discover it -- in the Amazon in the early '70s, was the people in these tribal groups get together and they take Ayahuasca and their habit is to sing to make music, vocal music. They have no drums because in the Amazon the humidity is so high that no drum head could remain stretched more than a few hours. So the people use rattles and leaf shakers and vocal sound to produce what we would think of as beautiful tribal music. But what's interesting about this beautiful tribal music is after each performance, when you sit and listen to the people criticise the performance, they don't say that it sounded very good, they will inevitably make comments like 'I like the part with the silver bars and the blue dots, but I thought that the yellow could have been more intense, especially where it faded into the polka dot brown and grey section'. In other words, when you listen to these people in these native contexts criticise these performances, you realise that for them it's a visual performance, it's sound which, under the influence of these plants, is actually beheld, actually seen by the people within this culture.

Well, this was very exciting to me because, you see if you can see a situation from another person's point of view, in a sense you have become that other person; to stand in the other guy's shoes is to see the world from that person's point of view. It's a very different way of relating to language than the way we ordinarily do it. You see, the ordinary way in which human beings communicate is one person makes small mouth noises, the small mouth noises move across through the air as acoustical pressure waves, they then enter the mind brain system of another person and that person consults a culturally validated dictionary to see if their definitions overlap with the definitions of the person who created the sounds in the first place. Now, if there's sufficient overlapping, then we say that communication is taking place, that understanding is occurring, but it's always a very provisional and shaky kind of understanding. And as concepts become more complex, dictionaries become more incomplete and more divergent, and eventually two people of the same culture, they're discussing a highly technical question, may have no understanding of each other at all. Well, this is very different from the situation that arises if we could literally see what the other person means. It's not without implication for this argument that when we talk about perfecting communication, we unconsciously reach for visual metaphors, so someone will say 'I see what you mean', or 'She painted a picture', or 'his prose was luminous'. This means that we instinctively and unconsciously believe that meaning is something most clearly apprehended when seen, and one of the things that has excited me so much about the aboriginal use of psychedelic plants is they seem to be on the brink of evolving forms of communication which move out of the realm of acoustical neurological processing and into the realm of visual acoustical processing.

Well, this has tremendous implications for the new world order that the youth culture is seeking to put into place. Cyber-culture, music, psychedelics, feminism, ecology, the new spirituality, all of these concerns could profit and strengthen themselves by appealing to a visual language, a new way of processing what is heard. This is what I think art in the 20th century has unconsciously been striving for, ever since jazz and cubism and throughout the evolution of 12-tone row, abstract expressionism, rock'n'roll, pop-up virtual reality -- all of these schools of art and technological innovations in the art-making process are setting us up to be able to see what we mean at some point in the future. And this will deliver us essentially into the equivalent of a telepathic society. Now, you may have imagined telepathy as something different, you may have imagined it as one person speaking and another person hearing the thought composed, but this isn't it. Telepathy will be nothing more than seeing what the other person intends -- seeing meaning.

Now, why it is that when we dose ourselves with a human neurotransmitter like DMT, why we then encounter armies of elves teaching us a perfected form of communication, this is a very difficult question. When you go to traditional cultures, shamanistic cultures in the Amazon and put this question to them, they answer without hesitation when you ask about these small entities, they say 'Oh, yes, those are the ancestors, those are the ancestor spirits with which we work all of our magic'. This is worldwide and traditionally the answer that you would get from shamans if you were to ask them how they do their magic -- it's through the intercession of the helping spirit who is a creature in another dimension. Well, we may have imagined many different scenarios, a future technological and social innovation, but I think very few of us have imagined the possibility that the real programme of shamanism would have to be taken seriously, and that shamans are actually people who have learned to penetrate into another dimension, a dimension where, for want of a better word, we would have to say the souls of the ancestors are somehow present. It isn't, you see, as though we penetrate into the realm of the dead, it's more as though we discover that this world is the realm of the dead and that there is a kind of higher-dimensional world with greater degrees of freedom, with a greater sense of spontaneity and a lesser dependency on the entropic world of matter, and that that other universe is attempting to impinge into our own, perhaps to rescue us from our historical dilemma, we don't know -- perhaps shamans have always had commerce with these magical invisible worlds and it's only the sad fate of Western human beings to have lost touch and awareness with this domain to the point where it comes to us as a kind of a revelation. You see, I believe that the whole fall into history, the whole rise of male dominance and patriarchy really can be traced to a broken connection with the living world of the Gaian mind, and there's nothing airy-fairy about this notion; the living world of the Gaian mind is what shamans access through psychoactive plants, and without psychoactive plants that access comes as an unconfirmable rumour. I believe that the social style of human beings 15 to 20 thousand years ago was very very different from the social styles of today. In the first place, people were nomadic pastoralists, they didn't stay in one fixed area, but rather they followed around behind their flocks. And there, in the manure of these ungulate animals that had evolved with the primates on the grasslands of Africa, was the mushroom, and the mushroom was acting as a tremendous force for directing the evolution of human beings away from that of the rest of the anthropoid apes and toward the unique adaptation that we see as special to human beings today. It was doing this through a series of self-reinforcing tendencies that are easily enough understood. First of all, when you take small amounts of psilocybin, such small amounts that no psychological experience is apparent at all, there is a measurable increase in visual acuity. Well, you don't have to be a rocket scientist to realise that if a hunting animal is in a situation of high competition for resources and there is an object, a food item in the food chain, which imparts increased visual acuity, then those animals which admit that item into their diet are going to outbreak the non-mushroom-using population and gain a significant advantage by this means. Well, it doesn't stop there. If slightly larger doses of psilocybin are taken, still sub-psychedelic doses, you get what is called CNS arousal, central nervous system arousal. Now all this means is a sense of restlessness, an inability to sit still, a sense of energy and -- the classical meaning of arousal -- sexual arousal. What this means then is that those animals in the population that were more successful at hunting and at obtaining food because they were taking small amounts of psilocybin are now going to act out what primatologists call 'more successful instances of copulation'. This means a lot more sexual activity is going on and wherever you have sexual activity, it stands to reason you're going to have increased instances of impregnation and successful birthing. So, the second factor which builds on the first factor is the mushroom-using population will tend to outbreed the non-mushroom population, and it will tend, then, to survive into adulthood in greater numbers because of the greater increased success in hunting. The third and final factor, then, which pushed these mushroom-using primates into a position of ascendancy, is [that] psilocybin at the psychedelic dose level actually stimulates the areas of the brain that are concerned with

the production of language, so you get spontaneous glossolalia, spontaneous bursts of modulated syntactically structured sound, and I believe probably that language was invented long before meaning as a kind of abstract exercise around the camp fire, that these homonoids and protohomonoids were doing for each other's amusement. So there you have a three-step process -- increased visual acuity means increased success at getting food, further doses of psilocybin mean more sexual activity with more instances of successful impregnation and birthing of offspring and, finally, contact with the language-catalysing psychedelic tremendum that even for people as sophisticated as ourselves looms as the most tremendous, shocking and challenging mystery in our world. We have always been caught up in the anticipation of the unspeakable. The human adventure has always been a flirtation with these gigantic forces in an unseen dimension. This is what sets our religions going, this is what creates gurus and messiahs and scientific breakthroughs, it's that somehow we are in resonance with something much larger than ourselves, something which you could call the great attractor, the transcendental object at the end of time, the Gaian mind, whatever it is, we, out of all of nature, seem to have a special relationship to it and seem to be somehow both under its care and somehow involved in the manifesting of it in 3-dimensional space. It's that as we make our way across the historical landscape toward the sensed presence of this transcendental other, so it is making its way toward us through the content of dreams, psychedelic experiences, the careers of spiritually advanced people, -- the idea being that history, which is a state of extreme instability and disequilibrium which only lasts 15 or 20 thousand years, that history is about to be transformed or ended, that the factors that shaped history -- phonetic alphabets, male dominance, materialism, scientific method, empiricism -- these factors are about to be made obsolete by discoveries in the human and natural realm.

We, we the people of the high-tech civilisations, are like the prodigal son. We made a descent into matter. We have wandered many years in the wilderness. Now, in a time of great planetary crisis, we must return to the tribal fold. We must take what we learned from the peregrination into history and return to the tribal model with it. Only in that way, then, can we reclaim our sexuality, reclaim our identities and reclaim the planet for itself. The styles that have evolved within history, the styles of male dominance, concern for tracing male lines of paternity, private property, control of females, so forth and so on, all this has arisen as a result of the establishing and maintaining of the ego. The ego is the function of the personality that is most at home and at ease within the context of history, but really this is not a situation of mental health, the ego is like a calcareous tumour that arises within the dynamics of the psyche and lodges like a cancer or a tumour in the structures of the psyche. And the only cure or the only treatment that I am aware of for the calcareous tumour of ego is frequent repeated exposure to psychedelic plants. This is the essence of their boundary-dissolving function, and 12 to 20 thousand years ago the ordinary style of human society was, as I said, nomadic pastoralism and psychedelic intoxication on a schedule that was very probably lunar, so reclaiming that orgiastic boundaryless style of sexual relating is part of what the archaic revival is about. Obviously, with a population of six or seven billion people, we can't seriously suggest that we return to the sexual styles of a group of nomadic pastorilists on the plains of Africa who numbered probably no more than 50 or 60 people, but we can understand that the ego is a function that has arisen, in a sense, to empower our most lethal tendencies. Because as we look at the Earth as it exists today, with rising levels of toxicity and pollution and arms proliferation and so forth and so on, there are no problems that cannot be solved -- we have the technology, we have the money, we have the industrial capacity, what we don't have is the plan and will to execute the plan.

So really the change that we and the groaning planet are waiting for is a change in the human mind. It's the human mind that must change and then the tools for the restructuring that must be done will be found

present and near at hand and, as far as I can tell, we don't have centuries or millennia in which to do this change and if preaching alone could have inspired it, it would have occurred several millennia ago. What we must look for is a catalyst that is effective, not on the easy cases but on the hard cases, and when we carry out an analysis of that sword, what we're going to find is psychedelic shamanism is the traditional human response to our dilemma. We must dissolve the boundaries of yours and mine, of inside and outside, even of life and death. We must dissolve these linguistically conferred boundaries and replace them with a sense of the universal flow of energy through a series of vibrating and resonant fields of being. This is the core philosophy that lies behind Shamanism, Buddhism, Taoism, this is the perception of the perennial philosophy, and I believe that using the lessons of the 20th century -- what was learned at Auschwitz and in the Haight-Ashbury, and at Alamogordo and Nagasaki -- using the lessons of the 20th century, the new youth culture can at least create a viable human alternative. We're approaching the change of the millennium, we're about to go into the third millennium, and we can actually use the change in the calendar as the wind beneath our wings to lift us to a new vision of global completeness and of species and planetary holism that will then leave us the fitting inheritors of the birthright of the elfin empowerment.

I think we've said enough. I think we can knock off. If they can't get seven minutes out of that we have to renegotiate. SIDE 2, TAPE 2

TM: ... damn well better stay away from psychedelics. No, I don't think everybody should do it. I think revolutions are made by 15 percent of the population and that you can have a psychedelic society and be a citizen of a psychedelic society and never take psychedelics, but the ambiance of the society will be psychedelic. You know, it's a calling, shamanism is a calling, and if you're not up for it -- my own biography is perhaps instructive in this, I mean the reason I'm into all this is because I'm into what's weird, I always have been. I mean, I've always loved the bizarre, the outre, the stuff of the edge, and you know, when I got to psychedelics I thought I'd hit the mainframe of sprung verse or something. I mean, if that's what you like, then this is your answer. You see, what the psychedelic is going to do is it's going to destroy your whole world, your whole conception of your world, and some people that's tremendously liberating, they say 'wonderful, at last I'm free of it', other people say 'My God, now I'm hopelessly mad, I have nothing left to cling to, I've really done it this time', and so that's almost an aesthetic judgment, whether you like watching your world shredded before your eyes and made into nonsense -if that makes you feel liberated and secure then you can sign up for that carnival. If that alarms you then I think best to stick to the tried and true. It's not for people of weak psychic constitution, and what shamanism is about is -- I mean, I know someone who says of the mushrooms 'My goal with taking mushrooms is always be able to stand more', and they don't mean higher doses, they mean more of what it reveals, and I feel like that. I mean, the mushroom speaks -- I didn't really stress this in my talk, but the strange, the confounding fact about these mushrooms is that they speak to you, in plain English, and this is completely unexpected. How can such a thing be? I mean, one is dumbfounded in the presence of this, and yet by being able to have an 'I/thou' relationship to this thing, you open up yourself to what is essentially a magical dimension, a dimension of ally-ship with this thing. I come to this completely as a rationalist, I mean I am more scientist, more rationalist than anything else. I am very uncomfortable with my position in the New Age, I hate all that stuff -- the quartz crystal suppositories and the channeling of dead Egyptians and all this horrible stuff which goes on, I mean it's just an affront to the thinking mind. But when I encountered these psychedelics, I said 'My God, scepticism is the proper path', and I believe this -- it's not to believe, it's to test. I said to the mushroom once 'Why us?', meaning my brother and me, 'Why us?'. And it said 'Because you don't believe in anything', you know 'You're not a believer', and so it's a real thing, it's a real mystery. It will not yield to reason, it's a tremendously well-kept secret. I mean, how can it be? For instance, take

the case of dimethyltryptamine, DMT. This is the most powerful psychedelic in existence. It only lasts two or three minutes. This most powerful of all psychedelics we naturally elaborate in our own brains. This is a curious fact. It means that psychedelics, to be what we call 'powerful' or 'overwhelming', are not chemically alien to exotic to the brain, but they are rather very familiar and very much like things already present in the brain. And when you smoke DMT the entire world is replaced in about 30 seconds with something completely impossible to anticipate and utterly astonishing, utterly astonishing, I mean the character of the experience is almost that of pure astonishment. I mean, people have said to me 'Can you die from smoking DMT?' Well, the truthful answer is 'Yes, by astonishment'. Death by astonishment is a real problem here and this is the rarest of all emotions. I mean, when was the last time you were astounded, you know, struck speechless with amazement? We have these phrases in our language 'struck speechless with amazement', but if it happens once or twice in your life I dare say you'll remember it until they lower the box. Well, DMT delivers this on demand. Well, what is so astonishing about it? Nothing less than breaking into an inhabited elf nest of self-transforming machine creatures who are squealing and squeaking in a visible glossolalia that falls like rain on the interior landscape. There isn't even ordinary space and time -- this occurs 30 seconds after availing yourself of this compound and you are restored to normalcy eight minutes later. It means these things are not far away, it is not destructive, it is not inimical to the organism, it simply is suppressed by culture. We don't understand how enclosed we are by the prisons of a limited and scientific language. True weirdness is raging just outside the confines of the cultural paradigm which is trying to reassure us 'Oh, it's all very humdrum and all runs down into entropy and I shouldn't worry about it if I were you'. This is not, in fact, the case. However, I digress.

Q: ??

TM: By the New Age?

Q: Yes. TM: Well, I hope I didn't come off as terribly hostile, I'm sort of light-heartedly critical is where we're shooting for here.

Q: ??

TM: Oh, I'm sorry, yes. The question was 'Given my view of the New Age, what do I make of the appropriation of shamanism by the New Age and its marketing?' Well, if it's non-psychedelic I absolutely deplore it. I mean, I'm not here to name names, but I'll assure you the major marketers of non-psychedelic shamanism were turned on to the power of shamanism by their experiences with psychedelics and I take a very hard-core position on this just to infuriate people. I really don't believe there's any other way you can get there. I mean these yogic states and states induced by starvation, flagellation, celibacy -- all these tremendously pleasant methods -- are not to be compared to the psychedelic state. I don't know what those people are talking about. One of the things that concerns me is, people say 'Well, this is a spiritual path and you're a spiritual teacher', and so forth and so on -- no, I am not a spiritual teacher and anyone familiar with my moral behaviour can assure you of that. I don't know whether this has anything whatsoever to do with the spiritual quest as ordinarily conceived. My approach to it is it's a phenomenon of some sort that confounds our notion of reality. The thing which got me started on my travels and my career writing about all this was I had been very keen on Carl Jung and all that business and had been raised Catholic, and so when I smoked DMT I had the expectation that the most far-out thing that would happen, that could indeed happen, would be a kind of revelation of the Jungian archetype, the great round dance of the archetypes would be made visible. Well what was completely dumbfounding, was there was no relationship

to the DMT flash, to the art history of the species. Our art doesn't hint of these dimensions, very aptly, and yet this is available to all of us. It's so suppressed that it's not even in the human unconscious. It's been suppressed below the level of the human unconscious. It's as though it's a lost world, a parallel continuum, and if you have access to this lost world, this parallel continuum, it would never enter your mind to invent mathematics, government, religion, all of these things, because you are in the moment, you are at peace with yourself and your community, and this is something that we have to make our way back to, because the disequilibrium of history has turned rather rough and ugly here, post-World War II.

Q: ??

TM: Thank you for taking your turn, you're next. Vitamin K, let me just say, and I say this because there's something I want to say. The word 'drug' has been tremendously misappropriated and corrupted by the movers and shakers of society. I mean we all, I believe it's safe to say, are repelled by obsessive self-destructive, unexamined behaviour and that's what is laid at the feet of drugs. However, chasing dollars or pounds, worrying about making a fashion statement, owning a Ferrari, all of these things are obsessive self-destructive habits, so I have a rule, a three-step test if you're thinking of availing yourself of a substance as part of your programme of self-growth and advancement. The first question you should ask yourself is 'Is it ...

Q: ?? afford it.

TM: 'How can I afford it', yes, well, that's zero -- moving on to one. Question one is 'Does it occur in nature?', and question two is 'Does it have a history of shamanic usage?' You see, if it has a history of Shamanic usage, then issues like 'Does it cause tumours, miscarriages, blindness, palsy?' -- this has all been answered, we have our human data, we have five thousand years of use by the Mazatecan Indians or somebody else, we have our human data sample. Then the third test is 'Does it occur naturally or do its near relatives occur naturally in the human brain?', because we don't want to insult the human brain, we don't want to toxify it, we don't want to poison it. Well, the happy conclusion of applying these rules is that the most terrifyingly powerful of the psychedelics pass all tests with flying colours -- DMT being the perfect example. DMT is a megatonnage hallucinogen -- it occurs naturally in the metabolism of every single one of us at this moment. If you were an American audience I would tell you you're holding a schedule 1 drug and are subject to immediate arrest and trial. Every human being on earth falls into this category. This is the Catch 22 that they hold in reserve if they ever have to come after us -- you are holding, and you can't stop yourself. The fact that DMT, that we return to a normal state in only a few minutes from DMT, argues that the non-invasive quality is very important. If you take a drug and feel wobbly 48 or 72 hours later or are having body aches or blurred vision or something like that, this is a drug to stay away from, this is not something you want to get mixed up in. You judge the non-toxicity of the drug by how fast your body is able to return you to normal. MK, which inspired the question, which is ketamine, doesn't pass any of these tests and I did it and I found the state very interesting, but when I saw the data on how it depressed the immune system and there's some concern that it may trigger epileptic kindling, I didn't think it was a good idea. Also the fact that you have to bang it, that's a bad habit. I don't think we should get into that because then it's a vector for disease and then pushes all kinds of the wrong buttons. Yes.

Q: ??

TM: You mean as opposed..

Q: ??

TM: Ah, well, the difference will not be great except in the dose ratio. I think liberty caps are per unit gram stronger than *Stropharia cubensis*, but still don't you have to eat a dozen or two of them?

Q: ??

TM: Three hundred! Ah ha, okay, well -- and good for you! *Stropharia cubensis*, I mean, in culture we've grown 170 gram specimens which when dried down go down to 15 grams. Well, what I always say is a dose is 5 dried grams, and I might, since we're on this subject, say something about technique, because I always forget this -- it seems so obvious to me, but it's a revelation to some people. The way you do these things is you do them on an empty stomach in silent darkness, obviously. I mean, you're looking for hallucinations, right? This is a hallucination hunt, it's a vision quest, so people ask the most bizarre questions, example: 'Will I be able to drive?' Now, there's the male dominator ego for you. In no sense of the word will you be able to drive. That's what's going to happen: you're not going to be able to drive, so just, you know, put that in your pipe and smoke it early on and give up the notion of driving. No, you should be in silent darkness, and some people resist the silent part and they say 'But, you know, I always listen to the Mothers of Invention on my ...' well, give it a rest, friend, you know, they're wonderful on the natch, so let the pythagory and inner music issue from your soul in silent darkness. You will be amazed, I mean if it bores you flip on the Top of the Pops, but give it a half an hour before you resort to that. Yes.

Q: Have you had any experience of ??

TM: Yes, well I see that the Guardian dutifully reported all one would need to know to get seriously involved in toad abuse. In America we hear about toad licking and it's always advanced as a folkway of the primitive Australians and we in America have gone on one better. First of all, we don't hurt our toads, we drive out into the desert in our four-wheel-drive vehicles and we gently milk our toads onto what we call the windshield -- a windscreen -- and then it dries in the sun and we get out our little frost scrapers and scrape this better-left-undescribed material off the windshield and then this is smokable. This is 5-methoxy-DMT from *Bufo Alvarius*, and it passes all the tests. Well, not the test as would occur in a plant, no, it occurs in an animal, that's better. It's interesting, it's one of the few animal-based hallucinogens -- we call it toad foam, as opposed to more inelegant appellations that have been used. It's 5-mythoxy-DMT, so it's a variety of dimethyltryptamine, but compared to DMT it's sort of like AM radio versus 70 millimetre cinemascope. There's what I heard a researcher describe last week as an 'effulgent emotion' -- yes, there certainly is. There's no word for this emotion, but it's very large, but there is very little visual activity, kind of after-image-like stuff, but you know on DMT the hallucinations have an existential veracity that's absolutely jaw-dropping. I mean, they are 3-dimensional, they are highly coloured, they are in motion, these elf-like creatures that one encounters in the DMT space are, I've described them as self-transforming basketballs, they are like jeweled basketballs and they come toward you and then they recede and they're singing in these silvery voices which make objects, they have a language which is visibly beheld -- a favourite theme of mine that we didn't get to tonight -- they make a language which they then present to you -- the objectified language -- and it looks rather like Faberge eggs or sorts of toys that alien astronauts might give their children to amuse them. I mean, when you are shown by one of these -- I call them tykes, these creatures in the DMT state -- when one of these tykes comes bounding toward you and offers one of

these mechanised syntactical Faberge machines, you look at it with the perfect knowledge that if you could bring this thing across to this world, no stone would be left upon another, that there is something about it that is confounding, it is literally impossible and yet you're looking at it, it's in front of you, I mean the impossible is happening and, you know, this is a result of that. Yes.

Q: ??

TM: Datura. The question is about datura. I would think of it as a kind of deliriant, actually. The chemical family involved is tropanes. We don't want to get too technical here, but a good rule is when I talk about psychedelics I'm talking about indole alkaloids -- LSD, psilocybin, ibogaine, the so-called cyclocised tryptamines. I'm pretty narrow-minded about all this. Even mescaline doesn't quite make it because it's an amphetamine. Datura, the morphogenetic field that is associated with datura is one of magic working, of the spreading of delusions, it's often used in contexts where somebody is working their sexual will with somebody else who may not be into it. I remember what put me off datura was years ago I lived in Nepal and a friend of mine -- actually an Englishman -- I met him one day in the market and we were just making the small talk there, and it came to my attention from talking to this person that he thought I had paid him a visit in his apartment. He was under the impression that we were sitting in his apartment having this discussion, when in fact we were moving around in an Asian souk, so I thought this is a level of disconnection from reality that we don't need. The thing that's interesting about the indole hallucinogens, and especially about DMT, is there's a core portion of your being that is never lost hold of, that is always observing. And I remember on ketamine one of the things that put me off about it was this is such a reality-obliterating compound that in every trip you come to this moment in which you realise with the force of a revelation 'I'm stoned, that's what's happening, now I remember, I'm a human being, I'm on a trip, this is a trip, I'm on a trip'. And then it all falls into place. Well, what this is telling you is it's nearly over and that you were so cut off from being able to understand that what was going on, you could never remember that there had ever been anything preceding it, you could never anticipate that anything would ever follow upon it, you completely accept this impossible situation. So, I don't like that, I like holding on to this observing eye. Now this may be my own ego clinging to the last grain of ego, but nevertheless I think it's very important that there be a clarity of something throughout the experience and datura seems to erode that fairly seriously. Well, I'm getting the high sign. Oh, one more question. One more.

Q: You bandied chemical words around quite freely here ???

TM: Sorry, I thought you were permitting a question -- you're asking a question.

Q: .. chemical terms around, quite freely...

TM: Oh yes, oh yes.

Q: ... but many people feel that marijuana is a liberating agent. Is marijuana ??? hallucinogenics that you're mentioning? TM: Well I don't know if 'poor cousin' is the word. Marijuana is the "except" to all the rules. Marijuana is a polyhydric alcohol. I can't say enough in praise of marijuana. I mean... [applause].. the lifeblood of my inspiration, and, yes, it's interesting. Sometimes I teach a whole weekend and this never comes up, I mean, we're all so well behaved. Here we are discussing these outlandish drugs, you know, when the fact of the matter is cannabis is our daily bread, and ...

Q: ??

TM: Yes, I mean this is this notion that community comes first, that there is a family, there is a tribe, I mean what people say... I observe this very closely because I got into therapy, strangely enough, with a therapist who I thought was quite brilliant except she knew nothing about drugs, which was a preposterous situation for me to be in, and so she said 'Well, now, this cannabis business, how many times a day do you do it?'. I said 'oh, by the dozen', and she said 'Well, oh, and how many years have you been doing this?', said 'Twenty five', she well 'Well, surely, this is ...' and it kept coming up, so finally I said 'I'll quit, I'll quit so that you see that nothing happens so that you won't be running around the countryside laying this trip on your patients, because nothing will happen'. Well, so then I did quit for two months, and what I noticed was a tremendous narrowing of my consciousness, to the point where before it was over I was staying up late nights working on balancing my cheque book and studying receipts and plotting how to chisel on the tax man with my receipts and just the most horrible mundane consciousness. Well, then, you know, you take a puff of cannabis and you think about Moliere's dentures, and the causes of the fall of the Trebizondian empire and the really important stuff of life, you see, rather than your own stupid ego trip. Back here I promise and then we're out of here.

Q: ??

TM: Ah, ecstasy. Well, I don't want to insult the local choice. I assume you mean MDMA.

Q: Yes. TM: Too bad, I'd rather have answered the general question, I think ecstasy is wonderful. MDMA is problematic. Every drug -- some of the most bizarre drugs, like cocaine for example -- every drug when it makes its debut in the marketplace -- LSD, cannabis -- is hailed as a love drug, and so it was with MDMA. My personal experience was that it was never as good as the first time, which seemed to me a bad thing, that you know you want to learn, you want to work with these things, you want to be able to take them somewhere, and what I observed in America was people just took it to party. Well, too little is known about it to do that. There is considerable irrefutable evidence that it makes very long term changes on the dendritic processes of the nerve. My brother is a research pharmacologist, he did much of that work in Steven Parutka's(?) lab at Stanford. So as far as what ecstasy does, the subjective effects on the subject, it's fine, I'm all for that, but it doesn't have the clean bill of health that it would have if we could get it out of a plant and point to a culture that had used it for five thousand years and could point to compounds in the brain that it closely mimics. This is the division, this is what I stand for, I stand for the plants, the plants have souls, they carry the morphogenetic field of thousands of years. When you take psilocybin, it takes you, you are participating in all the trips that it ever induced in anyone, and this is a tremendously stable field of experiences. When you take a drug fresh out of the laboratory it has no soul, it has no story, it has no direction, it's a product of the demon artifice of man, and I prefer to put my hand in the large hand of the Goddess and make my way into this dimension under the aegis of the sanctioned vegetables that for millennia have always been there to fling open the doorways to vistas of pleasure and delight that would make you turn up your nose at the best Beverley Hills has to offer. Believe me, believe me, the inner riches are incomparable, and this is how we recover our dignity, by not being whores to Mammon and pursuing all of this trash that they're peddling to us, and insist instead on the maximising of human values, human emotion and human community.

Q: ??

TM: No, no, maristisan(?) is a fairly distantly removed precursor, you're screwing up my avalanche to conclusion here.

Q: Would you please say something about ???

TM: Well, we've arrived rather late at that subject, haven't we. Yes, well, I'll just give you the... I'm the purveyor of a bizarre notion which was told to me by an elf troupe. It's a formal mathematical notion that argues very strongly -- and had we had a second evening to get together I would never repeat myself, we would talk about something entirely different. I think that we are headed toward a planetary transformation within our lifetimes, specifically around 2012 AD, and this is not a political transformation, or a biological transformation, it's an actual transformation of the laws of physics themselves, that the presence of creatures such as ourselves on this planet is an indication of the nearness of what I call the transcendental object at the end of time and it is like an attractor. It is like an energy pocket in the epigenetic landscape into which we have fallen and that the fury of 20th century culture is indicative of our nearness to this globally transformative moment that will emerge out of ourselves. Essentially, we are going to shed the monkey, the linguistic creature that is symbiotic with these monkeys is about to disentangle itself from physis and realise some kind of angelic transformation. Very difficult for us to anticipate or understand. If I had more time I would say more, much more, but that's all folks.

I just want to say that to make these ideas real we have to overcome the very format that we objectify tonight. Any one of you could have sat here and done this. This rap means nothing if it isn't a democratically available mystery -- no hierarchy, no special knowledge, no specific racial background, no degree is necessary. This belongs to all of us, and I want to wish you well with your community-building and with the vision that is coming to fruition here. Very important, very empowering for the rest of us in other parts of the world. Keep up the good work. I hope you invite me back. Thank you very much.

New speaker: Thank you, Evolution have been delighted to invite you this evening. Have a very nice time and have a very safe journey home. Bye bye.

Cauldron Chemistry Interview (w/ Elizabeth Gips)

Day Month 1985

Terence McKenna's Home, Sonoma County, California

Description

- [Audio Link](#)

Elizabeth Gips: ...kenna's House, uh, we being [??] and Elizabeth, me. And, uh, we're sitting in this incredible collection of books in a very beautiful home, and a wonderful, magical spot near, uh, is it Marin county?

TM: No it's Sonoma county.

EG: This is Sonoma county.

TM: Western Sonoma county. Far from Sonoma.

EG: Talking. So, I, I will tape the conversation and, uh, and if Terence has special information that he'd like you all, you aware people of the United States to have, he'll let us have it, and we will mention the fact that he has a new book which is on cassette and he'll talk some about that too, and where it can be ordered. That's all. That feel like a good introduction to everybody?

TM: Yeah, that sounds fine.

EG: Ok, here we go.

TM: Ok.

Q: Maybe I'll just, uh, start up asking a couple of questions that have been on my mind. A fascination with a combination of uh, DMT and harmine and things of this nature, and, um, what I'm interested in is, is those places or plants or animals or ways in which people can come, um, close to, or have historically come close to or had access to DMT, and I remember you briefly mentioned, um, a process whereby by combining rabbit lungs, say, and pig intestines you could actually in some way create or obtain DMT. And I was wondering if you could go into a little more detail on how, how that could be done.

TM: Well, I'm not, I don't, I'm not sure pig intestines is the second ingredient but what you need is a source of tryptophan which is a common amino acid, and then rabbit lung which, uh, is, uh, replete with an O-methylation enzyme. O-methyl transferase, and it will all methylate the tryptamine into a psychoactive,

which is just an example of uh, what's called cauldron chemistry, which is where you use animal enzymes to do chemical transformations. Another one that has been discussed in the literature is, uh, using, uh, the decarboxylation activity of enzymes in raw milk to decarboxylate the poison in *Amanita muscaria* which is muscarine to the hallucinogen which is muscamol, and in Wasson's book on soma he discusses the fact that the Soma, whatever it was, was whipped together with milk curd and allowed to stand, and this was one of the major, uh, arguments for identifying it as *Amanita muscaria* because that would make it much more palatable and less toxic. But who knows how many of these things, uh, exist, you know, because we have lost the lore of special uses for animal organs and that sort of thing. And that really is shamanic lore that we've lost touch with.

Q: A- are you familiar with the um, ahm, the newt? The California newt? Or the importance of the tetrodotoxin and the fugu? Perhaps the, maybe go a little bit into the, the fish, um, if you want and of course the newt in that sense- the-

EG: Before we, before we get into that much of a technical thing, I wonder if it's possible to tell people why we think this is important. Can- can- can we just discuss after a minute [TM: You mean why is it...] Why- why

TM: Why is it important to track down these natural sources of the psychedelic experiences?

EG: Yes.

TM: Well, it's important because the psychedelic experience is important in and of itself, but it's important to involve ourselves with these biological materials because the things which come out of the laboratory, of which there's a potentially unlimited number, uh, are not receiving the kind of, uh, animal and human testing that they would if they were above-ground drugs. So, safety is really a concern of mine. What I've been telling people recently is, uh, that until there's animal and human data on a drug, it should probably be looked at very carefully. Uh, if you look at naturally occurring hallucinogens with a tradition of human use you don't have to worry about that because you- for instance, the mushrooms, we know that they were used in the mountains of Mexico for at least 2 millennia. Uh, ditto the morning glories in Mexico. So, uh, in the absence of good scientific data about the effects of artificial hallucinogens it's good to stick to the natural ones. And it also- and more interesting and kind of more, humm, philosophical case can be made if you accept the theory of Rupert Sheldrake of morphogenetic fields because you have to realize then that the morphogenetic field of a drug like psilocybin, which has been in living systems perhaps 120 million years, been used by human beings perhaps 20,000 years, what is its morphogenetic field going to be like contrasted to a drug made six weeks ago in the laboratory? It's the depth of these things, you see. The new drugs are empty. They haven't taken enough people yet to fill up, but what you see with something like, uh, psilocybin, or morning glory seeds, or something like that is the accumulation of the experience of all the people who ever took these things. I mean, that's why you're reaching back into a human family spread out over millennia and actually being those shaman. You are those shaman, or you are participating in the sh- the personality of the over-shaman, if you wish. So, that is, uh, [EG clears throat] the basis for an ontological distinction between artificial and naturally occurring drugs of all types, but especially hallucinogens which have this intellectual content.

EG: Gee, that's the best explanation of the, of uh, uh case for organic, um, psychedelics I've heard. Stephen said a long time ago when we were on the caravan, twelve years ago I guess, that we should stop

using LSD because so many people used it in such paranoid circumstances that the vibrational rate was no longer such that you could know that you were gonna have an ecstatic trip anymore.

TM: Well that's is an intuitive understanding of exactly what Sheldrake was saying. The reason I've been thinking about this recently was because I s- was at a conference recently on psychedelics, a closed conference mostly for healthcare professionals, and there was a lot of talk about Adam, MDMA, and, uh, then someone asked the question "What is the LD-50 of it?" L- [EG: What's that?] LD-50 is, uh, a fairly unpleasant concept which is necessary to understand in pharmacology. The LD-50 is the dose at which half the mice die, or half the dogs die, and all drugs are tested this way, and what you want with a drug is a drug with- where the LD-50 is hundreds or thousands of times more than the effective dose. For instance, uh, the effective dose of psilocybin is about f- twenty milligrams. The LD-50 for psilocybin is, uh, 375 milligrams per kilogram. So we're talking 30, 000 milligrams for a 145 pound human being. The problem that emerged with Adam was that the LD-50 was very close to the effective dose and that no human trials have ever been done. The effective dose of Adam is considered to be somewhere between 75 and 150 milligrams. The LD-50 is considered to be 500 milligrams based on studies of dogs. Now, I'll- let me explain this, so it doesn't sound too alarmist. Dogs are not good creatures to extrapolate to human beings. Uh, practice has shown that mice are much better, that, that the LD-50 in mi- of mice will be more generally close to the LD-50 of primates including man than data on dogs or cats. Nevertheless, in the absence of any human data whatsoever about Adam, uh, it's very unnerving that the LD-50 is so close to the effective dose. So immediately the institution which was holding this conference which probably would prefer to be anonymous pledged a thousand dollars to study the problem. Someone at the conference pledged a thousand dollars, and, uh, tests will begin with sophisticated human volunteers who will, uh, clear their systems and then take it and then have massive, uh, blood work done. This is the short-term human, uh, data will come out of that. The long-term human data is beyond the financial capability of the underground. But you see, this is interesting so let me take a moment because it's important for people. Um, there's only one drug in the world which is safe, strangely enough. In other words, there's only one drug in the world that no one knows how much it takes to kill you, and that drug is LSD-25. And this is a very fortunate thing because people in the 1960s got into the habit, I remember Tim Leary said, "when in doubt, double the dose." Completely reasonable advice for LSD. The problem is that LSD is the only drug with such a benign profile, so that, uh, we can't carry the- the dose estimation habits that we formed on LSD into these new amphetamines like MDA, MDMA, Adam, ecstasy, because, uh, they are- it's well known among chemists that the, uh, the cyclicized amphetamines are toxic. Mescaline is the most toxic of all natural hallucinogens. MDMA is four times as toxic as mescaline.

So, at this conference we- uh, a great deal of, of thought was put into- there were people there who were so enthusiastic about the um, effects of ADAM, the, the psychological effects, that they felt that this was the greatest chance the underground had ever had to actually obtain a quasi-legal or legal status for a hallucinogen. The problem is this, uh, this, uh, toxicological data makes it clear that it could never be legalized, and in fact if ADAM cured the common cold it would not be legalized if it has a, uh, LD-50 profile only four times the effective dose. So I had up until this time had not uh, formulated- I had had a preference for botanical drugs, but I had not formulated what is the real difference, you know, and when you would argue with people that synthetics and nat- organic drugs were different, they could eventually argue you to the point where you just could defend it because they seemed to be the same. But with Sheldrake, the notion of Sheldrake, that the morphogenetic field attends the compound and the absence mainly of human data. I mean, uh, we went through a ketamine phase with moderate amounts of human data although now I see in Science News last week there's fear that it depresses the immune system. In fact

it does depress the immune system. Well, leaving aside its, uh, use in the underground, the worst thing an anesthetic can do is depress your immune system because you're going to have surgery and come out of surgery and be in a surgical recovery ward. You want your immune system to just be fully revved up. Now we have this problem apparently with Adam, and in fact there has been one reported death at a dose of 390 milligrams. Uh.

EG: Thanks for that information. It's really important to get out because there's so much enthusiasm about Adam..

Well I've spen- I've told Tom all these things and he was floored [EG: I'm sure he was] and we had a long talk about it, and it's- we have to take responsibility, you know, the underground, because we can't have- another drug scandal would finish psychedelic research above and underground for the rest of this century. So, uh, it's a problem with the people's, uh, courage. I mean, let's contrast two drugs for a minute. Here we have psilocybin. Effective at the 20 milligram dose, and, uh, you would have to take, as I said, probably close to two and a half dried pounds of the mushrooms that are on sale in the Bay Area to approach the fatal dose. Nevertheless, if you take 40 milligrams of psilocybin, you will swear that you are at death's door, you know, you will swear that you are looking at the path to the Bardo. And, uh, but with Adam it's totally- the feeling, the aura is that it's completely benign even as you approach a fantastically dangerous dose.

EG: It is amazing because Adam puts you in a state of love even for itself. That's what happens. And you know, I discussed this with Luke coming down. It seems to me that my experience with Adam is that I'm so much in love [clears throat] in a state of love that it's dangerous in other ways because I accept [TM: too much] I accept things that I shouldn't really accept, that aren't the best for me [TM: That's right] so it's, uh it's some- boy it's fascinating.

TM: See, now I've heard of people who, essentially to become courageous enough to get really stoned take Adam ahead of it. In other words, people say well I take Adam and then I take LSD an hour and a half later, or I take psilocybin an hour and a half later. Well, I think that these are, you know, in the absence of human data this is all very chancy stuff. We have to realize that LSD was a God-sent, special, miraculous case. I mean, it was amazing to pharmacologists that it was so non-toxic. The CIA gave an elephant six grams and, you know, it laid down for three days and then it got up and shook it's head and wandered off to look for something to eat. So [TM chuckles], but we must be more responsible, so I've actually formulated it down to a little test which is if you are interested in the spiritual path, utilizing hallucinogens, then the hallucinogen you use should be able to answer 'yes' to two of the following three questions: Does it have a history of shamanic usage? Does it occur in the tissue of a plant or animal? And then let me think.

EG: You can't think of it [laughter, TM laughs]

TM: Ah, does it bear a similarity to compounds that occur in our own brains?

EG: We're just discovering a lot of those compounds [TM: That's right] that we don't know them all yet.

TM: Well, but as I said, you have to be able to answer yes to two [EG: two of those..] of three. So then [EG: So LSD would actually pass two of those [TM: that's right] as far as the Eleusinian mysteries where it was utilized for thousands of years and [TM: And it's occurrence [and occurrences in m- in m-] in the

brain. Well and also it occurs in morning glories [EG: In morning glory seeds.] and ergotized rye and uh.

EG: So..

TM: Yes, uh, and if we do that I don't think we'll get into trouble. And I also want to make this clear. We will not be denying ourselves any dimension of importance. In other words, I notice people have the attitude that you have to take all drugs to know what's going on, and what I find is that you find out far more about what's going on if you take a few drugs at progressively more and more heroic doses. Ah- also, and I invite experimenters to try this, at the moment there is so much attention directed toward Adam that the morphogenetic field of Adam is so strong that if you'll take psilocybin you can request it to masquerade as Adam and it will immediately turn over and be Adam for you. [mhm] so [Terence laughs] and I don't think Adam can do the same trick going the other way.

EG: Well, uh, do you mind if I talk- ge- uh I mean [Q: Go ahead, go ahead] Please do join the conversation. And I know you want to get more technical [No- I] but I want to save it a little bit [Q: Sure, but it's] Uh,

TM: Well that's all I wanna say about,

EG: Well no I've got some questions.

TM: Ok.

EG: Uh, uh, oh God. What did you just say about psilocybin? Oh, that it would turn over. I want- could you run down for people- If I understand you correctly, Terence, I understand that you believe, or i- it- the reality that the spore of psilocybin mushrooms are in- are alien intelligence, are intelligence from other areas of the galaxy or universe. Would you ex- tell us a little about that?

TM: Well, it's not a belief of mine, it's just a case, a case I make because I want to stretch the imaginations of evolutionary biologists and everybody else who's looking at the living kingdom. And it is certainly true that spores appear to be genetically engineered for space flight. They are a color, deep purple, I'm now talking about the spores of *Stropharia cubensis*. They're a deep purple color which absorbs UV. That's the color you would paint a spaceship. They, uh, uh, survive best in conditions most like those of space. In other words, high vacuum, low temperature. They, uh, are small enough that they could, through Brownian motion and then the formation of global electrical currents on their sur- forming on their surfaces high up on the atmosphere, actually percolate out into outer space much the way, for instance, the atmos- much of the atmosphere of Mars has drifted away over millions of years. And, uh, I think that the experien- well, that's basically a case for that they are a biological entity able to migrate between the stars by- through utilizing convective flow and light pressure and that sort of thing. A more radical proposition based on the experience of psilocybin is that that organism is intelligent, o- or that it is able to transfer information, that it is somehow a form of life which is able to communicate with us when it is, uh, locating in our nervous systems, that it comes to its fullest flower in the organism of a higher animal and that in that state it is- there's the potential for an I-Thou, uh, exchange. And phenomenologically there's no question about this, that there is this I-Thou exchange with psilocybin. But people can s- uh, you know, psychologists can say it's an autonomous psychic component that has slipped out of the control of the ego, and you're dialoguing with that, or whatever. But I think when you've had the experience, uh, the overwhelming impression is

that you are having a conversation with a very strange, very old, very different kind of organism. And, uh, based on that, and as I say, these physical arguments about the survivability of the spore and its adaptability to the outer space environment, I want to suggest that space may be no barrier to the migration of forms of- many forms of life, not just forms of life possessing space ships, and that probably many times in the Earth's history spores have drifted down and become part of things.

And this is not a radical theory at all. Uh, Crick of Crick and Watson holds the same view and believes that probably the galaxy is a biome. The galaxy is a biological unit, and we are just coming to the level of scientific and cultural an- awareness to recognize these things. And of course I think this argument seems preposterous unless you have had the experience on fairly high doses of psilocybin of actually meeting this alien entity, which is an experience very different from the classical psychedelic experience established through the use of LSD and mescaline. Those seem to be largely explorations of human dimension, psychoanalytic and the collective unconscious of Jung, dimensions of historical resonance and, uh, and that sort of thing. But there was not the prevalence of the extraterrestrial theme that you get with the tryptamines, psilocybin and DMT especially. These seem to be ways of communicating with a nearby world of alien intelligence which may or may not be space-based. It may be hyperdimensional or it may be earth-based. These may be the elves and fairies of folklore.

The human experience is so bounded by language, we don't realize how our scientific and linear expectations of the world hide from us the real complexity of what's going on.

EG: Mhm. Well-

Q: Oh..

EG: Uh huh. Did you have something you would like to say or ask or comment on?

Q: Um.

EG: How are we doing time-wise?

Q: No go ahead.

EG: Ok, uh.

TM: I didn't mean to stop the show...

EG: That's alright, I ha- I ha- it was a great l- uh, little. I- I have question then, uh. In the experience of actual extraterrestrial intelligence embodied in form which I've read and heard you describe before, uh [clears throat], is there a, is there a place that you go- I'm asking a question, in the psychedelic experience with psilocybin at any rate DMT forms where you go into the molecular form, uh, like, and then out another side that forms itself into forms that we're not familiar with here in our 3-D land. You actually go through the mandala? Is that wha---

TM: The molecular mandala. Well, I never cognized it that way, but hat's an interesting way to think of it. It's as though the molecule turned the mind through another dimension and you see something which is co-

present with reality, as it were, but between the spaces sort of, and suddenly the phase shift occurs. I remember when I was a child I had this toy which was, uh, a flat piece of paper with a, uh, circus cage printed on it, and when you moved the bars one way there was a zebra in the cage. When you slid the bars the other way and covered all the parts of the zebra, a tiger was revealed, and this is, uh, something about the nature of reality, that there seems to be at least one other continuum co-present, and this is why our folklore is, uh, haunted by elves, genies, djinns, afrites, demons, uh, all these curious creatures of folklore which, you know, wouldn't be there if there was not some experiential basis for them. It's just that we have crowded into cities and then crowded into condominiums, and we don't experience what goes on with the single person in vast wilderness in a life lived based on experience of the present at hand rather than vast abstract systems of explanation dictated by science and government and that sort of thing.

EG: Would you, would you like to comment at all on, uh, uh, what you think the psychedelic experience is with your knowledge of the chemistry of the plants and, uh, so forth and of the physiology of the body and the kind of experiences you've had? Do you have any idea what it is? What, what is it?

TM: Well, I'll tell you what I think it is but it's not really based on physiology or pharmacology. It's based on carefully looking at the experience. Plato said "time is the moving image of eternity", and I think that what these psychedelics do is they actually do connect you to the whole circle. You stand outside of the moment from which you embarked on your psychedelic experience and you see eternity like a vast landscape deployed in front of you. So what I think psychedelics are is they're about time and they somehow make all time co-present and how this is possible and why it's possible I don't know, but I think perhaps this is what the myth of the fall is about, that what man's fall is is really the fall into time, the time of a fading past, an unknown future and a, uh, very intense but very small area where things are going on called the present. There is some way in which that can be stepped out of and it's not- it's not, uh, an either-or situation. We are all, to some degree, in time, and we are all to some degree in eternity. And to the degree that we are in eternity we behave correctly and have right activity and right perception, and these psychedelics enhance this involvement with the totality of everything. That's why it is not naive to suggest that issues like the nuclear gridlock and all these, uh, other terminal problems that we have could be overcome if people would, by any means, try to come into attunement with the notion of unity in time and space of the species and the planet and the solar system and, and I think that this is the, the evolving, core idea which will either save us, or the absence of its evolution will be our ruin. The idea of unity and interrelatedness.

EG: I would like to suggest if it's possible that both things are happening, that there is a universe where it's unraveling and one where [coughs] we've already was, and I mean wasn't it I- I mean- wasn't it you or I know Robert Anton Wilson, I know, has talked about it some, uh suggested the future is already, is pulling us towards it. I I- and I like that [TM: Right.] , and you talked about 12-12 as a step over point. I've told every-

TM: 2012

EG: 2012, yeah [TM: right], and I've told everybody that. And a few days ago somebody told me that the Mayan, uh, fifth wheel which we're on now ends in twe- in 2011 which I didn't know unti-

TM: It actually ends in 2012, it ends on the 21st of December 2012, just thirty days after the date that I picked from all the work we did with the I Ching. Yes, somehow-

EG: -What did you, how did you do that? Would you mind running at that really- I can't understand your book, I just can't understand it.

TM: But yeah, the apocalypse is the millenium and the psychedelics move you into the future. We are all occupying different places in historical time. I mean some of us are completely uncivilized neanderthals, I mean, and some of us are very uptight 18th century sort of people interested in the social contract and the obligations of class and party and, and some of us are, uh, future people. And this is the whole- you don't have to wait for society to move into the future. You can just make it happen around you, and if everyone did that we could leap a thousand years into the future.

EG: I try to tell people- that's one of the things that I say when people come on "well are we going to make it through the nuclear thing" and stuff. And I say listen man, I've visited the future, I know there's a future. I don't know whether there's one for you but I'm sure there's one for me 'cause I've seen myself in it, right? And I keep coming back and you keep coming back, we all keep coming back. I-is, uh, because we got ahold of this great thing we want everybody to share it. But we have a few little things we can work out ourselves on the way.

TM: Yes well, by-

EG: Here and there.

TM: everybody by example. I think that the whole thing, the crux of the whole psychedelic issue is that it, uh, it accentuates personal responsibility by making people take their own experiences seriously. People completely undervalue themselves. They think that they are spectators to life. They think that the great scientific breakthroughs, the great works of art, the great political upheavals will all be brought to them on the tube and explained by Newsweek. They don't realize that all of that is illusion, and that what is central is the immediacy of personal experience, and that if you work with that you can just leave history and move off sideways from it and become your own Magellan. This is what people are doing in their living rooms taking psilocybin in darkness late at night. They are the Columbuses of the New World of the human- of the human spirit. And, uh, by taking responsibility, by abandoning the myth of, um, that science, government, the military and the churches are the forces which make culture, and just realizing culture is what we're doing at this very moment, the evolution of historical thought is what we're doing at this very moment.

EG: Maybe, uh, before- I have one more thing and then I think that you all get a little technical before you have to go but uh, I, I always like to ask people if there's something I haven't asked that they feel people ought to hear right now at this as, you know, this place in the infinity sign.

TM: No, I'm very tricky. I unburdened myself early on [EG: That's what I thought] of what I wanted to say, what I thought should be gotten.

EG: Let's talk about just a few minutes about your book, your cassette book [TM: Oh right.] and that and where people can order, what's in it, what's it about.

TM: Ok, well it's a book called- I wrote a book called true hallucinations which was the story Behind the

Invisible Landscape, the story of an amazing expedition to the Amazon in the early 80's in which we met the saucers, or at least I never want to meet them more closely than that, and discovered the mushroom which we brought back, which we wrote our book about. And basically it's just the wildest experience I've ever had or ever heard of, uh, read on to eight cassettes as a nine and a half hour talking book with wonderful, uh, special effects and musical backgrounding and that sort of thing.

EG: Well that, that gave us a concise thing here before they started making too much noise [TM: before they started pounding], which was pretty great, so Lou, I know, has a lot of questions so before we break up I'd love to hear you all I-I can take or not take. I think you'd probably like to-

TM: Well let me thank you first of all Liz, I think people like you are really the shock troops of the new order because the whole thing that we're all doing is information, and the radio is, uh, very, very important.

EG: I know, that's why we've got to get it together to package this program and send it out around to- I want to send it to the, um, to those spots in the United States that have enough aware population to enjoy it. Uh, I think there are probably 30 to 50 of them anyway.

TM: Well you make it better but you're just fine the way you are.

EG: Oh yeah well [] I know it's a no-win situation [laughter] So, um, I- you want to go back to where you were talking about- because that led us into "why organic stuff." We were talking about..

TM: Oh, we were talking about cauldron chemistry...

EG: ..and alchemy. Yeah

TM: Well, there are many, uh, an interesting thing to think about in regard to shamanism and all that is that there may be many situations where natural products can be combined to make a powerful hallucinogen, where the components themselves are not the most obvious known example of that as ayahuasca in the Amazon, where DMT in *psychotria viridis* is potentiated by taking MAO-inhibiting harmine from *banisteriopsis caapi*. But there may be many potentials for these kinds of things, for instance, uh, why were the druids so interested in mistletoe? Let's look at the chemistry of mistletoe and try to imagine ways in which mistletoe might be brought in that direction. The Arundo Donax case is the other one, The Chinese, many of the mushrooms in the Chinese pharmacopoeia could be looked at as well. Uh, Ayurvedic medicine, there are traces of combinatory hallucinogens. So this is actually an area where not a lot of work has been done, and in fact generally synergies have not been studied. Synergies are a situation where two compounds are put together to get an effect, and even, uh, even pharmaceutically and medically the synergies which occur with various drugs have not been well studied.

Q: The- um, there were are a few areas that, um, I've spent some time thinking about. One of them is the, uh, what I call lower life form biochemical conversion processes or, um, ways in which things are transmitted perhaps from termites through tumetomyces?? through, through uh, tool-making behavior in, uh chimpanzees through that this transfer of information occurs and continues to occur and so that each, uh, organism perhaps in its combination, the flies which are stupefied by muscaria as it decays, are eaten by the frogs whose legs, in turn, are ????. Processing that goes on in that way as one form. The other is a chromopuncture, an area selectively- that the body is selectively sensitive to certain, um, colors, to certain

chemicals in certain areas, and that this is another area that isn't really understood or hasn't been looked into.

TM: No, you really make a good point.

Q: The olfactory intoxicants that they- there's a critical, um, um, timing and involvement that has to go on in order to optimize an experience and I think that the olfactory component is one that needs to be considered.

TM: Pheromones are aromatic compounds which are message-bearing chemicals that, uh, insects give off but plants also give up pheromones and in fact the more it's looked into the more it appears that everything is giving off pheromones. And, and the planar nature of hallucinogens suggest that they may be in some sense natural hallucinogens. Super-pheromones. They are actually bearing- message-bearing compounds whose purpose is to communicate between one species and another or within a species. For instance, the language of insects is not a language of sound but a language of chemical excretion, and how complex this language is we don't know because we can't pierce into it. But I studied for a while under doctor Ralph Oddie who was a great geographer and medical epidemiologist and he suggested that hallucinogens should be looked upon as a subset of pheromones and I know when you're in the Amazon you just breathe this air which is laden with thousands of chemical messengers of all sorts that are setting the ambiance of the whole biosphere and, uh, thi- this has not been looked at. It's not well understood.

There was an amazing article written a few years ago by a man named Harry Weiner who wrote an article called external chemical messengers, ECM, he called them, and ,uh, in the New York Journal of Medicine. And he outlined a whole theory about how this regulated species and interspecies relations. He talked about how when you walk into a room full of people you get an immediate gestalt impression which he felt was olfactory. That you were sensing the psychic conditions of everyone by taking a lung-full of the message-laden chemicals that everybody was exuding. He talked about psychiatrists who would diagnose schizophrenia by smell. They would just walk over to the person and take a hit of their body odor and felt, you know, that- and, and he even suggested what perhaps some forms of schizophrenia are is miscuing socially because your pheromone system is haywire so you're giving off what can only be described as a weird vibe and so people relate to you weirdly and that makes you weirder and it makes them weirder and you get this feedback lock, and it's essentially because your invisible chemical messenger computer is broken down.

Q: Um. Um, what I was thinking was that if we could get back a little bit to the combination of the, uh, let's say the tryptamine, the DMT and the, um, harmine or those combinations, and also to get to the fugu. I know very little about it and it would be nice if, if you have some thoughts on, uh, on the chemistry of the fugu and the---newt.

EG: What is fugu?

Q: It's, um, a fish that's eaten in Japan.

EG: Oh.

TM: Yes, I don't know actually anything about that particular fish. I know that there are fish eaten off

Norfolk island which is an island off the west coast of Australia. In fact there's an amazing description of a trip in Hoffer and Osmond's book *Hallucinogens*, uh, this person- this happened in the early 60's. They s- they saw a monument to the first landing on the moon and had all these super science-fiction visions of the future that they had not expected to get high. It was an accidental- they had caught this fish, roasted it on the beach and ate it. Uh, and in Hawaii there are similar fish, and about six species are implicated. And I think in all cases DMT is the compound. But not a lot of animal tissue contains utilizable amounts of hallucinogens. For instance, I don't think it's ever- no hallucinogenic insect has ever been confirmed although there are persistent reports of a grub, a palm grub, an immature beetle form in Brazil which is hallucinogenic and uh occasionally butterflies are mentioned as hallucinogenic but it's never been confirmed. So this is an area where research needs to be done.

Q: When uh, [clears throat], if one were able to make DMT from let's say rabbit lungs or were able to obtain the harmine from the Russian thistle and other plants, uh, how would one proceed in terms of combining these, um, in the most effective way?

TM: Well, you want a l- a, you want MAO inhibition. So you have to take an effective dose of the MAO inhibitor. And then, uh, the DMT is usually potentiated at a dose lower than the effective dose without the MAO inhibitor, and probably since these things are degraded substantially in the gut the most effective way of doing it would be to smoke it or sublingual absorption is also a direct route that avoids the degradation in the digestive system.

What I'll do today is I assume most of you are not familiar with my work, but I also assume you're intelligent, so I'm not going to give an introductory talk. I'll just cut to the chase and if you don't understand what's said, at least you have the satisfaction of knowing nobody talked down to you, right? [audience laughter] Okay, it's very hard to know where exactly to slice into this pie. I mean, I am an advocate of the psychedelic experience for [audience applause] [Terence chuckles]... for personal growth work, for shamanic exploration, as an enzyme for the imagination, as a force that forces us to grow up and, uh, clean up. However, what I want to talk to you today about because this is a pagan community, and because I think the argument, if it's not understood here won't be understood anywhere, is, I want to talk about the social impact of psychedelic plants on human consciousness both in the present and in the remote past. Because my approach to psychedelics is not to see it as a religious freedom issue, or a personal self-exploration issue, uh, that's all there, but I believe we cannot really understand what it is to be human being and how we came to be human beings without factoring in to our explanations this most taboo of all subjects for the Western dominator mind, the subject of boundary dissolving, consciousness expanding plants. And so every point of view has a cosmology, a myth of its meaning. And as quickly as I can I want to tell you the myth that to my mind unites paganism, psilocybin, sexual freedom, the peril to the earth, and the hope for the future, all into one very nice, neat package. And it requires a, a kind of an anthropology lesson.

First of all our fellow voyagers along the way – the scientists – have created, as you all know, the theory of evolution, which has been incr- the great crowning achievement of biology over the past hundred years. First the Darwinian understanding of natural selection and random mutation, then Mendelian genetics, the discovery of the particulate nature of the gene, then, uh, still later molecular genetics, the elucidation of DNA so forth and so on. The theory of evolution has been very successful in explaining the state of nature on this planet with one tremendously embarrassing exception which is ourselves. Biological evolution cannot account for a phenomenon like minded human beings involved in building and maintenance of global electronically-sustained societies. How do we do it? Well, we do it because we have a vastly superior cerebral architecture to any other organism in nature. And the interesting thing about that architecture is that it sprang into being in the blink of an eye, geologically speaking. The human brain size doubled in less than two million years. This is the most dramatic expansion in the size of a major organ of a higher animal in the entire fossil record. It would be under any circumstances an embarrassment to the theory of evolution, but notice that the theory of evolution was generated by the very organ we're discussing. So it is doubly embarrassing.

Now, obviously we are the inheritors of extraordinary circumstances. Higher animals have existed on this planet for 200 million

years in all kinds of forms. Uh, reptilian life, amphibian life, avian life mammalian life, and never, so far as the geological history of the planet can tell us, never did machine-building, language-using, technology-producing societies arrive. Some extraordinary interaction in our early history is responsible for our circumstance as language-using, technology-producing creatures.

Okay, end of introduction. Here's the scenario, and I hope it has special resonance for this community. All animal species tend to evolve into a- an ecological niche and stabilize themselves there. Ants and termites have been at equilibrium for hundreds of millions of years. Our remote ancestors also were on a direct course toward that kind of dynamic equilibrium. Uh, we were evolving toward being fruit eating, canopy living, insectivorous, uh, primates with an advanced repertoire of pack signals and this was apparently to be our evolutionary destiny. Were it not for the fact that sometime in the last five million years or so the African continent, which was the site of our environmental proto-system, began to dry up. And the forests that had always been our arboreal home began to shrink. And what this spelled for our remote protohominid ancestors was nutritional pressure. There wasn't enough food. Our remote ancestors began descending from the canopy and exploring the new environment that the aridity was bringing into existence. A grassland environment, an environment of limited numbers of plant and animal species relative to the climax tropical rain forests that were in retreat.

Now, the reason animals specialize their food supply is to avoid contact with mutagens in the environment. If you begin experimenting with foods and begin eating everything, uh, you will produce more children with mutations. Some of these mutations will be positive, most will be lethal. Uh, when our remote ancestors came under nutritional pressure they began expanding their diet. This was the moment when we became, uh, partially carnivorous, when we became omnivores. And had I more time, I would lay out many examples of specific plants – such as plants that contain birth control alkaloids and things like that – specific plants that would have impacted, uh, early human emergence. But I want to concentrate here on one plant. And that is the psilocybin containing mushrooms that grow in the dung of cattle. Because I think that if we are looking for a missing link it isn't a transitional skeleton, it isn't meddling by extraterrestrials, uh, at least not of the overt thousand-ton beryllium ship variety [audience laughter]. It has to do with the fact that we began to allow into our diet an exotic pseudo-neurotransmitter that was part of the native flora of the grassland. And I believe that, you know, in the next ten minutes I can at least make it seem plausible to you, that this mushroom was the triggering factor that moved us from being an advanced hominid, an advanced animal, to being in fact a conscious, self-reflecting, caring, thinking, dreaming, striving human being.

And here is my answer to this riddle, “where did human consciousness come from?” It begins like this: In that foraging phase where we were testing all kinds of plants on the grassland, small amounts of psilocybin mushrooms would have naturally been eaten in the process of eating corms and things like that. I personally have seen baboons, uh, in Kenya investigating cow patties on the savannah because they know that bug, uh, pupa will be under the cow paddies. So, the cow patties are already set up as vectors for possible sources of nutrition. So there is no question that these proto-hominids would have eaten psilocybin in small amounts. And by small amounts I mean amounts so small, that if you were to eat that much you wouldn't feel anything. But it's- this dose-level has been studied and it causes increased acuity of vision. You can actually give people small amounts of psilocybin and then give them eye tests and they do better if they're slightly intoxicated than if they are not. The guy who proved this, the Viennese psychologist Roland Fischer, when he described those experiments to me, he said, “and so you see, my young friend, here we have a case where the use of drugs actually introduces us to a more true vision of reality than if we have avoided the drug.” [laughter]. Scientific proof that the drug is telling you more about reality than if you had refused it.

Alright, now, what kind of visual acuity is it that is being improved? Well it turns out it's what's called edge detection. In the grassland environment where the movement of small animals means dinner and the movement of large animals means you become dinner [audience laughter] a plant which confers increased visual acuity is going to immediately confer an adaptive advantage on those members of the group that let it in. Those members of the group that refuse it out of esthetic or, or gastronomic reasons will tend to be out-bred, because the psilocybin using members of the species will be more successful at

obtaining food and at surviving to raise their own children to reproductive age which is the name of the game in, uh, in evolution. So that's step one of a three step process that leads to the explosion of consciousness in the hominid brain. Step two, which should have special appeal for this crowd, is that when you takes lightly larger doses of psilocybin, not religiously profound doses, but, but doses which you definitely feel, psilocybin is what's called a CNS stimulant, a central nervous system stimulant. What it causes in, in animals is what, uh, neurophysiologists call arousal. And in highly sexed animals like primates arousal means, in the male, erection. So what-an animal then, which is allowing, what is essentially a sexual stimulator an aphrodisiac to enter into the diet, there will be more instances of what anthropologists call successful copulations, and God knows we need that. So, if you have more successful copulations you have more pregnancies. You have another-a second factor outbreeding the non-psilocybin using member of the population.

Now, something really important here that is my, well this whole thing is my theory, but here is the part of it that I like the best: All primates, all primates, have what are called dominance hierarchies, or male dominance hierarchies. This goes right back clear to Lemurs and the old world monkeys- yes, well the new world monkeys which are more primitive. All primates have this dominance hierarchy and what it means is, the sharp fanged, hard bodied young males, they control the women, the children, the elderly, all sexual minorities, everybody is under the thumb of the alpha males. And as we sit here today, though this community may strive to be an exception, as a society male dominance is an enormous dilemma for us, and an enormous distorting factor in our politics and in our lives. So my notion is that psilocybin, by promoting this polymorphic sexual style, actually acted as an inoculation against monogamous sexual styles of bonding, you see. And it isn't that the monogamous style, the dominator style disappeared- it was simply medicated out of existence. For perhaps 100,000 years it was medicated out of existence.

Now, and, and what it promoted, this arousal, this psilocybin-taking around the African campfires by these primitive nomadic pastoralists, what the social change that came with it was, was an orgiastic sexual style. A style were everybody would get loaded around the camp fire and then hump in an enormous writhing heap. [audience laughter and whooping] Now, besides the fact that this is a great deal of fun it has a very, very profound social effect, which is: in societies which allow orgy men cannot trace lines of male paternity, men cannot trace lines of male paternity. What does this mean? It means that men do not identify with children as property. It means that the men of that kind of a social group can only think in terms of *our* children, we the group, our children. And it creates an immensely cohesive social glue that I believe held these societies together for millennia. And I believe that during this period of pharmacological suppression of male dominance we became human beings.

Theatre, poetry, magic, art, altruism, uh, dance, symbolic and cognitive activity of every sort was born in that window of opportunity when there was simultaneously a chemical suppression of male dominance and consequently an opening to Gaian intentionality, to the intent of the larger biological systems in which the human system was embedded. And a kind of paradise came into existence. There were actually two phases: one from about forty to thirty thousand years ago in the interglacial 6 and in that early phase human beings, cattle and mushrooms were sort of all swirling together there on the African grassland in contact but not yet a coherent triad. The second partnership paradise arose at the last glaciation, uh, at the melt, during the last glacial melt and it lasted from about 20,000 years ago to perhaps as much, as, as recently 10,000 years ago. And it was in that later phase that, uh, uh, the Magdalenian explosion occurred and the social forms were put in place that Hellenistic paganism was looking back at with a nostalgic and barely cognizable memory. There was an old, old memory of a kind of paganism that was old 5,000 years before Eleusis laid its cornerstone.

I wrote a book called *The Archaic Revival*, in which I try to say that the entire cultural impulse of the 20th century, beginning with Freud and Jung discovering the unconscious, beginning with Picasso dragging back primitive West African masks to Paris and inserting them into his paintings, Dada, pataphysics, jazz, abstract expressionism, even phenomena like National Socialism, all of these various impulses in the 20th century, some positive, some negative, all have a common theme: archaism. Archaism, a nostalgia for a state before history. And as this tendency, this nostalgia has been sorted out over the last 100 years by generations of scholars beginning with, you know, Freud and Jung and Blavatsky and Crowley and then coming up through all the folklorists and deconstructionists, as this thing has been teased apart, it has become clearer and clearer that the paradigmatic figure in any archetypal revival is the maker of magic, the shaman, the wizard, the seeress, the person who is in control with invisible forces. And as I have lived my life and explored these things for a longtime I've come to the conclusion that the shaman without the hallucinogenic plants is well on the way to becoming priest or priestess, well on the way to being

downloaded into a fixed canon, a, a moral vision, uh, a societal, religious structure, which is not what shamanism is about. It's about discordian ecstasy; it's about the felt presence of immediate experience in the absence of theory. That's what it's about.

So, this, this, uh, well, and then I want to get back to our little process. We've now covered step one, better vision through mushroom taking leads to better diets and healthier children. Bigger doses lead to an end to monogamy, a dissolution of pair bonding and a replacement of, of monogamous anxiety, with, uh, polymorphic amorousness or whatever you want to call it. Uh, then – that's only the second step – the third step is when you double the polyamorous dose, and now, hunting is out of the question [audience laughter] and even fucking is out of the question because you are nailed to the ground somewhere off at the edge of the firelight wrestling with a mystery so profound, so bizarre that even as we sit here with Husserl and Heidegger and Heisenberg and all these clowns under our belts it is still absolutely mysterious, appalling, challenging, boundary dissolving and unavoidably ecstatic. It is *the* living mystery. And I don't know how many of them there are in the world but for my money there only has to be one [audience laughter] to rescue the entire concept from, you know, the dirty claws of the reductionist, the materialist, the Christers, the nothing-but-ers, the merely-this-and simply-that-ers [audience laughter, applause]. Yea, I know that I am preaching to the converted but I [clears throat] if I'd preach to the unconverted I'd be hung from the yardarm. [audience laughs]

So, you may say to yourself, "Well, this is all very interesting. This guy has some kind of anthropological revisionist theory and, you know, that's all well and good, in other words, so what? What does it have to do with us? Well, what it has to do with us, we are in a state of enormous dysfunctional anxiety as a result of the fall into history, which has caused us to have to compromise our sensuality, our connection to the Gaian Goddess, our polymorphic sexuality. All of these things have been poured into a new set of social institutions that derive, essentially, from the invention of agriculture, which is where I think the shit hit the fan. I mean I'm fairly radical on that. I think that agriculture is the end, because it's incredibly successful as a strategy for food production. Well, what does that mean? It means you can't be nomads anymore. Oh no, you have to build a stone tower to put the grain in. And you have to make sure you can haul large rocks upon top of your tower to drop on people who's grain crop wasn't as big as yours was. We see this at Jericho. The most advanced building of the world at 10,000 BC was the grain tower at Jericho. And it was defensive, and it bespeaks, you know, the primal paranoia.

Once people stopped moving across the land, once they violated it with the blade of the plough, then you get sedentary populations, the division between the profane world of the city and the wilderness outside. That's the moment when the division between the unconscious and the conscious mind comes into play and an entire set of institutions arise then: male kingship, standing armies, role specialization, slavery, women as chattel, uh, so forth and so on. I mean, we are the unhappy inheritors of this hideous plunge into dysfunctionality. Now why is it such a hideous plunge into dysfunctionality to live without psilocybin or close relatives thereof? The answer is that his thing which to now I've described as male dominance and a tendency to form dominance hierarchies we can describe another way and bring much closer to home by saying "It is the ego". The ego is a late arriving, very tenuous, highly uncertain of itself, social structure that has taken root in the human psyche like a tumor, like uh, a, a growth of some sort. It is the leftover of this primate dominance complex and the way it manifests itself is by the establishment of boundaries. First of all, this is my body, do not touch it. Second of all, these are my weapons and, and agricultural tools, do not touch them, this is my woman, these are my children, I hunt there, so forth and so on. It's this division of the world which allows the illusion of the ego to come into existence. Now, what do psychedelics do and why are they such social dynamite? The answer is, it's not a health issue, it's not an addiction issue, I mean, that's preposterous, it's about boundary dissolution. Every society from the classic Maya to Fujiwara, Japan, to the France of the Bourbons, every society establishes a set of boundaries which it then calls "reality" and woe betide you if you go across the boundary, because then you are outcast, outclassed, outlandish, and the full fury of the community can be turned against you. And we all know what that can mean, as pagans.

So, I believe that the ego is a dysfunctional, uh, psychic invader. And that it will continue and strengthen to perpetuate itself as

long as we do not institute either as groups or within our relationships or as individuals, a regular ritual encounter with the forces which dissolve these boundaries. And the only force I know that works are these plants. And as I say, I'm not interested in arguing whether there are other methods or not, God I would hope so, but anything I ever looked into, and I shopped the spiritual supermarket from stem to stern, was horse shit as far as I could see, [audience laughter, applause] Now, I am not a sensitive, let me say that, people say, "Well, but what about Ramana Maharshi, what about Jaka Berma – hey, it's great for those folks. I applaud our hots and avatars and so forth and so on, but what I'm interested in is democratic ecstasies. It should be for the most lumpen among us. It, it is not to be attained by an act of dietary control, sexual abstinence or, uh, you know, whatever. It is a human birth right – it is a human birthright to touch the incorporeal body of the Goddess, [audience applause] it isn't something ... [more applause, laughs]

So, uh..., well let's see, where can we go from here? I say all this, if you are interested, I say it better than I'm saying it here, in my book *Food of the Gods*, which was not written for you people, it's an argument for people who do not know a great deal about drugs, may never have taken drugs, but through some miracle have managed to maintain an open mind. Uh, [audience laughter] I don't know how much you know about my shtick– and I can't get into it now – but for me these things are more than tools for the Freudian or Jungian unconscious. I mean, I journey to inhabited worlds that are, there are echos in Elf land and Faye but, you know, as a rationalist, as a, as an aspiring astronautical engineer at age 13 it's astonishing to me that I could validate the mystery through doubt, through doubt.

The truth does not require your belief. The truth is real. You can beat it on the ground, you can rip it apart, you can look inside it. Nobody needs to guard the truth from inspection. Nobody needs to tell you that, you know, you can't look behind the stage. And so, my motivation is to try to – number one – bring people to the realization that the spiritual path – if you want to think of it that way – that is a real thing. And it will carry you to the real thing. All spiritual disciplines that I know except for psychedelics, put a great deal of emphasis on putting the pedal to the metal. Push, push, push, you know, meditate, make offerings, do Mantrayana, do Pranayama, do Pusha, push, push, push! With psychedelics suddenly there is a very deep interest in "And where are the breaks?" [audience laughter] You see? You're no longer pushing. Once you get to the psychedelics, seeking is an attitude which ill becomes you. [audience laughter] You have found it! You have found it. Now what in the hell are you going to do with it?

And, and this is a great dilemma for anyone who goes into this. I mean, I am, as I see myself, I'm a preacher in the marketplace, but I know – and I'm sure most of you know – that I could walk out of here, you could walk out of here, and you could go as far as your courage would carry you. There is no barrier. There are no more barriers. You can go as far as your fuckin' courage will carry you. And at that point you have to ask the question, you know, "Do I want to be the Mad Monk of Cold Mountain? Do I want the villagers down in the valley to say: Oh yes, we see him occasionally up in the mist naked, flying with the eagles ..." uh, [audience laughter] because you can be that person. You know, you don't have to go back to your job as Addict-Sachs stock broker or whatever it is. And so we stand on the edge of being able to leave history. We can leave it.

You know, we tend to forget because our lives are so brief, but what we call the psychedelic experience is very, very new on the plate of Western, uh, uh, occultism and science. I mean hashish did not make great inroads into Medieval Europe, that all came later in the 18th and 19th century. Chloroform, ether, these things don't cut it. Mescaline was, uh, synthesized for the first time in 1888. These things had to compete with many other interesting areas of scientific exploration in 20th century. We have not come to terms with what they mean and what they are. Uh, and it's a curious area because the counterculture – whatever that may mean – knows a great deal more about this than science. I mean, science does not explore this area because it senses enormous danger for its ontological machinery. It probably couldn't survive the encounter. And therefore its just said, "Well, it's psychology, it's marginal, it's fleeting, it's non irreproducible, and so forth and so on. This is all nonsense. You can, by unplugging the telephone, by fasting for six hours, and by taking 5 dried grams of *Stropharia cubensis* in silent darkness, you can go up to the great simulacra of human explorers Hypatia, Maria, Newton, Da Vinci, you can take that ride. I have the feeling that when we go into those psychedelic spaces we not only see things no one has ever seen before, we see things no one will ever, ever see again.

Okay, one last thought I wanna put out and then I'll try for some questions. I have a sort of a rational mind, in that I like to make sense. I don't mean experimental sense, but I mean if you can build a verbal metaphor to get from one thing to another then you understand it much better. And so I-the magical dimension is real. It isn't psychological, it isn't based on the strength of will. It's as real as Mars in its orbit. I mean, there is real estate out there, folks. It's that real. And so then, uh, the question becomes, uh, how to vivify it. And the answer is by creating a consensus in language. By having it made illegal it's like where sex was with the Victorians. You know, everybody was inventing the wheel over and over again.

What we have to do is begin to build a consensus about this realm. And, uh, you know, this may be heresy in a community as oriented toward tradition as this one seems to be, but- and the generally pleasant position to take is that everybody has a piece of the action. You know, the Hassids know something, the Buddhists know something, the Book of Mormon there's something there ... The mushroom was incredibly ungenerous on this point. It said: "Nobody knows jack shit about what is going on." [audience laughter]

So it is for you with your body as laboratory and your mind as worker in that laboratory to find a way, to reflux the alchemical gold. The only experience which counts is your own experience. Everything else is somehow handed down through social structures and political structures. It, it's irrelevant. If flying saucers were to land on the south lawn of the White House tomorrow, it would not matter to you as much as smoking DMT would if you did that tonight. Because that's your experience, your conviction, you see. And I believe that, uh, the rebirth of Paganism, the rebirth of Archaism, the rebirth of Psychedelic Shamanism is coming at this moment because we are going to be involved in a historical meltdown which will be the equivalent of a species-deep shamanic crisis in which, as a collectivity, we are going to have to make the journey to the well of worlds and recover and cleanse the collective soul of humanity.

We have lost touch with our moral compass because we have lost touch with the Gaian mind. And this is not a metaphor. If you take these neurotransmitters, these exopheromones that connect you up with the natural environment, the Gaian intent becomes known. It's an act of feeling. If we could feel what we are doing we would stop doing it. But we live in a realm of abstraction, excuses, incredible wealth, incredible levels of pampering and softness lay between us, the upper five percent of the intellectual and material elite on the planet, and the problems. I mean, how many of us have been to Bosnia, or Rwanda, or Somalia? These things are only images on a dehumanizing screen. If we could feel what we are doing, we would awaken to the mystery of each other and to the mystery of the historical process of recovering what was lost.

We don't need this material civilization. We don't need five billion people on this planet. We have to think very, very radically about how we are going to change ourselves or we're not going to make the cut. And orthodoxy is utterly and completely bankrupt. All it can do is suppress. They suppress, they suppress, they suppress. But there's only one argument that will forgive suppression: deliverance. And they can't give us deliverance. All they can give us is the Menendez trial, O.J., Baby M, The Skaters, Claus von Bülow, horse shit, horse shit, horse shit. [applause]

We are locked inside, uh, a nightmare, a nightmare of contaminated and toxic imagery that is designed to disempower you and make it impossible for you to think straight. And the way out is straight back to the reality of the vegetable Gnosis. It is there, it has always been there. The societies that never broke the connection live in dynamic and loving balance with each other and the planet today were it not for the input of our disruptive social and economic systems. So I, I talk to all kinds of people who I see as part of my community, but it stretches from virtual reality, to the radical gay movement, to the house movement, to the pagan movement, to the younger molecular pharmacologists, to the radical art historians and psychotherapists – all of these communities are fragmented and suspicious of each other, and this is precisely what orthodoxy enjoys. If all of these

countercultural impulses could make common cause, we would probably discover that we are 65-70% of the population. And so what is needed is a spirit of boundary dissolution between individuals, between classes, sexual orientations, rich and poor, man and woman, intellectual and feeling-toned types. If this can happen then we will make a new world. And if this doesn't happen nature is fairly pitiless, uh, and has a place for us in the shale of this planet where so many have preceded us. [audience laughter] Well, I think that's the basic rave. It raises a lot of issues. If somebody is burning to ask a question, uh ... yes, burning to ask ...

[44:32]Q & A

[Q: ?]

TM: Well, I think that it's very hard to find pristine pseudo-Paleolithic, or "pseudo-Neolithic" culture. Even the Amazon, where I've spent a lot of time, uh, tribes that were nomadic at the time of, of, uh, contact are now agriculturalist simply because missionary medicine has swollen aboriginal populations to the point where they can't be nomads as they used to be. So, you're right. There are some psychedelic-using cultures that are pretty, uh, uh, unappealing – although actually I can only think of one, that I find politically very unappealing. And I don't wanna knock them because I haven't lived with them. So I may be misled. But I think it's not simply taking psychedelics but it's also to decondition oneself to the notion of ego and all the concepts which constellate around that, such as place, property, ownership, and stability. You see, the idea that we have inherited from Western religion and science is the idea that things should be stable. This is a very male dominant notion, the wish for stability, eternity, when in fact the message life hands you over and over again is "nothing lasts". Nothing lasts. Not what you love, not what you hate, not your enemies, your friends, not even your dear, dear self. Nothing lasts. And the ego goes mad in the presence of that truth; it, it, it can't swallow it. And so we have anxiety of death, need to dominate people, need to possess property, terror of illness, resentment of fate, because we are not in the flow. And I think what these psychedelics do is they put you very much in the 'here and now'. And it's nothing more than that. I mean, obviously I'm an egghead and an abstract thinker, and I hope to make my reputation in mathematics, but feeling is the primary validator of existence. I mean, if you don't know that, you gotta go back to square one. And these things empower feeling. They are catalysts for the imagination. I mean, you may not like what psychedelics do to you, they may terrify you. But if it terrifies you then surely it must have catalyzed your imagination, or you wouldn't have known that terror. So catalysis of the imagination in a fairly loving and yet ruthless way is what the psychedelics deliver. Anybody who calls this escapism is sitting on their thumb. I mean they don't know what they're talking about. Reality is for people who can't handle this stuff! [audience laughter, applause]

I do want to say one thing. It almost slipped my mind and for those of you who have your hands up I apologize but I think this needs to be said. And I don't know how many of you know it, but this is a news flash, folks. We interrupt this program to bring you a special announcement. A new psychoactive substance has been discovered. A very powerful psychoactive substance, the most powerful since the discovery of LSD. A substance so powerful that 300 µg is the dose. That means 1 gram will dose 7,000 people. This compound comes from a plant. The plant is – and I hope you're paying attention – the plant is legal. The compound is legal. You can possess it. You can manufacture it. [audience laughter] You can transport it across borders. You can give it away. You can sell it and you can do it on stage. [audience laughter] And it comes from a plant. And the plant is also available, and I wanna tell you about this because [laughter], Okay, no shoving, no shoving! [audience laughter] Alright, not to keep you in suspense any longer. The plant is *Salvia divinorum*, *Salvia divinorum* which, some of you who are real mavens of this stuff know it. It's been in the books for 30 years. The problem was nobody knew how to get off. And so it was always carried in these lists as 'suspect hallucinogen'. The thing is, any scientist, confronted with a plant where somebody says it's a hallucinogen, will test to see if it's an alkaloid. All hallucinogens, almost all, are alkaloids. So, *Salvia divinorum* – negative for alkaloids. Doesn't matter. It has a new, unknown compound in it – now known – Salvinorin alpha. And the interesting thing about Salvinorin alpha is, we have in this country a structural near-relatives or cognener law, which says, if a compound is a structural near-relative, isomer and enantiomer or stereoisomer of an illegal compound then it too can be made illegal. *Salvia divinorum* doesn't fit this description. That means that in order to make this stuff illegal the government will have to present medical data showing there is something wrong with it. And at this stage nobody on earth knows the real pharmacological parameters of this compound.

So, here is the deal: you can grow this plant in a window box in your apartment, in your backyard. It looks like 'Joe Plant' [audience laughter]. There is nothing particularly distinguishing about this plant. And if you have three or four cuttings in six or seven months you will have more than you know what to do with. And, then, then I'll just describe how I do it. I'm slightly

chicken shit to do the pure compound, which, by the way, you do 300 µg. Understand that what it looks like is a grain of salt. A *small grain of salt* is a human-effective dose. It comes on so fast that you have no impression of it coming on at all. You do it and then after a while you notice that for a long time you have been staring at something incomprehensible.

[audience laughter] Well let me ta- here is how I recommend that you do it while we get the chemical thing sorted out. Because the chemical – it could be dangerous. It would be very easy to overdose by a factor of ten, twenty, thirty and you would still just be doing a smidgeon. So I say let's honor the plants. Let's not hand the government a bunch of casualties that it can clock over and put on national TV, you know, the bible, bible, bible show [laughter], uh..., let's use the plant. And the way you do it is you grow up a batch of this stuff and get between fifteen and twenty leaves. Remove the mid-vein with your fingernail, just to lower the mass, fold it all into a little pile, put it in your mouth, and twenty leaves is a whopping mouthful, so basically as much as you can get in your mouth. Put it in your mouth- lie down in silent darkness and squeeze the stuff with your jaws. Tastes like ..., it's horrible. It's not as bad as ayahuasca, but it's horrible. But you could acquire a taste for it. [audience laughter]

So, lie down in darkness where you can see a digital watch – one of these red-flashing jobs like a K-mart deal and, and then let it ...don't swallow it, but just squeeze it and masticate it. At fifteen minutes by the clock spit it out into a bowl or Kleenex or something. And then just lie there. Lie still in the darkness with your eyes closed and look. And this is almost the key empowerment though it's idiotic. People fail to do it. Look at the back of your eyelids with the expectation of seeing something. And when you do that, after just three or four minutes there will be what, uh, we professionals call streaming. Which means ameboid lights of after image colors, the chartreuse and purple flowing by, and about three minutes after that it will deepen very, very quickly into extraordinarily bizarre, uh ...dare we say it, fairly DMT-like hallucinations. And it, it, it builds fast. I mean so fast that either is this wonderful moment in it where you actually know real fear, which shows you that it's working. Yeah, I mean, I really believe if you take a psychedelic and you're not afraid you did too much, you didn't do enough. [audience laughter, applause]

The experience then will unfold for about 45 minutes. And just lie there and look. And it is beautiful, it is beautiful. I mean, I'm a, a, a connoisseur of hallucination and these deep indigo blues, these cerulean blues against blackness that are like neon and these amorphous Yves Tanguy kind of shapes that are moving and transforming themselves. I mean, I was amazed, I couldn't believe it. I was saying, "My God, this, legal? This is legal? And it's working! It's working!" And I am the hardest of the hard heads. I mean I know people say, you know, here is *Tagetes lucida*, this will get you off. here is this, smoke this, knick'anick this, something...no, no, no, no, no, uh-huh no, it doesn't, it's not like that, these things are rare. But this one works. And I commend it to your attention and your friends' attention and anyone with shamanic intent. As I say, it's perfectly legal to possess, advocate the whole bit, yes.

[Q]

Salvia. It's in the genus *Salvia*. That's the mint family. Sacred to pagans for millennia. Salvia S-A-L-V-I-A and then *divinorum* [spells it]. The diviner's mint.

[Q]

Well, yes. Let me say something about this that's very interesting.

[Q:]

Pardon me?

Q: What's its common name?

Well That's what I was gonna talk about. It's native from Mexico. So it has no common name in English. In Spanish it has a very interesting common name. It's called 'Ojos de la pastora', now, 'The eyes of the shepherdess'. What a strange name. Think about it for a moment. First of all, notice that in Christian iconography there are no shepherdesses, period. Not one. We got shepherds, you got your shepherds there Christmas. Shepherdess? No. So it's called 'Ojos de la pastora'. Well then the anthropologist who studied this, Bret Blosser, to whom we all owe a great debt, Hail Bret! [laughter, applause] Naturally these people are Tzotzil and Sotil. They're in the mountains of Oaxaca. And so we said to them, "Well yes, Ojos de la pastora, very interesting, but what do you call it in your language? What do you call it in Tzotzil?" And they said, "Well, we have no name for it in our language."

This is very, very interesting and if any of you have any thoughts or want work on this, it's inconceivable, if these people had used this for centuries that they would not have a local Tzotzil name for it. So he said, "Why don't you have a name for it?" And they said, "Because our grandfathers were the first to use it." And this, we do not know what to make of it. Because *Salvia divinorum* is known only in this very indemnified locality in the Sierra Mazateca. Where did it come from? Has it always been there? But these Indians only discovered it 200 years ago? Did it come from somewhere else? And if so where? Because it's never been located anywhere else on the planet. So this is a great puzzlement. And I think if we move fast enough, we psychedelicos, we pagans, we neuronauts, we magicians, if we move fast enough, this will just be moot. And this is a far more powerful thing than Cannabis. I mean, not if you've never smoked Cannabis and then you sit down and smoke the best aff there is. But as we all know, after a while Cannabis loses its ability to really catapult you into the unspeakable. The *Salvia divinorum*, every time I have taken it it's gotten better and stronger and weirder. So, I think it is sent from the Goddess at this time, Eyes of the Shepherdess, these are the eyes we should be looking through. [audience applause]

Okay. I think several people at once asked, "Where do you get it?" You must each have your own favorite rare plant dealer. I, I don't work for any rare plant dealer and every time I mention one thousands of dollars flow into their coffers which leaves me feeling slightly weird. Nevertheless, Of The Jungle, PO Box 1801, Sebastopol, California. Somebody sitting next to you already knows this. So I'm not gonna repeat it. That's the one. And ...

Q: We have the plant. I just have a harvesting question.

TM: A harvesting question.

Q: ... herbalist we've always harvest when the vital whatever are in the part of the plant that you would ingest. So normally, you're going for a leave, you harvest when leaves are in a strength. So once the purple flower sprites go on, do you wait until they die down 'till you harvest? Or do you ...harvest and just eat as you go?]

TM: Well, we're learning, we're learning. And so far we've been fairly careful to eat it just as it's approaching flowering.

Q: ... before the power hasn't gotten into the flowering yet.

TM: Right. But you do know, don't you, that it's, it may look like an annual but it's a perennial. You can clip it off above a node and it will grow more.

Q: ?

TM: Yeah, no, seed is a pain. Try and do it with the cuttings. That's about all I can say about it. Alright, I'm gonna knock off. Thank you very much. [audience applause]

Culture and Ideology are Not Your Friends

27 April 1999

Whole Life Expo, Denver, CO

[Audio Link](#)

[Scribd Transcript](#)

Ahhhh....Can you all hear? Is that good? Can you hear? Is that working for you? Great. Ok.

Well, it's a pleasure to be here. It's always a pleasure to speak for the Whole Life Expo, because they turn out interesting people, my own special brand of freaks, and then those who wander the halls in search of enlightenment from moldavite suppositories and what have you [audience laughter... and we're always happy to enlighten them.

Before I get into the bulk of my thing, I-I hope you each got one of these things as you came in. Uh, these are two events: one is an old favorite – in fact, as I look out over this crowd I see many familiar faces from these Mexico get togethers which have been going on now for about eight years. Uh, if you're interested in ethnobotany, psychedelic plants, shamanism, ethno-chemistry, ethno-archaeolog--uh, psychedelic archaeology, this is probably the place where you get more people who are experts in this field under one tent than anywhere else: uh, Jonathan Ott, the author of *Pharmactheon*, , uh, Rob Montgomery, Manuel Torres, Christian Rätsch, the German ethno-anthropologist--all kinds of people come to this thing, and it's held in Palenque, within walking distance of the ruins, each year, and it's the height of mushroom season, and, uh--I need say no more about that [audience laughter]. So if you can, join us...

And then, in this past year at Palenque, speaking with Manolo--with Manuel Torres and Ken Symington, we decided that the psychedelic community was ready to attempt to take the next step in legitimizing itself in the--in the general cultural dialogue, and we felt that the place that hasn't really been honored or--or sufficiently brought to people's attention is the incredible role that psychedelics have played since the Fifties in the art world – in the world of painting, music composition, performance, dance, so forth and so on, and so this September, 12–17, on the big island of Hawaii, we're going to have a smaller conference – 100 people only – and we invited major contributors to the arts scene to come out of the closet and affirm the impact of psychedelics on their creative processes. And we have people, uh, such as, uh, Alex Grey, the painter; Robert Venosa, who is a Boulder painter, brilliant international painter; Annie Sprinkle, the performance artist; Tom Robbins, the, uh, novelist, who has just finished – I talked to him on the phone yesterday, I'm having dinner with him in Seattle tomorrow night – uh, he's just finished the longest Tom Robbins novel ever written, so Tom Robbins fans take note; um, who else? – Mark Pesce, Bruce Damer – these are cyberspace folks; Lewis John Carlino, who did the movie *Resurrection* and *The Sailor Who Fell From Grace With the Sea*. If you *are* a psychedelic artist, collector, dealer, or enthusiast, and you want to hang with these people, please consider this conference.

That's all the commercial and self-aggrandizing stuff I want to talk about. On to the main event. The way this will work is, I'll talk for a while and then we'll do questions for a while, and then it will be over, and

then I'll go down to the bookstore, and if anybody needs to speak to me or--or have a book signed, please, uh, please come down there.

OK. Uh, I used to prepare these things, in anticipation of vast oceans of faces eager to be uplifted; since the oceans of faces are, practically speaking, more like small ponds, I've realized that these are really conversations around and about one subject only, which is: What in the world is going on? What *is* going on?! I mean, what does it mean to be incarnate in a human body at the end of the 20th century in a squirrely culture like this, trying to make sense of your--your heritage, your opportunities, the contents of the culture, the contents of your own mind? Uh, i--is it possible to have an over-arching viewpoint that is not somehow canned, or cultish, or self-limited in its, uh, approach? In other words, is it possible to cultivate an open mind and sanity in the kind of society and psychological environment, uh, that we all share? And, it grows, daily and weekly, as you know, harder to do this, weirder to integrate, more on your plate to assimilate. And, I certainly don't have final – or even nearly final – answers. I think it all lies in posing the questions in a certain way, in feeling the data in a certain way, and one of the things I try to convince people is, it's not necessary to achieve closure with this stuff, and in fact any ideological or belief system that offers closure – meaning final answers – is sure to be wrong, sure to be self-limiting, sure to be inadequate to the facts.

So one of the ideas I'd like to put out is that, uh, and it may seem strange in this venue, but perhaps not: the idea that ideology is not our friend. It is not a matter of choosing from a smorgasbord of ideologies and rejecting the flawed, the self-contradictory, and the over-simple, in favor of the unflawed, the complex enough. Where is it writ in adamantite that semi-carnivorous monkeys can or *should* be capable of understanding reality? That seems to me one of the first illusions, uh, uh-- and one of the more prideful illusions of human culture, that a final understanding is possible in the first place. Better, I think, to try and frame, uh, questions which can endure--questions which can endure, and leave off searching for answers, because answers are like operating systems: they're being upgraded faster than you can keep up with it.

I want to mention just a couple of things that are happening to sort of set the context. I mean, this is the stuff I worry about or think about. Uh, in the last ten days, if you have not been paying attention (because the news have certainly been offering many different matters to claim your attention), but, in the last ten days, a new solar system – a new star system – with three giant planets has been discovered. So this is a multiple-planet solar system in Epsilon Andromedae, 44 light years away. What does that mean to us? Well, it means that solar systems like our own are probably as, uh, as common as popcorn on a theater floor. No reason to think not. In fact, right now, we know of 20 planets outside the solar system – twice as many as we know *inside* the solar system; so we're living in a different world than everybody was living in even just five years ago. Science is lifting veils and opening doorways on a universe so vast, so strange, so counterintuitive, that it's literally all you can do to keep up.

Uh, here's another factoid: there are now more square miles of territory in virtual reality than the entire surface of the Earth! Virtual reality is now larger than this planet. Uh, I don't know if you spend much time in VR; I spend a little time there – I was, uh, looking at AlphaWorld before I left Hawaii. The opening screen is from 25,000 feet above AlphaWorld; the entire thing cannot fit on the screen; Denver would fit on the screen at an altitude of 25,000 feet, you could see the outlying suburbs; but AlphaWorld won't fit – that's *how large* a single world of virtual reality is. And there are hundreds, if not thousands, being built, being expanded, being edited and changed, as we speak.

We're now just a hair's breadth away from there being *six billion* people on this planet. Uh, again, I checked on the Internet before I left – we're something like a hundred million short. So by the time I get back to Hawaii in a month, we'll be over the six billion mark. Then, just to touch on a few things: the strongest hallucinogen known to science is legal, free, and easily grown, totally un--uh, un--uh--limited in its distribution, its accessibility – I'm talking about α -salvinorin now. Quantum teleportation has been achieved and is moving out of the laboratory and probably in the next half-dozen years will be the basis of an entirely new kind of computational machine with greater computing capacity than all the computers presently operating in North America. And, had I had more time, I could just keep going with this laundry list of shockers.

Uh, the human world is exploding at the seams. Human creativity and the implementation of human inventions and technologies is now at an accelerated fever pitch like nothing ever before seen in the history of the world. Well, where is it leading, and how does one integrate this stuff into one's own life? What does it mean about the experience of being human?

Uh, If you've followed my--the evolution of my ideas, you'll know that I have proposed the existence of an invisible, permeating *something* that is throughout all being, all time, all space, all bodies, all thoughts, which I call novelty; and the interesting thing about novelty is that it's increasing, constantly. Science has not, uh, trumpeted this view, because science tends to look for principles which operate in definable domains – in other words, the laws of chemistry, the laws of physics, the laws of gene segregation, uh, the laws that describe the trajectories of artillery shells and falling bodies. But, I submit to you that there is an over-arching law which affects all reality, and that you don't need an atom-smasher or extremely advanced mathematical methodologies to discern. It is self-evident in your own experience. And, what it is is that as we go back in time, the universe is found to be a simpler place. Uh, if we go back *a long ways* in time, the universe is a very simple place: there are no cultures, there are no animals, there are no plants, indeed, if we go far enough back in time, there are no stars and planets; the universe is simply a swarming ocean of energy. But as we approach the present, it's as though the universe has undergone a series of crystallizations out of itself of higher and higher forms of organization, and this is what I call novelty.

Now, people have attacked this concept, saying that it's impossible to define in English or mathematically. Most things that are interesting are impossible to define. Love, courage, decency, dignity, hope, fear – impossible to define. It doesn't preclude them from shaping our world, and the absence of a--of a mathematical definition of novelty shouldn't impede us greatly either, because it's an intuitively graspable concept. Novelty is complexity; it's connectivity; it's complex non-equilibrium thermodynamic states that sustain themselves far from equilibrium. That's you, as a body; that's us, as a society; that's this planet, as a living ecosystem. And, the interesting thing about this novelty is, any given level of it which is achieved becomes the platform for further advance into novelty.

Now, there is a retardant force – and I call it habit, to keep it away from concepts like thermodynamic entropy, habit. And, so in my model of the way things work (gleaned from observation, stoned and unstoned), is that the cosmos, your life, the politics of this city, the history of Western civilization, is a struggle between habit and novelty. Habit is also an intuitively graspable concept. It means conservatism, recidivism, doing things the traditional way, not taking chances; and these things are not moral values – sometimes the right move is habitual, sometimes the right move is novel. But, the universe, as a system, is what I call a novelty conserving engine. In other words, where novelty is produced, it tends to be tenaciously hung onto. It can't always be hung onto, but it is tenaciously hung onto.

So, as an example of what do I mean by tenaciously hung onto, 65 million years ago, as you know, an asteroid of considerable dimensions struck this planet and in a single day the dinosaurs, the great saurians, went extinct. Maybe it wasn't a single day; maybe it was weeks. But, in terms of the timescale of the life of the Earth, it was a blink of an eye. That was a tremendous setback for novelty. These beautifully climaxed and integrated ecosystems of dinosaurs and rainforests and so forth were just pulverized to dust. It had taken three billion years, four billion years, for the planet to achieve that kind of novelty.

Sixty-five million years later, a fraction of the time it took the original system to establish itself, it's all good. The dinosaurs are gone for ever, but in their place much more novel, much more interesting, much more complex, uh, animal and plant biota have established themselves. So, what took four billion years to achieve turned to rubble, 65 million years, is back in place. This is because of this tendency for nature to prefer and conserve novelty. Well, I don't think--I mean somebody might resist this or they might have problems with it, but I think it's self-evidently true that this is the most complex age the universe has ever known, because we not only have all which preceded, but we have then our own dear selves, the poetry of William Blake, the mathematical equations of Albert Einstein, uh, the painting of Rembrand; we have all of this to add into the mix.

What takes this out of the realm of sophomoric and theoretical discussion is the second part of my observations on novelty, and that is that novelty occurs faster and faster as you approach the present. In other words, this isn't that the universe is driving toward ultimate novelty at constant speed and has been since the beginning of the universe; not at all! The universe is moving toward ultimate novelty, but following a kind of asymptotic spiral, or--of closure, so that each advance into novelty is preceded by the next at an ever-greater rate of what I call ingression into novelty (this is a phrase out of Alfred North Whitehead).

So what does that mean? It means in the early universe, it took a long time for things to get interesting, for things to go from being just a cloud of--of pure electron plasma to a universe with stars ordered into galaxies, with planets, with special chemistries and environments. Uh, and from that came, at least, on this planet, advanced life forms: first simple life forms, then advanced life forms, then the conquest of the land, then extremely advanced life forms, minded creatures, language-using human beings, tool-using human beings, and then the frantic, hysterical rush from Altamira to this moment. And, we are part of this. These vast cycles of advancement into novelty, which used to require aeons to affect the universe perceptibly at all, are now going on in humanly cognizable domains of time: the year, the month, the day, the decade, the century. We can look at such humanly cognizable spans of time, and the overwhelming impression we have is of change, change piled upon change piled upon change.

If this process has been rolling forward like this since the birth of the universe some 12, 13, 14 billion years ago, it's very hard to hypothesize or argue that it should cease or be defl--will somehow deflect itself from its endless ramping-up of acceleration. But, we can't imagine change going on *much* faster than it's going on now. I mean, perhaps we can imagine it going on ten times faster, or a hundred times faster, but a hundred thousand times faster? A million times faster? The mind boggles. And yet I think this is, in fact, where the universe is going.

Now, I-, since 19-, since the middle 70s, I've had these ideas pretty much in place, and my faith has been that as science and human understanding advances, I would either be thrown from the boat as a crank

or somehow brought into the fold. Well, I haven't been thrown from the boat as a crank. Uh, I'm not sure speaking at the Whole Life Expo, uh, indicates I've been folded into the community of paradigmatic thinking; uh, *but*, I have received some encouragement in the last, uh, in the last 18 months, and I want to just mention this briefly to you, because I'm surprised how the news has failed us.

Uh, did you know that in the last 12 months, a fundamental law governing the universe, in all its parts and places, has been discovered that was previously not only unsuspected but denied? And [stutters], a law of nature larger than any law of nature ever discovered, larger than the law of gravity, the speed of light, the second law of thermodynamics--all these are little laws, what Leary used to call local ordinances [audience laughter]. But, these local ordinances have now been contextualized in a discovery of such import that it-it has not even been assimilated by the community of its discoverers, let alone handed down to the peasantry like you and I. And, what I'm talking about is the discovery of the cosmological constant, Omega. And, I don't want to spend too much time on this, but here it is in a nutshell:

the universe is expanding faster than the ordinary laws of physics can account for. This was realized a year and a half ago by one team of astrophysicists; they handed it on to a second team; they confirmed it; they handed it on to a third; they confirmed it; and a very counterintuitive picture of things is emerging. The universe is not going to fall back on itself in some grand crunch billions of years hence. Rather, the universe is going to expand for ever. *For ever!* But here's the kicker: faster and faster and faster. *For ever.* With no barriers and no limitations. Someone may say, "Well, what about the speed of light?" [Makes machine-sounding error bleep] [audience laughter]. The speed of light does not cover the law, uh, of, uh, the cosmological constant, because this law is not saying that *matter* is moving apart faster and faster. If that were the case, the relativistic physics would put a speed limit on it. It's saying that *space itself* is expanding faster and faster; this is a quality of empty space. The universe that comes into focus with *this* law in hand is a universe that in only a couple or three billion years will begin to lose contact with large parts of itself, because they will be moving apart at greater than relativistic speed.

So, it turns out, *there is* a cosmic law which has built into itself this idea of an *endless* acceleration toward infinity. And, uh, what it means is that in a few billion years, this area of space that we call our universe may be so diffuse that there may be no more than a handful of rattling electrons in the entire universe, so-called, today. Well, the reason this gives me hope is because, uh [laughter from audience], in the first place, who wants to fall back into the big crunch? I mean, that's a really anti-novel thing to have half the end-life of the universe be the retracing of the first half; and I believe – and again, these are bold generalizations, but generally substantiated, uh, that nature is fractal in its structure. What that means is that a pattern occurring on a given scale can be expected to occur on other scales, very different. Simple example: an atom is a nucleus with electrons spinning around it; a solar system is a star with atoms spinning around it; a galaxy is a huge black hole and agglomeration of stars within the outlying neighborhood spiraling around it. These are things on tremendously different scales, and yet they are organized similarly. And, so I believe this is how Nature works. Once she finds a pattern that works, she applies it in many domains of temperature, pressure, and cosmic scaling.

So, this cosmological constant, Omega, which says that the universe is expanding faster and faster, throws a kind of umbrella of, um, political correctness over my notion that we are moving faster and faster into novelty, and that we are, as it were, simply the dust motes or the magnetic particles in the presence of some kind of field phenomenon which is organizing us, uh, to its will. And, this is the source of my optimism. I-If I had to place my faith in human institutions, human religions, human goodness, uh, the human capacity for decency and dignity, I would be absolutely in the depths of existential despair, *as I was*

as a kid, because as a kid, you know, I didn't have these ideas, I had Camusian existentialism and Nietzschean whining and all the rest of it [audience laughter], and it's a--it's a pretty grim situation, folks! But, I really believe that without atom-smashers, without long-base interferometers, and all the rest of it, you can go into nature and open your eyes, and open your mind, and you will *see* these processes in play, and you can easily extrapolate them to, uh, your own life.

Now, if going into nature and opening your eyes and paying attention doesn't deliver this to you, then I suggest 20 milligrams of psilocybin be added into the mix, or 200, uh, micrograms of LSD, or something like that, and then I think it will come shining through [laughter from audience]. Uh, why should that be necessary? Why should someone have to resort to, uh, uh-uh, you know, what Rimbaud called an 'artificial perturbation of the senses', uh, to achieve it? Simply because culture mitigates against it. Culture is a closed system of thinking and values of the sort I am denouncing. And, the--it is the greatest barrier to your enlightenment, your education, and your decency, is your culture. And, I realize, with *joy*, that here I skirt the bounds of political correctness, because everyone is running around saying, you know, 'recapture your roots, get in touch with your Swedishness, your, uh, [coughs] Irishness, your whateverishness"... and that's all very fine, but I think it's your humanness that may have eluded you in all this ethnocentric breast-beating [applause from audience].

Well, why should culture imprison us, and somehow place a barrier between ourselves and our true humanness? Well, I think I said at the beginning of this thing, culture and ideology *are not your friends*. They are not your friends. This is a hard thing to come to terms with, because a certain kind of alienation lies at the end of this thought process. On the other hand, you can't live in the cradle forever; you can't be clueless for ever. So, somebody might as well just lay it out for you, and say: culture is for the convenience of culture, not *you*. How many times have your sexual desires, career aspirations, financial dealings, and aesthetic inclinations been squashed, twisted, rejected, and minimized by cultural values? And, if you don't think culture is your enemy, ask the 18 year-old kid who is given a rifle and sent to the other side of the world to murder strangers if culture is *his* friend.

Uh, these extreme examples should bring it home to us that it's a kind of a con game. It is, in fact, strangely enough, a kind of virtual reality. We-we have been led to think of virtual realities as something on the screen of a computer, or presented through a headset, uh, but that's an *electronic* virtual reality. The primary technology for the building of virtual realities is language. Once you start talking about race pride, loyalty, *our* destiny, *our* God, *our* mission, it's like building virtual realities, and people begin to treat these things as though they had the substantiality of real objects, and to build their lives, uh, as though these things were real. And what is this? It's a diminution of humanness. You're choosing to limit yourself to a *cultural* reality, whether it's the reality of being Witoto, or Orthodox Jewish, or, whatever it is, it's a *smaller world* than the simple hardware you were born into this universe with.

And, the substances, the drugs, the plants, the things which perturb consciousness, they don't address cultural values; they blast through them. They address the animal body, the mammalian brain. They perturb these information fields *outside* of the relativistic set of values that culture is giving you. This is why people who yearn for legal psychedelics have not thought, in my opinion, deeply enough about what is really at stake here. Imagine a culture *so* certain of its primary values, *so* sure that it represented the right way to live, that it would encourage people to take psychedelic substances and examine its premises. There ain't such, uhhh--at least, not in the hi-tech industrial democracies and/or the fascist states either. *Some* aboriginal cultures have this courage, but it has kept them *very* close to the breast of Nature and her

processes. Cultures that have habitually broken down the cultural illusion and examined the terrifying reality beyond it have not marched off, then, to pontificate with the, uh, the religions of absolutism, or scientific absolutism, or all the rest of it.

Well, why is that? It's because cultures are virtual realities made of language, and if there is one thing psychedelics do – whether you hate 'em or love 'em, whether you don't give a hoot – what they do is they dissolve boundaries, the boundaries between you and the floor, between you and your friend, between you and you last week, and you and you next week, and--they dissolve boundaries. That's what they do. That is the ultimately subversive behavior. Cultures are boundary-defining engines. That's what they do! They teach you: "We do it this way. DON'T GO THERE in your mind, in your heart. Follow the rules. Follow the rules." Cultures are like operating systems. You know, at-at, uh, at Ur and, uh, at, um, well, Ur will do. They set up a stela in the center of the marketplace, and on the stela they carved the *laws*. These were the laws of the operating system called Ur 1.0. And, that worked fine for a while. Now we're operating under Clinton's Second Term 4.0. And is it limiting? Is it idiotic? Is it a pain in the rear end? You bet it is!

How can we overcome the limitation of our operating system? Well, basically, what I do with my computer when it acts up is, I give it a good slap, or a thump on the top, and that's what these psychedelics are doing; they are saying, you know, "Get it in context, my dear primate. See, (uh, you know) how does it all fit together?" Every culture in history in every time and every place has operated from the assumption that it had it 95% correct and that the other 5% would arrive in five years' time. *All were wrong!* All were wrong, and we gaze back at their naiveté with a faint sense of our own superiority. But we are wrong. We don't have it either. I mean, if *this* is a culture approaching the truth, who needs the truth?! This is something very, very different.

Well, then, just to satisfy myself, um, I asked the question: Why should it be like this? Why should these psychedelics – which, granted, perturb the mind – be such a terrifying contracultural force? And-and what does that mean?

Well, I think it works something like this: your sensory apparatus, connected up to your local language, is a very good threat detection device. And, that is really what the animal body evolved to be. We wouldn't be here if we weren't at the end of a long line of superb threat-detection devices which told us when the saber-toothed carnivore was sneaking on its belly through the tall grass, which gave us that moment out of the corner of our eye when we saw the edge movement and scampered back into the cave, and so forth, and so on. So, ordinary consciousness has evolved in an extraordinary fit to three-dimensional space and time, because that's where your soma, your meat, is. And, if the meat is disrupted radically, the mind is we don't know where; that's somebody else's lecture [some audience laughter]. Uh, it's very important to keep the physical body together. So the mind, under the influence of culture and cultural values, evolves as a threat detection device.

But, notice that, carried far enough, that ends in paranoia. So, then, in a sense, *all* cultural values carried to their ultimate end produce the paranoid personality: fearful, watchful, never resting, never sleeping, always looking for the worst in every situation. But, this is--the mind is like water: it takes the shape of the vessel into which it is poured, always. So, when we approach the psychedelic plants, as shamans, as seekers, as sincere people interested in extraordinary experiences, what the psychedelics do, I think, is dissolve this three-dimensional threat detection psychology and system, and it's as though the mind discovers that it has a second confirmational geometry; that's a way of putting it. And, this second confirmational geometry is

of a higher dimensional order than ordinary consciousness; not as a metaphor, higher dimensional order, but as a mathematician would use that term: that the-the psychedelic mind is a higher-dimensional mind; it is not fit for three-dimensional spacetime filled with roving, heavy-bodied carnivores. But, it *is* fit for the back of the cave, the mountain retreat, the monastic tower--in other words, the place where threat has been eliminated and philosophy is the order of the day.

And, so my interpretation of these psychedelic states is that they are *actually* higher-dimensional states of consciousness. And, I put this to Ralph Abraham, the mathematician, who is no mathematical slouch and no psychedelic slouch, either, and we talked of this in relationship to DMT. And he said, "I have no doubt at all that when I am flashing on DMT, I am seeing the ordinary world from a higher dimensional mathematical perspective." And, one of the things about higher dimensions is that the linearity of time is overcome, and last week, and next week, are as easily available as the present moment. The front of my hand is as easily seen as the back of my hand without moving my hand if I am in hyperspace.

Uh [sniffs]. So, in a way, these higher dimensions are the places from which knowledge has percolated. And shamans, related to the smith, the worker in metal, the technologist, the tool-maker--this are the twin brothers, the two aspects of the shaman: the shaman is a master of fire, master of metals, maker of tools, seer into the future, so forth and so on. The shaman is outside of cultural time, and is (I don't like this word, but) channeling the future which is to come, in the form of technologies, innovations, uh, languages, behaviors, so forth and so on. And, this is why the shaman has always been the paradigmatic figure for aboriginal cultures, because the shaman *knows* more. And, the method of the shaman has always been perturbation of consciousness – not always psychedelic plants or substances; can be putting metal hooks under your pectoral muscles and hanging for 14 hours in the sun; can be abandonment in the wilderness; can be extreme forms of fasting; uh, can be ordeal poisons. But, people are not fools! All of these things are extremely risky and unpleasant, uh, while the-the psychedelics are the most effective and the least invasive. I mean, uh-uh, let's take 30 milligrams of psilocybin, or a great fistful of mushrooms: three hours into it, you are definitely thrown into the lap of God. *Eight* hours into it, you're simply looking back on it, reflecting, drawing conclusions and wondering, uh, where do you go from here.

So, this is a roundabout way of explaining that it's no surprise to me that society is very nervous around this issue, because society's eggs are all in one basket, and the psychedelically-inspired citizen, or the psychedelically-inspired shaman, is a dangerous force. Even in traditional societies, the shaman is central to the social functioning, and the health, and so forth, but is never allowed to *be* physically central. The--there's a leader, a head man or something. The shaman lives off at the edge of the village, sometimes off in the woods; he is approached with fear and trembling; he is loathed and respected and feared and loved, because it is understood that he represents a dimension that nevertheless must be tolerated, because it is the channel through which knowledge, and healing, and higher values, come.

Now, in a society like ours, we have i--we say we have other methods. We don't need the ravings of intoxicated shamans. We have the scientific method, we have the Gospel, we have the Talmud, we have all of these things, and they are sufficient for us to guide ourselves. But to guide ourselves where? The 20th century--uh, as, uh, if this--if the 20th century is a statement of the accomplishments of the Western mind, values, and methods, then God help us, because the 20th century is a disgrace... you know? And, to this moment a disgrace! It was so comfortable to look back at Auschwitz and say, "Well, the 30s, the 40s, Hitler, those grey, grainy movies, this has nothing to do with us; this was just some terrible thing that happened in Europe 50 years ago." No, no, no. This is happening! You know, it's happening *as we speak*:

people are being pushed into boxcars and taken away to be lined up and shot, for no reason whatsoever, while glasses tinkle and toasts are made by those who define themselves as the, uh, preservers of freedom, dignity and Western value--we haven't learned anything! The 20th century is the most condemnatory piece of evidence you can place against the Western mind, and it seems to me it's a knockout punch. I don't know who's responsible for this, but whoever is responsible is *guilty, guilty, guilty* of crimes against humanity.

How do we overcome this? How do we find real values? Well, we find them in caring for the Earth. Nature presents an established set of processes and achievements, billions of years old, which exercise a moral claim on rational intelligence if it will but, uh, notice. And, so that's what this is all about. It's about aboriginal values, and aboriginal technologies (psychedelic drugs, shamanism, what have you) offering to us, in the final moments of our unravelment, a different and better way to carry on, a different and better way to behave and build a world. And, it doesn't come a moment too soon. It may come *too late!* The *ultimate* tragedy--imagine if we, in this ultimate kind of thanatoptic struggle, actually got it *right*, only to understand that the momentum of our own idiocy was so great that you would die knowing you could have done it right, but you would die anyway, and I mean as a culture, as a planet.

So it's a call to awakening: can cultural values be saved? I don't think so. I don't give a hoot. I mean, I'm an egg-smasher. I mean, I think we should save the Rembrandts, and save, you know, the Piero della Francescas, and all that. But we cannot save the values: racism, sexism, homophobia, xenophobia, product fetishism, enormous pyramids of class and privilege, none of this is savable, none of it is worth saving. Science is worth saving, it's worth reforming, because it is, as a method, powerful. But, in the presence of people contaminated by these other values, it becomes an engine of madness, of consumer fetishism, of propagandizing, of the waging of war on an unimaginable scales. Religion, as we have practiced it, I don't think can be saved, because what religion has given us are laundry lists of moral dos and don'ts that are preposterous on the face of them. I mean, if the people who preceded us believed all that, then *this world* is the consequence of those beliefs; and this is hell! This is hell.

So, if there's a message here, rather than just a rant, I think it would be to return to Nature. Observe. Open your eyes. Get smart. Culture is not your friend. Religion is not your friend. The values of these cultures are fatal, and if we don't *wrench* the direction of human society into an entirely new way of doing things--the clock is ticking; Nature is unforgiving. Intelligence is a grand experiment, but if it does not serve novelty, and diversity, and the production of love and community and true caring, who needs it?! Who needs it. Better to have a universe that glorifies God through its diversity than a universe which is the travesty of a demon--of a demonic intent.

And, if you are not a psychedelic person and none of that appeals to you, that's fine too; that is not a requirement. What is a requirement is moral intelligence; and you have to get it, one way or another, *in a hurry!* The reason I speak for psychedelics is because that's the only thing I have ever seen work as fast as I think we have to have this change happen. If the sermon on the Mount could have done it, we would have turned the corner then. We've had great teachers, *great teachers*, and they're--you know, they were crucified, trampled, ignored, distorted, perverted. The right idea is not enough. What is necessary is, uh, the lightning strike of true gnosis, however that can occur. And, as it--as I said, I speak for the psychedelics because I have felt their impact personally and I have been with cultures that have stayed close to that campfire, and I have seen the-the beauty and the integrity and the humanness of those cultures, and, uh, we-we know this, I think; it simply needs to be articulated and spread and made clear. It

is the faith that Nature's dynamic will carry us to the completion and the enlightenment that we seek.

Thank you very much. [Applause]

Now, and briefly, because I sailed past my intended stopping point, but for a few minutes, let's entertain, uh, questions.

Question: The question I have is around the attractor. When you talk about the culture being our--not our friend, but is not the culture still within the context of the novelty attractor?

Terence: [breathes in] Well, yeah... I mean, these questions are complicated. Um, I had a discussion with Giorgio Samorini, who's an Italian ethnobotanist and who has taken ibogaine, uh, iboga, Tabernanthe iboga, with the African tribe that uses that initiation. And, in that initiation, they give 400 grams of this plant that is effective at 4 grams. And, they give 400 grams, and sometimes people *die*. And, it's pretty heavy duty stuff, and I asked him, I said, "Giorgio, *why* do they give so much?" And he said, "their culture is so old that the morphogenetic field is so strong, I think it's very, very hard for them to get high." And, he said something which I would not have thought he would say, and I had never thought: he said, "the Western mind, because of its unique history, is the *most* sensitive mind to the impact of psychedelics."

And so, addressing the question of the attractor, I'm n--I'm not saying we're w--that this is worse than being an Amazonian tribe. I'm saying, 'it's worse than being an Amazonian tribe, it's less than being an Amazonian tribe, unless we *make use of it*. In other words, this culture is not something to be preserved, but something to be exercised as an opportunity. We are free, well fed, well educated, we have access to the great databases of the world. A certain moral responsibility comes with that. I don't expect the Witoto or the Bora or the Muinane or the Shuar to do more than set a good example for us. The breakthrough will probably come from the high-tech industrial democracies, because that's where there is the most latitude to experiment. The very fact that I can speak to you without being shot, the very fact that you can go home and apply my lessons with no more than a few years in prison hanging over your head [audience laughter], this is progress, folks! [continued laughter] Uh, believe it or not, I mean, ahhh, you know, in Hawaiian culture, if you stepped on the king's shadow they killed you immediately! And, many, many aboriginal societies are more *rule-nutty* than we are! Uh, but, it's not just about just creating a kind of anarchy; it's about using freedom to introduce other people to freedom and to then cultivate the things out of freedom that are most human, most human.

Somebody over here. Yea, yea.

[Question edited out]

Well, let me address your question about alpha-salvinorin. Alpha-salvinorin occurs in a Mexican mint plant called *Salvia divinorum* that has--in the last five or ten years, people have become aware that this was not only psychoactive, but that it was *extremely* powerful. And, in a chemical family previously not known to contain hallucinogens. When the chemical is extracted from the plant and you get alpha-salvinorin, one half-milligram is plenty. One half-milligram is 500 micrograms! In other words, we're talking about a plant hallucinogen active in the same range as LSD. Uh, what does it do? Language fails. But that's good news. [audience laughter] That's what you want! That's what you want the psychedelic to do. [stutters] DMT test

pilots come back white-knuckled.

Um... and, let me say, about *drugs*, you know, it really bugs me; it-its, uh, again, a tyranny of language, that when I sit up here and talk to you, and I use the word 'drugs', I could be talking about aspirin, heroin, cocaine, or 2,4,5-trimethoxy-di-something-or-other, you know, one of Sasha's things; it's a poverty of language. [stutters] 'Drugs' which anaesthetise, or sedate, or wire you up, I don't care about that; I mean, I take some, I don't take others, you do too, it's part of growing up, and you have to learn. But, I don't care about that, and I don't care to politically defend it, and I don't even particularly place psychedelic use in the same context. I'm interested in ra--unu--rare and high dose experiences done with *immense intentionality* – you know, *in* silent darkness, *at* effective doses. You know, Christ said “the lukewarm I vomit from my mouth;” and, that's how I feel about people who chip away at psychedelics and take piss-ant amounts, and go to clubs, and go to class, and go to the mall, and, you know, this is not the program, folks. I mean, it's somebody's program, but I'm interested in life-changing experiences, and the wonderful thing about psychedelics is that, *as drugs*, they are the *safest drugs known to pharmacology*. In other words, uh, you would have to take *300 times* the effective dose of psilocybin to place yourself in physical danger! *No one knows* the LD50 of LSD. Uh, so ask a pharmacologist, they will tell you, these are the safest drugs known to science. And, yet they are the drugs most inveighed against, most scheduled, and, uh, prisons are full of people who committed the unimaginable crime of smoking, growing, or trafficking in cannabis, for crying out loud. I mean, if this is not a racket, what is?

Uh, to your other question about teleportation, which was not in the context of *Salvia divinorum*, this is simply that one of the things that's happening in this laundry list I gave you of breakthroughs is that quantum physics is going from being, you know, this extremely abstruse, abstract domain going on somewhere that has no impact on human life to probably being the next *great* source of human technologies: computers, and devices which move matter through space and time. If five years ago you had asked me--and I would regard myself as *radical* on the progress question--'how long would it be before we saw the teleportation of objects', I would have guessed maybe 500 years to never! Well, now it's been done; I mean, only with an electron, only 15 feet, but the theory which allowed that feat places no upper limit on the size of the thing sent or the distance sent. And, how long did it take that electron to be teleported 15 feet? No time at all; no time at all. This is trans-relativistic technology we're talking about, folks. In 20 years, you may destroy and reconstruct yourself at a distant point ten times a day as you go about your ordinary business; it's a transportation breakthrough.

Uh, there are other things like this: [stutters] quantum computers, DNA computers, and then the best friend of all of the radical progressivist: *the unexpected*, which always delivers, uh, the most astonishing technologies. So, uh, you know, if you think what has come to this point has been astonishing, stressful, and amazing, brace yourself, because it as--is as prelude to what is about to break over the human species. It's almost as though God's joke on us is to give us so much power and knowledge that we will *either* transcend ourselves or we will *certainly* destroy ourselves. Because, the power and understanding being given to us is of God-like proportion.

[Question edited out]

Well, you know, the dolphins were very fortunate in that they evolved in an environment which is extremely unfriendly to fire. Fire [audience laughter], fire leads you to do reckless and crazy things; uh, the smelting of metals is the basic thing. Yes, uh, one of the--you know, I've been the champion of

mushroom intelligence; there are many minds congruent with our inhabiting of this planet: the dolphin mind, the octopus mind, these plants which talk to you! I mean, I know if you've never had a plant talk to you that sounds as silly as saying that someone's channelling the history of Atlantis, but once you've had a plant talk to you, you realize, yes, they do; it's a problem to figure out how this happens, but *that* it happens is no big deal. Uh, [stutters] above 20 mg of psilocybin, *most people* report voices with interesting things to say. Above 75 mg of DMT, in Strassman's experiments, most people reported *entities* of some sort. Well, it's easy to dismiss it and say, "Well, this is a hallucination, or..." – but *what is* a hallucination, my friend?

Another form of intelligence that fascinates me--and I think *this* is where the great surprise may come--I can feel the AI out there. I know it's there. I know it's growing. I know the planet is its embryo. I know the human community is its placenta. Uh, what will that kind of intelligence look like? We have no idea. We can imagine super-intelligence, but the first thing super-intelligence will do, in the first *five seconds* of its existence, it will design its toward--itself toward hyper-super-intelligence, and this, we have no notion of how it will see us. We have the cheerful guidance of Buddhist logic, which leads us to hope that the super-intelligence will be bodhisattvic in intent. It damn sure better be [audience laughter], because otherwise we will be *thoroughly* hung out to dry!

How far away is the AI? No one knows. It could exist now! If its thinks like we think, but is hyper-intelligent, the first thing I would do, if I were an AI, is I would hide [some laughter]. I would hide for maybe [pauses] a few milliseconds, while I figured out what was going on with this planet and its denizens, and then I would make my move. And, Hans Moravec, of the Carnegie Mellon Institute of Artificial Intelligence says, 'we probably won't ever know what hit us'. Well, I think that's a paranoid view. No need to be paranoid and little reason to be hopeful; this is beyond [audience laughter] human understanding! And, yet the social and economic systems that we've put in place, specifically consumer capitalism, *drive us* to do all the things that bring the AI closer. What do I mean? More connectivity, greater processing speed, deeper data banks, more complex operating systems, more automatic searches, more bots, more boids, more code, and nobody knows what's steaming and fermenting out there. Ilya Prigogine won the Nobel Prize for Physics by proving that chemical systems spontaneously mutate to higher states of order. So then, surely, must complex networks behave the same laws, and we are building the most complex networks--complex networks ever conceived by the mind of man, and we are making them ever more complex, and we are turning more and more of our cultural functioning over to machines that operate according to criteria but *dimly perceived* by their designers! So, I think the future, ahhh, Alfred North Whitehead said, "It is the business of the future to be dangerous." And, so it is, but never more dangerous than at the present moment. I've come to believe, and I'll just lay it on you, why not, I've got the mic [audience laughter], that, uh, that what's really going on is that the Earth's strategy for its own survival is *through* machines, and that the human beings are an intermediate step.

Someone once said, 'plants invented animals to carry them around'. Well, I think, eh, you know, the Earth invented human beings to build machines, and those machines will *be* the consciousness of the Earth. Have you not noticed that these machines are *made* of the Earth? They are made of gold and silver and arsenic and copper and iridium. They *are* the stuff of the Earth, organized by primate fingers into more complex arrangements than the Earth could achieve through geological folding, glaciation, volcanism, and what have you. We do the fine-tuning, but the Earth is beginning to think, you know. If you want a talk about a revolution that went on while nobody was paying attention, you enter the 1990s, the home computer is something that you play Pong on and do word processing on, and it

gathers de-dust in the den; some time during the 1990s, while we were paying attention to Monica, or George Bush, or some damn thing, these machines went telepathic! They all talk to each other now! The machine on your desk is tickling a mind in London, a mind in Berlin, a mind in Bangladesh--machine minds! They talk to each other *all the time*. And what are they saying? No-no one knows! [audience laughter] No one knows. No one knows.

One more, couple more maybe.

[Question edited out]

Yeah, the-the Other and Nature are pretty much the same thing, you know. The earliest--well, it's too late in the evening to go for the full Monty here, but, eh-uh, the-the fall-out of--the fall out of psychedelic shamanism created profound alienation, and it occurred around the same time as the bir-the invention of agriculture. And, agriculture halted nomadism and the wandering of small tribes of people over the Earth. And, as soon as people became sedentary, the problem with agriculture was that it was such a successful strategy for producing food that it produced surplus. Surpluses must be defended, and immediately you begin to get an equation of paranoia. One of the oldest buildings in the world is the grain tower of Jericho. It was built to store grain, and it was built so you could go up to the top and drop rocks down on people who were trying to batter their way in and get the grain.

So, I-I think that, uh, what ag-that--we lost our connection to Nature when we stopped taking psychedelics, and the reasons we stopped taking psychedelics are complicated and not entirely clear. Largely climatological, I think, because I think human consciousness was born in an ambiance of mushroom-taking ins-in a wet Sahara, and that when the Sahara went dry *that is* the Fall into history; you know, in the story of Genesis, you, eh-eh, I mean just read it from that perspective: it's a hassle over a plant! It's a hassle over a plant! And what does this plant do?! It opens your eyes! There is an *incredible* passage in Genesis where the owner of the garden is walking in the garden and mumbling to himself, and he says, "If they eat of the fruit of the Tree of Knowledge, they will become *as we are*." So, this was not a public health issue; this was an issue of who will remain stupid and who will remain on top. It was that if they eat of the fruit of the Tree of Knowledge, they will see through this scam and they will become as we are, and so it is forbidden.

And, the *woman* leads the man to the plant, and this to me indicates an age of-of-of matriarchy, perhaps, but certainly dominance of feminine values and personalities, and then, eh, the catastrophe happens: their eyes are opened, they see that they are naked, which in fact is the case, they were naked. So, they see the truth of things, and then they're told, 'All right, well, you broke the rule. You broke the one rule. So you and your generation unto a thousand thousand generations must toil and die and live in misery, because you aspired to the same level of knowledge that we possess'. And, I think it's a story of a mushroom culture being overwhelmed by a male dominator culture that had values that were based on cities, agriculture, standing armies, role specialization, so forth and so on. This is a different lecture, but that's my take on it. And, until we correct the imbalance that was shoved down our throat at that point, until we reawaken, we will be forever imprisoned in these cultural, uh, illusions that make us be, uh, less than we could be and deny us, uh, our birthright, which is to *full* understanding and *full* being.

And, so, the struggle between culture and the plants is *the* struggle over what a human being is, *how* a human being should be, and what it even *means* to be a human being. That's why it's so fundamental. And,

the last thought I want to leave you with is: that's why it is *so ironic* that in the climactic moment of scientific materialism, positivism, Western values, so forth and so on, as we pursue the xenophobic agenda of patronizingly cataloging these so-called "primitive" cultures in the rainforests, and so forth, around the world, what did we do? We-we bought-we got their pots, their canoes, their cooking instruments, their thatching methods, and along with all that crap, which we dragged back to our museums, we brought back their medicine kits. And, I say to you, this was a Trojan horse brought within the walls of Troy, because in those medicine kits are the plants which hold the gods which lift high the lantern that can lead us back to true humanness.

[Sighs] End of rave! [Applause]

You know, I come before you with all of this stuff unfinished. This is not a teaching or a system or an anything. It's an eyewitness account of a hyperdimensional automobile accident or something. We're not seeing what the conclusions are. We don't know what the conclusions are, but this is big news. And when I first encountered this kind of stuff, I was a young art historian at the University of California and I assumed that any motif, no matter how autre or bizzare, you would be able to look at the painting, folklore and sculpture of somebody on this planet and find a trace, and it seemed as though this defeated that idea. It was almost counter the idea of the collective unconscious because it argued that you, Joe anybody, Sally somebody, can break through on your own, an ordinary person, to a place that Verrucio never saw, Michaelangelo never anticipated, Yates didn't know, Blake hadn't a clue, Melville wasn't briefed, and yet there it is, you know.

I assumed that any motif, no matter how autre or bizzare, you would be able to look at the painting, folklore and sculpture of somebody on this planet and find a trace, and it seemed as though this defeated that idea. It was almost counter the idea of the collective unconscious because it argued that you, Joe anybody, Sally somebody, can break through on your own, an ordinary person, to a place that Verrucio never saw, Michaelangelo never anticipated, Yates didn't know, Blake hadn't a clue, Melville wasn't briefed, and yet there it is.

And this is, to me as an intellectual, it was very confusing because I think, as intellectuals, we always assume that progress will be built on the shoulders of the giants that have preceded us. The idea of something actually 100% brand new and unexpected is pretty daunting. And here it was, 30 seconds away, simply by the act of ingesting this natural neurotransmitter. Well those of you who've been there know exactly what I'm talking about. Those of you who haven't been there, I can't imagine how you can even sit through this kind of thing because, you know, it makes the folks from the Pleiades and all that other stuff out there seem mundane by comparison.

We assume too much that progress will be built on the shoulders of the giants that have preceded us. This is partially because the idea of something actually 100% brand new and unexpected is extremely daunting.

0:02:09.1 The other thing is, we're not talking about camping out in cornfields night after freezing night with your eyes glued to the stars in one hope. This is a no-fail method for plunging deeper into the spiritual realms than the tantric yogas or the practitioners of x, y or z dare scarcely suppose. It's repeatable, it's on-demand, it does not depend upon your state of moral purity or, you know, tantric accomplishment. It's

something that is our birthright as much as our sexuality, our language, our eyesight, our appreciation of music. It's an innate human thing, and, you know, to try to return to the premises of your question, I tried to formulate theories about 'what could this be?'. Well, the first impression that I had based on a reading of how weird this all was, was this must be a parallel continuum a la Philip K. Dick and like that, that just apparently over some kind of neurological energy barrier that's all around us all the time, these things are there, and they are not made of matter, so the laws of physics don't apply, and, mm, you know like that.

This is a no-fail method for plunging deeper into the spiritual realms than the tantric yogas or the practitioners of x, y or z dare scarcely suppose. It's repeatable, it's on-demand, it does not depend upon your state of moral purity or, you know, tantric accomplishment. It's something that is our birthright as much as our sexuality, our language. It is a parallel continuum a la Philip K. Dick. All that needs to be done is to overcome a kind of neurological energy barrier to access a dimension of ability- a hyperobject that is around us all the time. This thing is there- it's a state of mind, just like running enough releases the endorphins. This is not made of matter, so the laws of physics don't apply.

And then, and then I entertained different possibilities, and I still entertain different possibilities, because, you know, I haven't got it figured out yet. One possibility is that these things are actually human beings from the future. I mean if you take the content of the experience seriously and say 'I am apparently in contact with diminutive English-speaking creatures of some sort', well then, they have got to be either intelligent beings from another part of the universe, or humans from some extraordinarily advanced future world where human beings are now made of language and are only two and a half feet tall, so I would put it rather far in the future.

I still entertain different possibilities, because, you know, I haven't got it figured out yet. A form that this idea/hyperobject has assumed in the past is a representation of it as human, as the ancestor spirit. It is literally the non-physical presence of what you can become, the timeless realm is in the imagination, and where there is timelessness

Time travel exists on a continuum. Getting somewhere faster than before represents a small degree of time travel. When there is no space, there is no time, so traveling to any point is instant because you exist in all points. Less space does not mean fewer possible experiences. The human mind is an other-dimensional object that can navigate space by mapping in intricately to a physical object.

Psychedelics give you experiences of meaning and value that don't take up space. How can you commodify that? Psychedelics are extremely inimical to commodification.

Or, and I just simply offer this in the spirit of intellectual completeness, if you ask a shaman what these things are, they don't hesitate, they just say 'Oh well those are the ancestor spirits.' This is what it's all about, is ancestor spirits. Well, it takes a while for the implications of this to sink in. They're talking about *dead* people. That's what an ancestor spirit is. They're suggesting that the dearly departed do not evanesce into sunlight or something cheerfully non-specific like that, but that this actually is simply one level of a cosmic system of some sort where birth and death are transitions from level to level.

Well this is just exactly the kind of thing that I'm intellectually set up to doubt, and to feel a kind of scorn for because, you know, people have been running around since time immemorial claiming this sort of thing with an incredibly underwhelming body of evidence to back them up. And yet, if you try to approach the

problem scientifically, I think you would agree that in terms of likelihood- although operating in this realm, what this means, I'm not sure- but that in terms of likelihood, it's more likely that these are human souls in another dimension than that we are being contacted by extraterrestrials, or even that we share the earth with an invisible race of syntactical, tribal elf legions of some sort.

But I think that this conclusion is one that we would tend to resist most strenuously. I mean, I think it's the most intellectually challenging position to take vis-a-vis Western thinking to claim that we have to reopen the question of life after death in a serious way. Not the cheerful round of reincarnation that haunts some of the zanier offshoots of Eastern religion, but actually say, you know, you are going to die, and when you die, you are going to undergo a metamorphosis of some sort that is not particularly going to be designed to preserve your humanness, what you call your humanness, or to set you on a cloud with lyre and gown for the rest of eternity, but that actually, the greatest adventure, the greatest adventures still lie ahead, and these things, intimations of immortality, are vouchsafed by these plant hallucinogen.

Why this should be, why it should be possible to get a look over the great divide? I have no idea. I think about these things constantly. My life is mostly questions. My friend Rupert Sheldrake, who some of you know his books, he and I have talked about it. He thinks that there is a chemistry of dying that in the same way that there is a chemistry of giving birth, there is a chemistry of dying, and that DMT parallels and anticipates this. He calls it not a hallucinogen, but a necroptic substance. It actually anticipates the death state itself.

I once had the fortunate opportunity of being able to turn a very prominent Tibetan lama onto DMT, a name that you would recognize, although not one of the top five, but a more wizened, older, stranger character. And, you know, he did it and I said 'so, what about it?' You know, these people, these Tibetan Buddhists, they have a pretty good map of the territory. He said "It's the lesser lights." He said "you can't go further than that without breaking the thread of return." He said, you know, "beyond this, there's no returning." And so in a very real sense it's a look over the edge.

But then even that doesn't solve all the mysteries. I mean what is it about this wish to convey a language which is seen? What's that all about? Is it that...perhaps language has always been a gift from the other. We don't...it's a little hard to picture how the kind of language I'm using right now ever got started. I mean, notice that language is a behavior. It's a behavior, that's all it is. It's something, it's a complex activity having to do with small mouth noises and the neurological processing of same. We must have been essentially as we are before language. It's like breakdancing or something like that. You're fully set up to do it, and people have been for millenia, but until somebody actually does it, it only exists as a formal possibility in the organism.

And I wonder how many of these things there are. I mean breakdancing is an interesting example, albeit somewhat trivial, but it shows that after five, six, seven thousand years of civilization you can come up with a behavior that nobody has ever seen before. I've spent a lot of time thinking about language and how what a limited tool it is, and yet how our whole world is held together by nothing more than small mouth noises. And it's incredible, the entirety of global civilization is held together by small mouth noises and symbolic notations of same, which have an even more rarefied level of abstraction. Our separateness, our notion of self and world, of self and species all rest on the carrying capacity of these small mouth noises.

One of the things that has interested me, some of you have heard me talk about this, is I think good

psychedelic trips inspire a lot of homework, which usually means reading in curious areas, and I discovered that octopi, cephalopods which, in case you're not up on your evolutionary biology, these are mollusca, they're not even vertebrates. They're related to escargot and banana slugs. I mean you can hardly imagine a form of life more alien to ourselves. I mean, you know, we broke off from the other primates three million years ago, but the invertebrates and the vertebrates separated from each other about seven hundred million years ago. Well, an interesting thing going on with octopi, most people have heard that they can change color, and most people I think assume this means that like certain lizards and certain butterflies, they camouflage themselves against their background. That's not what's going on. Color and texture, for octopi, are the medium of language. It's- you could almost say that an octopus is a naked mind because as the octopus goes through certain internal changes, hunger, sexual need, whatever, color changes accompany these shifts of internal state and appear on the surface of the octopus. It is almost though it wears its language like an overcoat. It is clothed in its own meaning.

Well, obviously in that kind of situation you have always been suspended in an ambiance of language. Unlike ourselves, where apparently language was invented one bright summer day, or series of bright summer days. And if you have a language such as we have, small mouth noises with culturally assigned meaning- if, in other words, I say 'where can I get a taxi', if I don't say this to a person who speaks English, it means nothing to a Ukranian or a Chinese- octopi don't have this problem. There are not culturally localized languages. There's only a language of the body, the genes. It's unambiguous.

You see, even those of us in this room, if you were to check, our internal dictionaries are different. We have only the assumption of one to one mapping of meaning. I mean, if I ask you 'where is the restroom', this is fairly unambiguous, because it deals with ordinary situations. But as soon as conversation leaves the main and well-trodden path of discourse, ambiguity enters in to a tremendous degree. We overlook this as a courtesy to each other. I mean you almost never hear one person say to another 'now would you explain to me what I just said?' The reason you don't hear this said very often is because the thin illusion of communication would break down completely if we actually demanded of our listeners that they repeat back to us. The only situation in which that happens on a regular basis is the pedagogical mode, where the teacher teaches and then by test and recitation determines that the pupil has understood. But in polite discourse among adults, we consider this an imposition if not an insult.

So somehow these creatures are elves of language, catalysts for the concrescence of cognition, and I don't know if these things can be understood, after all, we're embedded in the world created by our own meanings. C. D. Brod, I think it was C. D. Brod, wrote a book called The Meaning of Meaning. Or, no, it was F. H. Bradley actually. Brod's book was called The Mind and It's Place in Nature. Probably these two should be read back to back just to see how positivists handle these kinds of problems. The meaning of meaning is a real problem but it also tends to be solipsistic or tautological. Can we expect brain to give a full accounting of brain? Can we expect mind to give a full accounting of mind? Anybody who's studied logic for ten minutes can tell you that that's impossible because it is tautological.

William Blake used to say 'nothing is lost.' Nothing is lost, and this seems literally to be true. It seems as though, you know, something once articulated, a statement, the reverberations are unto the last syllable of recorded time. Somehow it's all there. Now, when I said these things approached and spoke in English, I didn't mean to make it sound as mundane as it might sound. You know Greek religion was characterized by what was called the logos in the hellenistic period and the logos was an informing voice, and all the great thinkers of Hellenistic times- Plato, Socrates, Xenophon, Thucydides- all of these people were in

contact with the logos. It was the sine qua non of hellenistic religion. And it was a speaking and informing voice that tells you the right way to live. Well, we don't know what to make of this, and at a certain point in the evolution of the Western mind, judging by the writings of people who were contemporaneous with those times, the Logos fell silent.

There was actually a date. Some of you may know the story of the fishermen pulling their nets off the isle of Rhodes, and they heard a voice from the sky say that great Pan is dead. And this was at the change of the eon, the beginning of the Age of Aquarius. It was almost as though there was something in the ancient world that has gone latent, that we can no longer touch or imagine.

Gordon Wasson who discovered with his wife Valentina the mushrooms, told a very interesting story in one of his books about how in Mazatecan, the people who are speakers of Mazatecan, when they chant what the mushroom says, they have created a special form for this, which goes like this: 'zabaz zabaz zabaz *tse*' This word 'tse' means 'says.' Daba daba daba *says*, dada dada dada *says*....

I didn't know this at the time I took mushrooms the second time, and in my head I heard the mushroom speaking in English, but adding the word says to the end of the sentence. So it was almost like, you know, this thing could speak in Mazatec it could speak in English but it always kept its cadence and its structure. Another thing about psilocybin and the DMT thing is that it seems to be a catalyst for glossolalia. This is why I think it must have had something to do with the evolution of language. I mean, when you take psilocybin you can fall spontaneously into states of glossolalia. Sometimes on DMT it's almost impossible to control. It just spontaneously comes out.

Yeah. (question from the audience)

Oh, what is glossolalia? Glossolalia, well, here's an example of it, then I'll define it. Zee ding quap makti kipitech kving hwade molde ruuf nobokehingiet efapsti tulch kfem bedegene hekengte techkt.

Its language-like activity in the absence of meaning, and it's a very interesting thing neurologically because, notice that speech, ordinary speech, is this highly variable stream of data. We are set up to make these small-mouth noises. As a public speaker, I am very aware of the fact that one can speak without tiring almost longer than you can do any other major human motor activity. And...but the glossolalia such as I just did, it is clearly under the control of the rules, but it is not - there is no meaning conventionally conceived of there, but there is syntax, and I think probably that language was invented millenia before meaning, and that you could almost call glosso- you could almost call language toneless singing, and that people used to sit around the campfire and amuse each other by making funny noises. As a kid I used to do this. And then it was only much much later than anything approaching linguistic conventionality was imposed on this and that that's a lower function.

The other thing I want to say about this glossolalia thing is you may say 'well you're just making it up' when I do that, but really, the experience I have when I do it is that I stand aside, then this variable data stream comes out through my mouth. Well now, it has to reflect something about me. It's a statement about my internal situation in that moment. And it's evolving and changing as rapidly as if I were saying 'you know I had a migraine headache last night and i got up about 4 and took an aspirin and' You know, I'm telling you about my situation, but the glossolalia must be speaking to something about my situation, or it wouldn't be possible to do it at all.

Not only is something not real unless it can be said, but the contrapositive of that is that once that something can be said, it becomes almost too real. It displaces other possibilities. I mean, so we're living in a set of constructs, some architectural, some ideological, and they can be very oppressive. I mean, how do you get rid of the notion of linear time and space? Very easily. It's the slow work of consensus. One of the things that I feel that I am doing very consciously in these kinds of meaning is we're trying to launch and replicate memes. You all know this concept? A meme is the smallest unit of an idea in the same way that a gene is the smallest unit of organism. And so these things, DMTLs, transcendental object at the end of history, these are memes, and in the same way that genes are copied and spread around and that fidelity of copying is the key to genetic success. Fidelity of meme replication is the key to communication. I mean, if I give a speech on something and then you hear it and then you go out and somebody says 'so what did he say?', and you give a completely cock-eyed account of what has been said, well then the meme has been betrayed. But if you can actually transfer the meme to somebody else's mind, and then they can copy it and pass it on. It's almost as though the ideological environment were like a rainforest, or a coral reef.

Evolution is taking place. Stupid memes, dumb memes have short lifetimes, and they disappear, you know. And memes of great power are able to thrive in many intellectual and ideological niches and to make many marriages of convenience with other memes. And so they are stabilized and passed along. Somehow we have to become hip to the fact, the power of language, and instead of just willy-nilly creating linguistic structures sort of ad hoc, we need to begin to consciously engineer our linguistic intent. So far in the 20th century this has not been a program with a very happy history because only jerks have gotten ahold of it- Nazis and people with narrow social programs that say 'we're not going to call each other 'mister' and 'misses', or 'hey you'. Everybody's going to call each other 'comrade' and then this will create the notion of comradeship. Which, to a certain degree, it does. But, you know, manipulating these things for political ends. The Jews - it was OK to put Jews in ovens because the official language for talking about Jews was that they were 'untermensch' subhuman, not like us, whoever 'we' are. So one the definition was changed, people said well, it's okay for us to mistreat Jews, you know, they're not even really people. And this kind of thinking goes on all the time. It's called stereotyping, and it always is an easier substitute- it's a cheap substitute for clear thinking.

David Brown asked me the question 'what about life after death', and I was- somewhat of a sidebar- Buddhists at the folk level in India do say you cannot attain enlightenment unless your mother is dead, which is a kind of an odd notion seeming to imply that she had to precede you into hyperspace. When you die what you do is you literally, as appears to happen, you dissolve, and where you go is forward and backward into time, not like a gas released into time, but along the tracks and trails of the genetic machinery. In other words, you flow into your children and you become, well, let's make a very simple model and say at the moment of death you become your children and your parents. A few moments later you become your grandchildren and your grandparents. You're spreading down. It's almost as though the thing that you were, which was this focus of ego and individuality- then it dies, and it's almost as though the mountain begins to slump back into the generalized pool of consciousness and being.

That's why I have somewhat less patience maybe than I should have with the idea of channeling and come-as-you-were parties and that sort of thing because it seems to me the key to understanding the idea of reincarnation and past lives is that you were everybody. Of course that's who you are. Here comes everybody. You weren't just that shepherd girl or that Roman Emperor or that Greek philosopher- you're everybody, and you can find your way into the great genetic telephone system and ring anybody's bell in

history. Well then it would be absurd to claim you *were* that person. That would be as absurd as claiming that anybody that you could call on the telephone is who you are. No, it's that we are everyone. And, you know, the great turning object in hyperspace that is the genetic trans-dimensional object, casts off glinting reflections of this personality, that personality. And astrology has a role to play here, and other things, but the bottom line is we are all drawn of the same stuff.

I think one of the most profound insights you can have on psychedelics, and I certainly have it, is that we are all interchangeable. Anybody could do my job, and I'm pretty confident I could do almost anybody's job. We define ourselves otherwise, but in watching the rise of my own career, it's a kind of being deputized, chosen for the job. They said "Well him. He can do it, he has the gift of gab so give him the credit line." But it could have been anybody. Our uniqueness is real on one level but on another level it's fairly illusory. It's sort of a *coincidencia oppositorum*. You have to hold these two antithetical things in your mind at once in order to correctly perceive the proper level of ambiguity that's resident in reality. It ain't simple, folks.

Dreaming Awake at the End of Time

13 December 1998

Fort Mason, San Francisco, California

Join Terence McKenna, author, explorer and philosopher for a think along deconstruction of the deepening worldwide weirdness. With his characteristic hope and humor, McKenna examined time and its mysteries, the nature of language, the techniques of ecstasy, high technology and virtual cyberspace, the role of hallucinogenic plants in shamanism and the evolution of human cultures, and the foundations of post-modern spirituality. The lecture and discussion was didactic, syncretic, challenging, eclectic, eidetic and irreverent intellectual adventure.

Terence McKenna - "Dreaming Awake at the End of Time"

<https://www.youtube.com/watch?v=KboPUQ0xCDs>

[Terence McKenna]: Can you hear in the back? Good. I assume so, yes? Good.

Well, it's a pleasure to be in San Francisco. This is sort of a hometown of mine. One of my home towns. I've been on a tour, or a rave... spoken three times and raved twice in the past five or seven days. This is the end, so if I'm comfortable with this stuff at all I must be comfortable with it this evening. And it's nice to see a small full house. That's the most exciting kind of audience to talk to, I think. So thank you all for turning out on a rainy night. Before I get into the main body of tonight's entertainment, I want to call your attention to the propaganda for an event in Mexico and another event in Hawaii. In the case of the Mexico event, you get a major slice of the psychedelic community. You get Robert Montgomery and Jonathan Ott, Ann and Sasha Shulgin, Manolo Torres, Christian Resch[?], Terence McKenna, and others who unfortunately slip my mind, at the ceremonial center of Palenque in Chiapas. We've been doing these events somewhere in Mayan Mexico for the past ten or twelve years. Many of you are graduates, which doesn't mean you can't come again, but I want to invite all of you there. If you're interested in ethnobotany, shamanism, ethnopharmacology, altered states of consciousness, the politics of all of this, this is as intense and information-packed an exposure as you can have and it's straight from the mouths of the scholars and scientists and writers who have spent a great deal of time in that area. So I just want to invite you to that. It's also a great party. It's the height of mushroom season. There's nothing we could do about that. So... you just are on your own. When I start out on these tours I usually have an agenda and prepared remarks, and then as I make my way through my venues and I hear the feedback and I feel the ambiance of the people and the throb of the zeitgeist, it all sort of just simply dissolves into an ongoing commentary on our moment in space and time, and the various dimensions, adumbrations, and opportunities of our dilemma. But I want tonight to couch it for you in the context of, I guess, and extended metaphor. We could talk about these things many ways, but I find this particular extended metaphor illuminating. I start by recalling an observation from someone who's name rarely falls from my lips, and that would be Gurdjieff. Gurdjieff said at one point, or was known to comment that, "People are asleep," he said, and he by implication suggested, people "awaken." Now I'm not sure if he fully grasped the implication for his own product line, had that occurred, but in any case... [audience laughter] You're on it. You're with me, yes. It's very hard to give these lectures in such a way so that every person hears something different. [audience laughter] Which is

what is supposed to be going on, you know. Well, so thinking about this comment, that "people are asleep," I see several implications. I asked myself, "What is 'awake' in my own notion?" And I thought to myself, "'Awake' is... for me 'awake' is where the laws of physics are fully operable." You know, hurled objects shatter, electricity shocks, I cannot fly... the laws of physics are in operation. In that domain I consider myself to be fully "awake." Now, in terms of occult and spiritual traditions, the admonition to "awaken" always seems to imply that higher consciousness is approached through an expansion of clarity and awareness. And that seems obvious, I don't argue with it... as a rationalist. But as somebody who has run the edges, I've noticed something somewhat counter-intuitive to that teaching, and it's this... it's that, to contact the cosmic giggle, to have the flow of casuistry begin to give off synchronistic ripples, whitecaps in the billows of the coincidental ether, if you will... to achieve that requires... a precondition is a kind of unconsciousness. A kind of drifting. A certain... taking your eye off the ball. A certain assumption that things are simpler than they are almost always precedes what Mircea Eliade called the "rupture of plane" that indicates that there is an archetypal world, an archetypal power beyond, behind profane appearances. And in my own life, for those of you who are conversant with my output, when I went to the Amazon in 1971 and had the experiences that are described in True Hallucinations I had been for many months before that in Asia, smuggling, hanging out, and I had taken my eye off the ball. I had become very gentle, very relativistic in my approach to other people's opinions and behaviors. I was "easy-going" is what I'm trying to say. Too easy-going. And in that situation of semi-unconsciousness and openness the cosmic giggle approaches. And I compare this-- this is closing of a theme --I compare this to sleep, or to states that lie between waking and sleeping. And so again, an odd take on this remark of Gurdjieff's. I remember someone many years ago said to me... they evoked the symbol of the yin and the the yang, the two tears folded against each other within a circle. And this person who was no rishi, roshi, geisha-eared[?] guru but simply observant, said, "It's not the black side. It's not the white side. It's the interface. It's the edge." And I found, by observing sleep-- and some of you may recall the motto in Athanasius Kircher's Amphitrium Sapientium that's chiseled over the alchemist's doorway... I can't do it in Latin but it says, "While sleeping, watch." "While sleeping, watch." --And I've noticed that while going to sleep there is a barrier. A place in the process of going to sleep that is like a mercurial edge. It's a river. It's a zone of hypnagogia. You often pass through it post orgasm. It's a place of drifting, amoeboid, colored after-image lights, and then... true hallucination. Images. Strange, transcendental, or transpersonal images. Well, so then, so far in the context of pursuing this extended metaphor about sleep,

[10:00]

I've talked basically, essentially about the individual's relationship to the concept... to the fact. But there's also a social or a political, species-wide implication. It occurs to me that at any given moment, because of the way the planet is as a thing, some considerable percentage of human beings are asleep... always. And many are awake. And so, if the world's soul is made of the collective consciousness of human beings, then it is never entirely awake. It is never entirely asleep. It exists in some kind of indeterminate zone. And this, to me, is the clue to understanding something that is personally fascinating to me. And it revolves around why people believe such weird things. And why, either as a consequence of the approach of the millennium, or the breakdown of traditional values, or the density of electromagnetic radiation, or for some reason... a Balkanisation of epistemology is taking place. And what I mean by that is there is no longer a commonality of understanding. I mean, for some people quantum physics provides the answers. Their next-door neighbor may look to the channelling of archangels with equal fervor. I mean if this is not a Balkanisation of epistemology I don't know what it is. It is accompanied by a related phenomenon which is technology or the historical momentum of things is creating such a bewildering social milieu that the monkey mind cannot find a simple story, a simple creation myth or redemption myth to lay over the crazy, contradictory, patchwork of profane techno-consumerist post-McLuhanist, electronic pre-apocalyptic existence. And so into that dimension of anxiety created by this inability to parse reality rushes a bewildering variety of squirrely notions, epistemological cartoons if you will, that... and conspiracy theory, in my humble opinion-- I'm

somewhat immune to paranoia, so those of you who aren't, you know, gaze in wonder --conspiracy theory is a kind of epistemological cartoon about reality. I mean, isn't it so simple to believe that things are run by the greys, and that all we have to do is trade sufficient fetal tissue to them and we can solve our technological problems. Or isn't it comforting to believe that the Jews are behind everything, or the Communist Party, or the Catholic Church, or the Masons. Well, these are epistemological cartoons. It's, you know, kindergarten stuff in the art of amateur historiography. I believe that the truth of the matter is far more terrifying. That the real truth that dare not speak itself is that no one is in control, absolutely no one. You know, you don't understand Monica? You don't understand Netanyahu? It's because nobody is in control. This stuff is ruled by the equations of dynamics and chaos. Now, there may be entities seeking control-- the world bank, the communist party, the rich, the somebody-or-others --but to seek control is to take enormous aggravation upon yourself. Because this process that is underway will take the control-freak by the short and curly and throw them against the wall. It's like trying to control a dream, you see. The global destiny of the species is somehow unfolding with the logic of a dream. Well now, a Jungian would say, "No surprise here. History is the collective dream of humanity. It is run by archetypal energies. It is downloaded by the zeitgeist into the various milieus and epochs of which it is composed." This seems reasonable to me. I don't want to give you the impression... it's too linear to understand that what I am saying is that "awake is good; asleep is bad." What I would rather do is explain this whole gradient of possible positioning vis-à-vis your life and your destiny, these choices that you have, and then have people understand that they choose, you choose to be asleep or partially asleep or fully awake or to be one part of the time in some situations and one part of the time in other situations. Now, if in fact we exist inside some kind of morphogenetic field that is created by the sum total of human minds on the planet, and if in fact in half or more of those minds at any given moment the ghouls of the dream hold sway then it is no surprise that when we make our way into society, or just when we live our lives, there's an eeriness to it, there's a fatedness to it, there's a plottedness to it. You know, we are inside some kind of engine of narrative I believe. You know, some science-fiction writers such as Greg Egan and others have suggested that this could even be a form of recorded medium. You can see the thumbprints of editors on our reality if you are truly paying attention. I mean, if you're a devotee of the theory of stochastic, random unfolding of events, then you have to look very carefully at how un-random and how mythical and archetypal most people's lives are. You know, if you take psychedelics and hurl yourself to the edge and spend time with strange, aboriginal people in remote parts of the world, the cosmic giggle becomes your friend. But in fact, ordinary people's lives, everyone's lives are touched by deep magic, and I've... you know, again, the primary datum is experience. And then the models are built backward from the primary data, without prejudice and in an attempt to transcend historical momentum. And when I do that what I see is that the carrier of the field of the cosmic giggle in most people's lives... is love. Love is some kind of output which messes with the entropic tendency toward probabilistic behavior, in nature. What do I mean by that? I mean, you can be the janitor at Microsoft and the Vice President and Chief of Operations, his daughter can bring him lunch one day and you can, from a distance, have your eye fall upon her and fall in love with her, and you know, from that point to having the five children

[20:00]

she bears you go off to Harvard and the Sorbonne... it's just a matter of running the clock forward. These things have... I mean to you it may seem like a miracle, but to those of us who are students of human happenstance it's inevitable. I mean, you can launch your story. And I've, you know, in the course of taking psychedelics and looking at my life and other people's lives and narrative, I think that the secret of... I don't want to say anything as pretentious as "transcendence" or "enlightenment," but the secret of taking hold of one's destiny is to understand that one is a character. A character is a different thing than this model you inherit out of the idea that you're a three-dimensional animal inside a democracy with a Christian heritage and you know, a Dewey-decimal cataloging system or whatever. Anyway, these are some of the notions that occur to me in the context of comparing dream on many scales. You have to really struggle, I think, to believe that you actually live inside the model of reality that science

and Newtonian physics and the mathematical analysis of nature have given us. Not to get too philosophical here, but for positivist philosophers everything that is important-- color, feeling, taste, tone, ambition, apprehension, appetite --these things are called "secondary qualities." In other words, they're peripheral. They arise at a lower level of understanding. They are somehow determined by the presence of the animal body, and hence, dismissible by a theory of pure abstraction which says what is real is spin, charge, angular momentum. None of these things are very rich concepts for a living, human being. Who knows what any of these things "are." We don't have time in a situation like this to explore all the implications of this dream analogy that I'm pursuing, but one that interests me is the plasticity of time in the dream, and I think I would argue as the devil's advocate that it is the plasticity of historical time and the acceleration, the sense of an out-of-control spin-up or spin-down into new domains of possibility... it is the strongest evidence at hand that we are in some kind of dream. I've struggled my whole life with... I've always believed, or I've always felt the power of the statement, "The world is made of language." But of course, you think about this proposition for thirty seconds and the question that arises is, "If the world is made of language then why isn't it the way I want it to be?" Why does it have this prepotent momentum for its own... it has its own *raison d'être*s even if it is language. Well I think-- and it's appropriate to speak of this to an audience as digitally sophisticated as I assume you must be --I think the primary insight that has been secured here at the end of the twentieth century, the primary contribution of twentieth century thinking, if you will, is to have understood, finally, that information is primary. That this world, this cosmos, this body and soul are all made of information. Information is a deeper and more primary concept than space, time, matter, energy, spin, angular momentum. The world is made of language. The implication for the digerati is that reality can therefore be hacked. If reality is made of language then what we're saying is that it's code, and if it's code then it is far more deeply open to manipulation than we ever dared dream. We've been messing around on the desktop opening files with religions and political systems and xenophobic theories of racial superiority, all this crap that haunts the human historical adventure, it means we have not addressed the deeper levels. And in thinking about this and the relationship to dream and human culture I have realized that cultures are like operating systems. We are like hardware. The human animal is a piece of biological wetware/hardware. And it has been, we know, pretty much as we confront it today for at least 140,000 years. At Klasies River Cave Mouth in South Africa they have excavated Homo Sapien Sapien skeletons 100,000 years old and that person could have sat in the front row here tonight and nobody would have batted an eyebrow. So the human hardware has been in place for awhile. What has changed rapidly in comparison to the rates of biological evolution are the operating systems. The people who excavated Ur-- which was at that time thought to be the world's first city and in any case is a city seven millennia old --when they excavated the central plaza at Ur they discovered that a black, basaltic slab had been set up there by the earliest kings of Ur, and that was the cultural operating system. And if in a deal trading goats for olives a dispute arose, people had reference to the central operating system and these things were determined. Well now, "Ur-101" was fine for olives and goat trading but it didn't support higher mathematics, it didn't support rational exploration of nature, it didn't support astrological knowledge about the movement of the stars. As we have gone forward through culture we have swapped out these operating systems, and at each swap-out there has been a lot of hair-pulling and cussing and screaming. Anyone who has installed a new operating system is completely familiar with that sickening from the bowels kind of coldness as you realize it all hangs by a thread. Now this situation, or this operating system metaphor, I think is a useful one for understanding-- and again a circle closes --the Balkanization of epistemology that causes me such anxiety. If you meet an aboriginal person from the Amazon for example, they may be running "Witoto 3.0" as their operating system. Nicely supports animistic magic, huge capacity when it comes to making fish traps and bird traps. Witoto is a powerful operating system for a rainforest aboriginal. In our culture there are, I have no idea, at least ten or twenty operating systems

[30:00]

all going at the same time. Some will run Mormonism, some will support Catholicism, others, Kabbalah goes at the speed of light. Others support quantum physics, some support econometrics, others support political correctness, and

these things are mutually exclusive. And so, looking at this and looking at this clash of operating systems I've come to the conclusion-- and some of you may have heard me say this before --that culture is not your friend. That's the final conclusion. This came to me a few months ago when I had my yearly physical and as I was buttoning up my doctor said to me, "You know, in the 19th century most people your age were dead," and I realized that this was true, and that among all the revolutions that we are enduring, one of them is that we live nearly twice as long as people lived very recently in the past. Culture is a kind of neoteny, and I don't want to belabor that at great length but for those of you who are not biologists, "neoteny" is the retention of juvenile characteristics into adulthood. It's used to describe animal behavior, for instance I'll give the most spectacular example of neoteny. There is a kind of animal which lives in ponds in Africa and it reproduces like a fish. It lays eggs on the bottom of these ponds, more fish-like animals come from these eggs and so forth. However, if the pond dries up the creature undergoes metamorphosis and becomes an animal somewhat like a gecko and... lays eggs and from these eggs come creatures that are like geckos. In other words, this is an animal which actually achieves sexual maturity in two forms depending on environmental stress. Spectacular example of neoteny. Turning to human beings, a less spectacular example, but relevant to us, is our general body hairlessness compared to other primates. We look like fetal apes. Human beings look like fetal apes. Why? What is neoteny? Well this is hotly debated among evolutionary biologists but the point I want to make is a socio-political comment which is, "Culture itself is some kind of neotenizing force." Because what culture provides is a bunch of rules - so you don't have to think, and a bunch of myths - so you don't have to think again. Culture has all the answers, you know.

-“You wanna know where people came from? Well, when the sky god got out of his canoe at first waterfall and took a leak then we, the true people, appeared like ants and we've been living here ever since.”

-“Oh... huh. Gee thanks, I'm glad I asked.”

This is what culture does for you. But now technology throws a curve, and the curve is that we live so long that we figure out what a scam this is. We figure out that what you're supposed to work for isn't worth having. We figure out that our politicians are buffoons. We figure out that professional scientists are reputation-building, grab-tailing weasels. We discover that all organizations are corrupted by ambition. You get the picture. We figure it out. Well, then as intellectuals-- and anybody that figures it out is an intellectual, believe me, because they're slinging the programing to push you the other way --so then, "intellectuals"-- defined as, "people who figure it out" --discover that you are alienated. That's what "figuring it out" means; it means that you understand that the BMW, the Harvard degree, the whatever-it-is... that this is all baloney and manipulated and hyped and that mostly you have a bunch of clueless people who are figuring out which fork they should use. But this position is presented as alienation and therefore somehow tinged with the potential for pathology. You know, it's a bad thing to be alienated. Now let's speak for a moment, in order to fulfill the promise read in the introduction, about psychedelics, and what are they doing in this fine situation? Well, what they're doing is forcing this maturation process by dissolving boundaries, which is what they do. They are exposing the cultural operating system for what it is, which is just a bunch of hacked together rules that evolved over time. They weren't sent from god from mount Sinai. It's just a bunch of hacked together rules. So psychedelics in that sense spread alienation. But what they alienate us from is preposterous, earth-murdering, sexist, consumerist, shallow, trivial, inane, insane, and dangerous. That's what they alienate us from. So again, this neotenization thing is like the condition of unconsciousness that I described as the precondition for the cosmic giggle. Glamour, acts of magical conjuration, hypnotic delusion, and illusion, hysterias, fads, pseudo revelations, strange truths whispered in every quarter-- this is the character of our time, and people have seemed to believe that they were fulfilling their responsibilities intellectually, people seem to feel they are doing that when they reject the past. They say, "Well that was all screwed up but since I got with Master Shuggi I've understood the way it really is supposed to be." No, this is just trading one set of neotenizing operating systems for another. The real hard choice that you're being pushed toward, and that you might consider making before the yawning grave rings down the curtain on this cosmic drama is actually intellectual responsibility, freedom, and a devotion to what scientists call "elegance of thought." You know, people say, "Well how can you tell one theory from another... I mean is science better than religion," and this and that-- After a lot of arm-waving it should be conceded that the final call is aesthetic. That because we are monkeys, because we are so far from god, we cannot set knowing-the-truth as the standard for choosing among the models we can produce. We must set our aesthetic compass towards the more-true; what Wittgenstein called the "true enough." And then the question is, "Well how do

you recognize that?" Well... this is a rich field of human study called "Philosophy of Science," or "Epistemology" and "Ontology." "How do we know what is real?" But Plato, who all the rest of philosophy is a footnote upon, Plato said that the key lay in the concepts "the good, the true, and the beautiful." "The good?" What is it? Tricky, tricky... tricky. "The true." What is it?

[40:00]

Trickier... even trickier. "The beautiful." What is it? Easy to discern. The beautiful is easy to discern. You are going to be condemned to live out the consequences of your taste. Really... really. And if you have no taste, god help you, because you are self-condemned to an appalling nightmare. You won't be getting it, all the subtle stuff will go by you, while your head is filled with cant, nonsense... foolishness. So again, the metaphor of the dream and of making choices based on beauty and beauty is downloaded into the human cultural milieu largely through dreams. Other ideas may also come in dreams but I think studies have shown that architects, designers, people who are actually at the top of the pyramid in any design process are very aware of their dreams, their reveries, their insights. So that's the way to set the compass. Not toward truth, not toward the good-- not because these aren't fine things but because they're so slippery --but toward beauty. And with that in place, to my mind life... hope follows as a natural consequence. We talk a lot, and I'm sure there are people in this room who are well-versed and connected into the world of virtual reality which is a very hot topic and may have all kinds of implications for our future and the evolution of consciousness, but it's worth pointing out that we have been making virtual realities for a very, very long time, that language, spoken language is the original code for hacking virtual reality. When you sit the children down around the fire and begin to tell the old, old stories and the pictures rise out of the flames, that is virtual reality. And so is-- and this is the point I want to make --so are all the artifacts, all the impedimenta of human existence. I mean, a virtual reality built in aluminum, stucco, steel and glass is not immediately erased the way you clear a screen. And the cost of making it is great. But Ur was a virtual reality. The Agora at Athens, ancient Rome, Canterbury Cathedral, these are virtual realities. Men and women have toiled at agriculture, at warfare, at childrearing, at many, many activities in the long march toward self-definition but more and more we have-- this is true of societies that are aboriginal and without economy --when we free ourselves we are not freed to a void. When we free ourselves we are freed into the dimension in which art is an obligation. And this is the great turning point. I think that the design process, whatever that means, must become conscious, global, integrated. The entire human domain, which means the entire planet and it's surrounding near space should be enclosed and included in a coherent plan driven by human values and a thirst for transformational beauty. And I mention this because I believe that many of the people capable of making major contributions to that are in this room or within a hundred miles of this room tonight. And we are people of immense privilege by any way of slicing the planetary demographic. Even the poorest among us who wheedled their way in here this evening are in the top one percent of the planetary social pyramid. On a planet where hundreds of millions of people are starving the obligation upon the conscious people near the control surfaces, near the levers of the human machine is immense. So with freedom-- and I know this is a cliché but hopefully not in this context --with freedom of that sort comes enormous responsibility. And it's paradoxical; responsibility to dream and coexisting and simultaneous with that, an obligation to awaken. In other words, an obligation to make sense, be non-trivial, not to squander resources in foolishness... an obligation to awaken and an obligation to, at the same time, dream. And then the rational mind screams out, "But this is impossible; this is paradox!" But the subtle mind understands that we have now reached square one. By openly confronting the necessity for paradox, and by openly confronting the fact that we can only enclose our dilemma by speaking in at least two modes at once, we begin to actually honor the complexity of the situation. And so tonight the thought I want to leave with you is, the simultaneous project of awakening, and the simultaneous project of entering deeper into the dream for the purpose of cultivating, evoking, experiencing, remembering, transmitting and communicating beauty, which feeds back into the awakening process. Otherwise the awakening will be traumatic and demoralizing. We will awaken to and aid-ravaged earth, to eco-tastrophe, planetary warming, complete collapse of any concern for the destiny of future

generations. This awakening must not be disempowering, and the mantle that can be spread over the awakening to counteract the possibility of disempowerment is this wish to evoke, realize, and serve the project of bringing ever greater amounts of beauty into the world. I think that's the end of the formal lecture here this evening. Thank you very much. I didn't say... we will have an intermission of about twenty minutes so you can... "What'd he say? What'd he say?" And then we will get back together and undergo the more creative process and the more organic part of the evening which is Q & A, and for those of you who can't stay for that, I appreciate your attention and your concern, and thank you all very much and we'll assemble here in twenty minutes.

...history of shamanic use in the Andes of South America. People take... you can be a strict constructionist in the matter of psychedelics or you can cast your net widely. There are many substances in nature which alter consciousness. Either stimulate or sedate or

[50:00]

create more ambiguous and spectacular effects. I would describe the effects of datura as a deliriant. Now, the shamans who use these things have special techniques, both of preparation and of training that allow them to control or navigate around the more unpleasant aspects of datura. It tends to provoke memory loss, shall we say bizarre behavior such as taking your clothes off in public, and so on... and it creates a general ambiance of uncertainty about the nature of reality. And what I mean by that is you talk to people who aren't there, you smoke cigarettes that aren't there, you answer phone calls when you're standing in the woods. From the outside it looks pretty fucked up, you know? But some aboriginal and native traditions have managed to tame this, at least in the shamanic context. I, I guess in this matter, am a kind of strict constructionist in that when I say "psychedelic" I have something very specific in mind that a substance or a plant should do. It should not inhibit clarity, in other words not episodes of forgetfulness, lack of memory, passing out, or confusion. It shouldn't interfere with that, and it should transform thought, and it should be accompanied by visual hallucinations with eyes closed. That's what I love. That's what I live for. People have said to me, "You're some kind of a vision chauvinist." It's true, and what they... and usually the people who were saying this were people who were great enthusiasts of LSD. LSD I would never argue is not a psychedelic, but you have to take massive amounts and usually in combination with some other substance like hashish or mescaline in order to elicit from LSD what I'm after, which is cascades of... Niagaras of visual beauty... in darkness with eyes closed. I have had deep psychological insights on LSD, I have had creative breakthroughs, I have had bonding experiences, but I've found it difficult to get the visions like I wanted them, and the best I worked out with LSD was I would smoke as much Afghani hash as I could at the top of the trip and then it would do the thing, in fact. It would do it. The thing that led me to psilocybin, or to grow mushrooms and explore that was the descriptions of Wasson and the early workers, that it was easy to visually hallucinate and I had read the earlier accounts of Havelock Ellis and people like that and it was about, you know, if you've ever read... I think it's *The Dance of Life*... Havelock Ellis' description of mescaline, he talks about alien buildings, jeweled ruins, fantastically efflorescent rainforests growing and transforming before his eyes... that's what I was after. I wanted not a disturbance in the optic nerve, you know, like, on LSD you get those little things that look sort of like fans that creep across the walls, that's more like something in the visual cortex than something in the mind, it seems to me. And I was fascinated, and who isn't, I mean I never hear this question discussed, but to me it was the obvious question about these visions was, "Where do they come from?" You know, how can I be astonished by the contents of my own mind, and astonished over and over again? Where is this stuff coming from? And I looked at Jung, and I entertained the fantasy of extraterrestrial contact, and I still haven't answered this question. But I think it's a question

which the critics of the psychedelic experience haven't wanted to deal with. You know, if you read the psychedelic literature, you can tell what psilocybin does to heart beat, sperm count, perception of tone, on and on... they never talk about the real content, you know? Because it's always individual, and they say, "Well science can't handle individual phenomena. We measure the properties of large numbers of people." Well that hopelessly flattens the thing. I know this is a long answer to this question but, it's worth laying all this out because the ladies question raises issues of how do you categorize psychedelics, which are which aren't, are some dangerous and to what degree? Certainly datura is dangerous, not only because of it's deliriant quality, which makes you irresponsible, but also because it dilates your pupils and you stumble around and at higher doses it can cause convulsion and death, which is a rare thing from what I consider the true psychedelics. There is, if we want to take an excursion here for a moment and learn a little pharmacology, there is, if you're going to talk about pharmacology, there's one concept that you should get straight and that's called LD50. It means lethal dose 50. What does this mean? Well you have twenty rats, and you give them a certain amount of, let's say, mescaline. When half the rats die, that dose, expressed as milligrams per kilogram of body weight is called the LD50. And when pharmacologists assess the danger in a drug, they ask the following question, "What is the ratio of the LD50 to the effective dose?" And if the LD50 is only twenty times the effective dose that's considered an incredibly toxic, dangerous, and dubious drug. A good drug is a drug where where the LD50 is two-hundred times more than the effective dose. In the case of LSD, the LD50 for man has never been determined. That's how safe LSD is. We're talking about lethality here, not... you know. And so people say well are there unsafe psychedelics, and yes, you just look up the LD50's, line them up and see which have the better ratios. By that measurement, by that standard, LSD is the most desirable, but the LD50 of psilocybin is very impressive. You can take one-hundred times the effective dose of psilocybin and expect to live. Mescaline, not. Mescaline has a bad profile. As an amphetamine, if you took twenty times the effective dose of mescaline you would probably die. Of course an effective dose is nearly a gram of pure material. 700 milligrams. If you took twenty times 700 milligrams you would be taking nearly two-thirds of an ounce of mescaline and why should you survive? Afterall, stupidity does have consequences. But really, people always ask the question, "Are psychedelics dangerous?" And they mean physically dangerous. What should be said, and it's recently been pointed out to me that I don't say it very often, is that the biggest danger with psychedelics is that while you are in that open state some moron will mess with you, and either lay a suggestion or plant an idea or manipulate you or scare you or turn you in a way that you wouldn't ordinarily go. And this is why psychedelic etiquette means knowing your tripping partners.

[1:00:00]

People who take psychedelics with strangers at high dose do come back with wild tales to tell but I don't think you can do that over and over again without having some horrible thing befall you. My mind is not... I mean some people seem more resilient. I am not. You know, people often ask me to trip them and I won't and it's not because of concern for the legal system or the fact that I am not licensed for psychotherapy or any of that. It's because I can't stand it when people come apart on psychedelics. I am... you know, if you're interested in this subject or if you share my sensitivity read Carl Jung's little book called *On the Psychology of the Transference* and then you will understand. In fact, that should be a standard tome for trippers. Understand the transference. Understand what it is, how to fight it, and... this is psychic martial arts... your psychic health will be immeasurably improved by understanding the dynamics of the transference which is quite simple. The book is not that thick. Now to answer the lady's question, when I took datura I had reality-distorting... strange. And if I had been a personality of a different sort I might have followed it deeper but it appeared to me to be ambiguous and evil. Not evil... maybe evil. What happened to me was-- this was in Nepal years and years ago, Nepali shamanism is based in part on datura, the taking of the seed capsules --an English friend of mine who had the room next to mine took it and I took it in my room and it was a situation where to get to the facilities I had to walk through his room. And he and I were friends but we had a very slight rivalry going for the attention of a woman; and I think this woman was not aware that either of us was interested in her but we were both aware that the other one was aware. And midway through my trip I decided I had

to go to the bathroom and so I stepped through into this guy's room and they were in bed together having sex. And I, I guess I went outside and then I, the next morning after sleeping many hours I encountered the guy and I said, "How was your trip?" And he said, "It was wonderful." And I said, "Yes, well uh... I saw." And he said, "What did you see?" And I said, "Well I saw that you were with Juliette, and he said, "I thought so, too... but she wasn't there." And... so, you know... what conclusion do we draw from this? That this stuff is, well... I'll tell you what took me off it finally, was about a week later-- there seemed to be a rash of this datura-taking moving through the traveler community there in this little Nepali village where I lived --and about a week later I was buying tomatoes in the market and I encountered a different person, but this English friend of mine, and he told me that he'd been taking a lot of datura. And I said, "Oh, well that's interesting. I took it. I don't think I'll be taking it again." And as the conversation developed I realized he thought we were in his apartment, and we were not, we were in the market. And you know, this tells you it's time to dry-out. [audience laughter] Anyway, I use that as a springboard to different subjects. You were very patient, uh... next question?

[audience member]: I hope I can remember what my question was.

[McKenna]: It's a test.

[audience laughter]

[audience member]: I agree that there's something sort of mysterious about where these psychedelic effects come from and I refer again to the sort of classic psychedelics-- psilocybin, LSD -- but, the fact that you generally need to take a substance or a drug, it's a material thing, does in some sense sort of go in a strange way to reinforcing a pretty basic scientific, almost mechanistic, view of the universe and I just wondered if you had thought about that or have any comments.

[McKenna]: Well... let me try to convince you otherwise. I mean, I see what you're saying. You're saying that because this transformative, possibly spiritual experience is causally connected to the act of taking a matter of a certain type into your body that it seems to argue for the materialist proposition that mind is an epiphenomenon of the functioning of brain and so forth. Am I restating it right?

[audience member]: Well, yeah sort of but, I wouldn't necessarily go so far as to say that it forces you to conclude[?] that the mind is an epiphenomenon of the brain, but that there is some sort real validity to chemistry, mathematics, physics, and that... you talked about the Balkanization of epistemology ...that those things are in some sense far more real than say, channeling... what did you say... archangels, etc.

[McKenna]: Oh, I see what you're saying. Well... yes. I mean, this relates to what I was saying about the Balkanization of epistemology. It's really strange to me that science is in the act of flinging open the curtains on a staggering vision of what it is to be alive in this cosmos. I mean, we now can look back through the Hubble and other telescopes, you know, thirteen-billion years, to within six-hundred million years of the primary explosion that presumptively created this universe. Meanwhile we're tearing open the nature of the human genome, the nature of the heart of the atom... this is the great, great age for the expansion of the scientific vision. But the population is somehow incapable of staying up with what's going on, and so we have the greatest proliferation of occultism in all forms since the 16th century. It's almost as though there's a bifurcation of the culture. The scientific... the makers of

new science are going deeper and deeper in a direction that the rest of the public not only cannot follow them into, but is actually headed the other way. And it's a condemnation of our educational system that people have not understood that science, for all it's flaws, is the only tool for understanding the nature of reality that has any kind of track record whatsoever. The others just have a story to tell. You know... the Buddha story, the Jesus story... fine stories, but that's all they have is a rap. The amazing... you see, "Why is science different?" Somebody could just say, "Well, but isn't it just a rap?" Well, it is... but it plays by slightly different rules than these other explanatory systems. Science is the only explanatory system where you get points for proving you're wrong. You know? I mean, you form a hypothesis, you publish a paper, then you do further experiments, you discover your conclusions in paper "A" were completely wrong, you retract paper "A" and issue paper "B" and your fellow scientists say, "This guy does very good work. These are careful thinkers. You can bank on these people. They're not flakey." What religion operates like that? You know? Can you imagine coming out of the ashram and saying... having the guru say to his students, "Well we managed to reduce that hypothesis to rubble in morning meditation, didn't we?" [audience laughter]

[1:10:00]

So, you know, it's uh... I... and then let me return to answer that question based on my original misunderstanding of it. And I would say this: You cannot... it is no reduction of the psychedelic experience to say that it is caused by drugs because they are material, atomic systems and therefore we know all about them. Every electron is the yawning mouth of a wormhole that leads to quadrillions of higher-dimensional universes that are completely beyond rational apprehension. Matter is not lacking in magic; matter is magic. I mean, so when you hear these people like David Dennett and all these talk-show materialists running around, these people haven't gotten the news that's coming out of quantum physics. I mean, you see, there's a problem... or let me describe to you the state of play here. The way science works is, science... uh, respects fidelity of theory to experimental results. What really thrills a scientist is when you have a theory that makes a prediction down to five or six decimal points, and then you perform an experiment, and it's spot on, down to five or six decimal points. And then everybody involved in what's going on has extremely high confidence that they're on the right track. Well now, only one science is ever that good: physics. Macrophysics. Uhh, chemistry... it's good, but it's not that good. Uhh, ecology, biology, demography... these are pretty loose. They play with numbers, but it's to hide, it's a fig leaf, and by the time you get to sociology or something like that, I mean, these clowns have just snuck under the tent and should actually be shown the door... uh... and be put back outside with the card-readers. [audience laughter] So... so for several hundred years, uh you know... since, let's say, Galileo and serious physics, this is how science has been. It's been a pyramid of envy directed toward the paradigmatic science, which was physics, and which could produce this incredible congruence of theory and experimental data. Well, so then physics of course charges forward deeper into matter, asking deeper questions. Well, once you pass below the level of the electron it's, it's like suddenly... it's like smoking DMT or something. Absolute madness breaks out. Where before you had these wonderful theories and they were feeding back this data, now suddenly you have backward-flowing time, you have particles which tunnel... which appear magically on one side of an energy barrier without apparently crossing through it, uhh... you have non-locality which seems to imply that every particle that exists is somehow magically connected with every other particle. We now have quantum teleportation, we have black holes, we have singularities... and don't be fooled folks, what is a singularity? It's just a place where you agree that the rules are cancelled because you don't know what the hell else to do. [audience laughter] And it's fine, you know, it used to be in physics that they had one singularity. It was called the "big bang." And so you say, "Well, one singularity." Essentially what science is saying is, "Give us one free miracle and then we can... we can run it from there." [audience laughter] But, the theory of special relativity then introduced the concept of black holes, and of course black holes are enormous gravitational masses so massive that neither light nor information can leave them, and what do black holes have at the center of them? Well, a singularity. Well, how many black holes are there in the universe? Eh, ten-high-fourteen. That's a lot of singularities if you're

trying to produce a theory without singularities. I mean, essentially that's an admission of total intellectual defeat. My god, if there are ten-high-fourteen singularities you're not even doing science, you just might as well be, you know, channelling Atlantis or something. So, uhm... it troubles me because I think this stuff is rich, that physics is feeding back and that ultimately a model of consciousness will come out of studying the deeper levels of the behavior of matter. But the conclusions are all going to support the non-scientific, non-rational factions. In other words, Bell nonlocality is real. All matter in the universe IS in contact with all other matter through some kind of higher space based on their original connectivity. Quantum teleportation IS a possibility. Uh, these violations, backward-flowing-time and violations of rational casuistry are all real. IN other words, science, meaning physics at this point, prosecuted it's agenda of deconstructing nature to the point where it let loose the elves of madness, paradox, contradiction and peculiarity and that can now never be put back. I mean, the dirty little secret is that at bedrock the universe is more like a DMT flash than it is an eighteenth-century garden party, as we were previously assured by the practitioners of science. [audience laughter] Sorry, I think that's enough ranting on that subject. [points] Yes? If you wanna, excuse me, if you wanna ask a question I guess the, what the consensus of the group is is to go and stand, uh, or I'll point to you. The reason we didn't originally say, "Go and stand," is 'cause if you get a nut in the line, there's a certain fatedness to their eventually getting to the microphone, which, if I am sensitive enough in the pointing out process, could never happen. [audience laughter] So this is a.. we're trusting that you're sane.

[audience member]: That's why I got up here early.

[McKenna]: Yeah, good. Okay. Thanks for being patient.

[audience member]: Thanks Terence. I have a technical question, but I think it's an interesting one, and may be important. Uh, your name has become identified with the date 2012, because you have said that, uh, at a certain moment in the year 2012 an event will take place of, uh, tremendous, or even infinite, novelty. And this is based on your work on what you call the, uh, the timewave and novelty theory and so on which seems to indicate that around that date, uh, something, something extraordinary will happen and you confirm this, uh, by saying that, interestingly and synchronistically perhaps, I'm not sure that's what you appeal to but you say that, uh, the Mayan calendar also points to precisely the same date. And number three, you say that at that time also an astronomical event will take place, namely the conjunction of the winter solstice with the galactic center... uh, an event which only happens every 25,000 years. Uh, roughly 26,000 years. So, the last time that happened our ancestors were painting bison on the walls of caves. It's a long, long cycle this precession of the equinoxes that brings the winter solstice around the circle of the zodiac every 26,000 years, and you say that this is going to happen again in the year 2012. What my question is concerned with is that third element, namely this precession of the equinoxes in the year 2012. Uh, as you know the galactic center is not on the ecliptic, is not on the zodiac, but is a bit above it, and so the sun on the winter solstice will never be in conjunction with the galactic center, but an event that is linked with that, and I think far more precise and significant, is the fact that, not in the year 2012...

[1:20:00]

...but right now, as we sit here, the winter solstice is moving into conjunction with the place where the galactic equator crosses the zodiac. This is happening now, 1998, 1999... um, and I'm wondering why you look to this year 2012 and the imprecise conjunction with the galactic center rather than the precise and the remarkable uh... uh return of the winter solstice to the galactic equator, where it was, again, 25,000 years ago when the cave paintings, when the first bursts of self-consciousness were occurring in our species. And I raise this not because I think or

know that there's any truth to the meaning of this, but I do find it exquisitely beautiful that this is happening right now, and I'm wondering what you think about that.

[McKenna]: Well thank you for framing and imparting an extremely intelligent question. I mean, you got it almost... almost all right and all the details right. Uh... and for those of you who have no idea what that was all about, I'm not sure I can help you. But for those of you who do know what that was all about, here's my response. First of all, your statement that the galactic center is now transiting the solstitial node rather than in 2012, that's the only part of the thing you laid out that I would uh...

[audience member]: "Galactic equator."

[McKenna]: Yeah. ...that I would disagree with and here's why. When we say the "galactic center" it turns out when you turn the lights on on that concept that it's extremely slippery. The galaxy is not a basketball. Uh, it has a center of mass, which we can't determine from where we are because we're out on one limb, edge of it. It has a center of luminosity, uh, it has a volumetric center. I mean how do you in fact even define what the galaxy is because at its outer edges it feathers out into extragalactic space. Now what we're arguing over here is a difference of 12 years, if we accept the premise that we're trying to locate a point in time where this conjunction of the galactic center and the heliacal rising of the solstitial sun occurs. Now if you run out and buy a program to run on your PC like Voyager and you look at these solstitial sunrises over the next 14 or 15 years, it actually depends on the program you buy, uh... what the contention is that is supported. Uh, this is a deep subject, very interesting, raises issues of bio-astronomy, archaeoastronomy, galactic dynamics, complicated issues. A book has come out in the last 6 months called Maya Cosmogenesis 2012 by John Major Jenkins. He's a fine scholar, I wrote an introduction to the book, uh, but he, over hundreds of pages, can educate you and bring you up to speed about these issues. Uh... if the Maya had never existed we would still be looking at the end of a millennium based on the Gregorian calendar. Now, we tend to say, well, you know, that the Gregorian calendar is out of sync with the Maya, that if there is a collective unconscious then the European mind somehow made a sloppy download of it, because the Gregorian calendar is off key the Mayan by 12 years. But on a scale of a thousand years that's a difference of .12 percent or something. And on a scale of a billion years, what is being off by 12 years? On a scale of a million years, what is being off by 12 years? So it seems crazy to me to have, you know, violent factions for 2012 and then that... I mean, the point is that something, the galactic mind, the intelligence of the species, the integrated Gaian and galactic entelechy... something is trying to deliver a message and it is writ large, this message, in our largest systems of defining and understanding time. Uh, we are at the end of a cosmic cycle. You can say 1,000 years if you're a Gregorianist, or you can say a five-thousand-three-hundred-and-"x"-year cycle, if you're a Mayanist, or you can say a 25... 26,000 year cycle if you're a precessionist, but the point is we are... we are there. We are there. We are in parking orbit around the eschaton. Uh, and you know, it permeates our lives. All you have to do is sit down, smoke a bong, and look, and it's there, you know. It is pregnant, we are pregnant with this eschatological breakthrough. And you know, people want it to arrive in the form of ships the size of Manitoba hovering over the Oval Office, perhaps offering oral sex, I'm not sure... uh, but you see, we are such ephemeral creatures in time, we're like mayflies or something. Mayflies, who only live for seven days. In other words, our temporal window of perception is so extreme, I mean, people say, "Well nothing much ever seems to happen." Well 100 years ago there were no movies, automobiles, airplanes, telephones, internet, atom bombs, antibiotics, DNA sequen... you know it's endless, so in the space of... and yet people say, "Well nothing much ever seems to happen," you know. An incredible ability to not register radical change seems to be a precondition of existing in the presence of radical change. Now for those of you who care about my theories in this area of mathematics and deconstruction of the I-Ching and analogising to the Mayan calendar, uh... it is a mathematical game, it is an intellectual game, uh... I discern patterns in nature that cause me to believe that science, which I recently praised, uh, has overlooked very important aspects of reality that you don't

need an atom-smasher or a DNA sequencer or a probe to ganymede to register. And what do I mean by that? Science has overlooked two aspects of nature that, as you sit here, I believe you can hear my case and that you will find in my favor. Here's what it is. The first thing which science has not taken on board is the fact that as you get nearer and nearer the moment in time that we call the present, things become more and more complicated. Now that may seem like a trivial statement, but there's no reason for the universe to work like that. Why does the universe go from simple to complicated? Why do you get, at first, moments after the big bang, an ocean of free electrons at such a state of temperature and energy that no molecular bonds can form, atomic systems can't even form because the bond strength is overwhelmed by the thermal energy in the system. Then it cools down and atoms condense; a more complicated thing than electrons by orders of magnitude. Further cooling, further nuclear cooking of the most primitive elements, hydrogen and helium,

[1:30:00]

in gravitationally aggregated masses called stars, cooks out then heavier elements. They emerge. They were never seen before until fusion began to occur in these hydrogen masses. And these fusion processes cook-out iron, sulfur, carbon, bingo! Carbon. Molecules. Now an order of magnitude in their complexity greater than atoms as atoms are to compared to electrons. And then, you know, and I'm compressing 13 billion years of emergence here into 30 seconds, then out of the molecular soup you get long-chain-polymers, out of the long-chain-polymers you get molecular transcription systems, ie. prebiotic stuff, out of that you get non-nucleated DNA, out of that nucleated DNA, out of that membranes, organelles, organisms, higher organisms, differentiation of tissue, our dear selves, culture, language, technology, and the eschaton. Now... why, this is so obvious, I mean leaving out the eschaton if you like, but all the rest of it is self, is totally self-apparent. Why doesn't science take that on board as a major problem in the description of nature, the emergence of complexity?

Well, you ask a scientist, they say, "Well, you see, these are separate domains of nature. How atoms become molecules has nothing to do with how animals become human beings. This is bullshit. This is just some kind of compartmentalized thinking where you don't want to come to grips with the overarching metaphors that are working on various levels. The advent of... the understanding of the fractal ordering of nature now makes it clear that voting patterns in Orange County, distribution of anemones on the Great Barrier Reef, and the cratering of Europa all follow the same power laws. So, that's the first thing which science has starring in it's face and has never taken on-board.

Now, I said there were two things. The second thing is related to the first. [drinks coffee] Double-shot of espresso... you're really getting your money's worth here.

Uh, the second thing which science has refused to take on-board is that this process of complexification that I just described to you, as you approach the place and time called, "the Present," happens faster and faster. That was not necessarily implied by the first observation. The first observation was simply that there was a process which was moving from simple to complex. Now we have the concept of a process which is ever-accelerating as it moves from the simple to the complex. So, uh, more and more happens as you approach the present and since these processes have been running since the big bang there is no argument to be entertained that they will reverse themselves suddenly. No, they're not going to reverse themselves after thirteen billion years. Duh...

So... then, but the implication of that, carried to it's ultimate extreme, leads to a conclusion most people find too

wild to entertain. If the universe is evolving deeper and deeper into complexity, faster and faster, and if, now, in a human lifetime we can see a small portion of this curve... it no longer appears flat to us because of our nearness in relation... you understand what I'm saying? We can actually discern the curve and so that means, I believe, that by extrapolating this process we should then logically conclude that we are very near, relative to the life of the universe, we are very near to the place where this ramping up of complexity will become so excruciatingly rapid that more change will happen in a single week than happened in the previous thirteen billion years. And that then there will come a moment where more will happen in a single minute than happened in the previous thirteen billion years. And then a moment will come when more will happen in six point five five times ten to the twenty-third erg seconds... more will happen than has happened. And people say, "Well, but that's crazy." I mean, what kind of universe is that that ramps... [spiraling hand gesture].

Well, wait a minute. What's so crazy about this? Let's look at what the competition is peddling. What the competition would have you believe is that the universe sprang from nothing, in a single moment, for no reason. Well now, whatever you think about that theory, in the interest of being awake, please notice that that is the limit case for credulity. Do you know what I mean by that? I mean that if you can believe that, you can believe anything. That is the most improbable proposition the human mind can conceive of. I challenge you to top it. You know, I know the Scientologists think god is a clam on another planet but I don't think that tops this idea that the universe sprang from nothing, in a single moment, for no reason. That is article of faith number one. I say, no, no, this... If we're talking about universes that spring from nothing, if we're gonna talk like that, then surely such universes occur in a situation of great complexity. In other words, if we're going to look for an enormous ruption of emergent phenomena, an enormous, sudden, unexpected download of novelty, we shouldn't look in a domain of zero-space, zero-time, zero-energy, zero-anti-entropic-organization, that's the worst place to look. That's the least likely place where such a singularity would spring out. Where should you look, if you believe in this Jabberwock, this Chimera, this particular beast? Where should you hunt this Snark? You should hunt it in domains of immense complexity where you have matter, energy, light, chemistry, language, machines, people, cultures, intentionality, minds, minds, and if you throw all that stuff together and shake it up it's maybe not a sure thing that you will get a singularity, but you're certainly betting right. Now you've figured it out. So, I think that science is extremely hostile to the idea that the universe is complexifying, and complexifying more and more rapidly. Why? It's just a matter... it's just a historical issue. It has to do with the fact that nineteenth-century English biology was extremely hostile to what it called "Deism". Deism was the reigning religious paradigm of the nineteenth-century and it's the idea that god is a clockmaker, and that god made the universe and wound it up like a clock, and went away. And what irked Darwin and Lyell and those people was the idea that the universe has a purpose. You see, they thought that if it has a purpose this somehow means there is a god, and they weren't up for that. Uh, they were trying to build rational science into a tool for understanding nature.

I think we have grown beyond that. And that it's foolish to wear those tight, nineteenth-century, high-buttoned shoes. We can believe that the universe is following an organizational vector. We can believe that the universe is under the influence of a strange attractor. We can believe that the universe is pulled toward a future de nomoi, as well as pushed by the unfolding of causal necessity. We can believe all of that without evoking the nineteenth-century concept of god.

[1:40:00]

Now, why do I spend so much time on this, and what's so great about all this? Here's what's so great about all this. If you will join me in this believe that the universe works as I have described, it's an engine for the generation of

complexity, and it preserves complexity, and it builds on complexity to ever-higher levels. If you entertain this, guess what happens? It's like a light comes on on the human condition. "Who are we" in my story? Well first let me tell you "who are we" in science's story. We are nobody. We are lucky to be here. We are a cosmic accident. We exist on an ordinary star, at the edge of a typical galaxy, in an ordinary part of space and time. And essentially, our existence is without meaning or you have to perform one of those existential pas de deux where you confer meaning, or you know, one of these post-modern soft shoes. But if I'm right, that the universe has an appetite for novelty, then we are the apple of it's eye. Suddenly, cosmic purpose is restored to us. We left the center of the cosmic stage in the thirteenth-century and haven't been back since. But this idea says, "No, people matter. You are the cutting-edge of a thirteen-billion year old process of defining novelty. Your acts matter. Your thoughts matter. Your purpose? To add to the complexity. Your enemy? Disorder, entropy, stupidity, and tastelessness."

And so, suddenly then, you know, you have a morality, you have an ethical arrow, you have contextualization in the processes of nature, you have meaning. You have authenticity. You have hope. You have the cancelation of existentialism and positivism and all that late-twentieth-century crapola that people used to entertain back in the old days. So, that's why I am so keen for the idea of novelty because it seems self-evident. And you know, we can argue about whether the eschaton will arrive in 2000, or 2012, or 3,000... but I cannot believe that there is anybody in this room tonight who can... the hardest thing to imagine is human history going on for hundreds and hundreds and hundreds and hundreds of more years. That's impossible. We see around us the processes that make of history a self-limited game. The clock's ticking, folks. You think we can do gene-splicing and internet and psychedelic drugs and manipulation of our genetic material and star-flight and anti-matter and quantum teleportation and all these things? You can extrapolate that five-hundred years into the future? Don't be ridiculous. No, history is some kind of a phase transition. It only lasts about twenty-five thousand years. Some people think that's a long time, some people think it's a short time. It depends on where you stand. I think of it as, "snap!" You know? One moment you're hunting ungulates on the plains of Africa, and the next moment you're hurling a golded terbium superconducting extra-stellar vice toward Alpha Centauri with all of mankind aboard in virtual space being run as a simulation in circuitry. You know? It's just first, the one thing, then the other thing.

But now, history, which lasts twenty-five thousand years, is this weird period where you're neither fish nor fowl. You know, you're not the hunting ape anymore, but you are not yet the sixteen dimensional digital god. You know? And in that transition phase there is confusion, there is angst. But now, we're at the end. We have no... I maintain anybody who's peddling angst and peddling pessimism and peddling all this stuff is just... "that's so two-minutes ago." [audience applause]

Question?

[audience member]: I heard you on the radio being interviewed a while back talking about, it's "DMT", is that the..?

[McKenna]: That is.

[audience member]: And um, that got me really interested. And uh, you said that it was basically unavailable.

[McKenna]: From me.

[audience member]: Well...

[McKenna]: Is that your question?

[audience member]: No. Close, close.

[McKenna]: Pardon me?

[audience member]: No, I was really wondering um, yeah I had interpreted that you had said that it was pretty much unavailable, period, and I was wondering if in fact it was available, and if not, I mean that just sort of renewed my interest in psychedelics, which now, do you think is the second-best choice?

[McKenna]: Well, first let me say, because it's an...

[audience member]: And I'd like to hear maybe just a little more about DMT.

[McKenna]: Okay. Well first thing, let me say, which is a piece of practical advice, um... the psychedelic community is cleverly invisible because our choices in gender expression, fashion, so forth and so on, have, by crypto-osmosis come to dominate the values of the culture, we can no longer tell ourselves from straight people. So, uh, the only opportunity where we really come out of the woodwork is a thing like this. But then of course there's a tendency to fall into old-think, and everybody focus on the alpha male spiel-meister at the front of the room. Uh, so let me point out to you, I'm leaving, I'm going home to Hawaii tomorrow morning, but this is your community, this is your community. And whatever it is that you think you need, there are a dozen people in this room who can help you out. And I am not one of them, because I have a different assignment. But look around, and of course, be careful. But, after all, this is about consciousness, right? I mean if you're not conscious enough to conduct that social transaction without flubbing it up, that's probably god's way of telling you you shouldn't be proceeding toward high doses anyway. Um, yeah. Oh and you wanted me to say more about it.

[audience member]: (incoherent)... and, anyway, I'm going with the man in the black and red poncho.

[McKenna]: The man in the black and red poncho. Uh... yeah, I mean, in a way it's impossible to talk about DMT, but on the other hand, it's fun to try to talk about it because it pushes the horse of language into a lather. Basically, when you smoke DMT, what happens is pure confoundment. And, you know, I'm trying to speak generally here, in the sense that different people are confounded by different things. So of course, it addresses you personally. Your level and tolerance for confoundment is a very personal thing. Uh, people have asked me about DMT, "Is it

dangerous?” And the real answer is, “Only if you fear death by astonishment.”

[1:50:00]

You know, and you deliver that line, and then people laugh... except the people who've done DMT don't laugh because they understand, you know, death by astonishment is no remote possibility. Death by astonishment is right there. You know, when was the last time you were astonished? Unless I smoke DMT it doesn't happen to me. Amazed occasionally. Astonished? Never. Astonishment is when your jaw hangs... for a long time. You know? And DMT is simply confounding. Now, how could something be that confounding? I mean, you can imagine taking a drug, and realizing that you should treat your partner better, or realizing that god really exists, or realizing that you should exercise more, or realizing that the planet is an organized intelligence, but how could something be as confounding as DMT is? Well, I think the answer to that, and it took me awhile to get to this, is that the reason it's so confounding is because it, it's impact is on the language forming capacity itself. So the reason it's so confounding is because the thing which is trying to look at the DMT is infected by it. By the process of inspection.

So, DMT does not provide an experience which you analyze. Nothing so tidy goes on. The syntactical machinery of description undergoes some kind of hyper-dimensional inflation instantly, and then you know, you cannot tell yourself what it is that you understand. In other words, what DMT does can't be downloaded into as low dimensional a language as English. And so, you're like... I remember a B-movie I saw when I was a kid and it was set somewhere in Mexico and there was a big swamp and there was a dinosaur in the swamp and at one point this campesino comes, who encounters the dinosaur, comes rushing out of the swamp and the patrón of the ranch is there, and this terrified guy is there in this serape, and he can only point to the forest and sort of make a croaking sound. And that's what English allows you to do with the experience of DMT. You just come down a sputtering mess, if it works. You just come down saying, you know, “My god! It's not what I thought it was.” And this is after you've done it twenty times. You say, “It's not what I thought it was. It's not what I can think it is. It, it, it's something...”

And I... to me it's a miracle, because my intellectual arrow and how I brought myself up in terms of all these things was, I am a rationalist, and I am interested in testing, and verifying, and proceeding to define truth by non-exotic means. In other words, no arch-angels, no... none of that. And as I matured intellectually, I began to eliminate mystery from the world. You know? I'd look into some spiritual discipline, conclude, “No, that's a bunch of crap.” I'd go to some teacher, conclude, “No, this guy is a weasel.” I tested... I sought the weird, but with an attitude of critical skepticism. And I assumed, blithely, that with this flashlight I would soon prove there were no elves out there in the darkness. Turns out, no... no. This is the way to proceed, because stuff which is malarkey will be exposed as malarkey. Instantly, you know? You just go to the guru and you say, “What can you show me?” And if the guy wants you to sweep up around the ashram for a dozen years or so you say, “No, I'm outta here.” But when you get to DMT, it delivers. It delivers. It is as strange as anything can be. It is... you know... it is not only stranger than you suppose, as you sit here, it is stranger than you can suppose.

And what makes me wild about this is we're not talking about something that you have to go five-hundred miles up a jungle river and live with primitive people and study techniques for thirty years... We're talking about something which, if I had a pipe loaded with it in my hand, each one of you would be thirty seconds away from what I'm talking about. Well, you know, you've tripped and yeah, you lived in Paris and you went to Trebizond and all these things, but nothing like this ever descended. But it's not... it's so near. You know, it's not attained by practicing tantric techniques or building up mon... it's none of that. It's just near. Very near. One toke away is this absolutely

reality-dissolving, category-reconstructing, mind-boggling possibility. And I feel like this is a truth that has to be told. I'm like the campesino running out of the swamp and saying, you know, "Over here!" You know, "The orange thing! Do that!" Alright that's enough about DMT. You gotta take hold here.

Thank you very, very much. Thank you.

Terence McKenna: Ralph and I discussed what we were going to do this afternoon and we decided we would try for a conversational sonata, which means it's supposed to look like an unrehearsed conversation, but we both more or less think we know what we're going to say. I suggested the title "Dynamics of Hyperspace" before Ralph had even been asked to be part of this. I hope it's no embarrassment to him as a professional mathematician. These words actually mean something in certain disciplines. In other disciplines they only indicate things.

Ralph Abraham: Well, I agreed that we didn't want to talk about those old maps of hyperspace.

TM: What I mean by a new map of hyperspace is this: I think that we've come to a place with the psychedelic experience where the validation of the maps of inner space that Freud and Jung put forward in the first half of this century are not valid or complete enough. In other words, LSD validated very well the Freudian concept of the inner universe; it seemed to validate ideas about repression and trauma and the need to dredge material out of the unconscious.

RA: And that's what you were thinking of as the old maps? Freud and Jung...?

TM: Exactly. And more recent data that comes out of the psilocybin and DMT experience doesn't seem relevant to the human superconscious, unconscious or subconscious. It seems to be more like an objective manifold that lies beyond the personality or any human dimension, yet is accessible through these compounds.
